```
>>> from sage.all import *
>>> a = AugmentedLatticeDiagramFilling([[Integer(1),Integer(6)],[Integer(2)],
↪[Integer(3),Integer(4),Integer(2)],[],[],[Integer(5),Integer(5)]])
>>> a.reading_word()
word: 25465321
```

shape()

Return the shape of `self`.

EXAMPLES:

```
sage: a = AugmentedLatticeDiagramFilling([[1,6],[2],[3,4,2],[],[],[5,5]])
sage: a.shape()
[2, 1, 3, 0, 0, 2]
```

```
>>> from sage.all import *
>>> a = AugmentedLatticeDiagramFilling([[Integer(1),Integer(6)],[Integer(2)],
↪[Integer(3),Integer(4),Integer(2)],[],[],[Integer(5),Integer(5)]])
>>> a.shape()
[2, 1, 3, 0, 0, 2]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: a = AugmentedLatticeDiagramFilling([[1,6],[2],[3,4,2],[],[],[5,5]])
sage: a.weight()
[1, 2, 1, 1, 2, 1]
```

```
>>> from sage.all import *
>>> a = AugmentedLatticeDiagramFilling([[Integer(1),Integer(6)],[Integer(2)],
↪[Integer(3),Integer(4),Integer(2)],[],[],[Integer(5),Integer(5)]])
>>> a.weight()
[1, 2, 1, 1, 2, 1]
```

sage.combinat.sf.ns_macdonald.**E**(*mu*, *q=None*, *t=None*, *pi=None*)

Return the non-symmetric Macdonald polynomial in type A corresponding to a shape `mu`, with basement permuted according to `pi`.

Note that if both q and t are specified, then they must have the same parent.

REFERENCE:

- J. Haglund, M. Haiman, N. Loehr. *A combinatorial formula for non-symmetric Macdonald polynomials*. arXiv math/0601693v3.

See also

NonSymmetricMacdonaldPolynomials for a type free implementation where the polynomials are constructed recursively by the application of intertwining operators.

EXAMPLES:

```
sage: from sage.combinat.sf.ns_macdonald import E
sage: E([0,0,0])
1
sage: E([1,0,0])
x0
sage: E([0,1,0])
(t - 1)/(q*t^2 - 1)*x0 + x1
sage: E([0,0,1])
(t - 1)/(q*t - 1)*x0 + (t - 1)/(q*t - 1)*x1 + x2
sage: E([1,1,0])
x0*x1
sage: E([1,0,1])
(t - 1)/(q*t^2 - 1)*x0*x1 + x0*x2

```

`sage.combinat.sf.ns_macdonald.`**`Ht`**(*mu*, *q=None*, *t=None*, *pi=None*)

Return the symmetric Macdonald polynomial using the Haiman, Haglund, and Loehr formula.

Note that if both q and t are specified, then they must have the same parent.

REFERENCE:

- J. Haglund, M. Haiman, N. Loehr. *A combinatorial formula for non-symmetric Macdonald polynomials*. arXiv math/0601693v3.

EXAMPLES:

```
sage: from sage.combinat.sf.ns_macdonald import Ht
sage: HHt = SymmetricFunctions(QQ['q','t'].fraction_field()).macdonald().Ht()
sage: Ht([0,0,1])
x0 + x1 + x2
sage: HHt([1]).expand(3)
x0 + x1 + x2
sage: Ht([0,0,2])
x0^2 + (q + 1)*x0*x1 + x1^2 + (q + 1)*x0*x2 + (q + 1)*x1*x2 + x2^2
sage: HHt([2]).expand(3)
x0^2 + (q + 1)*x0*x1 + x1^2 + (q + 1)*x0*x2 + (q + 1)*x1*x2 + x2^2
```

```
>>> from sage.all import *

x0 + x1 + x2
>>> Ht([Integer(0),Integer(0),Integer(2)])
x0^2 + (q + 1)*x0*x1 + x1^2 + (q + 1)*x0*x2 + (q + 1)*x1*x2 + x2^2
>>> HHt([Integer(2)]).expand(Integer(3))
x0^2 + (q + 1)*x0*x1 + x1^2 + (q + 1)*x0*x2 + (q + 1)*x1*x2 + x2^2
```

class sage.combinat.sf.ns_macdonald.**LatticeDiagram**(*l*, *copy=True*)

Bases: *CombinatorialObject*

a(*i*, *j*)

Return the length of the arm of the box `(i, j)` in `self`.

EXAMPLES:

```
sage: a = LatticeDiagram([3,1,2,4,3,0,4,2,3])
sage: a.a(5,2)
3
```

```
>>> from sage.all import *
>>> a = LatticeDiagram([Integer(3),Integer(1),Integer(2),Integer(4),
↪Integer(3),Integer(0),Integer(4),Integer(2),Integer(3)])
>>> a.a(Integer(5),Integer(2))
3
```

arm(*i*, *j*)

Return the arm of the box `(i, j)` in `self`.

EXAMPLES:

```
sage: a = LatticeDiagram([3,1,2,4,3,0,4,2,3])
sage: a.arm(5,2)
[(1, 2), (3, 2), (8, 1)]
```

```
>>> from sage.all import *
>>> a = LatticeDiagram([Integer(3),Integer(1),Integer(2),Integer(4),
↪Integer(3),Integer(0),Integer(4),Integer(2),Integer(3)])
>>> a.arm(Integer(5),Integer(2))
[(1, 2), (3, 2), (8, 1)]
```

arm_left(*i*, *j*)

Return the left arm of the box `(i, j)` in `self`.

EXAMPLES:

```
sage: a = LatticeDiagram([3,1,2,4,3,0,4,2,3])
sage: a.arm_left(5,2)
[(1, 2), (3, 2)]
```

```
>>> from sage.all import *
>>> a = LatticeDiagram([Integer(3),Integer(1),Integer(2),Integer(4),
↪Integer(3),Integer(0),Integer(4),Integer(2),Integer(3)])
>>> a.arm_left(Integer(5),Integer(2))
[(1, 2), (3, 2)]
```

arm_right(*i*, *j*)

Return the right arm of the box `(i, j)` in `self`.

EXAMPLES:

```
sage: a = LatticeDiagram([3,1,2,4,3,0,4,2,3])
sage: a.arm_right(5,2)
[(8, 1)]
```

```
>>> from sage.all import *
>>> a = LatticeDiagram([Integer(3),Integer(1),Integer(2),Integer(4),
↪Integer(3),Integer(0),Integer(4),Integer(2),Integer(3)])
>>> a.arm_right(Integer(5),Integer(2))
[(8, 1)]
```

boxes()

EXAMPLES:

```
sage: a = LatticeDiagram([3,0,2])
sage: a.boxes()
[(1, 1), (1, 2), (1, 3), (3, 1), (3, 2)]
sage: a = LatticeDiagram([2, 1, 3, 0, 0, 2])
sage: a.boxes()
[(1, 1), (1, 2), (2, 1), (3, 1), (3, 2), (3, 3), (6, 1), (6, 2)]
```

```
>>> from sage.all import *
>>> a = LatticeDiagram([Integer(3),Integer(0),Integer(2)])
>>> a.boxes()
[(1, 1), (1, 2), (1, 3), (3, 1), (3, 2)]
>>> a = LatticeDiagram([Integer(2), Integer(1), Integer(3), Integer(0),␣
↪Integer(0), Integer(2)])
```

(continues on next page)

(continued from previous page)

```
>>> a.boxes()
[(1, 1), (1, 2), (2, 1), (3, 1), (3, 2), (3, 3), (6, 1), (6, 2)]
```

boxes_same_and_lower_right(*ii*, *jj*)

Return an iterator of the boxes of `self` that are in row `jj` but not identical with `(ii, jj)`, or lie in the row `jj - 1` (the row directly below `jj`; this might be the basement) and strictly to the right of `(ii, jj)`.

EXAMPLES:

```
sage: a = AugmentedLatticeDiagramFilling([[1,6],[2],[3,4,2],[],[],[5,5]])
sage: a = a.shape()
sage: list(a.boxes_same_and_lower_right(1,1))
[(2, 1), (3, 1), (6, 1), (2, 0), (3, 0), (4, 0), (5, 0), (6, 0)]
sage: list(a.boxes_same_and_lower_right(1,2))
[(3, 2), (6, 2), (2, 1), (3, 1), (6, 1)]
sage: list(a.boxes_same_and_lower_right(3,3))
[(6, 2)]
sage: list(a.boxes_same_and_lower_right(2,3))
[(3, 3), (3, 2), (6, 2)]
```

```
>>> from sage.all import *
>>> a = AugmentedLatticeDiagramFilling([[Integer(1),Integer(6)],[Integer(2)],
↪[Integer(3),Integer(4),Integer(2)],[],[],[Integer(5),Integer(5)]])
>>> a = a.shape()
>>> list(a.boxes_same_and_lower_right(Integer(1),Integer(1)))
[(2, 1), (3, 1), (6, 1), (2, 0), (3, 0), (4, 0), (5, 0), (6, 0)]
>>> list(a.boxes_same_and_lower_right(Integer(1),Integer(2)))
[(3, 2), (6, 2), (2, 1), (3, 1), (6, 1)]
>>> list(a.boxes_same_and_lower_right(Integer(3),Integer(3)))
[(6, 2)]
>>> list(a.boxes_same_and_lower_right(Integer(2),Integer(3)))
[(3, 3), (3, 2), (6, 2)]
```

flip()

Return the flip of `self`.

The flip map is defined as follows. Let `r = max(self)`. Then `self.flip()[i] = r - self[i]`.

EXAMPLES:

```
sage: a = LatticeDiagram([3,0,2])
sage: a.flip()
[0, 3, 1]
```

```
>>> from sage.all import *
>>> a = LatticeDiagram([Integer(3),Integer(0),Integer(2)])
>>> a.flip()
[0, 3, 1]
```

l(*i*, *j*)

Return `self[i] - j`.

EXAMPLES:

```
sage: a = LatticeDiagram([3,1,2,4,3,0,4,2,3])
sage: a.l(5,2)
1
```

```
>>> from sage.all import *
>>> a = LatticeDiagram([Integer(3),Integer(1),Integer(2),Integer(4),
↪Integer(3),Integer(0),Integer(4),Integer(2),Integer(3)])
>>> a.l(Integer(5),Integer(2))
1
```

leg(*i*, *j*)

Return the leg of the box `(i, j)` in `self`.

EXAMPLES:

```
sage: a = LatticeDiagram([3,1,2,4,3,0,4,2,3])
sage: a.leg(5,2)
[(5, 3)]
```

```
>>> from sage.all import *
>>> a = LatticeDiagram([Integer(3),Integer(1),Integer(2),Integer(4),
↪Integer(3),Integer(0),Integer(4),Integer(2),Integer(3)])
>>> a.leg(Integer(5),Integer(2))
[(5, 3)]
```

size()

Return the number of boxes in `self`.

EXAMPLES:

```
sage: a = LatticeDiagram([3,1,2,4,3,0,4,2,3])
sage: a.size()
22
```

```
>>> from sage.all import *
>>> a = LatticeDiagram([Integer(3),Integer(1),Integer(2),Integer(4),
↪Integer(3),Integer(0),Integer(4),Integer(2),Integer(3)])
>>> a.size()
22
```

class sage.combinat.sf.ns_macdonald.**NonattackingBacktracker**(*shape*, *pi=None*)

Bases: *GenericBacktracker*

EXAMPLES:

```
sage: from sage.combinat.sf.ns_macdonald import NonattackingBacktracker
sage: n = NonattackingBacktracker(LatticeDiagram([0,1,2]))
sage: n._ending_position
(3, 2)
sage: n._initial_state
(2, 1)
```

```
>>> from sage.all import *
>>> from sage.combinat.sf.ns_macdonald import NonattackingBacktracker
>>> n = NonattackingBacktracker(LatticeDiagram([Integer(0),Integer(1),
↪Integer(2)]))
>>> n._ending_position
(3, 2)
>>> n._initial_state
(2, 1)
```

get_next_pos(*ii*, *jj*)

EXAMPLES:

```
sage: from sage.combinat.sf.ns_macdonald import NonattackingBacktracker
sage: a = AugmentedLatticeDiagramFilling([[1,6],[2],[3,4,2],[],[],[5,5]])
sage: n = NonattackingBacktracker(a.shape())
sage: n.get_next_pos(1, 1)
(2, 1)
sage: n.get_next_pos(6, 1)
(1, 2)
sage: n = NonattackingBacktracker(LatticeDiagram([2,2,2]))
sage: n.get_next_pos(3, 1)
(1, 2)
```

```
>>> from sage.all import *
>>> from sage.combinat.sf.ns_macdonald import NonattackingBacktracker
>>> a = AugmentedLatticeDiagramFilling([[Integer(1),Integer(6)],[Integer(2)],
↪[Integer(3),Integer(4),Integer(2)],[],[],[Integer(5),Integer(5)]])
>>> n = NonattackingBacktracker(a.shape())
>>> n.get_next_pos(Integer(1), Integer(1))
(2, 1)
>>> n.get_next_pos(Integer(6), Integer(1))
(1, 2)
>>> n = NonattackingBacktracker(LatticeDiagram([Integer(2),Integer(2),
↪Integer(2)]))
>>> n.get_next_pos(Integer(3), Integer(1))
(1, 2)
```

sage.combinat.sf.ns_macdonald.**NonattackingFillings**(*shape*, *pi=None*)

Return the finite set of nonattacking fillings of a given shape.

EXAMPLES:

```
sage: NonattackingFillings([0,1,2])
Nonattacking fillings of [0, 1, 2]
sage: NonattackingFillings([0,1,2]).list()
[[[1], [2, 1], [3, 2, 1]],
 [[1], [2, 1], [3, 2, 2]],
 [[1], [2, 1], [3, 2, 3]],
 [[1], [2, 1], [3, 3, 1]],
 [[1], [2, 1], [3, 3, 2]],
 [[1], [2, 1], [3, 3, 3]],
 [[1], [2, 2], [3, 1, 1]],
 [[1], [2, 2], [3, 1, 2]],
```

(continues on next page)

(continued from previous page)

```
 [[1], [2, 2], [3, 1, 3]],
 [[1], [2, 2], [3, 3, 1]],
 [[1], [2, 2], [3, 3, 2]],
 [[1], [2, 2], [3, 3, 3]]]
```

```
>>> from sage.all import *
>>> NonattackingFillings([Integer(0),Integer(1),Integer(2)])
Nonattacking fillings of [0, 1, 2]
>>> NonattackingFillings([Integer(0),Integer(1),Integer(2)]).list()
[[[1], [2, 1], [3, 2, 1]],
 [[1], [2, 1], [3, 2, 2]],
 [[1], [2, 1], [3, 2, 3]],

 [[1], [2, 2], [3, 3, 2]],
 [[1], [2, 2], [3, 3, 3]]]
```

class sage.combinat.sf.ns_macdonald.**NonattackingFillings_shape**(*shape*, *pi=None*)

Bases: Parent, UniqueRepresentation

EXAMPLES:

```
sage: n = NonattackingFillings([0,1,2])
sage: n == loads(dumps(n))
True
```

```
>>> from sage.all import *
>>> n = NonattackingFillings([Integer(0),Integer(1),Integer(2)])
>>> n == loads(dumps(n))
True
```

flip()

Return the nonattacking fillings of the flipped shape.

EXAMPLES:

```
sage: NonattackingFillings([0,1,2]).flip()
Nonattacking fillings of [2, 1, 0]
```

```
>>> from sage.all import *
>>> NonattackingFillings([Integer(0),Integer(1),Integer(2)]).flip()
Nonattacking fillings of [2, 1, 0]
```

Orthogonal symmetric functions

AUTHORS:

- Travis Scrimshaw (2013-11-10): Initial version

class sage.combinat.sf.orthogonal.**SymmetricFunctionAlgebra_orthogonal**(*Sym*)

Bases: *SymmetricFunctionAlgebra_generic*

The orthogonal symmetric function basis (or orthogonal basis, to be short).

The orthogonal basis $\{o_\lambda\}$ where λ is taken over all partitions is defined by the following change of basis with the Schur functions:

$$s_\lambda = \sum_\mu \left(\sum_{\nu \in H} c^\lambda_{\mu\nu} \right) o_\mu$$

where H is the set of all partitions with even-width rows and $c^\lambda_{\mu\nu}$ is the usual Littlewood-Richardson (LR) coefficients. By the properties of LR coefficients, this can be shown to be a upper unitriangular change of basis.

Note

This is only a filtered basis, not a $\mathbf{Z}$-graded basis. However this does respect the induced $(\mathbf{Z}/2\mathbf{Z})$-grading.

INPUT:

- `Sym` – an instance of the ring of the symmetric functions

REFERENCES:

- [ChariKleber2000]
- [KoikeTerada1987]
- [ShimozonoZabrocki2006]

EXAMPLES:

Here are the first few orthogonal symmetric functions, in various bases:

```
sage: Sym = SymmetricFunctions(QQ)
sage: o = Sym.o()
sage: e = Sym.e()
sage: h = Sym.h()
sage: p = Sym.p()
sage: s = Sym.s()
sage: m = Sym.m()

sage: p(o([1]))
p[1]
sage: m(o([1]))
m[1]
sage: e(o([1]))
e[1]
sage: h(o([1]))
h[1]
sage: s(o([1]))
s[1]
```

(continues on next page)

(continued from previous page)

```
sage: p(o([2]))
-p[] + 1/2*p[1, 1] + 1/2*p[2]
sage: m(o([2]))
-m[] + m[1, 1] + m[2]
sage: e(o([2]))
-e[] + e[1, 1] - e[2]
sage: h(o([2]))
-h[] + h[2]
sage: s(o([2]))
-s[] + s[2]

sage: p(o([3]))
-p[1] + 1/6*p[1, 1, 1] + 1/2*p[2, 1] + 1/3*p[3]
sage: m(o([3]))
-m[1] + m[1, 1, 1] + m[2, 1] + m[3]
sage: e(o([3]))
-e[1] + e[1, 1, 1] - 2*e[2, 1] + e[3]
sage: h(o([3]))
-h[1] + h[3]
sage: s(o([3]))
-s[1] + s[3]

sage: Sym = SymmetricFunctions(ZZ)
sage: o = Sym.o()
sage: e = Sym.e()
sage: h = Sym.h()
sage: s = Sym.s()
sage: m = Sym.m()
sage: p = Sym.p()
sage: m(o([4]))
-m[1, 1] + m[1, 1, 1, 1] - m[2] + m[2, 1, 1] + m[2, 2] + m[3, 1] + m[4]
sage: e(o([4]))
-e[1, 1] + e[1, 1, 1, 1] + e[2] - 3*e[2, 1, 1] + e[2, 2] + 2*e[3, 1] - e[4]
sage: h(o([4]))
-h[2] + h[4]
sage: s(o([4]))
-s[2] + s[4]
```

```
>>> from sage.all import *

-m[1] + m[1, 1, 1] + m[2, 1] + m[3]
>>> e(o([Integer(3)]))
-e[1] + e[1, 1, 1] - 2*e[2, 1] + e[3]
>>> h(o([Integer(3)]))
-h[1] + h[3]
>>> s(o([Integer(3)]))
-s[1] + s[3]

>>> Sym = SymmetricFunctions(ZZ)
>>> o = Sym.o()
>>> e = Sym.e()
>>> h = Sym.h()
>>> s = Sym.s()
>>> m = Sym.m()
>>> p = Sym.p()
>>> m(o([Integer(4)]))
-m[1, 1] + m[1, 1, 1, 1] - m[2] + m[2, 1, 1] + m[2, 2] + m[3, 1] + m[4]
>>> e(o([Integer(4)]))
-e[1, 1] + e[1, 1, 1, 1] + e[2] - 3*e[2, 1, 1] + e[2, 2] + 2*e[3, 1] - e[4]
>>> h(o([Integer(4)]))
-h[2] + h[4]
>>> s(o([Integer(4)]))
-s[2] + s[4]
```

Some examples of conversions the other way:

```
sage: o(h[3])
o[1] + o[3]
sage: o(e[3])
o[1, 1, 1]
sage: o(m[2,1])
```

(continues on next page)

(continued from previous page)

```
o[1] - 2*o[1, 1, 1] + o[2, 1]
sage: o(p[3])
o[1, 1, 1] - o[2, 1] + o[3]
```

```
>>> from sage.all import *
>>> o(h[Integer(3)])
o[1] + o[3]
>>> o(e[Integer(3)])
o[1, 1, 1]
>>> o(m[Integer(2),Integer(1)])
o[1] - 2*o[1, 1, 1] + o[2, 1]
>>> o(p[Integer(3)])
o[1, 1, 1] - o[2, 1] + o[3]
```

Some multiplication:

```
sage: o([2]) * o([1,1])
o[1, 1] + o[2] + o[2, 1, 1] + o[3, 1]
sage: o([2,1,1]) * o([2])
o[1, 1] + o[1, 1, 1, 1] + 2*o[2, 1, 1] + o[2, 2] + o[2, 2, 1, 1]
 + o[3, 1] + o[3, 1, 1, 1] + o[3, 2, 1] + o[4, 1, 1]
sage: o([1,1]) * o([2,1])
o[1] + o[1, 1, 1] + 2*o[2, 1] + o[2, 1, 1, 1] + o[2, 2, 1]
 + o[3] + o[3, 1, 1] + o[3, 2]
```

```
>>> from sage.all import *
>>> o([Integer(2)]) * o([Integer(1),Integer(1)])
o[1, 1] + o[2] + o[2, 1, 1] + o[3, 1]
>>> o([Integer(2),Integer(1),Integer(1)]) * o([Integer(2)])
o[1, 1] + o[1, 1, 1, 1] + 2*o[2, 1, 1] + o[2, 2] + o[2, 2, 1, 1]
 + o[3, 1] + o[3, 1, 1, 1] + o[3, 2, 1] + o[4, 1, 1]
>>> o([Integer(1),Integer(1)]) * o([Integer(2),Integer(1)])
o[1] + o[1, 1, 1] + 2*o[2, 1] + o[2, 1, 1, 1] + o[2, 2, 1]
 + o[3] + o[3, 1, 1] + o[3, 2]
```

Examples of the Hopf algebra structure:

```
sage: o([1]).antipode()
-o[1]
sage: o([2]).antipode()
-o[] + o[1, 1]
sage: o([1]).coproduct()
o[] # o[1] + o[1] # o[]
sage: o([2]).coproduct()
o[] # o[] + o[] # o[2] + o[1] # o[1] + o[2] # o[]
sage: o([1]).counit()
0
sage: o.one().counit()
1
```

```
>>> from sage.all import *
>>> o([Integer(1)]).antipode()
```

(continues on next page)

(continued from previous page)

```
-o[1]
>>> o([Integer(2)]).antipode()
-o[] + o[1, 1]
>>> o([Integer(1)]).coproduct()
o[] # o[1] + o[1] # o[]
>>> o([Integer(2)]).coproduct()
o[] # o[] + o[] # o[2] + o[1] # o[1] + o[2] # o[]
>>> o([Integer(1)]).counit()
0
>>> o.one().counit()
1
```

Power sum symmetric functions

class sage.combinat.sf.powersum.**SymmetricFunctionAlgebra_power**(*Sym*)

Bases: *SymmetricFunctionAlgebra_multiplicative*

A class for methods associated to the power sum basis of the symmetric functions.

INPUT:

- `self` – the power sum basis of the symmetric functions
- `Sym` – an instance of the ring of symmetric functions

class Element

Bases: *Element*

adams_operator(*n*)

Return the image of the symmetric function `self` under the n-th Adams operator.

The n-th Adams operator $\mathbf{f}_n$ is defined to be the map from the ring of symmetric functions to itself that sends every symmetric function $P(x_1, x_2, x_3, \ldots)$ to $P(x_1^n, x_2^n, x_3^n, \ldots)$. This operator $\mathbf{f}_n$ is a Hopf algebra endomorphism, and satisfies

$$\mathbf{f}_n m_{(\lambda_1,\lambda_2,\lambda_3,\ldots)} = m_{(n\lambda_1,n\lambda_2,n\lambda_3,\ldots)}$$

for every partition $(\lambda_1, \lambda_2, \lambda_3, \ldots)$ (where m means the monomial basis). Moreover, $\mathbf{f}_n(p_r) = p_{nr}$ for every positive integer r (where p_k denotes the k-th powersum symmetric function).

The n-th Adams operator is also called the n-th Frobenius endomorphism. It is not related to the Frobenius map which connects the ring of symmetric functions with the representation theory of the symmetric group.

The n-th Adams operator is the n-th Adams operator of the Λ-ring of symmetric functions over the integers.

The n-th Adams operator can also be described via plethysm: Every symmetric function P satisfies $\mathbf{f}_n(P) = p_n \circ P = P \circ p_n$, where p_n is the n-th powersum symmetric function, and $\circ$ denotes (outer) plethysm.

INPUT:

- `n` – positive integer

OUTPUT:

The result of applying the n-th Adams operator (on the ring of symmetric functions) to `self`.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: p = Sym.p()
sage: p[3].adams_operator(2)
p[6]
sage: p[4,2,1].adams_operator(3)
p[12, 6, 3]
sage: p([]).adams_operator(4)
p[]
sage: p[3].adams_operator(1)
p[3]
sage: (p([3]) - p([2]) + p([])).adams_operator(3)
p[] - p[6] + p[9]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> p = Sym.p()
>>> p[Integer(3)].adams_operator(Integer(2))
p[6]
>>> p[Integer(4),Integer(2),Integer(1)].adams_operator(Integer(3))
p[12, 6, 3]
>>> p([]).adams_operator(Integer(4))
p[]
>>> p[Integer(3)].adams_operator(Integer(1))
p[3]
>>> (p([Integer(3)]) - p([Integer(2)]) + p([])).adams_operator(Integer(3))
p[] - p[6] + p[9]
```

See also

plethysm()

eval_at_permutation_roots(*rho*)

Evaluate at eigenvalues of a permutation matrix.

Evaluate an element of the power sum basis at the eigenvalues of a permutation matrix with cycle structure ρ.

This function evaluates an element at the roots of unity

$$\Xi_{\rho_1}, \Xi_{\rho_2}, \ldots, \Xi_{\rho_\ell}$$

where

$$\Xi_m = 1, \zeta_m, \zeta_m^2, \ldots, \zeta_m^{m-1}$$

and ζ_m is an m root of unity. These roots of unity represent the eigenvalues of permutation matrix with cycle structure ρ.

INPUT:

- `rho` – a partition or a list of nonnegative integers

OUTPUT: an element of the base ring

EXAMPLES:

```
sage: p = SymmetricFunctions(QQ).p()
sage: p([3,3]).eval_at_permutation_roots([6])
0
sage: p([3,3]).eval_at_permutation_roots([3])
9
sage: p([3,3]).eval_at_permutation_roots([1])
1
sage: p([3,3]).eval_at_permutation_roots([3,3])
36
sage: p([3,3]).eval_at_permutation_roots([1,1,1,1,1])
25
sage: (p[1]+p[2]+p[3]).eval_at_permutation_roots([3,2])
5
```

```
>>> from sage.all import *
>>> p = SymmetricFunctions(QQ).p()
>>> p([Integer(3),Integer(3)]).eval_at_permutation_roots([Integer(6)])
0
>>> p([Integer(3),Integer(3)]).eval_at_permutation_roots([Integer(3)])
9
>>> p([Integer(3),Integer(3)]).eval_at_permutation_roots([Integer(1)])
1
>>> p([Integer(3),Integer(3)]).eval_at_permutation_roots([Integer(3),
↪Integer(3)])
36
>>> p([Integer(3),Integer(3)]).eval_at_permutation_roots([Integer(1),
↪Integer(1),Integer(1),Integer(1),Integer(1)])
25
>>> (p[Integer(1)]+p[Integer(2)]+p[Integer(3)]).eval_at_permutation_
↪roots([Integer(3),Integer(2)])
5
```

expand(*n*, *alphabet='x'*)

Expand the symmetric function `self` as a symmetric polynomial in `n` variables.

INPUT:

- `n` – nonnegative integer
- `alphabet` – (default: `'x'`) a variable for the expansion

OUTPUT:

A monomial expansion of `self` in the n variables labelled by `alphabet`.

EXAMPLES:

```
sage: p = SymmetricFunctions(QQ).p()
sage: a = p([2])
sage: a.expand(2)
x0^2 + x1^2
sage: a.expand(3, alphabet=['a','b','c'])
a^2 + b^2 + c^2
sage: p([2,1,1]).expand(2)
x0^4 + 2*x0^3*x1 + 2*x0^2*x1^2 + 2*x0*x1^3 + x1^4
sage: p([7]).expand(4)
x0^7 + x1^7 + x2^7 + x3^7
```

(continues on next page)

(continued from previous page)

```
sage: p([7]).expand(4,alphabet='t')
t0^7 + t1^7 + t2^7 + t3^7
sage: p([7]).expand(4,alphabet='x,y,z,t')
x^7 + y^7 + z^7 + t^7
sage: p(1).expand(4)
1
sage: p(0).expand(4)
0
sage: (p([]) + 2*p([1])).expand(3)
2*x0 + 2*x1 + 2*x2 + 1
sage: p([1]).expand(0)
0
sage: (3*p([])).expand(0)
3
```

```
>>> from sage.all import *
>>> p = SymmetricFunctions(QQ).p()
>>> a = p([Integer(2)])
>>> a.expand(Integer(2))
x0^2 + x1^2
>>> a.expand(Integer(3), alphabet=['a','b','c'])
a^2 + b^2 + c^2
>>> p([Integer(2),Integer(1),Integer(1)]).expand(Integer(2))
x0^4 + 2*x0^3*x1 + 2*x0^2*x1^2 + 2*x0*x1^3 + x1^4
>>> p([Integer(7)]).expand(Integer(4))
x0^7 + x1^7 + x2^7 + x3^7
>>> p([Integer(7)]).expand(Integer(4),alphabet='t')
t0^7 + t1^7 + t2^7 + t3^7
>>> p([Integer(7)]).expand(Integer(4),alphabet='x,y,z,t')
x^7 + y^7 + z^7 + t^7
>>> p(Integer(1)).expand(Integer(4))
1
>>> p(Integer(0)).expand(Integer(4))
0
>>> (p([]) + Integer(2)*p([Integer(1)])).expand(Integer(3))
2*x0 + 2*x1 + 2*x2 + 1
>>> p([Integer(1)]).expand(Integer(0))
0
>>> (Integer(3)*p([])).expand(Integer(0))
3
```

exponential_specialization (*t=None*, *q=1*)

Return the exponential specialization of a symmetric function (when $q = 1$), or the q-exponential specialization (when $q \neq 1$).

The *exponential specialization* ex at t is a K-algebra homomorphism from the K-algebra of symmetric functions to another K-algebra R. It is defined whenever the base ring K is a $\mathbf{Q}$-algebra and t is an element of R. The easiest way to define it is by specifying its values on the powersum symmetric functions to be $p_1 = t$ and $p_n = 0$ for $n > 1$. Equivalently, on the homogeneous functions it is given by $ex(h_n) = t^n/n!$; see Proposition 7.8.4 of [EnumComb2].

By analogy, the q-exponential specialization is a K-algebra homomorphism from the K-algebra of symmetric functions to another K-algebra R that depends on two elements t and q of R for which the

elements $1 - q^i$ for all positive integers i are invertible. It can be defined by specifying its values on the complete homogeneous symmetric functions to be

$$ex_q(h_n) = t^n/[n]_q!,$$

where $[n]_q!$ is the q-factorial. Equivalently, for $q \neq 1$ and a homogeneous symmetric function f of degree n, we have

$$ex_q(f) = (1-q)^n t^n ps_q(f),$$

where $ps_q(f)$ is the stable principal specialization of f (see *principal_specialization()*). (See (7.29) in [EnumComb2].)

The limit of ex_q as $q \to 1$ is ex.

INPUT:

- `t` – (default: `None`) the value to use for t; the default is to create a ring of polynomials in `t`
- `q` – (default: 1) the value to use for q. If `q` is `None`, then a ring (or fraction field) of polynomials in `q` is created.

EXAMPLES:

```
sage: p = SymmetricFunctions(QQ).p()
sage: x = p[8,7,3,1]
sage: x.exponential_specialization()
0
sage: x = p[3] + 5*p[1,1] + 2*p[1] + 1
sage: x.exponential_specialization(t=var("t"))                          #␣
↪needs sage.symbolic
5*t^2 + 2*t + 1
```

```
>>> from sage.all import *
>>> p = SymmetricFunctions(QQ).p()
>>> x = p[Integer(8),Integer(7),Integer(3),Integer(1)]
>>> x.exponential_specialization()
0
>>> x = p[Integer(3)] + Integer(5)*p[Integer(1),Integer(1)] +␣
↪Integer(2)*p[Integer(1)] + Integer(1)
>>> x.exponential_specialization(t=var("t"))                            #␣
↪needs sage.symbolic
5*t^2 + 2*t + 1
```

We also support the q-exponential_specialization:

```
sage: factor(p[3].exponential_specialization(q=var("q"), t=var("t")))   #␣
↪needs sage.symbolic
(q - 1)^2*t^3/(q^2 + q + 1)
```

```
>>> from sage.all import *
>>> factor(p[Integer(3)].exponential_specialization(q=var("q"), t=var("t
↪")))   # needs sage.symbolic
(q - 1)^2*t^3/(q^2 + q + 1)
```

omega()

Return the image of `self` under the omega automorphism.

The *omega automorphism* is defined to be the unique algebra endomorphism ω of the ring of symmetric functions that satisfies $\omega(e_k) = h_k$ for all positive integers k (where e_k stands for the k-th elementary symmetric function, and h_k stands for the k-th complete homogeneous symmetric function). It furthermore is a Hopf algebra endomorphism and an involution, and it is also known as the *omega involution*. It sends the power-sum symmetric function p_k to $(-1)^{k-1}p_k$ for every positive integer k.

The images of some bases under the omega automorphism are given by

$$\omega(e_\lambda) = h_\lambda, \qquad \omega(h_\lambda) = e_\lambda, \qquad \omega(p_\lambda) = (-1)^{|\lambda|-\ell(\lambda)}p_\lambda, \qquad \omega(s_\lambda) = s_{\lambda'},$$

where λ is any partition, where $\ell(\lambda)$ denotes the length (*length()*) of the partition λ, where λ' denotes the conjugate partition (*conjugate()*) of λ, and where the usual notations for bases are used (e = elementary, h = complete homogeneous, p = powersum, s = Schur).

omega_involution() is a synonym for the *omega()* method.

OUTPUT: the image of `self` under the omega automorphism

EXAMPLES:

```
sage: p = SymmetricFunctions(QQ).p()
sage: a = p([2,1]); a
p[2, 1]
sage: a.omega()
-p[2, 1]
sage: p([]).omega()
p[]
sage: p(0).omega()
0
sage: p = SymmetricFunctions(ZZ).p()
sage: (p([3,1,1]) - 2 * p([2,1])).omega()
2*p[2, 1] + p[3, 1, 1]
```

```
>>> from sage.all import *
>>> p = SymmetricFunctions(QQ).p()
>>> a = p([Integer(2),Integer(1)]); a
p[2, 1]
>>> a.omega()
-p[2, 1]
>>> p([]).omega()
p[]
>>> p(Integer(0)).omega()
0
>>> p = SymmetricFunctions(ZZ).p()
>>> (p([Integer(3),Integer(1),Integer(1)]) - Integer(2) * p([Integer(2),
↪Integer(1)])).omega()
2*p[2, 1] + p[3, 1, 1]
```

omega_involution()

alias of *omega()*.

principal_specialization(*n=+Infinity*, *q=None*)

Return the principal specialization of a symmetric function.

The *principal specialization* of order n at q is the ring homomorphism $ps_{n,q}$ from the ring of symmetric functions to another commutative ring R given by $x_i \mapsto q^{i-1}$ for $i \in \{1, \ldots, n\}$ and $x_i \mapsto 0$ for $i > n$. Here, q is a given element of R, and we assume that the variables of our symmetric functions are

$x_1, x_2, x_3, \ldots$. (To be more precise, $ps_{n,q}$ is a K-algebra homomorphism, where K is the base ring.) See Section 7.8 of [EnumComb2].

The *stable principal specialization* at q is the ring homomorphism ps_q from the ring of symmetric functions to another commutative ring R given by $x_i \mapsto q^{i-1}$ for all i. This is well-defined only if the resulting infinite sums converge; thus, in particular, setting $q = 1$ in the stable principal specialization is an invalid operation.

INPUT:

- `n` – (default: `infinity`) a nonnegative integer or `infinity`, specifying whether to compute the principal specialization of order `n` or the stable principal specialization.
- `q` – (default: `None`) the value to use for q; the default is to create a ring of polynomials in `q` (or a field of rational functions in `q`) over the given coefficient ring.

We use the formulas from Proposition 7.8.3 of [EnumComb2]:

$$ps_{n,q}(p_\lambda) = \prod_i (1 - q^{n\lambda_i})/(1 - q^{\lambda_i}),$$
$$ps_{n,1}(p_\lambda) = n^{\ell(\lambda)},$$
$$ps_q(p_\lambda) = 1/\prod_i (1 - q^{\lambda_i}),$$

where $\ell(\lambda)$ denotes the length of λ, and where the products range from $i = 1$ to $i = \ell(\lambda)$.

EXAMPLES:

```
sage: p = SymmetricFunctions(QQ).p()
sage: x = p[8,7,3,1]
sage: x.principal_specialization(3, q=var("q"))                              #␣
↪needs sage.symbolic
(q^24 - 1)*(q^21 - 1)*(q^9 - 1)/((q^8 - 1)*(q^7 - 1)*(q - 1))

sage: x = 5*p[1,1,1] + 3*p[2,1] + 1
sage: x.principal_specialization(3, q=var("q"))                              #␣
↪needs sage.symbolic
5*(q^3 - 1)^3/(q - 1)^3 + 3*(q^6 - 1)*(q^3 - 1)/((q^2 - 1)*(q - 1)) + 1
```

```
>>> from sage.all import *
>>> p = SymmetricFunctions(QQ).p()
>>> x = p[Integer(8),Integer(7),Integer(3),Integer(1)]
>>> x.principal_specialization(Integer(3), q=var("q"))                       ␣
↪     # needs sage.symbolic
(q^24 - 1)*(q^21 - 1)*(q^9 - 1)/((q^8 - 1)*(q^7 - 1)*(q - 1))

>>> x = Integer(5)*p[Integer(1),Integer(1),Integer(1)] +␣
↪Integer(3)*p[Integer(2),Integer(1)] + Integer(1)
>>> x.principal_specialization(Integer(3), q=var("q"))                       ␣
↪     # needs sage.symbolic
5*(q^3 - 1)^3/(q - 1)^3 + 3*(q^6 - 1)*(q^3 - 1)/((q^2 - 1)*(q - 1)) + 1
```

By default, we return a rational function in q:

```
sage: x.principal_specialization(3)
8*q^6 + 18*q^5 + 36*q^4 + 38*q^3 + 36*q^2 + 18*q + 9
```

```
>>> from sage.all import *
>>> x.principal_specialization(Integer(3))
8*q^6 + 18*q^5 + 36*q^4 + 38*q^3 + 36*q^2 + 18*q + 9
```

If `n` is not given we return the stable principal specialization:

```
sage: x.principal_specialization(q=var("q"))                                #␣
↪needs sage.symbolic
3/((q^2 - 1)*(q - 1)) - 5/(q - 1)^3 + 1
```

```
>>> from sage.all import *
>>> x.principal_specialization(q=var("q"))                                  #␣
↪needs sage.symbolic
3/((q^2 - 1)*(q - 1)) - 5/(q - 1)^3 + 1
```

scalar(*x*, *zee=None*)

Return the standard scalar product of `self` and `x`.

INPUT:

- `x` – a power sum symmetric function
- `zee` – (default: uses standard `zee` function) optional input specifying the scalar product on the power sum basis with normalization $\langle p_\mu, p_\mu \rangle = \text{zee}(\mu)$. `zee` should be a function on partitions.

Note that the power-sum symmetric functions are orthogonal under this scalar product. With the default value of `zee`, the value of $\langle p_\lambda, p_\lambda \rangle$ is given by the size of the centralizer in S_n of a permutation of cycle type λ.

OUTPUT:

- the standard scalar product between `self` and `x`, or, if the optional parameter `zee` is specified, then the scalar product with respect to the normalization $\langle p_\mu, p_\mu \rangle = \text{zee}(\mu)$ with the power sum basis elements being orthogonal

EXAMPLES:

```
sage: p = SymmetricFunctions(QQ).p()
sage: p4 = Partitions(4)
sage: matrix([ [p(a).scalar(p(b)) for a in p4] for b in p4])
[ 4  0  0  0  0]
[ 0  3  0  0  0]
[ 0  0  8  0  0]
[ 0  0  0  4  0]
[ 0  0  0  0 24]
sage: p(0).scalar(p(1))
0
sage: p(1).scalar(p(2))
2

sage: zee = lambda x : 1
sage: matrix( [[p[la].scalar(p[mu], zee) for la in Partitions(3)] for mu␣
↪in Partitions(3)])
[1 0 0]
[0 1 0]
[0 0 1]
```

```
>>> from sage.all import *
>>> p = SymmetricFunctions(QQ).p()
>>> p4 = Partitions(Integer(4))
>>> matrix([ [p(a).scalar(p(b)) for a in p4] for b in p4])
[ 4  0  0  0  0]
[ 0  3  0  0  0]
[ 0  0  8  0  0]
[ 0  0  0  4  0]
[ 0  0  0  0 24]
>>> p(Integer(0)).scalar(p(Integer(1)))
0
>>> p(Integer(1)).scalar(p(Integer(2)))
2

>>> zee = lambda x : Integer(1)
>>> matrix( [[p[la].scalar(p[mu], zee) for la in Partitions(Integer(3))]␣
↪for mu in Partitions(Integer(3))])
[1 0 0]
[0 1 0]
[0 0 1]
```

verschiebung(*n*)

Return the image of the symmetric function `self` under the n-th Verschiebung operator.

The n-th Verschiebung operator $\mathbf{V}_n$ is defined to be the unique algebra endomorphism V of the ring of symmetric functions that satisfies $V(h_r) = h_{r/n}$ for every positive integer r divisible by n, and satisfies $V(h_r) = 0$ for every positive integer r not divisible by n. This operator $\mathbf{V}_n$ is a Hopf algebra endomorphism. For every nonnegative integer r with $n \mid r$, it satisfies

$$\mathbf{V}_n(h_r) = h_{r/n}, \quad \mathbf{V}_n(p_r) = np_{r/n}, \quad \mathbf{V}_n(e_r) = (-1)^{r-r/n} e_{r/n}$$

(where h is the complete homogeneous basis, p is the powersum basis, and e is the elementary basis). For every nonnegative integer r with $n \nmid r$, it satisfes

$$\mathbf{V}_n(h_r) = \mathbf{V}_n(p_r) = \mathbf{V}_n(e_r) = 0.$$

The n-th Verschiebung operator is also called the n-th Verschiebung endomorphism. Its name derives from the Verschiebung (German for "shift") endomorphism of the Witt vectors.

The n-th Verschiebung operator is adjoint to the n-th Adams operator (see *adams_operator()* for its definition) with respect to the Hall scalar product (*scalar()*).

The action of the n-th Verschiebung operator on the Schur basis can also be computed explicitly. The following (probably clumsier than necessary) description can be obtained by solving exercise 7.61 in Stanley's [STA].

Let λ be a partition. Let n be a positive integer. If the n-core of λ is nonempty, then $\mathbf{V}_n(s_\lambda) = 0$. Otherwise, the following method computes $\mathbf{V}_n(s_\lambda)$: Write the partition λ in the form $(\lambda_1, \lambda_2, \ldots, \lambda_{ns})$ for some nonnegative integer s. (If n does not divide the length of λ, then this is achieved by adding trailing zeroes to λ.) Set $\beta_i = \lambda_i + ns - i$ for every $s \in \{1, 2, \ldots, ns\}$. Then, $(\beta_1, \beta_2, \ldots, \beta_{ns})$ is a strictly decreasing sequence of nonnegative integers. Stably sort the list $(1, 2, \ldots, ns)$ in order of (weakly) increasing remainder of $-1 - \beta_i$ modulo n. Let ξ be the sign of the permutation that is used for this sorting. Let ψ be the sign of the permutation that is used to stably sort the list $(1, 2, \ldots, ns)$ in order of (weakly) increasing remainder of $i - 1$ modulo n. (Notice that $\psi = (-1)^{n(n-1)s(s-1)/4}$.) Then, $\mathbf{V}_n(s_\lambda) = \xi\psi \prod_{i=0}^{n-1} s_{\lambda^{(i)}}$, where $(\lambda^{(0)}, \lambda^{(1)}, \ldots, \lambda^{(n-1)})$ is the n-quotient of λ.

INPUT:

- `n` – positive integer

OUTPUT:

The result of applying the n-th Verschiebung operator (on the ring of symmetric functions) to `self`.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: p = Sym.p()
sage: p[3].verschiebung(2)
0
sage: p[4].verschiebung(4)
4*p[1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> p = Sym.p()
>>> p[Integer(3)].verschiebung(Integer(2))
0
>>> p[Integer(4)].verschiebung(Integer(4))
4*p[1]
```

The Verschiebung endomorphisms are multiplicative:

```
sage: all( all( p(lam).verschiebung(2) * p(mu).verschiebung(2)
....:           == (p(lam) * p(mu)).verschiebung(2)
....:           for mu in Partitions(4) )
....:       for lam in Partitions(4) )
True
```

```
>>> from sage.all import *
>>> all( all( p(lam).verschiebung(Integer(2)) * p(mu).
↪verschiebung(Integer(2))
...           == (p(lam) * p(mu)).verschiebung(Integer(2))
...           for mu in Partitions(Integer(4)) )
...       for lam in Partitions(Integer(4)) )
True
```

Testing the adjointness between the Adams operators $\mathbf{f}_n$ and the Verschiebung operators $\mathbf{V}_n$:

```
sage: Sym = SymmetricFunctions(QQ)
sage: p = Sym.p()
sage: all( all( p(lam).verschiebung(2).scalar(p(mu))
....:           == p(lam).scalar(p(mu).adams_operator(2))
....:           for mu in Partitions(2) )
....:       for lam in Partitions(4) )
True
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> p = Sym.p()
>>> all( all( p(lam).verschiebung(Integer(2)).scalar(p(mu))
...           == p(lam).scalar(p(mu).adams_operator(Integer(2)))
...           for mu in Partitions(Integer(2)) )
```

(continues on next page)

(continued from previous page)

```
...       for lam in Partitions(Integer(4)) )
True
```

antipode_on_basis(*partition*)

Return the antipode of `self[partition]`.

The antipode on the generator p_i (for $i > 0$) is $-p_i$, and the antipode on p_μ is $(-1)^{length(\mu)} p_\mu$.

INPUT:

- `self` – the power sum basis of the symmetric functions
- `partition` – a partition

OUTPUT:

- the result of the antipode on `self(partition)`

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: p = Sym.p()
sage: p.antipode_on_basis([2])
-p[2]
sage: p.antipode_on_basis([3])
-p[3]
sage: p.antipode_on_basis([2,2])
p[2, 2]
sage: p.antipode_on_basis([])
p[]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> p = Sym.p()
>>> p.antipode_on_basis([Integer(2)])
-p[2]
>>> p.antipode_on_basis([Integer(3)])
-p[3]
>>> p.antipode_on_basis([Integer(2),Integer(2)])
p[2, 2]
>>> p.antipode_on_basis([])
p[]
```

bottom_schur_function(*partition*, *degree=None*)

Return the least-degree component of `s[partition]`, where `s` denotes the Schur basis of the symmetric functions, and the grading is not the usual grading on the symmetric functions but rather the grading which gives every p_i degree 1.

This least-degree component has its degree equal to the Frobenius rank of `partition`, while the degree with respect to the usual grading is still the size of `partition`.

This method requires the base ring to be a (commutative) **Q**-algebra. This restriction is unavoidable, since the least-degree component (in general) has noninteger coefficients in all classical bases of the symmetric functions.

The optional keyword `degree` allows taking any homogeneous component rather than merely the least-degree one. Specifically, if `degree` is set, then the `degree`-th component will be returned.

REFERENCES:

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: p = Sym.p()
sage: p.bottom_schur_function([2,2,1])
-1/6*p[3, 2] + 1/4*p[4, 1]
sage: p.bottom_schur_function([2,1])
-1/3*p[3]
sage: p.bottom_schur_function([3])
1/3*p[3]
sage: p.bottom_schur_function([1,1,1])
1/3*p[3]
sage: p.bottom_schur_function(Partition([1,1,1]))
1/3*p[3]
sage: p.bottom_schur_function([2,1], degree=1)
-1/3*p[3]
sage: p.bottom_schur_function([2,1], degree=2)
0
sage: p.bottom_schur_function([2,1], degree=3)
1/3*p[1, 1, 1]
sage: p.bottom_schur_function([2,2,1], degree=3)
1/8*p[2, 2, 1] - 1/6*p[3, 1, 1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> p = Sym.p()
>>> p.bottom_schur_function([Integer(2),Integer(2),Integer(1)])
-1/6*p[3, 2] + 1/4*p[4, 1]
>>> p.bottom_schur_function([Integer(2),Integer(1)])
-1/3*p[3]
>>> p.bottom_schur_function([Integer(3)])
1/3*p[3]
>>> p.bottom_schur_function([Integer(1),Integer(1),Integer(1)])
1/3*p[3]
>>> p.bottom_schur_function(Partition([Integer(1),Integer(1),Integer(1)]))
1/3*p[3]
>>> p.bottom_schur_function([Integer(2),Integer(1)], degree=Integer(1))
-1/3*p[3]
>>> p.bottom_schur_function([Integer(2),Integer(1)], degree=Integer(2))
0
>>> p.bottom_schur_function([Integer(2),Integer(1)], degree=Integer(3))
1/3*p[1, 1, 1]
>>> p.bottom_schur_function([Integer(2),Integer(2),Integer(1)],␣
↪degree=Integer(3))
1/8*p[2, 2, 1] - 1/6*p[3, 1, 1]
```

coproduct_on_generators(i)

Return coproduct on generators for power sums p_i (for $i > 0$).

The elements p_i are primitive elements.

INPUT:

- `self` – the power sum basis of the symmetric functions

- `i` – positive integer

OUTPUT: the result of the coproduct on the generator $p(i)$

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: p = Sym.powersum()
sage: p.coproduct_on_generators(2)
p[] # p[2] + p[2] # p[]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> p = Sym.powersum()
>>> p.coproduct_on_generators(Integer(2))
p[] # p[2] + p[2] # p[]
```

eval_at_permutation_roots_on_generators(*k*, *rho*)

Evaluate p_k at eigenvalues of permutation matrix.

This function evaluates a symmetric function `p([k])` at the eigenvalues of a permutation matrix with cycle structure `\rho`.

This function evaluates a p_k at the roots of unity

$$\Xi_{\rho_1}, \Xi_{\rho_2}, \ldots, \Xi_{\rho_\ell}$$

where

$$\Xi_m = 1, \zeta_m, \zeta_m^2, \ldots, \zeta_m^{m-1}$$

and ζ_m is an m root of unity. This is characterized by $p_k[A, B] = p_k[A] + p_k[B]$ and $p_k[\Xi_m] = 0$ unless m divides k and $p_{rm}[\Xi_m] = m$.

INPUT:

- `k` – nonnegative integer
- `rho` – a partition or a list of nonnegative integers

OUTPUT: an element of the base ring

EXAMPLES:

```
sage: p = SymmetricFunctions(QQ).p()
sage: p.eval_at_permutation_roots_on_generators(3, [6])
0
sage: p.eval_at_permutation_roots_on_generators(3, [3])
3
sage: p.eval_at_permutation_roots_on_generators(3, [1])
1
sage: p.eval_at_permutation_roots_on_generators(3, [3,3])
6
sage: p.eval_at_permutation_roots_on_generators(3, [1,1,1,1,1])
5
```

```
>>> from sage.all import *
>>> p = SymmetricFunctions(QQ).p()
>>> p.eval_at_permutation_roots_on_generators(Integer(3), [Integer(6)])
0
>>> p.eval_at_permutation_roots_on_generators(Integer(3), [Integer(3)])
3
>>> p.eval_at_permutation_roots_on_generators(Integer(3), [Integer(1)])
1
>>> p.eval_at_permutation_roots_on_generators(Integer(3), [Integer(3),
↪Integer(3)])
6
>>> p.eval_at_permutation_roots_on_generators(Integer(3), [Integer(1),
↪Integer(1),Integer(1),Integer(1),Integer(1)])
5
```

Quotient of symmetric function space by ideal generated by Hall-Littlewood symmetric functions

The quotient of symmetric functions by the ideal generated by the Hall-Littlewood P symmetric functions indexed by partitions with first part greater than k. When $t = 1$ this space is the quotient of the symmetric functions by the ideal generated by the monomial symmetric functions indexed by partitions with first part greater than k.

AUTHORS:

- Chris Berg (2012-12-01)
- Mike Zabrocki - k-bounded Hall Littlewood P and dual k-Schur functions (2012-12-02)

class sage.combinat.sf.k_dual.**AffineSchurFunctions**(*kBoundedRing*)

Bases: *KBoundedQuotientBasis*

This basis is dual to the k-Schur functions at $t = 1$. This realization follows the monomial expansion given by Lam [Lam2006].

REFERENCES:

class sage.combinat.sf.k_dual.**DualkSchurFunctions**(*kBoundedRing*)

Bases: *KBoundedQuotientBasis*

This basis is dual to the k-Schur functions. The expansion is given in Section 4.12 of [LLMSSZ]. When $t = 1$ this basis is equal to the *AffineSchurFunctions* and that basis is more efficient in this case.

REFERENCES:

class sage.combinat.sf.k_dual.**KBoundedQuotient**(*Sym*, *k*, *t='t'*)

Bases: UniqueRepresentation, Parent

Initialization of the ring of Symmetric functions modulo the ideal of monomial symmetric functions which are indexed by partitions whose first part is greater than k.

INPUT:

- Sym – an element of class *sage.combinat.sf.sf.SymmetricFunctions*
- k – positive integer
- R – a ring

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: Q = Sym.kBoundedQuotient(3,t=1)

```

AffineGrothendieckPolynomial(*la*, *m*)

Return the affine Grothendieck polynomial indexed by the partition `la`. Because this belongs to the completion of the algebra, and hence is an infinite sum, it computes only up to those symmetric functions of degree at most `m`. The result is cached by `_AffineGrothendieckPolynomial()`.

INPUT:

- `la` – a k-bounded partition
- `m` – integer

EXAMPLES:

```
sage: Q = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1)
sage: Q.AffineGrothendieckPolynomial([2,1],4)
2*m3[1, 1, 1] - 8*m3[1, 1, 1, 1] + m3[2, 1] - 3*m3[2, 1, 1] - m3[2, 2]
```

```
>>> from sage.all import *
>>> Q = SymmetricFunctions(QQ).kBoundedQuotient(Integer(3),t=Integer(1))
>>> Q.AffineGrothendieckPolynomial([Integer(2),Integer(1)],Integer(4))
2*m3[1, 1, 1] - 8*m3[1, 1, 1, 1] + m3[2, 1] - 3*m3[2, 1, 1] - m3[2, 2]
```

F()

alias of *affineSchur()*.

a_realization()

Return a particular realization of `self` (the basis of k-bounded monomials if $t = 1$ and the basis of k-bounded Hall-Littlewood functions otherwise).

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: Q = Sym.kBoundedQuotient(3,t=1)
sage: Q.a_realization()
```

(continues on next page)

(continued from previous page)

```
3-Bounded Quotient of Symmetric Functions over Rational Field with t=1 in the␣
↪3-bounded monomial basis
sage: Q = Sym.kBoundedQuotient(3,t=2)
sage: Q.a_realization()
3-Bounded Quotient of Symmetric Functions over Rational Field with t=2 in the␣
↪3-bounded Hall-Littlewood P basis
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> Q = Sym.kBoundedQuotient(Integer(3),t=Integer(1))
>>> Q.a_realization()
3-Bounded Quotient of Symmetric Functions over Rational Field with t=1 in the␣
↪3-bounded monomial basis
>>> Q = Sym.kBoundedQuotient(Integer(3),t=Integer(2))
>>> Q.a_realization()
3-Bounded Quotient of Symmetric Functions over Rational Field with t=2 in the␣
↪3-bounded Hall-Littlewood P basis
```

affineSchur()

The affine Schur basis of the k-bounded quotient of symmetric functions, indexed by k-bounded partitions. This is also equal to the affine Stanley symmetric functions (see `WeylGroups.ElementMethods.stanley_symmetric_function()`) indexed by an affine Grassmannian permutation.

EXAMPLES:

```
sage: SymmetricFunctions(QQ).kBoundedQuotient(2,t=1).affineSchur()
2-Bounded Quotient of Symmetric Functions over Rational Field with t=1 in the␣
↪2-bounded affine Schur basis
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ).kBoundedQuotient(Integer(2),t=Integer(1)).
↪affineSchur()
2-Bounded Quotient of Symmetric Functions over Rational Field with t=1 in the␣
↪2-bounded affine Schur basis
```

ambient()

Returns the Symmetric Functions over the same ring as `self`. This is needed to realize our ring as a quotient.

dks()

alias of *dual_k_Schur()*.

dual_k_Schur()

The dual k-Schur basis of the k-bounded quotient of symmetric functions, indexed by k-bounded partitions. At $t = 1$ this is also equal to the affine Schur basis and calculations will be faster using elements in the *affineSchur()* basis.

EXAMPLES:

```
sage: SymmetricFunctions(QQ['t'].fraction_field()).kBoundedQuotient(2).dual_k_
↪Schur()
2-Bounded Quotient of Symmetric Functions over Fraction Field of Univariate␣
↪Polynomial Ring in t over Rational Field in the dual 2-Schur basis
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ['t'].fraction_field()).kBoundedQuotient(Integer(2)).
↪dual_k_Schur()
2-Bounded Quotient of Symmetric Functions over Fraction Field of Univariate␣
↪Polynomial Ring in t over Rational Field in the dual 2-Schur basis
```

kHLP()

alias of *kHallLittlewoodP()*.

kHallLittlewoodP()

The Hall-Littlewood P basis of the k-bounded quotient of symmetric functions, indexed by k-bounded partitions. At $t = 1$ this basis is equal to the k-bounded monomial basis and calculations will be faster using elements in the k-bounded monomial basis (see *kmonomial()*).

EXAMPLES:

```
sage: SymmetricFunctions(QQ['t'].fraction_field()).kBoundedQuotient(2).
↪kHallLittlewoodP()
2-Bounded Quotient of Symmetric Functions over Fraction Field of Univariate␣
↪Polynomial Ring in t over Rational Field in the 2-bounded Hall-Littlewood P␣
↪basis
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ['t'].fraction_field()).kBoundedQuotient(Integer(2)).
↪kHallLittlewoodP()
2-Bounded Quotient of Symmetric Functions over Fraction Field of Univariate␣
↪Polynomial Ring in t over Rational Field in the 2-bounded Hall-Littlewood P␣
↪basis
```

km()

alias of *kmonomial()*.

kmonomial()

The monomial basis of the k-bounded quotient of symmetric functions, indexed by k-bounded partitions.

EXAMPLES:

```
sage: SymmetricFunctions(QQ).kBoundedQuotient(2,t=1).kmonomial()
2-Bounded Quotient of Symmetric Functions over Rational Field with t=1 in the␣
↪2-bounded monomial basis
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ).kBoundedQuotient(Integer(2),t=Integer(1)).
↪kmonomial()
2-Bounded Quotient of Symmetric Functions over Rational Field with t=1 in the␣
↪2-bounded monomial basis
```

lift(*la*)

Give the lift map from the quotient ring of k-bounded symmetric functions to the symmetric functions. This method is here to make the TestSuite run properly.

INPUT:

- `la` – a k-bounded partition

OUTPUT:

- **The monomial element or a Hall-Littlewood P element of the symmetric functions** indexed by the partition `la`.

EXAMPLES:

```
sage: Q = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1)
sage: Q.lift([2,1])
m[2, 1]
sage: Q = SymmetricFunctions(QQ['t'].fraction_field()).kBoundedQuotient(3)
sage: Q.lift([2,1])
HLP[2, 1]
```

```
>>> from sage.all import *
>>> Q = SymmetricFunctions(QQ).kBoundedQuotient(Integer(3),t=Integer(1))
>>> Q.lift([Integer(2),Integer(1)])
m[2, 1]
>>> Q = SymmetricFunctions(QQ['t'].fraction_field()).
↪kBoundedQuotient(Integer(3))
>>> Q.lift([Integer(2),Integer(1)])
HLP[2, 1]
```

one()

Return the unit of the quotient ring of k-bounded symmetric functions. This method is here to make the TestSuite run properly.

EXAMPLES:

```
sage: Q = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1)
sage: Q.one()
m3[]
```

```
>>> from sage.all import *
>>> Q = SymmetricFunctions(QQ).kBoundedQuotient(Integer(3),t=Integer(1))
>>> Q.one()
m3[]
```

realizations()

A list of realizations of the k-bounded quotient.

EXAMPLES:

```
sage: kQ = SymmetricFunctions(QQ['t'].fraction_field()).kBoundedQuotient(3)
sage: kQ.realizations()
[3-Bounded Quotient of Symmetric Functions over Fraction Field of Univariate␣
↪Polynomial Ring in t over Rational Field in the 3-bounded monomial basis, 3-
↪Bounded Quotient of Symmetric Functions over Fraction Field of Univariate␣

↪Integer(2),Integer(1)] for rzn in kQ.realizations())
True
```

retract(*la*)

Give the retract map from the symmetric functions to the quotient ring of k-bounded symmetric functions. This method is here to make the TestSuite run properly.

INPUT:

- `la` – a partition

OUTPUT: the monomial element of the k-bounded quotient indexed by `la`

EXAMPLES:

```
sage: Q = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1)
sage: Q.retract([2,1])
m3[2, 1]
```

```
>>> from sage.all import *
>>> Q = SymmetricFunctions(QQ).kBoundedQuotient(Integer(3),t=Integer(1))
>>> Q.retract([Integer(2),Integer(1)])
m3[2, 1]
```

class sage.combinat.sf.k_dual.**KBoundedQuotientBases**(*base*)

Bases: Category_realization_of_parent

The category of bases for the k-bounded subspace of symmetric functions.

class ElementMethods

Bases: object

class ParentMethods

Bases: object

ambient()

Return the symmetric functions.

EXAMPLES:

```
sage: km = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1).km()
sage: km.ambient()
Symmetric Functions over Rational Field
```

```
>>> from sage.all import *
>>> km = SymmetricFunctions(QQ).kBoundedQuotient(Integer(3),t=Integer(1)).
↪km()
>>> km.ambient()
Symmetric Functions over Rational Field
```

antipode(*element*)

Return the antipode of element via lifting to the symmetric functions and then retracting into the k-bounded quotient basis.

INPUT:

- element – an element in a basis of the ring of symmetric functions

EXAMPLES:

```
sage: dks3 = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1).dual_k_Schur()
sage: dks3[3,2].antipode()
-dks3[1, 1, 1, 1, 1]
sage: km = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1).km()
sage: km[3,2].antipode()
m3[3, 2]
sage: km.antipode(km[3,2])
m3[3, 2]
sage: m = SymmetricFunctions(QQ).m()
sage: m[3,2].antipode()
m[3, 2] + 2*m[5]
```

```
>>> from sage.all import *
>>> dks3 = SymmetricFunctions(QQ).kBoundedQuotient(Integer(3),
↪t=Integer(1)).dual_k_Schur()
>>> dks3[Integer(3),Integer(2)].antipode()
-dks3[1, 1, 1, 1, 1]
>>> km = SymmetricFunctions(QQ).kBoundedQuotient(Integer(3),t=Integer(1)).
↪km()
>>> km[Integer(3),Integer(2)].antipode()
m3[3, 2]
>>> km.antipode(km[Integer(3),Integer(2)])
m3[3, 2]
>>> m = SymmetricFunctions(QQ).m()
>>> m[Integer(3),Integer(2)].antipode()
m[3, 2] + 2*m[5]
```

```
sage: km = SymmetricFunctions(FractionField(QQ['t'])).kBoundedQuotient(3).
↪km()
sage: km[1,1,1,1].antipode()
(t^3-3*t^2+3*t)*m3[1, 1, 1, 1] + (-t^2+2*t)*m3[2, 1, 1] + t*m3[2, 2] +␣
↪t*m3[3, 1]
sage: kHP = SymmetricFunctions(FractionField(QQ['t'])).
↪kBoundedQuotient(3).kHLP()
sage: kHP[2,2].antipode()
(t^9-t^6-t^5+t^2)*HLP3[1, 1, 1, 1] + (t^6-t^3-t^2+t)*HLP3[2, 1, 1] + (t^5-
↪t^2+1)*HLP3[2, 2] + (t^4-t)*HLP3[3, 1]
sage: dks = SymmetricFunctions(FractionField(QQ['t'])).
↪kBoundedQuotient(3).dks()
sage: dks[2,2].antipode()
dks3[2, 2]
sage: dks[3,2].antipode()
-t^2*dks3[1, 1, 1, 1, 1] + (t^2-1)*dks3[2, 2, 1] + (-t^5+t)*dks3[3, 2]
```

```
>>> from sage.all import *
>>> km = SymmetricFunctions(FractionField(QQ['t'])).
↪kBoundedQuotient(Integer(3)).km()
>>> km[Integer(1),Integer(1),Integer(1),Integer(1)].antipode()
(t^3-3*t^2+3*t)*m3[1, 1, 1, 1] + (-t^2+2*t)*m3[2, 1, 1] + t*m3[2, 2] +␣
↪t*m3[3, 1]
>>> kHP = SymmetricFunctions(FractionField(QQ['t'])).
↪kBoundedQuotient(Integer(3)).kHLP()
>>> kHP[Integer(2),Integer(2)].antipode()
(t^9-t^6-t^5+t^2)*HLP3[1, 1, 1, 1] + (t^6-t^3-t^2+t)*HLP3[2, 1, 1] + (t^5-
↪t^2+1)*HLP3[2, 2] + (t^4-t)*HLP3[3, 1]
>>> dks = SymmetricFunctions(FractionField(QQ['t'])).
↪kBoundedQuotient(Integer(3)).dks()
>>> dks[Integer(2),Integer(2)].antipode()
dks3[2, 2]
>>> dks[Integer(3),Integer(2)].antipode()
-t^2*dks3[1, 1, 1, 1, 1] + (t^2-1)*dks3[2, 2, 1] + (-t^5+t)*dks3[3, 2]
```

coproduct(*element*)

Return the coproduct of `element` via lifting to the symmetric functions and then returning to the k-bounded quotient basis. This method is implemented for all t but is (weakly) conjectured to not be

the correct operation for arbitrary t because the coproduct on dual-k-Schur functions does not have a positive expansion.

INPUT:

- `element` – an element in a basis of the ring of symmetric functions

EXAMPLES:

```
sage: Q3 = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1)
sage: km = Q3.km()
sage: km[3,2].coproduct()
m3[] # m3[3, 2] + m3[2] # m3[3] + m3[3] # m3[2] + m3[3, 2] # m3[]
sage: dks3 = Q3.dual_k_Schur()
sage: dks3[2,2].coproduct()
dks3[] # dks3[2, 2] + dks3[1] # dks3[2, 1] + dks3[1, 1] # dks3[1, 1] +␣
↪dks3[2] # dks3[2] + dks3[2, 1] # dks3[1] + dks3[2, 2] # dks3[]
```

```
>>> from sage.all import *
>>> Q3 = SymmetricFunctions(QQ).kBoundedQuotient(Integer(3),t=Integer(1))
>>> km = Q3.km()
>>> km[Integer(3),Integer(2)].coproduct()
m3[] # m3[3, 2] + m3[2] # m3[3] + m3[3] # m3[2] + m3[3, 2] # m3[]
>>> dks3 = Q3.dual_k_Schur()
>>> dks3[Integer(2),Integer(2)].coproduct()
dks3[] # dks3[2, 2] + dks3[1] # dks3[2, 1] + dks3[1, 1] # dks3[1, 1] +␣
↪dks3[2] # dks3[2] + dks3[2, 1] # dks3[1] + dks3[2, 2] # dks3[]
```

```
sage: Q3t = SymmetricFunctions(FractionField(QQ['t'])).kBoundedQuotient(3)
sage: km = Q3t.km()
sage: km[3,2].coproduct()
m3[] # m3[3, 2] + m3[2] # m3[3] + m3[3] # m3[2] + m3[3, 2] # m3[]
sage: dks = Q3t.dks()
sage: dks[2,1,1].coproduct()
dks3[] # dks3[2, 1, 1] + (-t+1)*dks3[1] # dks3[1, 1, 1] + dks3[1] #␣
↪dks3[2, 1] + (-t+1)*dks3[1, 1] # dks3[1, 1] + dks3[1, 1] # dks3[2] + (-
↪t+1)*dks3[1, 1, 1] # dks3[1] + dks3[2] # dks3[1, 1] + dks3[2, 1] #␣
↪dks3[1] + dks3[2, 1, 1] # dks3[]
sage: kHLP = Q3t.kHLP()
sage: kHLP[2,1].coproduct()
HLP3[] # HLP3[2, 1] + (-t^2+1)*HLP3[1] # HLP3[1, 1] + HLP3[1] # HLP3[2] +␣

```

```
>>> from sage.all import *
>>> Q3t = SymmetricFunctions(FractionField(QQ['t'])).
↪kBoundedQuotient(Integer(3))
>>> km = Q3t.km()
>>> km[Integer(3),Integer(2)].coproduct()
m3[] # m3[3, 2] + m3[2] # m3[3] + m3[3] # m3[2] + m3[3, 2] # m3[]
>>> dks = Q3t.dks()
>>> dks[Integer(2),Integer(1),Integer(1)].coproduct()
dks3[] # dks3[2, 1, 1] + (-t+1)*dks3[1] # dks3[1, 1, 1] + dks3[1] #␣
↪dks3[2, 1] + (-t+1)*dks3[1, 1] # dks3[1, 1] + dks3[1, 1] # dks3[2] + (-
```

(continues on next page)

(continued from previous page)

```
↪t+1)*dks3[1, 1, 1] # dks3[1] + dks3[2] # dks3[1, 1] + dks3[2, 1] #␣
↪dks3[1] + dks3[2, 1, 1] # dks3[]
>>> kHLP = Q3t.kHLP()
>>> kHLP[Integer(2),Integer(1)].coproduct()
HLP3[] # HLP3[2, 1] + (-t^2+1)*HLP3[1] # HLP3[1, 1] + HLP3[1] # HLP3[2] +␣
↪(-t^2+1)*HLP3[1, 1] # HLP3[1] + HLP3[2] # HLP3[1] + HLP3[2, 1] # HLP3[]
>>> km.coproduct(km[Integer(3),Integer(2)])
m3[] # m3[3, 2] + m3[2] # m3[3] + m3[3] # m3[2] + m3[3, 2] # m3[]
```

counit(*element*)

Return the counit of `element`.

The counit is the constant term of `element`.

INPUT:

- `element` – an element in a basis

EXAMPLES:

```
sage: km = SymmetricFunctions(FractionField(QQ['t'])).kBoundedQuotient(3).
↪km()
sage: f = 2*km[2,1] - 3*km([])
sage: f.counit()
-3
sage: km.counit(f)
-3
```

```
>>> from sage.all import *
>>> km = SymmetricFunctions(FractionField(QQ['t'])).
↪kBoundedQuotient(Integer(3)).km()
>>> f = Integer(2)*km[Integer(2),Integer(1)] - Integer(3)*km([])
>>> f.counit()
-3
>>> km.counit(f)
-3
```

degree_on_basis(*b*)

Return the degree of the basis element indexed by `b`.

INPUT:

- `b` – a partition

EXAMPLES:

```
sage: F = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1).affineSchur()
sage: F.degree_on_basis(Partition([3,2]))
5
```

```
>>> from sage.all import *
>>> F = SymmetricFunctions(QQ).kBoundedQuotient(Integer(3),t=Integer(1)).
↪affineSchur()
>>> F.degree_on_basis(Partition([Integer(3),Integer(2)]))
5
```

indices()

The set of k-bounded partitions of all nonnegative integers.

EXAMPLES:

```
sage: km = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1).km()
sage: km.indices()
3-Bounded Partitions
```

```
>>> from sage.all import *
>>> km = SymmetricFunctions(QQ).kBoundedQuotient(Integer(3),t=Integer(1)).
↪km()
>>> km.indices()
3-Bounded Partitions
```

lift(*la*)

Implement the lift map from the basis `self` to the monomial basis of symmetric functions.

INPUT:

- `la` – a k-bounded partition

OUTPUT: a symmetric function in the monomial basis

EXAMPLES:

```
sage: F = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1).affineSchur()
sage: F.lift([3,1])
m[1, 1, 1, 1] + m[2, 1, 1] + m[2, 2] + m[3, 1]
sage: Sym = SymmetricFunctions(QQ['t'].fraction_field())
sage: dks = Sym.kBoundedQuotient(3).dual_k_Schur()
sage: dks.lift([3,1])
t^5*HLP[1, 1, 1, 1] + t^2*HLP[2, 1, 1] + t*HLP[2, 2] + HLP[3, 1]
sage: dks = Sym.kBoundedQuotient(3,t=1).dual_k_Schur()
sage: dks.lift([3,1])
m[1, 1, 1, 1] + m[2, 1, 1] + m[2, 2] + m[3, 1]
```

```
>>> from sage.all import *
>>> F = SymmetricFunctions(QQ).kBoundedQuotient(Integer(3),t=Integer(1)).
↪affineSchur()
>>> F.lift([Integer(3),Integer(1)])
m[1, 1, 1, 1] + m[2, 1, 1] + m[2, 2] + m[3, 1]
>>> Sym = SymmetricFunctions(QQ['t'].fraction_field())
>>> dks = Sym.kBoundedQuotient(Integer(3)).dual_k_Schur()
>>> dks.lift([Integer(3),Integer(1)])
t^5*HLP[1, 1, 1, 1] + t^2*HLP[2, 1, 1] + t*HLP[2, 2] + HLP[3, 1]
>>> dks = Sym.kBoundedQuotient(Integer(3),t=Integer(1)).dual_k_Schur()
>>> dks.lift([Integer(3),Integer(1)])
m[1, 1, 1, 1] + m[2, 1, 1] + m[2, 2] + m[3, 1]
```

one_basis()

Return the basis element indexing `1`.

EXAMPLES:

```
sage: F = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1).affineSchur()
sage: F.one()  # indirect doctest
F3[]
```

```
>>> from sage.all import *
>>> F = SymmetricFunctions(QQ).kBoundedQuotient(Integer(3),t=Integer(1)).
↪affineSchur()
>>> F.one()  # indirect doctest
F3[]
```

product(*x*, *y*)

Return the product of two elements `x` and `y`.

INPUT:

- `x`, `y` – elements of the k-bounded quotient of symmetric functions

OUTPUT: a k-bounded symmetric function in the dual k-Schur function basis

EXAMPLES:

```
sage: dks3 = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1).dual_k_Schur()
sage: dks3.product(dks3[2,1],dks3[1,1])
2*dks3[1, 1, 1, 1, 1] + 2*dks3[2, 1, 1, 1] + 2*dks3[2, 2, 1] + dks3[3, 1,␣
↪1] + dks3[3, 2]
sage: dks3.product(dks3[2,1]+dks3[1], dks3[1,1])
dks3[1, 1, 1] + 2*dks3[1, 1, 1, 1, 1] + dks3[2, 1] + 2*dks3[2, 1, 1, 1] +␣
↪2*dks3[2, 2, 1] + dks3[3, 1, 1] + dks3[3, 2]
sage: dks3.product(dks3[2,1]+dks3[1], dks3([]))
dks3[1] + dks3[2, 1]
sage: dks3.product(dks3([]), dks3([]))
dks3[]
sage: dks3.product(dks3([]), dks3([4,1]))

retract(*la*)

Give the retract map from the symmetric functions to the quotient ring of k-bounded symmetric functions. This method is here to make the TestSuite run properly.

INPUT:

- `la` – a partition

OUTPUT: the monomial element of the k-bounded quotient indexed by `la`

EXAMPLES:

```
sage: Q = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1)
sage: Q.retract([2,1])
m3[2, 1]
```

```
>>> from sage.all import *
>>> Q = SymmetricFunctions(QQ).kBoundedQuotient(Integer(3),t=Integer(1))
>>> Q.retract([Integer(2),Integer(1)])
m3[2, 1]
```

super_categories()

The super categories of `self`.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ['t'])
sage: from sage.combinat.sf.k_dual import KBoundedQuotientBases
sage: Q = Sym.kBoundedQuotient(3,t=1)
sage: KQB = KBoundedQuotientBases(Q)
sage: KQB.super_categories()
[Category of realizations of 3-Bounded Quotient of Symmetric Functions over␣
↪Univariate Polynomial Ring in t over Rational Field with t=1,
 Join of Category of graded Hopf algebras with basis over Univariate␣
↪Polynomial Ring in t over Rational Field
     and Category of quotients of algebras over Univariate Polynomial Ring in␣
↪t over Rational Field
     and Category of quotients of graded modules with basis over Univariate␣
↪Polynomial Ring in t over Rational Field]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ['t'])
>>> from sage.combinat.sf.k_dual import KBoundedQuotientBases
>>> Q = Sym.kBoundedQuotient(Integer(3),t=Integer(1))
>>> KQB = KBoundedQuotientBases(Q)
>>> KQB.super_categories()
[Category of realizations of 3-Bounded Quotient of Symmetric Functions over␣
↪Univariate Polynomial Ring in t over Rational Field with t=1,
 Join of Category of graded Hopf algebras with basis over Univariate␣
↪Polynomial Ring in t over Rational Field
     and Category of quotients of algebras over Univariate Polynomial Ring in␣
↪t over Rational Field
     and Category of quotients of graded modules with basis over Univariate␣
↪Polynomial Ring in t over Rational Field]
```

class sage.combinat.sf.k_dual.**KBoundedQuotientBasis**(*kBoundedRing*, *prefix*)

Bases: *CombinatorialFreeModule*

Abstract base class for the bases of the k-bounded quotient.

class sage.combinat.sf.k_dual.**kMonomial**(*kBoundedRing*)

Bases: *KBoundedQuotientBasis*

The basis of monomial symmetric functions indexed by partitions with first part less than or equal to k.

lift(*la*)

Implement the lift function on the monomial basis. Given a k-bounded partition `la`, the lift will return the corresponding monomial basis element.

INPUT:

- `la` – a k-bounded partition

OUTPUT: a monomial symmetric function

EXAMPLES:

```
sage: km = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1).km()
sage: km.lift(Partition([3,1]))
m[3, 1]
sage: km.lift([])
m[]
```

(continues on next page)

(continued from previous page)

```
sage: km.lift(Partition([4,1]))
Traceback (most recent call last):
...

Traceback (most recent call last):
...
TypeError: do not know how to make x (= [4, 1]) an element of self (=3-
↪Bounded Quotient of Symmetric Functions over Rational Field with t=1 in the␣
↪3-bounded monomial basis)
```

retract(*la*)

Implement the retract function on the monomial basis. Given a partition `la`, the retract will return the corresponding k-bounded monomial basis element if `la` is k-bounded; zero otherwise.

INPUT:

- `la` – a partition

OUTPUT: a k-bounded monomial symmetric function in the k-quotient of symmetric functions

EXAMPLES:

```
sage: km = SymmetricFunctions(QQ).kBoundedQuotient(3,t=1).km()
sage: km.retract(Partition([3,1]))
m3[3, 1]
sage: km.retract(Partition([4,1]))
0
sage: km.retract([])
m3[]
sage: m = SymmetricFunctions(QQ).m()
sage: km(m[3, 1])
m3[3, 1]
sage: km(m[4, 1])
0
```

```
>>> from sage.all import *
>>> km = SymmetricFunctions(QQ).kBoundedQuotient(Integer(3),t=Integer(1)).km()
>>> km.retract(Partition([Integer(3),Integer(1)]))

```

class sage.combinat.sf.k_dual.**kbounded_HallLittlewoodP**(*kBoundedRing*)

Bases: *KBoundedQuotientBasis*

The basis of P Hall-Littlewood symmetric functions indexed by partitions with first part less than or equal to k.

lift(*la*)

Implement the lift function on the Hall-Littlewood P basis. Given a k-bounded partition `la`, the lift will return the corresponding Hall-Littlewood P basis element.

INPUT:

- `la` – a k-bounded partition

OUTPUT: a Hall-Littlewood symmetric function

EXAMPLES:

```
sage: kHLP = SymmetricFunctions(QQ['t'].fraction_field()).kBoundedQuotient(3).
↪kHallLittlewoodP()
sage: kHLP.lift(Partition([3,1]))
```

(continues on next page)

(continued from previous page)

```
HLP[3, 1]

```

Schur symmetric functions

class sage.combinat.sf.schur.**SymmetricFunctionAlgebra_schur**(*Sym*)

Bases: *SymmetricFunctionAlgebra_classical*

A class for methods related to the Schur symmetric function basis.

INPUT:

- `self` – a Schur symmetric function basis
- `Sym` – an instance of the ring of the symmetric functions

class Element

Bases: *Element*

expand(*n*, *alphabet='x'*)

Expand the symmetric function `self` as a symmetric polynomial in `n` variables.

INPUT:

- `n` – nonnegative integer
- `alphabet` – (default: `'x'`) a variable for the expansion

OUTPUT:

A monomial expansion of `self` in the n variables labelled by `alphabet`.

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: a = s([2,1])
sage: a.expand(2)
x0^2*x1 + x0*x1^2
sage: a.expand(3)
x0^2*x1 + x0*x1^2 + x0^2*x2 + 2*x0*x1*x2 + x1^2*x2 + x0*x2^2 + x1*x2^2
sage: a.expand(4)
x0^2*x1 + x0*x1^2 + x0^2*x2 + 2*x0*x1*x2 + x1^2*x2 + x0*x2^2 + x1*x2^2 +␣
↪x0^2*x3 + 2*x0*x1*x3 + x1^2*x3 + 2*x0*x2*x3 + 2*x1*x2*x3 + x2^2*x3 +␣
↪x0*x3^2 + x1*x3^2 + x2*x3^2
sage: a.expand(2, alphabet='y')
y0^2*y1 + y0*y1^2
sage: a.expand(2, alphabet=['a','b'])
a^2*b + a*b^2
sage: s([1,1,1,1]).expand(3)
0
sage: (s([]) + 2*s([1])).expand(3)
2*x0 + 2*x1 + 2*x2 + 1
```

(continues on next page)

(continued from previous page)

```
sage: s([1]).expand(0)
0
sage: (3*s([])).expand(0)
3
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> a = s([Integer(2),Integer(1)])
>>> a.expand(Integer(2))
x0^2*x1 + x0*x1^2
>>> a.expand(Integer(3))
x0^2*x1 + x0*x1^2 + x0^2*x2 + 2*x0*x1*x2 + x1^2*x2 + x0*x2^2 + x1*x2^2
>>> a.expand(Integer(4))
x0^2*x1 + x0*x1^2 + x0^2*x2 + 2*x0*x1*x2 + x1^2*x2 + x0*x2^2 + x1*x2^2 +␣
↪x0^2*x3 + 2*x0*x1*x3 + x1^2*x3 + 2*x0*x2*x3 + 2*x1*x2*x3 + x2^2*x3 +␣
↪x0*x3^2 + x1*x3^2 + x2*x3^2

a^2*b + a*b^2
>>> s([Integer(1),Integer(1),Integer(1),Integer(1)]).expand(Integer(3))
0
>>> (s([]) + Integer(2)*s([Integer(1)])).expand(Integer(3))
2*x0 + 2*x1 + 2*x2 + 1
>>> s([Integer(1)]).expand(Integer(0))
0
>>> (Integer(3)*s([])).expand(Integer(0))
3
```

exponential_specialization(*t=None*, *q=1*)

Return the exponential specialization of a symmetric function (when $q = 1$), or the q-exponential specialization (when $q \neq 1$).

The *exponential specialization* ex at t is a K-algebra homomorphism from the K-algebra of symmetric functions to another K-algebra R. It is defined whenever the base ring K is a $\mathbf{Q}$-algebra and t is an element of R. The easiest way to define it is by specifying its values on the powersum symmetric functions to be $p_1 = t$ and $p_n = 0$ for $n > 1$. Equivalently, on the homogeneous functions it is given by $ex(h_n) = t^n/n!$; see Proposition 7.8.4 of [EnumComb2].

By analogy, the q-exponential specialization is a K-algebra homomorphism from the K-algebra of symmetric functions to another K-algebra R that depends on two elements t and q of R for which the elements $1 - q^i$ for all positive integers i are invertible. It can be defined by specifying its values on the complete homogeneous symmetric functions to be

$$ex_q(h_n) = t^n/[n]_q!,$$

where $[n]_q!$ is the q-factorial. Equivalently, for $q \neq 1$ and a homogeneous symmetric function f of degree n, we have

$$ex_q(f) = (1-q)^n t^n ps_q(f),$$

where $ps_q(f)$ is the stable principal specialization of f (see *principal_specialization()*). (See (7.29) in [EnumComb2].)

The limit of ex_q as $q \to 1$ is ex.

INPUT:

- `t` – (default: `None`) the value to use for t; the default is to create a ring of polynomials in `t`
- `q` – (default: 1) the value to use for q. If `q` is `None`, then a ring (or fraction field) of polynomials in `q` is created.

We use the formula in the proof of Corollary 7.21.6 of [EnumComb2]

$$ex_q(s_\lambda) = t^{|\lambda|} q^{\sum_i (i-1)\lambda_i} / \prod_{u \in \lambda} (1 + q + q^2 + \cdots + q^{h(u)-1})$$

where $h(u)$ is the hook length of a cell u in λ.

As a limit case, we obtain a formula for $q = 1$

$$ex_1(s_\lambda) = f^\lambda t^{|\lambda|} / |\lambda|!$$

where f^λ is the number of standard Young tableaux of shape λ.

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: x = s[5,3]
sage: x.exponential_specialization()
1/1440*t^8

sage: x = 5*s[1,1,1] + 3*s[2,1] + 1
sage: x.exponential_specialization()
11/6*t^3 + 1
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> x = s[Integer(5),Integer(3)]
>>> x.exponential_specialization()
1/1440*t^8

>>> x = Integer(5)*s[Integer(1),Integer(1),Integer(1)] +␣
↪Integer(3)*s[Integer(2),Integer(1)] + Integer(1)
>>> x.exponential_specialization()
11/6*t^3 + 1
```

We also support the q-exponential_specialization:

```
sage: factor(s[3].exponential_specialization(q=var("q"), t=var("t")))   #␣
↪needs sage.symbolic
t^3/((q^2 + q + 1)*(q + 1))
```

```
>>> from sage.all import *
>>> factor(s[Integer(3)].exponential_specialization(q=var("q"), t=var("t
↪")))   # needs sage.symbolic
t^3/((q^2 + q + 1)*(q + 1))
```

omega()

Return the image of `self` under the omega automorphism.

The *omega automorphism* is defined to be the unique algebra endomorphism ω of the ring of symmetric functions that satisfies $\omega(e_k) = h_k$ for all positive integers k (where e_k stands for the k-th elementary

symmetric function, and h_k stands for the k-th complete homogeneous symmetric function). It furthermore is a Hopf algebra endomorphism and an involution, and it is also known as the *omega involution*. It sends the power-sum symmetric function p_k to $(-1)^{k-1}p_k$ for every positive integer k.

The images of some bases under the omega automorphism are given by

$$\omega(e_\lambda) = h_\lambda, \qquad \omega(h_\lambda) = e_\lambda, \qquad \omega(p_\lambda) = (-1)^{|\lambda|-\ell(\lambda)}p_\lambda, \qquad \omega(s_\lambda) = s_{\lambda'},$$

where λ is any partition, where $\ell(\lambda)$ denotes the length (`length()`) of the partition λ, where λ' denotes the conjugate partition (`conjugate()`) of λ, and where the usual notations for bases are used (e = elementary, h = complete homogeneous, p = powersum, s = Schur).

`omega_involution()` is a synonym for the `omega()` method.

OUTPUT: the image of `self` under the omega automorphism

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: s([2,1]).omega()
s[2, 1]
sage: s([2,1,1]).omega()
s[3, 1]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> s([Integer(2),Integer(1)]).omega()
s[2, 1]
>>> s([Integer(2),Integer(1),Integer(1)]).omega()
s[3, 1]
```

omega_involution()

alias of `omega()`.

principal_specialization(*n=+Infinity*, *q=None*)

Return the principal specialization of a symmetric function.

The *principal specialization* of order n at q is the ring homomorphism $ps_{n,q}$ from the ring of symmetric functions to another commutative ring R given by $x_i \mapsto q^{i-1}$ for $i \in \{1, \ldots, n\}$ and $x_i \mapsto 0$ for $i > n$. Here, q is a given element of R, and we assume that the variables of our symmetric functions are $x_1, x_2, x_3, \ldots$. (To be more precise, $ps_{n,q}$ is a K-algebra homomorphism, where K is the base ring.) See Section 7.8 of [EnumComb2].

The *stable principal specialization* at q is the ring homomorphism ps_q from the ring of symmetric functions to another commutative ring R given by $x_i \mapsto q^{i-1}$ for all i. This is well-defined only if the resulting infinite sums converge; thus, in particular, setting $q = 1$ in the stable principal specialization is an invalid operation.

INPUT:

- `n` – (default: `infinity`) a nonnegative integer or `infinity`, specifying whether to compute the principal specialization of order `n` or the stable principal specialization.
- `q` – (default: `None`) the value to use for q; the default is to create a ring of polynomials in `q` (or a field of rational functions in `q`) over the given coefficient ring.

For $q = 1$ we use the formula from Corollary 7.21.4 of [EnumComb2]:

$$ps_{n,1}(s_\lambda) = \prod_{u \in \lambda} (n + c(u))/h(u),$$

where $h(u)$ is the hook length of a cell u in λ, and where $c(u)$ is the content of a cell u in λ.

For $n = infinity$ we use the formula from Corollary 7.21.3 of [EnumComb2]

$$ps_q(s_\lambda) = q^{\sum_i (i-1)\lambda_i} / \prod_{u \in \lambda} (1 - q^{h(u)}).$$

Otherwise, we use the formula from Theorem 7.21.2 of [EnumComb2],

$$ps_{n,q}(s_\lambda) = q^{\sum_i (i-1)\lambda_i} \prod_{u \in \lambda} (1 - q^{n+c(u)})/(1 - q^{h(u)}).$$

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: x = s[2]
sage: x.principal_specialization(3)
q^4 + q^3 + 2*q^2 + q + 1

sage: x = 3*s[2,2] + 2*s[1] + 1
sage: x.principal_specialization(3, q=var("q"))                              #␣
↪needs sage.symbolic
3*(q^4 - 1)*(q^3 - 1)*q^2/((q^2 - 1)*(q - 1)) + 2*(q^3 - 1)/(q - 1) + 1

sage: x.principal_specialization(q=var("q"))                                 #␣
↪needs sage.symbolic
-2/(q - 1) + 3*q^2/((q^3 - 1)*(q^2 - 1)^2*(q - 1)) + 1
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> x = s[Integer(2)]
>>> x.principal_specialization(Integer(3))
q^4 + q^3 + 2*q^2 + q + 1

>>> x = Integer(3)*s[Integer(2),Integer(2)] + Integer(2)*s[Integer(1)] +␣
↪Integer(1)
>>> x.principal_specialization(Integer(3), q=var("q"))                        ␣
↪     # needs sage.symbolic
3*(q^4 - 1)*(q^3 - 1)*q^2/((q^2 - 1)*(q - 1)) + 2*(q^3 - 1)/(q - 1) + 1

>>> x.principal_specialization(q=var("q"))                                   #␣
↪needs sage.symbolic
-2/(q - 1) + 3*q^2/((q^3 - 1)*(q^2 - 1)^2*(q - 1)) + 1
```

scalar(*x*, *zee=None*)

Return the standard scalar product between `self` and x.

Note that the Schur functions are self-dual with respect to this scalar product. They are also lower-triangularly related to the monomial symmetric functions with respect to this scalar product.

INPUT:

- `x` – element of the ring of symmetric functions over the same base ring as `self`
- `zee` – an optional function on partitions giving the value for the scalar product between the power-sum symmetric function p_μ and itself (the default value is the standard *zee()* function)

OUTPUT: the scalar product between `self` and `x`

EXAMPLES:

```
sage: s = SymmetricFunctions(ZZ).s()
sage: a = s([2,1])
sage: b = s([1,1,1])
sage: c = 2*s([1,1,1])
sage: d = a + b
sage: a.scalar(a)
1
sage: b.scalar(b)
1
sage: b.scalar(a)
0
sage: b.scalar(c)
2
sage: c.scalar(c)
4
sage: d.scalar(a)
1
sage: d.scalar(b)
1
sage: d.scalar(c)
2
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(ZZ).s()
>>> a = s([Integer(2),Integer(1)])
>>> b = s([Integer(1),Integer(1),Integer(1)])
>>> c = Integer(2)*s([Integer(1),Integer(1),Integer(1)])
>>> d = a + b
>>> a.scalar(a)
1
>>> b.scalar(b)
1
>>> b.scalar(a)
0
>>> b.scalar(c)
2
>>> c.scalar(c)
4
>>> d.scalar(a)
1
>>> d.scalar(b)
1
>>> d.scalar(c)
2
```

```
sage: m = SymmetricFunctions(ZZ).monomial()
sage: p4 = Partitions(4)
sage: l = [ [s(p).scalar(m(q)) for q in p4] for p in p4]
sage: matrix(l)
[ 1  0  0  0  0]
[-1  1  0  0  0]
[ 0 -1  1  0  0]
```

(continues on next page)

(continued from previous page)

```
[ 1 -1 -1  1  0]
[-1  2  1 -3  1]
```

```
>>> from sage.all import *
>>> m = SymmetricFunctions(ZZ).monomial()
>>> p4 = Partitions(Integer(4))
>>> l = [ [s(p).scalar(m(q)) for q in p4] for p in p4]
>>> matrix(l)
[ 1  0  0  0  0]
[-1  1  0  0  0]
[ 0 -1  1  0  0]
[ 1 -1 -1  1  0]
[-1  2  1 -3  1]
```

verschiebung(*n*)

Return the image of the symmetric function `self` under the n-th Verschiebung operator.

The n-th Verschiebung operator $\mathbf{V}_n$ is defined to be the unique algebra endomorphism V of the ring of symmetric functions that satisfies $V(h_r) = h_{r/n}$ for every positive integer r divisible by n, and satisfies $V(h_r) = 0$ for every positive integer r not divisible by n. This operator $\mathbf{V}_n$ is a Hopf algebra endomorphism. For every nonnegative integer r with $n \mid r$, it satisfies

$$\mathbf{V}_n(h_r) = h_{r/n}, \quad \mathbf{V}_n(p_r) = np_{r/n}, \quad \mathbf{V}_n(e_r) = (-1)^{r-r/n} e_{r/n}$$

(where h is the complete homogeneous basis, p is the powersum basis, and e is the elementary basis). For every nonnegative integer r with $n \nmid r$, it satisfes

$$\mathbf{V}_n(h_r) = \mathbf{V}_n(p_r) = \mathbf{V}_n(e_r) = 0.$$

The n-th Verschiebung operator is also called the n-th Verschiebung endomorphism. Its name derives from the Verschiebung (German for "shift") endomorphism of the Witt vectors.

The n-th Verschiebung operator is adjoint to the n-th Frobenius operator (see *adams_operator()* for its definition) with respect to the Hall scalar product (*scalar()*).

The action of the n-th Verschiebung operator on the Schur basis can also be computed explicitly. The following (probably clumsier than necessary) description can be obtained by solving exercise 7.61 in Stanley's [STA].

Let λ be a partition. Let n be a positive integer. If the n-core of λ is nonempty, then $\mathbf{V}_n(s_\lambda) = 0$. Otherwise, the following method computes $\mathbf{V}_n(s_\lambda)$: Write the partition λ in the form $(\lambda_1, \lambda_2, \ldots, \lambda_{ns})$ for some nonnegative integer s. (If n does not divide the length of λ, then this is achieved by adding trailing zeroes to λ.) Set $\beta_i = \lambda_i + ns - i$ for every $s \in \{1, 2, \ldots, ns\}$. Then, $(\beta_1, \beta_2, \ldots, \beta_{ns})$ is a strictly decreasing sequence of nonnegative integers. Stably sort the list $(1, 2, \ldots, ns)$ in order of (weakly) increasing remainder of $-1 - \beta_i$ modulo n. Let ξ be the sign of the permutation that is used for this sorting. Let ψ be the sign of the permutation that is used to stably sort the list $(1, 2, \ldots, ns)$ in order of (weakly) increasing remainder of $i - 1$ modulo n. (Notice that $\psi = (-1)^{n(n-1)s(s-1)/4}$.) Then, $\mathbf{V}_n(s_\lambda) = \xi\psi \prod_{i=0}^{n-1} s_{\lambda^{(i)}}$, where $(\lambda^{(0)}, \lambda^{(1)}, \ldots, \lambda^{(n-1)})$ is the n-quotient of λ.

INPUT:

- `n` – positive integer

OUTPUT:

The result of applying the n-th Verschiebung operator (on the ring of symmetric functions) to `self`.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: s = Sym.s()
sage: s[5].verschiebung(2)
0
sage: s[6].verschiebung(6)
s[1]
sage: s[6,3].verschiebung(3)
s[2, 1] + s[3]
sage: s[6,3,1].verschiebung(2)
-s[3, 2]
sage: s[3,2,1].verschiebung(1)
s[3, 2, 1]
sage: s([]).verschiebung(1)
s[]
sage: s([]).verschiebung(4)
s[]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> s = Sym.s()
>>> s[Integer(5)].verschiebung(Integer(2))
0
>>> s[Integer(6)].verschiebung(Integer(6))
s[1]
>>> s[Integer(6),Integer(3)].verschiebung(Integer(3))
s[2, 1] + s[3]
>>> s[Integer(6),Integer(3),Integer(1)].verschiebung(Integer(2))
-s[3, 2]
>>> s[Integer(3),Integer(2),Integer(1)].verschiebung(Integer(1))
s[3, 2, 1]
>>> s([]).verschiebung(Integer(1))
s[]
>>> s([]).verschiebung(Integer(4))
s[]
```

coproduct_on_basis(*mu*)

Return the coproduct of `self(mu)`.

Here `self` is the basis of Schur functions in the ring of symmetric functions.

INPUT:

- `self` – a Schur symmetric function basis
- `mu` – a partition

OUTPUT:

- the image of the `mu`-th Schur function under the comultiplication of the Hopf algebra of symmetric functions; this is an element of the tensor square of the Schur basis

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: s = Sym.schur()
```

(continues on next page)

(continued from previous page)

```
sage: s.coproduct_on_basis([2])
s[] # s[2] + s[1] # s[1] + s[2] # s[]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> s = Sym.schur()
>>> s.coproduct_on_basis([Integer(2)])
s[] # s[2] + s[1] # s[1] + s[2] # s[]
```

product_on_basis(*left*, *right*)

Return the product of `left` and `right`.

INPUT:

- `self` – a Schur symmetric function basis
- `left`, `right` – partitions

OUTPUT: an element of the Schur basis, the product of `left` and `right`

Symmetric functions

For a comprehensive tutorial on how to use symmetric functions in Sage

See also

SymmetricFunctions()

We define the algebra of symmetric functions in the Schur and elementary bases:

```
sage: s = SymmetricFunctions(QQ).schur()
sage: e = SymmetricFunctions(QQ).elementary()
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).schur()
>>> e = SymmetricFunctions(QQ).elementary()
```

Each is actually a graded Hopf algebra whose basis is indexed by integer partitions:

```
sage: s.category()
Category of graded bases of Symmetric Functions over Rational Field
sage: s.basis().keys()
Partitions
```

```
>>> from sage.all import *
>>> s.category()
Category of graded bases of Symmetric Functions over Rational Field
>>> s.basis().keys()
Partitions
```

Let us compute with some elements in different bases:

```
sage: f1 = s([2,1]); f1
s[2, 1]
sage: f2 = e(f1); f2 # basis conversion
e[2, 1] - e[3]
sage: f1 == f2
True
sage: f1.expand(3, alphabet=['x','y','z'])
x^2*y + x*y^2 + x^2*z + 2*x*y*z + y^2*z + x*z^2 + y*z^2
sage: f2.expand(3, alphabet=['x','y','z'])
x^2*y + x*y^2 + x^2*z + 2*x*y*z + y^2*z + x*z^2 + y*z^2
```

```
>>> from sage.all import *
>>> f1 = s([Integer(2),Integer(1)]); f1
s[2, 1]
```

(continues on next page)

(continued from previous page)

```
>>> f2 = e(f1); f2 # basis conversion
e[2, 1] - e[3]
>>> f1 == f2
True
>>> f1.expand(Integer(3), alphabet=['x','y','z'])
x^2*y + x*y^2 + x^2*z + 2*x*y*z + y^2*z + x*z^2 + y*z^2
>>> f2.expand(Integer(3), alphabet=['x','y','z'])
x^2*y + x*y^2 + x^2*z + 2*x*y*z + y^2*z + x*z^2 + y*z^2
```

```
sage: m = SymmetricFunctions(QQ).monomial()
sage: m([3,1])
m[3, 1]
sage: m(4) # This is the constant 4, not the partition 4.
4*m[]
sage: m([4]) # This is the partition 4.
m[4]
sage: 3*m([3,1])-1/2*m([4])
3*m[3, 1] - 1/2*m[4]
```

```
>>> from sage.all import *
>>> m = SymmetricFunctions(QQ).monomial()
>>> m([Integer(3),Integer(1)])
m[3, 1]
>>> m(Integer(4)) # This is the constant 4, not the partition 4.
4*m[]
>>> m([Integer(4)]) # This is the partition 4.
m[4]
>>> Integer(3)*m([Integer(3),Integer(1)])-Integer(1)/Integer(2)*m([Integer(4)])
3*m[3, 1] - 1/2*m[4]
```

```
sage: p = SymmetricFunctions(QQ).power()
sage: f = p(3)
sage: f
3*p[]
sage: f.parent()
Symmetric Functions over Rational Field in the powersum basis
sage: f + p([3,2])
3*p[] + p[3, 2]
```

```
>>> from sage.all import *
>>> p = SymmetricFunctions(QQ).power()
>>> f = p(Integer(3))
>>> f
3*p[]
>>> f.parent()
Symmetric Functions over Rational Field in the powersum basis
>>> f + p([Integer(3),Integer(2)])
3*p[] + p[3, 2]
```

One can convert symmetric functions to symmetric polynomials and vice versa:

```
sage: Sym = SymmetricFunctions(QQ)
sage: p = Sym.powersum()
sage: h = Sym.homogeneous()
sage: f = h[2,1] + 2*p[3,1]
sage: poly = f.expand(3); poly
2*x0^4 + 2*x0^3*x1 + 2*x0*x1^3 + 2*x1^4 + 2*x0^3*x2 + 2*x1^3*x2
+ 2*x0*x2^3 + 2*x1*x2^3 + 2*x2^4 + x0^3 + 2*x0^2*x1 + 2*x0*x1^2 + x1^3
+ 2*x0^2*x2 + 3*x0*x1*x2 + 2*x1^2*x2 + 2*x0*x2^2 + 2*x1*x2^2 + x2^3
sage: Sym.from_polynomial(poly)
3*m[1, 1, 1] + 2*m[2, 1] + m[3] + 2*m[3, 1] + 2*m[4]
sage: Sym.from_polynomial(poly) == f
True
sage: g = h[1,1,1,1]
sage: poly = g.expand(3)
sage: Sym.from_polynomial(poly) == g
False
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> p = Sym.powersum()
>>> h = Sym.homogeneous()
>>> f = h[Integer(2),Integer(1)] + Integer(2)*p[Integer(3),Integer(1)]
>>> poly = f.expand(Integer(3)); poly
2*x0^4 + 2*x0^3*x1 + 2*x0*x1^3 + 2*x1^4 + 2*x0^3*x2 + 2*x1^3*x2
+ 2*x0*x2^3 + 2*x1*x2^3 + 2*x2^4 + x0^3 + 2*x0^2*x1 + 2*x0*x1^2 + x1^3
+ 2*x0^2*x2 + 3*x0*x1*x2 + 2*x1^2*x2 + 2*x0*x2^2 + 2*x1*x2^2 + x2^3
>>> Sym.from_polynomial(poly)
3*m[1, 1, 1] + 2*m[2, 1] + m[3] + 2*m[3, 1] + 2*m[4]
>>> Sym.from_polynomial(poly) == f
True
>>> g = h[Integer(1),Integer(1),Integer(1),Integer(1)]
>>> poly = g.expand(Integer(3))
>>> Sym.from_polynomial(poly) == g
False
```

```
sage: Sym = SymmetricFunctions(QQ)
sage: s = Sym.s()
sage: h = Sym.h()
sage: p = Sym.p()
sage: e = Sym.e()

class sage.combinat.sf.sfa.**FilteredSymmetricFunctionsBases**(*parent_with_realization*)

Bases: Category_realization_of_parent

The category of filtered bases of the ring of symmetric functions.

super_categories()

The super categories of self.

EXAMPLES:

```
sage: from sage.combinat.sf.sfa import FilteredSymmetricFunctionsBases
sage: Sym = SymmetricFunctions(QQ)
sage: bases = FilteredSymmetricFunctionsBases(Sym)
sage: bases.super_categories()
[Category of bases of Symmetric Functions over Rational Field,
 Category of commutative filtered Hopf algebras with basis over Rational␣
↪Field]
```

```
>>> from sage.all import *
>>> from sage.combinat.sf.sfa import FilteredSymmetricFunctionsBases
>>> Sym = SymmetricFunctions(QQ)
>>> bases = FilteredSymmetricFunctionsBases(Sym)
>>> bases.super_categories()
[Category of bases of Symmetric Functions over Rational Field,
 Category of commutative filtered Hopf algebras with basis over Rational␣
↪Field]
```

class sage.combinat.sf.sfa.**GradedSymmetricFunctionsBases**(*parent_with_realization*)

Bases: Category_realization_of_parent

The category of graded bases of the ring of symmetric functions.

These are further required to have the property that the basis element indexed by the empty partition is 1.

class ElementMethods

Bases: object

degree_negation()

Return the image of self under the degree negation automorphism of the ring of symmetric functions.

The degree negation is the automorphism which scales every homogeneous element of degree k by $(-1)^k$ (for all k).

Calling degree_negation(self) is equivalent to calling self.parent().degree_negation(self).

EXAMPLES:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: m = Sym.monomial()
sage: f = 2*m[2,1] + 4*m[1,1] - 5*m[1] - 3*m[[]]
sage: f.degree_negation()
-3*m[] + 5*m[1] + 4*m[1, 1] - 2*m[2, 1]
```

(continues on next page)

(continued from previous page)

```
sage: x = m.zero().degree_negation(); x
0
sage: parent(x) is m
True
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> m = Sym.monomial()
>>> f = Integer(2)*m[Integer(2),Integer(1)] + Integer(4)*m[Integer(1),
↪Integer(1)] - Integer(5)*m[Integer(1)] - Integer(3)*m[[]]
>>> f.degree_negation()
-3*m[] + 5*m[1] + 4*m[1, 1] - 2*m[2, 1]
>>> x = m.zero().degree_negation(); x
0
>>> parent(x) is m
True
```

degree_zero_coefficient()

Return the degree zero coefficient of `self`.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: m = Sym.monomial()
sage: f = 2*m[2,1] + 3*m[[]]
sage: f.degree_zero_coefficient()
3
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> m = Sym.monomial()
>>> f = Integer(2)*m[Integer(2),Integer(1)] + Integer(3)*m[[]]
>>> f.degree_zero_coefficient()
3
```

is_unit()

Return whether this element is a unit in the ring.

EXAMPLES:

```
sage: m = SymmetricFunctions(ZZ).monomial()
sage: (2*m[2,1] + m[[]]).is_unit()
False

sage: m = SymmetricFunctions(QQ).monomial()
sage: (3/2*m([])).is_unit()
True
```

```
>>> from sage.all import *
>>> m = SymmetricFunctions(ZZ).monomial()
>>> (Integer(2)*m[Integer(2),Integer(1)] + m[[]]).is_unit()
False
```

(continues on next page)

(continued from previous page)

```
>>> m = SymmetricFunctions(QQ).monomial()
>>> (Integer(3)/Integer(2)*m([])).is_unit()
True
```

class ParentMethods

Bases: object

antipode_by_coercion(*element*)

The antipode of element.

INPUT:

- element – element in a basis of the ring of symmetric functions

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: p = Sym.p()
sage: s = Sym.s()
sage: e = Sym.e()
sage: h = Sym.h()
sage: (h([]) + h([1])).antipode() # indirect doctest
h[] - h[1]
sage: (s([]) + s([1]) + s[2]).antipode()
s[] - s[1] + s[1, 1]
sage: (p([2]) + p([3])).antipode()
-p[2] - p[3]
sage: (e([2]) + e([3])).antipode()
e[1, 1] - e[1, 1, 1] - e[2] + 2*e[2, 1] - e[3]
sage: f = Sym.f()
sage: f([3,2,1]).antipode()
-f[3, 2, 1] - 4*f[3, 3] - 2*f[4, 2] - 2*f[5, 1] - 6*f[6]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> p = Sym.p()
>>> s = Sym.s()
>>> e = Sym.e()
>>> h = Sym.h()
>>> (h([]) + h([Integer(1)])).antipode() # indirect doctest
h[] - h[1]
>>> (s([]) + s([Integer(1)]) + s[Integer(2)]).antipode()
s[] - s[1] + s[1, 1]
>>> (p([Integer(2)]) + p([Integer(3)])).antipode()
-p[2] - p[3]
>>> (e([Integer(2)]) + e([Integer(3)])).antipode()
e[1, 1] - e[1, 1, 1] - e[2] + 2*e[2, 1] - e[3]
>>> f = Sym.f()
>>> f([Integer(3),Integer(2),Integer(1)]).antipode()
-f[3, 2, 1] - 4*f[3, 3] - 2*f[4, 2] - 2*f[5, 1] - 6*f[6]
```

The antipode is an involution:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: s = Sym.s()
sage: all( s[u].antipode().antipode() == s[u] for u in Partitions(4) )
True
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> s = Sym.s()
>>> all( s[u].antipode().antipode() == s[u] for u in␣
↪Partitions(Integer(4)) )
True
```

The antipode is an algebra homomorphism:

```
sage: Sym = SymmetricFunctions(FiniteField(23))
sage: h = Sym.h()
sage: all( all( (s[u] * s[v]).antipode() == s[u].antipode() * s[v].
↪antipode()
....:           for u in Partitions(3) )
....:       for v in Partitions(3) )
True
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(FiniteField(Integer(23)))
>>> h = Sym.h()
>>> all( all( (s[u] * s[v]).antipode() == s[u].antipode() * s[v].
↪antipode()
...             for u in Partitions(Integer(3)) )
...       for v in Partitions(Integer(3)) )
True
```

counit(*element*)

Return the counit of `element`.

The counit is the constant term of `element`.

INPUT:

- `element` – element in a basis of the ring of symmetric functions

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: m = Sym.monomial()
sage: f = 2*m[2,1] + 3*m[[]]
sage: f.counit()
3
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> m = Sym.monomial()
>>> f = Integer(2)*m[Integer(2),Integer(1)] + Integer(3)*m[[]]
>>> f.counit()
3
```

degree_negation(*element*)

Return the image of `element` under the degree negation automorphism of the ring of symmetric functions.

The degree negation is the automorphism which scales every homogeneous element of degree k by $(-1)^k$ (for all k).

INPUT:

- `element` – symmetric function written in `self`

EXAMPLES:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: m = Sym.monomial()
sage: f = 2*m[2,1] + 4*m[1,1] - 5*m[1] - 3*m[[]]
sage: m.degree_negation(f)
-3*m[] + 5*m[1] + 4*m[1, 1] - 2*m[2, 1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> m = Sym.monomial()
>>> f = Integer(2)*m[Integer(2),Integer(1)] + Integer(4)*m[Integer(1),
↪Integer(1)] - Integer(5)*m[Integer(1)] - Integer(3)*m[[]]
>>> m.degree_negation(f)
-3*m[] + 5*m[1] + 4*m[1, 1] - 2*m[2, 1]
```

super_categories()

The super categories of `self`.

EXAMPLES:

```
sage: from sage.combinat.sf.sfa import GradedSymmetricFunctionsBases
sage: Sym = SymmetricFunctions(QQ)
sage: bases = GradedSymmetricFunctionsBases(Sym)
sage: bases.super_categories()
[Category of filtered bases of Symmetric Functions over Rational Field,
 Category of commutative graded Hopf algebras with basis over Rational Field]
```

```
>>> from sage.all import *
>>> from sage.combinat.sf.sfa import GradedSymmetricFunctionsBases
>>> Sym = SymmetricFunctions(QQ)
>>> bases = GradedSymmetricFunctionsBases(Sym)
>>> bases.super_categories()
[Category of filtered bases of Symmetric Functions over Rational Field,
 Category of commutative graded Hopf algebras with basis over Rational Field]
```

class sage.combinat.sf.sfa.**SymmetricFunctionAlgebra_generic**(*Sym*, *basis_name=None*, *prefix=None*, *graded=True*)

Bases: *CombinatorialFreeModule*

Abstract base class for symmetric function algebras.

Todo

Most of the methods in this class are generic (manipulations of morphisms, …) and should be generalized (or removed)

Element

alias of *SymmetricFunctionAlgebra_generic_Element*

basis_name()

Return the name of the basis of `self`.

This is used for output and, for the classical bases of symmetric functions, to connect this basis with Symmetrica.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: s = Sym.s()
sage: s.basis_name()
'Schur'
sage: p = Sym.p()
sage: p.basis_name()
'powersum'
sage: h = Sym.h()
sage: h.basis_name()
'homogeneous'
sage: e = Sym.e()
sage: e.basis_name()
'elementary'
sage: m = Sym.m()
sage: m.basis_name()
'monomial'
sage: f = Sym.f()
sage: f.basis_name()
'forgotten'
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> s = Sym.s()
>>> s.basis_name()
'Schur'
>>> p = Sym.p()
>>> p.basis_name()
'powersum'
>>> h = Sym.h()
>>> h.basis_name()
'homogeneous'
>>> e = Sym.e()
>>> e.basis_name()
'elementary'
>>> m = Sym.m()
>>> m.basis_name()
'monomial'
>>> f = Sym.f()
>>> f.basis_name()
```

(continues on next page)

(continued from previous page)

```
'forgotten'
```

change_ring(*R*)

Return the base change of `self` to R.

EXAMPLES:

```
sage: s = SymmetricFunctions(ZZ).s()
sage: s.change_ring(QQ)
Symmetric Functions over Rational Field in the Schur basis
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(ZZ).s()
>>> s.change_ring(QQ)
Symmetric Functions over Rational Field in the Schur basis
```

construction()

Return a pair `(F, R)`, where `F` is a *SymmetricFunctionsFunctor* and R is a ring, such that `F(R)` returns `self`.

EXAMPLES:

```
sage: s = SymmetricFunctions(ZZ).s()
sage: s.construction()
(SymmetricFunctionsFunctor[Schur], Integer Ring)
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(ZZ).s()
>>> s.construction()
(SymmetricFunctionsFunctor[Schur], Integer Ring)
```

coproduct_by_coercion(*elt*)

Return the coproduct of the element `elt` by coercion to the Schur basis.

INPUT:

- `elt` – an instance of this basis

OUTPUT:

- The image of `elt` under the comultiplication (=coproduct) of the coalgebra of symmetric functions. The result is an element of the tensor squared of the basis `self`.

EXAMPLES:

```
sage: m = SymmetricFunctions(QQ).m()
sage: m[3,1,1].coproduct()
m[] # m[3, 1, 1] + m[1] # m[3, 1] + m[1, 1] # m[3] + m[3] # m[1, 1] + m[3, 1]
↪# m[1] + m[3, 1, 1] # m[]
sage: m.coproduct_by_coercion(m[2,1])
m[] # m[2, 1] + m[1] # m[2] + m[2] # m[1] + m[2, 1] # m[]
sage: m.coproduct_by_coercion(m[2,1]) == m([2,1]).coproduct()
True
sage: McdH = SymmetricFunctions(QQ['q','t'].fraction_field()).macdonald().H()
sage: McdH[2,1].coproduct()
```

(continues on next page)

(continued from previous page)

```
McdH[] # McdH[2, 1] + ((q^2*t-1)/(q*t-1))*McdH[1] # McdH[1, 1] + ((q*t^2-1)/

```

dual_basis(*scalar=None*, *scalar_name=''*, *basis_name=None*, *prefix=None*)

Return the dual basis of `self` with respect to the scalar product `scalar`.

INPUT:

- `scalar` – a function `zee` from partitions to the base ring which specifies the scalar product by $\langle p_\lambda, p_\lambda \rangle = \text{zee}(\lambda)$. (Independently on the function chosen, the power sum basis will always be orthogonal; the function `scalar` only determines the norms of the basis elements.) If `scalar` is None, then the standard (Hall) scalar product is used.
- `scalar_name` – name of the scalar function
- `prefix` – prefix used to display the basis

EXAMPLES:

The duals of the elementary symmetric functions with respect to the Hall scalar product are the forgotten symmetric functions.

```
sage: e = SymmetricFunctions(QQ).e()
sage: f = e.dual_basis(prefix='f'); f
Dual basis to Symmetric Functions over Rational Field in the elementary basis␣
↪with respect to the Hall scalar product
sage: f([2,1])^2
4*f[2, 2, 1, 1] + 6*f[2, 2, 2] + 2*f[3, 2, 1] + 2*f[3, 3] + 2*f[4, 1, 1] +␣
↪f[4, 2]
sage: f([2,1]).scalar(e([2,1]))
1
sage: f([2,1]).scalar(e([1,1,1]))
0
```

```
>>> from sage.all import *
>>> e = SymmetricFunctions(QQ).e()
>>> f = e.dual_basis(prefix='f'); f
Dual basis to Symmetric Functions over Rational Field in the elementary basis␣
↪with respect to the Hall scalar product
>>> f([Integer(2),Integer(1)])**Integer(2)
4*f[2, 2, 1, 1] + 6*f[2, 2, 2] + 2*f[3, 2, 1] + 2*f[3, 3] + 2*f[4, 1, 1] +␣
↪f[4, 2]
>>> f([Integer(2),Integer(1)]).scalar(e([Integer(2),Integer(1)]))
1
>>> f([Integer(2),Integer(1)]).scalar(e([Integer(1),Integer(1),Integer(1)]))
0
```

Since the power-sum symmetric functions are orthogonal, their duals with respect to the Hall scalar product are scalar multiples of themselves.

```
sage: p = SymmetricFunctions(QQ).p()
sage: q = p.dual_basis(prefix='q'); q
Dual basis to Symmetric Functions over Rational Field in the powersum basis␣
↪with respect to the Hall scalar product
sage: q([2,1])^2
4*q[2, 2, 1, 1]
sage: p([2,1]).scalar(q([2,1]))
1
sage: p([2,1]).scalar(q([1,1,1]))
0
```

```
>>> from sage.all import *
>>> p = SymmetricFunctions(QQ).p()
>>> q = p.dual_basis(prefix='q'); q
Dual basis to Symmetric Functions over Rational Field in the powersum basis␣
↪with respect to the Hall scalar product
>>> q([Integer(2),Integer(1)])**Integer(2)
4*q[2, 2, 1, 1]
>>> p([Integer(2),Integer(1)]).scalar(q([Integer(2),Integer(1)]))
1
>>> p([Integer(2),Integer(1)]).scalar(q([Integer(1),Integer(1),Integer(1)]))
0
```

from_polynomial(*poly*, *check=True*)

Convert polynomial to a symmetric function in the monomial basis and then to the basis `self`.

INPUT:

- `poly` – a symmetric polynomial
- `check` – boolean (default: `True`); specifies whether the computation checks that the polynomial is indeed symmetric

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: h = Sym.homogeneous()
sage: f = (h([]) + h([2,1]) + h([3])).expand(3)
sage: h.from_polynomial(f)
h[] + h[2, 1] + h[3]
sage: s = Sym.s()
sage: g = (s([]) + s([2,1])).expand(3); g
x0^2*x1 + x0*x1^2 + x0^2*x2 + 2*x0*x1*x2 + x1^2*x2 + x0*x2^2 + x1*x2^2 + 1
sage: s.from_polynomial(g)
s[] + s[2, 1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> h = Sym.homogeneous()
>>> f = (h([]) + h([Integer(2),Integer(1)]) + h([Integer(3)])).
↪expand(Integer(3))
>>> h.from_polynomial(f)
h[] + h[2, 1] + h[3]
>>> s = Sym.s()
>>> g = (s([]) + s([Integer(2),Integer(1)])).expand(Integer(3)); g
x0^2*x1 + x0*x1^2 + x0^2*x2 + 2*x0*x1*x2 + x1^2*x2 + x0*x2^2 + x1*x2^2 + 1
>>> s.from_polynomial(g)
s[] + s[2, 1]
```

get_print_style()

Return the value of the current print style for `self`.

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: s.get_print_style()
```

(continues on next page)

(continued from previous page)

```
'lex'
sage: s.set_print_style('length')
sage: s.get_print_style()
'length'
sage: s.set_print_style('lex')
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> s.get_print_style()
'lex'
>>> s.set_print_style('length')
>>> s.get_print_style()
'length'
>>> s.set_print_style('lex')
```

prefix()

Return the prefix on the elements of `self`.

EXAMPLES:

```
sage: schur = SymmetricFunctions(QQ).schur()
sage: schur([3,2,1])
s[3, 2, 1]
sage: schur.prefix()
's'
```

```
>>> from sage.all import *
>>> schur = SymmetricFunctions(QQ).schur()
>>> schur([Integer(3),Integer(2),Integer(1)])
s[3, 2, 1]
>>> schur.prefix()
's'
```

product_by_coercion(*left*, *right*)

Return the product of elements `left` and `right` by coercion to the Schur basis.

INPUT:

- `left`, `right` – instances of this basis

OUTPUT: the product of `left` and `right` expressed in the basis `self`

EXAMPLES:

```
sage: p = SymmetricFunctions(QQ).p()
sage: p.product_by_coercion(p[3,1,1], p[2,2])
p[3, 2, 2, 1, 1]
sage: m = SymmetricFunctions(QQ).m()
sage: m.product_by_coercion(m[2,1],m[1,1]) == m[2,1]*m[1,1]
True
```

```
>>> from sage.all import *
>>> p = SymmetricFunctions(QQ).p()
>>> p.product_by_coercion(p[Integer(3),Integer(1),Integer(1)], p[Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(2)])
p[3, 2, 2, 1, 1]
>>> m = SymmetricFunctions(QQ).m()
>>> m.product_by_coercion(m[Integer(2),Integer(1)],m[Integer(1),Integer(1)])␣
↪== m[Integer(2),Integer(1)]*m[Integer(1),Integer(1)]
True
```

set_print_style(*ps*)

Set the value of the current print style to `ps`.

INPUT:

- `ps` – string specifying the printing style

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: s.get_print_style()
'lex'
sage: s.set_print_style('length')
sage: s.get_print_style()
'length'
sage: s.set_print_style('lex')
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> s.get_print_style()
'lex'
>>> s.set_print_style('length')
>>> s.get_print_style()
'length'
>>> s.set_print_style('lex')
```

symmetric_function_ring()

Return the family of symmetric functions associated to the basis `self`.

OUTPUT: an instance of the ring of symmetric functions

EXAMPLES:

```
sage: schur = SymmetricFunctions(QQ).schur()
sage: schur.symmetric_function_ring()
Symmetric Functions over Rational Field
sage: power = SymmetricFunctions(QQ['t']).power()
sage: power.symmetric_function_ring()
Symmetric Functions over Univariate Polynomial Ring in t over Rational Field
```

```
>>> from sage.all import *
>>> schur = SymmetricFunctions(QQ).schur()
>>> schur.symmetric_function_ring()
Symmetric Functions over Rational Field
>>> power = SymmetricFunctions(QQ['t']).power()
>>> power.symmetric_function_ring()
Symmetric Functions over Univariate Polynomial Ring in t over Rational Field
```

transition_matrix(*basis*, *n*)

Return the transition matrix between `self` and `basis` for the homogeneous component of degree `n`.

INPUT:

- `basis` – a basis of the ring of symmetric functions
- `n` – nonnegative integer

OUTPUT:

A matrix of coefficients giving the expansion of the homogeneous degree-n elements of `self` in the degree-n elements of `basis`.

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: m = SymmetricFunctions(QQ).m()
sage: s.transition_matrix(m,5)
[1 1 1 1 1 1 1]
[0 1 1 2 2 3 4]
[0 0 1 1 2 3 5]
[0 0 0 1 1 3 6]
[0 0 0 0 1 2 5]
[0 0 0 0 0 1 4]
[0 0 0 0 0 0 1]
sage: s.transition_matrix(m,1)
[1]
sage: s.transition_matrix(m,0)
[1]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> m = SymmetricFunctions(QQ).m()
>>> s.transition_matrix(m,Integer(5))
[1 1 1 1 1 1 1]
[0 1 1 2 2 3 4]
[0 0 1 1 2 3 5]
[0 0 0 1 1 3 6]
[0 0 0 0 1 2 5]
[0 0 0 0 0 1 4]
[0 0 0 0 0 0 1]
>>> s.transition_matrix(m,Integer(1))
[1]
>>> s.transition_matrix(m,Integer(0))
[1]
```

```
sage: p = SymmetricFunctions(QQ).p()
sage: s.transition_matrix(p, 4)
[ 1/4  1/3  1/8  1/4 1/24]
[-1/4    0 -1/8  1/4  1/8]

class sage.combinat.sf.sfa.**SymmetricFunctionAlgebra_generic_Element**

Bases: IndexedFreeModuleElement

Class of generic elements for the symmetric function algebra.

adams_operator(*n*)

Return the image of the symmetric function `self` under the n-th Adams operator.

The n-th Adams operator $\mathbf{f}_n$ is defined to be the map from the ring of symmetric functions to itself that sends every symmetric function $P(x_1, x_2, x_3, \ldots)$ to $P(x_1^n, x_2^n, x_3^n, \ldots)$. This operator $\mathbf{f}_n$ is a Hopf algebra

endomorphism, and satisfies

$$\mathbf{f}_n m_{(\lambda_1,\lambda_2,\lambda_3,\ldots)} = m_{(n\lambda_1,n\lambda_2,n\lambda_3,\ldots)}$$

for every partition $(\lambda_1, \lambda_2, \lambda_3, \ldots)$ (where m means the monomial basis). Moreover, $\mathbf{f}_n(p_r) = p_{nr}$ for every positive integer r (where p_k denotes the k-th powersum symmetric function).

The n-th Adams operator is also called the n-th Frobenius endomorphism. It is not related to the Frobenius map which connects the ring of symmetric functions with the representation theory of the symmetric group.

The n-th Adams operator is also the n-th Adams operator of the Λ-ring of symmetric functions over the integers.

The n-th Adams operator can also be described via plethysm: Every symmetric function P satisfies $\mathbf{f}_n(P) = p_n \circ P = P \circ p_n$, where p_n is the n-th powersum symmetric function, and $\circ$ denotes (outer) plethysm.

INPUT:

- `n` – positive integer

OUTPUT:

The result of applying the n-th Adams operator (on the ring of symmetric functions) to `self`.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: p = Sym.p()
sage: h = Sym.h()
sage: s = Sym.s()
sage: m = Sym.m()
sage: s[3].adams_operator(2)
-s[3, 3] + s[4, 2] - s[5, 1] + s[6]
sage: m[4,2,1].adams_operator(3)
m[12, 6, 3]
sage: p[4,2,1].adams_operator(3)
p[12, 6, 3]
sage: h[4].adams_operator(2)
h[4, 4] - 2*h[5, 3] + 2*h[6, 2] - 2*h[7, 1] + 2*h[8]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> p = Sym.p()
>>> h = Sym.h()
>>> s = Sym.s()
>>> m = Sym.m()
>>> s[Integer(3)].adams_operator(Integer(2))
-s[3, 3] + s[4, 2] - s[5, 1] + s[6]
>>> m[Integer(4),Integer(2),Integer(1)].adams_operator(Integer(3))
m[12, 6, 3]
>>> p[Integer(4),Integer(2),Integer(1)].adams_operator(Integer(3))
p[12, 6, 3]
>>> h[Integer(4)].adams_operator(Integer(2))
h[4, 4] - 2*h[5, 3] + 2*h[6, 2] - 2*h[7, 1] + 2*h[8]
```

The Adams endomorphisms are multiplicative:

```
sage: all( all( s(lam).adams_operator(3) * s(mu).adams_operator(3) # long time
....:           == (s(lam) * s(mu)).adams_operator(3)
....:           for mu in Partitions(3) )
....:       for lam in Partitions(3) )
True
sage: all( all( m(lam).adams_operator(2) * m(mu).adams_operator(2)
....:           == (m(lam) * m(mu)).adams_operator(2)
....:           for mu in Partitions(4) )
....:       for lam in Partitions(4) )
True
sage: all( all( p(lam).adams_operator(2) * p(mu).adams_operator(2)
....:           == (p(lam) * p(mu)).adams_operator(2)
....:           for mu in Partitions(3) )
....:       for lam in Partitions(4) )
True
```

```
>>> from sage.all import *
>>> all( all( s(lam).adams_operator(Integer(3)) * s(mu).adams_
↪operator(Integer(3)) # long time
...           == (s(lam) * s(mu)).adams_operator(Integer(3))
...           for mu in Partitions(Integer(3)) )
...       for lam in Partitions(Integer(3)) )
True
>>> all( all( m(lam).adams_operator(Integer(2)) * m(mu).adams_
↪operator(Integer(2))
...           == (m(lam) * m(mu)).adams_operator(Integer(2))
...           for mu in Partitions(Integer(4)) )
...       for lam in Partitions(Integer(4)) )
True
>>> all( all( p(lam).adams_operator(Integer(2)) * p(mu).adams_
↪operator(Integer(2))
...           == (p(lam) * p(mu)).adams_operator(Integer(2))
...           for mu in Partitions(Integer(3)) )
...       for lam in Partitions(Integer(4)) )
True
```

Being Hopf algebra endomorphisms, the Adams operators commute with the antipode:

```
sage: all( p(lam).adams_operator(4).antipode()
....:       == p(lam).antipode().adams_operator(4)
....:       for lam in Partitions(3) )
True
```

```
>>> from sage.all import *
>>> all( p(lam).adams_operator(Integer(4)).antipode()
...       == p(lam).antipode().adams_operator(Integer(4))
...       for lam in Partitions(Integer(3)) )
True
```

Testing the $\mathbf{f}_n(P) = p_n \circ P = P \circ p_n$ equality (over $\mathbf{Q}$, since plethysm is currently not defined over $\mathbf{Z}$ in Sage):

```
sage: Sym = SymmetricFunctions(QQ)
sage: s = Sym.s()
sage: p = Sym.p()
sage: all( s(lam).adams_operator(3) == s(lam).plethysm(p[3])
....:      == s(p[3].plethysm(s(lam)))
....:      for lam in Partitions(4) )
True
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> s = Sym.s()
>>> p = Sym.p()
>>> all( s(lam).adams_operator(Integer(3)) == s(lam).plethysm(p[Integer(3)])
...      == s(p[Integer(3)].plethysm(s(lam)))
...      for lam in Partitions(Integer(4)) )
True
```

By Exercise 7.61 in Stanley's EC2 [STA] (see the errata on his website), $\mathbf{f}_n(h_m)$ is a linear combination of Schur polynomials (of straight shapes) using coefficients 0, 1 and -1 only; moreover, all partitions whose Schur polynomials occur with coefficient $\neq 0$ in this combination have empty n-cores. Let us check this on examples:

```
sage: all( all( all( (coeff == -1 or coeff == 1)
....:                and lam.core(n) == Partition([])
....:                for lam, coeff in s([m]).adams_operator(n) )
....:           for n in range(2, 4) )
....:      for m in range(4) )
True
```

```
>>> from sage.all import *
>>> all( all( all( (coeff == -Integer(1) or coeff == Integer(1))
...                and lam.core(n) == Partition([])
...                for lam, coeff in s([m]).adams_operator(n) )
...           for n in range(Integer(2), Integer(4)) )
...      for m in range(Integer(4)) )
True
```

See also

plethysm()

Todo

This method is fast on the monomial and the powersum bases, while all other bases get converted to the monomial basis. For most bases, this is probably the quickest way to do, but at least the Schur basis should have a better option. (Quoting from Stanley's EC2 [STA]: "D. G. Duncan, J. London Math. Soc. 27 (1952), 235-236, or Y. M. Chen, A. M. Garsia, and J. B. Remmel, Contemp. Math. 34 (1984), 109-153".)

arithmetic_product(*x*)

Return the arithmetic product of `self` and `x` in the basis of `self`.

The arithmetic product is a binary operation $\boxdot$ on the ring of symmetric functions which is bilinear in its two arguments and satisfies

$$p_\lambda \boxdot p_\mu = \prod_{i \geq 1, j \geq 1} p_{\mathrm{lcm}(\lambda_i, \mu_j)}^{\gcd(\lambda_i, \mu_j)}$$

for any two partitions $\lambda = (\lambda_1, \lambda_2, \lambda_3, \ldots)$ and $\mu = (\mu_1, \mu_2, \mu_3, \ldots)$ (where p_ν denotes the power-sum symmetric function indexed by the partition ν, and p_i denotes the i-th power-sum symmetric function). This is enough to define the arithmetic product if the base ring is torsion-free as a $\mathbf{Z}$-module; for all other cases the arithmetic product is uniquely determined by requiring it to be functorial in the base ring. See http://mathoverflow.net/questions/138148/ for a discussion of this arithmetic product.

If f and g are two symmetric functions which are homogeneous of degrees a and b, respectively, then $f \boxdot g$ is homogeneous of degree ab.

The arithmetic product is commutative and associative and has unity $e_1 = p_1 = h_1$.

INPUT:

- `x` – element of the ring of symmetric functions over the same base ring as `self`

OUTPUT:

Arithmetic product of `self` with `x`; this is a symmetric function over the same base ring as `self`.

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: s([2]).arithmetic_product(s([2]))
s[1, 1, 1, 1] + 2*s[2, 2] + s[4]
sage: s([2]).arithmetic_product(s([1,1]))
s[2, 1, 1] + s[3, 1]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> s([Integer(2)]).arithmetic_product(s([Integer(2)]))
s[1, 1, 1, 1] + 2*s[2, 2] + s[4]
>>> s([Integer(2)]).arithmetic_product(s([Integer(1),Integer(1)]))
s[2, 1, 1] + s[3, 1]
```

The symmetric function `e[1]` is the unity for the arithmetic product:

```
sage: e = SymmetricFunctions(ZZ).e()
sage: all( e([1]).arithmetic_product(e(q)) == e(q) for q in Partitions(4) )
True
```

```
>>> from sage.all import *
>>> e = SymmetricFunctions(ZZ).e()
>>> all( e([Integer(1)]).arithmetic_product(e(q)) == e(q) for q in␣
↪Partitions(Integer(4)) )
True
```

The arithmetic product is commutative:

```
sage: e = SymmetricFunctions(FiniteField(19)).e()
sage: m = SymmetricFunctions(FiniteField(19)).m()
sage: all( all( e(p).arithmetic_product(m(q)) == m(q).arithmetic_
↪product(e(p))  # long time (26s on sage.math, 2013)
....:           for q in Partitions(4) )
....:      for p in Partitions(4) )
True
```

```
>>> from sage.all import *
>>> e = SymmetricFunctions(FiniteField(Integer(19))).e()
>>> m = SymmetricFunctions(FiniteField(Integer(19))).m()
>>> all( all( e(p).arithmetic_product(m(q)) == m(q).arithmetic_product(e(p))
↪# long time (26s on sage.math, 2013)
...           for q in Partitions(Integer(4)) )
...      for p in Partitions(Integer(4)) )
True
```

Note

The currently existing implementation of this function is technically unsatisfactory. It distinguishes the case when the base ring is a **Q**-algebra (in which case the arithmetic product can be easily computed using the power sum basis) from the case where it isn't. In the latter, it does a computation using universal coefficients, again distinguishing the case when it is able to compute the "corresponding" basis of the symmetric function algebra over **Q** (using the `corresponding_basis_over` hack) from the case when it isn't (in which case it transforms everything into the Schur basis, which is slow).

bernstein_creation_operator(*n*)

Return the image of `self` under the n-th Bernstein creation operator.

Let n be an integer. The n-th Bernstein creation operator $\mathbf{B}_n$ is defined as the endomorphism of the space Sym of symmetric functions which sends every f to

$$\sum_{i \geq 0} (-1)^i h_{n+i} e_i^{\perp},$$

where usual notations are in place (h stands for the complete homogeneous symmetric functions, e for the elementary ones, and $e_i^{\perp}$ means skewing (*skew_by()*) by e_i).

This has been studied in [BBSSZ2012], section 2.2, where the following rule is given for computing $\mathbf{B}_n$ on a Schur function: If $(\alpha_1, \alpha_2, \ldots, \alpha_n)$ is an n-tuple of integers (positive or not), then

$$\mathbf{B}_n s_{(\alpha_1, \alpha_2, \ldots, \alpha_n)} = s_{(n, \alpha_1, \alpha_2, \ldots, \alpha_n)}.$$

Here, $s_{(\alpha_1, \alpha_2, \ldots, \alpha_n)}$ is the "Schur function" associated to the n-tuple $(\alpha_1, \alpha_2, \ldots, \alpha_n)$, and defined by literally applying the Jacobi-Trudi identity, i.e., by

$$s_{(\alpha_1, \alpha_2, \ldots, \alpha_n)} = \det\left(\left(h_{\alpha_i - i + j} \right)_{i,j=1,2,\ldots,n} \right).$$

This notion of a Schur function clearly extends the classical notion of Schur function corresponding to a partition, but is easily reduced to the latter (in fact, for any n-tuple α of integers, one easily sees that s_α is either 0 or minus-plus a Schur function corresponding to a partition; and it is easy to determine which of these is the case and find the partition by a combinatorial algorithm).

EXAMPLES:

Let us check that what this method computes agrees with the definition:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: e = Sym.e()
sage: h = Sym.h()
sage: s = Sym.s()
sage: def bernstein_creation_by_def(n, f):
....:     # `n`-th Bernstein creation operator applied to `f`
....:     # computed according to its definition.
....:     res = f.parent().zero()
....:     if not f:
....:         return res
....:     max_degree = max(sum(m) for m, c in f)
....:     for i in range(max_degree + 1):
....:         if n + i >= 0:
....:             res += (-1) ** i * h[n + i] * f.skew_by(e[i])
....:     return res
sage: all( bernstein_creation_by_def(n, s[l]) == s[l].bernstein_creation_
↪operator(n)
....:      for n in range(-2, 3) for l in Partitions(4) )
True
sage: all( bernstein_creation_by_def(n, s[l]) == s[l].bernstein_creation_
↪operator(n)
....:      for n in range(-3, 4) for l in Partitions(3) )
True
sage: all( bernstein_creation_by_def(n, e[l]) == e[l].bernstein_creation_
↪operator(n)
....:      for n in range(-3, 4) for k in range(3) for l in Partitions(k) )
True
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> e = Sym.e()
>>> h = Sym.h()
>>> s = Sym.s()
>>> def bernstein_creation_by_def(n, f):
...     # `n`-th Bernstein creation operator applied to `f`
...     # computed according to its definition.
...     res = f.parent().zero()
...     if not f:
...         return res
...     max_degree = max(sum(m) for m, c in f)
...     for i in range(max_degree + Integer(1)):
...         if n + i >= Integer(0):
...             res += (-Integer(1)) ** i * h[n + i] * f.skew_by(e[i])
...     return res
>>> all( bernstein_creation_by_def(n, s[l]) == s[l].bernstein_creation_
↪operator(n)
...      for n in range(-Integer(2), Integer(3)) for l in␣
↪Partitions(Integer(4)) )
True
>>> all( bernstein_creation_by_def(n, s[l]) == s[l].bernstein_creation_
↪operator(n)
...      for n in range(-Integer(3), Integer(4)) for l in␣
```

(continues on next page)

(continued from previous page)

```
↪Partitions(Integer(3)) )
True
>>> all( bernstein_creation_by_def(n, e[l]) == e[l].bernstein_creation_
↪operator(n)
...       for n in range(-Integer(3), Integer(4)) for k in range(Integer(3))␣
↪for l in Partitions(k) )
True
```

Some examples:

```
sage: s[3,2].bernstein_creation_operator(3)
s[3, 3, 2]
sage: s[3,2].bernstein_creation_operator(1)
-s[2, 2, 2]
sage: h[3,2].bernstein_creation_operator(-2)
h[2, 1]
sage: h[3,2].bernstein_creation_operator(-1)
h[2, 1, 1] - h[2, 2] - h[3, 1]
sage: h[3,2].bernstein_creation_operator(0)
-h[3, 1, 1] + h[3, 2]
sage: h[3,2].bernstein_creation_operator(1)
-h[2, 2, 2] + h[3, 2, 1]
sage: h[3,2].bernstein_creation_operator(2)
-h[3, 3, 1] + h[4, 2, 1]
```

```
>>> from sage.all import *
>>> s[Integer(3),Integer(2)].bernstein_creation_operator(Integer(3))
s[3, 3, 2]
>>> s[Integer(3),Integer(2)].bernstein_creation_operator(Integer(1))
-s[2, 2, 2]
>>> h[Integer(3),Integer(2)].bernstein_creation_operator(-Integer(2))
h[2, 1]
>>> h[Integer(3),Integer(2)].bernstein_creation_operator(-Integer(1))
h[2, 1, 1] - h[2, 2] - h[3, 1]
>>> h[Integer(3),Integer(2)].bernstein_creation_operator(Integer(0))
-h[3, 1, 1] + h[3, 2]
>>> h[Integer(3),Integer(2)].bernstein_creation_operator(Integer(1))
-h[2, 2, 2] + h[3, 2, 1]
>>> h[Integer(3),Integer(2)].bernstein_creation_operator(Integer(2))
-h[3, 3, 1] + h[4, 2, 1]
```

character_to_frobenius_image(*n*)

Interpret `self` as a GL_n character and then take the Frobenius image of this character of the permutation matrices S_n which naturally sit inside of GL_n.

To know the value of this character at a permutation of cycle structure ρ the symmetric function `self` is evaluated at the eigenvalues of a permutation of cycle structure ρ. The Frobenius image is then defined as $\sum_{\rho \vdash n} f[\Xi_\rho] p_\rho / z_\rho$.

See also

eval_at_permutation_roots()

INPUT:

- `n` – nonnegative integer to interpret `self` as a character of GL_n

OUTPUT: a symmetric function of degree `n`

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: s([1,1]).character_to_frobenius_image(5)
s[3, 1, 1] + s[4, 1]
sage: s([2,1]).character_to_frobenius_image(5)
s[2, 2, 1] + 2*s[3, 1, 1] + 2*s[3, 2] + 3*s[4, 1] + s[5]
sage: s([2,2,2]).character_to_frobenius_image(3)
s[3]
sage: s([2,2,2]).character_to_frobenius_image(4)
s[2, 2] + 2*s[3, 1] + 2*s[4]
sage: s([2,2,2]).character_to_frobenius_image(5)
2*s[2, 2, 1] + s[3, 1, 1] + 4*s[3, 2] + 3*s[4, 1] + 2*s[5]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> s([Integer(1),Integer(1)]).character_to_frobenius_image(Integer(5))
s[3, 1, 1] + s[4, 1]
>>> s([Integer(2),Integer(1)]).character_to_frobenius_image(Integer(5))
s[2, 2, 1] + 2*s[3, 1, 1] + 2*s[3, 2] + 3*s[4, 1] + s[5]
>>> s([Integer(2),Integer(2),Integer(2)]).character_to_frobenius_
↪image(Integer(3))
s[3]
>>> s([Integer(2),Integer(2),Integer(2)]).character_to_frobenius_
↪image(Integer(4))
s[2, 2] + 2*s[3, 1] + 2*s[4]
>>> s([Integer(2),Integer(2),Integer(2)]).character_to_frobenius_
↪image(Integer(5))
2*s[2, 2, 1] + s[3, 1, 1] + 4*s[3, 2] + 3*s[4, 1] + 2*s[5]
```

degree()

Return the degree of `self` (which is defined to be 0 for the zero element).

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: z = s([4]) + s([2,1]) + s([1,1,1]) + s([1]) + 3
sage: z.degree()
4
sage: s(1).degree()
0
sage: s(0).degree()
0
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> z = s([Integer(4)]) + s([Integer(2),Integer(1)]) + s([Integer(1),
↪Integer(1),Integer(1)]) + s([Integer(1)]) + Integer(3)
>>> z.degree()
4
>>> s(Integer(1)).degree()
0
>>> s(Integer(0)).degree()
0
```

derivative_with_respect_to_p1(*n=1*)

Return the symmetric function obtained by taking the derivative of `self` with respect to the power-sum symmetric function p_1 when the expansion of `self` in the power-sum basis is considered as a polynomial in p_k's (with $k \geq 1$).

This is the same as skewing `self` by the first power-sum symmetric function p_1.

INPUT:

- `n` – (default: 1) nonnegative integer which determines which power of the derivative is taken

EXAMPLES:

```
sage: p = SymmetricFunctions(QQ).p()
sage: a = p([1,1,1])
sage: a.derivative_with_respect_to_p1()
3*p[1, 1]
sage: a.derivative_with_respect_to_p1(1)
3*p[1, 1]
sage: a.derivative_with_respect_to_p1(2)
6*p[1]
sage: a.derivative_with_respect_to_p1(3)
6*p[]
```

```
>>> from sage.all import *
>>> p = SymmetricFunctions(QQ).p()
>>> a = p([Integer(1),Integer(1),Integer(1)])
>>> a.derivative_with_respect_to_p1()
3*p[1, 1]
>>> a.derivative_with_respect_to_p1(Integer(1))
3*p[1, 1]
>>> a.derivative_with_respect_to_p1(Integer(2))
6*p[1]
>>> a.derivative_with_respect_to_p1(Integer(3))
6*p[]
```

```
sage: s = SymmetricFunctions(QQ).s()
sage: s([3]).derivative_with_respect_to_p1()
s[2]
sage: s([2,1]).derivative_with_respect_to_p1()
s[1, 1] + s[2]
sage: s([1,1,1]).derivative_with_respect_to_p1()
s[1, 1]
```

(continues on next page)

(continued from previous page)

```
sage: s(0).derivative_with_respect_to_p1()
0
sage: s(1).derivative_with_respect_to_p1()
0
sage: s([1]).derivative_with_respect_to_p1()
s[]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> s([Integer(3)]).derivative_with_respect_to_p1()
s[2]
>>> s([Integer(2),Integer(1)]).derivative_with_respect_to_p1()
s[1, 1] + s[2]
>>> s([Integer(1),Integer(1),Integer(1)]).derivative_with_respect_to_p1()
s[1, 1]
>>> s(Integer(0)).derivative_with_respect_to_p1()
0
>>> s(Integer(1)).derivative_with_respect_to_p1()
0
>>> s([Integer(1)]).derivative_with_respect_to_p1()
s[]
```

Let us check that taking the derivative with respect to `p[1]` is equivalent to skewing by `p[1]`:

```
sage: p1 = s([1])
sage: all( s(lam).derivative_with_respect_to_p1()
....:      == s(lam).skew_by(p1) for lam in Partitions(4) )
True
```

```
>>> from sage.all import *
>>> p1 = s([Integer(1)])
>>> all( s(lam).derivative_with_respect_to_p1()
...      == s(lam).skew_by(p1) for lam in Partitions(Integer(4)) )
True
```

eval_at_permutation_roots(*rho*)

Evaluate at eigenvalues of a permutation matrix.

Evaluate a symmetric function at the eigenvalues of a permutation matrix whose cycle structure is `rho`. This computation is computed by coercing to the power sum basis where the value may be computed on the generators.

This function evaluates an element at the roots of unity

$$\Xi_{\rho_1}, \Xi_{\rho_2}, \ldots, \Xi_{\rho_\ell}$$

where

$$\Xi_m = 1, \zeta_m, \zeta_m^2, \ldots, \zeta_m^{m-1}$$

and ζ_m is an m root of unity. These roots of unity represent the eigenvalues of permutation matrix with cycle structure ρ.

INPUT:

- `rho` – a partition or a list of nonnegative integers

OUTPUT: an element of the base ring

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: s([3,3]).eval_at_permutation_roots([6])
0
sage: s([3,3]).eval_at_permutation_roots([3])
1
sage: s([3,3]).eval_at_permutation_roots([1])
0
sage: s([3,3]).eval_at_permutation_roots([3,3])
4
sage: s([3,3]).eval_at_permutation_roots([1,1,1,1,1])
175
sage: (s[1]+s[2]+s[3]).eval_at_permutation_roots([3,2])
2
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> s([Integer(3),Integer(3)]).eval_at_permutation_roots([Integer(6)])
0
>>> s([Integer(3),Integer(3)]).eval_at_permutation_roots([Integer(3)])
1
>>> s([Integer(3),Integer(3)]).eval_at_permutation_roots([Integer(1)])
0
>>> s([Integer(3),Integer(3)]).eval_at_permutation_roots([Integer(3),
↪Integer(3)])
4
>>> s([Integer(3),Integer(3)]).eval_at_permutation_roots([Integer(1),
↪Integer(1),Integer(1),Integer(1),Integer(1)])
175
>>> (s[Integer(1)]+s[Integer(2)]+s[Integer(3)]).eval_at_permutation_
↪roots([Integer(3),Integer(2)])
2
```

expand(*n*, *alphabet='x'*)

Expand the symmetric function `self` as a symmetric polynomial in `n` variables.

INPUT:

- `n` – nonnegative integer
- `alphabet` – (default: `'x'`) a variable for the expansion

OUTPUT:

A monomial expansion of `self` in the n variables labelled `x0`, `x1`, ..., `x{n-1}` (or just `x` if $n = 1$), where `x` is `alphabet`.

EXAMPLES:

```
sage: J = SymmetricFunctions(QQ).jack(t=2).J()
sage: J([2,1]).expand(3)
4*x0^2*x1 + 4*x0*x1^2 + 4*x0^2*x2 + 6*x0*x1*x2 + 4*x1^2*x2 + 4*x0*x2^2 +␣
```

(continues on next page)

(continued from previous page)

```
↪4*x1*x2^2
sage: (2*J([2])).expand(0)
0
sage: (3*J([])).expand(0)
3
```

```
>>> from sage.all import *
>>> J = SymmetricFunctions(QQ).jack(t=Integer(2)).J()
>>> J([Integer(2),Integer(1)]).expand(Integer(3))
4*x0^2*x1 + 4*x0*x1^2 + 4*x0^2*x2 + 6*x0*x1*x2 + 4*x1^2*x2 + 4*x0*x2^2 +␣
↪4*x1*x2^2
>>> (Integer(2)*J([Integer(2)])).expand(Integer(0))
0
>>> (Integer(3)*J([])).expand(Integer(0))
3
```

exponential_specialization(*t=None*, *q=1*)

Return the exponential specialization of a symmetric function (when $q = 1$), or the q-exponential specialization (when $q \neq 1$).

The *exponential specialization* ex at t is a K-algebra homomorphism from the K-algebra of symmetric functions to another K-algebra R. It is defined whenever the base ring K is a $\mathbf{Q}$-algebra and t is an element of R. The easiest way to define it is by specifying its values on the powersum symmetric functions to be $p_1 = t$ and $p_n = 0$ for $n > 1$. Equivalently, on the homogeneous functions it is given by $ex(h_n) = t^n/n!$; see Proposition 7.8.4 of [EnumComb2].

By analogy, the q-exponential specialization is a K-algebra homomorphism from the K-algebra of symmetric functions to another K-algebra R that depends on two elements t and q of R for which the elements $1-q^i$ for all positive integers i are invertible. It can be defined by specifying its values on the complete homogeneous symmetric functions to be

$$ex_q(h_n) = t^n/[n]_q!,$$

where $[n]_q!$ is the q-factorial. Equivalently, for $q \neq 1$ and a homogeneous symmetric function f of degree n, we have

$$ex_q(f) = (1-q)^n t^n ps_q(f),$$

where $ps_q(f)$ is the stable principal specialization of f (see *principal_specialization()*). (See (7.29) in [EnumComb2].)

The limit of ex_q as $q \to 1$ is ex.

INPUT:

- `t` – (default: `None`) the value to use for t; the default is to create a ring of polynomials in `t`
- `q` – (default: 1) the value to use for q. If `q` is `None`, then a ring (or fraction field) of polynomials in `q` is created.

EXAMPLES:

```
sage: m = SymmetricFunctions(QQ).m()
sage: (m[2,1]+m[1,1]).exponential_specialization()
1/2*t^2
sage: (m[2,1]+m[1,1]).exponential_specialization(q=1)
```

(continues on next page)

(continued from previous page)

```
1/2*t^2
sage: m[1,1].exponential_specialization(q=None)
(q/(q + 1))*t^2
sage: Qq = PolynomialRing(QQ, "q"); q = Qq.gen()
sage: m[1,1].exponential_specialization(q=q)
(q/(q + 1))*t^2
sage: Qt = PolynomialRing(QQ, "t"); t = Qt.gen()
sage: m[1,1].exponential_specialization(t=t)
1/2*t^2

factor()

Return the factorization of this symmetric function.

EXAMPLES:

```
sage: e = SymmetricFunctions(QQ).e()
sage: factor((5*e[3] + e[2,1] + e[1])*(7*e[2] + e[5,1]))
(e[1] + e[2, 1] + 5*e[3]) * (7*e[2] + e[5, 1])

sage: R.<x, y> = QQ[]
sage: s = SymmetricFunctions(R.fraction_field()).s()
sage: factor((s[3] + x*s[2,1] + 1)*(3*y*s[2] + s[4,1] + x*y))
(-s[] - x*s[2, 1] - s[3]) * (-x*y*s[] - 3*y*s[2] - s[4, 1])
```

```
>>> from sage.all import *
>>> e = SymmetricFunctions(QQ).e()
>>> factor((Integer(5)*e[Integer(3)] + e[Integer(2),Integer(1)] +␣
↪e[Integer(1)])*(Integer(7)*e[Integer(2)] + e[Integer(5),Integer(1)]))
(e[1] + e[2, 1] + 5*e[3]) * (7*e[2] + e[5, 1])

>>> R = QQ['x, y']; (x, y,) = R._first_ngens(2)
>>> s = SymmetricFunctions(R.fraction_field()).s()
>>> factor((s[Integer(3)] + x*s[Integer(2),Integer(1)] +␣
↪Integer(1))*(Integer(3)*y*s[Integer(2)] + s[Integer(4),Integer(1)] + x*y))
(-s[] - x*s[2, 1] - s[3]) * (-x*y*s[] - 3*y*s[2] - s[4, 1])
```

gcd(*other*)

Return the greatest common divisor with `other`.

INPUT:

- `other` – the other symmetric function

EXAMPLES:

```
sage: e = SymmetricFunctions(ZZ).e()
sage: A = 5*e[3] + e[2,1] + e[1]
sage: B = 7*e[2] + e[5,1]
sage: C = 3*e[1,1] + e[2]
sage: gcd(A*B^2, B*C)
7*e[2] + e[5, 1]

sage: p = SymmetricFunctions(ZZ).p()
sage: gcd(e[2,1], p[1,1]-p[2])
e[2]
sage: gcd(p[2,1], p[3,2]-p[2,1])
p[2]
```

```
>>> from sage.all import *
>>> e = SymmetricFunctions(ZZ).e()
>>> A = Integer(5)*e[Integer(3)] + e[Integer(2),Integer(1)] + e[Integer(1)]
>>> B = Integer(7)*e[Integer(2)] + e[Integer(5),Integer(1)]
>>> C = Integer(3)*e[Integer(1),Integer(1)] + e[Integer(2)]
>>> gcd(A*B**Integer(2), B*C)
7*e[2] + e[5, 1]

>>> p = SymmetricFunctions(ZZ).p()
>>> gcd(e[Integer(2),Integer(1)], p[Integer(1),Integer(1)]-p[Integer(2)])
e[2]
>>> gcd(p[Integer(2),Integer(1)], p[Integer(3),Integer(2)]-p[Integer(2),
↪Integer(1)])
p[2]
```

hl_creation_operator(*nu*, *t=None*)

This is the vertex operator that generalizes Jing's operator.

It is a linear operator that raises the degree by $|\nu|$. This creation operator is a t-analogue of multiplication by `s(nu)`.

See also

Proposition 5 in [SZ2001].

INPUT:

- `nu` – a partition or a list of integers
- `t` – (default: `None`, in which case `t` is used) an element of the base ring

REFERENCES:

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ['t']).s()
sage: s([2]).hl_creation_operator([3,2])
s[3, 2, 2] + t*s[3, 3, 1] + t*s[4, 2, 1] + t^2*s[4, 3] + t^2*s[5, 2]

sage: Sym = SymmetricFunctions(FractionField(QQ['t']))
sage: HLQp = Sym.hall_littlewood().Qp()
sage: s = Sym.s()

inner_plethysm(*x*)

Return the inner plethysm of `self` with `x`.

Whenever R is a $\mathbf{Q}$-algebra, and f and g are two symmetric functions over R such that the constant term of f is zero, the inner plethysm of f with g is a symmetric function over R, and the degree of this symmetric function

is the same as the degree of g. We will denote the inner plethysm of f with g by $f\{g\}$ (in contrast to the notation of outer plethysm which is generally denoted $f[g]$); in Sage syntax, it is `f.inner_plethysm(g)`.

First we describe the axiomatic definition of the operation; see below for a representation-theoretic interpretation. In the following equations, we denote the outer product (i.e., the standard product on the ring of symmetric functions, `product()`) by $\cdot$ and the Kronecker product (*`itensor()`*) by $*$).

$$(f+g)\{h\} = f\{h\} + g\{h\}$$
$$(f \cdot g)\{h\} = (f\{h\}) * (g\{h\})$$
$$p_k\{f+g\} = p_k\{f\} + p_k\{g\}$$

where p_k is the k-th power-sum symmetric function for every $k > 0$.

Let σ be a permutation of cycle type μ and let μ^k be the cycle type of σ^k. Then,

$$p_k\{p_\mu/z_\mu\} = \sum_{\nu:\nu^k=\mu} p_\nu/z_\nu$$

Since $(p_\mu/z_\mu)_\mu$ is a basis for the symmetric functions, these four formulas define the symmetric function operation $f\{g\}$ for any symmetric functions f and g (where f has constant term 0) by expanding f in the power sum basis and g in the dual basis p_μ/z_μ.

See also

`itensor()`, `sage.combinat.partition.partition_power`, *`plethysm()`*

This operation admits a representation-theoretic interpretation in the case where f is a Schur function s_λ and g is a homogeneous degree n symmetric function with nonnegative integral coefficients in the Schur basis. The symmetric function $f\{g\}$ is the Frobenius image of the S_n-representation constructed as follows.

The assumptions on g imply that g is the Frobenius image of a representation ρ of the symmetric group S_n:

$$\rho : S_n \to GL_N.$$

If the degree N of this representation is greater than or equal to the number of parts of λ, then f, which denotes s_λ, corresponds to the character of some irreducible GL_N-representation, say

$$\sigma : GL_N \to GL_M.$$

The composition $\sigma \circ \rho : S_n \to GL_M$ is a representation of S_n whose Frobenius image is precisely $f\{g\}$.

If N is less than the number of parts of λ, then $f\{g\}$ is 0 by definition.

When f is a symmetric function with constant term $\neq 0$, the inner plethysm $f\{g\}$ isn't well-defined in the ring of symmetric functions. Indeed, it is not clear how to define $1\{g\}$. The most sensible way to get around this probably is defining it as the infinite sum $h_0 + h_1 + h_2 + \cdots$ (where h_i means the i-th complete homogeneous symmetric function) in the completion of this ring with respect to its grading. This is how [SchaThi1994] defines $1\{g\}$. The present method, however, sets it to be the sum of h_i over all i for which the i-th homogeneous component of g is nonzero. This is rather a hack than a reasonable definition. Use with caution!

Note

If a symmetric function g is written in the form $g = g_0 + g_1 + g_2 + \cdots$ with each g_i homogeneous of degree i, then $f\{g\} = f\{g_0\} + f\{g_1\} + f\{g_2\} + \cdots$ for every f with constant term 0. But in general, inner plethysm is not linear in the second variable.

REFERENCES:

INPUT:

- `x` – element of the ring of symmetric functions over the same base ring as `self`

OUTPUT: an element of symmetric functions in the parent of `self`

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)

inner_tensor(*x*)

alias of *itensor()*.

internal_coproduct()

Return the inner coproduct of `self` in the basis of `self`.

The inner coproduct (also known as the Kronecker coproduct, as the internal coproduct, or as the second comultiplication on the ring of symmetric functions) is a ring homomorphism $\Delta^\times$ from the ring of symmetric functions to the tensor product (over the base ring) of this ring with itself. It is uniquely characterized by the formula

$$\Delta^\times(h_n) = \sum_{\lambda \vdash n} s_\lambda \otimes s_\lambda = \sum_{\lambda \vdash n} h_\lambda \otimes m_\lambda = \sum_{\lambda \vdash n} m_\lambda \otimes h_\lambda,$$

where $\lambda \vdash n$ means λ is a partition of n, and n is any nonnegative integer. It also satisfies

$$\Delta^\times(p_n) = p_n \otimes p_n$$

for any positive integer n. If the base ring is a $\mathbf{Q}$-algebra, it also satisfies

$$\Delta^\times(h_n) = \sum_{\lambda \vdash n} z_\lambda^{-1} p_\lambda \otimes p_\lambda,$$

where

$$z_\lambda = \prod_{i=1}^{\infty} i^{m_i(\lambda)} m_i(\lambda)!$$

with $m_i(\lambda)$ meaning the number of appearances of i in λ (see *zee()*).

The method *kronecker_coproduct()* is a synonym of *internal_coproduct()*.

EXAMPLES:

```
sage: s = SymmetricFunctions(ZZ).s()
sage: a = s([2,1])
sage: a.internal_coproduct()
s[1, 1, 1] # s[2, 1] + s[2, 1] # s[1, 1, 1] + s[2, 1] # s[2, 1] + s[2, 1] #␣
↪s[3] + s[3] # s[2, 1]

sage: e = SymmetricFunctions(QQ).e()
sage: b = e([2])
sage: b.internal_coproduct()
e[1, 1] # e[2] + e[2] # e[1, 1] - 2*e[2] # e[2]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(ZZ).s()
>>> a = s([Integer(2),Integer(1)])
>>> a.internal_coproduct()
s[1, 1, 1] # s[2, 1] + s[2, 1] # s[1, 1, 1] + s[2, 1] # s[2, 1] + s[2, 1] #␣
↪s[3] + s[3] # s[2, 1]
```

(continues on next page)

(continued from previous page)

```
>>> e = SymmetricFunctions(QQ).e()
>>> b = e([Integer(2)])
>>> b.internal_coproduct()
e[1, 1] # e[2] + e[2] # e[1, 1] - 2*e[2] # e[2]
```

The internal coproduct is adjoint to the internal product with respect to the Hall inner product: Any three symmetric functions f, g and h satisfy $\langle f * g, h\rangle = \sum_i \langle f, h'_i\rangle \langle g, h''_i\rangle$, where we write $\Delta^\times(h)$ as $\sum_i h'_i \otimes h''_i$. Let us check this in degree 4:

```
sage: e = SymmetricFunctions(FiniteField(29)).e()
sage: s = SymmetricFunctions(FiniteField(29)).s()
sage: m = SymmetricFunctions(FiniteField(29)).m()
sage: def tensor_incopr(f, g, h):  # computes \sum_i \left< f, h'_i \right> \
↪left< g, h''_i \right>
....:     result = h.base_ring().zero()
....:     for partition_pair, coeff in h.internal_coproduct():
....:         result += coeff * h.parent()(f).scalar(partition_pair[0]) * h.
↪parent()(g).scalar(partition_pair[1])
....:     return result
sage: all( all( all( tensor_incopr(e[u], s[v], m[w]) == (e[u].itensor(s[v])).
↪scalar(m[w])  # long time (10s on sage.math, 2013)
....:                for w in Partitions(5) )
....:           for v in Partitions(2) )
....:      for u in Partitions(3) )
True
```

```
>>> from sage.all import *
>>> e = SymmetricFunctions(FiniteField(Integer(29))).e()
>>> s = SymmetricFunctions(FiniteField(Integer(29))).s()
>>> m = SymmetricFunctions(FiniteField(Integer(29))).m()
>>> def tensor_incopr(f, g, h):  # computes \sum_i \left< f, h'_i \right> \
↪left< g, h''_i \right>
...     result = h.base_ring().zero()
...     for partition_pair, coeff in h.internal_coproduct():
...         result += coeff * h.parent()(f).scalar(partition_
↪pair[Integer(0)]) * h.parent()(g).scalar(partition_pair[Integer(1)])
...     return result
>>> all( all( all( tensor_incopr(e[u], s[v], m[w]) == (e[u].itensor(s[v])).
↪scalar(m[w])  # long time (10s on sage.math, 2013)
...                for w in Partitions(Integer(5)) )
...           for v in Partitions(Integer(2)) )
...      for u in Partitions(Integer(3)) )
True
```

Let us check the formulas for $\Delta^\times(h_n)$ and $\Delta^\times(p_n)$ given in the description of this method:

```
sage: e = SymmetricFunctions(QQ).e()
sage: p = SymmetricFunctions(QQ).p()
sage: h = SymmetricFunctions(QQ).h()
sage: s = SymmetricFunctions(QQ).s()
sage: all( s(h([n])).internal_coproduct() == sum([tensor([s(lam), s(lam)])␣
↪for lam in Partitions(n)])
```

(continues on next page)

(continued from previous page)

```
....:       for n in range(6) )
True
sage: all( h([n]).internal_coproduct() == sum([tensor([h(lam), h(m(lam))])␣
↪for lam in Partitions(n)])
....:       for n in range(6) )
True
sage: all( factorial(n) * h([n]).internal_coproduct()
....:       == sum([lam.conjugacy_class_size() * tensor([h(p(lam)), h(p(lam))])
....:               for lam in Partitions(n)])
....:       for n in range(6) )
True
```

```
>>> from sage.all import *
>>> e = SymmetricFunctions(QQ).e()
>>> p = SymmetricFunctions(QQ).p()
>>> h = SymmetricFunctions(QQ).h()
>>> s = SymmetricFunctions(QQ).s()
>>> all( s(h([n])).internal_coproduct() == sum([tensor([s(lam), s(lam)]) for␣
↪lam in Partitions(n)])
...       for n in range(Integer(6)) )
True
>>> all( h([n]).internal_coproduct() == sum([tensor([h(lam), h(m(lam))]) for␣
↪lam in Partitions(n)])
...       for n in range(Integer(6)) )
True
>>> all( factorial(n) * h([n]).internal_coproduct()
...       == sum([lam.conjugacy_class_size() * tensor([h(p(lam)), h(p(lam))])
...               for lam in Partitions(n)])
...       for n in range(Integer(6)) )
True
```

internal_product(*x*)

alias of *itensor()*.

is_schur_positive()

Return `True` if and only if `self` is Schur positive.

If s is the space of Schur functions over `self`'s base ring, then this is the same as `self._is_positive(s)`.

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: a = s([2,1]) + s([3])
sage: a.is_schur_positive()
True
sage: a = s([2,1]) - s([3])
sage: a.is_schur_positive()
False
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> a = s([Integer(2),Integer(1)]) + s([Integer(3)])
>>> a.is_schur_positive()
```

(continues on next page)

(continued from previous page)

```
True
>>> a = s([Integer(2),Integer(1)]) - s([Integer(3)])
>>> a.is_schur_positive()
False
```

```
sage: QQx = QQ['x']
sage: s = SymmetricFunctions(QQx).s()
sage: x = QQx.gen()
sage: a = (1+x)*s([2,1])
sage: a.is_schur_positive()
True
sage: a = (1-x)*s([2,1])
sage: a.is_schur_positive()
False
sage: s(0).is_schur_positive()
True
sage: s(1+x).is_schur_positive()
True
```

```
>>> from sage.all import *
>>> QQx = QQ['x']
>>> s = SymmetricFunctions(QQx).s()
>>> x = QQx.gen()
>>> a = (Integer(1)+x)*s([Integer(2),Integer(1)])
>>> a.is_schur_positive()
True
>>> a = (Integer(1)-x)*s([Integer(2),Integer(1)])
>>> a.is_schur_positive()
False
>>> s(Integer(0)).is_schur_positive()
True
>>> s(Integer(1)+x).is_schur_positive()
True
```

itensor(x)

Return the internal (tensor) product of `self` and `x` in the basis of `self`.

The internal tensor product can be defined as the linear extension of the definition on power sums $p_\lambda * p_\mu = \delta_{\lambda,\mu} z_\lambda p_\lambda$, where $z_\lambda = (1^{r_1} r_1!)(2^{r_2} r_2!) \cdots$ for $\lambda = (1^{r_1} 2^{r_2} \cdots)$ and where $*$ denotes the internal tensor product. The internal tensor product is also known as the Kronecker product, or as the second multiplication on the ring of symmetric functions.

Note that the internal product of any two homogeneous symmetric functions of equal degrees is a homogeneous symmetric function of the same degree. On the other hand, the internal product of two homogeneous symmetric functions of distinct degrees is 0.

Note

The internal product is sometimes referred to as "inner product" in the literature, but unfortunately this name is shared by a different operation, namely the Hall inner product (see *scalar()*).

INPUT:

- `x` – element of the ring of symmetric functions over the same base ring as `self`

OUTPUT:

- the internal product of `self` with `x` (an element of the ring of symmetric functions in the same basis as `self`)

The methods *itensor()*, *internal_product()*, *kronecker_product()*, *inner_tensor()* are all synonyms.

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: a = s([2,1])
sage: b = s([3])
sage: a.itensor(b)
s[2, 1]
sage: c = s([3,2,1])
sage: c.itensor(c)
s[1, 1, 1, 1, 1, 1] + 2*s[2, 1, 1, 1, 1] + 3*s[2, 2, 1, 1] + 2*s[2, 2, 2]
 + 4*s[3, 1, 1, 1] + 5*s[3, 2, 1] + 2*s[3, 3] + 4*s[4, 1, 1]
 + 3*s[4, 2] + 2*s[5, 1] + s[6]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> a = s([Integer(2),Integer(1)])
>>> b = s([Integer(3)])
>>> a.itensor(b)
s[2, 1]
>>> c = s([Integer(3),Integer(2),Integer(1)])
>>> c.itensor(c)
s[1, 1, 1, 1, 1, 1] + 2*s[2, 1, 1, 1, 1] + 3*s[2, 2, 1, 1] + 2*s[2, 2, 2]
 + 4*s[3, 1, 1, 1] + 5*s[3, 2, 1] + 2*s[3, 3] + 4*s[4, 1, 1]
 + 3*s[4, 2] + 2*s[5, 1] + s[6]
```

There are few quantitative results pertaining to Kronecker products in general, which makes their computation so difficult. Let us test a few of them in different bases.

The Kronecker product of any homogeneous symmetric function f of degree n with the n-th complete homogeneous symmetric function `h[n]` (a.k.a. `s[n]`) is f:

```
sage: h = SymmetricFunctions(ZZ).h()
sage: all( h([5]).itensor(h(p)) == h(p) for p in Partitions(5) )
True
```

```
>>> from sage.all import *
>>> h = SymmetricFunctions(ZZ).h()
>>> all( h([Integer(5)]).itensor(h(p)) == h(p) for p in␣
↪Partitions(Integer(5)) )
True
```

The Kronecker product of a Schur function s_λ with the n-th elementary symmetric function `e[n]`, where $n = |\lambda|$, is $s_{\lambda'}$ (where λ' is the conjugate partition of λ):

```
sage: F = CyclotomicField(12)
sage: s = SymmetricFunctions(F).s()
```

(continues on next page)

(continued from previous page)

```
sage: e = SymmetricFunctions(F).e()
sage: all( e([5]).itensor(s(p)) == s(p.conjugate()) for p in Partitions(5) )
True
```

```
>>> from sage.all import *
>>> F = CyclotomicField(Integer(12))
>>> s = SymmetricFunctions(F).s()
>>> e = SymmetricFunctions(F).e()
>>> all( e([Integer(5)]).itensor(s(p)) == s(p.conjugate()) for p in␣
↪Partitions(Integer(5)) )
True
```

The Kronecker product is commutative:

```
sage: e = SymmetricFunctions(FiniteField(19)).e()
sage: m = SymmetricFunctions(FiniteField(19)).m()
sage: all( all( e(p).itensor(m(q)) == m(q).itensor(e(p)) for q in␣
↪Partitions(4) )
....:      for p in Partitions(4) )
True

sage: F = FractionField(QQ['q','t'])
sage: mq = SymmetricFunctions(F).macdonald().Q()
sage: mh = SymmetricFunctions(F).macdonald().H()
sage: all( all( mq(p).itensor(mh(r)) == mh(r).itensor(mq(p))    # long time
....:           for r in Partitions(4) )
....:      for p in Partitions(3) )
True
```

```
>>> from sage.all import *
>>> e = SymmetricFunctions(FiniteField(Integer(19))).e()
>>> m = SymmetricFunctions(FiniteField(Integer(19))).m()
>>> all( all( e(p).itensor(m(q)) == m(q).itensor(e(p)) for q in␣
↪Partitions(Integer(4)) )
...      for p in Partitions(Integer(4)) )
True

>>> F = FractionField(QQ['q','t'])
>>> mq = SymmetricFunctions(F).macdonald().Q()
>>> mh = SymmetricFunctions(F).macdonald().H()
>>> all( all( mq(p).itensor(mh(r)) == mh(r).itensor(mq(p))    # long time
...           for r in Partitions(Integer(4)) )
...      for p in Partitions(Integer(3)) )
True
```

Let us check (on examples) Proposition 5.2 of Gelfand, Krob, Lascoux, Leclerc, Retakh, Thibon, "Noncommutative symmetric functions", arXiv hep-th/9407124, for $r = 2$:

```
sage: e = SymmetricFunctions(FiniteField(29)).e()
sage: s = SymmetricFunctions(FiniteField(29)).s()
sage: m = SymmetricFunctions(FiniteField(29)).m()
sage: def tensor_copr(u, v, w):  # computes \mu ((u \otimes v) * \Delta(w))␣
```

(continues on next page)

(continued from previous page)

```
↪with
....:                               # * meaning Kronecker product and \mu␣
↪meaning the
....:                               # usual multiplication.
....:     result = w.parent().zero()
....:     for partition_pair, coeff in w.coproduct():
....:         result += coeff * w.parent()(u).itensor(partition_pair[0]) * w.
↪parent()(v).itensor(partition_pair[1])
....:     return result
sage: all( all( all( tensor_copr(e[u], s[v], m[w])   # long time
....:                == (e[u] * s[v]).itensor(m[w])
....:                for w in Partitions(5) )
....:           for v in Partitions(2) )
....:      for u in Partitions(3) )
True
```

```
>>> from sage.all import *
>>> e = SymmetricFunctions(FiniteField(Integer(29))).e()
>>> s = SymmetricFunctions(FiniteField(Integer(29))).s()
>>> m = SymmetricFunctions(FiniteField(Integer(29))).m()
>>> def tensor_copr(u, v, w):  # computes \mu ((u \otimes v) * \Delta(w)) with
...                            # * meaning Kronecker product and \mu meaning␣
↪the
...                            # usual multiplication.
...     result = w.parent().zero()
...     for partition_pair, coeff in w.coproduct():
...         result += coeff * w.parent()(u).itensor(partition_
↪pair[Integer(0)]) * w.parent()(v).itensor(partition_pair[Integer(1)])
...     return result
>>> all( all( all( tensor_copr(e[u], s[v], m[w])   # long time
...                == (e[u] * s[v]).itensor(m[w])
...                for w in Partitions(Integer(5)) )
...           for v in Partitions(Integer(2)) )
...      for u in Partitions(Integer(3)) )
True
```

Some examples from Briand, Orellana, Rosas, "The stability of the Kronecker products of Schur functions." arXiv 0907.4652:

```
sage: s = SymmetricFunctions(ZZ).s()
sage: s[2,2].itensor(s[2,2])
s[1, 1, 1, 1] + s[2, 2] + s[4]
sage: s[3,2].itensor(s[3,2])
s[2, 1, 1, 1] + s[2, 2, 1] + s[3, 1, 1] + s[3, 2] + s[4, 1] + s[5]
sage: s[4,2].itensor(s[4,2])
s[2, 2, 2] + s[3, 1, 1, 1] + 2*s[3, 2, 1] + s[4, 1, 1] + 2*s[4, 2] + s[5, 1]␣
↪+ s[6]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(ZZ).s()
>>> s[Integer(2),Integer(2)].itensor(s[Integer(2),Integer(2)])
s[1, 1, 1, 1] + s[2, 2] + s[4]
```

(continues on next page)

(continued from previous page)

```
>>> s[Integer(3),Integer(2)].itensor(s[Integer(3),Integer(2)])
s[2, 1, 1, 1] + s[2, 2, 1] + s[3, 1, 1] + s[3, 2] + s[4, 1] + s[5]
>>> s[Integer(4),Integer(2)].itensor(s[Integer(4),Integer(2)])
s[2, 2, 2] + s[3, 1, 1, 1] + 2*s[3, 2, 1] + s[4, 1, 1] + 2*s[4, 2] + s[5, 1]␣
↪+ s[6]
```

An example from p. 220 of Thibon, "Hopf algebras of symmetric functions and tensor products of symmetric group representations", International Journal of Algebra and Computation, 1991:

```
sage: s = SymmetricFunctions(QQbar).s()
sage: s[2,1].itensor(s[2,1])
s[1, 1, 1] + s[2, 1] + s[3]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQbar).s()
>>> s[Integer(2),Integer(1)].itensor(s[Integer(2),Integer(1)])
s[1, 1, 1] + s[2, 1] + s[3]
```

Note

The currently existing implementation of this function is technically unsatisfactory. It distinguishes the case when the base ring is a **Q**-algebra (in which case the Kronecker product can be easily computed using the power sum basis) from the case where it isn't. In the latter, it does a computation using universal coefficients, again distinguishing the case when it is able to compute the "corresponding" basis of the symmetric function algebra over **Q** (using the `corresponding_basis_over` hack) from the case when it isn't (in which case it transforms everything into the Schur basis, which is slow).

kronecker_coproduct()

alias of *internal_coproduct()*.

kronecker_product(*x*)

alias of *itensor()*.

left_padded_kronecker_product(*x*)

Return the left-padded Kronecker product of `self` and `x` in the basis of `self`.

The left-padded Kronecker product is a bilinear map mapping two symmetric functions to another, not necessarily preserving degree. It can be defined as follows: Let $*$ denote the Kronecker product (*itensor()*) on the space of symmetric functions. For any partitions α, β, γ, let $g_{\alpha,\beta}^{\gamma}$ denote the coefficient of the complete homogeneous symmetric function h_γ in the Kronecker product $h_\alpha * h_\beta$. For every partition $\lambda = (\lambda_1, \lambda_2, \lambda_3, \ldots)$ and every integer $n > |\lambda| + \lambda_1$, let $\lambda[n]$ denote the n-completion of λ (this is the partition $(n - |\lambda|, \lambda_1, \lambda_2, \lambda_3, \ldots)$; see *t_completion()*). Then, for any partitions α and β and every integer $n \geq |\alpha| + |\beta| + \alpha_1 + \beta_1$, we can write the Kronecker product $h_{\alpha[n]} * h_{\beta[n]}$ in the form

$$h_{\alpha[n]} * h_{\beta[n]} = \sum_{\gamma} g_{\alpha[n],\beta[n]}^{\gamma[n]} h_{\gamma[n]}$$

with γ ranging over all partitions. The coefficients $g_{\alpha[n],\beta[n]}^{\gamma[n]}$ are independent on n. These coefficients $g_{\alpha[n],\beta[n]}^{\gamma[n]}$ are denoted by $\overline{g}_{\alpha,\beta}^{\gamma}$, and the symmetric function

$$\sum_{\gamma} \overline{g}_{\alpha,\beta}^{\gamma} h_\gamma$$

is said to be the *left-padded Kronecker product* of h_α and h_β. By bilinearity, this extends to a definition of a left-padded Kronecker product of any two symmetric functions.

This notion of left-padded Kronecker product can be lifted to the non-commutative symmetric functions (*left_padded_kronecker_product()*).

Warning

Do not mistake this product for the reduced Kronecker product (*reduced_kronecker_product()*), which uses the Schur functions instead of the complete homogeneous functions in its definition.

INPUT:

- `x` – element of the ring of symmetric functions over the same base ring as `self`

OUTPUT:

- the left-padded Kronecker product of `self` with `x` (an element of the ring of symmetric functions in the same basis as `self`)

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: h = Sym.h()
sage: h[2,1].left_padded_kronecker_product(h[3])
h[1, 1, 1, 1] + h[2, 1] + h[2, 1, 1] + h[2, 1, 1, 1] + h[2, 2, 1] + h[3, 2, 1]
sage: h[2,1].left_padded_kronecker_product(h[1])
h[1, 1, 1] + h[2, 1] + h[2, 1, 1]
sage: h[1].left_padded_kronecker_product(h[2,1])
h[1, 1, 1] + h[2, 1] + h[2, 1, 1]
sage: h[1,1].left_padded_kronecker_product(h[2])
h[1, 1] + 2*h[1, 1, 1] + h[2, 1, 1]
sage: h[1].left_padded_kronecker_product(h[2,1,1])
h[1, 1, 1, 1] + 2*h[2, 1, 1] + h[2, 1, 1, 1]
sage: h[2].left_padded_kronecker_product(h[3])
h[2, 1] + h[2, 1, 1] + h[3, 2]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> h = Sym.h()
>>> h[Integer(2),Integer(1)].left_padded_kronecker_product(h[Integer(3)])
h[1, 1, 1, 1] + h[2, 1] + h[2, 1, 1] + h[2, 1, 1, 1] + h[2, 2, 1] + h[3, 2, 1]
>>> h[Integer(2),Integer(1)].left_padded_kronecker_product(h[Integer(1)])
h[1, 1, 1] + h[2, 1] + h[2, 1, 1]
>>> h[Integer(1)].left_padded_kronecker_product(h[Integer(2),Integer(1)])
h[1, 1, 1] + h[2, 1] + h[2, 1, 1]
>>> h[Integer(1),Integer(1)].left_padded_kronecker_product(h[Integer(2)])
h[1, 1] + 2*h[1, 1, 1] + h[2, 1, 1]
>>> h[Integer(1)].left_padded_kronecker_product(h[Integer(2),Integer(1),
↪Integer(1)])
h[1, 1, 1, 1] + 2*h[2, 1, 1] + h[2, 1, 1, 1]
>>> h[Integer(2)].left_padded_kronecker_product(h[Integer(3)])
h[2, 1] + h[2, 1, 1] + h[3, 2]
```

Taking the left-padded Kronecker product with $1 = h_\emptyset$ is the identity map on the ring of symmetric functions:

```
sage: all( h[Partition([])].left_padded_kronecker_product(h[lam])
....:      == h[lam] for i in range(4)
....:      for lam in Partitions(i) )
True
```

```
>>> from sage.all import *
>>> all( h[Partition([])].left_padded_kronecker_product(h[lam])
...      == h[lam] for i in range(Integer(4))
...      for lam in Partitions(i) )
True
```

Here is a rule for the left-padded Kronecker product of h_1 (this is the same as $h_{(1)}$) with any complete homogeneous function: Let λ be a partition. Then, the left-padded Kronecker product of h_1 and h_λ is $\sum_\mu a_\mu h_\mu$, where the sum runs over all partitions μ, and the coefficient a_μ is defined as the number of ways to obtain μ from λ by one of the following two operations:

- Insert a 1 into λ.
- Subtract 1 from one of the entries of λ (and remove the entry if it thus becomes 0), and insert a 1 into λ.

We check this for partitions of size ≤ 4:

```
sage: def mults1(I):
....:     # Left-padded Kronecker multiplication by h[1].
....:     res = h[I[:] + [1]]
....:     for k in range(len(I)):
....:         I2 = I[:]
....:         if I2[k] == 1:
....:             I2 = I2[:k] + I2[k+1:]
....:         else:
....:             I2[k] -= 1
....:         res += h[sorted(I2 + [1], reverse=True)]
....:     return res
sage: all( mults1(I) == h[1].left_padded_kronecker_product(h[I])
....:                == h[I].left_padded_kronecker_product(h[1])
....:      for i in range(5) for I in Partitions(i) )
True
```

```
>>> from sage.all import *
>>> def mults1(I):
...     # Left-padded Kronecker multiplication by h[1].
...     res = h[I[:] + [Integer(1)]]
...     for k in range(len(I)):
...         I2 = I[:]
...         if I2[k] == Integer(1):
...             I2 = I2[:k] + I2[k+Integer(1):]
...         else:
...             I2[k] -= Integer(1)
...         res += h[sorted(I2 + [Integer(1)], reverse=True)]
...     return res
>>> all( mults1(I) == h[Integer(1)].left_padded_kronecker_product(h[I])
...                == h[I].left_padded_kronecker_product(h[Integer(1)])
...      for i in range(Integer(5)) for I in Partitions(i) )
True
```

The left-padded Kronecker product is commutative:

```
sage: all( h[lam].left_padded_kronecker_product(h[mu])
....:      == h[mu].left_padded_kronecker_product(h[lam])
....:      for lam in Partitions(3) for mu in Partitions(3) )
True
```

```
>>> from sage.all import *
>>> all( h[lam].left_padded_kronecker_product(h[mu])
...      == h[mu].left_padded_kronecker_product(h[lam])
...      for lam in Partitions(Integer(3)) for mu in Partitions(Integer(3)) )
True
```

nabla(*q=None*, *t=None*, *power=1*)

Return the value of the nabla operator applied to `self`.

The eigenvectors of the nabla operator are the Macdonald polynomials in the Ht basis.

If the parameter `power` is an integer then it calculates nabla to that integer. The default value of `power` is 1.

INPUT:

- `q`, `t` – parameters (default: `None`, in which case `q` and `t` are used)
- `power` – (default: `1`) an integer indicating how many times to apply the operator ∇. Negative values of `power` indicate powers of ∇^{-1}.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(FractionField(QQ['q','t']))
sage: p = Sym.power()
sage: p([1,1]).nabla()
-(1/2*q*t-1/2*q-1/2*t-1/2)*p[1, 1] + (1/2*q*t-1/2*q-1/2*t+1/2)*p[2]
sage: p([2,1]).nabla(q=1)
-(t+1)*p[1, 1, 1] + t*p[2, 1]
sage: p([2]).nabla(q=1)*p([1]).nabla(q=1)
-(t+1)*p[1, 1, 1] + t*p[2, 1]
sage: s = Sym.schur()
sage: s([2,1]).nabla()
-(q^3*t+q^2*t^2+q*t^3)*s[1, 1, 1] - (q^2*t+q*t^2)*s[2, 1]
sage: s([1,1,1]).nabla()

```

omega()

Return the image of `self` under the omega automorphism.

The *omega automorphism* is defined to be the unique algebra endomorphism ω of the ring of symmetric functions that satisfies $\omega(e_k) = h_k$ for all positive integers k (where e_k stands for the k-th elementary symmetric function, and h_k stands for the k-th complete homogeneous symmetric function). It furthermore is a Hopf algebra endomorphism and an involution, and it is also known as the *omega involution*. It sends the power-sum symmetric function p_k to $(-1)^{k-1}p_k$ for every positive integer k.

The images of some bases under the omega automorphism are given by

$$\omega(e_\lambda) = h_\lambda, \qquad \omega(h_\lambda) = e_\lambda, \qquad \omega(p_\lambda) = (-1)^{|\lambda|-\ell(\lambda)} p_\lambda, \qquad \omega(s_\lambda) = s_{\lambda'},$$

where λ is any partition, where $\ell(\lambda)$ denotes the length (*length()*) of the partition λ, where λ' denotes the conjugate partition (*conjugate()*) of λ, and where the usual notations for bases are used (e = elementary, h = complete homogeneous, p = powersum, s = Schur).

The default implementation converts to the Schur basis, then performs the automorphism and changes back.

omega_involution() is a synonym for the *omega()* method.

EXAMPLES:

```
sage: J = SymmetricFunctions(QQ).jack(t=1).P()
sage: a = J([2,1]) + J([1,1,1])
sage: a.omega()
JackP[2, 1] + JackP[3]
sage: J(0).omega()
0
sage: J(1).omega()
JackP[]
```

```
>>> from sage.all import *
>>> J = SymmetricFunctions(QQ).jack(t=Integer(1)).P()
>>> a = J([Integer(2),Integer(1)]) + J([Integer(1),Integer(1),Integer(1)])
>>> a.omega()
JackP[2, 1] + JackP[3]
>>> J(Integer(0)).omega()
0
>>> J(Integer(1)).omega()
JackP[]
```

The forgotten symmetric functions are the images of the monomial symmetric functions under omega:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: m = Sym.m()
sage: f = Sym.f()
sage: all( f(lam) == m(lam).omega() for lam in Partitions(3) )
True
sage: all( m(lam) == f(lam).omega() for lam in Partitions(3) )
True
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> m = Sym.m()
>>> f = Sym.f()
>>> all( f(lam) == m(lam).omega() for lam in Partitions(Integer(3)) )
True
>>> all( m(lam) == f(lam).omega() for lam in Partitions(Integer(3)) )
True
```

omega_involution()

alias of *omega()*.

omega_qt(*q=None*, *t=None*)

Return the image of `self` under the q,t-deformed omega automorphism which sends p_k to $(-1)^{k-1} \cdot \frac{1-q^k}{1-t^k} \cdot p_k$ for all positive integers k.

In general, this is well-defined outside of the powersum basis only if the base ring is a $\mathbf{Q}$-algebra.

If $q = t$, then this is the omega automorphism (*omega()*).

INPUT:

- `q`, `t` – parameters (default: `None`, in which case `'q'` and `'t'` are used)

EXAMPLES:

```
sage: QQqt = QQ['q,t'].fraction_field()
sage: q,t = QQqt.gens()
sage: p = SymmetricFunctions(QQqt).p()
sage: p[5].omega_qt()
-((q^5-1)/(-t^5+1))*p[5]
sage: p[5].omega_qt(q,t)
-((q^5-1)/(-t^5+1))*p[5]
sage: p([2]).omega_qt(q,t)
((q^2-1)/(-t^2+1))*p[2]
```

(continues on next page)

(continued from previous page)

```
sage: p([2,1]).omega_qt(q,t)
-((q^3-q^2-q+1)/(t^3-t^2-t+1))*p[2, 1]
sage: p([3,2]).omega_qt(5,q)

>>> s = Sym.schur()
>>> s(S([Integer(1),Integer(1)]).omega_qt())
s[2]
```

plethysm(*x*, *include=None*, *exclude=None*)

Return the outer plethysm of `self` with `x`.

This is implemented only over base rings which are **Q**-algebras. (To compute outer plethysms over general binomial rings, change bases to the fraction field.)

The outer plethysm of f with g is commonly denoted by $f[g]$ or by $f \circ g$. It is an algebra map in f, but not (generally) in g.

By default, the degree one elements are taken to be the variables returned by `variable_names_recursive` on the base ring of `self`. If the base ring does not implement this method, there are no default degree one elements. This setting can be modified by specifying the `include` and `exclude` keywords.

In particular, algebraic or symbolic elements are not inferred to be degree one variables:

```
sage: p = SymmetricFunctions(QQbar).p()
sage: p[2](QQbar(sqrt(-1)))
I
sage: p = SymmetricFunctions(SR).p()
sage: p[2](SR("x") * p[2])
x*p[4]
```

```
>>> from sage.all import *
>>> p = SymmetricFunctions(QQbar).p()
>>> p[Integer(2)](QQbar(sqrt(-Integer(1))))
I
>>> p = SymmetricFunctions(SR).p()
>>> p[Integer(2)](SR("x") * p[Integer(2)])
x*p[4]
```

INPUT:

- `x` – a symmetric function over the same base ring as `self`
- `include` – list of variables to be treated as degree one elements instead of the default degree one elements
- `exclude` – list of variables to be excluded from the default degree one elements

OUTPUT:

An element in the parent of `x` or the base ring R of `self` when `x` is in R.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: s = Sym.s()
sage: h = Sym.h()
sage: h3h2 = h[3](h[2]); h3h2
h[2, 2, 2] - 2*h[3, 2, 1] + h[3, 3] + h[4, 1, 1] - h[5, 1] + h[6]
sage: s(h3h2)
s[2, 2, 2] + s[4, 2] + s[6]
```

(continues on next page)

(continued from previous page)

```
sage: p = Sym.p()
sage: p3s21 = p[3](s[2,1]); p3s21
s[2, 2, 2, 1, 1, 1] - s[2, 2, 2, 2, 1] - s[3, 2, 1, 1, 1, 1]
 + s[3, 2, 2, 2] + s[3, 3, 1, 1, 1] - s[3, 3, 2, 1] + 2*s[3, 3, 3]
 + s[4, 1, 1, 1, 1, 1] - s[4, 3, 2] + s[4, 4, 1] - s[5, 1, 1, 1, 1]
 + s[5, 2, 2] - s[5, 4] + s[6, 1, 1, 1] - s[6, 2, 1] + s[6, 3]
sage: p(p3s21)
1/3*p[3, 3, 3] - 1/3*p[9]
sage: e = Sym.e()
sage: e[3](e[2])
e[3, 3] + e[4, 1, 1] - 2*e[4, 2] - e[5, 1] + e[6]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> s = Sym.s()
>>> h = Sym.h()
>>> h3h2 = h[Integer(3)](h[Integer(2)]); h3h2
h[2, 2, 2] - 2*h[3, 2, 1] + h[3, 3] + h[4, 1, 1] - h[5, 1] + h[6]
>>> s(h3h2)
s[2, 2, 2] + s[4, 2] + s[6]
>>> p = Sym.p()
>>> p3s21 = p[Integer(3)](s[Integer(2),Integer(1)]); p3s21
s[2, 2, 2, 1, 1, 1] - s[2, 2, 2, 2, 1] - s[3, 2, 1, 1, 1, 1]
 + s[3, 2, 2, 2] + s[3, 3, 1, 1, 1] - s[3, 3, 2, 1] + 2*s[3, 3, 3]
 + s[4, 1, 1, 1, 1, 1] - s[4, 3, 2] + s[4, 4, 1] - s[5, 1, 1, 1, 1]
 + s[5, 2, 2] - s[5, 4] + s[6, 1, 1, 1] - s[6, 2, 1] + s[6, 3]
>>> p(p3s21)
1/3*p[3, 3, 3] - 1/3*p[9]
>>> e = Sym.e()
>>> e[Integer(3)](e[Integer(2)])
e[3, 3] + e[4, 1, 1] - 2*e[4, 2] - e[5, 1] + e[6]
```

Note that the output is in the basis of the input `x`:

```
sage: s[2,1](h[3])
h[4, 3, 2] - h[4, 4, 1] - h[5, 2, 2] + h[5, 3, 1] + h[5, 4]
 + h[6, 2, 1] - 2*h[6, 3] - h[7, 1, 1] + h[7, 2] + h[8, 1] - h[9]

sage: h[2,1](s[3])
s[4, 3, 2] + s[4, 4, 1] + s[5, 2, 2] + s[5, 3, 1] + s[5, 4]
 + s[6, 2, 1] + 2*s[6, 3] + 2*s[7, 2] + s[8, 1] + s[9]
```

```
>>> from sage.all import *
>>> s[Integer(2),Integer(1)](h[Integer(3)])
h[4, 3, 2] - h[4, 4, 1] - h[5, 2, 2] + h[5, 3, 1] + h[5, 4]
 + h[6, 2, 1] - 2*h[6, 3] - h[7, 1, 1] + h[7, 2] + h[8, 1] - h[9]

>>> h[Integer(2),Integer(1)](s[Integer(3)])
s[4, 3, 2] + s[4, 4, 1] + s[5, 2, 2] + s[5, 3, 1] + s[5, 4]
 + s[6, 2, 1] + 2*s[6, 3] + 2*s[7, 2] + s[8, 1] + s[9]
```

Examples over a polynomial ring:

```
sage: R.<t> = QQ[]
sage: s = SymmetricFunctions(R).s()
sage: a = s([3])
sage: f = t * s([2])
sage: a(f)
t^3*s[2, 2, 2] + t^3*s[4, 2] + t^3*s[6]
sage: f(a)
t*s[4, 2] + t*s[6]
sage: s(0).plethysm(s[1])
0
sage: s(1).plethysm(s[1])
s[]
sage: s(1).plethysm(s(0))
s[]
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> s = SymmetricFunctions(R).s()
>>> a = s([Integer(3)])
>>> f = t * s([Integer(2)])
>>> a(f)
t^3*s[2, 2, 2] + t^3*s[4, 2] + t^3*s[6]
>>> f(a)
t*s[4, 2] + t*s[6]
>>> s(Integer(0)).plethysm(s[Integer(1)])
0
>>> s(Integer(1)).plethysm(s[Integer(1)])
s[]
>>> s(Integer(1)).plethysm(s(Integer(0)))
s[]
```

When `x` is a constant, then it is returned as an element of the base ring:

```
sage: s[3](2).parent() is R
True
```

```
>>> from sage.all import *
>>> s[Integer(3)](Integer(2)).parent() is R
True
```

Sage also handles plethysm of tensor products of symmetric functions:

```
sage: s = SymmetricFunctions(QQ).s()
sage: X = tensor([s[1],s[[]]])
sage: Y = tensor([s[[]],s[1]])
sage: s[1,1,1](X+Y)
s[] # s[1, 1, 1] + s[1] # s[1, 1] + s[1, 1] # s[1] + s[1, 1, 1] # s[]
sage: s[1,1,1](X*Y)
s[1, 1, 1] # s[3] + s[2, 1] # s[2, 1] + s[3] # s[1, 1, 1]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
```

(continues on next page)

(continued from previous page)

```
>>> X = tensor([s[Integer(1)],s[[]]])
>>> Y = tensor([s[[]],s[Integer(1)]])
>>> s[Integer(1),Integer(1),Integer(1)](X+Y)
s[] # s[1, 1, 1] + s[1] # s[1, 1] + s[1, 1] # s[1] + s[1, 1, 1] # s[]
>>> s[Integer(1),Integer(1),Integer(1)](X*Y)
s[1, 1, 1] # s[3] + s[2, 1] # s[2, 1] + s[3] # s[1, 1, 1]
```

One can use this to work with symmetric functions in two sets of commuting variables. For example, we verify the Cauchy identities (in degree 5):

```
sage: m = SymmetricFunctions(QQ).m()
sage: P5 = Partitions(5)
sage: sum(s[mu](X)*s[mu](Y) for mu in P5) == sum(m[mu](X)*h[mu](Y) for mu in␣
↪P5)
True
sage: sum(s[mu](X)*s[mu.conjugate()](Y) for mu in P5) ==␣
↪sum(m[mu](X)*e[mu](Y) for mu in P5)
True
```

```
>>> from sage.all import *
>>> m = SymmetricFunctions(QQ).m()
>>> P5 = Partitions(Integer(5))
>>> sum(s[mu](X)*s[mu](Y) for mu in P5) == sum(m[mu](X)*h[mu](Y) for mu in P5)
True
>>> sum(s[mu](X)*s[mu.conjugate()](Y) for mu in P5) == sum(m[mu](X)*e[mu](Y)␣
↪for mu in P5)
True
```

Sage can also do the plethysm with an element in the completion:

```
sage: s = SymmetricFunctions(QQ).s()
sage: L = LazySymmetricFunctions(s)
sage: f = s[2,1]
sage: g = L(s[1]) / (1 - L(s[1])); g
s[1] + (s[1,1]+s[2]) + (s[1,1,1]+2*s[2,1]+s[3])
 + (s[1,1,1,1]+3*s[2,1,1]+2*s[2,2]+3*s[3,1]+s[4])
 + (s[1,1,1,1,1]+4*s[2,1,1,1]+5*s[2,2,1]+6*s[3,1,1]+5*s[3,2]+4*s[4,1]+s[5])
 + ... + O^8
sage: fog = f(g)
sage: fog[:8]
[s[2, 1],
 s[1, 1, 1, 1] + 3*s[2, 1, 1] + 2*s[2, 2] + 3*s[3, 1] + s[4],
 2*s[1, 1, 1, 1, 1] + 8*s[2, 1, 1, 1] + 10*s[2, 2, 1]
 + 12*s[3, 1, 1] + 10*s[3, 2] + 8*s[4, 1] + 2*s[5],
 3*s[1, 1, 1, 1, 1, 1] + 17*s[2, 1, 1, 1, 1] + 30*s[2, 2, 1, 1]
 + 16*s[2, 2, 2] + 33*s[3, 1, 1, 1] + 54*s[3, 2, 1] + 16*s[3, 3]
 + 33*s[4, 1, 1] + 30*s[4, 2] + 17*s[5, 1] + 3*s[6],
 5*s[1, 1, 1, 1, 1, 1, 1] + 30*s[2, 1, 1, 1, 1, 1] + 70*s[2, 2, 1, 1, 1]
 + 70*s[2, 2, 2, 1] + 75*s[3, 1, 1, 1, 1] + 175*s[3, 2, 1, 1]
 + 105*s[3, 2, 2] + 105*s[3, 3, 1] + 100*s[4, 1, 1, 1] + 175*s[4, 2, 1]
 + 70*s[4, 3] + 75*s[5, 1, 1] + 70*s[5, 2] + 30*s[6, 1] + 5*s[7]]
sage: parent(fog)
```

Todo

The implementation of plethysm in `sage.data_structures.stream.Stream_plethysm` seems to be faster. This should be investigated.

principal_specialization(*n=+Infinity*, *q=None*)

Return the principal specialization of a symmetric function.

The *principal specialization* of order n at q is the ring homomorphism $ps_{n,q}$ from the ring of symmetric functions to another commutative ring R given by $x_i \mapsto q^{i-1}$ for $i \in \{1, \ldots, n\}$ and $x_i \mapsto 0$ for $i > n$. Here, q is a given element of R, and we assume that the variables of our symmetric functions are $x_1, x_2, x_3, \ldots$. (To be more precise, $ps_{n,q}$ is a K-algebra homomorphism, where K is the base ring.) See Section 7.8 of [EnumComb2].

The *stable principal specialization* at q is the ring homomorphism ps_q from the ring of symmetric functions to another commutative ring R given by $x_i \mapsto q^{i-1}$ for all i. This is well-defined only if the resulting infinite sums converge; thus, in particular, setting $q = 1$ in the stable principal specialization is an invalid operation.

INPUT:

- n – (default: infinity) a nonnegative integer or infinity, specifying whether to compute the principal specialization of order n or the stable principal specialization.
- q – (default: None) the value to use for q; the default is to create a ring of polynomials in q (or a field of rational functions in q) over the given coefficient ring.

EXAMPLES:

```
sage: m = SymmetricFunctions(QQ).m()
sage: x = m[1,1]
sage: x.principal_specialization(3)
q^3 + q^2 + q
```

```
>>> from sage.all import *
>>> m = SymmetricFunctions(QQ).m()
>>> x = m[Integer(1),Integer(1)]
>>> x.principal_specialization(Integer(3))
q^3 + q^2 + q
```

By default we return a rational function in q. Sometimes it is better to obtain an element of the symbolic ring:

```
sage: h = SymmetricFunctions(QQ).h()
sage: (h[3]+h[2]).principal_specialization(q=var("q"))                    #␣
↪needs sage.symbolic
1/((q^2 - 1)*(q - 1)) - 1/((q^3 - 1)*(q^2 - 1)*(q - 1))
```

```
>>> from sage.all import *
>>> h = SymmetricFunctions(QQ).h()
>>> (h[Integer(3)]+h[Integer(2)]).principal_specialization(q=var("q"))       ␣
↪              # needs sage.symbolic
1/((q^2 - 1)*(q - 1)) - 1/((q^3 - 1)*(q^2 - 1)*(q - 1))
```

In case q is in the base ring, it must be passed explicitly:

```
sage: R = QQ['q,t']
sage: Ht = SymmetricFunctions(R).macdonald().Ht()
sage: Ht[2].principal_specialization()
Traceback (most recent call last):
...
ValueError: the variable q is in the base ring, pass it explicitly

sage: Ht[2].principal_specialization(q=R("q"))
(q^2 + 1)/(q^3 - q^2 - q + 1)
```

```
>>> from sage.all import *
>>> R = QQ['q,t']
>>> Ht = SymmetricFunctions(R).macdonald().Ht()
>>> Ht[Integer(2)].principal_specialization()
Traceback (most recent call last):
...
ValueError: the variable q is in the base ring, pass it explicitly

>>> Ht[Integer(2)].principal_specialization(q=R("q"))
(q^2 + 1)/(q^3 - q^2 - q + 1)
```

Note that the principal specialization can be obtained as a plethysm:

```
sage: R = QQ['q'].fraction_field()
sage: s = SymmetricFunctions(R).s()
sage: one = s.one()
sage: q = R("q")
sage: f = s[3,2,2]
sage: f.principal_specialization(q=q) == f(one/(1-q)).coefficient([])
True
sage: f.principal_specialization(n=4, q=q) == f(one*(1-q^4)/(1-q)).
↪coefficient([])
True
```

```
>>> from sage.all import *
>>> R = QQ['q'].fraction_field()
>>> s = SymmetricFunctions(R).s()
>>> one = s.one()
>>> q = R("q")
>>> f = s[Integer(3),Integer(2),Integer(2)]
>>> f.principal_specialization(q=q) == f(one/(Integer(1)-q)).coefficient([])
True
>>> f.principal_specialization(n=Integer(4), q=q) == f(one*(Integer(1)-
↪q**Integer(4))/(Integer(1)-q)).coefficient([])
True
```

reduced_kronecker_product(*x*)

Return the reduced Kronecker product of `self` and `x` in the basis of `self`.

The reduced Kronecker product is a bilinear map mapping two symmetric functions to another, not necessarily preserving degree. It can be defined as follows: Let $*$ denote the Kronecker product (*itensor()*) on the space of symmetric functions. For any partitions α, β, γ, let $g_{\alpha,\beta}^{\gamma}$ denote the coefficient of the Schur function s_γ in the Kronecker product $s_\alpha * s_\beta$ (this is called a Kronecker coefficient). For every partition $\lambda = (\lambda_1, \lambda_2, \lambda_3, \ldots)$ and every integer $n > |\lambda| + \lambda_1$, let $\lambda[n]$ denote the n-completion of λ (this is the partition $(n - |\lambda|, \lambda_1, \lambda_2, \lambda_3, \ldots)$; see *t_completion()*). Then, Theorem 1.2 of [BOR2009] shows that for any partitions α and β and every integer $n \geq |\alpha| + |\beta| + \alpha_1 + \beta_1$, we can write the Kronecker product $s_{\alpha[n]} * s_{\beta[n]}$ in the form

$$s_{\alpha[n]} * s_{\beta[n]} = \sum_{\gamma} g_{\alpha[n],\beta[n]}^{\gamma[n]} s_{\gamma[n]}$$

with γ ranging over all partitions. The coefficients $g_{\alpha[n],\beta[n]}^{\gamma[n]}$ are independent on n. These coefficients $g_{\alpha[n],\beta[n]}^{\gamma[n]}$ are denoted by $\overline{g}_{\alpha,\beta}^{\gamma}$, and the symmetric function

$$\sum_{\gamma} \overline{g}_{\alpha,\beta}^{\gamma} s_\gamma$$

is said to be the *reduced Kronecker product* of s_α and s_β. By bilinearity, this extends to a definition of a reduced Kronecker product of any two symmetric functions.

The definition of the reduced Kronecker product goes back to Murnaghan, and has recently been studied in [BOR2009], [BdVO2012] and other places (our notation $\overline{g}_{\alpha,\beta}^{\gamma}$ appears in these two sources).

INPUT:

- `x` – element of the ring of symmetric functions over the same base ring as `self`

OUTPUT:

- the reduced Kronecker product of `self` with `x` (an element of the ring of symmetric functions in the same basis as `self`)

EXAMPLES:

The example from page 2 of [BOR2009]:

```
sage: Sym = SymmetricFunctions(QQ)
sage: s = Sym.schur()
sage: s[2].reduced_kronecker_product(s[2])
s[] + s[1] + s[1, 1] + s[1, 1, 1] + 2*s[2] + 2*s[2, 1] + s[2, 2] + s[3] + s[3,
↪ 1] + s[4]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> s = Sym.schur()
>>> s[Integer(2)].reduced_kronecker_product(s[Integer(2)])
s[] + s[1] + s[1, 1] + s[1, 1, 1] + 2*s[2] + 2*s[2, 1] + s[2, 2] + s[3] + s[3,
↪ 1] + s[4]
```

Taking the reduced Kronecker product with $1 = s_\emptyset$ is the identity map on the ring of symmetric functions:

```
sage: all( s[Partition([])].reduced_kronecker_product(s[lam])
....:       == s[lam] for i in range(4)
....:       for lam in Partitions(i) )
True
```

```
>>> from sage.all import *
>>> all( s[Partition([])].reduced_kronecker_product(s[lam])
...       == s[lam] for i in range(Integer(4))
...       for lam in Partitions(i) )
True
```

While reduced Kronecker products are hard to compute in general, there is a rule for taking reduced Kronecker products with s_1. Namely, for every partition λ, the reduced Kronecker product of s_λ with s_1 is $\sum_\mu a_\mu s_\mu$, where the sum runs over all partitions μ, and the coefficient a_μ is defined as the number of ways to obtain μ from λ by one of the following three operations:

- Add an addable cell (*addable_cells()*) to λ.
- Remove a removable cell (*removable_cells()*) from λ.
- First remove a removable cell from λ, then add an addable cell to the resulting Young diagram.

This is, in fact, Proposition 5.15 of [CO2010] in an elementary wording. We check this for partitions of size ≤ 4:

```
sage: def mults1(lam):
....:     # Reduced Kronecker multiplication by s[1], according
....:     # to [CO2010]_.
....:     res = s.zero()
....:     for mu in lam.up_list():
....:         res += s(mu)
....:     for mu in lam.down_list():
....:         res += s(mu)
....:         for nu in mu.up_list():
```

(continues on next page)

(continued from previous page)

```
....:             res += s(nu)
....:     return res
sage: all( mults1(lam) == s[1].reduced_kronecker_product(s[lam])
....:      for i in range(5) for lam in Partitions(i) )
True
```

```
>>> from sage.all import *
>>> def mults1(lam):
...     # Reduced Kronecker multiplication by s[1], according
...     # to [CO2010]_.
...     res = s.zero()
...     for mu in lam.up_list():
...         res += s(mu)
...     for mu in lam.down_list():
...         res += s(mu)
...         for nu in mu.up_list():
...             res += s(nu)
...     return res
>>> all( mults1(lam) == s[Integer(1)].reduced_kronecker_product(s[lam])
...      for i in range(Integer(5)) for lam in Partitions(i) )
True
```

Here is the example on page 3 of Christian Gutschwager's arXiv 0912.4411v3:

```
sage: s[1,1].reduced_kronecker_product(s[2])
s[1] + 2*s[1, 1] + s[1, 1, 1] + s[2] + 2*s[2, 1] + s[2, 1, 1] + s[3] + s[3, 1]
```

```
>>> from sage.all import *
>>> s[Integer(1),Integer(1)].reduced_kronecker_product(s[Integer(2)])
s[1] + 2*s[1, 1] + s[1, 1, 1] + s[2] + 2*s[2, 1] + s[2, 1, 1] + s[3] + s[3, 1]
```

Example 39 from F. D. Murnaghan, "The analysis of the Kronecker product of irreducible representations of the symmetric group", American Journal of Mathematics, Vol. 60, No. 3, Jul. 1938:

```
sage: s[3].reduced_kronecker_product(s[2,1])
s[1] + 2*s[1, 1] + 2*s[1, 1, 1] + s[1, 1, 1, 1] + 2*s[2] + 5*s[2, 1] + 4*s[2,␣
↪1, 1]
+ s[2, 1, 1, 1] + 3*s[2, 2] + 2*s[2, 2, 1] + 2*s[3] + 5*s[3, 1] + 3*s[3, 1, 1]
+ 3*s[3, 2] + s[3, 2, 1] + 2*s[4] + 3*s[4, 1] + s[4, 1, 1] + s[4, 2] + s[5]
+ s[5, 1]
```

```
>>> from sage.all import *
>>> s[Integer(3)].reduced_kronecker_product(s[Integer(2),Integer(1)])
s[1] + 2*s[1, 1] + 2*s[1, 1, 1] + s[1, 1, 1, 1] + 2*s[2] + 5*s[2, 1] + 4*s[2,␣
↪1, 1]
+ s[2, 1, 1, 1] + 3*s[2, 2] + 2*s[2, 2, 1] + 2*s[3] + 5*s[3, 1] + 3*s[3, 1, 1]
+ 3*s[3, 2] + s[3, 2, 1] + 2*s[4] + 3*s[4, 1] + s[4, 1, 1] + s[4, 2] + s[5]
+ s[5, 1]
```

Todo

This implementation of the reduced Kronecker product is painfully slow.

restrict_degree(*d*, *exact=True*)

Return the degree `d` component of `self`.

INPUT:

- `d` – positive integer, degree of the terms to be returned
- `exact` – boolean, if `True`, returns the terms of degree exactly `d`, otherwise returns all terms of degree less than or equal to `d`

OUTPUT: the homogeneous component of `self` of degree `d`

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: z = s([4]) + s([2,1]) + s([1,1,1]) + s([1])
sage: z.restrict_degree(2)
0
sage: z.restrict_degree(1)
s[1]
sage: z.restrict_degree(3)
s[1, 1, 1] + s[2, 1]
sage: z.restrict_degree(3, exact=False)
s[1] + s[1, 1, 1] + s[2, 1]
sage: z.restrict_degree(0)
0
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> z = s([Integer(4)]) + s([Integer(2),Integer(1)]) + s([Integer(1),
↪Integer(1),Integer(1)]) + s([Integer(1)])
>>> z.restrict_degree(Integer(2))
0
>>> z.restrict_degree(Integer(1))
s[1]
>>> z.restrict_degree(Integer(3))
s[1, 1, 1] + s[2, 1]
>>> z.restrict_degree(Integer(3), exact=False)
s[1] + s[1, 1, 1] + s[2, 1]
>>> z.restrict_degree(Integer(0))
0
```

restrict_partition_lengths(*l*, *exact=True*)

Return the terms of `self` labelled by partitions of length `l`.

INPUT:

- `l` – nonnegative integer
- `exact` – boolean, defaulting to `True`

OUTPUT:

- if `True`, returns the terms labelled by partitions of length precisely `l`; otherwise returns all terms labelled by partitions of length less than or equal to `l`

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: z = s([4]) + s([2,1]) + s([1,1,1]) + s([1])
sage: z.restrict_partition_lengths(2)
s[2, 1]
sage: z.restrict_partition_lengths(0)
0
sage: z.restrict_partition_lengths(2, exact = False)
s[1] + s[2, 1] + s[4]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> z = s([Integer(4)]) + s([Integer(2),Integer(1)]) + s([Integer(1),
↪Integer(1),Integer(1)]) + s([Integer(1)])
>>> z.restrict_partition_lengths(Integer(2))
s[2, 1]
>>> z.restrict_partition_lengths(Integer(0))
0
>>> z.restrict_partition_lengths(Integer(2), exact = False)
s[1] + s[2, 1] + s[4]
```

restrict_parts(*n*)

Return the terms of `self` labelled by partitions λ with $\lambda_1 \leq n$.

INPUT:

- `n` – positive integer, to restrict the parts of the partitions of the terms to be returned

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: z = s([4]) + s([2,1]) + s([1,1,1]) + s([1])
sage: z.restrict_parts(2)
s[1] + s[1, 1, 1] + s[2, 1]
sage: z.restrict_parts(1)
s[1] + s[1, 1, 1]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> z = s([Integer(4)]) + s([Integer(2),Integer(1)]) + s([Integer(1),
↪Integer(1),Integer(1)]) + s([Integer(1)])
>>> z.restrict_parts(Integer(2))
s[1] + s[1, 1, 1] + s[2, 1]
>>> z.restrict_parts(Integer(1))
s[1] + s[1, 1, 1]
```

scalar(*x*, *zee=None*)

Return the standard scalar product between `self` and `x`.

This is also known as the "Hall inner product" or the "Hall scalar product".

INPUT:

- x – element of the ring of symmetric functions over the same base ring as self
- zee – an optional function on partitions giving the value for the scalar product between p_μ and p_μ (default: the standard *zee()* function)

This is the default implementation that converts both self and x into either Schur functions (if zee is not specified) or power-sum functions (if zee is specified) and performs the scalar product in that basis.

EXAMPLES:

```
sage: e = SymmetricFunctions(QQ).e()
sage: h = SymmetricFunctions(QQ).h()
sage: m = SymmetricFunctions(QQ).m()
sage: p4 = Partitions(4)
sage: matrix([ [e(a).scalar(h(b)) for a in p4] for b in p4])
[ 0  0  0  0  1]
[ 0  0  0  1  4]
[ 0  0  1  2  6]
[ 0  1  2  5 12]
[ 1  4  6 12 24]
sage: matrix([ [h(a).scalar(e(b)) for a in p4] for b in p4])
[ 0  0  0  0  1]
[ 0  0  0  1  4]
[ 0  0  1  2  6]
[ 0  1  2  5 12]
[ 1  4  6 12 24]
sage: matrix([ [m(a).scalar(e(b)) for a in p4] for b in p4])
[-1  2  1 -3  1]
[ 0  1  0 -2  1]
[ 0  0  1 -2  1]
[ 0  0  0 -1  1]
[ 0  0  0  0  1]
sage: matrix([ [m(a).scalar(h(b)) for a in p4] for b in p4])
[1 0 0 0 0]
[0 1 0 0 0]
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]

sage: p = SymmetricFunctions(QQ).p()
sage: m(p[3,2]).scalar(p[3,2], zee=lambda mu: 2**mu.length())
4
sage: m(p[3,2]).scalar(p[2,2,1], lambda mu: 1)
0
sage: m[3,2].scalar(h[3,2], zee=lambda mu: 2**mu.length())
2/3
```

```
>>> from sage.all import *
>>> e = SymmetricFunctions(QQ).e()
>>> h = SymmetricFunctions(QQ).h()
>>> m = SymmetricFunctions(QQ).m()
>>> p4 = Partitions(Integer(4))
>>> matrix([ [e(a).scalar(h(b)) for a in p4] for b in p4])
[ 0  0  0  0  1]
[ 0  0  0  1  4]
```

(continues on next page)

(continued from previous page)

```
[ 0  0  1  2  6]
[ 0  1  2  5 12]
[ 1  4  6 12 24]

>>> m(p[Integer(3),Integer(2)]).scalar(p[Integer(3),Integer(2)], zee=lambda␣
↪mu: Integer(2)**mu.length())
4
>>> m(p[Integer(3),Integer(2)]).scalar(p[Integer(2),Integer(2),Integer(1)],␣
↪lambda mu: Integer(1))
0
>>> m[Integer(3),Integer(2)].scalar(h[Integer(3),Integer(2)], zee=lambda mu:␣
↪Integer(2)**mu.length())
2/3
```

scalar_hl(*x*, *t=None*)

alias of *scalar_t()*.

scalar_jack(*x*, *t=None*)

Return the Jack-scalar product between `self` and `x`.

This scalar product is defined so that the power sum elements p_μ are orthogonal and $\langle p_\mu, p_\mu \rangle = z_\mu t^{\ell(\mu)}$, where $\ell(\mu)$ denotes the length of μ.

INPUT:

- `x` – element of the ring of symmetric functions over the same base ring as `self`
- `t` – an optional parameter (default: `None` in which case `t` is used)

EXAMPLES:

```
sage: p = SymmetricFunctions(QQ['t']).power()
sage: matrix([[p(mu).scalar_jack(p(nu)) for nu in Partitions(4)] for mu in␣
↪Partitions(4)])
[   4*t      0      0      0      0]
[     0  3*t^2      0      0      0]
```

(continues on next page)

(continued from previous page)

```
[     0      0  8*t^2      0      0]
[     0      0      0  4*t^3      0]
[     0      0      0      0 24*t^4]
sage: matrix([[p(mu).scalar_jack(p(nu),2) for nu in Partitions(4)] for mu in␣
↪Partitions(4)])
[  8   0   0   0   0]
[  0  12   0   0   0]
[  0   0  32   0   0]
[  0   0   0  32   0]
[  0   0   0   0 384]
sage: JQ = SymmetricFunctions(QQ['t'].fraction_field()).jack().Q()
sage: matrix([[JQ(mu).scalar_jack(JQ(nu)) for nu in Partitions(3)] for mu in␣
↪Partitions(3)])
[(1/3*t^2 + 1/2*t + 1/6)/t^3                             0                      ␣
↪     0]
[                          0 (1/2*t + 1)/(t^3 + 1/2*t^2)                      ␣
↪     0]
[                          0                             0       6/(t^3 + 3*t^2␣
↪+ 2*t)]
```

```
>>> from sage.all import *
>>> p = SymmetricFunctions(QQ['t']).power()
>>> matrix([[p(mu).scalar_jack(p(nu)) for nu in Partitions(Integer(4))] for␣
↪mu in Partitions(Integer(4))])
[   4*t      0      0      0      0]
[     0  3*t^2      0      0      0]
[     0      0  8*t^2      0      0]

↪+ 2*t)]
```

scalar_qt(*x*, *q=None*, *t=None*)

Return the q,t-deformed standard Hall-Littlewood scalar product of `self` and `x`.

INPUT:

- `x` – element of the ring of symmetric functions over the same base ring as `self`
- `q`, `t` – parameters (default: `None` in which case `q` and `t` are used)

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: a = s([2,1])
sage: sp = a.scalar_qt(a); factor(sp)
(t - 1)^-3 * (q - 1) * (t^2 + t + 1)^-1 * (q^2*t^2 - q*t^2 + q^2 - 2*q*t + t^
↪2 - q + 1)
sage: sp.parent()
Fraction Field of Multivariate Polynomial Ring in q, t over Rational Field
sage: a.scalar_qt(a,q=0)
(-t^2 - 1)/(t^5 - 2*t^4 + t^3 - t^2 + 2*t - 1)

↪2 - y + 1)
```

scalar_t(*x*, *t=None*)

Return the t-deformed standard Hall-Littlewood scalar product of `self` and `x`.

INPUT:

- `x` – element of the ring of symmetric functions over the same base ring as `self`
- `t` – parameter (default: `None`, in which case `t` is used)

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: a = s([2,1])
sage: sp = a.scalar_t(a); sp
(-t^2 - 1)/(t^5 - 2*t^4 + t^3 - t^2 + 2*t - 1)
sage: sp.parent()
Fraction Field of Univariate Polynomial Ring in t over Rational Field
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> a = s([Integer(2),Integer(1)])
>>> sp = a.scalar_t(a); sp
(-t^2 - 1)/(t^5 - 2*t^4 + t^3 - t^2 + 2*t - 1)
>>> sp.parent()
Fraction Field of Univariate Polynomial Ring in t over Rational Field
```

skew_by(*x*)

Return the result of skewing `self` by `x`. (Skewing by `x` is the endomorphism (as additive group) of the ring of symmetric functions adjoint to multiplication by `x` with respect to the Hall inner product.)

INPUT:

- `x` – element of the ring of symmetric functions over the same base ring as `self`

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: s([3,2]).skew_by(s([2]))
s[2, 1] + s[3]
sage: s([3,2]).skew_by(s([1,1,1]))
0
sage: s([3,2,1]).skew_by(s([2,1]))
s[1, 1, 1] + 2*s[2, 1] + s[3]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> s([Integer(3),Integer(2)]).skew_by(s([Integer(2)]))
```

(continues on next page)

(continued from previous page)

```
s[2, 1] + s[3]
>>> s([Integer(3),Integer(2)]).skew_by(s([Integer(1),Integer(1),Integer(1)]))
0
>>> s([Integer(3),Integer(2),Integer(1)]).skew_by(s([Integer(2),Integer(1)]))
s[1, 1, 1] + 2*s[2, 1] + s[3]
```

```
sage: p = SymmetricFunctions(QQ).powersum()
sage: p([4,3,3,2,2,1]).skew_by(p([2,1]))
4*p[4, 3, 3, 2]
sage: zee = sage.combinat.sf.sfa.zee
sage: zee([4,3,3,2,2,1])/zee([4,3,3,2])
4
sage: s(0).skew_by(s([1]))
0
sage: s(1).skew_by(s([1]))
0
sage: s([]).skew_by(s([]))
s[]
sage: s([]).skew_by(s[1])
0
```

```
>>> from sage.all import *
>>> p = SymmetricFunctions(QQ).powersum()
>>> p([Integer(4),Integer(3),Integer(3),Integer(2),Integer(2),Integer(1)]).
↪skew_by(p([Integer(2),Integer(1)]))
4*p[4, 3, 3, 2]
>>> zee = sage.combinat.sf.sfa.zee
>>> zee([Integer(4),Integer(3),Integer(3),Integer(2),Integer(2),Integer(1)])/
↪zee([Integer(4),Integer(3),Integer(3),Integer(2)])
4
>>> s(Integer(0)).skew_by(s([Integer(1)]))
0
>>> s(Integer(1)).skew_by(s([Integer(1)]))
0
>>> s([]).skew_by(s([]))
s[]
>>> s([]).skew_by(s[Integer(1)])
0
```

theta(a)

Return the image of `self` under the theta endomorphism which sends p_k to $a \cdot p_k$ for every positive integer k.

In general, this is well-defined outside of the powersum basis only if the base ring is a $\mathbf{Q}$-algebra.

INPUT:

- `a` – an element of the base ring

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: s([2,1]).theta(2)
```

(continues on next page)

(continued from previous page)

```
2*s[1, 1, 1] + 6*s[2, 1] + 2*s[3]
sage: p = SymmetricFunctions(QQ).p()
sage: p([2]).theta(2)
2*p[2]
sage: p(0).theta(2)
0
sage: p(1).theta(2)
p[]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> s([Integer(2),Integer(1)]).theta(Integer(2))
2*s[1, 1, 1] + 6*s[2, 1] + 2*s[3]
>>> p = SymmetricFunctions(QQ).p()
>>> p([Integer(2)]).theta(Integer(2))
2*p[2]
>>> p(Integer(0)).theta(Integer(2))
0
>>> p(Integer(1)).theta(Integer(2))
p[]
```

theta_qt(*q=None*, *t=None*)

Return the image of `self` under the q,t-deformed theta endomorphism which sends p_k to $\frac{1-q^k}{1-t^k} \cdot p_k$ for all positive integers k.

In general, this is well-defined outside of the powersum basis only if the base ring is a **Q**-algebra.

INPUT:

- `q`, `t` – parameters (default: `None`, in which case 'q' and 't' are used)

EXAMPLES:

```
sage: QQqt = QQ['q,t'].fraction_field()
sage: q,t = QQqt.gens()
sage: p = SymmetricFunctions(QQqt).p()
sage: p([2]).theta_qt(q,t)
-((q^2-1)/(-t^2+1))*p[2]
sage: p([2,1]).theta_qt(q,t)
((q^3-q^2-q+1)/(t^3-t^2-t+1))*p[2, 1]
sage: p(0).theta_qt(q=1,t=3)
0
sage: p([2,1]).theta_qt(q=2,t=3)
3/16*p[2, 1]
sage: s = p.realization_of().schur()
sage: s([3]).theta_qt(q=0)*(1-t)*(1-t^2)*(1-t^3)
t^3*s[1, 1, 1] + (t^2+t)*s[2, 1] + s[3]
sage: p(1).theta_qt()
p[]
```

```
>>> from sage.all import *
>>> QQqt = QQ['q,t'].fraction_field()
>>> q,t = QQqt.gens()
```

(continues on next page)

(continued from previous page)

```
>>> p = SymmetricFunctions(QQqt).p()
>>> p([Integer(2)]).theta_qt(q,t)
-((q^2-1)/(-t^2+1))*p[2]
>>> p([Integer(2),Integer(1)]).theta_qt(q,t)
((q^3-q^2-q+1)/(t^3-t^2-t+1))*p[2, 1]
>>> p(Integer(0)).theta_qt(q=Integer(1),t=Integer(3))
0
>>> p([Integer(2),Integer(1)]).theta_qt(q=Integer(2),t=Integer(3))
3/16*p[2, 1]
>>> s = p.realization_of().schur()
>>> s([Integer(3)]).theta_qt(q=Integer(0))*(Integer(1)-t)*(Integer(1)-
↪t**Integer(2))*(Integer(1)-t**Integer(3))
t^3*s[1, 1, 1] + (t^2+t)*s[2, 1] + s[3]
>>> p(Integer(1)).theta_qt()
p[]
```

verschiebung(*n*)

Return the image of the symmetric function `self` under the n-th Verschiebung operator.

The n-th Verschiebung operator $\mathbf{V}_n$ is defined to be the unique algebra endomorphism V of the ring of symmetric functions that satisfies $V(h_r) = h_{r/n}$ for every positive integer r divisible by n, and satisfies $V(h_r) = 0$ for every positive integer r not divisible by n. This operator $\mathbf{V}_n$ is a Hopf algebra endomorphism. For every nonnegative integer r with $n \mid r$, it satisfies

$$\mathbf{V}_n(h_r) = h_{r/n}, \quad \mathbf{V}_n(p_r) = np_{r/n}, \quad \mathbf{V}_n(e_r) = (-1)^{r-r/n} e_{r/n}$$

(where h is the complete homogeneous basis, p is the powersum basis, and e is the elementary basis). For every nonnegative integer r with $n \nmid r$, it satisfes

$$\mathbf{V}_n(h_r) = \mathbf{V}_n(p_r) = \mathbf{V}_n(e_r) = 0.$$

The n-th Verschiebung operator is also called the n-th Verschiebung endomorphism. Its name derives from the Verschiebung (German for "shift") endomorphism of the Witt vectors.

The n-th Verschiebung operator is adjoint to the n-th Adams operator (see *adams_operator()* for its definition) with respect to the Hall scalar product (*scalar()*).

The action of the n-th Verschiebung operator on the Schur basis can also be computed explicitly. The following (probably clumsier than necessary) description can be obtained by solving exercise 7.61 in Stanley's [STA].

Let λ be a partition. Let n be a positive integer. If the n-core of λ is nonempty, then $\mathbf{V}_n(s_\lambda) = 0$. Otherwise, the following method computes $\mathbf{V}_n(s_\lambda)$: Write the partition λ in the form $(\lambda_1, \lambda_2, \ldots, \lambda_{ns})$ for some nonnegative integer s. (If n does not divide the length of λ, then this is achieved by adding trailing zeroes to λ.) Set $\beta_i = \lambda_i + ns - i$ for every $s \in \{1, 2, \ldots, ns\}$. Then, $(\beta_1, \beta_2, \ldots, \beta_{ns})$ is a strictly decreasing sequence of nonnegative integers. Stably sort the list $(1, 2, \ldots, ns)$ in order of (weakly) increasing remainder of $-1 - \beta_i$ modulo n. Let ξ be the sign of the permutation that is used for this sorting. Let ψ be the sign of the permutation that is used to stably sort the list $(1, 2, \ldots, ns)$ in order of (weakly) increasing remainder of $i - 1$ modulo n. (Notice that $\psi = (-1)^{n(n-1)s(s-1)/4}$.) Then, $\mathbf{V}_n(s_\lambda) = \xi\psi \prod_{i=0}^{n-1} s_{\lambda^{(i)}}$, where $(\lambda^{(0)}, \lambda^{(1)}, \ldots, \lambda^{(n-1)})$ is the n-quotient of λ.

INPUT:

- `n` – positive integer

OUTPUT:

The result of applying the n-th Verschiebung operator (on the ring of symmetric functions) to `self`.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: p = Sym.p()
sage: h = Sym.h()
sage: s = Sym.s()
sage: m = Sym.m()
sage: s[3].verschiebung(2)
0
sage: s[3].verschiebung(3)
s[1]
sage: p[3].verschiebung(3)
3*p[1]
sage: m[3,2,1].verschiebung(3)
-18*m[1, 1] - 3*m[2]
sage: p[3,2,1].verschiebung(3)
0
sage: h[4].verschiebung(2)
h[2]
sage: p[2].verschiebung(2)
2*p[1]
sage: m[3,2,1].verschiebung(6)
12*m[1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> p = Sym.p()
>>> h = Sym.h()
>>> s = Sym.s()
>>> m = Sym.m()
>>> s[Integer(3)].verschiebung(Integer(2))
0
>>> s[Integer(3)].verschiebung(Integer(3))
s[1]
>>> p[Integer(3)].verschiebung(Integer(3))
3*p[1]
>>> m[Integer(3),Integer(2),Integer(1)].verschiebung(Integer(3))
-18*m[1, 1] - 3*m[2]
>>> p[Integer(3),Integer(2),Integer(1)].verschiebung(Integer(3))
0
>>> h[Integer(4)].verschiebung(Integer(2))
h[2]
>>> p[Integer(2)].verschiebung(Integer(2))
2*p[1]
>>> m[Integer(3),Integer(2),Integer(1)].verschiebung(Integer(6))
12*m[1]
```

The Verschiebung endomorphisms are multiplicative:

```
sage: all( all( s(lam).verschiebung(2) * s(mu).verschiebung(2)
....:           == (s(lam) * s(mu)).verschiebung(2)
....:           for mu in Partitions(4) )
```

(continues on next page)

(continued from previous page)

```
....:       for lam in Partitions(4) )
True
```

```
>>> from sage.all import *
>>> all( all( s(lam).verschiebung(Integer(2)) * s(mu).verschiebung(Integer(2))
...            == (s(lam) * s(mu)).verschiebung(Integer(2))
...            for mu in Partitions(Integer(4)) )
...       for lam in Partitions(Integer(4)) )
True
```

Being Hopf algebra endomorphisms, the Verschiebung operators commute with the antipode:

```
sage: all( p(lam).verschiebung(3).antipode()
....:       == p(lam).antipode().verschiebung(3)
....:       for lam in Partitions(6) )
True
```

```
>>> from sage.all import *
>>> all( p(lam).verschiebung(Integer(3)).antipode()
...       == p(lam).antipode().verschiebung(Integer(3))
...       for lam in Partitions(Integer(6)) )
True
```

Testing the adjointness between the Adams operators $\mathbf{f}_n$ and the Verschiebung operators $\mathbf{V}_n$:

```
sage: Sym = SymmetricFunctions(QQ)
sage: s = Sym.s()
sage: p = Sym.p()
sage: all( all( s(lam).verschiebung(2).scalar(p(mu))
....:           == s(lam).scalar(p(mu).adams_operator(2))
....:           for mu in Partitions(3) )
....:       for lam in Partitions(6) )
True
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> s = Sym.s()
>>> p = Sym.p()
>>> all( all( s(lam).verschiebung(Integer(2)).scalar(p(mu))
...           == s(lam).scalar(p(mu).adams_operator(Integer(2)))
...           for mu in Partitions(Integer(3)) )
...       for lam in Partitions(Integer(6)) )
True
```

class sage.combinat.sf.sfa.**SymmetricFunctionsBases**(*parent_with_realization*)

Bases: Category_realization_of_parent

The category of bases of the ring of symmetric functions.

INPUT:

- `self` – a category of bases for the symmetric functions
- `base` – ring of symmetric functions

class ParentMethods

Bases: object

Eulerian(*n*, *j*, *k=None*)

Return the Eulerian symmetric function $Q_{n,j}$ (with n either an integer or a partition) or $Q_{n,j,k}$ (if the optional argument `k` is specified) in terms of the basis `self`.

It is known that the Eulerian quasisymmetric functions are in fact symmetric functions [SW2010]. For more information, see *QuasiSymmetricFunctions.Fundamental.Eulerian()*, which accepts the same syntax as this method.

INPUT:

- `n` – the nonnegative integer n or a partition
- `j` – the number of excedances
- `k` – (optional) if specified, determines the number of fixed points of the permutations which are being summed over

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: m = Sym.m()
sage: m.Eulerian(3, 1)
4*m[1, 1, 1] + 3*m[2, 1] + 2*m[3]
sage: h = Sym.h()
sage: h.Eulerian(4, 2)
h[2, 2] + h[3, 1] + h[4]
sage: s = Sym.s()
sage: s.Eulerian(5, 2)
s[2, 2, 1] + s[3, 1, 1] + 5*s[3, 2] + 6*s[4, 1] + 6*s[5]
sage: s.Eulerian([2,2,1], 2)
s[2, 2, 1] + s[3, 2] + s[4, 1] + s[5]
sage: s.Eulerian(5, 2, 2)
s[3, 2] + s[4, 1] + s[5]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> m = Sym.m()
>>> m.Eulerian(Integer(3), Integer(1))
4*m[1, 1, 1] + 3*m[2, 1] + 2*m[3]
>>> h = Sym.h()
>>> h.Eulerian(Integer(4), Integer(2))
h[2, 2] + h[3, 1] + h[4]
>>> s = Sym.s()
>>> s.Eulerian(Integer(5), Integer(2))
s[2, 2, 1] + s[3, 1, 1] + 5*s[3, 2] + 6*s[4, 1] + 6*s[5]
>>> s.Eulerian([Integer(2),Integer(2),Integer(1)], Integer(2))
s[2, 2, 1] + s[3, 2] + s[4, 1] + s[5]
>>> s.Eulerian(Integer(5), Integer(2), Integer(2))
s[3, 2] + s[4, 1] + s[5]
```

We check Equation (5.4) in [SW2010]:

```
sage: h.Eulerian([6], 3)
h[3, 2, 1] - h[4, 1, 1] + 2*h[4, 2] + h[5, 1]
sage: s.Eulerian([6], 3)
s[3, 2, 1] + s[3, 3] + 3*s[4, 2] + 3*s[5, 1] + 3*s[6]
```

```
>>> from sage.all import *
>>> h.Eulerian([Integer(6)], Integer(3))
h[3, 2, 1] - h[4, 1, 1] + 2*h[4, 2] + h[5, 1]
>>> s.Eulerian([Integer(6)], Integer(3))
s[3, 2, 1] + s[3, 3] + 3*s[4, 2] + 3*s[5, 1] + 3*s[6]
```

abreu_nigro_g(*H*, *k*, *q='q'*)

Return the Abreu-Nigro $g_{H,k}(x;q)$ symmetric function for the Hessenberg function `H` in the basis `self`.

INPUT:

- `H` – list; the Hessenberg function
- `k` – integer; must satisfy `0 <= k < len(H)`
- `q` – (default: `'q'`) base ring element for q

A *Hessenberg function* (of length n) is a function $H\colon \{1,\ldots,n\} \to \{1,\ldots,n\}$ such that $\max(i, H(i-1)) \leq H(i) \leq n$ for all i (by convention $H(0) = 0$). The *Abreu-Nigro g symmetric function* [AN2023] (Definition 1.3) is defined by

$$g_{H,k}(x;q) := \sum_{\sigma=\tau_1\cdots\tau_j} (-1)^{|\tau_1|-n+k} q^{w_H(\sigma)} h_{|\tau_1|-n+k}(x)\omega(\rho_{|\tau_2|,\ldots,|\tau_j|}(x;q)),$$

where the sum is over all permutations $\sigma \in S_n$ such that $|\tau_1| \geq n-k$ and $\sigma(i) \leq H(i)$ for all i; $\tau_1,\ldots,\tau_j$ is the cycle decomposition of σ (with cycles sorted by smallest elements, and with these smallest elements placed at the beginning of each cycle); ρ_λ is the Abreu-Nigro basis [AN2021II] (see *SymmetricFunctions.abreu_nigro*); and

$$w_H(\sigma) = |\{(i,j) \mid i < j \leq H(i) \text{ and } j \text{ precedes } i \text{ in } \sigma^c\}|,$$

with σ^c being the permutation formed by removing the parentheses in the cycle decomposition $\tau_1\cdots\tau_j$.

EXAMPLES:

We verify the e-positivity of some examples:

```
sage: q = ZZ['q'].fraction_field().gen()
sage: Sym = SymmetricFunctions(q.parent())
sage: e = Sym.e()
sage: e.abreu_nigro_g([1,2], 0, q)
0
sage: e.abreu_nigro_g([1,2], 1, q)
e[1]
sage: e.abreu_nigro_g([2,2], 0, q)
e[]
sage: e.abreu_nigro_g([2,2], 1, q)
0
sage: H = [3, 3, 4, 5, 6, 7, 7]
sage: [e.abreu_nigro_g(H, k, q) for k in range(7)]
[(q+1)*e[],
 q*e[1],
 (q^2+q)*e[2],
 q^2*e[2, 1] + (q^3+2*q^2+q)*e[3],
 (q^3+q^2)*e[2, 2] + (q^3+q^2)*e[3, 1] + (q^4+2*q^3+2*q^2+q)*e[4],
 q^3*e[3, 2] + (q^4+q^3+q^2)*e[5],
 (q^4+q^3)*e[3, 3] + (q^4+q^3)*e[4, 2] + (q^5+q^4+q^3+q^2)*e[6]]
```

```
>>> from sage.all import *
>>> q = ZZ['q'].fraction_field().gen()
>>> Sym = SymmetricFunctions(q.parent())
>>> e = Sym.e()
>>> e.abreu_nigro_g([Integer(1),Integer(2)], Integer(0), q)
0
>>> e.abreu_nigro_g([Integer(1),Integer(2)], Integer(1), q)
e[1]
>>> e.abreu_nigro_g([Integer(2),Integer(2)], Integer(0), q)
e[]
>>> e.abreu_nigro_g([Integer(2),Integer(2)], Integer(1), q)
0
>>> H = [Integer(3), Integer(3), Integer(4), Integer(5), Integer(6),␣
↪Integer(7), Integer(7)]
>>> [e.abreu_nigro_g(H, k, q) for k in range(Integer(7))]
[(q+1)*e[],
 q*e[1],
 (q^2+q)*e[2],
 q^2*e[2, 1] + (q^3+2*q^2+q)*e[3],
 (q^3+q^2)*e[2, 2] + (q^3+q^2)*e[3, 1] + (q^4+2*q^3+2*q^2+q)*e[4],
 q^3*e[3, 2] + (q^4+q^3+q^2)*e[5],
 (q^4+q^3)*e[3, 3] + (q^4+q^3)*e[4, 2] + (q^5+q^4+q^3+q^2)*e[6]]
```

We reproduce Example 1.5 in [AN2023]:

```
sage: H = [2, 4, 4, 5, 6, 6]
sage: [e.abreu_nigro_g(H, k, q) for k in range(6)]
[(q+1)*e[],
 q*e[1],
 (q^2+q)*e[2],
 q^2*e[3],
 (q^3+q^2)*e[4],
 (q^4+3*q^3+q^2)*e[3, 2] + (q^4+q^3+q^2)*e[4, 1]
  + (q^5+2*q^4+2*q^3+2*q^2+q)*e[5]]
```

```
>>> from sage.all import *
>>> H = [Integer(2), Integer(4), Integer(4), Integer(5), Integer(6),␣
↪Integer(6)]
>>> [e.abreu_nigro_g(H, k, q) for k in range(Integer(6))]
[(q+1)*e[],
 q*e[1],
 (q^2+q)*e[2],
 q^2*e[3],
 (q^3+q^2)*e[4],
 (q^4+3*q^3+q^2)*e[3, 2] + (q^4+q^3+q^2)*e[4, 1]
  + (q^5+2*q^4+2*q^3+2*q^2+q)*e[5]]
```

We verify Theorem 1.7 in [AN2023] for an example:

```
sage: from sage.combinat.q_analogues import q_int
sage: H = [2, 4, 4, 4]
sage: G = posets.HessenbergPoset(H).incomparability_graph()
sage: cqf = G.chromatic_quasisymmetric_function(q, q.parent()); cqf
```

(continues on next page)

(continued from previous page)

```
(q^4+6*q^3+10*q^2+6*q+1)*M[1, 1, 1, 1] + (q^3+2*q^2+q)*M[1, 1, 2]
 + (q^3+2*q^2+q)*M[1, 2, 1] + (q^3+2*q^2+q)*M[2, 1, 1]
sage: e(cqf.to_symmetric_function())
(q^3+2*q^2+q)*e[3, 1] + (q^4+2*q^3+2*q^2+2*q+1)*e[4]
sage: sum(q_int(k, q) * e[k] * e.abreu_nigro_g(H, len(H)-k, q)
....:     for k in range(1, len(H)+1))
(q^3+2*q^2+q)*e[3, 1] + (q^4+2*q^3+2*q^2+2*q+1)*e[4]
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_int
>>> H = [Integer(2), Integer(4), Integer(4), Integer(4)]
>>> G = posets.HessenbergPoset(H).incomparability_graph()
>>> cqf = G.chromatic_quasisymmetric_function(q, q.parent()); cqf
(q^4+6*q^3+10*q^2+6*q+1)*M[1, 1, 1, 1] + (q^3+2*q^2+q)*M[1, 1, 2]
 + (q^3+2*q^2+q)*M[1, 2, 1] + (q^3+2*q^2+q)*M[2, 1, 1]
>>> e(cqf.to_symmetric_function())
(q^3+2*q^2+q)*e[3, 1] + (q^4+2*q^3+2*q^2+2*q+1)*e[4]
>>> sum(q_int(k, q) * e[k] * e.abreu_nigro_g(H, len(H)-k, q)
...     for k in range(Integer(1), len(H)+Integer(1)))
(q^3+2*q^2+q)*e[3, 1] + (q^4+2*q^3+2*q^2+2*q+1)*e[4]
```

carlitz_shareshian_wachs(*n*, *d*, *s*, *comparison=None*)

Return the Carlitz-Shareshian-Wachs symmetric function $X_{n,d,s}$ (if `comparison` is `None`), or $U_{n,d,s}$ (if `comparison` is `-1`), or $V_{n,d,s}$ (if `comparison` is `0`), or $W_{n,d,s}$ (if `comparison` is `1`) written in the basis `self`. These functions are defined below.

The Carlitz-Shareshian-Wachs symmetric functions have been introduced in [GriRei18], Exercise 2.9.11, as refinements of a certain particular case of chromatic quasisymmetric functions defined by Shareshian and Wachs. Their definitions are as follows:

Let n, d and s be three nonnegative integers. Let $W(n,d,s)$ denote the set of all n-tuples $(w_1, w_2, \ldots, w_n)$ of positive integers having the property that there exist precisely d elements i of $\{1, 2, \ldots, n-1\}$ satisfying $w_i > w_{i+1}$, and precisely s elements i of $\{1, 2, \ldots, n-1\}$ satisfying $w_i = w_{i+1}$. For every $w = (w_1, w_2, \ldots, w_n) \in W(n,d,s)$, let x_w be the monomial $x_{w_1} x_{w_2} \cdots x_{w_n}$. We then define the power series $X_{n,d,s}$ by

$$X_{n,d,s} = \sum_{w \in W(n,d,s)} x_w.$$

This is a symmetric function (according to [GriRei18], Exercise 2.9.11(b)), and for $s = 0$ equals the t^d-coefficient of the descent enumerator of Smirnov words of length n (an example of a chromatic quasisymmetric function which happens to be symmetric – see [ShaWach2014], Example 2.5).

Assume that $n > 0$. Then, we can define three further power series as follows:

$$U_{n,d,s} = \sum_{w_1 < w_n} x_w; \qquad V_{n,d,s} = \sum_{w_1 = w_n} x_w; \qquad W_{n,d,s} = \sum_{w_1 > w_n} x_w,$$

where all three sums range over $w = (w_1, w_2, \ldots, w_n) \in W(n,d,s)$. These three power series $U_{n,d,s}$, $V_{n,d,s}$ and $W_{n,d,s}$ are symmetric functions as well ([GriRei18], Exercise 2.9.11(c)). Their sum is $X_{n,d,s}$.

REFERENCES:

INPUT:

- `n` – nonnegative integer
- `d` – nonnegative integer

- `s` – nonnegative integer
- `comparison` – (default: `None`) a variable which can take the forms `None`, `-1`, `0` and `1`

OUTPUT:

The Carlitz-Shareshian-Wachs symmetric function $X_{n,d,s}$ (if `comparison` is `None`), or $U_{n,d,s}$ (if `comparison` is `-1`), or $V_{n,d,s}$ (if `comparison` is `0`), or $W_{n,d,s}$ (if `comparison` is `1`) written in the basis `self`.

EXAMPLES:

The power series $X_{n,d,s}$:

```
sage: Sym = SymmetricFunctions(ZZ)

↪comparison=Integer(1))
0
```

completion()

alias of *formal_series_ring()*.

degree_on_basis(*b*)

Return the degree of the basis element indexed by `b`.

INPUT:

- `self` – a basis of the symmetric functions
- `b` – a partition

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ['q,t'].fraction_field())
sage: m = Sym.monomial()
sage: m.degree_on_basis(Partition([3,2]))
5
sage: P = Sym.macdonald().P()
sage: P.degree_on_basis(Partition([]))
0
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ['q,t'].fraction_field())
>>> m = Sym.monomial()
>>> m.degree_on_basis(Partition([Integer(3),Integer(2)]))
5
>>> P = Sym.macdonald().P()
>>> P.degree_on_basis(Partition([]))
0
```

formal_series_ring()

Return the completion of all formal linear combinations of `self` with finite linear combinations in each homogeneous degree (computed lazily).

EXAMPLES:

```
sage: s = SymmetricFunctions(ZZ).s()
sage: L = s.formal_series_ring()
sage: L
Lazy completion of Symmetric Functions over Integer Ring in the Schur␣
↪basis
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(ZZ).s()
>>> L = s.formal_series_ring()
>>> L
Lazy completion of Symmetric Functions over Integer Ring in the Schur␣
↪basis
```

fraction_field()

Return the fraction field of `self`.

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: s.fraction_field()
Fraction Field of Symmetric Functions over Rational Field in the Schur␣
↪basis
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> s.fraction_field()
Fraction Field of Symmetric Functions over Rational Field in the Schur␣
↪basis
```

gessel_reutenauer(*lam*)

Return the Gessel-Reutenauer symmetric function corresponding to the partition `lam` written in the basis `self`.

Let λ be a partition. The *Gessel-Reutenauer symmetric function* $\mathbf{GR}_\lambda$ corresponding to λ is the symmetric function denoted L_λ in [GR1993] and in Exercise 7.89 of [STA] and denoted $\mathbf{GR}_\lambda$ in Definition 6.6.34 of [GriRei18]. It is also called the *higher Lie character*, for instance in [Sch2003b]. It can be defined in several ways:

- It is the sum of the monomials $\mathbf{x}_w$ over all words w over the alphabet $\{1, 2, 3, \ldots\}$ which have CFL type λ. Here, the monomial $\mathbf{x}_w$ for a word $w = (w_1, w_2, \ldots, w_k)$ is defined as $x_{w_1} x_{w_2} \cdots x_{w_k}$, and the *CFL type* of a word w is defined as the partition obtained by sorting (in decreasing order) the lengths of the factors in the Lyndon factorization (*lyndon_factorization()*) of w. The fact that this power series $\mathbf{GR}_\lambda$ is symmetric is not obvious.
- It is the sum of the fundamental quasisymmetric functions $F_{\mathrm{Des}\,\sigma}$ over all permutations σ that have cycle type λ. See *sage.combinat.ncsf_qsym.qsym.QuasiSymmetricFunctions.Fundamental* for the definition of fundamental quasisymmetric functions, and *cycle_type()* for that of cycle type. For a permutation σ, we use $\mathrm{Des}\,\sigma$ to denote the descent composition (*descents_composition()*) of σ. Again, this definition does not make the symmetry of $\mathbf{GR}_\lambda$ obvious.
- For every positive integer n, we have

$$\mathbf{GR}_{(n)} = \frac{1}{n} \sum_{d|n} \mu(d) p_d^{n/d},$$

where p_d denotes the d-th power-sum symmetric function. This $\mathbf{GR}_{(n)}$ is also denoted by L_n, and is called the Lie character. Now, the higher Lie character $\mathbf{GR}_\lambda$ is defined as the product:

$$h_{m_1}[L_1] \cdot h_{m_2}[L_2] \cdot h_{m_3}[L_3] \cdots,$$

where m_i denotes the multiplicity of the part i in λ, and where the square brackets stand for plethysm (*plethysm()*). This definition makes the symmetry (but not the integrality!) of $\mathbf{GR}_\lambda$ obvious.

The equivalences of these three definitions are proven in [GR1993] Sections 2-3. (See also [GriRei18] Subsection 6.6.2 for the equivalence of the first two definitions and further formulas.)

$\mathbf{GR}_\lambda$ has further significance in representations afforded by the tensor algebra $T(V)$ of a finite dimensional vector space. The Poincaré-Birkhoff-Witt theorem describes the universal enveloping algebra of a Lie algebra. It gives a decomposition of the degree-n component $T_n(V)$ of $T(V)$ into $GL(V)$ representations indexed by partitions. The higher Lie characters are the symmetric group S_n characters corresponding to this decomposition via Schur-Weyl duality.

Another important question, *Thrall's problem* (see e.g. [Sch2003b]) asks, for λ a partition of n, can we combinatorially interpret the coefficients α_μ^λ in the Schur-expansion of $\mathbf{GR}_\lambda$:

$$\mathbf{GR}_\lambda = \sum_{\mu \vdash n} \alpha_\mu^\lambda s_\mu.$$

INPUT:

- `lam` – a partition or a positive integer (in the latter case, it is understood to mean the partition `[lam]`)

OUTPUT:

The Gessel-Reutenauer symmetric function $\mathbf{GR}_\lambda$, where λ is `lam`, expanded in the basis `self`.

EXAMPLES:

The first few values of $\mathbf{GR}_{(n)} = L_n$:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: h = Sym.h()
sage: h.gessel_reutenauer(1)
h[1]
sage: h.gessel_reutenauer(2)
h[1, 1] - h[2]
sage: h.gessel_reutenauer(3)
h[2, 1] - h[3]
sage: h.gessel_reutenauer(4)
h[2, 1, 1] - h[2, 2]
sage: h.gessel_reutenauer(5)
h[2, 1, 1, 1] - h[2, 2, 1] - h[3, 1, 1] + h[3, 2] + h[4, 1] - h[5]
sage: h.gessel_reutenauer(6)
h[2, 1, 1, 1, 1] - h[2, 2, 1, 1] - h[2, 2, 2]
 - 2*h[3, 1, 1, 1] + 5*h[3, 2, 1] - 2*h[3, 3] + h[4, 1, 1]
 - h[4, 2] - h[5, 1] + h[6]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> h = Sym.h()
>>> h.gessel_reutenauer(Integer(1))
h[1]
>>> h.gessel_reutenauer(Integer(2))
h[1, 1] - h[2]
>>> h.gessel_reutenauer(Integer(3))
h[2, 1] - h[3]
>>> h.gessel_reutenauer(Integer(4))
h[2, 1, 1] - h[2, 2]
>>> h.gessel_reutenauer(Integer(5))
h[2, 1, 1, 1] - h[2, 2, 1] - h[3, 1, 1] + h[3, 2] + h[4, 1] - h[5]
>>> h.gessel_reutenauer(Integer(6))
```

(continues on next page)

(continued from previous page)

```
h[2, 1, 1, 1, 1] - h[2, 2, 1, 1] - h[2, 2, 2]
 - 2*h[3, 1, 1, 1] + 5*h[3, 2, 1] - 2*h[3, 3] + h[4, 1, 1]
 - h[4, 2] - h[5, 1] + h[6]
```

Gessel-Reutenauer functions indexed by partitions:

```
sage: h.gessel_reutenauer([2, 1])
h[1, 1, 1] - h[2, 1]
sage: h.gessel_reutenauer([2, 2])
h[1, 1, 1, 1] - 3*h[2, 1, 1] + 2*h[2, 2] + h[3, 1] - h[4]
```

```
>>> from sage.all import *
>>> h.gessel_reutenauer([Integer(2), Integer(1)])
h[1, 1, 1] - h[2, 1]
>>> h.gessel_reutenauer([Integer(2), Integer(2)])
h[1, 1, 1, 1] - 3*h[2, 1, 1] + 2*h[2, 2] + h[3, 1] - h[4]
```

The Gessel-Reutenauer functions are Schur-positive:

```
sage: s = Sym.s()
sage: s.gessel_reutenauer([2, 1])
s[1, 1, 1] + s[2, 1]
sage: s.gessel_reutenauer([2, 2, 1])
s[1, 1, 1, 1, 1] + s[2, 1, 1, 1] + s[2, 2, 1] + s[3, 2]
```

```
>>> from sage.all import *
>>> s = Sym.s()
>>> s.gessel_reutenauer([Integer(2), Integer(1)])
s[1, 1, 1] + s[2, 1]
>>> s.gessel_reutenauer([Integer(2), Integer(2), Integer(1)])
s[1, 1, 1, 1, 1] + s[2, 1, 1, 1] + s[2, 2, 1] + s[3, 2]
```

They do not form a basis, as the following example (from [GR1993] p. 201) shows:

```
sage: s.gessel_reutenauer([4]) == s.gessel_reutenauer([2, 1, 1])
True
```

```
>>> from sage.all import *
>>> s.gessel_reutenauer([Integer(4)]) == s.gessel_reutenauer([Integer(2),␣
↪Integer(1), Integer(1)])
True
```

They also go by the name *higher Lie character*:

```
sage: s.higher_lie_character([2, 2, 1]) == s.gessel_reutenauer([2, 2, 1])
True
```

```
>>> from sage.all import *
>>> s.higher_lie_character([Integer(2), Integer(2), Integer(1)]) == s.
↪gessel_reutenauer([Integer(2), Integer(2), Integer(1)])
True
```

Of the above three equivalent definitions of $\mathbf{GR}_\lambda$, we use the third one for computations. Let us check that the second one gives the same results:

```
sage: QSym = QuasiSymmetricFunctions(ZZ)
sage: F = QSym.F() # fundamental basis
sage: def GR_def2(lam): # `\mathbf{GR}_\lambda`
....:     n = lam.size()
....:     r = F.sum_of_monomials([sigma.descents_composition()
....:                             for sigma in Permutations(n)
....:                             if sigma.cycle_type() == lam])
....:     return r.to_symmetric_function()
sage: all( GR_def2(lam) == h.gessel_reutenauer(lam)
....:      for n in range(5) for lam in Partitions(n) )
True
```

```
>>> from sage.all import *
>>> QSym = QuasiSymmetricFunctions(ZZ)
>>> F = QSym.F() # fundamental basis
>>> def GR_def2(lam): # `\mathbf{GR}_\lambda`
...     n = lam.size()
...     r = F.sum_of_monomials([sigma.descents_composition()
...                             for sigma in Permutations(n)
...                             if sigma.cycle_type() == lam])
...     return r.to_symmetric_function()
>>> all( GR_def2(lam) == h.gessel_reutenauer(lam)
...      for n in range(Integer(5)) for lam in Partitions(n) )
True
```

And the first one, too (assuming symmetry):

```
sage: m = Sym.m()
sage: def GR_def1(lam): # `\mathbf{GR}_\lambda`
....:     n = lam.size()
....:     Permus_mset = sage.combinat.permutation.Permutations_mset
....:     def coeff_of_m_mu_in_result(mu):
....:         words_to_check = Permus_mset([i for i, l in enumerate(mu)
....:                                       for _ in range(l)])
....:         return sum((1 for w in words_to_check if
....:                     Partition(list(reversed(sorted([len(v) for v in␣
↪Word(w).lyndon_factorization()])))
....:                     == lam))
....:     r = m.sum_of_terms([(mu, coeff_of_m_mu_in_result(mu))
....:                         for mu in Partitions(n)],
....:                        distinct=True)
....:     return r
sage: all( GR_def1(lam) == h.gessel_reutenauer(lam)
....:      for n in range(5) for lam in Partitions(n) )
True
```

```
>>> from sage.all import *
>>> m = Sym.m()
>>> def GR_def1(lam): # `\mathbf{GR}_\lambda`
...     n = lam.size()
```

(continues on next page)

(continued from previous page)

```
...       Permus_mset = sage.combinat.permutation.Permutations_mset
...       def coeff_of_m_mu_in_result(mu):
...           words_to_check = Permus_mset([i for i, l in enumerate(mu)
...                                         for _ in range(l)])
...           return sum((Integer(1) for w in words_to_check if
...                       Partition(list(reversed(sorted([len(v) for v in
↪Word(w).lyndon_factorization()])))
...                       == lam))
...       r = m.sum_of_terms([(mu, coeff_of_m_mu_in_result(mu))
...                           for mu in Partitions(n)],
...                          distinct=True)
...       return r
>>> all( GR_def1(lam) == h.gessel_reutenauer(lam)
...       for n in range(Integer(5)) for lam in Partitions(n) )
True
```

Note

The currently existing implementation of this function is technically unsatisfactory. It distinguishes the case when the base ring is a **Q**-algebra from the case where it isn't. In the latter, it does a computation using universal coefficients, again distinguishing the case when it is able to compute the "corresponding" basis of the symmetric function algebra over **Q** (using the `corresponding_basis_over` hack) from the case when it isn't (in which case it transforms everything into the Schur basis, which is slow).

higher_lie_character(*lam*)

alias of *gessel_reutenauer()*.

is_commutative()

Return whether this symmetric function algebra is commutative.

INPUT:

- `self` – a basis of the symmetric functions

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: s.is_commutative()
True
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> s.is_commutative()
True
```

is_field(*proof=True*)

Return whether `self` is a field. (It is not.)

INPUT:

- `self` – a basis of the symmetric functions
- `proof` – an optional argument (default: value: `True`)

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: s.is_field()
False
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> s.is_field()
False
```

is_integral_domain(*proof=True*)

Return whether `self` is an integral domain. (It is if and only if the base ring is an integral domain.)

INPUT:

- `self` – a basis of the symmetric functions
- `proof` – an optional argument (default: value: `True`)

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: s.is_integral_domain()
True

sage: s = SymmetricFunctions(Zmod(14)).s()
sage: s.is_integral_domain()
False
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> s.is_integral_domain()
True

>>> s = SymmetricFunctions(Zmod(Integer(14))).s()
>>> s.is_integral_domain()
False
```

lehrer_solomon(*lam*)

Return the Lehrer-Solomon symmetric function (also known as the Whitney homology character) corresponding to the partition `lam` written in the basis `self`.

Let $\lambda \vdash n$ be a partition. The *Lehrer-Solomon symmetric function* $\mathbf{LS}_\lambda$ corresponding to λ is the Frobenius characteristic of the representation denoted $\mathrm{Ind}_{Z_\lambda}^{S_n}(\xi_\lambda)$ in Theorem 4.5 of [LS1986] or W_λ in Theorem 2.7 of [HR2017]. It was first computed as a symmetric function in [Sun1994].

It is the symmetric group representation corresponding to a summand of the Whitney homology of the set partition lattice. The summand comes from the orbit of set partitions with block sizes corresponding to λ (after reordering appropriately).

It can be computed using Sundaram's plethystic formula (see [Sun1994] Theorem 1.8):

$$\mathbf{LS}_\lambda = \prod_{\text{odd } j \geq 1} h_{m_j}[\pi_j] \prod_{\text{even } j \geq 2} e_{m_j}[\pi_j],$$

where h_{m_j} are complete homogeneous symmetric functions, e_{m_j} are elementary symmetric functions, and π_j are the images of the Gessel-Reutenauer symmetric function $\mathbf{GR}_{(j)}$ (see *gessel_reutenauer()*) under the involution ω (i.e. *omega_involution()*):

```
sage: Sym = SymmetricFunctions(QQ)
sage: s = Sym.s()
sage: pi_2 = (s.gessel_reutenauer(2)).omega_involution()
sage: pi_1 = (s.gessel_reutenauer(1)).omega_involution()
sage: s.lehrer_solomon([2,1]) == pi_2 * pi_1 # since h_1, e_1 are␣
↪plethystic identities
True
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> s = Sym.s()
>>> pi_2 = (s.gessel_reutenauer(Integer(2))).omega_involution()
>>> pi_1 = (s.gessel_reutenauer(Integer(1))).omega_involution()
>>> s.lehrer_solomon([Integer(2),Integer(1)]) == pi_2 * pi_1 # since h_1,␣
↪e_1 are plethystic identities
True
```

Note that this also gives the S_n-equivariant structure of the Orlik-Solomon algebra of the braid arrangement (also known as the type-A reflection arrangement).

The representation corresponding to $\mathbf{LS}_\lambda$ exhibits representation stability [Chu2012], and a sharp bound is given in [HR2017].

INPUT:

- `lam` – a partition or a positive integer (in the latter case, it is understood to mean the partition `[lam]`)

OUTPUT:

The Lehrer-Solomon symmetric function $\mathbf{LS}_\lambda$, where λ is `lam`, expanded in the basis `self`.

EXAMPLES:

The first few values of $\mathbf{LS}_{(n)}$:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: h = Sym.h()
sage: h.lehrer_solomon(1)
h[1]
sage: h.lehrer_solomon(2)
h[2]
sage: h.lehrer_solomon(3)
h[2, 1] - h[3]
sage: h.lehrer_solomon(4)
h[2, 1, 1] - h[2, 2]
sage: h.lehrer_solomon(5)
h[2, 1, 1, 1] - h[2, 2, 1] - h[3, 1, 1] + h[3, 2] + h[4, 1] - h[5]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> h = Sym.h()
>>> h.lehrer_solomon(Integer(1))
h[1]
>>> h.lehrer_solomon(Integer(2))
h[2]
>>> h.lehrer_solomon(Integer(3))
h[2, 1] - h[3]
```

(continues on next page)

(continued from previous page)

```
>>> h.lehrer_solomon(Integer(4))
h[2, 1, 1] - h[2, 2]
>>> h.lehrer_solomon(Integer(5))
h[2, 1, 1, 1] - h[2, 2, 1] - h[3, 1, 1] + h[3, 2] + h[4, 1] - h[5]
```

The *whitney_homology_character()* method is an alias:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: s = Sym.schur()
sage: s.lehrer_solomon([2, 2, 1]) == s.whitney_homology_character([2, 2,␣
↪1])
True
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> s = Sym.schur()
>>> s.lehrer_solomon([Integer(2), Integer(2), Integer(1)]) == s.whitney_
↪homology_character([Integer(2), Integer(2), Integer(1)])
True
```

Lehrer-Solomon functions indexed by partitions:

```
sage: h.lehrer_solomon([2, 1])
h[2, 1]
sage: h.lehrer_solomon([2, 2])
h[3, 1] - h[4]
```

```
>>> from sage.all import *
>>> h.lehrer_solomon([Integer(2), Integer(1)])
h[2, 1]
>>> h.lehrer_solomon([Integer(2), Integer(2)])
h[3, 1] - h[4]
```

The Lehrer-Solomon functions are Schur-positive:

```
sage: s = Sym.s()
sage: s.lehrer_solomon([2, 1])
s[2, 1] + s[3]
sage: s.lehrer_solomon([2, 2, 1])
s[3, 1, 1] + s[3, 2] + s[4, 1]
sage: s.lehrer_solomon([4, 1])
s[2, 1, 1, 1] + s[2, 2, 1] + 2*s[3, 1, 1] + s[3, 2] + s[4, 1]
```

```
>>> from sage.all import *
>>> s = Sym.s()
>>> s.lehrer_solomon([Integer(2), Integer(1)])
s[2, 1] + s[3]
>>> s.lehrer_solomon([Integer(2), Integer(2), Integer(1)])
s[3, 1, 1] + s[3, 2] + s[4, 1]
>>> s.lehrer_solomon([Integer(4), Integer(1)])
s[2, 1, 1, 1] + s[2, 2, 1] + 2*s[3, 1, 1] + s[3, 2] + s[4, 1]
```

one_basis()

Return the empty partition, as per `AlgebrasWithBasis.ParentMethods.one_basis`.

INPUT:

- `self` – a basis of the ring of symmetric functions

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ['t'].fraction_field())
sage: s = Sym.s()
sage: s.one_basis()
[]
sage: Q = Sym.hall_littlewood().Q()
sage: Q.one_basis()
[]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ['t'].fraction_field())
>>> s = Sym.s()
>>> s.one_basis()
[]
>>> Q = Sym.hall_littlewood().Q()
>>> Q.one_basis()
[]
```

Todo

generalize to Modules.Graded.Connected.ParentMethods

skew_schur(x)

Return the skew Schur function indexed by `x` in `self`.

INPUT:

- `x` – a skew partition

EXAMPLES:

```
sage: sp = SkewPartition([[5,3,3,1], [3,2,1]])
sage: s = SymmetricFunctions(QQ).s()
sage: s.skew_schur(sp)
s[2, 2, 1, 1] + s[2, 2, 2] + s[3, 1, 1, 1] + 3*s[3, 2, 1]
 + s[3, 3] + 2*s[4, 1, 1] + 2*s[4, 2] + s[5, 1]

sage: e = SymmetricFunctions(QQ).e()
sage: ess = e.skew_schur(sp); ess
e[2, 1, 1, 1, 1] - e[2, 2, 1, 1] - e[3, 1, 1, 1] + e[3, 2, 1]
sage: ess == e(s.skew_schur(sp))
True
```

```
>>> from sage.all import *
>>> sp = SkewPartition([[Integer(5),Integer(3),Integer(3),Integer(1)],␣
↪[Integer(3),Integer(2),Integer(1)]])
>>> s = SymmetricFunctions(QQ).s()
>>> s.skew_schur(sp)
```

(continues on next page)

(continued from previous page)

```
s[2, 2, 1, 1] + s[2, 2, 2] + s[3, 1, 1, 1] + 3*s[3, 2, 1]
 + s[3, 3] + 2*s[4, 1, 1] + 2*s[4, 2] + s[5, 1]

>>> e = SymmetricFunctions(QQ).e()
>>> ess = e.skew_schur(sp); ess
e[2, 1, 1, 1, 1] - e[2, 2, 1, 1] - e[3, 1, 1, 1] + e[3, 2, 1]
>>> ess == e(s.skew_schur(sp))
True
```

whitney_homology_character(*lam*)

alias of *lehrer_solomon()*.

super_categories()

The super categories of `self`.

EXAMPLES:

```
sage: from sage.combinat.sf.sfa import SymmetricFunctionsBases
sage: Sym = SymmetricFunctions(QQ)
sage: bases = SymmetricFunctionsBases(Sym)
sage: bases.super_categories()
[Category of realizations of Symmetric Functions over Rational Field,
 Category of commutative Hopf algebras with basis over Rational Field,
 Join of Category of realizations of Hopf algebras over Rational Field
     and Category of graded algebras over Rational Field
     and Category of graded coalgebras over Rational Field,
 Category of unique factorization domains]

sage: Sym = SymmetricFunctions(ZZ["x"])
sage: bases = SymmetricFunctionsBases(Sym)
sage: bases.super_categories()
[Category of realizations of Symmetric Functions over Univariate Polynomial␣
↪Ring in x over Integer Ring,
 Category of commutative Hopf algebras with basis over Univariate Polynomial␣
↪Ring in x over Integer Ring,
 Join of Category of realizations of Hopf algebras over Univariate Polynomial␣
↪Ring in x over Integer Ring
     and Category of graded algebras over Univariate Polynomial Ring in x␣
↪over Integer Ring
     and Category of graded coalgebras over Univariate Polynomial Ring in x␣
↪over Integer Ring]
```

```
>>> from sage.all import *
>>> from sage.combinat.sf.sfa import SymmetricFunctionsBases
>>> Sym = SymmetricFunctions(QQ)
>>> bases = SymmetricFunctionsBases(Sym)
>>> bases.super_categories()

↪over Integer Ring]
```

class sage.combinat.sf.sfa.**SymmetricFunctionsFamilyFunctor**(*basis*, *family*, *name*, **args*)

Bases: *SymmetricFunctionsFunctor*

Initialize the functor.

INPUT:

- `basis` – the basis of the symmetric function algebra

Warning

Strictly speaking, this is not necessarily a functor on `CommutativeRings`, but rather a functor on commutative rings with some distinguished elements. For example, for the Macdonald polynomials, we have to specify q and t in the ring. Apart from that, the codomain of this functor could actually be `CommutativeAlgebras` over the given ring, but parameterized functors are currently not available.

EXAMPLES:

```
sage: from sage.combinat.sf.sfa import SymmetricFunctionsFamilyFunctor
sage: R.<t> = ZZ[]
sage: basis = SymmetricFunctions(R).macdonald(q=1).H()
sage: family = sage.combinat.sf.macdonald.Macdonald
sage: name = basis.basis_name()
sage: SymmetricFunctionsFamilyFunctor(basis, family, name, 1, t)
SymmetricFunctionsFunctor[Macdonald H with q=1]
```

```
>>> from sage.all import *
>>> from sage.combinat.sf.sfa import SymmetricFunctionsFamilyFunctor
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> basis = SymmetricFunctions(R).macdonald(q=Integer(1)).H()
>>> family = sage.combinat.sf.macdonald.Macdonald
>>> name = basis.basis_name()
>>> SymmetricFunctionsFamilyFunctor(basis, family, name, Integer(1), t)
SymmetricFunctionsFunctor[Macdonald H with q=1]
```

class sage.combinat.sf.sfa.**SymmetricFunctionsFunctor**(*basis*, *name*, **args*)

Bases: `ConstructionFunctor`

A constructor for algebras of symmetric functions.

EXAMPLES:

```
sage: s = SymmetricFunctions(QQ).s()
sage: s.construction()
(SymmetricFunctionsFunctor[Schur], Rational Field)
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).s()
>>> s.construction()
(SymmetricFunctionsFunctor[Schur], Rational Field)
```

rank = 9

sage.combinat.sf.sfa.**zee**(*part*)

Return the size of the centralizer of any permutation of cycle type `part`.

Note that the size of the centralizer is the inner product between `p(part)` and itself, where p is the power-sum symmetric functions.

INPUT:

- `part` – integer partition (for example, `[2,1,1]`)

OUTPUT:

- the integer $\prod_i i^{m_i(part)} m_i(part)!$ where $m_i(part)$ is the number of parts in the partition `part` equal to i

EXAMPLES:

```
sage: from sage.combinat.sf.sfa import zee
sage: zee([2,1,1])
4
```

```
>>> from sage.all import *
>>> from sage.combinat.sf.sfa import zee
>>> zee([Integer(2),Integer(1),Integer(1)])
4
```

Symmetric functions defined by orthogonality and triangularity

One characterization of Schur functions is that they are upper triangularly related to the monomial symmetric functions and orthogonal with respect to the Hall scalar product. We can use the class SymmetricFunctionAlgebra_orthotriang to obtain the Schur functions from this definition.

```
sage: from sage.combinat.sf.sfa import zee
sage: from sage.combinat.sf.orthotriang import SymmetricFunctionAlgebra_orthotriang
sage: Sym = SymmetricFunctions(QQ)
sage: m = Sym.m()
sage: s = SymmetricFunctionAlgebra_orthotriang(Sym, m, zee, 's', 'Schur functions')
sage: s([2,1])^2
s[2, 2, 1, 1] + s[2, 2, 2] + s[3, 1, 1, 1] + 2*s[3, 2, 1] + s[3, 3] + s[4, 1, 1] +␣
↪s[4, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.sf.sfa import zee
>>> from sage.combinat.sf.orthotriang import SymmetricFunctionAlgebra_orthotriang
>>> Sym = SymmetricFunctions(QQ)
>>> m = Sym.m()
>>> s = SymmetricFunctionAlgebra_orthotriang(Sym, m, zee, 's', 'Schur functions')
>>> s([Integer(2),Integer(1)])**Integer(2)
s[2, 2, 1, 1] + s[2, 2, 2] + s[3, 1, 1, 1] + 2*s[3, 2, 1] + s[3, 3] + s[4, 1, 1] +␣
↪s[4, 2]
```

```
sage: s2 = SymmetricFunctions(QQ).s()
sage: s2([2,1])^2
s[2, 2, 1, 1] + s[2, 2, 2] + s[3, 1, 1, 1] + 2*s[3, 2, 1] + s[3, 3] + s[4, 1, 1] +␣
↪s[4, 2]
```

```
>>> from sage.all import *
>>> s2 = SymmetricFunctions(QQ).s()
>>> s2([Integer(2),Integer(1)])**Integer(2)
s[2, 2, 1, 1] + s[2, 2, 2] + s[3, 1, 1, 1] + 2*s[3, 2, 1] + s[3, 3] + s[4, 1, 1] +␣
↪s[4, 2]
```

class sage.combinat.sf.orthotriang.**OrthotriangBasisFunctor**(*basis*)

Bases: *SymmetricFunctionsFunctor*

A constructor for algebras of symmetric functions constructed by orthogonality and triangularity.

EXAMPLES:

```
sage: from sage.combinat.sf.sfa import zee
sage: from sage.combinat.sf.orthotriang import SymmetricFunctionAlgebra_
↪orthotriang
sage: Sym = SymmetricFunctions(QQ)
sage: m = Sym.m()
sage: s = SymmetricFunctionAlgebra_orthotriang(Sym, m, zee, 's', 'Schur')
sage: s.construction()
(SymmetricFunctionsFunctor[Schur], Rational Field)
```

```
>>> from sage.all import *
>>> from sage.combinat.sf.sfa import zee
>>> from sage.combinat.sf.orthotriang import SymmetricFunctionAlgebra_orthotriang
>>> Sym = SymmetricFunctions(QQ)
>>> m = Sym.m()
>>> s = SymmetricFunctionAlgebra_orthotriang(Sym, m, zee, 's', 'Schur')
>>> s.construction()
(SymmetricFunctionsFunctor[Schur], Rational Field)
```

class sage.combinat.sf.orthotriang.**SymmetricFunctionAlgebra_orthotriang**(*Sym*, *base*, *scalar*, *prefix*, *basis_name*, *leading_coeff*)

Bases: *SymmetricFunctionAlgebra_generic*

Initialization of the symmetric function algebra defined via orthotriangular rules.

INPUT:

- `self` – a basis determined by an orthotriangular definition
- `Sym` – ring of symmetric functions
- `base` – an instance of a basis of the ring of symmetric functions (e.g. the Schur functions)
- `scalar` – a function `zee` on partitions. The function `zee` determines the scalar product on the power sum basis with normalization $\langle p_\mu, p_\mu \rangle = \mathrm{zee}(\mu)$.
- `prefix` – the prefix used to display the basis
- `basis_name` – the name used for the basis

Note

The base ring is required to be a **Q**-algebra for this method to be usable, since the scalar product is defined by its values on the power sum basis.

EXAMPLES:

```
sage: from sage.combinat.sf.sfa import zee
sage: from sage.combinat.sf.orthotriang import SymmetricFunctionAlgebra_
↪orthotriang
sage: Sym = SymmetricFunctions(QQ)
sage: m = Sym.m()
sage: s = SymmetricFunctionAlgebra_orthotriang(Sym, m, zee, 's', 'Schur'); s
Symmetric Functions over Rational Field in the Schur basis
```

```
>>> from sage.all import *
>>> from sage.combinat.sf.sfa import zee
>>> from sage.combinat.sf.orthotriang import SymmetricFunctionAlgebra_orthotriang
>>> Sym = SymmetricFunctions(QQ)
>>> m = Sym.m()
>>> s = SymmetricFunctionAlgebra_orthotriang(Sym, m, zee, 's', 'Schur'); s
Symmetric Functions over Rational Field in the Schur basis
```

class Element

Bases: *SymmetricFunctionAlgebra_generic_Element*

construction()

Return a pair `(F, R)`, where `F` is a *SymmetricFunctionsFunctor* and R is a ring, such that `F(R)` returns `self`.

EXAMPLES:

```
sage: from sage.combinat.sf.sfa import zee
sage: from sage.combinat.sf.orthotriang import SymmetricFunctionAlgebra_
↪orthotriang
sage: Sym = SymmetricFunctions(QQ)
sage: m = Sym.m()
sage: s = SymmetricFunctionAlgebra_orthotriang(Sym, m, zee, 's', 'Schur')
sage: s.construction()
(SymmetricFunctionsFunctor[Schur], Rational Field)
```

```
>>> from sage.all import *
>>> from sage.combinat.sf.sfa import zee
>>> from sage.combinat.sf.orthotriang import SymmetricFunctionAlgebra_
↪orthotriang
>>> Sym = SymmetricFunctions(QQ)
>>> m = Sym.m()
>>> s = SymmetricFunctionAlgebra_orthotriang(Sym, m, zee, 's', 'Schur')
>>> s.construction()
(SymmetricFunctionsFunctor[Schur], Rational Field)
```

product(*left*, *right*)

Return `left * right` by converting both to the base and then converting back to `self`.

INPUT:

- `self` – a basis determined by an orthotriangular definition
- `left`, `right` – elements in `self`

OUTPUT: the expansion of the product of `left` and `right` in the basis `self`

EXAMPLES:

```
sage: from sage.combinat.sf.sfa import zee
sage: from sage.combinat.sf.orthotriang import SymmetricFunctionAlgebra_
↪orthotriang
sage: Sym = SymmetricFunctions(QQ)
sage: m = Sym.m()
sage: s = SymmetricFunctionAlgebra_orthotriang(Sym, m, zee, 's', 'Schur␣
↪functions')
sage: s([1])*s([2,1]) #indirect doctest
s[2, 1, 1] + s[2, 2] + s[3, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.sf.sfa import zee
>>> from sage.combinat.sf.orthotriang import SymmetricFunctionAlgebra_
↪orthotriang
>>> Sym = SymmetricFunctions(QQ)
>>> m = Sym.m()
>>> s = SymmetricFunctionAlgebra_orthotriang(Sym, m, zee, 's', 'Schur␣
↪functions')
>>> s([Integer(1)])*s([Integer(2),Integer(1)]) #indirect doctest
s[2, 1, 1] + s[2, 2] + s[3, 1]
```

Symmetric functions, with their multiple realizations

class sage.combinat.sf.sf.**SymmetricFunctions**(*R*)

Bases: `UniqueRepresentation`, `Parent`

The abstract algebra of commutative symmetric functions.

Symmetric Functions in Sage

Author: Jason Bandlow, Anne Schilling, Nicolas M. Thiery, Mike Zabrocki

This document is an introduction to working with symmetric function theory in Sage. It is not intended to be an introduction to the theory of symmetric functions ([MAC] and [STA], Chapter 7, are two excellent references.) The reader is also expected to be familiar with Sage.

The algebra of symmetric functions

The algebra of symmetric functions is the unique free commutative graded connected algebra over the given ring, with one generator in each degree. It can also be thought of as the inverse limit (in the category of graded algebras) of the algebra of symmetric polynomials in n variables as $n \to \infty$. Sage allows us to construct the algebra of symmetric functions over any ring. We will use a base ring of rational numbers in these first examples:

```
sage: Sym = SymmetricFunctions(QQ)
sage: Sym
Symmetric Functions over Rational Field
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> Sym
Symmetric Functions over Rational Field
```

Sage knows certain categorical information about this algebra:

```
sage: Sym.category()
Join of Category of Hopf algebras over Rational Field
    and Category of unique factorization domains
    and Category of graded algebras over Rational Field
    and Category of commutative algebras over Rational Field
    and Category of monoids with realizations
    and Category of graded coalgebras over Rational Field
    and Category of coalgebras over Rational Field with realizations
    and Category of cocommutative coalgebras over Rational Field
```

```
>>> from sage.all import *
>>> Sym.category()
Join of Category of Hopf algebras over Rational Field
    and Category of unique factorization domains
    and Category of graded algebras over Rational Field
    and Category of commutative algebras over Rational Field
    and Category of monoids with realizations
    and Category of graded coalgebras over Rational Field
    and Category of coalgebras over Rational Field with realizations
    and Category of cocommutative coalgebras over Rational Field
```

Notice that `Sym` is an *abstract* algebra. This reflects the fact that there are multiple natural bases. To work with specific elements, we need a *realization* of this algebra. In practice, this means we need to specify a basis.

An example basis - power sums

Here is an example of how one might use the power sum realization:

```
sage: p = Sym.powersum()
sage: p
Symmetric Functions over Rational Field in the powersum basis
```

```
>>> from sage.all import *
>>> p = Sym.powersum()
>>> p
Symmetric Functions over Rational Field in the powersum basis
```

`p` now represents the realization of the symmetric function algebra on the power sum basis. The basis itself is accessible through:

```
sage: p.basis()
Lazy family (Term map from Partitions to Symmetric Functions over
Rational Field in the powersum basis(i))_{i in Partitions}
sage: p.basis().keys()
Partitions
```

```
>>> from sage.all import *
>>> p.basis()
Lazy family (Term map from Partitions to Symmetric Functions over
Rational Field in the powersum basis(i))_{i in Partitions}
>>> p.basis().keys()
Partitions
```

This last line means that `p.basis()` is an association between the set of Partitions and the basis elements of the algebra `p`. To construct a specific element one can therefore do:

```
sage: p.basis()[Partition([2,1,1])]
p[2, 1, 1]
```

```
>>> from sage.all import *
>>> p.basis()[Partition([Integer(2),Integer(1),Integer(1)])]
p[2, 1, 1]
```

As this is rather cumbersome, realizations of the symmetric function algebra allow for the following abuses of notation:

```
sage: p[Partition([2, 1, 1])]
p[2, 1, 1]
sage: p[[2, 1, 1]]
p[2, 1, 1]
sage: p[2, 1, 1]
p[2, 1, 1]
```

```
>>> from sage.all import *
>>> p[Partition([Integer(2), Integer(1), Integer(1)])]
p[2, 1, 1]
>>> p[[Integer(2), Integer(1), Integer(1)]]
```

(continues on next page)

(continued from previous page)

```
p[2, 1, 1]
>>> p[Integer(2), Integer(1), Integer(1)]
p[2, 1, 1]
```

or even:

```
sage: p[(i for i in [2, 1, 1])]
p[2, 1, 1]
```

```
>>> from sage.all import *
>>> p[(i for i in [Integer(2), Integer(1), Integer(1)])]
p[2, 1, 1]
```

In the special case of the empty partition, due to a limitation in Python syntax, one cannot use:

```
sage: p[]       # todo: not implemented
```

```
>>> from sage.all import *
>>> p[]       # todo: not implemented
```

Please use instead:

```
sage: p[[]]
p[]
```

```
>>> from sage.all import *
>>> p[[]]
p[]
```

Note

When elements are constructed using the `p[something ]` syntax, an error will be raised if the input cannot be interpreted as a partition. This is *not* the case when `p.basis()` is used:

```
sage: p['something']
Traceback (most recent call last):
...
ValueError: all parts of 'something' should be nonnegative integers
sage: p.basis()['something']
p'something'
```

```
>>> from sage.all import *
>>> p['something']
Traceback (most recent call last):
...
ValueError: all parts of 'something' should be nonnegative integers
>>> p.basis()['something']
p'something'
```

Elements of `p` are linear combinations of such compositions:

```
sage: p.an_element()
2*p[] + 2*p[1] + 3*p[2]
```

```
>>> from sage.all import *
>>> p.an_element()
2*p[] + 2*p[1] + 3*p[2]
```

Algebra structure

Algebraic combinations of basis elements can be entered in a natural way:

```
sage: p[2,1,1] + 2 * p[1] * (p[4] + p[2,1])
3*p[2, 1, 1] + 2*p[4, 1]
```

```
>>> from sage.all import *
>>> p[Integer(2),Integer(1),Integer(1)] + Integer(2) * p[Integer(1)] *␣
↪(p[Integer(4)] + p[Integer(2),Integer(1)])
3*p[2, 1, 1] + 2*p[4, 1]
```

Let us explore the other operations of `p`. We can ask for the mathematical properties of `p`:

```
sage: p.categories()
[Category of graded bases of Symmetric Functions over Rational Field,
 Category of filtered bases of Symmetric Functions over Rational Field,
 Category of bases of Symmetric Functions over Rational Field,
 Category of graded Hopf algebras with basis over Rational Field,
 ...]
```

```
>>> from sage.all import *
>>> p.categories()
[Category of graded bases of Symmetric Functions over Rational Field,
 Category of filtered bases of Symmetric Functions over Rational Field,
 Category of bases of Symmetric Functions over Rational Field,
 Category of graded Hopf algebras with basis over Rational Field,
 ...]
```

To start with, `p` is a graded algebra, the grading being induced by the size of the partitions. Due to this, the one is the basis element indexed by the empty partition:

```
sage: p.one()
p[]
```

```
>>> from sage.all import *
>>> p.one()
p[]
```

The `p` basis is multiplicative; that is, multiplication is induced by linearity from the (nonincreasingly sorted) concatenation of partitions:

```
sage: p[3,1] * p[2,1]
p[3, 2, 1, 1]
```

(continues on next page)

(continued from previous page)

```
sage: (p.one() + 2 * p[3,1]) * p[4, 2]
p[4, 2] + 2*p[4, 3, 2, 1]
```

```
>>> from sage.all import *
>>> p[Integer(3),Integer(1)] * p[Integer(2),Integer(1)]
p[3, 2, 1, 1]

>>> (p.one() + Integer(2) * p[Integer(3),Integer(1)]) * p[Integer(4), Integer(2)]
p[4, 2] + 2*p[4, 3, 2, 1]
```

The classical bases

In addition to the power sum basis, other classical bases of the symmetric function algebra include the elementary, complete homogeneous, monomial, and Schur bases:

```
sage: e = Sym.elementary()
sage: h = Sym.homogeneous()
sage: m = Sym.monomial()
sage: s = Sym.schur()
```

```
>>> from sage.all import *
>>> e = Sym.elementary()
>>> h = Sym.homogeneous()
>>> m = Sym.monomial()
>>> s = Sym.schur()
```

These and others can be defined all at once with the single command:

```
sage: Sym.inject_shorthands()
Defining e as shorthand for Symmetric Functions over Rational Field in the␣
↪elementary basis
Defining f as shorthand for Symmetric Functions over Rational Field in the␣
↪forgotten basis
Defining h as shorthand for Symmetric Functions over Rational Field in the␣
↪homogeneous basis
Defining m as shorthand for Symmetric Functions over Rational Field in the␣
↪monomial basis
Defining p as shorthand for Symmetric Functions over Rational Field in the␣
↪powersum basis
Defining s as shorthand for Symmetric Functions over Rational Field in the Schur␣
↪basis
```

```
>>> from sage.all import *
>>> Sym.inject_shorthands()
Defining e as shorthand for Symmetric Functions over Rational Field in the␣
↪elementary basis
Defining f as shorthand for Symmetric Functions over Rational Field in the␣
↪forgotten basis
Defining h as shorthand for Symmetric Functions over Rational Field in the␣
↪homogeneous basis
Defining m as shorthand for Symmetric Functions over Rational Field in the␣
```

(continues on next page)

(continued from previous page)

```
↪monomial basis
Defining p as shorthand for Symmetric Functions over Rational Field in the␣
↪powersum basis
Defining s as shorthand for Symmetric Functions over Rational Field in the Schur␣
↪basis
```

We can then do conversions from one basis to another:

```
sage: s(p[2,1])
-s[1, 1, 1] + s[3]

sage: m(p[3])
m[3]
sage: m(p[3,2])
m[3, 2] + m[5]
```

```
>>> from sage.all import *
>>> s(p[Integer(2),Integer(1)])
-s[1, 1, 1] + s[3]

>>> m(p[Integer(3)])
m[3]
>>> m(p[Integer(3),Integer(2)])
m[3, 2] + m[5]
```

For computations which mix bases, Sage will return a result with respect to a single (not necessarily predictable) basis:

```
sage: p[2] * s[2] - m[4]
1/2*p[2, 1, 1] + 1/2*p[2, 2] - p[4]

sage: p( m[1] * ( e[3]*s[2] + 1 ))
p[1] + 1/12*p[1, 1, 1, 1, 1, 1] - 1/6*p[2, 1, 1, 1, 1] - 1/4*p[2, 2, 1, 1] + 1/
↪6*p[3, 1, 1, 1] + 1/6*p[3, 2, 1]
```

```
>>> from sage.all import *
>>> p[Integer(2)] * s[Integer(2)] - m[Integer(4)]
1/2*p[2, 1, 1] + 1/2*p[2, 2] - p[4]

>>> p( m[Integer(1)] * ( e[Integer(3)]*s[Integer(2)] + Integer(1) ))
p[1] + 1/12*p[1, 1, 1, 1, 1, 1] - 1/6*p[2, 1, 1, 1, 1] - 1/4*p[2, 2, 1, 1] + 1/
↪6*p[3, 1, 1, 1] + 1/6*p[3, 2, 1]
```

The one for different bases such as the power sum and Schur function is the same:

```
sage: s.one() == p.one()
True
```

```
>>> from sage.all import *
>>> s.one() == p.one()
True
```

Basic computations

In this section, we explore some of the many methods that can be applied to an arbitrary symmetric function:

```
sage: f = s[2]^2; f
s[2, 2] + s[3, 1] + s[4]
```

```
>>> from sage.all import *
>>> f = s[Integer(2)]**Integer(2); f
s[2, 2] + s[3, 1] + s[4]
```

For more methods than discussed here, create a symmetric function as above, and use `f.<tab>`.

Representation theory of the symmetric group

The Schur functions s_λ can also be interpreted as irreducible characters of the symmetric group S_n, where n is the size of the partition λ. Since the Schur functions of degree n form a basis of the symmetric functions of degree n, it follows that an arbitrary symmetric function (homogeneous of degree n) may be interpreted as a function on the symmetric group. In this interpretation the power sum symmetric function p_λ is the characteristic function of the conjugacy class with shape λ, multiplied by the order of the centralizer of an element. Hence the irreducible characters can be computed as follows:

```
sage: Sym = SymmetricFunctions(QQ)
sage: s = Sym.schur()
sage: p = Sym.power()
sage: P = Partitions(5).list()
sage: P = [P[i] for i in range(len(P)-1,-1,-1)]
sage: M = matrix([[s[P[i]].scalar(p[P[j]]) for j in range(len(P))] for i in␣
↪range(len(P))])
sage: M
[ 1 -1  1  1 -1 -1  1]
[ 4 -2  0  1  1  0 -1]
[ 5 -1  1 -1 -1  1  0]
[ 6  0 -2  0  0  0  1]
[ 5  1  1 -1  1 -1  0]
[ 4  2  0  1 -1  0 -1]
[ 1  1  1  1  1  1  1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> s = Sym.schur()
>>> p = Sym.power()
>>> P = Partitions(Integer(5)).list()
>>> P = [P[i] for i in range(len(P)-Integer(1),-Integer(1),-Integer(1))]
>>> M = matrix([[s[P[i]].scalar(p[P[j]]) for j in range(len(P))] for i in␣
↪range(len(P))])
>>> M
[ 1 -1  1  1 -1 -1  1]
[ 4 -2  0  1  1  0 -1]
[ 5 -1  1 -1 -1  1  0]
[ 6  0 -2  0  0  0  1]
[ 5  1  1 -1  1 -1  0]
[ 4  2  0  1 -1  0 -1]
[ 1  1  1  1  1  1  1]
```

We can indeed check that this agrees with the character table of S_5:

```
sage: SymmetricGroup(5).character_table() == M
True
```

```
>>> from sage.all import *
>>> SymmetricGroup(Integer(5)).character_table() == M
True
```

In this interpretation of symmetric functions as characters on the symmetric group, the multiplication and comultiplication are interpreted as induction (from $S_n \times S_m$ to S_{n+m}) and restriction, respectively. The Schur functions can also be interpreted as characters of GL_n, see Partitions and Schur functions.

The omega involution

The ω involution is the linear extension of the map which sends e_λ to h_λ:

```
sage: h(f)
h[2, 2]
sage: e(f.omega())
e[2, 2]
```

```
>>> from sage.all import *
>>> h(f)
h[2, 2]
>>> e(f.omega())
e[2, 2]
```

The Hall scalar product

The Hall scalar product on the algebra of symmetric functions makes the Schur functions into an orthonormal basis:

```
sage: f.scalar(f)
3
```

```
>>> from sage.all import *
>>> f.scalar(f)
3
```

Skewing

Skewing is the adjoint operation to multiplication with respect to this scalar product:

```
sage: f.skew_by(s[1])
2*s[2, 1] + 2*s[3]
```

```
>>> from sage.all import *
>>> f.skew_by(s[Integer(1)])
2*s[2, 1] + 2*s[3]
```

In general, `s[la].skew_by(s[mu])` is the symmetric function typically denoted $s_{\lambda\setminus\mu}$ or $s_{\lambda/\mu}$.

Expanding into variables

We can expand a symmetric function into a symmetric polynomial in a specified number of variables:

```
sage: f.expand(2)
x0^4 + 2*x0^3*x1 + 3*x0^2*x1^2 + 2*x0*x1^3 + x1^4
```

```
>>> from sage.all import *
>>> f.expand(Integer(2))
x0^4 + 2*x0^3*x1 + 3*x0^2*x1^2 + 2*x0*x1^3 + x1^4
```

See the documentation for `expand` for more examples.

The Kronecker product

As in the section on the *Representation theory of the symmetric group*, a symmetric function may be considered as a class function on the symmetric group where the elements p_μ/z_μ are the indicators of a permutation having cycle structure μ. The Kronecker product of two symmetric functions corresponds to the pointwise product of these class functions.

Since the Schur functions are the irreducible characters of the symmetric group under this identification, the Kronecker product of two Schur functions corresponds to the internal tensor product of two irreducible symmetric group representations.

Under this identification, the Kronecker product of p_μ/z_μ and p_ν/z_ν is p_μ/z_μ if $\mu = \nu$, and the result is equal to 0 otherwise.

`internal_product`, `kronecker_product`, `inner_tensor` and `itensor` are different names for the same function.

```
sage: f.kronecker_product(f)
s[1, 1, 1, 1] + 3*s[2, 1, 1] + 4*s[2, 2] + 5*s[3, 1] + 3*s[4]
```

```
>>> from sage.all import *
>>> f.kronecker_product(f)
s[1, 1, 1, 1] + 3*s[2, 1, 1] + 4*s[2, 2] + 5*s[3, 1] + 3*s[4]
```

Plethysm

The *plethysm* of symmetric functions is the operation corresponding to composition of representations of the general linear group. See [STA] Chapter 7, Appendix 2 for details.

```
sage: s[2].plethysm(s[2])
s[2, 2] + s[4]
```

```
>>> from sage.all import *
>>> s[Integer(2)].plethysm(s[Integer(2)])
s[2, 2] + s[4]
```

Plethysm can also be written as a composition of functions:

```
sage: s[2]( s[2] )
s[2, 2] + s[4]
```

```
>>> from sage.all import *
>>> s[Integer(2)]( s[Integer(2)] )
s[2, 2] + s[4]
```

If the coefficient ring contains degree 1 elements, these are handled properly by plethysm:

```
sage: R.<t> = QQ[]; s = SymmetricFunctions(R).schur()
sage: s[2]( (1-t)*s[1] )
(t^2-t)*s[1, 1] + (-t+1)*s[2]
```

```
>>> from sage.all import *
>>> R = QQ['t']; (t,) = R._first_ngens(1); s = SymmetricFunctions(R).schur()
>>> s[Integer(2)]( (Integer(1)-t)*s[Integer(1)] )
(t^2-t)*s[1, 1] + (-t+1)*s[2]
```

See the documentation for `plethysm` for more information.

Inner plethysm

The operation of inner plethysm `f.inner_plethysm(g)` models the composition of the S_n representation represented by g with the GL_m representation whose character is f. See the documentation of `inner_plethysm`, [ST94] or [STA], exercise 7.74 solutions for more information:

```
sage: s = SymmetricFunctions(QQ).schur()
sage: f = s[2]^2
sage: f.inner_plethysm(s[2])
s[2]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).schur()
>>> f = s[Integer(2)]**Integer(2)
>>> f.inner_plethysm(s[Integer(2)])
s[2]
```

Hopf algebra structure

The ring of symmetric functions is further endowed with a coalgebra structure. The coproduct is an algebra morphism, and therefore determined by its values on the generators; the power sum generators are primitive:

```
sage: p[1].coproduct()
p[] # p[1] + p[1] # p[]
sage: p[2].coproduct()
p[] # p[2] + p[2] # p[]
```

```
>>> from sage.all import *
>>> p[Integer(1)].coproduct()
p[] # p[1] + p[1] # p[]
>>> p[Integer(2)].coproduct()
p[] # p[2] + p[2] # p[]
```

The coproduct, being cocommutative on the generators, is cocommutative everywhere:

```
sage: p[2, 1].coproduct()
p[] # p[2, 1] + p[1] # p[2] + p[2] # p[1] + p[2, 1] # p[]
```

```
>>> from sage.all import *
>>> p[Integer(2), Integer(1)].coproduct()
p[] # p[2, 1] + p[1] # p[2] + p[2] # p[1] + p[2, 1] # p[]
```

This coproduct, along with the counit which sends every symmetric function to its 0-th homogeneous component, makes the ring of symmetric functions into a graded connected bialgebra. It is known that every graded connected bialgebra has an antipode. For the ring of symmetric functions, the antipode can be characterized explicitly: The antipode is an anti-algebra morphism (thus an algebra morphism, since our algebra is commutative) which sends p_λ to $(-1)^{\mathrm{length}(\lambda)} p_\lambda$ for every partition λ. Thus, in particular, it sends the generators on the p basis to their opposites:

```
sage: p[3].antipode()
-p[3]
sage: p[3,2,1].antipode()
-p[3, 2, 1]
```

```
>>> from sage.all import *
>>> p[Integer(3)].antipode()
-p[3]
>>> p[Integer(3),Integer(2),Integer(1)].antipode()
-p[3, 2, 1]
```

The graded connected bialgebra of symmetric functions over a **Q**-algebra has a rather simply-understood structure: It is (isomorphic to) the symmetric algebra of its space of primitives (which is spanned by the power-sum symmetric functions).

Here are further examples:

```
sage: f = s[2]^2
sage: f.antipode()
s[1, 1, 1, 1] + s[2, 1, 1] + s[2, 2]
sage: f.coproduct()
s[] # s[2, 2] + s[] # s[3, 1] + s[] # s[4] + 2*s[1] # s[2, 1] + 2*s[1] # s[3] +␣
↪s[1, 1] # s[1, 1]
+ s[1, 1] # s[2] + s[2] # s[1, 1] + 3*s[2] # s[2] + 2*s[2, 1] # s[1] + s[2, 2] #␣
↪s[] + 2*s[3] # s[1]
+ s[3, 1] # s[] + s[4] # s[]
sage: f.coproduct().apply_multilinear_morphism( lambda x,y: x*y.antipode() )
0
```

```
>>> from sage.all import *
>>> f = s[Integer(2)]**Integer(2)
>>> f.antipode()
s[1, 1, 1, 1] + s[2, 1, 1] + s[2, 2]
>>> f.coproduct()
s[] # s[2, 2] + s[] # s[3, 1] + s[] # s[4] + 2*s[1] # s[2, 1] + 2*s[1] # s[3] +␣
↪s[1, 1] # s[1, 1]
+ s[1, 1] # s[2] + s[2] # s[1, 1] + 3*s[2] # s[2] + 2*s[2, 1] # s[1] + s[2, 2] #␣
↪s[] + 2*s[3] # s[1]
+ s[3, 1] # s[] + s[4] # s[]
```

(continues on next page)

(continued from previous page)

```
>>> f.coproduct().apply_multilinear_morphism( lambda x,y: x*y.antipode() )
0
```

Transformations of symmetric functions

There are many methods in Sage which make it easy to manipulate symmetric functions. For example, if we have some function which acts on partitions (say, conjugation), it is a simple matter to apply it to the support of a symmetric function. Here is an example:

```
sage: conj = lambda mu: mu.conjugate()
sage: f = h[4] + 2*h[3,1]
sage: f.map_support(conj)
h[1, 1, 1, 1] + 2*h[2, 1, 1]
```

```
>>> from sage.all import *
>>> conj = lambda mu: mu.conjugate()
>>> f = h[Integer(4)] + Integer(2)*h[Integer(3),Integer(1)]
>>> f.map_support(conj)
h[1, 1, 1, 1] + 2*h[2, 1, 1]
```

We can also easily modify the coefficients:

```
sage: def foo(mu, coeff): return mu.conjugate(), -coeff
sage: f.map_item(foo)
-h[1, 1, 1, 1] - 2*h[2, 1, 1]
```

```
>>> from sage.all import *
>>> def foo(mu, coeff): return mu.conjugate(), -coeff
>>> f.map_item(foo)
-h[1, 1, 1, 1] - 2*h[2, 1, 1]
```

See also `map_coefficients`.

There are also methods for building functions directly:

```
sage: s.sum_of_monomials(mu for mu in Partitions(3))
s[1, 1, 1] + s[2, 1] + s[3]
sage: s.sum_of_monomials(Partitions(3))
s[1, 1, 1] + s[2, 1] + s[3]
sage: s.sum_of_terms( (mu, mu[0]) for mu in Partitions(3))
s[1, 1, 1] + 2*s[2, 1] + 3*s[3]
```

```
>>> from sage.all import *
>>> s.sum_of_monomials(mu for mu in Partitions(Integer(3)))
s[1, 1, 1] + s[2, 1] + s[3]
>>> s.sum_of_monomials(Partitions(Integer(3)))
s[1, 1, 1] + s[2, 1] + s[3]
>>> s.sum_of_terms( (mu, mu[Integer(0)]) for mu in Partitions(Integer(3)))
s[1, 1, 1] + 2*s[2, 1] + 3*s[3]
```

These are the preferred way to build elements within a program; the result will usually be faster than using `sum()`. It also guarantees that empty sums yields the zero of `s` (see also `s.sum`).

Note also that it is a good idea to use:

```
sage: s.one()
s[]
sage: s.zero()
0
```

```
>>> from sage.all import *
>>> s.one()
s[]
>>> s.zero()
0
```

instead of `s(1)` and `s(0)` within programs where speed is important, in order to prevent unnecessary coercions.

Different base rings

Depending on the base ring, the different realizations of the symmetric function algebra may not span the same space:

```
sage: SZ = SymmetricFunctions(ZZ)
sage: p = SZ.power(); s = SZ.schur()
sage: p(s[1,1,1])
Traceback (most recent call last):
...
TypeError: no conversion of this rational to integer
```

```
>>> from sage.all import *
>>> SZ = SymmetricFunctions(ZZ)
>>> p = SZ.power(); s = SZ.schur()
>>> p(s[Integer(1),Integer(1),Integer(1)])
Traceback (most recent call last):
...
TypeError: no conversion of this rational to integer
```

Because of this, some functions may not behave as expected when working over the integers, even though they make mathematical sense:

```
sage: s[1,1,1].plethysm(s[1,1,1])
Traceback (most recent call last):
...
TypeError: no conversion of this rational to integer
```

```
>>> from sage.all import *
>>> s[Integer(1),Integer(1),Integer(1)].plethysm(s[Integer(1),Integer(1),
↪Integer(1)])
Traceback (most recent call last):
...
TypeError: no conversion of this rational to integer
```

It is possible to work over different base rings simultaneously:

```
sage: s = SymmetricFunctions(QQ).schur()
sage: p = SymmetricFunctions(QQ).power()
sage: sz = SymmetricFunctions(ZZ).schur(); sz._prefix = 'sz'
sage: pz = SymmetricFunctions(ZZ).power(); pz._prefix = 'pz'
sage: p(sz[1,1,1])
1/6*p[1, 1, 1] - 1/2*p[2, 1] + 1/3*p[3]
sage: sz( 1/6*p[1, 1, 1] - 1/2*p[2, 1] + 1/3*p[3] )
sz[1, 1, 1]
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).schur()
>>> p = SymmetricFunctions(QQ).power()
>>> sz = SymmetricFunctions(ZZ).schur(); sz._prefix = 'sz'
>>> pz = SymmetricFunctions(ZZ).power(); pz._prefix = 'pz'
>>> p(sz[Integer(1),Integer(1),Integer(1)])
1/6*p[1, 1, 1] - 1/2*p[2, 1] + 1/3*p[3]
>>> sz( Integer(1)/Integer(6)*p[Integer(1), Integer(1), Integer(1)] - Integer(1)/
↪Integer(2)*p[Integer(2), Integer(1)] + Integer(1)/Integer(3)*p[Integer(3)] )
sz[1, 1, 1]
```

As shown in this example, if you are working over multiple base rings simultaneously, it is a good idea to change the prefix in some cases, so that you can tell from the output which realization your result is in.

Let us change the notation back for the remainder of this tutorial:

```
sage: sz._prefix = 's'
sage: pz._prefix = 'p'
```

```
>>> from sage.all import *
>>> sz._prefix = 's'
>>> pz._prefix = 'p'
```

One can also use the Sage standard renaming idiom to get shorter outputs:

```
sage: Sym = SymmetricFunctions(QQ)
sage: Sym.rename('Sym')
sage: Sym
Sym
sage: Sym.rename()
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> Sym.rename('Sym')
>>> Sym
Sym
>>> Sym.rename()
```

And we name it back:

```
sage: Sym.rename('Symmetric Functions over Rational Field'); Sym
Symmetric Functions over Rational Field
```

```
>>> from sage.all import *
>>> Sym.rename('Symmetric Functions over Rational Field'); Sym
Symmetric Functions over Rational Field
```

Other bases

There are two additional basis of the symmetric functions which are not considered as classical bases:

- forgotten basis
- Witt basis

The forgotten basis is the dual basis of the elementary symmetric functions basis with respect to the Hall scalar product. The Witt basis can be constructed by

$$\prod_{d=1}^{\infty}(1-w_d t^d)^{-1} = \sum_{n=0}^{\infty} h_n t^n$$

where t is a formal variable.

There are further bases of the ring of symmetric functions, in general over fields with parameters such as q and t:

- Hall-Littlewood bases
- Jack bases
- Macdonald bases
- k-Schur functions
- Hecke character basis

We briefly demonstrate how to access these bases. For more information, see the documentation of the individual bases.

The *Jack polynomials* can be obtained as:

```
sage: Sym = SymmetricFunctions(FractionField(QQ['t']))
sage: Jack = Sym.jack()
sage: P = Jack.P(); J = Jack.J(); Q = Jack.Q()
sage: J(P[2,1])
(1/(t+2))*JackJ[2, 1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(FractionField(QQ['t']))
>>> Jack = Sym.jack()
>>> P = Jack.P(); J = Jack.J(); Q = Jack.Q()
>>> J(P[Integer(2),Integer(1)])
(1/(t+2))*JackJ[2, 1]
```

The parameter t can be specialized as follows:

```
sage: Sym = SymmetricFunctions(QQ)
sage: Jack = Sym.jack(t = 1)
sage: P = Jack.P(); J = Jack.J(); Q = Jack.Q()
sage: J(P[2,1])
1/3*JackJ[2, 1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> Jack = Sym.jack(t = Integer(1))
>>> P = Jack.P(); J = Jack.J(); Q = Jack.Q()
>>> J(P[Integer(2),Integer(1)])
1/3*JackJ[2, 1]
```

Similarly one can access the Hall-Littlewood and Macdonald polynomials, etc:

```
sage: Sym = SymmetricFunctions(FractionField(QQ['q','t']))
sage: Mcd = Sym.macdonald()
sage: P = Mcd.P(); J = Mcd.J(); Q = Mcd.Q()
sage: J(P[2,1])
(1/(-q*t^4+2*q*t^3-q*t^2+t^2-2*t+1))*McdJ[2, 1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(FractionField(QQ['q','t']))
>>> Mcd = Sym.macdonald()
>>> P = Mcd.P(); J = Mcd.J(); Q = Mcd.Q()
>>> J(P[Integer(2),Integer(1)])
(1/(-q*t^4+2*q*t^3-q*t^2+t^2-2*t+1))*McdJ[2, 1]
```

We can also construct the $\bar{q}$ basis that can be used to determine character tables for Hecke algebras (with quadratic relation $T_i^2 = (1-q)T_i + q$):

```
sage: Sym = SymmetricFunctions(ZZ['q'].fraction_field())
sage: qbar = Sym.hecke_character()
sage: s = Sym.s()
sage: s(qbar[2,1])
-s[1, 1, 1] + (q-1)*s[2, 1] + q*s[3]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ['q'].fraction_field())
>>> qbar = Sym.hecke_character()
>>> s = Sym.s()
>>> s(qbar[Integer(2),Integer(1)])
-s[1, 1, 1] + (q-1)*s[2, 1] + q*s[3]
```

k-Schur functions

The k-Schur functions live in the k-bounded subspace of the ring of symmetric functions. It is possible to compute in the k-bounded subspace directly:

```
sage: Sym = SymmetricFunctions(QQ)
sage: ks = Sym.kschur(3,1)
sage: f = ks[2,1]*ks[2,1]; f
ks3[2, 2, 1, 1] + ks3[2, 2, 2] + ks3[3, 1, 1, 1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> ks = Sym.kschur(Integer(3),Integer(1))
>>> f = ks[Integer(2),Integer(1)]*ks[Integer(2),Integer(1)]; f
ks3[2, 2, 1, 1] + ks3[2, 2, 2] + ks3[3, 1, 1, 1]
```

or to lift to the ring of symmetric functions:

```
sage: f.lift()
s[2, 2, 1, 1] + s[2, 2, 2] + s[3, 1, 1, 1] + 2*s[3, 2, 1] + s[3, 3] + s[4, 1, 1]␣
↪+ s[4, 2]
```

```
>>> from sage.all import *
>>> f.lift()
s[2, 2, 1, 1] + s[2, 2, 2] + s[3, 1, 1, 1] + 2*s[3, 2, 1] + s[3, 3] + s[4, 1, 1]␣
↪+ s[4, 2]
```

However, it is not always possible to convert a symmetric function to the k-bounded subspace:

```
sage: s = Sym.schur()
sage: ks(s[2,1,1])
Traceback (most recent call last):
...
ValueError: s[2, 1, 1] is not in the image
```

```
>>> from sage.all import *
>>> s = Sym.schur()
>>> ks(s[Integer(2),Integer(1),Integer(1)])
Traceback (most recent call last):
...
ValueError: s[2, 1, 1] is not in the image
```

The k-Schur functions are more generally defined with a parameter t and they are a basis of the subspace spanned by the Hall-Littlewood `Qp` symmetric functions indexed by partitions whose first part is less than or equal to k:

```
sage: Sym = SymmetricFunctions(QQ['t'].fraction_field())
sage: SymS3 = Sym.kBoundedSubspace(3) # default t='t'
sage: ks = SymS3.kschur()
sage: Qp = Sym.hall_littlewood().Qp()
sage: ks(Qp[2,1,1,1])
ks3[2, 1, 1, 1] + (t^2+t)*ks3[2, 2, 1] + (t^3+t^2)*ks3[3, 1, 1] + t^4*ks3[3, 2]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ['t'].fraction_field())
>>> SymS3 = Sym.kBoundedSubspace(Integer(3)) # default t='t'
>>> ks = SymS3.kschur()
>>> Qp = Sym.hall_littlewood().Qp()
>>> ks(Qp[Integer(2),Integer(1),Integer(1),Integer(1)])
ks3[2, 1, 1, 1] + (t^2+t)*ks3[2, 2, 1] + (t^3+t^2)*ks3[3, 1, 1] + t^4*ks3[3, 2]
```

The subspace spanned by the k-Schur functions with a parameter t are not known to form a natural algebra. However it is known that the product of a k-Schur function and an ℓ-Schur function is in the linear span of the $k + \ell$-Schur functions:

```
sage: ks(ks[2,1]*ks[1,1])
Traceback (most recent call last):
...
ValueError: s[2, 1, 1, 1] + s[2, 2, 1] + s[3, 1, 1] + s[3, 2] is not in the image
sage: ks[2,1]*ks[1,1]
```

(continues on next page)

(continued from previous page)

```
s[2, 1, 1, 1] + s[2, 2, 1] + s[3, 1, 1] + s[3, 2]
sage: ks6 = Sym.kBoundedSubspace(6).kschur()
sage: ks6(ks[3,1,1]*ks[3])
ks6[3, 3, 1, 1] + ks6[4, 2, 1, 1] + (t+1)*ks6[4, 3, 1] + t*ks6[4, 4]
+ ks6[5, 1, 1, 1] + ks6[5, 2, 1] + t*ks6[5, 3] + ks6[6, 1, 1]
```

```
>>> from sage.all import *
>>> ks(ks[Integer(2),Integer(1)]*ks[Integer(1),Integer(1)])
Traceback (most recent call last):
...
ValueError: s[2, 1, 1, 1] + s[2, 2, 1] + s[3, 1, 1] + s[3, 2] is not in the image
>>> ks[Integer(2),Integer(1)]*ks[Integer(1),Integer(1)]
s[2, 1, 1, 1] + s[2, 2, 1] + s[3, 1, 1] + s[3, 2]
>>> ks6 = Sym.kBoundedSubspace(Integer(6)).kschur()
>>> ks6(ks[Integer(3),Integer(1),Integer(1)]*ks[Integer(3)])
ks6[3, 3, 1, 1] + ks6[4, 2, 1, 1] + (t+1)*ks6[4, 3, 1] + t*ks6[4, 4]
+ ks6[5, 1, 1, 1] + ks6[5, 2, 1] + t*ks6[5, 3] + ks6[6, 1, 1]
```

The k-split basis is a second basis of the ring spanned by the k-Schur functions with a parameter t. The k-split basis has the property that $Q'_\lambda[X;t]$ expands positively in the k-split basis and the k-split basis conjecturally expands positively in the k-Schur functions. The definition can be found in [LLMSSZ] p. 81.:

```
sage: ksp3 = SymS3.ksplit()
sage: ksp3(Qp[2,1,1,1])
ksp3[2, 1, 1, 1] + t^2*ksp3[2, 2, 1] + (t^3+t^2)*ksp3[3, 1, 1] + t^4*ksp3[3, 2]
sage: [ks(ksp3(la)) for la in sorted(ksp3(Qp[2,1,1,1]).support())]
[ks3[2, 1, 1, 1] + t*ks3[2, 2, 1], ks3[2, 2, 1], ks3[3, 1, 1], ks3[3, 2]]
```

```
>>> from sage.all import *
>>> ksp3 = SymS3.ksplit()
>>> ksp3(Qp[Integer(2),Integer(1),Integer(1),Integer(1)])
ksp3[2, 1, 1, 1] + t^2*ksp3[2, 2, 1] + (t^3+t^2)*ksp3[3, 1, 1] + t^4*ksp3[3, 2]
>>> [ks(ksp3(la)) for la in sorted(ksp3(Qp[Integer(2),Integer(1),Integer(1),
↪Integer(1)]).support())]
[ks3[2, 1, 1, 1] + t*ks3[2, 2, 1], ks3[2, 2, 1], ks3[3, 1, 1], ks3[3, 2]]
```

dual k-Schur functions

The dual space to the subspace spanned by the k-Schur functions is most naturally realized as a quotient of the ring of symmetric functions by an ideal. When $t = 1$ the ideal is generated by the monomial symmetric functions indexed by partitions whose first part is greater than k.:

```
sage: Sym = SymmetricFunctions(QQ)
sage: SymQ3 = Sym.kBoundedQuotient(3,t=1)
sage: km = SymQ3.kmonomial()
sage: km[2,1]*km[2,1]
4*m3[2, 2, 1, 1] + 6*m3[2, 2, 2] + 2*m3[3, 2, 1] + 2*m3[3, 3]
sage: F = SymQ3.affineSchur()
sage: F[2,1]*F[2,1]
2*F3[1, 1, 1, 1, 1, 1] + 4*F3[2, 1, 1, 1, 1] + 4*F3[2, 2, 1, 1] + 4*F3[2, 2, 2]
+ 2*F3[3, 1, 1, 1] + 4*F3[3, 2, 1] + 2*F3[3, 3]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> SymQ3 = Sym.kBoundedQuotient(Integer(3),t=Integer(1))
>>> km = SymQ3.kmonomial()
>>> km[Integer(2),Integer(1)]*km[Integer(2),Integer(1)]
4*m3[2, 2, 1, 1] + 6*m3[2, 2, 2] + 2*m3[3, 2, 1] + 2*m3[3, 3]
>>> F = SymQ3.affineSchur()
>>> F[Integer(2),Integer(1)]*F[Integer(2),Integer(1)]
2*F3[1, 1, 1, 1, 1, 1] + 4*F3[2, 1, 1, 1, 1] + 4*F3[2, 2, 1, 1] + 4*F3[2, 2, 2]
+ 2*F3[3, 1, 1, 1] + 4*F3[3, 2, 1] + 2*F3[3, 3]
```

When t is not equal to 1, the subspace spanned by the k-Schur functions is realized as a quotient of the ring of symmetric functions by the ideal generated by the Hall-Littlewood symmetric functions in the P basis indexed by partitions with first part greater than k.:

```
sage: Sym = SymmetricFunctions(FractionField(QQ['t']))
sage: SymQ3 = Sym.kBoundedQuotient(3)
sage: kHLP = SymQ3.kHallLittlewoodP()
sage: kHLP[2,1]*kHLP[2,1]
(t^2+2*t+1)*HLP3[2, 2, 1, 1] + (t^3+2*t^2+2*t+1)*HLP3[2, 2, 2]
+ (-t^4-t^3+t+1)*HLP3[3, 1, 1, 1] + (-t^2+t+2)*HLP3[3, 2, 1] + (t+1)*HLP3[3, 3]
sage: HLP = Sym.hall_littlewood().P()
sage: kHLP(HLP[3,1])
HLP3[3, 1]
sage: kHLP(HLP[4])
0
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(FractionField(QQ['t']))
>>> SymQ3 = Sym.kBoundedQuotient(Integer(3))
>>> kHLP = SymQ3.kHallLittlewoodP()
>>> kHLP[Integer(2),Integer(1)]*kHLP[Integer(2),Integer(1)]
(t^2+2*t+1)*HLP3[2, 2, 1, 1] + (t^3+2*t^2+2*t+1)*HLP3[2, 2, 2]
+ (-t^4-t^3+t+1)*HLP3[3, 1, 1, 1] + (-t^2+t+2)*HLP3[3, 2, 1] + (t+1)*HLP3[3, 3]
>>> HLP = Sym.hall_littlewood().P()
>>> kHLP(HLP[Integer(3),Integer(1)])
HLP3[3, 1]
>>> kHLP(HLP[Integer(4)])
0
```

In this space, the basis which is dual to the k-Schur functions conjecturally expands positively in the k-bounded Hall-Littlewood functions and has positive structure coefficients.:

```
sage: dks = SymQ3.dual_k_Schur()
sage: kHLP(dks[2,2])
(t^4+t^2)*HLP3[1, 1, 1, 1] + t*HLP3[2, 1, 1] + HLP3[2, 2]
sage: dks[2,1]*dks[1,1]
(t^2+t)*dks3[1, 1, 1, 1, 1] + (t+1)*dks3[2, 1, 1, 1] + (t+1)*dks3[2, 2, 1]
+ dks3[3, 1, 1] + dks3[3, 2]
```

```
>>> from sage.all import *
>>> dks = SymQ3.dual_k_Schur()
>>> kHLP(dks[Integer(2),Integer(2)])
```

(continues on next page)

(continued from previous page)

```
(t^4+t^2)*HLP3[1, 1, 1, 1] + t*HLP3[2, 1, 1] + HLP3[2, 2]
>>> dks[Integer(2),Integer(1)]*dks[Integer(1),Integer(1)]
(t^2+t)*dks3[1, 1, 1, 1, 1] + (t+1)*dks3[2, 1, 1, 1] + (t+1)*dks3[2, 2, 1]
+ dks3[3, 1, 1] + dks3[3, 2]
```

At $t = 1$ the k-bounded Hall-Littlewood basis is equal to the k-bounded monomial basis and the dual k-Schur elements are equal to the affine Schur basis. The k-bounded monomial basis and affine Schur functions are faster and should be used instead of the k-bounded Hall-Littlewood P basis and dual k-Schur functions when $t = 1$.:

```
sage: SymQ3 = Sym.kBoundedQuotient(3,t=1)
sage: dks = SymQ3.dual_k_Schur()
sage: F = SymQ3.affineSchur()
sage: F[3,1]==dks[3,1]
True
```

```
>>> from sage.all import *
>>> SymQ3 = Sym.kBoundedQuotient(Integer(3),t=Integer(1))
>>> dks = SymQ3.dual_k_Schur()
>>> F = SymQ3.affineSchur()
>>> F[Integer(3),Integer(1)]==dks[Integer(3),Integer(1)]
True
```

Implementing new bases

In order to implement a new symmetric function basis, Sage will need to know at a minimum how to change back and forth between at least one other basis (although they do not necessarily have to be the same basis). All of the standard functions associated with the basis will have a default implementation (although a more specific implementation may be more efficient).

To present an idea of how this is done, we will create here the example of how to implement the basis $s_\mu[X(1-t)]$.

To begin, we import the class *sage.combinat.sf.sfa.SymmetricFunctionAlgebra_generic()*. Our new basis will inherit all of the default methods from this class:

```
sage: from sage.combinat.sf.sfa import SymmetricFunctionAlgebra_generic as SFA_
↪generic
```

```
>>> from sage.all import *
>>> from sage.combinat.sf.sfa import SymmetricFunctionAlgebra_generic as SFA_
↪generic
```

Now the basis we are creating has a parameter t which is possible to specialize. In this example we will convert to and from the Schur basis. For this we implement methods `_self_to_s` and `_s_to_self`. By registering these two functions as coercions, Sage then knows automatically how it possible to change between any two bases for which there is a path of changes of bases.

```
sage: from sage.categories.morphism import SetMorphism
sage: class SFA_st(SFA_generic):
....:     def __init__(self, Sym, t):
....:         SFA_generic.__init__(self, Sym, basis_name=
....:           "Schur functions with a plethystic substitution of X -> X(1-t)",
....:           prefix='st')
....:         self._s = Sym.s()
```

(continues on next page)

(continued from previous page)

```
....:         self.t = Sym.base_ring()(t)
....:         cat = HopfAlgebras(Sym.base_ring()).WithBasis()
....:         self.register_coercion(
....:           SetMorphism(Hom(self._s, self, cat), self._s_to_self))
....:         self._s.register_coercion(
....:           SetMorphism(Hom(self, self._s, cat), self._self_to_s))
....:     def _s_to_self(self, f):
....:         # f is a Schur function and the output is in the st basis
....:         return self._from_dict(f.theta_qt(0,self.t)._monomial_coefficients)
....:     def _self_to_s(self, f):
....:         # f is in the st basis and the output is in the Schur basis
....:         return self._s.sum(cmu*self._s(mu).theta_qt(self.t,0) for mu,cmu in␣
↪f)
....:     class Element(SFA_generic.Element):
....:         pass
```

```
>>> from sage.all import *
>>> from sage.categories.morphism import SetMorphism
>>> class SFA_st(SFA_generic):
...     def __init__(self, Sym, t):
...         SFA_generic.__init__(self, Sym, basis_name=
...           "Schur functions with a plethystic substitution of X -> X(1-t)",
...           prefix='st')
...         self._s = Sym.s()
...         self.t = Sym.base_ring()(t)
...         cat = HopfAlgebras(Sym.base_ring()).WithBasis()
...         self.register_coercion(
...           SetMorphism(Hom(self._s, self, cat), self._s_to_self))
...         self._s.register_coercion(
...           SetMorphism(Hom(self, self._s, cat), self._self_to_s))
...     def _s_to_self(self, f):
...         # f is a Schur function and the output is in the st basis
...         return self._from_dict(f.theta_qt(Integer(0),self.t)._monomial_
↪coefficients)
...     def _self_to_s(self, f):
...         # f is in the st basis and the output is in the Schur basis
...         return self._s.sum(cmu*self._s(mu).theta_qt(self.t,Integer(0)) for mu,
↪cmu in f)
...     class Element(SFA_generic.Element):
...         pass
```

An instance of this basis is created by calling it with a symmetric function ring `Sym` and a parameter `t` which is in the base ring of `Sym`. The `Element` class inherits all of the methods from *sage.combinat.sf.sfa.SymmetricFunctionAlgebra_generic_Element*.

In the reference [MAC] on page 354, this basis is denoted $S_\lambda(x;t)$ and the change of basis coefficients of the Macdonald `J` basis are the coefficients $K_{\lambda\mu}(q,t)$. Here is an example of its use:

```
sage: QQqt = QQ['q','t'].fraction_field()
sage: q, t = QQqt.gens()
sage: st = SFA_st(SymmetricFunctions(QQqt),t)
sage: st
```

(continues on next page)

(continued from previous page)

```
Symmetric Functions over Fraction Field of Multivariate Polynomial
 Ring in q, t over Rational Field in the Schur functions with a
 plethystic substitution of X -> X(1-t) basis
sage: st[2,1] * st[1]
st[2, 1, 1] + st[2, 2] + st[3, 1]
sage: st([2]).coproduct()
st[] # st[2] + st[1] # st[1] + st[2] # st[]
sage: J = st.symmetric_function_ring().macdonald().J()
sage: st(J[2,1])
q*st[1, 1, 1] + (q*t+1)*st[2, 1] + t*st[3]
```

```
>>> from sage.all import *
>>> QQqt = QQ['q','t'].fraction_field()
>>> q, t = QQqt.gens()
>>> st = SFA_st(SymmetricFunctions(QQqt),t)
>>> st
Symmetric Functions over Fraction Field of Multivariate Polynomial

 plethystic substitution of X -> X(1-t) basis
>>> st[Integer(2),Integer(1)] * st[Integer(1)]
st[2, 1, 1] + st[2, 2] + st[3, 1]
>>> st([Integer(2)]).coproduct()
st[] # st[2] + st[1] # st[1] + st[2] # st[]
>>> J = st.symmetric_function_ring().macdonald().J()
>>> st(J[Integer(2),Integer(1)])
q*st[1, 1, 1] + (q*t+1)*st[2, 1] + t*st[3]
```

Acknowledgements

The design is heavily inspired from the implementation of symmetric functions in MuPAD-Combinat (see [HT04] and [FD06]).

REFERENCES:

Further tests

Todo

- Introduce fields with degree 1 elements as in MuPAD-Combinat, to get proper plethysm.
- Use UniqueRepresentation to get rid of all the manual cache handling for the bases
- Devise a mechanism so that pickling bases of symmetric functions pickles the coercions which have a cache.

Schur()

alias of *schur()*.

Witt()

alias of *witt()*.

a_realization()

Return a particular realization of `self` (the Schur basis).

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: Sym.a_realization()
Symmetric Functions over Rational Field in the Schur basis
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> Sym.a_realization()
Symmetric Functions over Rational Field in the Schur basis
```

abreu_nigro(*q='q'*)

The Abreu-Nigro basis of the Symmetric Functions.

EXAMPLES:

```
sage: q = ZZ['q'].fraction_field().gen()
sage: SymmetricFunctions(q.parent()).abreu_nigro()
Symmetric Functions over Fraction Field of Univariate Polynomial Ring in q␣
↪over Integer Ring in the Abreu-Nigro basis
```

```
>>> from sage.all import *
>>> q = ZZ['q'].fraction_field().gen()
>>> SymmetricFunctions(q.parent()).abreu_nigro()
Symmetric Functions over Fraction Field of Univariate Polynomial Ring in q␣
↪over Integer Ring in the Abreu-Nigro basis
```

complete()

The complete basis of the Symmetric Functions.

EXAMPLES:

```
sage: SymmetricFunctions(QQ).complete()
Symmetric Functions over Rational Field in the homogeneous basis
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ).complete()
Symmetric Functions over Rational Field in the homogeneous basis
```

e()

alias of *elementary()*.

elementary()

The elementary basis of the Symmetric Functions.

EXAMPLES:

```
sage: SymmetricFunctions(QQ).elementary()
Symmetric Functions over Rational Field in the elementary basis
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ).elementary()
Symmetric Functions over Rational Field in the elementary basis
```

f()

alias of *forgotten()*.

forgotten()

The forgotten basis of the Symmetric Functions (or the basis dual to the elementary basis with respect to the Hall scalar product).

EXAMPLES:

```
sage: SymmetricFunctions(QQ).forgotten()
Symmetric Functions over Rational Field in the forgotten basis
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ).forgotten()
Symmetric Functions over Rational Field in the forgotten basis
```

from_polynomial(*f*)

Convert a symmetric polynomial `f` to a symmetric function.

INPUT:

- `f` – a symmetric polynomial

This function converts a symmetric polynomial f in a polynomial ring in finitely many variables to a symmetric function in the monomial basis of the ring of symmetric functions over the same base ring.

EXAMPLES:

```
sage: P = PolynomialRing(QQ, 'x', 3)
sage: x = P.gens()
sage: f = x[0] + x[1] + x[2]
sage: S = SymmetricFunctions(QQ)
sage: S.from_polynomial(f)
m[1]

sage: f = x[0] + 2*x[1] + x[2]
sage: S.from_polynomial(f)
Traceback (most recent call last):
...
ValueError: x0 + 2*x1 + x2 is not a symmetric polynomial
```

```
>>> from sage.all import *
>>> P = PolynomialRing(QQ, 'x', Integer(3))
>>> x = P.gens()
>>> f = x[Integer(0)] + x[Integer(1)] + x[Integer(2)]
>>> S = SymmetricFunctions(QQ)
>>> S.from_polynomial(f)
m[1]

>>> f = x[Integer(0)] + Integer(2)*x[Integer(1)] + x[Integer(2)]
>>> S.from_polynomial(f)
Traceback (most recent call last):
...
ValueError: x0 + 2*x1 + x2 is not a symmetric polynomial
```

h()

alias of *complete()*.

hall_littlewood(*t='t'*)

Return the entry point for the various Hall-Littlewood bases.

INPUT:

- `t` – parameter

Hall-Littlewood symmetric functions including bases P, Q, Qp. The Hall-Littlewood P and Q functions at $t = -1$ are the Schur-P and Schur-Q functions when indexed by strict partitions.

The parameter t must be in the base ring of parent.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(FractionField(QQ['t']))
sage: P = Sym.hall_littlewood().P(); P
Symmetric Functions over Fraction Field of Univariate Polynomial
Ring in t over Rational Field in the Hall-Littlewood P basis
sage: P[2]
HLP[2]
sage: Q = Sym.hall_littlewood().Q(); Q
Symmetric Functions over Fraction Field of Univariate Polynomial
Ring in t over Rational Field in the Hall-Littlewood Q basis
sage: Q[2]
HLQ[2]
sage: Qp = Sym.hall_littlewood().Qp(); Qp
Symmetric Functions over Fraction Field of Univariate Polynomial
Ring in t over Rational Field in the Hall-Littlewood Qp basis
sage: Qp[2]
HLQp[2]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(FractionField(QQ['t']))
>>> P = Sym.hall_littlewood().P(); P
Symmetric Functions over Fraction Field of Univariate Polynomial
Ring in t over Rational Field in the Hall-Littlewood P basis
>>> P[Integer(2)]
HLP[2]
>>> Q = Sym.hall_littlewood().Q(); Q
Symmetric Functions over Fraction Field of Univariate Polynomial
Ring in t over Rational Field in the Hall-Littlewood Q basis
>>> Q[Integer(2)]
HLQ[2]
>>> Qp = Sym.hall_littlewood().Qp(); Qp
Symmetric Functions over Fraction Field of Univariate Polynomial
Ring in t over Rational Field in the Hall-Littlewood Qp basis
>>> Qp[Integer(2)]
HLQp[2]
```

hecke_character(*q='q'*)

The basis of symmetric functions that determines the character tables for Hecke algebras.

EXAMPLES:

```
sage: SymmetricFunctions(ZZ['q'].fraction_field()).hecke_character()
Symmetric Functions over
 Fraction Field of Univariate Polynomial Ring in q over Integer Ring
 in the Hecke character with q=q basis
sage: SymmetricFunctions(QQ).hecke_character(1/2)
Symmetric Functions over Rational Field in the Hecke character with q=1/2␣
↪basis
```

```
>>> from sage.all import *
>>> SymmetricFunctions(ZZ['q'].fraction_field()).hecke_character()
Symmetric Functions over
 Fraction Field of Univariate Polynomial Ring in q over Integer Ring
 in the Hecke character with q=q basis
>>> SymmetricFunctions(QQ).hecke_character(Integer(1)/Integer(2))
Symmetric Functions over Rational Field in the Hecke character with q=1/2␣
↪basis
```

homogeneous()

alias of *complete()*.

ht()

alias of *induced_trivial_character()*.

induced_trivial_character()

The induced trivial character basis of the Symmetric Functions.

The trivial character of

$$S_{n-|\lambda|} \times S_{\lambda_1} \times S_{\lambda_2} \times \cdots \times S_{\lambda_{\ell}(\lambda)}$$

induced to the group S_n is a symmetric function in the eigenvalues of a permutation matrix. This basis is that character.

It has the property that if the element indexed by the partition λ is evaluated at the roots of a permutation of cycle structure ρ then the value is the coefficient $\langle h_{(n-|\lambda|,\lambda)}, p_\rho \rangle$.

In terms of methods that are implemented in Sage, if `n` is a sufficiently large integer, then `ht(lam).character_to_frobenius_image(n)` is equal the complete function indexed by `[n-sum(lam)]+lam`.

This basis is introduced in [OZ2015].

See also

character_to_frobenius_image(), *eval_at_permutation_roots()*

EXAMPLES:

```
sage: SymmetricFunctions(QQ).induced_trivial_character()
Symmetric Functions over Rational Field in the induced trivial symmetric␣
↪group character basis
sage: ht = SymmetricFunctions(QQ).ht()
sage: h = SymmetricFunctions(QQ).h()
sage: h(ht([3,2]).character_to_frobenius_image(9))
h[4, 3, 2]
```

(continues on next page)

(continued from previous page)

```
sage: h(ht([3,2]).character_to_frobenius_image(7))
h[3, 2, 2]
sage: h(ht([3,2]).character_to_frobenius_image(5))
h[3, 2]
sage: h(ht([3,2]).character_to_frobenius_image(4))
0
sage: p = SymmetricFunctions(QQ).p()
sage: [h([4,1]).scalar(p(rho)) for rho in Partitions(5)]
[0, 1, 0, 2, 1, 3, 5]
sage: [ht([1]).eval_at_permutation_roots(rho) for rho in Partitions(5)]
[0, 1, 0, 2, 1, 3, 5]
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ).induced_trivial_character()
Symmetric Functions over Rational Field in the induced trivial symmetric␣
↪group character basis
>>> ht = SymmetricFunctions(QQ).ht()
>>> h = SymmetricFunctions(QQ).h()
>>> h(ht([Integer(3),Integer(2)]).character_to_frobenius_image(Integer(9)))
h[4, 3, 2]
>>> h(ht([Integer(3),Integer(2)]).character_to_frobenius_image(Integer(7)))
h[3, 2, 2]
>>> h(ht([Integer(3),Integer(2)]).character_to_frobenius_image(Integer(5)))
h[3, 2]
>>> h(ht([Integer(3),Integer(2)]).character_to_frobenius_image(Integer(4)))
0
>>> p = SymmetricFunctions(QQ).p()
>>> [h([Integer(4),Integer(1)]).scalar(p(rho)) for rho in␣
↪Partitions(Integer(5))]
[0, 1, 0, 2, 1, 3, 5]
>>> [ht([Integer(1)]).eval_at_permutation_roots(rho) for rho in␣
↪Partitions(Integer(5))]
[0, 1, 0, 2, 1, 3, 5]
```

irreducible_rook_character()

The irreducible character basis of the rook monoid as symmetric functions.

It might also be called the induced irreducible character basis because it is the character of an irreducible S_k module induced to S_n where $n > k$.

The formula for the rook irreducible character basis indexed by the partition `lam` is given by the formula

$$\sum_{\gamma} \langle s_\lambda, p_\gamma \rangle \frac{\overline{\mathbf{p}}_\gamma}{z_\gamma},$$

where if $\gamma = (1^{m_1} 2^{m_2} \cdots \ell^{m_\ell})$ then

$$\overline{\mathbf{p}}_\gamma = \prod_{i \geq 1} i^{m_i} \prod_{n=0}^{m_i - 1} \left(\left(\frac{1}{i} \sum_{d|i} \mu(i/d) p_d \right) - n \right).$$

Let ϕ_n be the Frobenius image of the symmetric function as a character, then

$$\phi_n(\tilde{x}_\lambda) = s_\lambda s_{n-|\lambda|}$$

This basis appears implicitly in a paper by Assaf and Speyer [AS2020]. The basis appears explicitly in a paper by Orellana and Zabrocki [OZ2019].

```

irreducible_symmetric_group_character()

The irreducible S_n character basis of the Symmetric Functions.

This basis has the property that if the element indexed by the partition λ is evaluated at the roots of a permutation of cycle structure ρ then the value is the irreducible character $\chi^{(|\rho|-|\lambda|,\lambda)}(\rho)$.

In terms of methods that are implemented in Sage, if `n` is a sufficiently large integer, then `st(lam)`.

`character_to_frobenius_image(n)` is equal the Schur function indexed by `[n-sum(lam)]+lam`.

This basis is introduced in [OZ2015].

[4, 2, 0, 1, -1, 0, -1]
>>> list(reversed([st([Integer(1)]).eval_at_permutation_roots(rho)
...   for rho in Partitions(Integer(5))]))
[4, 2, 0, 1, -1, 0, -1]
```

jack(*t='t'*)

Return the entry point for the various Jack bases.

INPUT:

- `t` – parameter

Jack symmetric functions including bases P, Q, Qp.

The parameter t must be in the base ring of parent.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(FractionField(QQ['t']))
sage: JP = Sym.jack().P(); JP
Symmetric Functions over Fraction Field of Univariate Polynomial Ring in t␣
↪over Rational Field in the Jack P basis
sage: JQ = Sym.jack().Q(); JQ
Symmetric Functions over Fraction Field of Univariate Polynomial Ring in t␣
↪over Rational Field in the Jack Q basis
sage: JJ = Sym.jack().J(); JJ
Symmetric Functions over Fraction Field of Univariate Polynomial Ring in t␣
↪over Rational Field in the Jack J basis
sage: JQp = Sym.jack().Qp(); JQp
Symmetric Functions over Fraction Field of Univariate Polynomial Ring in t␣
↪over Rational Field in the Jack Qp basis
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(FractionField(QQ['t']))
>>> JP = Sym.jack().P(); JP
Symmetric Functions over Fraction Field of Univariate Polynomial Ring in t␣
↪over Rational Field in the Jack P basis
>>> JQ = Sym.jack().Q(); JQ
Symmetric Functions over Fraction Field of Univariate Polynomial Ring in t␣
↪over Rational Field in the Jack Q basis
>>> JJ = Sym.jack().J(); JJ
Symmetric Functions over Fraction Field of Univariate Polynomial Ring in t␣
↪over Rational Field in the Jack J basis
>>> JQp = Sym.jack().Qp(); JQp
Symmetric Functions over Fraction Field of Univariate Polynomial Ring in t␣
↪over Rational Field in the Jack Qp basis
```

kBoundedQuotient(*k*, *t='t'*)

Return the k-bounded quotient space of the ring of symmetric functions.

INPUT:

- `k` – positive integer

The quotient of the ring of symmetric functions …

See also

sage.combinat.sf.k_dual.KBoundedQuotient()

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: KQ = Sym.kBoundedQuotient(3); KQ
Traceback (most recent call last):
...
TypeError: unable to convert 't' to a rational
sage: KQ = Sym.kBoundedQuotient(3,t=1); KQ
3-Bounded Quotient of Symmetric Functions over Rational Field with t=1
sage: Sym = SymmetricFunctions(QQ['t'].fraction_field())
```

(continues on next page)

(continued from previous page)

```
sage: KQ = Sym.kBoundedQuotient(3); KQ
3-Bounded Quotient of Symmetric Functions over Fraction Field of Univariate␣
↪Polynomial Ring in t over Rational Field
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> KQ = Sym.kBoundedQuotient(Integer(3)); KQ
Traceback (most recent call last):
...
TypeError: unable to convert 't' to a rational
>>> KQ = Sym.kBoundedQuotient(Integer(3),t=Integer(1)); KQ
3-Bounded Quotient of Symmetric Functions over Rational Field with t=1
>>> Sym = SymmetricFunctions(QQ['t'].fraction_field())
>>> KQ = Sym.kBoundedQuotient(Integer(3)); KQ
3-Bounded Quotient of Symmetric Functions over Fraction Field of Univariate␣
↪Polynomial Ring in t over Rational Field
```

kBoundedSubspace(*k*, *t='t'*)

Return the k-bounded subspace of the ring of symmetric functions.

INPUT:

- `k` – positive integer
- `t` – a formal parameter; $t = 1$ yields a subring

The subspace of the ring of symmetric functions spanned by $\{s_\lambda[X/(1-t)]\}_{\lambda_1 \leq k} = \{s^{(k)}_\lambda[X,t]\}_{\lambda_1 \leq k}$ over the base ring $\mathbf{Q}[t]$. When $t = 1$, this space is in fact a subalgebra of the ring of symmetric functions generated by the complete homogeneous symmetric functions h_i for $1 \leq i \leq k$.

See also

sage.combinat.sf.new_kschur.KBoundedSubspace()

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: KB = Sym.kBoundedSubspace(3,1); KB
3-bounded Symmetric Functions over Rational Field with t=1

sage: Sym = SymmetricFunctions(QQ['t'])
sage: Sym.kBoundedSubspace(3)
3-bounded Symmetric Functions over Univariate Polynomial Ring in t over␣
↪Rational Field

sage: Sym = SymmetricFunctions(QQ['z'])
sage: z = Sym.base_ring().gens()[0]
sage: Sym.kBoundedSubspace(3,t=z)
3-bounded Symmetric Functions over Univariate Polynomial Ring in z over␣
↪Rational Field with t=z
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> KB = Sym.kBoundedSubspace(Integer(3),Integer(1)); KB
3-bounded Symmetric Functions over Rational Field with t=1

>>> Sym = SymmetricFunctions(QQ['t'])
>>> Sym.kBoundedSubspace(Integer(3))
3-bounded Symmetric Functions over Univariate Polynomial Ring in t over␣
↪Rational Field

>>> Sym = SymmetricFunctions(QQ['z'])
>>> z = Sym.base_ring().gens()[Integer(0)]
>>> Sym.kBoundedSubspace(Integer(3),t=z)
3-bounded Symmetric Functions over Univariate Polynomial Ring in z over␣
↪Rational Field with t=z
```

khomogeneous(k)

Return the homogeneous symmetric functions in the k-bounded subspace.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: kh = Sym.khomogeneous(4)
sage: kh[3]*kh[4]
h4[4, 3]
sage: kh[4].lift()
h[4]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> kh = Sym.khomogeneous(Integer(4))
>>> kh[Integer(3)]*kh[Integer(4)]
h4[4, 3]
>>> kh[Integer(4)].lift()
h[4]
```

kschur(k, t='t')

Return the k-Schur functions.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: ks = Sym.kschur(3,1)
sage: ks[2]*ks[2]
ks3[2, 2] + ks3[3, 1]
sage: ks[2,1,1].lift()
s[2, 1, 1] + s[3, 1]

sage: Sym = SymmetricFunctions(QQ['t'])
sage: ks = Sym.kschur(3)
sage: ks[2,2,1].lift()
s[2, 2, 1] + t*s[3, 2]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> ks = Sym.kschur(Integer(3),Integer(1))
>>> ks[Integer(2)]*ks[Integer(2)]
ks3[2, 2] + ks3[3, 1]
>>> ks[Integer(2),Integer(1),Integer(1)].lift()
s[2, 1, 1] + s[3, 1]

>>> Sym = SymmetricFunctions(QQ['t'])
>>> ks = Sym.kschur(Integer(3))
>>> ks[Integer(2),Integer(2),Integer(1)].lift()
s[2, 2, 1] + t*s[3, 2]
```

ksplit(k, t='t')

Return the k-split basis of the k-bounded subspace.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: ksp = Sym.ksplit(3,1)
sage: ksp[2]*ksp[2]
ksp3[2, 2] + ksp3[3, 1]
sage: ksp[2,1,1].lift()
s[2, 1, 1] + s[2, 2] + s[3, 1]

sage: Sym = SymmetricFunctions(QQ['t'])
sage: ksp = Sym.ksplit(3)
sage: ksp[2,1,1].lift()
s[2, 1, 1] + t*s[2, 2] + t*s[3, 1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> ksp = Sym.ksplit(Integer(3),Integer(1))
>>> ksp[Integer(2)]*ksp[Integer(2)]
ksp3[2, 2] + ksp3[3, 1]
>>> ksp[Integer(2),Integer(1),Integer(1)].lift()
s[2, 1, 1] + s[2, 2] + s[3, 1]

>>> Sym = SymmetricFunctions(QQ['t'])
>>> ksp = Sym.ksplit(Integer(3))
>>> ksp[Integer(2),Integer(1),Integer(1)].lift()
s[2, 1, 1] + t*s[2, 2] + t*s[3, 1]
```

llt(k, t='t')

The LLT symmetric functions.

INPUT:

- `k` – positive integer indicating the level
- `t` – a parameter (default: t)

LLT polynomials in $hspin$ and $hcospin$ bases.

EXAMPLES:

```
sage: llt3 = SymmetricFunctions(QQ['t'].fraction_field()).llt(3); llt3
level 3 LLT polynomials over Fraction Field of Univariate
Polynomial Ring in t over Rational Field
sage: llt3.hspin()
Symmetric Functions over Fraction Field of Univariate Polynomial
Ring in t over Rational Field in the level 3 LLT spin basis
sage: llt3.hcospin()
Symmetric Functions over Fraction Field of Univariate Polynomial
Ring in t over Rational Field in the level 3 LLT cospin basis
sage: llt3.hcospin()
Symmetric Functions over Fraction Field of Univariate Polynomial
Ring in t over Rational Field in the level 3 LLT cospin basis
```

```
>>> from sage.all import *
>>> llt3 = SymmetricFunctions(QQ['t'].fraction_field()).llt(Integer(3)); llt3
level 3 LLT polynomials over Fraction Field of Univariate
Polynomial Ring in t over Rational Field
>>> llt3.hspin()
Symmetric Functions over Fraction Field of Univariate Polynomial
Ring in t over Rational Field in the level 3 LLT spin basis
>>> llt3.hcospin()
Symmetric Functions over Fraction Field of Univariate Polynomial
Ring in t over Rational Field in the level 3 LLT cospin basis
>>> llt3.hcospin()
Symmetric Functions over Fraction Field of Univariate Polynomial
Ring in t over Rational Field in the level 3 LLT cospin basis
```

m()

alias of *monomial()*.

macdonald(*q='q'*, *t='t'*)

Return the entry point for the various Macdonald bases.

INPUT:

- q, t – parameters

Macdonald symmetric functions including bases P, Q, J, H, Ht. This also contains the S basis which is dual to the Schur basis with respect to the q, t scalar product.

The parameters q and t must be in the base_ring of parent.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(FractionField(QQ['q','t']))
sage: P = Sym.macdonald().P(); P
Symmetric Functions over Fraction Field of Multivariate Polynomial Ring in q,␣
↪t over Rational Field in the Macdonald P basis
sage: P[2]
McdP[2]
sage: Q = Sym.macdonald().Q(); Q
Symmetric Functions over Fraction Field of Multivariate Polynomial Ring in q,␣
↪t over Rational Field in the Macdonald Q basis
sage: S = Sym.macdonald().S()
sage: s = Sym.schur()
```

(continues on next page)

(continued from previous page)

```
sage: matrix([[S(la).scalar_qt(s(mu)) for la in Partitions(3)] for mu in␣
↪Partitions(3)])
[1 0 0]
[0 1 0]
[0 0 1]
sage: H = Sym.macdonald().H()
sage: s(H[2,2])
q^2*s[1, 1, 1, 1] + (q^2*t+q*t+q)*s[2, 1, 1] + (q^2*t^2+1)*s[2, 2] + (q*t^
↪2+q*t+t)*s[3, 1] + t^2*s[4]

sage: Sym = SymmetricFunctions(QQ['z','q'].fraction_field())
sage: z, q = Sym.base_ring().gens()
sage: Hzq = Sym.macdonald(q=z,t=q).H()
sage: H1z = Sym.macdonald(q=1,t=z).H()
sage: s = Sym.schur()
sage: s(H1z([2,2]))
s[1, 1, 1, 1] + (2*z+1)*s[2, 1, 1] + (z^2+1)*s[2, 2] + (z^2+2*z)*s[3, 1] + z^
↪2*s[4]
sage: s(Hzq[2,2])
z^2*s[1, 1, 1, 1] + (z^2*q+z*q+z)*s[2, 1, 1] + (z^2*q^2+1)*s[2, 2] + (z*q^
↪2+z*q+q)*s[3, 1] + q^2*s[4]
sage: s(H1z(Hzq[2,2]))
z^2*s[1, 1, 1, 1] + (z^2*q+z*q+z)*s[2, 1, 1] + (z^2*q^2+1)*s[2, 2] + (z*q^
↪2+z*q+q)*s[3, 1] + q^2*s[4]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(FractionField(QQ['q','t']))

```

(continues on next page)

(continued from previous page)

```
>>> s(H1z([Integer(2),Integer(2)]))
s[1, 1, 1, 1] + (2*z+1)*s[2, 1, 1] + (z^2+1)*s[2, 2] + (z^2+2*z)*s[3, 1] + z^
↪2*s[4]
>>> s(Hzq[Integer(2),Integer(2)])
z^2*s[1, 1, 1, 1] + (z^2*q+z*q+z)*s[2, 1, 1] + (z^2*q^2+1)*s[2, 2] + (z*q^
↪2+z*q+q)*s[3, 1] + q^2*s[4]
>>> s(H1z(Hzq[Integer(2),Integer(2)]))
z^2*s[1, 1, 1, 1] + (z^2*q+z*q+z)*s[2, 1, 1] + (z^2*q^2+1)*s[2, 2] + (z*q^
↪2+z*q+q)*s[3, 1] + q^2*s[4]
```

monomial()

The monomial basis of the Symmetric Functions.

EXAMPLES:

```
sage: SymmetricFunctions(QQ).monomial()
Symmetric Functions over Rational Field in the monomial basis
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ).monomial()
Symmetric Functions over Rational Field in the monomial basis
```

o()

alias of *orthogonal()*.

orthogonal()

The orthogonal basis of the symmetric functions.

See also

SymmetricFunctionAlgebra_orthogonal

EXAMPLES:

```
sage: SymmetricFunctions(QQ).orthogonal()
Symmetric Functions over Rational Field in the orthogonal basis
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ).orthogonal()
Symmetric Functions over Rational Field in the orthogonal basis
```

p()

alias of *powersum()*.

power()

alias of *powersum()*.

powersum()

The power sum basis of the Symmetric Functions.

EXAMPLES:

```
sage: SymmetricFunctions(QQ).powersum()
Symmetric Functions over Rational Field in the powersum basis
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ).powersum()
Symmetric Functions over Rational Field in the powersum basis
```

qbar(*q='q'*)

alias of *hecke_character()*.

register_isomorphism(*morphism*, *only_conversion=False*)

Register an isomorphism between two bases of `self`, as a canonical coercion (unless the optional keyword `only_conversion` is set to `True`, in which case the isomorphism is registered as conversion only).

EXAMPLES:

We override the canonical coercion from the Schur basis to the powersum basis by a (stupid!) map $s_\lambda \mapsto 2p_\lambda$.

```
sage: Sym = SymmetricFunctions(QQ['zorglub']) # make sure we are not going to␣
↪screw up later tests
sage: s = Sym.s(); p = Sym.p().dual_basis()
sage: phi = s.module_morphism(diagonal = lambda t: 2, codomain = p)
sage: phi(s[2, 1])
2*d_p[2, 1]
sage: Sym.register_isomorphism(phi)
sage: p(s[2,1])
2*d_p[2, 1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ['zorglub']) # make sure we are not going to␣
↪screw up later tests
>>> s = Sym.s(); p = Sym.p().dual_basis()
>>> phi = s.module_morphism(diagonal = lambda t: Integer(2), codomain = p)
>>> phi(s[Integer(2), Integer(1)])
2*d_p[2, 1]
>>> Sym.register_isomorphism(phi)
>>> p(s[Integer(2),Integer(1)])
2*d_p[2, 1]
```

The map is supposed to implement the canonical isomorphism between the two bases. Otherwise, the results will be mathematically wrong, as above. Use with care!

s()

alias of *schur()*.

schur()

The Schur basis of the Symmetric Functions.

EXAMPLES:

```
sage: SymmetricFunctions(QQ).schur()
Symmetric Functions over Rational Field in the Schur basis
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ).schur()
Symmetric Functions over Rational Field in the Schur basis
```

sp()

alias of *symplectic()*.

st()

alias of *irreducible_symmetric_group_character()*.

symplectic()

The symplectic basis of the symmetric functions.

See also

SymmetricFunctionAlgebra_symplectic

EXAMPLES:

```
sage: SymmetricFunctions(QQ).symplectic()
Symmetric Functions over Rational Field in the symplectic basis
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ).symplectic()
Symmetric Functions over Rational Field in the symplectic basis
```

w()

alias of *witt()*.

witt()

The Witt basis of the symmetric functions.

EXAMPLES:

```
sage: SymmetricFunctions(QQ).witt()
Symmetric Functions over Rational Field in the Witt basis
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ).witt()
Symmetric Functions over Rational Field in the Witt basis
```

xt()

alias of *irreducible_rook_character()*.

zonal()

The zonal basis of the Symmetric Functions.

EXAMPLES:

```
sage: SymmetricFunctions(QQ).zonal()
Symmetric Functions over Rational Field in the zonal basis
```

```
>>> from sage.all import *
>>> SymmetricFunctions(QQ).zonal()
Symmetric Functions over Rational Field in the zonal basis
```

class sage.combinat.sf.sf.**SymmetricaConversionOnBasis**(*t*, *domain*, *codomain*)

Bases: object

Initialization of self.

INPUT:

- t – a function taking a monomial in CombinatorialFreeModule(QQ, Partitions()), and returning a (partition, coefficient) list
- domain, codomain – parents

Construct a function mapping a partition to an element of codomain.

This is a temporary quick hack to wrap around the existing symmetrica conversions, without changing their specs.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ['x'])
sage: p = Sym.p(); s = Sym.s()
sage: def t(x): (p, c), = x; return [(p, 2*c), (p.conjugate(), c)]
sage: f = sage.combinat.sf.sf.SymmetricaConversionOnBasis(t, p, s)
sage: f(Partition([3,1]))
s[2, 1, 1] + 2*s[3, 1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ['x'])
>>> p = Sym.p(); s = Sym.s()
>>> def t(x): (p, c), = x; return [(p, Integer(2)*c), (p.conjugate(), c)]
>>> f = sage.combinat.sf.sf.SymmetricaConversionOnBasis(t, p, s)
>>> f(Partition([Integer(3),Integer(1)]))
s[2, 1, 1] + 2*s[3, 1]
```

Symplectic symmetric functions

AUTHORS:

- Travis Scrimshaw (2013-11-10): Initial version

class sage.combinat.sf.symplectic.**SymmetricFunctionAlgebra_symplectic**(*Sym*)

Bases: *SymmetricFunctionAlgebra_generic*

The symplectic symmetric function basis (or symplectic basis, to be short).

The symplectic basis $\{sp_\lambda\}$ where λ is taken over all partitions is defined by the following change of basis with the Schur functions:

$$s_\lambda = \sum_\mu \left(\sum_{\nu \in V} c^\lambda_{\mu\nu} \right) sp_\mu$$

where V is the set of all partitions with even-height columns and $c^\lambda_{\mu\nu}$ is the usual Littlewood-Richardson (LR) coefficients. By the properties of LR coefficients, this can be shown to be a upper unitriangular change of basis.

Note

This is only a filtered basis, not a $\mathbf{Z}$-graded basis. However this does respect the induced $(\mathbf{Z}/2\mathbf{Z})$-grading.

INPUT:

- `Sym` – an instance of the ring of the symmetric functions

REFERENCES:

EXAMPLES:

Here are the first few symplectic symmetric functions, in various bases:

```
sage: Sym = SymmetricFunctions(QQ)
sage: sp = Sym.sp()
sage: e = Sym.e()
sage: h = Sym.h()
sage: p = Sym.p()
sage: s = Sym.s()
sage: m = Sym.m()

sage: p(sp([1]))
p[1]
sage: m(sp([1]))
m[1]
sage: e(sp([1]))
e[1]
sage: h(sp([1]))
h[1]
sage: s(sp([1]))
s[1]

sage: p(sp([2]))
1/2*p[1, 1] + 1/2*p[2]
sage: m(sp([2]))
m[1, 1] + m[2]
sage: e(sp([2]))
e[1, 1] - e[2]
sage: h(sp([2]))
h[2]
sage: s(sp([2]))
s[2]

sage: p(sp([3]))
1/6*p[1, 1, 1] + 1/2*p[2, 1] + 1/3*p[3]
sage: m(sp([3]))
m[1, 1, 1] + m[2, 1] + m[3]
sage: e(sp([3]))
e[1, 1, 1] - 2*e[2, 1] + e[3]
sage: h(sp([3]))
h[3]
sage: s(sp([3]))
s[3]
```

(continues on next page)

(continued from previous page)

```
sage: Sym = SymmetricFunctions(ZZ)
sage: sp = Sym.sp()
sage: e = Sym.e()
sage: h = Sym.h()
sage: s = Sym.s()
sage: m = Sym.m()
sage: p = Sym.p()
sage: m(sp([4]))
m[1, 1, 1, 1] + m[2, 1, 1] + m[2, 2] + m[3, 1] + m[4]
sage: e(sp([4]))
e[1, 1, 1, 1] - 3*e[2, 1, 1] + e[2, 2] + 2*e[3, 1] - e[4]
sage: h(sp([4]))
h[4]
sage: s(sp([4]))
s[4]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> sp = Sym.sp()
>>> e = Sym.e()
>>> h = Sym.h()
>>> p = Sym.p()
>>> s = Sym.s()
>>> m = Sym.m()

>>> p(sp([Integer(1)]))
p[1]
>>> m(sp([Integer(1)]))
m[1]
>>> e(sp([Integer(1)]))
e[1]
>>> h(sp([Integer(1)]))
h[1]
>>> s(sp([Integer(1)]))
s[1]

>>> p(sp([Integer(2)]))
1/2*p[1, 1] + 1/2*p[2]
>>> m(sp([Integer(2)]))
m[1, 1] + m[2]
>>> e(sp([Integer(2)]))
e[1, 1] - e[2]
>>> h(sp([Integer(2)]))
h[2]
>>> s(sp([Integer(2)]))
s[2]

>>> p(sp([Integer(3)]))
1/6*p[1, 1, 1] + 1/2*p[2, 1] + 1/3*p[3]
>>> m(sp([Integer(3)]))
m[1, 1, 1] + m[2, 1] + m[3]
```

(continues on next page)

(continued from previous page)

```
>>> e(sp([Integer(3)]))
e[1, 1, 1] - 2*e[2, 1] + e[3]
>>> h(sp([Integer(3)]))
h[3]
>>> s(sp([Integer(3)]))
s[3]

>>> Sym = SymmetricFunctions(ZZ)
>>> sp = Sym.sp()
>>> e = Sym.e()
>>> h = Sym.h()
>>> s = Sym.s()
>>> m = Sym.m()
>>> p = Sym.p()
>>> m(sp([Integer(4)]))
m[1, 1, 1, 1] + m[2, 1, 1] + m[2, 2] + m[3, 1] + m[4]
>>> e(sp([Integer(4)]))
e[1, 1, 1, 1] - 3*e[2, 1, 1] + e[2, 2] + 2*e[3, 1] - e[4]
>>> h(sp([Integer(4)]))
h[4]
>>> s(sp([Integer(4)]))
s[4]
```

Some examples of conversions the other way:

```
sage: sp(h[3])
sp[3]
sage: sp(e[3])
sp[1] + sp[1, 1, 1]
sage: sp(m[2,1])
-sp[1] - 2*sp[1, 1, 1] + sp[2, 1]
sage: sp(p[3])
sp[1, 1, 1] - sp[2, 1] + sp[3]
```

```
>>> from sage.all import *
>>> sp(h[Integer(3)])
sp[3]
>>> sp(e[Integer(3)])
sp[1] + sp[1, 1, 1]
>>> sp(m[Integer(2),Integer(1)])
-sp[1] - 2*sp[1, 1, 1] + sp[2, 1]
>>> sp(p[Integer(3)])
sp[1, 1, 1] - sp[2, 1] + sp[3]
```

Some multiplication:

```
sage: sp([2]) * sp([1,1])
sp[1, 1] + sp[2] + sp[2, 1, 1] + sp[3, 1]
sage: sp([2,1,1]) * sp([2])
sp[1, 1] + sp[1, 1, 1, 1] + 2*sp[2, 1, 1] + sp[2, 2] + sp[2, 2, 1, 1]
 + sp[3, 1] + sp[3, 1, 1, 1] + sp[3, 2, 1] + sp[4, 1, 1]
sage: sp([1,1]) * sp([2,1])
```

(continues on next page)

(continued from previous page)

```
sp[1] + sp[1, 1, 1] + 2*sp[2, 1] + sp[2, 1, 1, 1] + sp[2, 2, 1]
 + sp[3] + sp[3, 1, 1] + sp[3, 2]
```

```
>>> from sage.all import *
>>> sp([Integer(2)]) * sp([Integer(1),Integer(1)])
sp[1, 1] + sp[2] + sp[2, 1, 1] + sp[3, 1]
>>> sp([Integer(2),Integer(1),Integer(1)]) * sp([Integer(2)])
sp[1, 1] + sp[1, 1, 1, 1] + 2*sp[2, 1, 1] + sp[2, 2] + sp[2, 2, 1, 1]
 + sp[3, 1] + sp[3, 1, 1, 1] + sp[3, 2, 1] + sp[4, 1, 1]
>>> sp([Integer(1),Integer(1)]) * sp([Integer(2),Integer(1)])
sp[1] + sp[1, 1, 1] + 2*sp[2, 1] + sp[2, 1, 1, 1] + sp[2, 2, 1]
 + sp[3] + sp[3, 1, 1] + sp[3, 2]
```

Examples of the Hopf algebra structure:

```
sage: sp([1]).antipode()
-sp[1]
sage: sp([2]).antipode()
sp[] + sp[1, 1]
sage: sp([1]).coproduct()
sp[] # sp[1] + sp[1] # sp[]
sage: sp([2]).coproduct()
sp[] # sp[2] + sp[1] # sp[1] + sp[2] # sp[]
sage: sp([1]).counit()
0
sage: sp.one().counit()
1
```

```
>>> from sage.all import *
>>> sp([Integer(1)]).antipode()
-sp[1]
>>> sp([Integer(2)]).antipode()
sp[] + sp[1, 1]
>>> sp([Integer(1)]).coproduct()
sp[] # sp[1] + sp[1] # sp[]
>>> sp([Integer(2)]).coproduct()
sp[] # sp[2] + sp[1] # sp[1] + sp[2] # sp[]
>>> sp([Integer(1)]).counit()
0
>>> sp.one().counit()
1
```

Witt symmetric functions

class sage.combinat.sf.witt.**SymmetricFunctionAlgebra_witt**(*Sym*)

Bases: *SymmetricFunctionAlgebra_multiplicative*

The Witt symmetric function basis (or Witt basis, to be short).

The Witt basis of the ring of symmetric functions is denoted by (x_λ) in [HazWitt1], section 9.63, and by (q_λ) in [DoranIV1996]. We will denote this basis by (w_λ) (which is precisely how it is denoted in [GriRei18], Exercise 2.9.3(d)). It is a multiplicative basis (meaning that $w_\emptyset = 1$ and that every partition λ satisfies $w_\lambda = w_{\lambda_1} w_{\lambda_2} w_{\lambda_3} \cdots$, where w_i means $w_{(i)}$ for every nonnegative integer i).

This basis can be defined in various ways. Probably the most well-known one is using the equation

$$\prod_{d=1}^{\infty}(1-w_d t^d)^{-1} = \sum_{n=0}^{\infty} h_n t^n$$

where t is a formal variable and h_n are the complete homogeneous symmetric functions, extended to 0 by $h_0 = 1$. This equation allows one to uniquely determine the functions $w_1, w_2, w_3, \ldots$ by recursion; one consequently extends the definition to all w_λ by requiring multiplicativity.

A way to rewrite the above equation without power series is:

$$h_n = \sum_{\lambda \vdash n} w_\lambda$$

for all nonnegative integers n, where $\lambda \vdash n$ means that λ is a partition of n.

A similar equation (which is easily seen to be equivalent to the former) is

$$e_n = \sum_{\lambda} (-1)^{n-\ell(\lambda)} w_\lambda,$$

with the sum running only over *strict* partitions λ of n this time. This equation can also be used to recursively define the w_n. Furthermore, every positive integer n satisfies

$$p_n = \sum_{d|n} d w_d^{n/d},$$

and this can be used to define the w_n recursively over any ring which is torsion-free as a $\mathbf{Z}$-module. While these equations all yield easy formulas for classical bases of the ring of symmetric functions in terms of the Witt symmetric functions, it seems difficult to obtain explicit formulas in the other direction.

The Witt symmetric functions owe their name to the fact that the ring of symmetric functions can be viewed as the coordinate ring of the group scheme of Witt vectors, and the Witt symmetric functions are the functions that send a Witt vector to its components (whereas the powersum symmetric functions send a Witt vector to its ghost components). Details can be found in [HazWitt1] or section 3.2 of [BorWi2004].

INPUT:

- `Sym` – an instance of the ring of the symmetric functions

REFERENCES:

EXAMPLES:

Here are the first few Witt symmetric functions, in various bases:

```
sage: Sym = SymmetricFunctions(QQ)
sage: w = Sym.w()
sage: e = Sym.e()
sage: h = Sym.h()
sage: p = Sym.p()
sage: s = Sym.s()
sage: m = Sym.m()

sage: p(w([1]))
p[1]
sage: m(w([1]))
m[1]
sage: e(w([1]))
```

(continues on next page)

(continued from previous page)

```
e[1]
sage: h(w([1]))
h[1]
sage: s(w([1]))
s[1]

sage: p(w([2]))
-1/2*p[1, 1] + 1/2*p[2]
sage: m(w([2]))
-m[1, 1]
sage: e(w([2]))
-e[2]
sage: h(w([2]))
-h[1, 1] + h[2]
sage: s(w([2]))
-s[1, 1]

sage: p(w([3]))
-1/3*p[1, 1, 1] + 1/3*p[3]
sage: m(w([3]))
-2*m[1, 1, 1] - m[2, 1]
sage: e(w([3]))
-e[2, 1] + e[3]
sage: h(w([3]))
-h[2, 1] + h[3]
sage: s(w([3]))
-s[2, 1]

sage: Sym = SymmetricFunctions(ZZ)
sage: w = Sym.w()
sage: e = Sym.e()
sage: h = Sym.h()
sage: s = Sym.s()
sage: m = Sym.m()
sage: p = Sym.p()
sage: m(w([4]))
-9*m[1, 1, 1, 1] - 4*m[2, 1, 1] - 2*m[2, 2] - m[3, 1]
sage: e(w([4]))
-e[2, 1, 1] + e[3, 1] - e[4]
sage: h(w([4]))
-h[1, 1, 1, 1] + 2*h[2, 1, 1] - h[2, 2] - h[3, 1] + h[4]
sage: s(w([4]))
-s[1, 1, 1, 1] - s[2, 1, 1] - s[2, 2] - s[3, 1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> w = Sym.w()
>>> e = Sym.e()
>>> h = Sym.h()
>>> p = Sym.p()
>>> s = Sym.s()
>>> m = Sym.m()
```

(continues on next page)

(continued from previous page)

```
>>> p(w([Integer(1)]))
p[1]
>>> m(w([Integer(1)]))
m[1]
>>> e(w([Integer(1)]))
e[1]
>>> h(w([Integer(1)]))
h[1]
>>> s(w([Integer(1)]))
s[1]

>>> p(w([Integer(2)]))
-1/2*p[1, 1] + 1/2*p[2]
>>> m(w([Integer(2)]))
-m[1, 1]
>>> e(w([Integer(2)]))
-e[2]
>>> h(w([Integer(2)]))
-h[1, 1] + h[2]
>>> s(w([Integer(2)]))
-s[1, 1]

>>> p(w([Integer(3)]))
-1/3*p[1, 1, 1] + 1/3*p[3]
>>> m(w([Integer(3)]))
-2*m[1, 1, 1] - m[2, 1]
>>> e(w([Integer(3)]))
-e[2, 1] + e[3]
>>> h(w([Integer(3)]))
-h[2, 1] + h[3]
>>> s(w([Integer(3)]))
-s[2, 1]

>>> Sym = SymmetricFunctions(ZZ)
>>> w = Sym.w()
>>> e = Sym.e()
>>> h = Sym.h()
>>> s = Sym.s()
>>> m = Sym.m()
>>> p = Sym.p()
>>> m(w([Integer(4)]))
-9*m[1, 1, 1, 1] - 4*m[2, 1, 1] - 2*m[2, 2] - m[3, 1]
>>> e(w([Integer(4)]))
-e[2, 1, 1] + e[3, 1] - e[4]
>>> h(w([Integer(4)]))
-h[1, 1, 1, 1] + 2*h[2, 1, 1] - h[2, 2] - h[3, 1] + h[4]
>>> s(w([Integer(4)]))
-s[1, 1, 1, 1] - s[2, 1, 1] - s[2, 2] - s[3, 1]
```

Some examples of conversions the other way:

```
sage: w(h[3])
w[1, 1, 1] + w[2, 1] + w[3]
sage: w(e[3])
-w[2, 1] + w[3]
sage: w(m[2,1])
2*w[2, 1] - 3*w[3]
sage: w(p[3])
w[1, 1, 1] + 3*w[3]
```

```
>>> from sage.all import *
>>> w(h[Integer(3)])
w[1, 1, 1] + w[2, 1] + w[3]
>>> w(e[Integer(3)])
-w[2, 1] + w[3]
>>> w(m[Integer(2),Integer(1)])
2*w[2, 1] - 3*w[3]
>>> w(p[Integer(3)])
w[1, 1, 1] + 3*w[3]
```

Antipodes:

```
sage: w([1]).antipode()
-w[1]
sage: w([2]).antipode()
-w[1, 1] - w[2]
```

```
>>> from sage.all import *
>>> w([Integer(1)]).antipode()
-w[1]
>>> w([Integer(2)]).antipode()
-w[1, 1] - w[2]
```

The following holds for all odd i and is easily proven by induction:

```
sage: all(w([i]).antipode() == -w([i]) for i in range(1, 10, 2))
True
```

```
>>> from sage.all import *
>>> all(w([i]).antipode() == -w([i]) for i in range(Integer(1), Integer(10),␣
↪Integer(2)))
True
```

The Witt basis does not allow for simple expressions for comultiplication and antipode in general (this is related to the fact that the sum of two Witt vectors isn't easily described in terms of the components). Therefore, a number of computations with Witt symmetric functions pass through the complete homogeneous symmetric functions by default.

class Element

Bases: *Element*

omega()

Return the image of `self` under the omega automorphism.

The *omega automorphism* is defined to be the unique algebra endomorphism ω of the ring of symmetric

functions that satisfies $\omega(e_k) = h_k$ for all positive integers k (where e_k stands for the k-th elementary symmetric function, and h_k stands for the k-th complete homogeneous symmetric function). It furthermore is a Hopf algebra endomorphism and an involution, and it is also known as the *omega involution*. It sends the power-sum symmetric function p_k to $(-1)^{k-1}p_k$ for every positive integer k.

The images of some bases under the omega automorphism are given by

$$\omega(e_\lambda) = h_\lambda, \qquad \omega(h_\lambda) = e_\lambda, \qquad \omega(p_\lambda) = (-1)^{|\lambda|-\ell(\lambda)}p_\lambda, \qquad \omega(s_\lambda) = s_{\lambda'},$$

where λ is any partition, where $\ell(\lambda)$ denotes the length (*length()*) of the partition λ, where λ' denotes the conjugate partition (*conjugate()*) of λ, and where the usual notations for bases are used (e = elementary, h = complete homogeneous, p = powersum, s = Schur).

omega_involution() is a synonym for the *omega()* method.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: w = Sym.w()
sage: a = w([4,3,1,1]); a
w[4, 3, 1, 1]
sage: a.omega()
-w[3, 1, 1, 1, 1, 1, 1] - w[3, 2, 1, 1, 1, 1]
 - w[3, 2, 2, 1, 1] - w[4, 3, 1, 1]

sage: h = Sym.h()
sage: all(w(h(w[la]).omega()) == w[la].omega()
....:     for n in range(6) for la in Partitions(n))
True
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> w = Sym.w()
>>> a = w([Integer(4),Integer(3),Integer(1),Integer(1)]); a
w[4, 3, 1, 1]
>>> a.omega()
-w[3, 1, 1, 1, 1, 1, 1] - w[3, 2, 1, 1, 1, 1]
 - w[3, 2, 2, 1, 1] - w[4, 3, 1, 1]

>>> h = Sym.h()
>>> all(w(h(w[la]).omega()) == w[la].omega()
...     for n in range(Integer(6)) for la in Partitions(n))
True
```

coproduct(*elt*)

Return the coproduct of the element `elt`.

INPUT:

- `elt` – a symmetric function written in this basis

OUTPUT:

The coproduct acting on `elt`; the result is an element of the tensor squared of the basis `self`.

EXAMPLES:

```
sage: w = SymmetricFunctions(QQ).w()
sage: w[2].coproduct()
w[] # w[2] - w[1] # w[1] + w[2] # w[]
sage: w.coproduct(w[2])
w[] # w[2] - w[1] # w[1] + w[2] # w[]
sage: w[2,1].coproduct()
w[] # w[2, 1] - w[1] # w[1, 1] + w[1] # w[2] - w[1, 1] # w[1] + w[2] # w[1] +␣
↪w[2, 1] # w[]
sage: w.coproduct(w[2,1])
w[] # w[2, 1] - w[1] # w[1, 1] + w[1] # w[2] - w[1, 1] # w[1] + w[2] # w[1] +␣
↪w[2, 1] # w[]
```

```
>>> from sage.all import *
>>> w = SymmetricFunctions(QQ).w()
>>> w[Integer(2)].coproduct()
w[] # w[2] - w[1] # w[1] + w[2] # w[]
>>> w.coproduct(w[Integer(2)])
w[] # w[2] - w[1] # w[1] + w[2] # w[]
>>> w[Integer(2),Integer(1)].coproduct()
w[] # w[2, 1] - w[1] # w[1, 1] + w[1] # w[2] - w[1, 1] # w[1] + w[2] # w[1] +␣
↪w[2, 1] # w[]
>>> w.coproduct(w[Integer(2),Integer(1)])
w[] # w[2, 1] - w[1] # w[1, 1] + w[1] # w[2] - w[1, 1] # w[1] + w[2] # w[1] +␣
↪w[2, 1] # w[]
```

verschiebung(n)

Return the image of the symmetric function `self` under the n-th Verschiebung operator.

The n-th Verschiebung operator $\mathbf{V}_n$ is defined to be the unique algebra endomorphism V of the ring of symmetric functions that satisfies $V(h_r) = h_{r/n}$ for every positive integer r divisible by n, and satisfies $V(h_r) = 0$ for every positive integer r not divisible by n. This operator $\mathbf{V}_n$ is a Hopf algebra endomorphism. For every nonnegative integer r with $n \mid r$, it satisfies

$$\mathbf{V}_n(h_r) = h_{r/n}, \quad \mathbf{V}_n(p_r) = np_{r/n}, \quad \mathbf{V}_n(e_r) = (-1)^{r-r/n} e_{r/n}, \quad \mathbf{V}_n(w_r) = w_{r/n},$$

(where h is the complete homogeneous basis, p is the powersum basis, e is the elementary basis, and w is the Witt basis). For every nonnegative integer r with $n \nmid r$, it satisfes

$$\mathbf{V}_n(h_r) = \mathbf{V}_n(p_r) = \mathbf{V}_n(e_r) = \mathbf{V}_n(w_r) = 0.$$

The n-th Verschiebung operator is also called the n-th Verschiebung endomorphism. Its name derives from the Verschiebung (German for "shift") endomorphism of the Witt vectors.

The n-th Verschiebung operator is adjoint to the n-th Frobenius operator (see *adams_operator()* for its definition) with respect to the Hall scalar product (*scalar()*).

The action of the n-th Verschiebung operator on the Schur basis can also be computed explicitly. The following (probably clumsier than necessary) description can be obtained by solving exercise 7.61 in Stanley's [STA].

Let λ be a partition. Let n be a positive integer. If the n-core of λ is nonempty, then $\mathbf{V}_n(s_\lambda) = 0$. Otherwise, the following method computes $\mathbf{V}_n(s_\lambda)$: Write the partition λ in the form $(\lambda_1, \lambda_2, \ldots, \lambda_{ns})$ for some nonnegative integer s. (If n does not divide the length of λ, then this is achieved by adding trailing zeroes to λ.) Set $\beta_i = \lambda_i + ns - i$ for every $s \in \{1, 2, \ldots, ns\}$. Then, $(\beta_1, \beta_2, \ldots, \beta_{ns})$ is a strictly decreasing sequence of nonnegative integers. Stably sort the list $(1, 2, \ldots, ns)$ in order of (weakly) increasing remainder

of $-1-\beta_i$ modulo n. Let ξ be the sign of the permutation that is used for this sorting. Let ψ be the sign of the permutation that is used to stably sort the list $(1, 2, \ldots, ns)$ in order of (weakly) increasing remainder of $i-1$ modulo n. (Notice that $\psi = (-1)^{n(n-1)s(s-1)/4}$.) Then, $\mathbf{V}_n(s_\lambda) = \xi\psi \prod_{i=0}^{n-1} s_{\lambda^{(i)}}$, where $(\lambda^{(0)}, \lambda^{(1)}, \ldots, \lambda^{(n-1)})$ is the n-quotient of λ.

INPUT:

- `n` – positive integer

OUTPUT:

The result of applying the n-th Verschiebung operator (on the ring of symmetric functions) to `self`.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(ZZ)
sage: w = Sym.w()
sage: w[3].verschiebung(2)
0
sage: w[4].verschiebung(4)
w[1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(ZZ)
>>> w = Sym.w()
>>> w[Integer(3)].verschiebung(Integer(2))
0
>>> w[Integer(4)].verschiebung(Integer(4))
w[1]
```

k-Schur functions

class sage.combinat.sf.new_kschur.**KBoundedSubspace**(*Sym*, *k*, *t='t'*)

Bases: `UniqueRepresentation`, `Parent`

This class implements the subspace of the ring of symmetric functions spanned by $\{s_\lambda[X/(1-t)]\}_{\lambda_1 \leq k} = \{s_\lambda^{(k)}[X;t]\}_{\lambda_1 \leq k}$ over the base ring $\mathbf{Q}[t]$. When $t = 1$, this space is in fact a subring of the ring of symmetric functions generated by the complete homogeneous symmetric functions h_i for $1 \leq i \leq k$.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: KB = Sym.kBoundedSubspace(3,1); KB
3-bounded Symmetric Functions over Rational Field with t=1

sage: Sym = SymmetricFunctions(QQ['t'])
sage: KB = Sym.kBoundedSubspace(3); KB
3-bounded Symmetric Functions over Univariate Polynomial Ring in t over Rational␣
↪Field
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> KB = Sym.kBoundedSubspace(Integer(3),Integer(1)); KB
3-bounded Symmetric Functions over Rational Field with t=1

>>> Sym = SymmetricFunctions(QQ['t'])
```

(continues on next page)

(continued from previous page)

```
>>> KB = Sym.kBoundedSubspace(Integer(3)); KB
3-bounded Symmetric Functions over Univariate Polynomial Ring in t over Rational␣
↪Field
```

The k-Schur function basis can be constructed as follows:

```
sage: ks = KB.kschur(); ks
3-bounded Symmetric Functions over Univariate Polynomial Ring in t over Rational␣
↪Field in the 3-Schur basis
```

```
>>> from sage.all import *
>>> ks = KB.kschur(); ks
3-bounded Symmetric Functions over Univariate Polynomial Ring in t over Rational␣
↪Field in the 3-Schur basis
```

K_kschur()

Return the k-bounded basis called the K-k-Schur basis.

See [Morse11] and [LamSchillingShimozono10].

REFERENCES:

EXAMPLES:

```
sage: kB = SymmetricFunctions(QQ).kBoundedSubspace(3,1)
sage: g = kB.K_kschur()
sage: g
3-bounded Symmetric Functions over Rational Field with t=1 in the K-3-Schur␣
↪basis
sage: kB = SymmetricFunctions(QQ['t']).kBoundedSubspace(3)
sage: g = kB.K_kschur()

ValueError: This basis only exists for t=1
```

khomogeneous()

The homogeneous basis of this algebra.

See also

kHomogeneous()

EXAMPLES:

```
sage: kh3 = SymmetricFunctions(QQ).kBoundedSubspace(3,1).khomogeneous()
sage: TestSuite(kh3).run()
```

```
>>> from sage.all import *
>>> kh3 = SymmetricFunctions(QQ).kBoundedSubspace(Integer(3),Integer(1)).
↪khomogeneous()
>>> TestSuite(kh3).run()
```

kschur()

The k-Schur basis of this algebra.

See also

kSchur()

EXAMPLES:

```
sage: ks3 = SymmetricFunctions(QQ).kBoundedSubspace(3,1).kschur()
sage: TestSuite(ks3).run()
```

```
>>> from sage.all import *
>>> ks3 = SymmetricFunctions(QQ).kBoundedSubspace(Integer(3),Integer(1)).
↪kschur()
>>> TestSuite(ks3).run()
```

ksplit()

The k-split basis of this algebra.

See also

kSplit()

EXAMPLES:

```
sage: ksp3 = SymmetricFunctions(QQ).kBoundedSubspace(3,1).ksplit()
sage: TestSuite(ksp3).run()
```

```
>>> from sage.all import *
>>> ksp3 = SymmetricFunctions(QQ).kBoundedSubspace(Integer(3),Integer(1)).
↪ksplit()
>>> TestSuite(ksp3).run()
```

realizations()

A list of realizations of this algebra.

EXAMPLES:

```
sage: SymmetricFunctions(QQ).kBoundedSubspace(3,1).realizations()
[3-bounded Symmetric Functions over Rational Field with t=1 in the 3-Schur␣
↪basis,
 3-bounded Symmetric Functions over Rational Field with t=1 in the 3-split␣
↪basis,

↪Rational Field in the 3-Schur basis,
 3-bounded Symmetric Functions over Univariate Polynomial Ring in t over␣
↪Rational Field in the 3-split basis]
```

retract(*sym*)

Return the retract of `sym` from the ring of symmetric functions to `self`.

INPUT:

- `sym` – a symmetric function

OUTPUT:

- the analogue of the symmetric function in the k-bounded subspace (if possible)

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: s = Sym.schur()
sage: KB = Sym.kBoundedSubspace(3,1); KB
3-bounded Symmetric Functions over Rational Field with t=1
sage: KB.retract(s[2]+s[3])
ks3[2] + ks3[3]
sage: KB.retract(s[2,1,1])
Traceback (most recent call last):
```

(continues on next page)

(continued from previous page)

```
...
ValueError: s[2, 1, 1] is not in the image
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> s = Sym.schur()
>>> KB = Sym.kBoundedSubspace(Integer(3),Integer(1)); KB
3-bounded Symmetric Functions over Rational Field with t=1
>>> KB.retract(s[Integer(2)]+s[Integer(3)])
ks3[2] + ks3[3]
>>> KB.retract(s[Integer(2),Integer(1),Integer(1)])
Traceback (most recent call last):
...
ValueError: s[2, 1, 1] is not in the image
```

class sage.combinat.sf.new_kschur.**KBoundedSubspaceBases**(*base*, *t='t'*)

Bases: Category_realization_of_parent

The category of bases for the k-bounded subspace of symmetric functions.

class ElementMethods

Bases: object

expand(**args*, ***kwargs*)

Return the monomial expansion of `self` in n variables.

INPUT:

- `n` – positive integer

OUTPUT: monomial expansion of `self` in n variables

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: ks = Sym.kschur(3,1)
sage: ks[3,1].expand(2)
x0^4 + 2*x0^3*x1 + 2*x0^2*x1^2 + 2*x0*x1^3 + x1^4
sage: s = Sym.schur()
sage: ks[3,1].expand(2) == s(ks[3,1]).expand(2)
True

sage: Sym = SymmetricFunctions(QQ['t'])
sage: ks = Sym.kschur(3)
sage: f = ks[3,2]-ks[1]
sage: f.expand(2)
t^2*x0^5 + (t^2 + t)*x0^4*x1 + (t^2 + t + 1)*x0^3*x1^2 + (t^2 + t + 1)*x0^
↪2*x1^3 + (t^2 + t)*x0*x1^4 + t^2*x1^5 - x0 - x1
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> ks = Sym.kschur(Integer(3),Integer(1))
>>> ks[Integer(3),Integer(1)].expand(Integer(2))
x0^4 + 2*x0^3*x1 + 2*x0^2*x1^2 + 2*x0*x1^3 + x1^4
>>> s = Sym.schur()
```

(continues on next page)

(continued from previous page)

```
>>> ks[Integer(3),Integer(1)].expand(Integer(2)) == s(ks[Integer(3),
↪Integer(1)]).expand(Integer(2))
True

>>> Sym = SymmetricFunctions(QQ['t'])
>>> ks = Sym.kschur(Integer(3))
>>> f = ks[Integer(3),Integer(2)]-ks[Integer(1)]
>>> f.expand(Integer(2))
t^2*x0^5 + (t^2 + t)*x0^4*x1 + (t^2 + t + 1)*x0^3*x1^2 + (t^2 + t + 1)*x0^
↪2*x1^3 + (t^2 + t)*x0*x1^4 + t^2*x1^5 - x0 - x1
```

hl_creation_operator(*nu*, *t=None*)

This is the vertex operator that generalizes Jing's operator.

It is a linear operator that raises the degree by $|\nu|$. This creation operator is a t-analogue of multiplication by `s(nu)` .

See also

Proposition 5 in [SZ2001].

INPUT:

- `nu` – a partition or a list of integers
- `t` – (default: `None`, in which case `t` is used) an element of the base ring

EXAMPLES:

```
sage: Sym = SymmetricFunctions(FractionField(QQ['t']))
sage: ks = Sym.kschur(4)
sage: s = Sym.schur()
sage: s(ks([3,1,1]).hl_creation_operator([1]))
(t-1)*s[2, 2, 1, 1] + t^2*s[3, 1, 1, 1] + (t^3+t^2-t)*s[3, 2, 1] + (t^3-t^
↪2)*s[3, 3] + (t^4+t^3)*s[4, 1, 1] + t^4*s[4, 2] + t^5*s[5, 1]
sage: ks([3,1,1]).hl_creation_operator([1])

ks4[3, 1, 1, 1] + ks4[3, 2, 1] + ks4[4, 1, 1]
```

is_schur_positive(**args*, ***kwargs*)

Return whether `self` is Schur positive.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: ks = Sym.kschur(3,1)
sage: f = ks[3,2]+ks[1]
sage: f.is_schur_positive()
True
sage: f = ks[3,2]-ks[1]
sage: f.is_schur_positive()
False

sage: Sym = SymmetricFunctions(QQ['t'])
sage: ks = Sym.kschur(3)
sage: f = ks[3,2]+ks[1]
sage: f.is_schur_positive()
True
sage: f = ks[3,2]-ks[1]
sage: f.is_schur_positive()
False
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> ks = Sym.kschur(Integer(3),Integer(1))
>>> f = ks[Integer(3),Integer(2)]+ks[Integer(1)]
>>> f.is_schur_positive()
True
>>> f = ks[Integer(3),Integer(2)]-ks[Integer(1)]
>>> f.is_schur_positive()
False

>>> Sym = SymmetricFunctions(QQ['t'])
>>> ks = Sym.kschur(Integer(3))
>>> f = ks[Integer(3),Integer(2)]+ks[Integer(1)]
>>> f.is_schur_positive()
True
>>> f = ks[Integer(3),Integer(2)]-ks[Integer(1)]
>>> f.is_schur_positive()
False
```

omega()

Return the ω operator on `self`.

At $t = 1$, ω maps the k-Schur function $s^{(k)}_\lambda$ to $s^{(k)}_{\lambda^{(k)}}$, where $\lambda^{(k)}$ is the k-conjugate of the partition λ.

See also

k_conjugate().

For generic t, ω sends $s^{(k)}_\lambda[X;t]$ to $t^d s^{(k)}_{\lambda^{(k)}}[X;1/t]$, where d is the size of the core of λ minus the size of λ. Most of the time, this result is not in the k-bounded subspace.

See also

omega_t_inverse().

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: ks = Sym.kschur(3,1)
sage: ks[2,2,1,1].omega()
ks3[2, 2, 2]
sage: kh = Sym.khomogeneous(3)
sage: kh[3].omega()
h3[1, 1, 1] - 2*h3[2, 1] + h3[3]

sage: Sym = SymmetricFunctions(FractionField(QQ['t']))
sage: ks = Sym.kschur(3)
sage: ks[3,1,1].omega()
Traceback (most recent call last):
...
ValueError: t*s[2, 1, 1, 1] + s[3, 1, 1] is not in the image
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> ks = Sym.kschur(Integer(3),Integer(1))
>>> ks[Integer(2),Integer(2),Integer(1),Integer(1)].omega()
ks3[2, 2, 2]
>>> kh = Sym.khomogeneous(Integer(3))
>>> kh[Integer(3)].omega()
h3[1, 1, 1] - 2*h3[2, 1] + h3[3]

>>> Sym = SymmetricFunctions(FractionField(QQ['t']))
>>> ks = Sym.kschur(Integer(3))
>>> ks[Integer(3),Integer(1),Integer(1)].omega()
Traceback (most recent call last):
...
ValueError: t*s[2, 1, 1, 1] + s[3, 1, 1] is not in the image
```

omega_t_inverse()

Return the map $t \to 1/t$ composed with ω on `self`.

Unlike the map *omega()*, the result of *omega_t_inverse()* lives in the k-bounded subspace and hence will return an element even for generic t. For $t = 1$, *omega()* and *omega_t_inverse()* return the same result.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(FractionField(QQ['t']))
sage: ks = Sym.kschur(3)
sage: ks[3,1,1].omega_t_inverse()
1/t*ks3[2, 1, 1, 1]
sage: ks[3,2].omega_t_inverse()
1/t^2*ks3[1, 1, 1, 1, 1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(FractionField(QQ['t']))
>>> ks = Sym.kschur(Integer(3))
>>> ks[Integer(3),Integer(1),Integer(1)].omega_t_inverse()
1/t*ks3[2, 1, 1, 1]
>>> ks[Integer(3),Integer(2)].omega_t_inverse()
1/t^2*ks3[1, 1, 1, 1, 1]
```

scalar(*x*, *zee=None*)

Return standard scalar product between `self` and `x`.

INPUT:

- `x` – element of the ring of symmetric functions over the same base ring as `self`
- `zee` – an optional function on partitions giving the value for the scalar product between p_μ and p_μ (default: use the standard *zee()* function)

See also

scalar()

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ['t'])
sage: ks3 = Sym.kschur(3)
sage: ks3[3,2,1].scalar( ks3[2,2,2] )
t^3 + t
sage: dks3 = Sym.kBoundedQuotient(3).dks()
sage: [ks3[3,2,1].scalar(dks3(la)) for la in Partitions(6, max_part=3)]
[0, 1, 0, 0, 0, 0, 0]
sage: dks3 = Sym.kBoundedQuotient(3,t=1).dks()
sage: [ks3[2,2,2].scalar(dks3(la)) for la in Partitions(6, max_part=3)]
[0, t - 1, 0, 1, 0, 0, 0]
sage: ks3 = Sym.kschur(3,t=1)
sage: [ks3[2,2,2].scalar(dks3(la)) for la in Partitions(6, max_part=3)]
[0, 0, 0, 1, 0, 0, 0]
sage: kH = Sym.khomogeneous(4)
sage: kH([2,2,1]).scalar(ks3[2,2,1])
3
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ['t'])
>>> ks3 = Sym.kschur(Integer(3))
>>> ks3[Integer(3),Integer(2),Integer(1)].scalar( ks3[Integer(2),
↪Integer(2),Integer(2)] )
```

(continues on next page)

(continued from previous page)

```
t^3 + t
>>> dks3 = Sym.kBoundedQuotient(Integer(3)).dks()
>>> [ks3[Integer(3),Integer(2),Integer(1)].scalar(dks3(la)) for la in␣
↪Partitions(Integer(6), max_part=Integer(3))]
[0, 1, 0, 0, 0, 0, 0]
>>> dks3 = Sym.kBoundedQuotient(Integer(3),t=Integer(1)).dks()
>>> [ks3[Integer(2),Integer(2),Integer(2)].scalar(dks3(la)) for la in␣
↪Partitions(Integer(6), max_part=Integer(3))]
[0, t - 1, 0, 1, 0, 0, 0]
>>> ks3 = Sym.kschur(Integer(3),t=Integer(1))
>>> [ks3[Integer(2),Integer(2),Integer(2)].scalar(dks3(la)) for la in␣
↪Partitions(Integer(6), max_part=Integer(3))]
[0, 0, 0, 1, 0, 0, 0]
>>> kH = Sym.khomogeneous(Integer(4))
>>> kH([Integer(2),Integer(2),Integer(1)]).scalar(ks3[Integer(2),
↪Integer(2),Integer(1)])
3
```

class ParentMethods

Bases: object

antipode(*element*)

Return the antipode on `self` by lifting to the space of symmetric functions, computing the antipode, and then converting to `self.parent()`. This is only the antipode for $t = 1$ and for other values of t the result may not be in the space where the k-Schur functions live.

INPUT:

- `element` – an element in a basis of the ring of symmetric functions

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: ks3 = Sym.kschur(3,1)
sage: ks3[3,2].antipode()
-ks3[1, 1, 1, 1, 1]
sage: ks3.antipode(ks3[3,2])
-ks3[1, 1, 1, 1, 1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> ks3 = Sym.kschur(Integer(3),Integer(1))
>>> ks3[Integer(3),Integer(2)].antipode()
-ks3[1, 1, 1, 1, 1]
>>> ks3.antipode(ks3[Integer(3),Integer(2)])
-ks3[1, 1, 1, 1, 1]
```

coproduct(*element*)

Return the coproduct operation on `element`.

The coproduct is first computed on the homogeneous basis if $t = 1$ and on the Hall-Littlewood `Qp` basis otherwise. The result is computed then converted to the tensor squared of `self.parent()`.

INPUT:

- `element` – an element in a basis of the ring of symmetric functions

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: ks3 = Sym.kschur(3,1)
sage: ks3[2,1].coproduct()
ks3[] # ks3[2, 1] + ks3[1] # ks3[1, 1] + ks3[1] # ks3[2] + ks3[1, 1] #␣
↪ks3[1] + ks3[2] # ks3[1] + ks3[2, 1] # ks3[]
sage: h3 = Sym.khomogeneous(3)
sage: h3[2,1].coproduct()
h3[] # h3[2, 1] + h3[1] # h3[1, 1] + h3[1] # h3[2] + h3[1, 1] # h3[1] +␣
↪h3[2] # h3[1] + h3[2, 1] # h3[]
sage: ks3t = SymmetricFunctions(FractionField(QQ['t'])).kschur(3)
sage: ks3t[2,1].coproduct()
ks3[] # ks3[2, 1] + ks3[1] # ks3[1, 1] + ks3[1] # ks3[2] + ks3[1, 1] #␣
↪ks3[1] + ks3[2] # ks3[1] + ks3[2, 1] # ks3[]
sage: ks3t[3,1].coproduct()
ks3[] # ks3[3, 1] + ks3[1] # ks3[2, 1] + (t+1)*ks3[1] # ks3[3] + ks3[1,␣
↪1] # ks3[2] + ks3[2] # ks3[1, 1]
+ (t+1)*ks3[2] # ks3[2] + ks3[2, 1] # ks3[1] + (t+1)*ks3[3] # ks3[1] +␣
↪ks3[3, 1] # ks3[]
sage: h3.coproduct(h3[2,1])
h3[] # h3[2, 1] + h3[1] # h3[1, 1] + h3[1] # h3[2] + h3[1, 1] # h3[1] +␣
↪h3[2] # h3[1] + h3[2, 1] # h3[]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> ks3 = Sym.kschur(Integer(3),Integer(1))
>>> ks3[Integer(2),Integer(1)].coproduct()
ks3[] # ks3[2, 1] + ks3[1] # ks3[1, 1] + ks3[1] # ks3[2] + ks3[1, 1] #␣
↪ks3[1] + ks3[2] # ks3[1] + ks3[2, 1] # ks3[]
>>> h3 = Sym.khomogeneous(Integer(3))
>>> h3[Integer(2),Integer(1)].coproduct()
h3[] # h3[2, 1] + h3[1] # h3[1, 1] + h3[1] # h3[2] + h3[1, 1] # h3[1] +␣
↪h3[2] # h3[1] + h3[2, 1] # h3[]
>>> ks3t = SymmetricFunctions(FractionField(QQ['t'])).kschur(Integer(3))
>>> ks3t[Integer(2),Integer(1)].coproduct()
ks3[] # ks3[2, 1] + ks3[1] # ks3[1, 1] + ks3[1] # ks3[2] + ks3[1, 1] #␣
↪ks3[1] + ks3[2] # ks3[1] + ks3[2, 1] # ks3[]
>>> ks3t[Integer(3),Integer(1)].coproduct()
ks3[] # ks3[3, 1] + ks3[1] # ks3[2, 1] + (t+1)*ks3[1] # ks3[3] + ks3[1,␣
↪1] # ks3[2] + ks3[2] # ks3[1, 1]
+ (t+1)*ks3[2] # ks3[2] + ks3[2, 1] # ks3[1] + (t+1)*ks3[3] # ks3[1] +␣
↪ks3[3, 1] # ks3[]
>>> h3.coproduct(h3[Integer(2),Integer(1)])
h3[] # h3[2, 1] + h3[1] # h3[1, 1] + h3[1] # h3[2] + h3[1, 1] # h3[1] +␣
↪h3[2] # h3[1] + h3[2, 1] # h3[]
```

counit(*element*)

Return the counit of `element`.

The counit is the constant term of `element`.

INPUT:

- `element` – an element in a basis of the ring of symmetric functions

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: ks3 = Sym.kschur(3,1)
sage: f = 2*ks3[2,1] + 3*ks3[[]]
sage: f.counit()
3
sage: ks3.counit(f)
3
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> ks3 = Sym.kschur(Integer(3),Integer(1))
>>> f = Integer(2)*ks3[Integer(2),Integer(1)] + Integer(3)*ks3[[]]
>>> f.counit()
3
>>> ks3.counit(f)
3
```

degree_on_basis(*b*)

Return the degree of the basis element indexed by *b*.

INPUT:

- `b` – a partition

EXAMPLES:

```
sage: ks3 = SymmetricFunctions(QQ).kschur(3,1)
sage: ks3.degree_on_basis(Partition([3,2]))
5
```

```
>>> from sage.all import *
>>> ks3 = SymmetricFunctions(QQ).kschur(Integer(3),Integer(1))
>>> ks3.degree_on_basis(Partition([Integer(3),Integer(2)]))
5
```

one_basis()

Return the basis element indexing `1`.

EXAMPLES:

```
sage: ks3 = SymmetricFunctions(QQ).kschur(3,1)
sage: ks3.one()  # indirect doctest
ks3[]
```

```
>>> from sage.all import *
>>> ks3 = SymmetricFunctions(QQ).kschur(Integer(3),Integer(1))
>>> ks3.one()  # indirect doctest
ks3[]
```

transition_matrix(*other*, *n*)

Return the degree `n` transition matrix between `self` and `other`.

INPUT:

- `other` – a basis in the ring of symmetric functions
- `n` – positive integer

The entry in the i-th row and j-th column is the coefficient obtained by writing the i-th element of the basis of `self` in terms of the basis `other`, and extracting the j-th coefficient.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ); s = Sym.schur()
sage: ks3 = Sym.kschur(3,1)
sage: ks3.transition_matrix(s,5)
[1 1 1 0 0 0 0]
[0 1 0 1 0 0 0]
[0 0 1 0 1 0 0]
[0 0 0 1 0 1 0]
[0 0 0 0 1 1 1]

sage: Sym = SymmetricFunctions(QQ['t'])
sage: s = Sym.schur()
sage: ks = Sym.kschur(3)
sage: ks.transition_matrix(s,5)
[t^2   t   1   0   0   0   0]
[  0   t   0   1   0   0   0]
[  0   0   t   0   1   0   0]
[  0   0   0   t   0   1   0]
[  0   0   0   0 t^2   t   1]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ); s = Sym.schur()
>>> ks3 = Sym.kschur(Integer(3),Integer(1))
>>> ks3.transition_matrix(s,Integer(5))
[1 1 1 0 0 0 0]
[0 1 0 1 0 0 0]
[0 0 1 0 1 0 0]
[0 0 0 1 0 1 0]
[0 0 0 0 1 1 1]

>>> Sym = SymmetricFunctions(QQ['t'])
>>> s = Sym.schur()
>>> ks = Sym.kschur(Integer(3))
>>> ks.transition_matrix(s,Integer(5))
[t^2   t   1   0   0   0   0]
[  0   t   0   1   0   0   0]
[  0   0   t   0   1   0   0]
[  0   0   0   t   0   1   0]
[  0   0   0   0 t^2   t   1]
```

super_categories()

The super categories of `self`.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ['t'])
sage: from sage.combinat.sf.new_kschur import KBoundedSubspaceBases
sage: KB = Sym.kBoundedSubspace(3)
sage: KBB = KBoundedSubspaceBases(KB); KBB
Category of k bounded subspace bases of 3-bounded Symmetric Functions over␣
```

(continues on next page)

(continued from previous page)

```

↪Univariate Polynomial Ring in t over Rational Field]
```

class sage.combinat.sf.new_kschur.**K_kSchur**(*kBoundedRing*)

Bases: *CombinatorialFreeModule*

This class implements the basis of the k-bounded subspace called the K-k-Schur basis.

See [Morse2011], [LamSchillingShimozono2010].

REFERENCES:

K_k_Schur_non_commutative_variables(*la*)

Return the K-k-Schur function, as embedded inside the affine zero Hecke algebra.

INPUT:

- `la` – a k-bounded Partition

OUTPUT: an element of the affine zero Hecke algebra

EXAMPLES:

```
sage: g = SymmetricFunctions(QQ).kBoundedSubspace(3,1).K_kschur()
sage: g.K_k_Schur_non_commutative_variables([2,1])
T[3,1,0] + T[1,2,0] + T[3,2,0] + T[0,1,0] + T[2,0,1] + T[0,3,0] + T[2,0,3] +␣
↪T[0,3,1] + T[2,3,2] + T[2,3,1] + T[3,1,2] + T[1,2,1] - T[2,0] - T[3,1]

ValueError: Partition should be 3-bounded
```

homogeneous_basis_noncommutative_variables_zero_Hecke(*la*)

Return the homogeneous basis element indexed by `la`, viewed as an element inside the affine zero Hecke algebra. For the code, see method _homogeneous_basis.

INPUT:

- `la` – a k-bounded partition

OUTPUT: an element of the affine zero Hecke algebra

EXAMPLES:

```
sage: g = SymmetricFunctions(QQ).kBoundedSubspace(3,1).K_kschur()
sage: g.homogeneous_basis_noncommutative_variables_zero_Hecke([2,1])
T[2,1,0] + T[3,1,0] + T[1,2,0] + T[3,2,0] + T[0,1,0] + T[2,0,1] + T[1,0,3] +␣
↪T[0,3,0] + T[2,0,3] + T[0,3,2] + T[0,3,1] + T[2,3,2] + T[3,2,1] + T[2,3,1]␣

↪T[0,3,0] + T[2,0,3] + T[0,3,2] + T[0,3,1] + T[2,3,2] + T[3,2,1] + T[2,3,1]␣
↪+ T[3,1,2] + T[1,2,1] - T[1,0] - 2*T[2,0] - T[0,3] - T[3,2] - 2*T[3,1] -␣
↪T[2,1]
>>> g.homogeneous_basis_noncommutative_variables_zero_Hecke([])
1
```

lift(*x*)

Return the lift of a k-bounded symmetric function.

INPUT:

- **`x` – an expression in the K-k-Schur basis. Equivalently, `x` can be a** k-bounded partition (then `x` corresponds to the basis element indexed by `x`)

OUTPUT: a symmetric function

EXAMPLES:

```
sage: g = SymmetricFunctions(QQ).kBoundedSubspace(3,1).K_kschur()
sage: g.lift([2,1])
h[2] + h[2, 1] - h[3]
sage: g.lift([])
h[]
sage: g.lift([4,1])
Traceback (most recent call last):
...
TypeError: do not know how to make x (= [4, 1]) an element of self (=3-
↪bounded Symmetric Functions over Rational Field with t=1 in the K-3-Schur␣
↪basis)
```

```
>>> from sage.all import *
>>> g = SymmetricFunctions(QQ).kBoundedSubspace(Integer(3),Integer(1)).K_
↪kschur()
>>> g.lift([Integer(2),Integer(1)])

↪bounded Symmetric Functions over Rational Field with t=1 in the K-3-Schur␣
↪basis)
```

product(x, y)

Return the product of the two K-k-Schur functions.

INPUT:

- x, y – elements of the k-bounded subspace, in the K-k-Schur basis

OUTPUT: an element of the k-bounded subspace, in the K-k-Schur basis

EXAMPLES:

```
sage: g = SymmetricFunctions(QQ).kBoundedSubspace(3,1).K_kschur()
sage: g.product(g([2,1]), g[1])
-2*Kks3[2, 1] + Kks3[2, 1, 1] + Kks3[2, 2]
sage: g.product(g([2,1]), g([]))
Kks3[2, 1]
```

```
>>> from sage.all import *
>>> g = SymmetricFunctions(QQ).kBoundedSubspace(Integer(3),Integer(1)).K_
↪kschur()
>>> g.product(g([Integer(2),Integer(1)]), g[Integer(1)])
-2*Kks3[2, 1] + Kks3[2, 1, 1] + Kks3[2, 2]
>>> g.product(g([Integer(2),Integer(1)]), g([]))
Kks3[2, 1]
```

retract(x)

Return the retract of a symmetric function.

INPUT:

- x – a symmetric function

OUTPUT: a k-bounded symmetric function in the K-k-Schur basis

EXAMPLES:

```
sage: g = SymmetricFunctions(QQ).kBoundedSubspace(3,1).K_kschur()
sage: m = SymmetricFunctions(QQ).m()
sage: g.retract(m[2,1])
-2*Kks3[1] + 4*Kks3[1, 1] - 2*Kks3[1, 1, 1] - Kks3[2] + Kks3[2, 1]
sage: g.retract(m([]))
Kks3[]
```

```
>>> from sage.all import *
>>> g = SymmetricFunctions(QQ).kBoundedSubspace(Integer(3),Integer(1)).K_
↪kschur()
>>> m = SymmetricFunctions(QQ).m()
>>> g.retract(m[Integer(2),Integer(1)])
-2*Kks3[1] + 4*Kks3[1, 1] - 2*Kks3[1, 1, 1] - Kks3[2] + Kks3[2, 1]
>>> g.retract(m([]))
Kks3[]
```

class sage.combinat.sf.new_kschur.**kHomogeneous**(*kBoundedRing*)

Bases: *CombinatorialFreeModule*

Space of k-bounded homogeneous symmetric functions.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ)
sage: kH = Sym.khomogeneous(3)
sage: kH[2]
h3[2]
sage: kH[2].lift()
h[2]
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ)
>>> kH = Sym.khomogeneous(Integer(3))
>>> kH[Integer(2)]
h3[2]
>>> kH[Integer(2)].lift()
h[2]
```

class sage.combinat.sf.new_kschur.**kSchur**(*kBoundedRing*)

Bases: *CombinatorialFreeModule*

Space of k-Schur functions.

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ['t'])
sage: KB = Sym.kBoundedSubspace(3); KB
3-bounded Symmetric Functions over Univariate Polynomial Ring in t over Rational␣
↪Field
```

```
>>> from sage.all import *
>>> Sym = SymmetricFunctions(QQ['t'])
>>> KB = Sym.kBoundedSubspace(Integer(3)); KB
3-bounded Symmetric Functions over Univariate Polynomial Ring in t over Rational␣
↪Field
```

The k-Schur function basis can be constructed as follows:

```
sage: ks3 = KB.kschur(); ks3
3-bounded Symmetric Functions over Univariate Polynomial Ring in t over Rational␣
↪Field in the 3-Schur basis
```

```
>>> from sage.all import *
>>> ks3 = KB.kschur(); ks3
3-bounded Symmetric Functions over Univariate Polynomial Ring in t over Rational␣
↪Field in the 3-Schur basis
```

We can convert to any basis of the ring of symmetric functions and, whenever it makes sense, also the other way round:

```
sage: s = Sym.schur()
sage: s(ks3([3,2,1]))
s[3, 2, 1] + t*s[4, 1, 1] + t*s[4, 2] + t^2*s[5, 1]
sage: t = Sym.base_ring().gen()
sage: ks3(s([3, 2, 1]) + t*s([4, 1, 1]) + t*s([4, 2]) + t^2*s([5, 1]))
ks3[3, 2, 1]
sage: s(ks3[2, 1, 1])
s[2, 1, 1] + t*s[3, 1]
sage: ks3(s[2, 1, 1] + t*s[3, 1])
ks3[2, 1, 1]
```

```
>>> from sage.all import *
>>> s = Sym.schur()
>>> s(ks3([Integer(3),Integer(2),Integer(1)]))
s[3, 2, 1] + t*s[4, 1, 1] + t*s[4, 2] + t^2*s[5, 1]
>>> t = Sym.base_ring().gen()
>>> ks3(s([Integer(3), Integer(2), Integer(1)]) + t*s([Integer(4), Integer(1),␣
↪Integer(1)]) + t*s([Integer(4), Integer(2)]) + t**Integer(2)*s([Integer(5),␣
↪Integer(1)]))
ks3[3, 2, 1]
>>> s(ks3[Integer(2), Integer(1), Integer(1)])
s[2, 1, 1] + t*s[3, 1]
>>> ks3(s[Integer(2), Integer(1), Integer(1)] + t*s[Integer(3), Integer(1)])
ks3[2, 1, 1]
```

k-Schur functions are indexed by partitions with first part $\leq k$. Constructing a k-Schur function for a larger partition raises an error:

```
sage: ks3([4,3,2,1]) #
Traceback (most recent call last):
...
TypeError: do not know how to make x (= [4, 3, 2, 1]) an element of self (=3-
```

(continues on next page)

(continued from previous page)

```
↪bounded Symmetric Functions over Univariate Polynomial Ring in t over Rational␣
↪Field in the 3-Schur basis)
```

```
>>> from sage.all import *
>>> ks3([Integer(4),Integer(3),Integer(2),Integer(1)]) #
Traceback (most recent call last):
...
TypeError: do not know how to make x (= [4, 3, 2, 1]) an element of self (=3-
↪bounded Symmetric Functions over Univariate Polynomial Ring in t over Rational␣
↪Field in the 3-Schur basis)
```

Similarly, attempting to convert a function that is not in the linear span of the k-Schur functions raises an error:

```
sage: ks3(s([4]))
Traceback (most recent call last):
...
ValueError: s[4] is not in the image
```

```
>>> from sage.all import *
>>> ks3(s([Integer(4)]))
Traceback (most recent call last):
...
ValueError: s[4] is not in the image
```

Note that the product of k-Schur functions is not guaranteed to be in the space spanned by the k-Schurs. In general, we only have that a k-Schur times a j-Schur function is in the $(k+j)$-bounded subspace. The multiplication of two k-Schur functions thus generally returns the product of the lift of the functions to the ambient symmetric function space. If the result happens to lie in the k-bounded subspace, then the result is cast into the k-Schur basis:

```
sage: ks2 = Sym.kBoundedSubspace(2).kschur()
sage: ks2[1] * ks2[1]
ks2[1, 1] + ks2[2]
sage: ks2[1] * ks2[2]
s[2, 1] + s[3]
```

```
>>> from sage.all import *
>>> ks2 = Sym.kBoundedSubspace(Integer(2)).kschur()
>>> ks2[Integer(1)] * ks2[Integer(1)]
ks2[1, 1] + ks2[2]
>>> ks2[Integer(1)] * ks2[Integer(2)]
s[2, 1] + s[3]
```

Because the target space of the product of a k-Schur and a j-Schur has several possibilities, the product of a k-Schur and j-Schur function is not implemented for distinct k and j. Let us show how to get around this 'manually':

```
sage: ks3 = Sym.kBoundedSubspace(3).kschur()
sage: ks2([2,1]) * ks3([3,1])
Traceback (most recent call last):
...
TypeError: unsupported operand parent(s) for *: '2-bounded Symmetric Functions␣
↪over Univariate Polynomial Ring in t over Rational Field in the 2-Schur basis'␣
```

(continues on next page)

(continued from previous page)

```
↪and '3-bounded Symmetric Functions over Univariate Polynomial Ring in t over␣
↪Rational Field in the 3-Schur basis'
```

```
>>> from sage.all import *
>>> ks3 = Sym.kBoundedSubspace(Integer(3)).kschur()
>>> ks2([Integer(2),Integer(1)]) * ks3([Integer(3),Integer(1)])
Traceback (most recent call last):
...
TypeError: unsupported operand parent(s) for *: '2-bounded Symmetric Functions␣
↪over Univariate Polynomial Ring in t over Rational Field in the 2-Schur basis'␣
↪and '3-bounded Symmetric Functions over Univariate Polynomial Ring in t over␣
↪Rational Field in the 3-Schur basis'
```

The workaround:

```
sage: f = s(ks2([2,1])) * s(ks3([3,1])); f # Convert to Schur functions first and␣
↪multiply there.
s[3, 2, 1, 1] + s[3, 2, 2] + (t+1)*s[3, 3, 1] + s[4, 1, 1, 1]
+ (2*t+2)*s[4, 2, 1] + (t^2+t+1)*s[4, 3] + (2*t+1)*s[5, 1, 1]
+ (t^2+2*t+1)*s[5, 2] + (t^2+2*t)*s[6, 1] + t^2*s[7]
```

```
>>> from sage.all import *
>>> f = s(ks2([Integer(2),Integer(1)])) * s(ks3([Integer(3),Integer(1)])); f #␣
↪Convert to Schur functions first and multiply there.
s[3, 2, 1, 1] + s[3, 2, 2] + (t+1)*s[3, 3, 1] + s[4, 1, 1, 1]
+ (2*t+2)*s[4, 2, 1] + (t^2+t+1)*s[4, 3] + (2*t+1)*s[5, 1, 1]
+ (t^2+2*t+1)*s[5, 2] + (t^2+2*t)*s[6, 1] + t^2*s[7]
```

or:

```
sage: f = ks2[2,1].lift() * ks3[3,1].lift()
sage: ks5 = Sym.kBoundedSubspace(5).kschur()
sage: ks5(f) # The product of a 'ks2' with a 'ks3' is a 'ks5'.
ks5[3, 2, 1, 1] + ks5[3, 2, 2] + (t+1)*ks5[3, 3, 1] + ks5[4, 1, 1, 1]
+ (t+2)*ks5[4, 2, 1] + (t^2+t+1)*ks5[4, 3] + (t+1)*ks5[5, 1, 1] + ks5[5, 2]
```

```
>>> from sage.all import *
>>> f = ks2[Integer(2),Integer(1)].lift() * ks3[Integer(3),Integer(1)].lift()
>>> ks5 = Sym.kBoundedSubspace(Integer(5)).kschur()
>>> ks5(f) # The product of a 'ks2' with a 'ks3' is a 'ks5'.
ks5[3, 2, 1, 1] + ks5[3, 2, 2] + (t+1)*ks5[3, 3, 1] + ks5[4, 1, 1, 1]
+ (t+2)*ks5[4, 2, 1] + (t^2+t+1)*ks5[4, 3] + (t+1)*ks5[5, 1, 1] + ks5[5, 2]
```

For other technical reasons, taking powers of k-Schur functions is not implemented, even when the answer is still in the k-bounded subspace:

```
sage: ks2([1])^2
Traceback (most recent call last):
...
TypeError: unsupported operand parent(s) for ^: '2-bounded Symmetric Functions␣
↪over Univariate Polynomial Ring in t over Rational Field in the 2-Schur basis'␣
↪and 'Integer Ring'
```

```
>>> from sage.all import *
>>> ks2([Integer(1)])**Integer(2)
Traceback (most recent call last):
...
TypeError: unsupported operand parent(s) for ^: '2-bounded Symmetric Functions␣
↪over Univariate Polynomial Ring in t over Rational Field in the 2-Schur basis'␣
↪and 'Integer Ring'
```

Todo

Get rid of said technical "reasons".

However, at $t = 1$, the product of k-Schur functions is in the span of the k-Schur functions always. Below are some examples at $t = 1$

```
sage: ks3 = Sym.kBoundedSubspace(3, t=1).kschur(); ks3
3-bounded Symmetric Functions over Univariate Polynomial Ring in t over Rational␣
↪Field with t=1 in the 3-Schur basis
sage: s = SymmetricFunctions(ks3.base_ring()).schur()
sage: ks3(s([3]))
ks3[3]
sage: s(ks3([3,2,1]))
s[3, 2, 1] + s[4, 1, 1] + s[4, 2] + s[5, 1]
sage: ks3([2,1])^2    # taking powers works for t=1
ks3[2, 2, 1, 1] + ks3[2, 2, 2] + ks3[3, 1, 1, 1]
```

```
>>> from sage.all import *
>>> ks3 = Sym.kBoundedSubspace(Integer(3), t=Integer(1)).kschur(); ks3
3-bounded Symmetric Functions over Univariate Polynomial Ring in t over Rational␣
↪Field with t=1 in the 3-Schur basis
>>> s = SymmetricFunctions(ks3.base_ring()).schur()
>>> ks3(s([Integer(3)]))
ks3[3]
>>> s(ks3([Integer(3),Integer(2),Integer(1)]))
s[3, 2, 1] + s[4, 1, 1] + s[4, 2] + s[5, 1]
>>> ks3([Integer(2),Integer(1)])**Integer(2)    # taking powers works for t=1
ks3[2, 2, 1, 1] + ks3[2, 2, 2] + ks3[3, 1, 1, 1]
```

product_on_basis(*left*, *right*)

Take the product of two k-Schur functions.

If $t \neq 1$, then take the product by lifting to the Schur functions and then retracting back into the k-bounded subspace (if possible).

If $t = 1$, then the product calls `_product_on_basis_via_rectangles`.

INPUT:

- `left`, `right` – partitions

OUTPUT: an element of the k-Schur functions

EXAMPLES:

```
sage: Sym = SymmetricFunctions(QQ['t'])
sage: ks3 = Sym.kschur(3,1)
sage: kH = Sym.khomogeneous(3)
sage: ks3(kH[2,1,1])
ks3[2, 1, 1] + ks3[2, 2] + ks3[3, 1]
sage: ks3([])*kH[2,1,1]
ks3[2, 1, 1] + ks3[2, 2] + ks3[3, 1]
sage: ks3([3,3,3,2,2,1,1,1])^2
ks3[3, 3, 3, 3, 3, 3, 2, 2, 2, 2, 1, 1, 1, 1, 1, 1]
sage: ks3([3,3,3,2,2,1,1,1])*ks3([2,2,2,2,2,1,1,1,1])
ks3[3, 3, 3, 2, 2, 2, 2, 2, 2, 2, 1, 1, 1, 1, 1, 1, 1]
sage: ks3([2,2,1,1,1,1])*ks3([2,2,2,1,1,1,1])
ks3[2, 2, 2, 2, 2, 1, 1, 1, 1, 1, 1, 1, 1] + ks3[2, 2, 2, 2, 2, 2, 1, 1, 1, 1,
↪ 1, 1]
sage: ks3[2,1]^2
ks3[2, 2, 1, 1] + ks3[2, 2, 2] + ks3[3, 1, 1, 1]

↪1] + s[4, 2]
```

class sage.combinat.sf.new_kschur.**kSplit**(*kBoundedRing*)

Bases: *CombinatorialFreeModule*

The k-split basis of the space of k-bounded-symmetric functions.

Fix `k` a positive integer and `t` an element of the base ring.

The k-split functions are a basis for the space of k-bounded symmetric functions that also have the bases

$$\{Q'_\lambda[X;t]\}_{\lambda_1 \leq k} = \{s^{(k)}_\lambda[X;t]\}_{\lambda_1 \leq k}$$

where $Q'_\lambda[X;t]$ are the Hall-Littlewood symmetric functions (using the notation of [MAC]) and $s^{(k)}_\lambda[X;t]$ are the k-Schur functions. If t is not a root of unity, then

$$\{s_\lambda[X/(1-t)]\}_{\lambda_1 \leq k}$$

is also a basis of this space.

The k-split basis has the property that $Q'_\lambda[X;t]$ expands positively in the k-split basis and the k-split basis conjecturally expands positively in the k-Schur functions. See [LLMSSZ] p. 81.

The k-split basis is defined recursively using the Hall-Littlewood creation operator defined in [SZ2001]. If a partition `la` is the concatenation (as lists) of a partition `mu` and `nu` where `mu` has maximal hook length equal to `k` then `ksp(la) = ksp(nu).hl_creation_operator(mu)`. If the hook length of `la` is less than or equal to `k`, then `ksp(la)` is equal to the Schur function indexed by `la`.

EXAMPLES:

```
sage: Symt = SymmetricFunctions(QQ['t'].fraction_field())
sage: kBS3 = Symt.kBoundedSubspace(3)
sage: ks3 = kBS3.kschur()
sage: ksp3 = kBS3.ksplit()
sage: ks3(ksp3[2,1,1])
ks3[2, 1, 1] + t*ks3[2, 2]
sage: ksp3(ks3[2,1,1])
ksp3[2, 1, 1] - t*ksp3[2, 2]
sage: ksp3[2,1]*ksp3[1]
s[2, 1, 1] + s[2, 2] + s[3, 1]
sage: ksp3[2,1].hl_creation_operator([1])
t*ksp3[2, 1, 1] + (-t^2+t)*ksp3[2, 2]

sage: Qp = Symt.hall_littlewood().Qp()
sage: ksp3(Qp[3,2,1])
ksp3[3, 2, 1] + t*ksp3[3, 3]

sage: kBS4 = Symt.kBoundedSubspace(4)
sage: ksp4 = kBS4.ksplit()
sage: ksp4(ksp3([3,2,1]))
ksp4[3, 2, 1] - t*ksp4[3, 3] + t*ksp4[4, 1, 1]
sage: ks4 = kBS4.kschur()
sage: ks4(ksp4[3,2,2,1])
ks4[3, 2, 2, 1] + t*ks4[3, 3, 1, 1] + t*ks4[3, 3, 2]
```

```
>>> from sage.all import *
>>> Symt = SymmetricFunctions(QQ['t'].fraction_field())
>>> kBS3 = Symt.kBoundedSubspace(Integer(3))
>>> ks3 = kBS3.kschur()
>>> ksp3 = kBS3.ksplit()
>>> ks3(ksp3[Integer(2),Integer(1),Integer(1)])
ks3[2, 1, 1] + t*ks3[2, 2]
>>> ksp3(ks3[Integer(2),Integer(1),Integer(1)])
ksp3[2, 1, 1] - t*ksp3[2, 2]
```

(continues on next page)

(continued from previous page)

```
>>> ksp3[Integer(2),Integer(1)]*ksp3[Integer(1)]
s[2, 1, 1] + s[2, 2] + s[3, 1]
>>> ksp3[Integer(2),Integer(1)].hl_creation_operator([Integer(1)])
t*ksp3[2, 1, 1] + (-t^2+t)*ksp3[2, 2]

>>> Qp = Symt.hall_littlewood().Qp()
>>> ksp3(Qp[Integer(3),Integer(2),Integer(1)])
ksp3[3, 2, 1] + t*ksp3[3, 3]

>>> kBS4 = Symt.kBoundedSubspace(Integer(4))
>>> ksp4 = kBS4.ksplit()
>>> ksp4(ksp3([Integer(3),Integer(2),Integer(1)]))
ksp4[3, 2, 1] - t*ksp4[3, 3] + t*ksp4[4, 1, 1]
>>> ks4 = kBS4.kschur()
>>> ks4(ksp4[Integer(3),Integer(2),Integer(2),Integer(1)])
ks4[3, 2, 2, 1] + t*ks4[3, 3, 1, 1] + t*ks4[3, 3, 2]
```

4.1.15 sage.combinat.species

Characteristic species

class sage.combinat.species.characteristic_species.**CharacteristicSpecies**(*n*, *min=None*, *max=None*, *weight=None*)

Bases: *GenericCombinatorialSpecies*, UniqueRepresentation

Return the characteristic species of order n.

This species has exactly one structure on a set of size n and no structures on sets of any other size.

EXAMPLES:

```
sage: X = species.CharacteristicSpecies(1)
sage: X.structures([1]).list()
[1]
sage: X.structures([1,2]).list()
[]
sage: X.generating_series()[0:4]
[0, 1, 0, 0]
sage: X.isotype_generating_series()[0:4]
[0, 1, 0, 0]
sage: X.cycle_index_series()[0:4]                                              #␣
↪needs sage.modules
[0, p[1], 0, 0]

sage: F = species.CharacteristicSpecies(3)
sage: c = F.generating_series()[0:4]
sage: F._check()
True
sage: F == loads(dumps(F))
True
```

```
>>> from sage.all import *
>>> X = species.CharacteristicSpecies(Integer(1))
>>> X.structures([Integer(1)]).list()
[1]
>>> X.structures([Integer(1),Integer(2)]).list()
[]
>>> X.generating_series()[Integer(0):Integer(4)]
[0, 1, 0, 0]
>>> X.isotype_generating_series()[Integer(0):Integer(4)]
[0, 1, 0, 0]
>>> X.cycle_index_series()[Integer(0):Integer(4)]
↪          # needs sage.modules
[0, p[1], 0, 0]

>>> F = species.CharacteristicSpecies(Integer(3))
>>> c = F.generating_series()[Integer(0):Integer(4)]
>>> F._check()
True
>>> F == loads(dumps(F))
True
```

class sage.combinat.species.characteristic_species.**CharacteristicSpeciesStructure**(*parent*, *labels*, *list*)

Bases: *GenericSpeciesStructure*

automorphism_group()

Return the group of permutations whose action on this structure leave it fixed. For the characteristic species, there is only one structure, so every permutation is in its automorphism group.

EXAMPLES:

```
sage: F = species.CharacteristicSpecies(3)
sage: a = F.structures(["a", "b", "c"]).random_element(); a
{'a', 'b', 'c'}
sage: a.automorphism_group()
↪needs sage.groups
Symmetric group of order 3! as a permutation group
```

```
>>> from sage.all import *
>>> F = species.CharacteristicSpecies(Integer(3))
>>> a = F.structures(["a", "b", "c"]).random_element(); a
{'a', 'b', 'c'}
>>> a.automorphism_group()
↪needs sage.groups
Symmetric group of order 3! as a permutation group
```

canonical_label()

EXAMPLES:

```
sage: F = species.CharacteristicSpecies(3)
sage: a = F.structures(["a", "b", "c"]).random_element(); a
```

(continues on next page)

(continued from previous page)

```
{'a', 'b', 'c'}
sage: a.canonical_label()
{'a', 'b', 'c'}
```

```
>>> from sage.all import *
>>> F = species.CharacteristicSpecies(Integer(3))
>>> a = F.structures(["a", "b", "c"]).random_element(); a
{'a', 'b', 'c'}
>>> a.canonical_label()
{'a', 'b', 'c'}
```

transport(*perm*)

Return the transport of this structure along the permutation `perm`.

EXAMPLES:

```
sage: F = species.CharacteristicSpecies(3)
sage: a = F.structures(["a", "b", "c"]).random_element(); a
{'a', 'b', 'c'}
sage: p = PermutationGroupElement((1,2))                                    #␣
↪needs sage.groups
sage: a.transport(p)                                                        #␣
↪needs sage.groups
{'a', 'b', 'c'}
```

```
>>> from sage.all import *
>>> F = species.CharacteristicSpecies(Integer(3))
>>> a = F.structures(["a", "b", "c"]).random_element(); a
{'a', 'b', 'c'}
>>> p = PermutationGroupElement((Integer(1),Integer(2)))                     ␣
↪              # needs sage.groups
>>> a.transport(p)                                                         #␣
↪needs sage.groups
{'a', 'b', 'c'}
```

sage.combinat.species.characteristic_species.**CharacteristicSpecies_class**

alias of *CharacteristicSpecies*

class sage.combinat.species.characteristic_species.**EmptySetSpecies**(*min=None*, *max=None*, *weight=None*)

Bases: *CharacteristicSpecies*

Return the empty set species.

This species has exactly one structure on the empty set. It is the same (and is implemented) as `CharacteristicSpecies(0)`.

EXAMPLES:

```
sage: X = species.EmptySetSpecies()
sage: X.structures([]).list()
[{}]
sage: X.structures([1,2]).list()
```

(continues on next page)

(continued from previous page)

```
[]
sage: X.generating_series()[0:4]
[1, 0, 0, 0]
sage: X.isotype_generating_series()[0:4]
[1, 0, 0, 0]
sage: X.cycle_index_series()[0:4]                                           #␣
↪needs sage.modules
[p[], 0, 0, 0]
```

```
>>> from sage.all import *
>>> X = species.EmptySetSpecies()
>>> X.structures([]).list()
[{}]
>>> X.structures([Integer(1),Integer(2)]).list()
[]
>>> X.generating_series()[Integer(0):Integer(4)]
[1, 0, 0, 0]
>>> X.isotype_generating_series()[Integer(0):Integer(4)]
[1, 0, 0, 0]
>>> X.cycle_index_series()[Integer(0):Integer(4)]                           ␣
↪           # needs sage.modules
[p[], 0, 0, 0]
```

sage.combinat.species.characteristic_species.**EmptySetSpecies_class**

alias of *EmptySetSpecies*

class sage.combinat.species.characteristic_species.**SingletonSpecies**(*min=None*, *max=None*, *weight=None*)

Bases: *CharacteristicSpecies*

Return the species of singletons.

This species has exactly one structure on a set of size 1. It is the same (and is implemented) as `CharacteristicSpecies(1)`.

EXAMPLES:

```
sage: X = species.SingletonSpecies()
sage: X.structures([1]).list()
[1]
sage: X.structures([1,2]).list()
[]
sage: X.generating_series()[0:4]
[0, 1, 0, 0]
sage: X.isotype_generating_series()[0:4]
[0, 1, 0, 0]
sage: X.cycle_index_series()[0:4]                                           #␣
↪needs sage.modules
[0, p[1], 0, 0]
```

```
>>> from sage.all import *
>>> X = species.SingletonSpecies()
>>> X.structures([Integer(1)]).list()
```

(continues on next page)

(continued from previous page)

```
[1]
>>> X.structures([Integer(1),Integer(2)]).list()
[]
>>> X.generating_series()[Integer(0):Integer(4)]
[0, 1, 0, 0]
>>> X.isotype_generating_series()[Integer(0):Integer(4)]
[0, 1, 0, 0]
>>> X.cycle_index_series()[Integer(0):Integer(4)]
↪          # needs sage.modules
[0, p[1], 0, 0]
```

sage.combinat.species.characteristic_species.**SingletonSpecies_class**

alias of *SingletonSpecies*

Combinatorial species

A combinatorial species, as introduced by Joyal, is a functor from the category of finite sets with bijections to the category of finite sets with bijections. Alternatively, we can regard a combinatorial species as a formal sum of group actions of the symmetric groups $\mathfrak{S}_n$, for $n \in \mathbf{N}$. For example, the trivial action of $\mathfrak{S}_n$ corresponds to the species $\mathcal{E}_n$ of sets of cardinality n.

More generally, a weighted multisort species in k sorts is a functor from the category of k-tuples of finite sets with bijections to the category of weighted finite sets with weight-preserving bijections. We may think of the sorts as variables, traditionally denoted by X, Y, Z.

Such a species is equivalent to a formal sum of group actions of groups $\mathfrak{S}_{n_1} \times \cdots \times \mathfrak{S}_{n_k}$ with $(n_1, \ldots, n_k) \in \mathbf{N}^k$, together with a weight on the orbits of each group action. Yet more generally, a virtual weighted multisort species is a formal difference of weighted multisort species.

We regard a combinatorial species as a sequence of group actions of the symmetric groups $\mathfrak{S}_n$, for $n \in \mathbf{N}$.

Coefficients of lazy species are computed on demand. They have infinite precision, although equality can only be decided in special cases.

There are currently two implementations of combinatorial species, one of which is deprecated and will be removed once all of the functionality has been ported to the new framework.

The recommended implementation is *Lazy Combinatorial Species* and used as the following examples illustrate.

EXAMPLES:

We define rooted ordered trees with leaves having weight q:

```
sage: R.<q> = QQ[]
sage: L.<X> = LazyCombinatorialSpecies(R)
sage: leaf = X
sage: node = q * X
sage: linorder = X/(1 - X)
sage: T = L.undefined(valuation=1)
sage: T.define(leaf + node * linorder(T))
sage: T.isotype_generating_series()
X + q*X^2 + ((q^2+q)*X^3) + ((q^3+3*q^2+q)*X^4) + ((q^4+6*q^3+6*q^2+q)*X^5)
+ ((q^5+10*q^4+20*q^3+10*q^2+q)*X^6) + O(X^7)
```

```
>>> from sage.all import *
>>> R = QQ['q']; (q,) = R._first_ngens(1)
```

(continues on next page)

(continued from previous page)

```
>>> L = LazyCombinatorialSpecies(R, names=('X',)); (X,) = L._first_ngens(1)
>>> leaf = X
>>> node = q * X
>>> linorder = X/(Integer(1) - X)
>>> T = L.undefined(valuation=Integer(1))
>>> T.define(leaf + node * linorder(T))
>>> T.isotype_generating_series()
X + q*X^2 + ((q^2+q)*X^3) + ((q^3+3*q^2+q)*X^4) + ((q^4+6*q^3+6*q^2+q)*X^5)
+ ((q^5+10*q^4+20*q^3+10*q^2+q)*X^6) + O(X^7)
```

We define rooted unordered trees with leaves of sort Y. The standard representation of a species is its molecular decomposition:

```
sage: L = LazyCombinatorialSpecies(R, "X")
sage: E = L.Sets()
sage: Ep = E.restrict(1)
sage: M.<X, Y> = LazyCombinatorialSpecies(R)
sage: A = M.undefined(valuation=1)
sage: A.define(Y + X * Ep(A))
sage: A.truncate(5)
Y + X*Y + (X^2*Y+X*E_2(Y)) + (X^3*Y+X^2*E_2(Y)+X^2*Y^2+X*E_3(Y))
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(R, "X")
>>> E = L.Sets()
>>> Ep = E.restrict(Integer(1))
>>> M = LazyCombinatorialSpecies(R, names=('X', 'Y',)); (X, Y,) = M._first_ngens(2)
>>> A = M.undefined(valuation=Integer(1))
>>> A.define(Y + X * Ep(A))
>>> A.truncate(Integer(5))
Y + X*Y + (X^2*Y+X*E_2(Y)) + (X^3*Y+X^2*E_2(Y)+X^2*Y^2+X*E_3(Y))
```

Combinatorial species

This file defines the main classes for working with combinatorial species, operations on them, as well as some implementations of basic species required for other constructions.

This code is based on the work of Ralf Hemmecke and Martin Rubey's Aldor-Combinat, which can be found at http://www.risc.uni-linz.ac.at/people/hemmecke/aldor/combinat/index.html. In particular, the relevant section for this file can be found at http://www.risc.uni-linz.ac.at/people/hemmecke/AldorCombinat/combinatse8.html.

Weighted Species:

As a first application of weighted species, we count unlabeled ordered trees by total number of nodes and number of internal nodes. To achieve this, we assign a weight of 1 to the leaves and of q to internal nodes:

```
sage: q = QQ['q'].gen()
sage: leaf = species.SingletonSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
sage: internal_node = species.SingletonSpecies(weight=q)
sage: L = species.LinearOrderSpecies(min=1)
sage: T = species.CombinatorialSpecies(min=1)
sage: T.define(leaf + internal_node*L(T))
sage: T.isotype_generating_series()[0:6]                                    #␣
↪needs sage.modules
[0, 1, q, q^2 + q, q^3 + 3*q^2 + q, q^4 + 6*q^3 + 6*q^2 + q]
```

```
>>> from sage.all import *
>>> q = QQ['q'].gen()
>>> leaf = species.SingletonSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
>>> internal_node = species.SingletonSpecies(weight=q)
>>> L = species.LinearOrderSpecies(min=Integer(1))
>>> T = species.CombinatorialSpecies(min=Integer(1))
>>> T.define(leaf + internal_node*L(T))
```

(continues on next page)

(continued from previous page)

```
>>> T.isotype_generating_series()[Integer(0):Integer(6)]                    ␣
↪              # needs sage.modules
[0, 1, q, q^2 + q, q^3 + 3*q^2 + q, q^4 + 6*q^3 + 6*q^2 + q]
```

Consider the following:

```
sage: T.isotype_generating_series().coefficient(4)                          #␣
↪needs sage.modules
q^3 + 3*q^2 + q
```

```
>>> from sage.all import *
>>> T.isotype_generating_series().coefficient(Integer(4))                   ␣
↪     # needs sage.modules
q^3 + 3*q^2 + q
```

This means that, among the trees on 4 nodes, one has a single internal node, three have two internal nodes, and one has three internal nodes.

class sage.combinat.species.species.**GenericCombinatorialSpecies**(*min=None*, *max=None*, *weight=None*)

Bases: SageObject

algebraic_equation_system()

Return a system of algebraic equations satisfied by this species.

The nodes are numbered in the order that they appear as vertices of the associated digraph.

EXAMPLES:

```
sage: B = species.BinaryTreeSpecies()
sage: B.algebraic_equation_system()                                         #␣
↪needs sage.graphs
[-node3^2 + node1, -node1 + node3 + (-z)]
```

```
>>> from sage.all import *
>>> B = species.BinaryTreeSpecies()
>>> B.algebraic_equation_system()                                           #␣
↪needs sage.graphs
[-node3^2 + node1, -node1 + node3 + (-z)]
```

```
sage: sorted(B.digraph().vertex_iterator(), key=str)                        #␣
↪needs sage.graphs
[Combinatorial species with min=1,
 Product of (Combinatorial species with min=1)
        and (Combinatorial species with min=1),
 Singleton species,
 Sum of (Singleton species)
    and (Product of (Combinatorial species with min=1)
    and (Combinatorial species with min=1))]
```

```
>>> from sage.all import *
>>> sorted(B.digraph().vertex_iterator(), key=str)                          #␣
↪needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
[Combinatorial species with min=1,
 Product of (Combinatorial species with min=1)
        and (Combinatorial species with min=1),
 Singleton species,
 Sum of (Singleton species)
    and (Product of (Combinatorial species with min=1)
    and (Combinatorial species with min=1))]
```

```
sage: B.algebraic_equation_system()[0].parent()                                 #␣
↪needs sage.graphs
Multivariate Polynomial Ring in node0, node1, node2, node3 over
 Fraction Field of Univariate Polynomial Ring in z over Rational Field
```

```
>>> from sage.all import *
>>> B.algebraic_equation_system()[Integer(0)].parent()                          ␣
↪     # needs sage.graphs
Multivariate Polynomial Ring in node0, node1, node2, node3 over
 Fraction Field of Univariate Polynomial Ring in z over Rational Field
```

composition(*g*)

EXAMPLES:

```
sage: S = species.SetSpecies()
sage: S(S)
Composition of (Set species) and (Set species)
```

```
>>> from sage.all import *
>>> S = species.SetSpecies()
>>> S(S)
Composition of (Set species) and (Set species)
```

cycle_index_series(*base_ring=None*)

Return the cycle index series for this species.

The cycle index series is a sequence of symmetric functions.

EXAMPLES:

```
sage: P = species.PermutationSpecies()
sage: g = P.cycle_index_series()                                                #␣
↪needs sage.modules
sage: g[0:4]                                                                    #␣
↪needs sage.modules
[p[], p[1], p[1, 1] + p[2], p[1, 1, 1] + p[2, 1] + p[3]]
```

```
>>> from sage.all import *
>>> P = species.PermutationSpecies()
>>> g = P.cycle_index_series()                                                  #␣
↪needs sage.modules
>>> g[Integer(0):Integer(4)]                                                    ␣
↪              # needs sage.modules
[p[], p[1], p[1, 1] + p[2], p[1, 1, 1] + p[2, 1] + p[3]]
```

digraph()

Return a directed graph where the vertices are the individual species that make up this one.

EXAMPLES:

```
sage: X = species.SingletonSpecies()
sage: B = species.CombinatorialSpecies()
sage: B.define(X+B*B)
sage: g = B.digraph(); g                                                    #␣
↪needs sage.graphs
Multi-digraph on 4 vertices

sage: sorted(g, key=str)                                                    #␣
↪needs sage.graphs
[Combinatorial species,
 Product of (Combinatorial species) and (Combinatorial species),
 Singleton species,
 Sum of (Singleton species) and
  (Product of (Combinatorial species) and (Combinatorial species))]

sage: d = {sp: i for i, sp in enumerate(g)}                                 #␣
↪needs sage.graphs
sage: g.relabel(d)                                                          #␣
↪needs sage.graphs
sage: g.canonical_label().edges(sort=True)                                  #␣
↪needs sage.graphs
[(0, 3, None), (2, 0, None), (2, 0, None), (3, 1, None), (3, 2, None)]
```

```
>>> from sage.all import *
>>> X = species.SingletonSpecies()
>>> B = species.CombinatorialSpecies()
>>> B.define(X+B*B)
>>> g = B.digraph(); g                                                      #␣
↪needs sage.graphs
Multi-digraph on 4 vertices

>>> sorted(g, key=str)                                                      #␣
↪needs sage.graphs
[Combinatorial species,
 Product of (Combinatorial species) and (Combinatorial species),
 Singleton species,
 Sum of (Singleton species) and
  (Product of (Combinatorial species) and (Combinatorial species))]

>>> d = {sp: i for i, sp in enumerate(g)}                                   #␣
↪needs sage.graphs
>>> g.relabel(d)                                                            #␣
↪needs sage.graphs
>>> g.canonical_label().edges(sort=True)                                    #␣
↪needs sage.graphs
[(0, 3, None), (2, 0, None), (2, 0, None), (3, 1, None), (3, 2, None)]
```

functorial_composition(*g*)

Return the functorial composition of `self` with `g`.

EXAMPLES:

```
sage: E = species.SetSpecies()
sage: E2 = E.restricted(min=2, max=3)
sage: WP = species.SubsetSpecies()
sage: P2 = E2*E
sage: G = WP.functorial_composition(P2)
sage: G.isotype_generating_series()[0:5]                                    #␣
↪needs sage.modules
[1, 1, 2, 4, 11]
```

```
>>> from sage.all import *
>>> E = species.SetSpecies()
>>> E2 = E.restricted(min=Integer(2), max=Integer(3))
>>> WP = species.SubsetSpecies()
>>> P2 = E2*E
>>> G = WP.functorial_composition(P2)
>>> G.isotype_generating_series()[Integer(0):Integer(5)]                    ␣
↪              # needs sage.modules
[1, 1, 2, 4, 11]
```

generating_series(*base_ring=None*)

Return the generating series for this species.

This is an exponential generating series so the n-th coefficient of the series corresponds to the number of labeled structures with n labels divided by $n!$.

EXAMPLES:

```
sage: P = species.PermutationSpecies()
sage: g = P.generating_series()
sage: g[:4]
[1, 1, 1, 1]
sage: g.counts(4)
[1, 1, 2, 6]
sage: P.structures([1,2,3]).list()
[[1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2], [3, 2, 1]]
sage: len(_)
6
```

```
>>> from sage.all import *
>>> P = species.PermutationSpecies()
>>> g = P.generating_series()
>>> g[:Integer(4)]
[1, 1, 1, 1]
>>> g.counts(Integer(4))
[1, 1, 2, 6]
>>> P.structures([Integer(1),Integer(2),Integer(3)]).list()
[[1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2], [3, 2, 1]]
>>> len(_)
6
```

is_weighted()

Return `True` if this species has a nontrivial weighting associated with it.

EXAMPLES:

```
sage: C = species.CycleSpecies()
sage: C.is_weighted()
False
```

```
>>> from sage.all import *
>>> C = species.CycleSpecies()
>>> C.is_weighted()
False
```

isotype_generating_series(*base_ring=None*)

Return the isotype generating series for this species.

The n-th coefficient of this series corresponds to the number of isomorphism types for the structures on n labels.

EXAMPLES:

```
sage: P = species.PermutationSpecies()
sage: g = P.isotype_generating_series()
sage: g[0:4]                                                                #␣
↪needs sage.libs.flint
[1, 1, 2, 3]
sage: g.counts(4)                                                           #␣
↪needs sage.libs.flint
[1, 1, 2, 3]
sage: P.isotypes([1,2,3]).list()                                            #␣
↪needs sage.libs.flint
[[2, 3, 1], [2, 1, 3], [1, 2, 3]]
sage: len(_)                                                                #␣
↪needs sage.libs.flint
3
```

```
>>> from sage.all import *
>>> P = species.PermutationSpecies()
>>> g = P.isotype_generating_series()
>>> g[Integer(0):Integer(4)]                                                ␣
↪              # needs sage.libs.flint
[1, 1, 2, 3]
>>> g.counts(Integer(4))                                                    ␣
↪     # needs sage.libs.flint
[1, 1, 2, 3]
>>> P.isotypes([Integer(1),Integer(2),Integer(3)]).list()                   ␣
↪                        # needs sage.libs.flint
[[2, 3, 1], [2, 1, 3], [1, 2, 3]]
>>> len(_)                                                                 #␣
↪needs sage.libs.flint
3
```

isotypes(*labels*, *structure_class=None*)

EXAMPLES:

```
sage: F = CombinatorialSpecies()
sage: F.isotypes([1,2,3]).list()
Traceback (most recent call last):
...
ValueError: stream is not yet defined
```

```
>>> from sage.all import *
>>> F = CombinatorialSpecies()
>>> F.isotypes([Integer(1),Integer(2),Integer(3)]).list()
Traceback (most recent call last):
...
ValueError: stream is not yet defined
```

product(*g*)

Return the product of `self` and `g`.

EXAMPLES:

```
sage: P = species.PermutationSpecies()
sage: F = P * P; F
Product of (Permutation species) and (Permutation species)
```

```
>>> from sage.all import *
>>> P = species.PermutationSpecies()
>>> F = P * P; F
Product of (Permutation species) and (Permutation species)
```

restricted(**args*, ***kwds*)

Return the restriction of the species.

INPUT:

- `min` – (optional) integer
- `max` – (optional) integer

EXAMPLES:

```
sage: S = species.SetSpecies().restricted(min=3); S
Set species with min=3
sage: S.structures([1,2]).list()
[]
sage: S.generating_series()[0:5]
[0, 0, 0, 1/6, 1/24]
```

```
>>> from sage.all import *
>>> S = species.SetSpecies().restricted(min=Integer(3)); S
Set species with min=3
>>> S.structures([Integer(1),Integer(2)]).list()
[]
>>> S.generating_series()[Integer(0):Integer(5)]
[0, 0, 0, 1/6, 1/24]
```

structures(*labels*, *structure_class=None*)

EXAMPLES:

```
sage: F = CombinatorialSpecies()
sage: F.structures([1,2,3]).list()
Traceback (most recent call last):
...
ValueError: stream is not yet defined
```

```
>>> from sage.all import *
>>> F = CombinatorialSpecies()
>>> F.structures([Integer(1),Integer(2),Integer(3)]).list()
Traceback (most recent call last):
...
ValueError: stream is not yet defined
```

sum(*g*)

Return the sum of `self` and `g`.

EXAMPLES:

```
sage: P = species.PermutationSpecies()
sage: F = P + P; F
Sum of (Permutation species) and (Permutation species)
sage: F.structures([1,2]).list()
[[1, 2], [2, 1], [1, 2], [2, 1]]
```

```
>>> from sage.all import *
>>> P = species.PermutationSpecies()
>>> F = P + P; F
Sum of (Permutation species) and (Permutation species)
>>> F.structures([Integer(1),Integer(2)]).list()
[[1, 2], [2, 1], [1, 2], [2, 1]]
```

weight_ring()

Return the ring in which the weights of this species occur.

By default, this is just the field of rational numbers.

EXAMPLES:

```
sage: species.SetSpecies().weight_ring()
Rational Field
```

```
>>> from sage.all import *
>>> species.SetSpecies().weight_ring()
Rational Field
```

weighted(*weight*)

Return a version of this species with the specified weight.

EXAMPLES:

```
sage: t = ZZ['t'].gen()
sage: C = species.CycleSpecies(); C
Cyclic permutation species
```

(continues on next page)

(continued from previous page)

```
sage: C.weighted(t)
Cyclic permutation species with weight=t
```

```
>>> from sage.all import *
>>> t = ZZ['t'].gen()
>>> C = species.CycleSpecies(); C
Cyclic permutation species
>>> C.weighted(t)
Cyclic permutation species with weight=t
```

Composition species

class sage.combinat.species.composition_species.**CompositionSpecies**(*F*, *G*, *min=None*, *max=None*, *weight=None*)

Bases: *GenericCombinatorialSpecies*, UniqueRepresentation

Return the composition of two species.

EXAMPLES:

```
sage: E = species.SetSpecies()
sage: C = species.CycleSpecies()
sage: S = E(C)
sage: S.generating_series()[:5]
[1, 1, 1, 1, 1]
sage: E(C) is S
True
```

```
>>> from sage.all import *
>>> E = species.SetSpecies()
>>> C = species.CycleSpecies()
>>> S = E(C)
>>> S.generating_series()[:Integer(5)]
[1, 1, 1, 1, 1]
>>> E(C) is S
True
```

weight_ring()

Return the weight ring for this species. This is determined by asking Sage's coercion model what the result is when you multiply (and add) elements of the weight rings for each of the operands.

EXAMPLES:

```
sage: E = species.SetSpecies(); C = species.CycleSpecies()
sage: L = E(C)
sage: L.weight_ring()
Rational Field
```

```
>>> from sage.all import *
>>> E = species.SetSpecies(); C = species.CycleSpecies()
>>> L = E(C)
>>> L.weight_ring()
Rational Field
```

class sage.combinat.species.composition_species.**CompositionSpeciesStructure**(*parent*, *labels*, *pi*, *f*, *gs*)

Bases: *GenericSpeciesStructure*

change_labels(*labels*)

Return a relabelled structure.

INPUT:

- `labels` – list of labels

OUTPUT:

A structure with the i-th label of `self` replaced with the i-th label of the list.

EXAMPLES:

```
sage: E = species.SetSpecies(); C = species.CycleSpecies()
sage: L = E(C)
sage: S = L.structures(['a','b','c']).list()                                #␣
↪needs sage.libs.flint
sage: a = S[2]; a                                                           #␣
↪needs sage.libs.flint
F-structure: {{'a', 'c'}, {'b'}}; G-structures: (('a', 'c'), ('b'))
sage: a.change_labels([1,2,3])                                              #␣
↪needs sage.libs.flint
F-structure: {{1, 3}, {2}}; G-structures: [(1, 3), (2)]
```

```
>>> from sage.all import *
>>> E = species.SetSpecies(); C = species.CycleSpecies()
>>> L = E(C)
>>> S = L.structures(['a','b','c']).list()                                  #␣
↪needs sage.libs.flint
>>> a = S[Integer(2)]; a                                                    ␣
↪     # needs sage.libs.flint
F-structure: {{'a', 'c'}, {'b'}}; G-structures: (('a', 'c'), ('b'))
>>> a.change_labels([Integer(1),Integer(2),Integer(3)])                     ␣
↪                        # needs sage.libs.flint
F-structure: {{1, 3}, {2}}; G-structures: [(1, 3), (2)]
```

transport(*perm*)

EXAMPLES:

```
sage: p = PermutationGroupElement((2,3))                                    #␣
↪needs sage.groups
sage: E = species.SetSpecies(); C = species.CycleSpecies()
sage: L = E(C)
sage: S = L.structures(['a','b','c']).list()                                #␣
↪needs sage.libs.flint
sage: a = S[2]; a                                                           #␣
↪needs sage.libs.flint
F-structure: {{'a', 'c'}, {'b'}}; G-structures: (('a', 'c'), ('b'))
sage: a.transport(p)                                                        #␣
↪needs sage.groups sage.libs.flint
F-structure: {{'a', 'b'}, {'c'}}; G-structures: (('a', 'c'), ('b'))
```

```
>>> from sage.all import *
>>> p = PermutationGroupElement((Integer(2),Integer(3)))
↪              # needs sage.groups
>>> E = species.SetSpecies(); C = species.CycleSpecies()
>>> L = E(C)
>>> S = L.structures(['a','b','c']).list()
↪needs sage.libs.flint
>>> a = S[Integer(2)]; a
↪     # needs sage.libs.flint
F-structure: {{'a', 'c'}, {'b'}}; G-structures: (('a', 'c'), ('b'))
>>> a.transport(p)
↪needs sage.groups sage.libs.flint
F-structure: {{'a', 'b'}, {'c'}}; G-structures: (('a', 'c'), ('b'))
```

sage.combinat.species.composition_species.**CompositionSpecies_class**

alias of *CompositionSpecies*

Cycle species

class sage.combinat.species.cycle_species.**CycleSpecies**(*min=None*, *max=None*, *weight=None*)

Bases: *GenericCombinatorialSpecies*, UniqueRepresentation

Return the species of cycles.

EXAMPLES:

```
sage: C = species.CycleSpecies(); C
Cyclic permutation species
sage: C.structures([1,2,3,4]).list()
[(1, 2, 3, 4),
 (1, 2, 4, 3),
 (1, 3, 2, 4),
 (1, 3, 4, 2),
 (1, 4, 2, 3),
 (1, 4, 3, 2)]
```

```
>>> from sage.all import *
>>> C = species.CycleSpecies(); C
Cyclic permutation species
>>> C.structures([Integer(1),Integer(2),Integer(3),Integer(4)]).list()
[(1, 2, 3, 4),
 (1, 2, 4, 3),
 (1, 3, 2, 4),
 (1, 3, 4, 2),
 (1, 4, 2, 3),
 (1, 4, 3, 2)]
```

class sage.combinat.species.cycle_species.**CycleSpeciesStructure**(*parent*, *labels*, *list*)

Bases: *GenericSpeciesStructure*

automorphism_group()

Return the group of permutations whose action on this structure leave it fixed.

EXAMPLES:

```
sage: P = species.CycleSpecies()
sage: a = P.structures([1, 2, 3, 4])[0]; a
(1, 2, 3, 4)
sage: a.automorphism_group()                                                #␣
↪needs sage.groups
Permutation Group with generators [(1,2,3,4)]
```

```
>>> from sage.all import *
>>> P = species.CycleSpecies()
>>> a = P.structures([Integer(1), Integer(2), Integer(3),␣
↪Integer(4)])[Integer(0)]; a
(1, 2, 3, 4)
>>> a.automorphism_group()                                                  #␣
↪needs sage.groups
Permutation Group with generators [(1,2,3,4)]
```

```
sage: [a.transport(perm) for perm in a.automorphism_group()]                #␣
↪needs sage.groups
[(1, 2, 3, 4), (1, 2, 3, 4), (1, 2, 3, 4), (1, 2, 3, 4)]
```

```
>>> from sage.all import *
>>> [a.transport(perm) for perm in a.automorphism_group()]                  #␣
↪needs sage.groups
[(1, 2, 3, 4), (1, 2, 3, 4), (1, 2, 3, 4), (1, 2, 3, 4)]
```

canonical_label()

EXAMPLES:

```
sage: P = species.CycleSpecies()
sage: P.structures(["a","b","c"]).random_element().canonical_label()
('a', 'b', 'c')
```

```
>>> from sage.all import *
>>> P = species.CycleSpecies()
>>> P.structures(["a","b","c"]).random_element().canonical_label()
('a', 'b', 'c')
```

permutation_group_element()

Return this cycle as a permutation group element.

EXAMPLES:

```
sage: F = species.CycleSpecies()
sage: a = F.structures(["a", "b", "c"])[0]; a
('a', 'b', 'c')
sage: a.permutation_group_element()                                         #␣
↪needs sage.groups
(1,2,3)
```

```
>>> from sage.all import *
>>> F = species.CycleSpecies()
>>> a = F.structures(["a", "b", "c"])[Integer(0)]; a
```

(continues on next page)

(continued from previous page)

```
('a', 'b', 'c')
>>> a.permutation_group_element()                                    #␣
↪needs sage.groups
(1,2,3)
```

transport(*perm*)

Return the transport of this structure along the permutation `perm`.

EXAMPLES:

```
sage: F = species.CycleSpecies()
sage: a = F.structures(["a", "b", "c"])[0]; a
('a', 'b', 'c')
sage: p = PermutationGroupElement((1,2))                               #␣
↪needs sage.groups
sage: a.transport(p)                                                   #␣
↪needs sage.groups
('a', 'c', 'b')
```

```
>>> from sage.all import *
>>> F = species.CycleSpecies()
>>> a = F.structures(["a", "b", "c"])[Integer(0)]; a
('a', 'b', 'c')
>>> p = PermutationGroupElement((Integer(1),Integer(2)))                ␣
↪              # needs sage.groups
>>> a.transport(p)                                                     #␣
↪needs sage.groups
('a', 'c', 'b')
```

sage.combinat.species.cycle_species.**CycleSpecies_class**

alias of *CycleSpecies*

Empty species

class sage.combinat.species.empty_species.**EmptySpecies**(*min=None*, *max=None*, *weight=None*)

Bases: *GenericCombinatorialSpecies*, UniqueRepresentation

Return the empty species. This species has no structure at all. It is the zero of the semi-ring of species.

EXAMPLES:

```
sage: X = species.EmptySpecies(); X
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
Empty species
sage: X.structures([]).list()
[]
sage: X.structures([1]).list()
[]
sage: X.structures([1,2]).list()
[]
sage: X.generating_series()[0:4]
```

(continues on next page)

(continued from previous page)

```
[0, 0, 0, 0]
sage: X.isotype_generating_series()[0:4]
[0, 0, 0, 0]
sage: X.cycle_index_series()[0:4]                                              #␣
↪needs sage.modules
[0, 0, 0, 0]
```

```
>>> from sage.all import *
>>> X = species.EmptySpecies(); X
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
Empty species
>>> X.structures([]).list()
[]
>>> X.structures([Integer(1)]).list()
[]
>>> X.structures([Integer(1),Integer(2)]).list()
[]
>>> X.generating_series()[Integer(0):Integer(4)]
[0, 0, 0, 0]
>>> X.isotype_generating_series()[Integer(0):Integer(4)]
[0, 0, 0, 0]
>>> X.cycle_index_series()[Integer(0):Integer(4)]                              ␣
↪              # needs sage.modules
[0, 0, 0, 0]
```

The empty species is the zero of the semi-ring of species. The following tests that it is neutral with respect to addition:

```
sage: Empt  = species.EmptySpecies()
sage: S = species.CharacteristicSpecies(2)
sage: X = S + Empt
sage: X == S    # TODO: Not Implemented
True
sage: (X.generating_series()[0:4] ==
....:  S.generating_series()[0:4])
True
sage: (X.isotype_generating_series()[0:4] ==
....:  S.isotype_generating_series()[0:4])
True
sage: (X.cycle_index_series()[0:4] ==                                          #␣
↪needs sage.modules
....:  S.cycle_index_series()[0:4])
True
```

```
>>> from sage.all import *
>>> Empt  = species.EmptySpecies()
>>> S = species.CharacteristicSpecies(Integer(2))
>>> X = S + Empt
>>> X == S    # TODO: Not Implemented
True
```

(continues on next page)

(continued from previous page)

```
>>> (X.generating_series()[Integer(0):Integer(4)] ==
...  S.generating_series()[Integer(0):Integer(4)])
True
>>> (X.isotype_generating_series()[Integer(0):Integer(4)] ==
...  S.isotype_generating_series()[Integer(0):Integer(4)])
True
>>> (X.cycle_index_series()[Integer(0):Integer(4)] ==
↪              # needs sage.modules
...  S.cycle_index_series()[Integer(0):Integer(4)])
True
```

The following tests that it is the zero element with respect to multiplication:

```
sage: Y = Empt*S
sage: Y == Empt    # TODO: Not Implemented
True
sage: Y.generating_series()[0:4]
[0, 0, 0, 0]
sage: Y.isotype_generating_series()[0:4]
[0, 0, 0, 0]
sage: Y.cycle_index_series()[0:4]                                              #␣
↪needs sage.modules
[0, 0, 0, 0]
```

```
>>> from sage.all import *
>>> Y = Empt*S
>>> Y == Empt    # TODO: Not Implemented
True
>>> Y.generating_series()[Integer(0):Integer(4)]
[0, 0, 0, 0]
>>> Y.isotype_generating_series()[Integer(0):Integer(4)]
[0, 0, 0, 0]
>>> Y.cycle_index_series()[Integer(0):Integer(4)]
↪              # needs sage.modules
[0, 0, 0, 0]
```

sage.combinat.species.empty_species.**EmptySpecies_class**

alias of *EmptySpecies*

Examples of combinatorial species

sage.combinat.species.library.**BinaryForestSpecies**()

Return the species of binary forests.

Binary forests are defined as sets of binary trees.

EXAMPLES:

```
sage: F = species.BinaryForestSpecies()
sage: F.generating_series().counts(10)
[1, 1, 3, 19, 193, 2721, 49171, 1084483, 28245729, 848456353]
sage: F.isotype_generating_series().counts(10)                                 #␣
↪needs sage.modules
```

(continues on next page)

(continued from previous page)

```
[1, 1, 2, 4, 10, 26, 77, 235, 758, 2504]
sage: F.cycle_index_series()[:7]                                                #␣
↪needs sage.modules
[p[],
 p[1],
 3/2*p[1, 1] + 1/2*p[2],

↪8*p[4, 1, 1] + 1/8*p[4, 2] + 1/5*p[5, 1] + 1/6*p[6]]
```

sage.combinat.species.library.**BinaryTreeSpecies**()

Return the species of binary trees on n leaves.

The species of binary trees B is defined by $B = X + B \cdot B$, where X is the singleton species.

EXAMPLES:

```
sage: B = species.BinaryTreeSpecies()
sage: B.generating_series().counts(10)
[0, 1, 2, 12, 120, 1680, 30240, 665280, 17297280, 518918400]
sage: B.isotype_generating_series().counts(10)
[0, 1, 1, 2, 5, 14, 42, 132, 429, 1430]
sage: B._check()
True
```

```
>>> from sage.all import *
>>> B = species.BinaryTreeSpecies()
>>> B.generating_series().counts(Integer(10))
```

(continues on next page)

(continued from previous page)

```

sage.combinat.species.library.**SimpleGraphSpecies**()

Return the species of simple graphs.

EXAMPLES:

```
sage: S = species.SimpleGraphSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
sage: S.generating_series().counts(10)

Functorial composition species

class sage.combinat.species.functorial_composition_species.**FunctorialCompositionSpecies**(*F*, *G*, *min=None*, *max=None*, *weight=None*)

Bases: *GenericCombinatorialSpecies*

Return the functorial composition of two species.

EXAMPLES:

```
sage: E = species.SetSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
sage: E2 = species.SetSpecies(size=2)
sage: WP = species.SubsetSpecies()
sage: P2 = E2*E
sage: G = WP.functorial_composition(P2)
sage: G.isotype_generating_series()[0:5]                                      #␣
↪needs sage.modules
[1, 1, 2, 4, 11]

sage: G = species.SimpleGraphSpecies()
sage: c = G.generating_series()[0:2]
sage: type(G)
<class 'sage.combinat.species.functorial_composition_species.
↪FunctorialCompositionSpecies'>
sage: G == loads(dumps(G))
True
sage: G._check()  # False due to isomorphism types not being implemented    #␣
↪needs sage.modules
False
```

```
>>> from sage.all import *
>>> E = species.SetSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
>>> E2 = species.SetSpecies(size=Integer(2))
```

(continues on next page)

(continued from previous page)

```
>>> WP = species.SubsetSpecies()
>>> P2 = E2*E
>>> G = WP.functorial_composition(P2)
>>> G.isotype_generating_series()[Integer(0):Integer(5)]                    ␣
↪          # needs sage.modules
[1, 1, 2, 4, 11]

>>> G = species.SimpleGraphSpecies()

>>> type(G)
<class 'sage.combinat.species.functorial_composition_species.
↪FunctorialCompositionSpecies'>
>>> G == loads(dumps(G))
True
>>> G._check()  # False due to isomorphism types not being implemented    # needs␣
↪sage.modules
False
```

weight_ring()

Return the weight ring for this species. This is determined by asking Sage's coercion model what the result is when you multiply (and add) elements of the weight rings for each of the operands.

EXAMPLES:

```
sage: G = species.SimpleGraphSpecies()
sage: G.weight_ring()
Rational Field
```

```
>>> from sage.all import *
>>> G = species.SimpleGraphSpecies()
>>> G.weight_ring()
Rational Field
```

sage.combinat.species.functorial_composition_species.
FunctorialCompositionSpecies_class

alias of *FunctorialCompositionSpecies*

class sage.combinat.species.functorial_composition_species.**FunctorialCompositionStructure**(*parent*, *labels*, *list*)

Bases: *GenericSpeciesStructure*

Generating series

This file makes a number of extensions to lazy power series by endowing them with some semantic content for how they're to be interpreted.

This code is based on the work of Ralf Hemmecke and Martin Rubey's Aldor-Combinat, which can be found at http://www.risc.uni-linz.ac.at/people/hemmecke/aldor/combinat/index.html. In particular, the relevant section for this file can be found at http://www.risc.uni-linz.ac.at/people/hemmecke/AldorCombinat/combinatse10.html. One notable difference is that we use power-sum symmetric functions as the coefficients of our cycle index series.

class sage.combinat.species.generating_series.**CycleIndexSeries**(*parent*, *coeff_stream*)

Bases: LazySymmetricFunction

coefficient_cycle_type(*t*)

Return the coefficient of a cycle type `t` in `self`.

EXAMPLES:

```
sage: # needs sage.modules
sage: from sage.combinat.species.generating_series import CycleIndexSeriesRing
sage: p = SymmetricFunctions(QQ).power()
sage: CIS = CycleIndexSeriesRing(QQ)
sage: f = CIS([0, p([1]), 2*p([1,1]),3*p([2,1])])
sage: f.coefficient_cycle_type([1])
1
sage: f.coefficient_cycle_type([1,1])
2
sage: f.coefficient_cycle_type([2,1])
3
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> from sage.combinat.species.generating_series import CycleIndexSeriesRing
>>> p = SymmetricFunctions(QQ).power()
>>> CIS = CycleIndexSeriesRing(QQ)
>>> f = CIS([Integer(0), p([Integer(1)]), Integer(2)*p([Integer(1),
↪Integer(1)]),Integer(3)*p([Integer(2),Integer(1)])])
>>> f.coefficient_cycle_type([Integer(1)])
1
>>> f.coefficient_cycle_type([Integer(1),Integer(1)])
2
>>> f.coefficient_cycle_type([Integer(2),Integer(1)])
3
```

count(*t*)

Return the number of structures corresponding to a certain cycle type `t`.

EXAMPLES:

```
sage: # needs sage.modules
sage: from sage.combinat.species.generating_series import CycleIndexSeriesRing
sage: p = SymmetricFunctions(QQ).power()
sage: CIS = CycleIndexSeriesRing(QQ)
sage: f = CIS([0, p([1]), 2*p([1,1]), 3*p([2,1])])
sage: f.count([1])
1
sage: f.count([1,1])
4
sage: f.count([2,1])
6
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> from sage.combinat.species.generating_series import CycleIndexSeriesRing
```

(continues on next page)

(continued from previous page)

```
>>> p = SymmetricFunctions(QQ).power()
>>> CIS = CycleIndexSeriesRing(QQ)
>>> f = CIS([Integer(0), p([Integer(1)]), Integer(2)*p([Integer(1),
↪Integer(1)]), Integer(3)*p([Integer(2),Integer(1)])])
>>> f.count([Integer(1)])
1
>>> f.count([Integer(1),Integer(1)])
4
>>> f.count([Integer(2),Integer(1)])
6
```

derivative(*n=1*)

Return the species-theoretic n-th derivative of `self`.

For a cycle index series $F(p_1, p_2, p_3, \ldots)$, its derivative is the cycle index series $F' = D_{p_1} F$ (that is, the formal derivative of F with respect to the variable p_1).

If F is the cycle index series of a species S then F' is the cycle index series of an associated species S' of S-structures with a "hole".

EXAMPLES:

The species E of sets satisfies the relationship $E' = E$:

```
sage: E = species.SetSpecies().cycle_index_series()                    #␣
↪needs sage.modules
sage: E[:8] == E.derivative()[:8]                                      #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> E = species.SetSpecies().cycle_index_series()                      #␣
↪needs sage.modules
>>> E[:Integer(8)] == E.derivative()[:Integer(8)]                       ␣
↪              # needs sage.modules
True
```

The species C of cyclic orderings and the species L of linear orderings satisfy the relationship $C' = L$:

```
sage: C = species.CycleSpecies().cycle_index_series()                  #␣
↪needs sage.modules
sage: L = species.LinearOrderSpecies().cycle_index_series()            #␣
↪needs sage.modules
sage: L[:8] == C.derivative()[:8]                                      #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> C = species.CycleSpecies().cycle_index_series()                    #␣
↪needs sage.modules
>>> L = species.LinearOrderSpecies().cycle_index_series()              #␣
↪needs sage.modules
>>> L[:Integer(8)] == C.derivative()[:Integer(8)]                       ␣
```

(continues on next page)

(continued from previous page)

```
↪              # needs sage.modules
True
```

exponential()

Return the species-theoretic exponential of `self`.

For a cycle index Z_F of a species F, its exponential is the cycle index series $Z_E \circ Z_F$, where Z_E is the *ExponentialCycleIndexSeries()*.

The exponential $Z_E \circ Z_F$ is then the cycle index series of the species $E \circ F$ of "sets of F-structures".

EXAMPLES:

Let BT be the species of binary trees, BF the species of binary forests, and E the species of sets. Then we have $BF = E \circ BT$:

```
sage: BT = species.BinaryTreeSpecies().cycle_index_series()                    #␣
↪needs sage.modules
sage: BF = species.BinaryForestSpecies().cycle_index_series()                  #␣
↪needs sage.modules
sage: BT.exponential().isotype_generating_series()[:8] == BF.isotype_
↪generating_series()[:8]                # needs sage.modules
True
```

```
>>> from sage.all import *
>>> BT = species.BinaryTreeSpecies().cycle_index_series()                    #␣
↪needs sage.modules
>>> BF = species.BinaryForestSpecies().cycle_index_series()                  #␣
↪needs sage.modules
>>> BT.exponential().isotype_generating_series()[:Integer(8)] == BF.isotype_
↪generating_series()[:Integer(8)]                # needs sage.modules
True
```

generating_series()

Return the generating series of `self`.

EXAMPLES:

```
sage: P = species.PartitionSpecies()
sage: cis = P.cycle_index_series()                                             #␣
↪needs sage.modules
sage: f = cis.generating_series()                                              #␣
↪needs sage.modules
sage: f[:5]                                                                    #␣
↪needs sage.modules
[1, 1, 1, 5/6, 5/8]
```

```
>>> from sage.all import *
>>> P = species.PartitionSpecies()
>>> cis = P.cycle_index_series()                                               #␣
↪needs sage.modules
>>> f = cis.generating_series()                                                #␣
↪needs sage.modules
>>> f[:Integer(5)]                                                             ␣
```

(continues on next page)

(continued from previous page)

```
↪      # needs sage.modules
[1, 1, 1, 5/6, 5/8]
```

isotype_generating_series()

Return the isotype generating series of `self`.

EXAMPLES:

```
sage: P = species.PermutationSpecies()
sage: cis = P.cycle_index_series()                                          #␣
↪needs sage.modules
sage: f = cis.isotype_generating_series()                                   #␣
↪needs sage.modules
sage: f[:10]                                                                #␣
↪needs sage.modules
[1, 1, 2, 3, 5, 7, 11, 15, 22, 30]
```

```
>>> from sage.all import *
>>> P = species.PermutationSpecies()
>>> cis = P.cycle_index_series()                                            #␣
↪needs sage.modules
>>> f = cis.isotype_generating_series()                                     #␣
↪needs sage.modules
>>> f[:Integer(10)]                                                         ␣
↪      # needs sage.modules
[1, 1, 2, 3, 5, 7, 11, 15, 22, 30]
```

logarithm()

Return the combinatorial logarithm of `self`.

For a cycle index Z_F of a species F, its logarithm is the cycle index series $Z_\Omega \circ Z_F$, where Z_Ω is the *LogarithmCycleIndexSeries()*.

The logarithm $Z_\Omega \circ Z_F$ is then the cycle index series of the (virtual) species $\Omega \circ F$ of "connected F-structures". In particular, if $F = E^+ \circ G$ for E^+ the species of nonempty sets and G some other species, then $\Omega \circ F = G$.

EXAMPLES:

Let G be the species of nonempty graphs and CG be the species of nonempty connected graphs. Then $G = E^+ \circ CG$, so $CG = \Omega \circ G$:

```
sage: G = species.SimpleGraphSpecies().cycle_index_series() - 1             #␣
↪needs sage.modules
sage: from sage.combinat.species.generating_series import␣
↪LogarithmCycleIndexSeries
sage: CG = LogarithmCycleIndexSeries()(G)                                   #␣
↪needs sage.modules
sage: CG.isotype_generating_series()[0:8]                                   #␣
↪needs sage.modules
[0, 1, 1, 2, 6, 21, 112, 853]
```

```
>>> from sage.all import *
>>> G = species.SimpleGraphSpecies().cycle_index_series() - Integer(1)      ␣
↪      # needs sage.modules
```

(continues on next page)

(continued from previous page)

```
>>> from sage.combinat.species.generating_series import␣
↪LogarithmCycleIndexSeries
>>> CG = LogarithmCycleIndexSeries()(G)                                    #␣
↪needs sage.modules
>>> CG.isotype_generating_series()[Integer(0):Integer(8)]                  ␣
↪              # needs sage.modules
[0, 1, 1, 2, 6, 21, 112, 853]
```

pointing()

Return the species-theoretic pointing of `self`.

For a cycle index F, its pointing is the cycle index series $F^\bullet = p_1 \cdot F'$.

If F is the cycle index series of a species S then $F^\bullet$ is the cycle index series of an associated species $S^\bullet$ of S-structures with a marked "root".

EXAMPLES:

The species $E^\bullet$ of "pointed sets" satisfies $E^\bullet = X \cdot E$:

```
sage: E = species.SetSpecies().cycle_index_series()                      #␣
↪needs sage.modules
sage: X = species.SingletonSpecies().cycle_index_series()                #␣
↪needs sage.modules
sage: E.pointing()[:8] == (X*E)[:8]                                      #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> E = species.SetSpecies().cycle_index_series()                        #␣
↪needs sage.modules
>>> X = species.SingletonSpecies().cycle_index_series()                  #␣
↪needs sage.modules
>>> E.pointing()[:Integer(8)] == (X*E)[:Integer(8)]                      ␣
↪              # needs sage.modules
True
```

class sage.combinat.species.generating_series.**CycleIndexSeriesRing**(*base_ring*, *sparse=True*)

Bases: `LazySymmetricFunctions`

Return the ring of cycle index series over `R`.

This is the ring of formal power series $\Lambda[x]$, where Λ is the ring of symmetric functions over `R` in the p-basis. Its purpose is to house the cycle index series of species (in a somewhat nonstandard notation tailored to Sage): If F is a species, then the *cycle index series* of F is defined to be the formal power series

$$\sum_{n \geq 0} \frac{1}{n!} \left(\sum_{\sigma \in S_n} \operatorname{fix} F[\sigma] \prod_{z \text{ is a cycle of } \sigma} p_{\text{length of } z} \right) x^n \in \Lambda_{\mathbf{Q}}[x],$$

where $\operatorname{fix} F[\sigma]$ denotes the number of fixed points of the permutation $F[\sigma]$ of $F[n]$. We notice that this power series is "equigraded" (meaning that its x^n-coefficient is homogeneous of degree n). A more standard convention in combinatorics would be to use x_i instead of p_i, and drop the x (that is, evaluate the above power series at $x = 1$); but this would be more difficult to implement in Sage, as it would be an element of a power series ring in infinitely many variables.

Note that it is just a `LazyPowerSeriesRing` (whose base ring is Λ) whose elements have some extra methods.

EXAMPLES:

```
sage: from sage.combinat.species.generating_series import CycleIndexSeriesRing
sage: R = CycleIndexSeriesRing(QQ); R                                          #␣
↪needs sage.modules
Cycle Index Series Ring over Rational Field
sage: p = SymmetricFunctions(QQ).p()                                           #␣
↪needs sage.modules
sage: R(lambda n: p[n])                                                        #␣
↪needs sage.modules
p[] + p[1] + p[2] + p[3] + p[4] + p[5] + p[6] + O^7
```

```
>>> from sage.all import *
>>> from sage.combinat.species.generating_series import CycleIndexSeriesRing
>>> R = CycleIndexSeriesRing(QQ); R                                            #␣
↪needs sage.modules
Cycle Index Series Ring over Rational Field
>>> p = SymmetricFunctions(QQ).p()                                             #␣
↪needs sage.modules
>>> R(lambda n: p[n])                                                          #␣
↪needs sage.modules
p[] + p[1] + p[2] + p[3] + p[4] + p[5] + p[6] + O^7
```

Element

alias of *CycleIndexSeries*

sage.combinat.species.generating_series.**ExponentialCycleIndexSeries**()

Return the cycle index series of the species E of sets.

This cycle index satisfies

$$Z_E = \sum_{n \geq 0} \sum_{\lambda \vdash n} \frac{p_\lambda}{z_\lambda}.$$

EXAMPLES:

```
sage: from sage.combinat.species.generating_series import␣
↪ExponentialCycleIndexSeries
sage: ExponentialCycleIndexSeries()[:5]                                        #␣
↪needs sage.modules
[p[], p[1], 1/2*p[1, 1] + 1/2*p[2], 1/6*p[1, 1, 1] + 1/2*p[2, 1]
 + 1/3*p[3], 1/24*p[1, 1, 1, 1] + 1/4*p[2, 1, 1] + 1/8*p[2, 2]
 + 1/3*p[3, 1] + 1/4*p[4]]
```

```
>>> from sage.all import *
>>> from sage.combinat.species.generating_series import␣
↪ExponentialCycleIndexSeries
>>> ExponentialCycleIndexSeries()[:Integer(5)]                                 ␣
↪     # needs sage.modules
[p[], p[1], 1/2*p[1, 1] + 1/2*p[2], 1/6*p[1, 1, 1] + 1/2*p[2, 1]
 + 1/3*p[3], 1/24*p[1, 1, 1, 1] + 1/4*p[2, 1, 1] + 1/8*p[2, 2]
 + 1/3*p[3, 1] + 1/4*p[4]]
```

class sage.combinat.species.generating_series.**ExponentialGeneratingSeries**(*parent*, *coeff_stream*)

Bases: LazyPowerSeries

A class for ordinary generating series.

Note that it is just a LazyPowerSeries whose elements have some extra methods.

EXAMPLES:

```
sage: from sage.combinat.species.generating_series import␣
↪OrdinaryGeneratingSeriesRing
sage: R = OrdinaryGeneratingSeriesRing(QQ)
sage: f = R(lambda n: n)
sage: f
z + 2*z^2 + 3*z^3 + 4*z^4 + 5*z^5 + 6*z^6 + O(z^7)
```

```
>>> from sage.all import *
>>> from sage.combinat.species.generating_series import␣
↪OrdinaryGeneratingSeriesRing
>>> R = OrdinaryGeneratingSeriesRing(QQ)
>>> f = R(lambda n: n)
>>> f
z + 2*z^2 + 3*z^3 + 4*z^4 + 5*z^5 + 6*z^6 + O(z^7)
```

count(*n*)

Return the number of structures of size n.

EXAMPLES:

```
sage: from sage.combinat.species.generating_series import␣
↪ExponentialGeneratingSeriesRing
sage: R = ExponentialGeneratingSeriesRing(QQ)
sage: f = R(lambda n: 1)
sage: [f.count(i) for i in range(7)]
[1, 1, 2, 6, 24, 120, 720]
```

```
>>> from sage.all import *
>>> from sage.combinat.species.generating_series import␣
↪ExponentialGeneratingSeriesRing
>>> R = ExponentialGeneratingSeriesRing(QQ)
>>> f = R(lambda n: Integer(1))
>>> [f.count(i) for i in range(Integer(7))]
[1, 1, 2, 6, 24, 120, 720]
```

counts(*n*)

Return the number of structures on a set for size i for each i in range(n).

EXAMPLES:

```
sage: from sage.combinat.species.generating_series import␣
↪ExponentialGeneratingSeriesRing
sage: R = ExponentialGeneratingSeriesRing(QQ)
sage: f = R(range(20))
sage: f.counts(5)
[0, 1, 4, 18, 96]
```

```
>>> from sage.all import *
>>> from sage.combinat.species.generating_series import␣
↪ExponentialGeneratingSeriesRing
>>> R = ExponentialGeneratingSeriesRing(QQ)
>>> f = R(range(Integer(20)))
>>> f.counts(Integer(5))
[0, 1, 4, 18, 96]
```

functorial_composition(*y*)

Return the exponential generating series which is the functorial composition of `self` with `y`.

If $f = \sum_{n=0}^{\infty} f_n \frac{x^n}{n!}$ and $g = \sum_{n=0}^{\infty} g_n \frac{x^n}{n!}$, then functorial composition $f \Box g$ is defined as

$$f \Box g = \sum_{n=0}^{\infty} f_{g_n} \frac{x^n}{n!}.$$

[1, 1, 1, 4/3, 8/3, 128/15, 2048/45, 131072/315, 2097152/315, 536870912/2835]
```

class sage.combinat.species.generating_series.**ExponentialGeneratingSeriesRing**(*base_ring*)

Bases: LazyPowerSeriesRing

Return the ring of exponential generating series over R.

Note that it is just a LazyPowerSeriesRing whose elements have some extra methods.

EXAMPLES:

```
sage: from sage.combinat.species.generating_series import␣
↪ExponentialGeneratingSeriesRing
sage: R = ExponentialGeneratingSeriesRing(QQ); R
Lazy Taylor Series Ring in z over Rational Field
sage: [R(lambda n: 1).coefficient(i) for i in range(4)]
[1, 1, 1, 1]
sage: R(lambda n: 1).counts(4)
[1, 1, 2, 6]
```

```
>>> from sage.all import *
>>> from sage.combinat.species.generating_series import␣
↪ExponentialGeneratingSeriesRing
>>> R = ExponentialGeneratingSeriesRing(QQ); R
Lazy Taylor Series Ring in z over Rational Field
>>> [R(lambda n: Integer(1)).coefficient(i) for i in range(Integer(4))]
[1, 1, 1, 1]
>>> R(lambda n: Integer(1)).counts(Integer(4))
[1, 1, 2, 6]
```

Element

alias of *ExponentialGeneratingSeries*

sage.combinat.species.generating_series.**LogarithmCycleIndexSeries**()

Return the cycle index series of the virtual species Ω, the compositional inverse of the species E^+ of nonempty sets.

The notion of virtual species is treated thoroughly in [BLL1998]. The specific algorithm used here to compute the cycle index of Ω is found in [Labelle2008].

EXAMPLES:

The virtual species Ω is 'properly virtual', in the sense that its cycle index has negative coefficients:

```
sage: from sage.combinat.species.generating_series import␣
↪LogarithmCycleIndexSeries
sage: LogarithmCycleIndexSeries()[0:4]                                    #␣
↪needs sage.modules
[0, p[1], -1/2*p[1, 1] - 1/2*p[2], 1/3*p[1, 1, 1] - 1/3*p[3]]
```

```
>>> from sage.all import *
>>> from sage.combinat.species.generating_series import LogarithmCycleIndexSeries
>>> LogarithmCycleIndexSeries()[Integer(0):Integer(4)]                    ␣
```

(continues on next page)

(continued from previous page)

```
↪              # needs sage.modules
[0, p[1], -1/2*p[1, 1] - 1/2*p[2], 1/3*p[1, 1, 1] - 1/3*p[3]]
```

Its defining property is that $\Omega \circ E^+ = E^+ \circ \Omega = X$ (that is, that composition with E^+ in both directions yields the multiplicative identity X):

```
sage: Eplus = sage.combinat.species.set_species.SetSpecies(min=1).cycle_index_
↪series()       # needs sage.modules
sage: LogarithmCycleIndexSeries()(Eplus)[0:4]                                  #␣
↪needs sage.modules
[0, p[1], 0, 0]
```

```
>>> from sage.all import *
>>> Eplus = sage.combinat.species.set_species.SetSpecies(min=Integer(1)).cycle_
↪index_series()       # needs sage.modules
>>> LogarithmCycleIndexSeries()(Eplus)[Integer(0):Integer(4)]                   ␣
↪              # needs sage.modules
[0, p[1], 0, 0]
```

class sage.combinat.species.generating_series.**OrdinaryGeneratingSeries**(*parent*, *coeff_stream*)

Bases: LazyPowerSeries

A class for ordinary generating series.

Note that it is just a LazyPowerSeries whose elements have some extra methods.

EXAMPLES:

```
sage: from sage.combinat.species.generating_series import␣
↪OrdinaryGeneratingSeriesRing
sage: R = OrdinaryGeneratingSeriesRing(QQ)
sage: f = R(lambda n: n)
sage: f
z + 2*z^2 + 3*z^3 + 4*z^4 + 5*z^5 + 6*z^6 + O(z^7)
```

```
>>> from sage.all import *
>>> from sage.combinat.species.generating_series import␣
↪OrdinaryGeneratingSeriesRing
>>> R = OrdinaryGeneratingSeriesRing(QQ)
>>> f = R(lambda n: n)
>>> f
z + 2*z^2 + 3*z^3 + 4*z^4 + 5*z^5 + 6*z^6 + O(z^7)
```

count(*n*)

Return the number of structures on a set of size n.

INPUT:

- n – the size of the set

EXAMPLES:

```
sage: from sage.combinat.species.generating_series import␣
↪OrdinaryGeneratingSeriesRing
```

(continues on next page)

(continued from previous page)

```
sage: R = OrdinaryGeneratingSeriesRing(QQ)
sage: f = R(range(20))
sage: f.count(10)
10
```

```
>>> from sage.all import *
>>> from sage.combinat.species.generating_series import␣
↪OrdinaryGeneratingSeriesRing
>>> R = OrdinaryGeneratingSeriesRing(QQ)
>>> f = R(range(Integer(20)))
>>> f.count(Integer(10))
10
```

counts(*n*)

Return the number of structures on a set for size `i` for each `i` in `range(n)`.

EXAMPLES:

```
sage: from sage.combinat.species.generating_series import␣
↪OrdinaryGeneratingSeriesRing
sage: R = OrdinaryGeneratingSeriesRing(QQ)
sage: f = R(range(20))
sage: f.counts(10)
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9]
```

```
>>> from sage.all import *
>>> from sage.combinat.species.generating_series import␣
↪OrdinaryGeneratingSeriesRing
>>> R = OrdinaryGeneratingSeriesRing(QQ)
>>> f = R(range(Integer(20)))
>>> f.counts(Integer(10))
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9]
```

class sage.combinat.species.generating_series.**OrdinaryGeneratingSeriesRing**(*base_ring*)

Bases: `LazyPowerSeriesRing`

Return the ring of ordinary generating series over `R`.

Note that it is just a `LazyPowerSeriesRing` whose elements have some extra methods.

EXAMPLES:

```
sage: from sage.combinat.species.generating_series import␣
↪OrdinaryGeneratingSeriesRing
sage: R = OrdinaryGeneratingSeriesRing(QQ); R
Lazy Taylor Series Ring in z over Rational Field
sage: [R(lambda n: 1).coefficient(i) for i in range(4)]
[1, 1, 1, 1]
sage: R(lambda n: 1).counts(4)
[1, 1, 1, 1]
sage: R == loads(dumps(R))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.species.generating_series import␣
↪OrdinaryGeneratingSeriesRing
>>> R = OrdinaryGeneratingSeriesRing(QQ); R
Lazy Taylor Series Ring in z over Rational Field
>>> [R(lambda n: Integer(1)).coefficient(i) for i in range(Integer(4))]
[1, 1, 1, 1]
>>> R(lambda n: Integer(1)).counts(Integer(4))
[1, 1, 1, 1]
>>> R == loads(dumps(R))
True
```

Element

alias of *OrdinaryGeneratingSeries*

Linear-order species

class sage.combinat.species.linear_order_species.**LinearOrderSpecies**(*min=None*, *max=None*, *weight=None*)

Bases: *GenericCombinatorialSpecies*, UniqueRepresentation

Return the species of linear orders.

EXAMPLES:

```
sage: L = species.LinearOrderSpecies()
sage: L.generating_series()[0:5]
[1, 1, 1, 1, 1]

sage: L = species.LinearOrderSpecies()
sage: L._check()
True
sage: L == loads(dumps(L))
True
```

```
>>> from sage.all import *
>>> L = species.LinearOrderSpecies()
>>> L.generating_series()[Integer(0):Integer(5)]
[1, 1, 1, 1, 1]

>>> L = species.LinearOrderSpecies()
>>> L._check()
True
>>> L == loads(dumps(L))
True
```

class sage.combinat.species.linear_order_species.**LinearOrderSpeciesStructure**(*parent*, *labels*, *list*)

Bases: *GenericSpeciesStructure*

automorphism_group()

Return the group of permutations whose action on this structure leave it fixed. For the species of linear orders, there is no non-trivial automorphism.

EXAMPLES:

```
sage: F = species.LinearOrderSpecies()
sage: a = F.structures(["a", "b", "c"])[0]; a
['a', 'b', 'c']
sage: a.automorphism_group()                                                #␣
↪needs sage.groups
Symmetric group of order 1! as a permutation group
```

```
>>> from sage.all import *
>>> F = species.LinearOrderSpecies()
>>> a = F.structures(["a", "b", "c"])[Integer(0)]; a
['a', 'b', 'c']
>>> a.automorphism_group()                                                  #␣
↪needs sage.groups
Symmetric group of order 1! as a permutation group
```

canonical_label()

EXAMPLES:

```
sage: P = species.LinearOrderSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
sage: s = P.structures(["a", "b", "c"]).random_element()
sage: s.canonical_label()
['a', 'b', 'c']
```

```
>>> from sage.all import *
>>> P = species.LinearOrderSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
>>> s = P.structures(["a", "b", "c"]).random_element()
>>> s.canonical_label()
['a', 'b', 'c']
```

transport(*perm*)

Return the transport of this structure along the permutation perm.

EXAMPLES:

```
sage: F = species.LinearOrderSpecies()
sage: a = F.structures(["a", "b", "c"])[0]; a
['a', 'b', 'c']
sage: p = PermutationGroupElement((1,2))                                    #␣
↪needs sage.groups
sage: a.transport(p)                                                        #␣
↪needs sage.groups
['b', 'a', 'c']
```

```
>>> from sage.all import *
>>> F = species.LinearOrderSpecies()
>>> a = F.structures(["a", "b", "c"])[Integer(0)]; a
```

(continues on next page)

(continued from previous page)

```
['a', 'b', 'c']
>>> p = PermutationGroupElement((Integer(1),Integer(2)))
↪              # needs sage.groups
>>> a.transport(p)
↪needs sage.groups
['b', 'a', 'c']
```

sage.combinat.species.linear_order_species.**LinearOrderSpecies_class**

alias of *LinearOrderSpecies*

Miscellaneous functions

sage.combinat.species.misc.**accept_size**(*f*)

The purpose of this decorator is to change calls like species.SetSpecies(size=1) to species.SetSpecies(min=1, max=2). This is to make caching species easier and to restrict the number of parameters that the lower level code needs to know about.

EXAMPLES:

```
sage: from sage.combinat.species.misc import accept_size
sage: def f(*args, **kwds):
....:       print("{} {}".format(args, sorted(kwds.items())))
sage: f = accept_size(f)
sage: f(min=1)
() [('min', 1)]
sage: f(size=2)
() [('max', 3), ('min', 2)]
```

```
>>> from sage.all import *
>>> from sage.combinat.species.misc import accept_size
>>> def f(*args, **kwds):
...       print("{} {}".format(args, sorted(kwds.items())))
>>> f = accept_size(f)
>>> f(min=Integer(1))
() [('min', 1)]
>>> f(size=Integer(2))
() [('max', 3), ('min', 2)]
```

sage.combinat.species.misc.**change_support**(*perm*, *support*, *change_perm=None*)

Changes the support of a permutation defined on [1, …, n] to support.

EXAMPLES:

```
sage: from sage.combinat.species.misc import change_support
sage: p = PermutationGroupElement((1,2,3)); p
(1,2,3)
sage: change_support(p, [3,4,5])
(3,4,5)
```

```
>>> from sage.all import *
>>> from sage.combinat.species.misc import change_support
>>> p = PermutationGroupElement((Integer(1),Integer(2),Integer(3))); p
```

(continues on next page)

(continued from previous page)

```
(1,2,3)
>>> change_support(p, [Integer(3),Integer(4),Integer(5)])
(3,4,5)
```

Partition species

class sage.combinat.species.partition_species.**PartitionSpecies**(*min=None*, *max=None*, *weight=None*)

Bases: *GenericCombinatorialSpecies*

Return the species of partitions.

EXAMPLES:

```
sage: P = species.PartitionSpecies()
sage: P.generating_series()[0:5]
[1, 1, 1, 5/6, 5/8]
sage: P.isotype_generating_series()[0:5]
[1, 1, 2, 3, 5]

sage: P = species.PartitionSpecies()
sage: P._check()
True
sage: P == loads(dumps(P))
True
```

```
>>> from sage.all import *
>>> P = species.PartitionSpecies()
>>> P.generating_series()[Integer(0):Integer(5)]
[1, 1, 1, 5/6, 5/8]
>>> P.isotype_generating_series()[Integer(0):Integer(5)]
[1, 1, 2, 3, 5]

>>> P = species.PartitionSpecies()
>>> P._check()
True
>>> P == loads(dumps(P))
True
```

class sage.combinat.species.partition_species.**PartitionSpeciesStructure**(*parent*, *labels*, *list*)

Bases: *GenericSpeciesStructure*

EXAMPLES:

```
sage: from sage.combinat.species.partition_species import␣
↪PartitionSpeciesStructure
sage: P = species.PartitionSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
sage: s = PartitionSpeciesStructure(P, ['a','b','c'], [[1,2],[3]]); s
{{'a', 'b'}, {'c'}}
```

(continues on next page)

(continued from previous page)

```
sage: s == loads(dumps(s))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.species.partition_species import PartitionSpeciesStructure
>>> P = species.PartitionSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
>>> s = PartitionSpeciesStructure(P, ['a','b','c'], [[Integer(1),Integer(2)],
↪[Integer(3)]]); s
{{'a', 'b'}, {'c'}}
>>> s == loads(dumps(s))
True
```

automorphism_group()

Return the group of permutations whose action on this set partition leave it fixed.

EXAMPLES:

```
sage: p = PermutationGroupElement((2,3))
sage: from sage.combinat.species.partition_species import␣
↪PartitionSpeciesStructure
sage: a = PartitionSpeciesStructure(None, [2,3,4], [[1,2],[3]]); a
{{2, 3}, {4}}
sage: a.automorphism_group()
Permutation Group with generators [(1,2)]
```

```
>>> from sage.all import *
>>> p = PermutationGroupElement((Integer(2),Integer(3)))
>>> from sage.combinat.species.partition_species import␣
↪PartitionSpeciesStructure
>>> a = PartitionSpeciesStructure(None, [Integer(2),Integer(3),Integer(4)],␣
↪[[Integer(1),Integer(2)],[Integer(3)]]); a
{{2, 3}, {4}}
>>> a.automorphism_group()
Permutation Group with generators [(1,2)]
```

canonical_label()

EXAMPLES:

```
sage: P = species.PartitionSpecies()
sage: S = P.structures(["a", "b", "c"])
sage: [s.canonical_label() for s in S]
[{{'a', 'b', 'c'}},
 {{'a', 'b'}, {'c'}},
 {{'a', 'b'}, {'c'}},
 {{'a', 'b'}, {'c'}},
 {{'a'}, {'b'}, {'c'}}]
```

```
>>> from sage.all import *
>>> P = species.PartitionSpecies()
```

(continues on next page)

(continued from previous page)

```
>>> S = P.structures(["a", "b", "c"])
>>> [s.canonical_label() for s in S]
[{{'a', 'b', 'c'}},
 {{'a', 'b'}, {'c'}},
 {{'a', 'b'}, {'c'}},
 {{'a', 'b'}, {'c'}},
 {{'a'}, {'b'}, {'c'}}]
```

change_labels(*labels*)

Return a relabelled structure.

INPUT:

- `labels` – list of labels

OUTPUT:

A structure with the i-th label of `self` replaced with the i-th label of the list.

EXAMPLES:

```
sage: p = PermutationGroupElement((2,3))
sage: from sage.combinat.species.partition_species import␣
↪PartitionSpeciesStructure
sage: a = PartitionSpeciesStructure(None, [2,3,4], [[1,2],[3]]); a
{{2, 3}, {4}}
sage: a.change_labels([1,2,3])
{{1, 2}, {3}}
```

```
>>> from sage.all import *
>>> p = PermutationGroupElement((Integer(2),Integer(3)))
>>> from sage.combinat.species.partition_species import␣
↪PartitionSpeciesStructure
>>> a = PartitionSpeciesStructure(None, [Integer(2),Integer(3),Integer(4)],␣
↪[[Integer(1),Integer(2)],[Integer(3)]]); a
{{2, 3}, {4}}
>>> a.change_labels([Integer(1),Integer(2),Integer(3)])
{{1, 2}, {3}}
```

transport(*perm*)

Return the transport of this set partition along the permutation perm. For set partitions, this is the direct product of the automorphism groups for each of the blocks.

EXAMPLES:

```
sage: p = PermutationGroupElement((2,3))
sage: from sage.combinat.species.partition_species import␣
↪PartitionSpeciesStructure
sage: a = PartitionSpeciesStructure(None, [2,3,4], [[1,2],[3]]); a
{{2, 3}, {4}}
sage: a.transport(p)
{{2, 4}, {3}}
```

```
>>> from sage.all import *
>>> p = PermutationGroupElement((Integer(2),Integer(3)))
>>> from sage.combinat.species.partition_species import␣
↪PartitionSpeciesStructure
>>> a = PartitionSpeciesStructure(None, [Integer(2),Integer(3),Integer(4)],␣
↪[[Integer(1),Integer(2)],[Integer(3)]]); a
{{2, 3}, {4}}
>>> a.transport(p)
{{2, 4}, {3}}
```

sage.combinat.species.partition_species.**PartitionSpecies_class**

alias of *PartitionSpecies*

Permutation species

class sage.combinat.species.permutation_species.**PermutationSpecies**(*min=None*, *max=None*, *weight=None*)

Bases: *GenericCombinatorialSpecies*, UniqueRepresentation

Return the species of permutations.

EXAMPLES:

```
sage: P = species.PermutationSpecies()
sage: P.generating_series()[0:5]
[1, 1, 1, 1, 1]
sage: P.isotype_generating_series()[0:5]
[1, 1, 2, 3, 5]

sage: P = species.PermutationSpecies()
sage: c = P.generating_series()[0:3]
sage: P._check()
True
sage: P == loads(dumps(P))
True
```

```
>>> from sage.all import *
>>> P = species.PermutationSpecies()
>>> P.generating_series()[Integer(0):Integer(5)]
[1, 1, 1, 1, 1]
>>> P.isotype_generating_series()[Integer(0):Integer(5)]
[1, 1, 2, 3, 5]

>>> P = species.PermutationSpecies()
>>> c = P.generating_series()[Integer(0):Integer(3)]
>>> P._check()
True
>>> P == loads(dumps(P))
True
```

class sage.combinat.species.permutation_species.**PermutationSpeciesStructure**(*parent*, *labels*, *list*)

Bases: *GenericSpeciesStructure*

automorphism_group()

Return the group of permutations whose action on this structure leave it fixed.

EXAMPLES:

```
sage: set_random_seed(0)
sage: p = PermutationGroupElement((2,3,4))
sage: P = species.PermutationSpecies()
sage: a = P.structures(["a", "b", "c", "d"])[2]; a
['a', 'c', 'b', 'd']
sage: a.automorphism_group()
Permutation Group with generators [(2,3), (1,4)]
```

```
>>> from sage.all import *
>>> set_random_seed(Integer(0))
>>> p = PermutationGroupElement((Integer(2),Integer(3),Integer(4)))
>>> P = species.PermutationSpecies()
>>> a = P.structures(["a", "b", "c", "d"])[Integer(2)]; a
['a', 'c', 'b', 'd']
>>> a.automorphism_group()
Permutation Group with generators [(2,3), (1,4)]
```

```
sage: [a.transport(perm) for perm in a.automorphism_group()]
[['a', 'c', 'b', 'd'],
 ['a', 'c', 'b', 'd'],
 ['a', 'c', 'b', 'd'],
 ['a', 'c', 'b', 'd']]
```

```
>>> from sage.all import *
>>> [a.transport(perm) for perm in a.automorphism_group()]
[['a', 'c', 'b', 'd'],
 ['a', 'c', 'b', 'd'],
 ['a', 'c', 'b', 'd'],
 ['a', 'c', 'b', 'd']]
```

canonical_label()

EXAMPLES:

```
sage: P = species.PermutationSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.

sage: S = P.structures(["a", "b", "c"])
sage: [s.canonical_label() for s in S]
[['a', 'b', 'c'],
 ['b', 'a', 'c'],
 ['b', 'a', 'c'],
 ['b', 'c', 'a'],
 ['b', 'c', 'a'],
 ['b', 'a', 'c']]
```

```
>>> from sage.all import *
>>> P = species.PermutationSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.

>>> S = P.structures(["a", "b", "c"])
>>> [s.canonical_label() for s in S]
[['a', 'b', 'c'],
 ['b', 'a', 'c'],
 ['b', 'a', 'c'],
 ['b', 'c', 'a'],
 ['b', 'c', 'a'],
 ['b', 'a', 'c']]
```

permutation_group_element()

Return `self` as a permutation group element.

EXAMPLES:

```
sage: p = PermutationGroupElement((2,3,4))
sage: P = species.PermutationSpecies()
sage: a = P.structures(["a", "b", "c", "d"])[2]; a
['a', 'c', 'b', 'd']
sage: a.permutation_group_element()
(2,3)
```

```
>>> from sage.all import *
>>> p = PermutationGroupElement((Integer(2),Integer(3),Integer(4)))
>>> P = species.PermutationSpecies()
>>> a = P.structures(["a", "b", "c", "d"])[Integer(2)]; a
['a', 'c', 'b', 'd']
>>> a.permutation_group_element()
(2,3)
```

transport(*perm*)

Return the transport of this structure along the permutation perm.

EXAMPLES:

```
sage: p = PermutationGroupElement((2,3,4))
sage: P = species.PermutationSpecies()
sage: a = P.structures(["a", "b", "c", "d"])[2]; a
['a', 'c', 'b', 'd']
sage: a.transport(p)
['a', 'd', 'c', 'b']
```

```
>>> from sage.all import *
>>> p = PermutationGroupElement((Integer(2),Integer(3),Integer(4)))
>>> P = species.PermutationSpecies()
>>> a = P.structures(["a", "b", "c", "d"])[Integer(2)]; a
['a', 'c', 'b', 'd']
```

(continues on next page)

(continued from previous page)

```
>>> a.transport(p)
['a', 'd', 'c', 'b']
```

sage.combinat.species.permutation_species.**PermutationSpecies_class**

alias of *PermutationSpecies*

Product species

class sage.combinat.species.product_species.**ProductSpecies**(*F*, *G*, *min=None*, *max=None*, *weight=None*)

Bases: *GenericCombinatorialSpecies*, UniqueRepresentation

EXAMPLES:

```
sage: X = species.SingletonSpecies()
sage: A = X*X
sage: A.generating_series()[0:4]
[0, 0, 1, 0]

sage: P = species.PermutationSpecies()
sage: F = P * P; F
Product of (Permutation species) and (Permutation species)
sage: F == loads(dumps(F))
True
sage: F._check()                                                    #␣
↪needs sage.libs.flint
True
```

```
>>> from sage.all import *
>>> X = species.SingletonSpecies()
>>> A = X*X
>>> A.generating_series()[Integer(0):Integer(4)]
[0, 0, 1, 0]

>>> P = species.PermutationSpecies()
>>> F = P * P; F
Product of (Permutation species) and (Permutation species)
>>> F == loads(dumps(F))
True
>>> F._check()                                                  # needs␣
↪sage.libs.flint
True
```

left_factor()

Return the left factor of this product.

EXAMPLES:

```
sage: P = species.PermutationSpecies()
sage: X = species.SingletonSpecies()
sage: F = P*X
sage: F.left_factor()
Permutation species
```

```
>>> from sage.all import *
>>> P = species.PermutationSpecies()
>>> X = species.SingletonSpecies()
>>> F = P*X
>>> F.left_factor()
Permutation species
```

right_factor()

Return the right factor of this product.

EXAMPLES:

```
sage: P = species.PermutationSpecies()
sage: X = species.SingletonSpecies()
sage: F = P*X
sage: F.right_factor()
Singleton species
```

```
>>> from sage.all import *
>>> P = species.PermutationSpecies()
>>> X = species.SingletonSpecies()
>>> F = P*X
>>> F.right_factor()
Singleton species
```

weight_ring()

Return the weight ring for this species. This is determined by asking Sage's coercion model what the result is when you multiply (and add) elements of the weight rings for each of the operands.

EXAMPLES:

```
sage: S = species.SetSpecies()
sage: C = S*S
sage: C.weight_ring()
Rational Field
```

```
>>> from sage.all import *
>>> S = species.SetSpecies()
>>> C = S*S
>>> C.weight_ring()
Rational Field
```

```
sage: S = species.SetSpecies(weight=QQ['t'].gen())
sage: C = S*S
sage: C.weight_ring()
Univariate Polynomial Ring in t over Rational Field
```

```
>>> from sage.all import *
>>> S = species.SetSpecies(weight=QQ['t'].gen())
>>> C = S*S
>>> C.weight_ring()
Univariate Polynomial Ring in t over Rational Field
```

```
sage: S = species.SetSpecies()
sage: C = (S*S).weighted(QQ['t'].gen())
sage: C.weight_ring()
Univariate Polynomial Ring in t over Rational Field
```

```
>>> from sage.all import *
>>> S = species.SetSpecies()
>>> C = (S*S).weighted(QQ['t'].gen())
>>> C.weight_ring()
Univariate Polynomial Ring in t over Rational Field
```

class sage.combinat.species.product_species.**ProductSpeciesStructure**(*parent*, *labels*, *subset*, *left*, *right*)

Bases: *GenericSpeciesStructure*

automorphism_group()

EXAMPLES:

```
sage: # needs sage.groups
sage: p = PermutationGroupElement((2,3))
sage: S = species.SetSpecies()
sage: F = S * S
sage: a = F.structures([1,2,3,4])[1]; a
{1}*{2, 3, 4}
sage: a.automorphism_group()
Permutation Group with generators [(2,3), (2,3,4)]
```

```
>>> from sage.all import *
>>> # needs sage.groups
>>> p = PermutationGroupElement((Integer(2),Integer(3)))
>>> S = species.SetSpecies()
>>> F = S * S
>>> a = F.structures([Integer(1),Integer(2),Integer(3),
...Integer(4)])[Integer(1)]; a
{1}*{2, 3, 4}
>>> a.automorphism_group()
Permutation Group with generators [(2,3), (2,3,4)]
```

```
sage: [a.transport(g) for g in a.automorphism_group()]                    #␣
↪needs sage.groups
[{1}*{2, 3, 4},
 {1}*{2, 3, 4},
 {1}*{2, 3, 4},
 {1}*{2, 3, 4},
 {1}*{2, 3, 4},
 {1}*{2, 3, 4}]
```

```
>>> from sage.all import *
>>> [a.transport(g) for g in a.automorphism_group()]                      #␣
↪needs sage.groups
[{1}*{2, 3, 4},
 {1}*{2, 3, 4},
```

(continues on next page)

(continued from previous page)

```
 {1}*{2, 3, 4},
 {1}*{2, 3, 4},
 {1}*{2, 3, 4},
 {1}*{2, 3, 4}]
```

```
sage: a = F.structures([1,2,3,4])[8]; a                                    #␣
↪needs sage.groups
{2, 3}*{1, 4}
sage: [a.transport(g) for g in a.automorphism_group()]                     #␣
↪needs sage.groups
[{2, 3}*{1, 4}, {2, 3}*{1, 4}, {2, 3}*{1, 4}, {2, 3}*{1, 4}]
```

```
>>> from sage.all import *
>>> a = F.structures([Integer(1),Integer(2),Integer(3),
↪Integer(4)])[Integer(8)]; a                                    # needs␣
↪sage.groups
{2, 3}*{1, 4}
>>> [a.transport(g) for g in a.automorphism_group()]                      #␣
↪needs sage.groups
[{2, 3}*{1, 4}, {2, 3}*{1, 4}, {2, 3}*{1, 4}, {2, 3}*{1, 4}]
```

canonical_label()

EXAMPLES:

```
sage: S = species.SetSpecies()
sage: F = S * S
sage: S = F.structures(['a','b','c']).list(); S
[{}*{'a', 'b', 'c'},
 {'a'}*{'b', 'c'},
 {'b'}*{'a', 'c'},
 {'c'}*{'a', 'b'},
 {'a', 'b'}*{'c'},
 {'a', 'c'}*{'b'},
 {'b', 'c'}*{'a'},
 {'a', 'b', 'c'}*{}]
```

```
>>> from sage.all import *
>>> S = species.SetSpecies()
>>> F = S * S
>>> S = F.structures(['a','b','c']).list(); S
[{}*{'a', 'b', 'c'},
 {'a'}*{'b', 'c'},
 {'b'}*{'a', 'c'},
 {'c'}*{'a', 'b'},
 {'a', 'b'}*{'c'},
 {'a', 'c'}*{'b'},
 {'b', 'c'}*{'a'},
 {'a', 'b', 'c'}*{}]
```

```
sage: F.isotypes(['a','b','c']).cardinality()
4
```

(continues on next page)

(continued from previous page)

```
sage: [s.canonical_label() for s in S]
[{}*{'a', 'b', 'c'},
 {'a'}*{'b', 'c'},
 {'a'}*{'b', 'c'},
 {'a'}*{'b', 'c'},
 {'a', 'b'}*{'c'},
 {'a', 'b'}*{'c'},
 {'a', 'b'}*{'c'},
 {'a', 'b', 'c'}*{}]
```

```
>>> from sage.all import *
>>> F.isotypes(['a','b','c']).cardinality()
4
>>> [s.canonical_label() for s in S]
[{}*{'a', 'b', 'c'},
 {'a'}*{'b', 'c'},
 {'a'}*{'b', 'c'},
 {'a'}*{'b', 'c'},
 {'a', 'b'}*{'c'},
 {'a', 'b'}*{'c'},
 {'a', 'b'}*{'c'},
 {'a', 'b', 'c'}*{}]
```

change_labels(*labels*)

Return a relabelled structure.

INPUT:

- `labels` – list of labels

OUTPUT:

A structure with the i-th label of `self` replaced with the i-th label of the list.

EXAMPLES:

```
sage: S = species.SetSpecies()
sage: F = S * S
sage: a = F.structures(['a','b','c'])[0]; a
{}*{'a', 'b', 'c'}
sage: a.change_labels([1,2,3])
{}*{1, 2, 3}
```

```
>>> from sage.all import *
>>> S = species.SetSpecies()
>>> F = S * S
>>> a = F.structures(['a','b','c'])[Integer(0)]; a
{}*{'a', 'b', 'c'}
>>> a.change_labels([Integer(1),Integer(2),Integer(3)])
{}*{1, 2, 3}
```

transport(*perm*)

EXAMPLES:

```
sage: # needs sage.groups
sage: p = PermutationGroupElement((2,3))
sage: S = species.SetSpecies()
sage: F = S * S
sage: a = F.structures(['a','b','c'])[4]; a
{'a', 'b'}*{'c'}
sage: a.transport(p)
{'a', 'c'}*{'b'}
```

```
>>> from sage.all import *
>>> # needs sage.groups
>>> p = PermutationGroupElement((Integer(2),Integer(3)))
>>> S = species.SetSpecies()
>>> F = S * S
>>> a = F.structures(['a','b','c'])[Integer(4)]; a
{'a', 'b'}*{'c'}
>>> a.transport(p)
{'a', 'c'}*{'b'}
```

sage.combinat.species.product_species.**ProductSpecies_class**

alias of *ProductSpecies*

Recursive species

class sage.combinat.species.recursive_species.**CombinatorialSpecies**(*min=None*)

Bases: *GenericCombinatorialSpecies*

EXAMPLES:

```
sage: F = CombinatorialSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
sage: loads(dumps(F))
Combinatorial species
```

```
>>> from sage.all import *
>>> F = CombinatorialSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
>>> loads(dumps(F))
Combinatorial species
```

```
sage: X = species.SingletonSpecies()
sage: E = species.EmptySetSpecies()
sage: L = CombinatorialSpecies()
sage: L.define(E+X*L)
sage: L.generating_series()[0:4]
[1, 1, 1, 1]
sage: LL = loads(dumps(L))
sage: LL.generating_series()[0:4]
[1, 1, 1, 1]
```

```
>>> from sage.all import *
>>> X = species.SingletonSpecies()
>>> E = species.EmptySetSpecies()
>>> L = CombinatorialSpecies()
>>> L.define(E+X*L)
>>> L.generating_series()[Integer(0):Integer(4)]
[1, 1, 1, 1]
>>> LL = loads(dumps(L))
>>> LL.generating_series()[Integer(0):Integer(4)]
[1, 1, 1, 1]
```

define(*x*)

Define `self` to be equal to the combinatorial species `x`.

This is used to define combinatorial species recursively. All of the real work is done by calling the `.set()` method for each of the series associated to `self`.

EXAMPLES: The species of linear orders L can be recursively defined by $L = 1 + X * L$ where 1 represents the empty set species and X represents the singleton species:

```
sage: X = species.SingletonSpecies()
sage: E = species.EmptySetSpecies()
sage: L = CombinatorialSpecies()
sage: L.define(E+X*L)
sage: L.generating_series()[0:4]
[1, 1, 1, 1]
sage: L.structures([1,2,3]).cardinality()
6
sage: L.structures([1,2,3]).list()
[1*(2*(3*{})),
 1*(3*(2*{})),
 2*(1*(3*{})),
 2*(3*(1*{})),
 3*(1*(2*{})),
 3*(2*(1*{}))]
```

```
>>> from sage.all import *
>>> X = species.SingletonSpecies()
>>> E = species.EmptySetSpecies()
>>> L = CombinatorialSpecies()
>>> L.define(E+X*L)
>>> L.generating_series()[Integer(0):Integer(4)]
[1, 1, 1, 1]
>>> L.structures([Integer(1),Integer(2),Integer(3)]).cardinality()
6
>>> L.structures([Integer(1),Integer(2),Integer(3)]).list()
[1*(2*(3*{})),
 1*(3*(2*{})),
 2*(1*(3*{})),
 2*(3*(1*{})),
 3*(1*(2*{})),
 3*(2*(1*{}))]
```

```
sage: L = species.LinearOrderSpecies()
sage: L.generating_series()[0:4]
[1, 1, 1, 1]
sage: L.structures([1,2,3]).cardinality()
6
sage: L.structures([1,2,3]).list()
[[1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2], [3, 2, 1]]
```

```
>>> from sage.all import *
>>> L = species.LinearOrderSpecies()
>>> L.generating_series()[Integer(0):Integer(4)]
[1, 1, 1, 1]
>>> L.structures([Integer(1),Integer(2),Integer(3)]).cardinality()
6
>>> L.structures([Integer(1),Integer(2),Integer(3)]).list()
[[1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2], [3, 2, 1]]
```

weight_ring()

EXAMPLES:

```
sage: F = species.CombinatorialSpecies()
sage: F.weight_ring()
Rational Field
```

```
>>> from sage.all import *
>>> F = species.CombinatorialSpecies()
>>> F.weight_ring()
Rational Field
```

```
sage: X = species.SingletonSpecies()
sage: E = species.EmptySetSpecies()
sage: L = CombinatorialSpecies()
sage: L.define(E+X*L)
sage: L.weight_ring()
Rational Field
```

```
>>> from sage.all import *
>>> X = species.SingletonSpecies()
>>> E = species.EmptySetSpecies()
>>> L = CombinatorialSpecies()
>>> L.define(E+X*L)
>>> L.weight_ring()
Rational Field
```

class sage.combinat.species.recursive_species.**CombinatorialSpeciesStructure**(*parent*, *s*, ***options*)

Bases: *SpeciesStructureWrapper*

Set species

class sage.combinat.species.set_species.**SetSpecies**(*min=None*, *max=None*, *weight=None*)

Bases: *GenericCombinatorialSpecies*, UniqueRepresentation

Return the species of sets.

EXAMPLES:

```
sage: E = species.SetSpecies()
sage: E.structures([1,2,3]).list()
[{1, 2, 3}]
sage: E.isotype_generating_series()[0:4]
[1, 1, 1, 1]

sage: S = species.SetSpecies()
sage: c = S.generating_series()[0:3]
sage: S._check()
True
sage: S == loads(dumps(S))
True
```

```
>>> from sage.all import *
>>> E = species.SetSpecies()
>>> E.structures([Integer(1),Integer(2),Integer(3)]).list()
[{1, 2, 3}]
>>> E.isotype_generating_series()[Integer(0):Integer(4)]
[1, 1, 1, 1]

>>> S = species.SetSpecies()
>>> c = S.generating_series()[Integer(0):Integer(3)]
>>> S._check()
True
>>> S == loads(dumps(S))
True
```

class sage.combinat.species.set_species.**SetSpeciesStructure**(*parent*, *labels*, *list*)

Bases: *GenericSpeciesStructure*

automorphism_group()

Return the group of permutations whose action on this set leave it fixed. For the species of sets, there is only one isomorphism class, so every permutation is in its automorphism group.

EXAMPLES:

```
sage: F = species.SetSpecies()
sage: a = F.structures(["a", "b", "c"]).random_element(); a
{'a', 'b', 'c'}
sage: a.automorphism_group()                                                #␣
↪needs sage.groups
Symmetric group of order 3! as a permutation group
```

```
>>> from sage.all import *
>>> F = species.SetSpecies()
>>> a = F.structures(["a", "b", "c"]).random_element(); a
```

(continues on next page)

(continued from previous page)

```
{'a', 'b', 'c'}
>>> a.automorphism_group()                                                    #␣
↪needs sage.groups
Symmetric group of order 3! as a permutation group
```

canonical_label()

EXAMPLES:

```
sage: S = species.SetSpecies()
sage: a = S.structures(["a","b","c"]).random_element(); a
{'a', 'b', 'c'}
sage: a.canonical_label()
{'a', 'b', 'c'}
```

```
>>> from sage.all import *
>>> S = species.SetSpecies()
>>> a = S.structures(["a","b","c"]).random_element(); a
{'a', 'b', 'c'}
>>> a.canonical_label()
{'a', 'b', 'c'}
```

transport(*perm*)

Return the transport of this set along the permutation perm.

EXAMPLES:

```
sage: F = species.SetSpecies()
sage: a = F.structures(["a", "b", "c"]).random_element(); a
{'a', 'b', 'c'}
sage: p = PermutationGroupElement((1,2))                                    #␣
↪needs sage.groups
sage: a.transport(p)                                                        #␣
↪needs sage.groups
{'a', 'b', 'c'}
```

```
>>> from sage.all import *
>>> F = species.SetSpecies()
>>> a = F.structures(["a", "b", "c"]).random_element(); a
{'a', 'b', 'c'}
>>> p = PermutationGroupElement((Integer(1),Integer(2)))                     ␣
↪              # needs sage.groups
>>> a.transport(p)                                                          #␣
↪needs sage.groups
{'a', 'b', 'c'}
```

sage.combinat.species.set_species.**SetSpecies_class**

alias of *SetSpecies*

Species structures

We will illustrate the use of the structure classes using the "balls and bars" model for integer compositions. An integer composition of 6 such as [2, 1, 3] can be represented in this model as 'oooooo' where the 6 o's correspond to the balls and the 2 's correspond to the bars. If BB is our species for this model, the it satisfies the following recursive definition:

BB = o + o*BB + o*|*BB

Here we define this species using the default structures:

```
sage: ball = species.SingletonSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
sage: bar = species.EmptySetSpecies()
sage: BB = CombinatorialSpecies()
sage: BB.define(ball + ball*BB + ball*bar*BB)
sage: o = var('o')                                                          #␣
↪needs sage.symbolic
sage: BB.isotypes([o]*3).list()                                             #␣
↪needs sage.symbolic
[o*(o*o), o*((o*{})*o), (o*{})*(o*o), (o*{})*((o*{})*o)]
```

```
>>> from sage.all import *
>>> ball = species.SingletonSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
>>> bar = species.EmptySetSpecies()
>>> BB = CombinatorialSpecies()
>>> BB.define(ball + ball*BB + ball*bar*BB)
>>> o = var('o')                                                          #␣
↪needs sage.symbolic
>>> BB.isotypes([o]*Integer(3)).list()                                       ␣
↪     # needs sage.symbolic
[o*(o*o), o*((o*{})*o), (o*{})*(o*o), (o*{})*((o*{})*o)]
```

If we ignore the parentheses, we can read off that the integer compositions are [3], [2, 1], [1, 2], and [1, 1, 1].

class sage.combinat.species.structure.**GenericSpeciesStructure**(*parent*, *labels*, *list*)

Bases: *CombinatorialObject*

This is a base class from which the classes for the structures inherit.

EXAMPLES:

```
sage: from sage.combinat.species.structure import GenericSpeciesStructure
sage: a = GenericSpeciesStructure(None, [2,3,4], [1,2,3])
sage: a
[2, 3, 4]
sage: a.parent() is None
True
sage: a == loads(dumps(a))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.species.structure import GenericSpeciesStructure
>>> a = GenericSpeciesStructure(None, [Integer(2),Integer(3),Integer(4)],␣
↪[Integer(1),Integer(2),Integer(3)])
>>> a
[2, 3, 4]
>>> a.parent() is None
True
>>> a == loads(dumps(a))
True
```

change_labels(*labels*)

Return a relabelled structure.

INPUT:

- `labels` – list of labels

OUTPUT:

A structure with the i-th label of `self` replaced with the i-th label of the list.

EXAMPLES:

```
sage: P = species.SubsetSpecies()
sage: S = P.structures(["a", "b", "c"])
sage: [s.change_labels([1,2,3]) for s in S]
[{}, {1}, {2}, {3}, {1, 2}, {1, 3}, {2, 3}, {1, 2, 3}]
```

```
>>> from sage.all import *
>>> P = species.SubsetSpecies()
>>> S = P.structures(["a", "b", "c"])
>>> [s.change_labels([Integer(1),Integer(2),Integer(3)]) for s in S]
[{}, {1}, {2}, {3}, {1, 2}, {1, 3}, {2, 3}, {1, 2, 3}]
```

is_isomorphic(*x*)

EXAMPLES:

```
sage: S = species.SetSpecies()
sage: a = S.structures([1,2,3]).random_element(); a
{1, 2, 3}
sage: b = S.structures(['a','b','c']).random_element(); b
{'a', 'b', 'c'}
sage: a.is_isomorphic(b)
True
```

```
>>> from sage.all import *
>>> S = species.SetSpecies()
>>> a = S.structures([Integer(1),Integer(2),Integer(3)]).random_element(); a
{1, 2, 3}
>>> b = S.structures(['a','b','c']).random_element(); b
{'a', 'b', 'c'}
>>> a.is_isomorphic(b)
True
```

labels()

Return the labels used for this structure.

> **Note**
>
> This includes labels which may not "appear" in this particular structure.

EXAMPLES:

```
sage: P = species.SubsetSpecies()
sage: s = P.structures(["a", "b", "c"]).random_element()
sage: s.labels()
['a', 'b', 'c']
```

```
>>> from sage.all import *
>>> P = species.SubsetSpecies()
>>> s = P.structures(["a", "b", "c"]).random_element()
>>> s.labels()
['a', 'b', 'c']
```

parent()

Return the species that this structure is associated with.

EXAMPLES:

```
sage: L = species.LinearOrderSpecies()
sage: a,b = L.structures([1,2])
sage: a.parent()
Linear order species
```

```
>>> from sage.all import *
>>> L = species.LinearOrderSpecies()
>>> a,b = L.structures([Integer(1),Integer(2)])
>>> a.parent()
Linear order species
```

class sage.combinat.species.structure.**IsotypesWrapper**(*species*, *labels*, *structure_class*)

Bases: *SpeciesWrapper*

A base class for the set of isotypes of a species with given set of labels. An object of this type is returned when you call the *isotypes* method of a species.

EXAMPLES:

```
sage: F = species.SetSpecies()
sage: S = F.isotypes([1,2,3])
sage: S == loads(dumps(S))
True
```

```
>>> from sage.all import *
>>> F = species.SetSpecies()
>>> S = F.isotypes([Integer(1),Integer(2),Integer(3)])
```

(continues on next page)

(continued from previous page)

```
>>> S == loads(dumps(S))
True
```

class sage.combinat.species.structure.**SimpleIsotypesWrapper**(*species*, *labels*, *structure_class*)

Bases: *SpeciesWrapper*

> **Warning**
>
> This is deprecated and currently not used for anything.

EXAMPLES:

```
sage: F = species.SetSpecies()
sage: S = F.structures([1,2,3])
sage: S == loads(dumps(S))
True
```

```
>>> from sage.all import *
>>> F = species.SetSpecies()
>>> S = F.structures([Integer(1),Integer(2),Integer(3)])
>>> S == loads(dumps(S))
True
```

class sage.combinat.species.structure.**SimpleStructuresWrapper**(*species*, *labels*, *structure_class*)

Bases: *SpeciesWrapper*

> **Warning**
>
> This is deprecated and currently not used for anything.

EXAMPLES:

```
sage: F = species.SetSpecies()
sage: S = F.structures([1,2,3])
sage: S == loads(dumps(S))
True
```

```
>>> from sage.all import *
>>> F = species.SetSpecies()
>>> S = F.structures([Integer(1),Integer(2),Integer(3)])
>>> S == loads(dumps(S))
True
```

sage.combinat.species.structure.**SpeciesStructure**

alias of *GenericSpeciesStructure*

class sage.combinat.species.structure.**SpeciesStructureWrapper**(*parent*, *s*, ***options*)

Bases: *GenericSpeciesStructure*

This is a class for the structures of species such as the sum species that do not provide "additional" structure. For example, if you have the sum C of species A and B, then a structure of C will either be either something from A

or B. Instead of just returning one of these directly, a "wrapper" is put around them so that they have their parent is C rather than A or B:

```
sage: X = species.SingletonSpecies()
sage: X2 = X+X
sage: s = X2.structures([1]).random_element(); s
1
sage: s.parent()
Sum of (Singleton species) and (Singleton species)
sage: from sage.combinat.species.structure import SpeciesStructureWrapper
sage: issubclass(type(s), SpeciesStructureWrapper)
True
```

```
>>> from sage.all import *
>>> X = species.SingletonSpecies()
>>> X2 = X+X
>>> s = X2.structures([Integer(1)]).random_element(); s
1
>>> s.parent()
Sum of (Singleton species) and (Singleton species)
>>> from sage.combinat.species.structure import SpeciesStructureWrapper
>>> issubclass(type(s), SpeciesStructureWrapper)
True
```

EXAMPLES:

```
sage: E = species.SetSpecies(); B = E+E
sage: s = B.structures([1,2,3]).random_element()
sage: s.parent()
Sum of (Set species) and (Set species)
sage: s == loads(dumps(s))
True
```

```
>>> from sage.all import *
>>> E = species.SetSpecies(); B = E+E
>>> s = B.structures([Integer(1),Integer(2),Integer(3)]).random_element()
>>> s.parent()
Sum of (Set species) and (Set species)
>>> s == loads(dumps(s))
True
```

canonical_label()

EXAMPLES:

```
sage: P = species.PartitionSpecies()
sage: s = (P+P).structures([1,2,3])[1]; s                                    #␣
↪needs sage.libs.flint
{{1, 3}, {2}}
sage: s.canonical_label()                                                    #␣
↪needs sage.libs.flint
{{1, 2}, {3}}
```

```
>>> from sage.all import *
>>> P = species.PartitionSpecies()
>>> s = (P+P).structures([Integer(1),Integer(2),Integer(3)])[Integer(1)]; s
↪                                  # needs sage.libs.flint
{{1, 3}, {2}}
>>> s.canonical_label()                                                    #
↪needs sage.libs.flint
{{1, 2}, {3}}
```

change_labels(*labels*)

Return a relabelled structure.

INPUT:

- `labels` – list of labels

OUTPUT:

A structure with the i-th label of `self` replaced with the i-th label of the list.

EXAMPLES:

```
sage: X = species.SingletonSpecies()
sage: X2 = X+X
sage: s = X2.structures([1]).random_element(); s
1
sage: s.change_labels(['a'])
'a'
```

```
>>> from sage.all import *
>>> X = species.SingletonSpecies()
>>> X2 = X+X
>>> s = X2.structures([Integer(1)]).random_element(); s
1
>>> s.change_labels(['a'])
'a'
```

transport(*perm*)

EXAMPLES:

```
sage: P = species.PartitionSpecies()
sage: s = (P+P).structures([1,2,3])[1]; s                                  #
↪needs sage.libs.flint
{{1, 3}, {2}}
sage: s.transport(PermutationGroupElement((2,3)))                          #
↪needs sage.groups sage.libs.flint
{{1, 2}, {3}}
```

```
>>> from sage.all import *
>>> P = species.PartitionSpecies()
>>> s = (P+P).structures([Integer(1),Integer(2),Integer(3)])[Integer(1)]; s
↪                                  # needs sage.libs.flint
{{1, 3}, {2}}
>>> s.transport(PermutationGroupElement((Integer(2),Integer(3))))
```

(continues on next page)

(continued from previous page)

```
↪              # needs sage.groups sage.libs.flint
{{1, 2}, {3}}
```

class sage.combinat.species.structure.**SpeciesWrapper**(*species*, *labels*, *iterator*, *generating_series*, *name*, *structure_class*)

Bases: Parent

This is a abstract base class for the set of structures of a species as well as the set of isotypes of the species.

Note

One typically does not use *SpeciesWrapper* directly, but instead instantiates one of its subclasses: *StructuresWrapper* or *IsotypesWrapper*.

EXAMPLES:

```
sage: from sage.combinat.species.structure import SpeciesWrapper
sage: F = species.SetSpecies()
sage: S = SpeciesWrapper(F, [1,2,3], "_structures", "generating_series",
↪'Structures', None)
sage: S
Structures for Set species with labels [1, 2, 3]
sage: S.list()
[{1, 2, 3}]
sage: S.cardinality()
1
```

```
>>> from sage.all import *
>>> from sage.combinat.species.structure import SpeciesWrapper
>>> F = species.SetSpecies()
>>> S = SpeciesWrapper(F, [Integer(1),Integer(2),Integer(3)], "_structures",
↪"generating_series", 'Structures', None)
>>> S
Structures for Set species with labels [1, 2, 3]
>>> S.list()
[{1, 2, 3}]
>>> S.cardinality()
1
```

cardinality()

Return the number of structures in this set.

EXAMPLES:

```
sage: F = species.SetSpecies()
sage: F.structures([1,2,3]).cardinality()
1
```

```
>>> from sage.all import *
>>> F = species.SetSpecies()
>>> F.structures([Integer(1),Integer(2),Integer(3)]).cardinality()
1
```

labels()

Return the labels used on these structures. If X is the species, then *labels()* returns the preimage of these structures under the functor X.

EXAMPLES:

```
sage: F = species.SetSpecies()
sage: F.structures([1,2,3]).labels()
[1, 2, 3]
```

```
>>> from sage.all import *
>>> F = species.SetSpecies()
>>> F.structures([Integer(1),Integer(2),Integer(3)]).labels()
[1, 2, 3]
```

class sage.combinat.species.structure.**StructuresWrapper**(*species*, *labels*, *structure_class*)

Bases: *SpeciesWrapper*

A base class for the set of structures of a species with given set of labels. An object of this type is returned when you call the *structures* method of a species.

EXAMPLES:

```
sage: F = species.SetSpecies()
sage: S = F.structures([1,2,3])
sage: S == loads(dumps(S))
True
```

```
>>> from sage.all import *
>>> F = species.SetSpecies()
>>> S = F.structures([Integer(1),Integer(2),Integer(3)])
>>> S == loads(dumps(S))
True
```

Subset species

class sage.combinat.species.subset_species.**SubsetSpecies**(*min=None*, *max=None*, *weight=None*)

Bases: *GenericCombinatorialSpecies*, UniqueRepresentation

Return the species of subsets.

EXAMPLES:

```
sage: S = species.SubsetSpecies()
sage: S.generating_series()[0:5]
[1, 2, 2, 4/3, 2/3]
sage: S.isotype_generating_series()[0:5]
[1, 2, 3, 4, 5]

sage: S = species.SubsetSpecies()
sage: c = S.generating_series()[0:3]
sage: S._check()
True
sage: S == loads(dumps(S))
True
```

```
>>> from sage.all import *
>>> S = species.SubsetSpecies()
>>> S.generating_series()[Integer(0):Integer(5)]
[1, 2, 2, 4/3, 2/3]
>>> S.isotype_generating_series()[Integer(0):Integer(5)]
[1, 2, 3, 4, 5]

>>> S = species.SubsetSpecies()
>>> c = S.generating_series()[Integer(0):Integer(3)]
>>> S._check()
True
>>> S == loads(dumps(S))
True
```

class sage.combinat.species.subset_species.**SubsetSpeciesStructure**(*parent*, *labels*, *list*)

Bases: *GenericSpeciesStructure*

automorphism_group()

Return the group of permutations whose action on this subset leave it fixed.

EXAMPLES:

```
sage: F = species.SubsetSpecies()
sage: a = F.structures([1,2,3,4])[6]; a
{1, 3}
sage: a.automorphism_group()                                                #␣
↪needs sage.groups
Permutation Group with generators [(2,4), (1,3)]
```

```
>>> from sage.all import *
>>> F = species.SubsetSpecies()
>>> a = F.structures([Integer(1),Integer(2),Integer(3),
↪Integer(4)])[Integer(6)]; a
{1, 3}
>>> a.automorphism_group()                                                  #␣
↪needs sage.groups
Permutation Group with generators [(2,4), (1,3)]
```

```
sage: [a.transport(g) for g in a.automorphism_group()]                      #␣
↪needs sage.groups
[{1, 3}, {1, 3}, {1, 3}, {1, 3}]
```

```
>>> from sage.all import *
>>> [a.transport(g) for g in a.automorphism_group()]                        #␣
↪needs sage.groups
[{1, 3}, {1, 3}, {1, 3}, {1, 3}]
```

canonical_label()

Return the canonical label of `self`.

EXAMPLES:

```
sage: P = species.SubsetSpecies()
sage: S = P.structures(["a", "b", "c"])
sage: [s.canonical_label() for s in S]
[{}, {'a'}, {'a'}, {'a'}, {'a', 'b'}, {'a', 'b'}, {'a', 'b'}, {'a', 'b', 'c'}]
```

```
>>> from sage.all import *
>>> P = species.SubsetSpecies()
>>> S = P.structures(["a", "b", "c"])
>>> [s.canonical_label() for s in S]
[{}, {'a'}, {'a'}, {'a'}, {'a', 'b'}, {'a', 'b'}, {'a', 'b'}, {'a', 'b', 'c'}]
```

complement()

Return the complement of `self`.

EXAMPLES:

```
sage: F = species.SubsetSpecies()
sage: a = F.structures(["a", "b", "c"])[5]; a
{'a', 'c'}
sage: a.complement()
{'b'}
```

```
>>> from sage.all import *
>>> F = species.SubsetSpecies()
>>> a = F.structures(["a", "b", "c"])[Integer(5)]; a
{'a', 'c'}
>>> a.complement()
{'b'}
```

label_subset()

Return a subset of the labels that "appear" in this structure.

EXAMPLES:

```
sage: P = species.SubsetSpecies()
sage: S = P.structures(["a", "b", "c"])
sage: [s.label_subset() for s in S]
[[], ['a'], ['b'], ['c'], ['a', 'b'], ['a', 'c'], ['b', 'c'], ['a', 'b', 'c']]
```

```
>>> from sage.all import *
>>> P = species.SubsetSpecies()
>>> S = P.structures(["a", "b", "c"])
>>> [s.label_subset() for s in S]
[[], ['a'], ['b'], ['c'], ['a', 'b'], ['a', 'c'], ['b', 'c'], ['a', 'b', 'c']]
```

transport(*perm*)

Return the transport of this subset along the permutation perm.

EXAMPLES:

```
sage: F = species.SubsetSpecies()
sage: a = F.structures(["a", "b", "c"])[5]; a
{'a', 'c'}
```

(continues on next page)

(continued from previous page)

```
sage: p = PermutationGroupElement((1,2))                                    #␣
↪needs sage.groups
sage: a.transport(p)                                                        #␣
↪needs sage.groups
{'b', 'c'}
sage: p = PermutationGroupElement((1,3))                                    #␣
↪needs sage.groups
sage: a.transport(p)                                                        #␣
↪needs sage.groups
{'a', 'c'}
```

```
>>> from sage.all import *
>>> F = species.SubsetSpecies()
>>> a = F.structures(["a", "b", "c"])[Integer(5)]; a
{'a', 'c'}
>>> p = PermutationGroupElement((Integer(1),Integer(2)))                    ␣
↪              # needs sage.groups
>>> a.transport(p)                                                          #␣
↪needs sage.groups
{'b', 'c'}
>>> p = PermutationGroupElement((Integer(1),Integer(3)))                    ␣
↪              # needs sage.groups
>>> a.transport(p)                                                          #␣
↪needs sage.groups
{'a', 'c'}
```

sage.combinat.species.subset_species.**SubsetSpecies_class**

alias of *SubsetSpecies*

Sum species

class sage.combinat.species.sum_species.**SumSpecies**(*F*, *G*, *min=None*, *max=None*, *weight=None*)

Bases: *GenericCombinatorialSpecies*, UniqueRepresentation

Return the sum of two species.

EXAMPLES:

```
sage: S = species.PermutationSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
sage: A = S+S
sage: A.generating_series()[:5]
[2, 2, 2, 2, 2]

sage: P = species.PermutationSpecies()
sage: F = P + P
sage: F._check()                                                            #␣
↪needs sage.libs.flint
True
sage: F == loads(dumps(F))
True
```

```
>>> from sage.all import *
>>> S = species.PermutationSpecies()
doctest:warning...
DeprecationWarning: combinat.species is superseded by LazyCombinatorialSpecies
See https://github.com/sagemath/sage/issues/38544 for details.
>>> A = S+S
>>> A.generating_series()[:Integer(5)]
[2, 2, 2, 2, 2]

>>> P = species.PermutationSpecies()
>>> F = P + P
>>> F._check()                                                    # needs␣
↪sage.libs.flint
True
>>> F == loads(dumps(F))
True
```

left_summand()

Return the left summand of this species.

EXAMPLES:

```
sage: P = species.PermutationSpecies()
sage: F = P + P*P
sage: F.left_summand()
Permutation species
```

```
>>> from sage.all import *
>>> P = species.PermutationSpecies()
>>> F = P + P*P
>>> F.left_summand()
Permutation species
```

right_summand()

Return the right summand of this species.

EXAMPLES:

```
sage: P = species.PermutationSpecies()
sage: F = P + P*P
sage: F.right_summand()
Product of (Permutation species) and (Permutation species)
```

```
>>> from sage.all import *
>>> P = species.PermutationSpecies()
>>> F = P + P*P
>>> F.right_summand()
Product of (Permutation species) and (Permutation species)
```

weight_ring()

Return the weight ring for this species. This is determined by asking Sage's coercion model what the result is when you add elements of the weight rings for each of the operands.

EXAMPLES:

```
sage: S = species.SetSpecies()
sage: C = S+S
sage: C.weight_ring()
Rational Field
```

```
>>> from sage.all import *
>>> S = species.SetSpecies()
>>> C = S+S
>>> C.weight_ring()
Rational Field
```

```
sage: S = species.SetSpecies(weight=QQ['t'].gen())
sage: C = S + S
sage: C.weight_ring()
Univariate Polynomial Ring in t over Rational Field
```

```
>>> from sage.all import *
>>> S = species.SetSpecies(weight=QQ['t'].gen())
>>> C = S + S
>>> C.weight_ring()
Univariate Polynomial Ring in t over Rational Field
```

class sage.combinat.species.sum_species.**SumSpeciesStructure**(*parent*, *s*, ***options*)

Bases: *SpeciesStructureWrapper*

sage.combinat.species.sum_species.**SumSpecies_class**

alias of *SumSpecies*

4.1.16 sage.combinat.words

Abstract word (finite or infinite)

This module gathers functions that works for both finite and infinite words.

AUTHORS:

- Sébastien Labbé
- Franco Saliola

EXAMPLES:

```
sage: a = 0.618
sage: g = words.CodingOfRotationWord(alpha=a, beta=1-a, x=a)
sage: f = words.FibonacciWord()
sage: p = f.longest_common_prefix(g, length='finite')
sage: p
word: 0100101001001010010100100101001001010010...
sage: p.length()
231
```

```
>>> from sage.all import *
>>> a = RealNumber('0.618')
>>> g = words.CodingOfRotationWord(alpha=a, beta=Integer(1)-a, x=a)
```

(continues on next page)

(continued from previous page)

```
>>> f = words.FibonacciWord()
>>> p = f.longest_common_prefix(g, length='finite')
>>> p
word: 0100101001001010010100100101001001010010...
>>> p.length()
231
```

class sage.combinat.words.abstract_word.**Word_class**

Bases: SageObject

apply_morphism(*morphism*)

Return the word obtained by applying the morphism to `self`.

INPUT:

- `morphism` – can be an instance of WordMorphism, or anything that can be used to construct one

EXAMPLES:

```
sage: w = Word("ab")
sage: d = {'a':'ab', 'b':'ba'}
sage: w.apply_morphism(d)
word: abba
sage: w.apply_morphism(WordMorphism(d))
word: abba
```

```
>>> from sage.all import *
>>> w = Word("ab")
>>> d = {'a':'ab', 'b':'ba'}
>>> w.apply_morphism(d)
word: abba
>>> w.apply_morphism(WordMorphism(d))
word: abba
```

```
sage: w = Word('ababa')
sage: d = dict(a='ab', b='ba')
sage: d
{'a': 'ab', 'b': 'ba'}
sage: w.apply_morphism(d)
word: abbaabbaab
```

```
>>> from sage.all import *
>>> w = Word('ababa')
>>> d = dict(a='ab', b='ba')
>>> d
{'a': 'ab', 'b': 'ba'}
>>> w.apply_morphism(d)
word: abbaabbaab
```

For infinite words:

```
sage: t = words.ThueMorseWord([0,1]); t
word: 0110100110010110100101100110100110010110...
```

(continues on next page)

(continued from previous page)

```
sage: t.apply_morphism({0:8,1:9})
word: 899898899889899898899889989988998898898998...
```

```
>>> from sage.all import *
>>> t = words.ThueMorseWord([Integer(0),Integer(1)]); t
word: 011010011001011010010110011010011001010110...
>>> t.apply_morphism({Integer(0):Integer(8),Integer(1):Integer(9)})
word: 899898899889899898899889989988998898898998...
```

complete_return_words_iterator(*fact*)

Return an iterator over all the complete return words of fact in `self` (without uniqueness).

A complete return words u of a factor v is a factor starting by the given factor v and ending just after the next occurrence of this factor v. See for instance [1].

INPUT:

- `fact` – a non empty finite word

OUTPUT: iterator

EXAMPLES:

```
sage: TM = words.ThueMorseWord()
sage: fact = Word([0,1,1,0,1])
sage: it = TM.complete_return_words_iterator(fact)
sage: next(it)
word: 01101001100101101
sage: next(it)
word: 01101001011001101
sage: next(it)
word: 011010011001011001101
sage: next(it)

```

REFERENCES:

- [1] J. Justin, L. Vuillon, Return words in Sturmian and episturmian words, Theor. Inform. Appl. 34 (2000) 343–356.

delta()

Return the image of `self` under the delta morphism.

This is the word composed of the length of consecutive runs of the same letter in a given word.

OUTPUT: word over integers

EXAMPLES:

For finite words:

```
sage: W = Words('0123456789')
sage: W('22112122').delta()
word: 22112
sage: W('555008').delta()
word: 321
sage: W().delta()
word:
sage: Word('aabbabaa').delta()
word: 22112
```

```
>>> from sage.all import *
>>> W = Words('0123456789')
>>> W('22112122').delta()
word: 22112
>>> W('555008').delta()
word: 321
>>> W().delta()
word:
>>> Word('aabbabaa').delta()
word: 22112
```

For infinite words:

```
sage: t = words.ThueMorseWord()
sage: t.delta()
word: 12112221121121122211222112221121121122221...
```

```
>>> from sage.all import *
>>> t = words.ThueMorseWord()
>>> t.delta()
word: 12112221121121122211222112221121121122221...
```

factor_occurrences_iterator(*fact*)

Return an iterator over all occurrences (including overlapping ones) of fact in `self` in their order of appearance.

INPUT:

- `fact` – a non empty finite word

OUTPUT: iterator

EXAMPLES:

```
sage: TM = words.ThueMorseWord()
sage: fact = Word([0,1,1,0,1])
sage: it = TM.factor_occurrences_iterator(fact)
sage: next(it)
0
sage: next(it)
12
sage: next(it)
24
```

```
>>> from sage.all import *
>>> TM = words.ThueMorseWord()
>>> fact = Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1)])
>>> it = TM.factor_occurrences_iterator(fact)
>>> next(it)
0
>>> next(it)
12
>>> next(it)
24
```

```
sage: u = Word('121')
sage: w = Word('121213211213')
sage: list(w.factor_occurrences_iterator(u))
[0, 2, 8]
```

```
>>> from sage.all import *
>>> u = Word('121')
>>> w = Word('121213211213')
>>> list(w.factor_occurrences_iterator(u))
[0, 2, 8]
```

finite_differences(*mod=None*)

Return the word obtained by the differences of consecutive letters of `self`.

INPUT:

- `self` – a word over the integers
- **`mod` – (default: `None`) it can be one of the following:**
  - None or 0 : result is over the integers
  - integer : result is over the integers modulo `mod`.

EXAMPLES:

```
sage: w = Word([x^2 for x in range(10)])
sage: w.finite_differences()
word: 1,3,5,7,9,11,13,15,17
```

(continues on next page)

(continued from previous page)

```
sage: w.finite_differences(mod=4)
word: 131313131
sage: w.finite_differences(mod=0)
word: 1,3,5,7,9,11,13,15,17
```

```
>>> from sage.all import *
>>> w = Word([x**Integer(2) for x in range(Integer(10))])
>>> w.finite_differences()
word: 1,3,5,7,9,11,13,15,17
>>> w.finite_differences(mod=Integer(4))
word: 131313131
>>> w.finite_differences(mod=Integer(0))
word: 1,3,5,7,9,11,13,15,17
```

first_occurrence(*other*, *start=0*)

Return the position of the first occurrence of `other` in `self`.

If `other` is not a factor of `self`, it returns `None` or loops forever when `self` is an infinite word.

INPUT:

- `other` – a finite word
- `start` – integer (default: 0) where the search starts

OUTPUT: integer or `None`

EXAMPLES:

```
sage: w = Word('01234567890123456789')
sage: w.first_occurrence(Word('3456'))
3
sage: w.first_occurrence(Word('3456'), start=7)
13
```

```
>>> from sage.all import *
>>> w = Word('01234567890123456789')
>>> w.first_occurrence(Word('3456'))
3
>>> w.first_occurrence(Word('3456'), start=Integer(7))
13
```

When the factor is not present, `None` is returned:

```
sage: w.first_occurrence(Word('3456'), start=17) is None
True
sage: w.first_occurrence(Word('3333')) is None
True
```

```
>>> from sage.all import *
>>> w.first_occurrence(Word('3456'), start=Integer(17)) is None
True
>>> w.first_occurrence(Word('3333')) is None
True
```

Also works for searching a finite word in an infinite word:

```
sage: w = Word('0123456789')^oo
sage: w.first_occurrence(Word('3456'))
3
sage: w.first_occurrence(Word('3456'), start=1000)
1003
```

```
>>> from sage.all import *
>>> w = Word('0123456789')**oo
>>> w.first_occurrence(Word('3456'))
3
>>> w.first_occurrence(Word('3456'), start=Integer(1000))
1003
```

But it will loop for ever if the factor is not found:

```
sage: w.first_occurrence(Word('3333')) # not tested -- infinite loop
```

```
>>> from sage.all import *
>>> w.first_occurrence(Word('3333')) # not tested -- infinite loop
```

The empty word occurs in a word:

```
sage: Word('123').first_occurrence(Word(''), 0)
0
sage: Word('').first_occurrence(Word(''), 0)
0
```

```
>>> from sage.all import *
>>> Word('123').first_occurrence(Word(''), Integer(0))
0
>>> Word('').first_occurrence(Word(''), Integer(0))
0
```

is_empty()

Return `True` if the length of `self` is zero, and `False` otherwise.

EXAMPLES:

```
sage: it = iter([])
sage: Word(it).is_empty()
True
sage: it = iter([1,2,3])
sage: Word(it).is_empty()
False
sage: from itertools import count
sage: Word(count()).is_empty()
False
```

```
>>> from sage.all import *
>>> it = iter([])
>>> Word(it).is_empty()
```

(continues on next page)

(continued from previous page)

```
True
>>> it = iter([Integer(1),Integer(2),Integer(3)])
>>> Word(it).is_empty()
False
>>> from itertools import count
>>> Word(count()).is_empty()
False
```

is_finite()

Return whether this word is known to be finite.

> **Warning**
>
> A word defined by an iterator such that its end has never been reached will returns False.

EXAMPLES:

```
sage: Word([]).is_finite()
True
sage: Word('a').is_finite()
True
sage: TM = words.ThueMorseWord()
sage: TM.is_finite()
False
```

```
>>> from sage.all import *
>>> Word([]).is_finite()
True
>>> Word('a').is_finite()
True
>>> TM = words.ThueMorseWord()
>>> TM.is_finite()
False
```

```
sage: w = Word(iter('a'*100))
sage: w.is_finite()
False
```

```
>>> from sage.all import *
>>> w = Word(iter('a'*Integer(100)))
>>> w.is_finite()
False
```

iterated_right_palindromic_closure(*f=None*, *algorithm='recursive'*)

Return the iterated (f-)palindromic closure of `self`.

INPUT:

- `f` – involution (default: `None`) on the alphabet of `self`; it must be callable on letters as well as words (e.g. WordMorphism)

- `algorithm` – string (default: `'recursive'`); specifying which algorithm to be used when computing the iterated palindromic closure. It must be one of the two following values:
  - `'definition'` – computed using the definition
  - `'recursive'` – computation based on an efficient formula that recursively computes the iterated right palindromic closure without having to recompute the longest f-palindromic suffix at each iteration [2].

OUTPUT: word; the iterated (f-)palindromic closure of `self`

EXAMPLES:

```
sage: Word('123').iterated_right_palindromic_closure()
word: 1213121
```

```
>>> from sage.all import *
>>> Word('123').iterated_right_palindromic_closure()
word: 1213121
```

```
sage: w = Word('abc')
sage: w.iterated_right_palindromic_closure()
word: abacaba
```

```
>>> from sage.all import *
>>> w = Word('abc')
>>> w.iterated_right_palindromic_closure()
word: abacaba
```

```
sage: w = Word('aaa')
sage: w.iterated_right_palindromic_closure()
word: aaa
```

```
>>> from sage.all import *
>>> w = Word('aaa')
>>> w.iterated_right_palindromic_closure()
word: aaa
```

```
sage: w = Word('abbab')
sage: w.iterated_right_palindromic_closure()
word: ababaababababaababa
```

```
>>> from sage.all import *
>>> w = Word('abbab')
>>> w.iterated_right_palindromic_closure()
word: ababaababababaababa
```

A right f-palindromic closure:

```
sage: f = WordMorphism('a->b,b->a')
sage: w = Word('abbab')
sage: w.iterated_right_palindromic_closure(f=f)
word: abbaabbaababbaabbaabbaababbaabbaab
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->b,b->a')
>>> w = Word('abbab')
>>> w.iterated_right_palindromic_closure(f=f)
word: abbaabbaababbaabbaabbaababbaabbaab
```

An infinite word:

```
sage: t = words.ThueMorseWord('ab')
sage: t.iterated_right_palindromic_closure()
word: ababaababababaababaababababaababaababababaabab...
```

```
>>> from sage.all import *
>>> t = words.ThueMorseWord('ab')
>>> t.iterated_right_palindromic_closure()
word: ababaababababaababaababababaababaababababaabab...
```

There are two implementations computing the iterated right f-palindromic closure, the latter being much more efficient:

```
sage: w = Word('abaab')
sage: u = w.iterated_right_palindromic_closure(algorithm='definition')
sage: v = w.iterated_right_palindromic_closure(algorithm='recursive')
sage: u
word: abaabaababaabaaba
sage: u == v
True
sage: w = words.RandomWord(8)
sage: u = w.iterated_right_palindromic_closure(algorithm='definition')
sage: v = w.iterated_right_palindromic_closure(algorithm='recursive')
sage: u == v
True
```

```
>>> from sage.all import *
>>> w = Word('abaab')
>>> u = w.iterated_right_palindromic_closure(algorithm='definition')
>>> v = w.iterated_right_palindromic_closure(algorithm='recursive')
>>> u
word: abaabaababaabaaba
>>> u == v
True
>>> w = words.RandomWord(Integer(8))
>>> u = w.iterated_right_palindromic_closure(algorithm='definition')
>>> v = w.iterated_right_palindromic_closure(algorithm='recursive')
>>> u == v
True
```

length()

Return the length of `self`.

lex_greater(*other*)

Return `True` if `self` is lexicographically greater than `other`.

EXAMPLES:

```
sage: w = Word([1,2,3])
sage: u = Word([1,3,2])
sage: v = Word([3,2,1])
sage: w.lex_greater(u)
False
sage: v.lex_greater(w)
True
sage: a = Word("abba")
sage: b = Word("abbb")
sage: a.lex_greater(b)
False
sage: b.lex_greater(a)
True
```

```
>>> from sage.all import *
>>> w = Word([Integer(1),Integer(2),Integer(3)])
>>> u = Word([Integer(1),Integer(3),Integer(2)])
>>> v = Word([Integer(3),Integer(2),Integer(1)])
>>> w.lex_greater(u)
False
>>> v.lex_greater(w)
True
>>> a = Word("abba")
>>> b = Word("abbb")
>>> a.lex_greater(b)
False
>>> b.lex_greater(a)
True
```

For infinite words:

```
sage: t = words.ThueMorseWord()
sage: t[:10].lex_greater(t)
False
sage: t.lex_greater(t[:10])
True
```

```
>>> from sage.all import *
>>> t = words.ThueMorseWord()
>>> t[:Integer(10)].lex_greater(t)
False
>>> t.lex_greater(t[:Integer(10)])
True
```

lex_less(*other*)

Return `True` if `self` is lexicographically less than `other`.

EXAMPLES:

```
sage: w = Word([1,2,3])
sage: u = Word([1,3,2])
sage: v = Word([3,2,1])
sage: w.lex_less(u)
True
sage: v.lex_less(w)
False
sage: a = Word("abba")
sage: b = Word("abbb")
sage: a.lex_less(b)
True
sage: b.lex_less(a)
False
```

```
>>> from sage.all import *
>>> w = Word([Integer(1),Integer(2),Integer(3)])
>>> u = Word([Integer(1),Integer(3),Integer(2)])
>>> v = Word([Integer(3),Integer(2),Integer(1)])
>>> w.lex_less(u)
True
>>> v.lex_less(w)
False
>>> a = Word("abba")
>>> b = Word("abbb")
>>> a.lex_less(b)
True
>>> b.lex_less(a)
False
```

For infinite words:

```
sage: t = words.ThueMorseWord()
sage: t.lex_less(t[:10])
False
sage: t[:10].lex_less(t)
True
```

```
>>> from sage.all import *
>>> t = words.ThueMorseWord()
>>> t.lex_less(t[:Integer(10)])
False
>>> t[:Integer(10)].lex_less(t)
True
```

longest_common_prefix(*other*, *length='unknown'*)

Return the longest common prefix of `self` and `other`.

INPUT:

- `other` – word
- `length` – string (default: `'unknown'`) the length type of the resulting word if known. It may be one of the following:

- 'unknown'
- 'finite'
- 'infinite'

EXAMPLES:

```
sage: f = lambda n : add(Integer(n).digits(2)) % 2
sage: t = Word(f)
sage: u = t[:10]
sage: t.longest_common_prefix(u)
word: 0110100110
```

```
>>> from sage.all import *
>>> f = lambda n : add(Integer(n).digits(Integer(2))) % Integer(2)
>>> t = Word(f)
>>> u = t[:Integer(10)]
>>> t.longest_common_prefix(u)
word: 0110100110
```

The longest common prefix of two equal infinite words:

```
sage: t1 = Word(f)
sage: t2 = Word(f)
sage: t1.longest_common_prefix(t2)
word: 01101001100101101001011001101001100100110...
```

```
>>> from sage.all import *
>>> t1 = Word(f)
>>> t2 = Word(f)
>>> t1.longest_common_prefix(t2)
word: 01101001100101101001011001101001100100110...
```

Useful to study the approximation of an infinite word:

```
sage: a = 0.618
sage: g = words.CodingOfRotationWord(alpha=a, beta=1-a, x=a)
sage: f = words.FibonacciWord()
sage: p = f.longest_common_prefix(g, length='finite')
sage: p.length()
231
```

```
>>> from sage.all import *
>>> a = RealNumber('0.618')
>>> g = words.CodingOfRotationWord(alpha=a, beta=Integer(1)-a, x=a)
>>> f = words.FibonacciWord()
>>> p = f.longest_common_prefix(g, length='finite')
>>> p.length()
231
```

longest_periodic_prefix(*period=1*)

Return the longest prefix of `self` having the given period.

INPUT:

- `period` – positive integer (default: 1)

OUTPUT: word

EXAMPLES:

```
sage: Word([]).longest_periodic_prefix()
word:
sage: Word([1]).longest_periodic_prefix()
word: 1
sage: Word([1,2]).longest_periodic_prefix()
word: 1
sage: Word([1,1,2]).longest_periodic_prefix()
word: 11
sage: Word([1,2,1,2,1,3]).longest_periodic_prefix(2)
word: 12121
sage: type(_)
<class 'sage.combinat.words.word.FiniteWord_iter_with_caching'>
sage: Word(lambda n:0).longest_periodic_prefix()
word: 00000000000000000000000000000000000000000...
```

```
>>> from sage.all import *
>>> Word([]).longest_periodic_prefix()
word:
>>> Word([Integer(1)]).longest_periodic_prefix()
word: 1
>>> Word([Integer(1),Integer(2)]).longest_periodic_prefix()
word: 1
>>> Word([Integer(1),Integer(1),Integer(2)]).longest_periodic_prefix()
word: 11
>>> Word([Integer(1),Integer(2),Integer(1),Integer(2),Integer(1),Integer(3)]).
↪longest_periodic_prefix(Integer(2))
word: 12121
>>> type(_)
<class 'sage.combinat.words.word.FiniteWord_iter_with_caching'>
>>> Word(lambda n:Integer(0)).longest_periodic_prefix()
word: 00000000000000000000000000000000000000000...
```

palindrome_prefixes_iterator(*max_length=None*)

Return an iterator over the palindrome prefixes of `self`.

INPUT:

- `max_length` – nonnegative integer or `None` (default); the maximum length of the prefixes

OUTPUT: iterator

EXAMPLES:

```
sage: w = Word('abaaba')
sage: for pp in w.palindrome_prefixes_iterator(): pp
word:
word: a
word: aba
word: abaaba
sage: for pp in w.palindrome_prefixes_iterator(max_length=4): pp
```

(continues on next page)

(continued from previous page)

```
word:
word: a
word: aba
```

```
>>> from sage.all import *
>>> w = Word('abaaba')
>>> for pp in w.palindrome_prefixes_iterator(): pp
word:
word: a
word: aba
word: abaaba
>>> for pp in w.palindrome_prefixes_iterator(max_length=Integer(4)): pp
word:
word: a
word: aba
```

You can iterate over the palindrome prefixes of an infinite word:

```
sage: f = words.FibonacciWord()
sage: for pp in f.palindrome_prefixes_iterator(max_length=20): pp
word:
word: 0
word: 010
word: 010010
word: 01001010010
word: 0100101001001010010
```

```
>>> from sage.all import *
>>> f = words.FibonacciWord()
>>> for pp in f.palindrome_prefixes_iterator(max_length=Integer(20)): pp
word:
word: 0
word: 010
word: 010010
word: 01001010010
word: 0100101001001010010
```

parent()

Return the parent of `self`.

partial_sums(*start*, *mod=None*)

Return the word defined by the partial sums of its prefixes.

INPUT:

- `self` – a word over the integers
- `start` – integer; the first letter of the resulting word
- **`mod` – (default: `None`) it can be one of the following:**
  - None or 0 : result is over the integers
  - integer : result is over the integers modulo `mod`.

EXAMPLES:

```
sage: w = Word(range(10))
sage: w.partial_sums(0)
word: 0,0,1,3,6,10,15,21,28,36,45
sage: w.partial_sums(1)
word: 1,1,2,4,7,11,16,22,29,37,46
```

```
>>> from sage.all import *
>>> w = Word(range(Integer(10)))
>>> w.partial_sums(Integer(0))
word: 0,0,1,3,6,10,15,21,28,36,45
>>> w.partial_sums(Integer(1))
word: 1,1,2,4,7,11,16,22,29,37,46
```

```
sage: w = Word([1,2,3,1,2,3,2,2,2,2])
sage: w.partial_sums(0, mod=None)
word: 0,1,3,6,7,9,12,14,16,18,20
sage: w.partial_sums(0, mod=0)
word: 0,1,3,6,7,9,12,14,16,18,20
sage: w.partial_sums(0, mod=8)
word: 01367146024
sage: w.partial_sums(0, mod=4)
word: 01323102020
sage: w.partial_sums(0, mod=2)
word: 01101100000
sage: w.partial_sums(0, mod=1)
word: 00000000000
```

```
>>> from sage.all import *
>>> w = Word([Integer(1),Integer(2),Integer(3),Integer(1),Integer(2),
↪Integer(3),Integer(2),Integer(2),Integer(2),Integer(2)])
>>> w.partial_sums(Integer(0), mod=None)
word: 0,1,3,6,7,9,12,14,16,18,20
>>> w.partial_sums(Integer(0), mod=Integer(0))
word: 0,1,3,6,7,9,12,14,16,18,20
>>> w.partial_sums(Integer(0), mod=Integer(8))
word: 01367146024
>>> w.partial_sums(Integer(0), mod=Integer(4))
word: 01323102020
>>> w.partial_sums(Integer(0), mod=Integer(2))
word: 01101100000
>>> w.partial_sums(Integer(0), mod=Integer(1))
word: 00000000000
```

prefixes_iterator(*max_length=None*)

Return an iterator over the prefixes of `self`.

INPUT:

- `max_length` – nonnegative integer or `None` (default); the maximum length of the prefixes

OUTPUT: iterator

EXAMPLES:

```
sage: w = Word('abaaba')
sage: for p in w.prefixes_iterator(): p
word:
word: a
word: ab
word: aba
word: abaa
word: abaab
word: abaaba
sage: for p in w.prefixes_iterator(max_length=3): p
word:
word: a
word: ab
word: aba
```

```
>>> from sage.all import *
>>> w = Word('abaaba')
>>> for p in w.prefixes_iterator(): p
word:
word: a
word: ab
word: aba
word: abaa
word: abaab
word: abaaba
>>> for p in w.prefixes_iterator(max_length=Integer(3)): p
word:
word: a
word: ab
word: aba
```

You can iterate over the prefixes of an infinite word:

```
sage: f = words.FibonacciWord()
sage: for p in f.prefixes_iterator(max_length=8): p
word:
word: 0
word: 01
word: 010
word: 0100
word: 01001
word: 010010
word: 0100101
word: 01001010
```

```
>>> from sage.all import *
>>> f = words.FibonacciWord()
>>> for p in f.prefixes_iterator(max_length=Integer(8)): p
word:
word: 0
word: 01
word: 010
```

(continues on next page)

(continued from previous page)

```
word: 0100
word: 01001
word: 010010
word: 0100101
word: 01001010
```

return_words_iterator(*fact*)

Return an iterator over all the return words of fact in self (without uniqueness).

INPUT:

- `fact` – a non empty finite word

OUTPUT: iterator

EXAMPLES:

```
sage: w = Word('baccabccbacbca')
sage: b = Word('b')
sage: list(w.return_words_iterator(b))
[word: bacca, word: bcc, word: bac]
```

```
>>> from sage.all import *
>>> w = Word('baccabccbacbca')
>>> b = Word('b')
>>> list(w.return_words_iterator(b))
[word: bacca, word: bcc, word: bac]
```

```
sage: TM = words.ThueMorseWord()
sage: fact = Word([0,1,1,0,1])
sage: it = TM.return_words_iterator(fact)
sage: next(it)
word: 011010011001
sage: next(it)
word: 011010010110
sage: next(it)
word: 0110100110010110
sage: next(it)
word: 01101001
sage: next(it)
word: 011010011001
sage: next(it)
word: 011010010110
```

```
>>> from sage.all import *
>>> TM = words.ThueMorseWord()
>>> fact = Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1)])
>>> it = TM.return_words_iterator(fact)
>>> next(it)
word: 011010011001
>>> next(it)
word: 011010010110
>>> next(it)
```

(continues on next page)

(continued from previous page)

```
word: 0110100110010110
>>> next(it)
word: 01101001
>>> next(it)
word: 011010011001
>>> next(it)
word: 011010010110
```

string_rep()

Return the (truncated) raw sequence of letters as a string.

EXAMPLES:

```
sage: Word('abbabaab').string_rep()
'abbabaab'
sage: Word([0, 1, 0, 0, 1]).string_rep()
'01001'
sage: Word([0,1,10,101]).string_rep()
'0,1,10,101'
sage: WordOptions(letter_separator='-')
sage: Word([0,1,10,101]).string_rep()
'0-1-10-101'
sage: WordOptions(letter_separator=',')
```

```
>>> from sage.all import *
>>> Word('abbabaab').string_rep()
'abbabaab'
>>> Word([Integer(0), Integer(1), Integer(0), Integer(0), Integer(1)]).string_
↪rep()
'01001'
>>> Word([Integer(0),Integer(1),Integer(10),Integer(101)]).string_rep()
'0,1,10,101'
>>> WordOptions(letter_separator='-')
>>> Word([Integer(0),Integer(1),Integer(10),Integer(101)]).string_rep()
'0-1-10-101'
>>> WordOptions(letter_separator=',')
```

sum_digits(*base=2*, *mod=None*)

Return the sequence of the sum modulo `mod` of the digits written in base `base` of `self`.

INPUT:

- `self` – word over natural numbers
- `base` – integer (default: 2) greater or equal to 2
- `mod` – modulo (default: `None`); can take the following values: - `integer` – the modulo - `None` – the value `base` is considered for the modulo

EXAMPLES:

The Thue-Morse word:

```
sage: from itertools import count
sage: Word(count()).sum_digits()
word: 01101001100101101001011001101001100101 10...
```

```
>>> from sage.all import *
>>> from itertools import count
>>> Word(count()).sum_digits()
word: 01101001100101101001011001101001100100110...
```

Sum of digits modulo 2 of the prime numbers written in base 2:

```
sage: Word(primes(1000)).sum_digits()                                          #␣
↪needs sage.libs.pari
word: 10011101001110101110110010111011100110 11...
```

```
>>> from sage.all import *
>>> Word(primes(Integer(1000))).sum_digits()                                   ␣
↪     # needs sage.libs.pari
word: 10011101001110101110110010111011100110 11...
```

Sum of digits modulo 3 of the prime numbers written in base 3:

```
sage: Word(primes(1000)).sum_digits(base=3)                                    #␣
↪needs sage.libs.pari
word: 21000020200022212221210222210221221110 22...
sage: Word(primes(1000)).sum_digits(base=3, mod=3)                             #␣
↪needs sage.libs.pari
word: 21000020200022212221210222210221221110 22...
```

```
>>> from sage.all import *
>>> Word(primes(Integer(1000))).sum_digits(base=Integer(3))                    ␣
↪              # needs sage.libs.pari
word: 21000020200022212221210222210221221110 22...
>>> Word(primes(Integer(1000))).sum_digits(base=Integer(3), mod=Integer(3))    ␣
↪                       # needs sage.libs.pari
word: 21000020200022212221210222210221221110 22...
```

Sum of digits modulo 2 of the prime numbers written in base 3:

```
sage: Word(primes(1000)).sum_digits(base=3, mod=2)                             #␣
↪needs sage.libs.pari
word: 01111111111111111111111111111111111111 11...
```

```
>>> from sage.all import *
>>> Word(primes(Integer(1000))).sum_digits(base=Integer(3), mod=Integer(2))    ␣
↪                       # needs sage.libs.pari
word: 01111111111111111111111111111111111111 11...
```

Sum of digits modulo 7 of the prime numbers written in base 10:

```
sage: Word(primes(1000)).sum_digits(base=10, mod=7)                            #␣
↪needs sage.libs.pari
word: 23502413544350410061324322413535460063 04...
```

```
>>> from sage.all import *
>>> Word(primes(Integer(1000))).sum_digits(base=Integer(10), mod=Integer(7)) ␣
```

(continues on next page)

(continued from previous page)

```
↪                          # needs sage.libs.pari
word: 23502413544350410061324322413535460063 04...
```

Negative entries:

```
sage: w = Word([-1,0,1,2,3,4,5])
sage: w.sum_digits()
Traceback (most recent call last):
...
NotImplementedError: nth digit of Thue-Morse word is not implemented for␣
↪negative value of n
```

```
>>> from sage.all import *
>>> w = Word([-Integer(1),Integer(0),Integer(1),Integer(2),Integer(3),
↪Integer(4),Integer(5)])
>>> w.sum_digits()
Traceback (most recent call last):
...
NotImplementedError: nth digit of Thue-Morse word is not implemented for␣
↪negative value of n
```

to_integer_word()

Return a word over the integers whose letters are those output by self._to_integer_iterator()

EXAMPLES:

```
sage: from itertools import count
sage: w = Word(count()); w
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,
↪27,28,29,30,31,32,33,34,35,36,37,38,39,...
sage: w.to_integer_word()
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,
↪27,28,29,30,31,32,33,34,35,36,37,38,39,...
sage: w = Word(iter("abbacabba"), length='finite'); w
word: abbacabba
sage: w.to_integer_word()
word: 011020110
sage: w = Word(iter("abbacabba"), length='unknown'); w
word: abbacabba
sage: w.to_integer_word()
word: 011020110
```

```
>>> from sage.all import *
>>> from itertools import count
>>> w = Word(count()); w
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,
↪27,28,29,30,31,32,33,34,35,36,37,38,39,...
>>> w.to_integer_word()
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,
↪27,28,29,30,31,32,33,34,35,36,37,38,39,...
>>> w = Word(iter("abbacabba"), length='finite'); w
word: abbacabba
```

(continues on next page)

(continued from previous page)

```
>>> w.to_integer_word()
word: 011020110
>>> w = Word(iter("abbacabba"), length='unknown'); w
word: abbacabba
>>> w.to_integer_word()
word: 011020110
```

Alphabet

AUTHORS:

- Franco Saliola (2008-12-17) : merged into sage
- Vincent Delecroix and Stepan Starosta (2012): remove classes for alphabet and use other Sage classes otherwise (TotallyOrderedFiniteSet, FiniteEnumeratedSet, …). More shortcut to standard alphabets.

EXAMPLES:

```
sage: build_alphabet("ab")
{'a', 'b'}
sage: build_alphabet([0,1,2])
{0, 1, 2}
sage: build_alphabet(name='PP')
Positive integers
sage: build_alphabet(name='NN')
Non negative integers
sage: build_alphabet(name='lower')
{'a', 'b', 'c', 'd', 'e', 'f', 'g', 'h', 'i', 'j', 'k', 'l', 'm', 'n', 'o', 'p', 'q',
↪'r', 's', 't', 'u', 'v', 'w', 'x', 'y', 'z'}
```

```
>>> from sage.all import *
>>> build_alphabet("ab")
{'a', 'b'}
>>> build_alphabet([Integer(0),Integer(1),Integer(2)])
{0, 1, 2}
>>> build_alphabet(name='PP')
Positive integers
>>> build_alphabet(name='NN')
Non negative integers
>>> build_alphabet(name='lower')
{'a', 'b', 'c', 'd', 'e', 'f', 'g', 'h', 'i', 'j', 'k', 'l', 'm', 'n', 'o', 'p', 'q',
↪'r', 's', 't', 'u', 'v', 'w', 'x', 'y', 'z'}
```

sage.combinat.words.alphabet.**Alphabet**(*data=None*, *names=None*, *name=None*)

alias of *build_alphabet()*.

sage.combinat.words.alphabet.**build_alphabet**(*data=None*, *names=None*, *name=None*)

Return an object representing an ordered alphabet.

INPUT:

- `data` – the letters of the alphabet; it can be:
  - a list/tuple/iterable of letters; the iterable may be infinite
  - an integer n to represent $\{1, \ldots, n\}$, or infinity to represent $\mathbf{N}$

- `names` – (optional) a list for the letters (i.e. variable names) or a string for prefix for all letters; if given a list, it must have the same cardinality as the set represented by `data`
- `name` – (optional) if given, then return a named set and can be equal to : `'lower'`, `'upper'`, `'space'`, `'underscore'`, `'punctuation'`, `'printable'`, `'binary'`, `'octal'`, `'decimal'`, `'hexadecimal'`, `'radix64'`.

  You can use many of them at once, separated by spaces : `'lower punctuation'` represents the union of the two alphabets `'lower'` and `'punctuation'`.

  Alternatively, `name` can be set to `'positive integers'` (or `'PP'`) or `'natural numbers'` (or `'NN'`).

  `name` cannot be combined with `data`.

EXAMPLES:

If the argument is a Set, it just returns it:

```
sage: build_alphabet(ZZ) is ZZ
True
sage: F = FiniteEnumeratedSet('abc')
sage: build_alphabet(F) is F
True
```

```
>>> from sage.all import *
>>> build_alphabet(ZZ) is ZZ
True
>>> F = FiniteEnumeratedSet('abc')
>>> build_alphabet(F) is F
True
```

If a list, tuple or string is provided, then it builds a proper Sage class (`TotallyOrderedFiniteSet`):

```
sage: build_alphabet([0,1,2])
{0, 1, 2}
sage: F = build_alphabet('abc'); F
{'a', 'b', 'c'}
sage: print(type(F).__name__)
TotallyOrderedFiniteSet_with_category
```

```
>>> from sage.all import *
>>> build_alphabet([Integer(0),Integer(1),Integer(2)])
{0, 1, 2}
>>> F = build_alphabet('abc'); F
{'a', 'b', 'c'}
>>> print(type(F).__name__)
TotallyOrderedFiniteSet_with_category
```

If an integer and a set is given, then it constructs a `TotallyOrderedFiniteSet`:

```
sage: build_alphabet(3, ['a','b','c'])
{'a', 'b', 'c'}
```

```
>>> from sage.all import *
>>> build_alphabet(Integer(3), ['a','b','c'])
{'a', 'b', 'c'}
```

If an integer and a string is given, then it considers that string as a prefix:

```
sage: build_alphabet(3, 'x')
{'x0', 'x1', 'x2'}
```

```
>>> from sage.all import *
>>> build_alphabet(Integer(3), 'x')
{'x0', 'x1', 'x2'}
```

If no data is provided, `name` may be a string which describe an alphabet. The available names decompose into two families. The first one are 'positive integers', 'PP', 'natural numbers' or 'NN' which refer to standard set of numbers:

```
sage: build_alphabet(name="positive integers")
Positive integers
sage: build_alphabet(name='PP')
Positive integers
sage: build_alphabet(name="natural numbers")
Non negative integers
sage: build_alphabet(name="NN")
Non negative integers
```

```
>>> from sage.all import *
>>> build_alphabet(name="positive integers")
Positive integers
>>> build_alphabet(name='PP')
Positive integers
>>> build_alphabet(name="natural numbers")
Non negative integers
>>> build_alphabet(name="NN")
Non negative integers
```

The other families for the option `name` are among 'lower', 'upper', 'space', 'underscore', 'punctuation', 'printable', 'binary', 'octal', 'decimal', 'hexadecimal', 'radix64' which refer to standard set of characters. Theses names may be combined by separating them by a space:

```
sage: build_alphabet(name='lower')
{'a', 'b', 'c', 'd', 'e', 'f', 'g', 'h', 'i', 'j', 'k', 'l', 'm', 'n', 'o', 'p',
↪'q', 'r', 's', 't', 'u', 'v', 'w', 'x', 'y', 'z'}
sage: build_alphabet(name='hexadecimal')
{'0', '1', '2', '3', '4', '5', '6', '7', '8', '9', 'a', 'b', 'c', 'd', 'e', 'f'}
sage: build_alphabet(name="decimal punctuation")
{'0', '1', '2', '3', '4', '5', '6', '7', '8', '9', ' ', ',', '.', ';', ':', '!',
↪'?'}
```

```
>>> from sage.all import *
>>> build_alphabet(name='lower')
{'a', 'b', 'c', 'd', 'e', 'f', 'g', 'h', 'i', 'j', 'k', 'l', 'm', 'n', 'o', 'p',
↪'q', 'r', 's', 't', 'u', 'v', 'w', 'x', 'y', 'z'}
>>> build_alphabet(name='hexadecimal')
{'0', '1', '2', '3', '4', '5', '6', '7', '8', '9', 'a', 'b', 'c', 'd', 'e', 'f'}
>>> build_alphabet(name="decimal punctuation")
{'0', '1', '2', '3', '4', '5', '6', '7', '8', '9', ' ', ',', '.', ';', ':', '!',
↪'?'}
```

In the case the alphabet is built from a list or a tuple, the order on the alphabet is given by the elements themselves:

```
sage: A = build_alphabet([0,2,1])
sage: A(0) < A(2)
True
sage: A(2) < A(1)
False
```

```
>>> from sage.all import *
>>> A = build_alphabet([Integer(0),Integer(2),Integer(1)])
>>> A(Integer(0)) < A(Integer(2))
True
>>> A(Integer(2)) < A(Integer(1))
False
```

If a different order is needed, you may use `TotallyOrderedFiniteSet` and set the option `facade` to `False`. That way, the comparison fits the order of the input:

```
sage: A = TotallyOrderedFiniteSet([4,2,6,1], facade=False)
sage: A(4) < A(2)
True
sage: A(1) < A(6)
False
```

```
>>> from sage.all import *
>>> A = TotallyOrderedFiniteSet([Integer(4),Integer(2),Integer(6),Integer(1)],␣
↪facade=False)
>>> A(Integer(4)) < A(Integer(2))
True
>>> A(Integer(1)) < A(Integer(6))
False
```

Be careful, the element of the set in the last example are no more integers and do not compare equal with integers:

```
sage: type(A.an_element())
<class 'sage.sets.totally_ordered_finite_set.TotallyOrderedFiniteSet_with_
↪category.element_class'>
sage: A(1) == 1
False
sage: 1 == A(1)
False
```

```
>>> from sage.all import *
>>> type(A.an_element())
<class 'sage.sets.totally_ordered_finite_set.TotallyOrderedFiniteSet_with_
↪category.element_class'>
>>> A(Integer(1)) == Integer(1)
False
>>> Integer(1) == A(Integer(1))
False
```

We give an example of an infinite alphabet indexed by the positive integers and the prime numbers:

```
sage: build_alphabet(oo, 'x')
Lazy family (x(i))_{i in Non negative integers}
sage: build_alphabet(Primes(), 'y')
Lazy family (y(i))_{i in Set of all prime numbers: 2, 3, 5, 7, ...}
```

```
>>> from sage.all import *
>>> build_alphabet(oo, 'x')
Lazy family (x(i))_{i in Non negative integers}
>>> build_alphabet(Primes(), 'y')
Lazy family (y(i))_{i in Set of all prime numbers: 2, 3, 5, 7, ...}
```

Combinatorics on words

Main modules and their methods:

- *Abstract word (finite or infinite)*
- *Finite word*
- *Infinite word*
- *Alphabet*
- *Set of words*
- *Word paths*
- *Word morphisms/substitutions*
- *Shuffle product of words*
- *Suffix tries and suffix trees*

Main classes and functions meant to be used by the user:

Word(), *FiniteWords*, *InfiniteWords*, *Words()*, *Alphabet()*, *WordMorphism*, *WordPaths*.

A list of common words can be accessed through `words.<tab>` and are listed in the *words catalog*.

Internal representation of words:

- *Word classes*
- *Fast word datatype using an array of unsigned char*
- *Datatypes for finite words*
- *Datatypes for words defined by iterators and callables*

Options:

- *User-customizable options for words*

See *WordOptions()*.

Common words

AUTHORS:

- Franco Saliola (2008-12-17): merged into sage
- Sébastien Labbé (2008-12-17): merged into sage
- Arnaud Bergeron (2008-12-17): merged into sage

- Amy Glen (2008-12-17): merged into sage
- Sébastien Labbé (2009-12-19): Added S-adic words (Issue #7543)

USE:

To see a list of all word constructors, type `words.` and then press the `Tab` key. The documentation for each constructor includes information about each word, which provides a useful reference.

REFERENCES:

EXAMPLES:

```
sage: t = words.ThueMorseWord(); t
word: 01101001100101101001011001101001100101 10...
```

```
>>> from sage.all import *
>>> t = words.ThueMorseWord(); t
word: 01101001100101101001011001101001100101 10...
```

class sage.combinat.words.word_generators.**LowerChristoffelWord**(*p*, *q*, *alphabet=(0, 1)*, *algorithm='cf'*)

Bases: *FiniteWord_list*

Return the lower Christoffel word of slope p/q, where p and q are relatively prime nonnegative integers, over the given two-letter alphabet.

The *Christoffel word of slope `p/q`* is obtained from the Cayley graph of $\mathbf{Z}/(p+q)\mathbf{Z}$ with generator q as follows. If $u \to v$ is an edge in the Cayley graph, then $v = u + p \mod p + q$. Label the edge $u \to v$ by `alphabet[1]` if $u < v$ and `alphabet[0]` otherwise. The Christoffel word is the word obtained by reading the edge labels along the cycle beginning from 0.

EXAMPLES:

```
sage: words.LowerChristoffelWord(4,7)
word: 00100100101
```

```
>>> from sage.all import *
>>> words.LowerChristoffelWord(Integer(4),Integer(7))
word: 00100100101
```

```
sage: words.LowerChristoffelWord(4,7,alphabet='ab')
word: aabaabaabab
```

```
>>> from sage.all import *
>>> words.LowerChristoffelWord(Integer(4),Integer(7),alphabet='ab')
word: aabaabaabab
```

markoff_number()

Return the Markoff number associated to the Christoffel word `self`.

The *Markoff number* of a Christoffel word w is $trace(M(w))/3$, where $M(w)$ is the 2×2 matrix obtained by applying the morphism: 0 -> matrix(2,[2,1,1,1]) 1 -> matrix(2,[5,2,2,1])

EXAMPLES:

```
sage: w0 = words.LowerChristoffelWord(4,7)
sage: w1, w2 = w0.standard_factorization()
sage: (m0,m1,m2) = (w.markoff_number() for w in (w0,w1,w2))                    #␣
↪needs sage.modules
sage: (m0,m1,m2)                                                               #␣
↪needs sage.modules
(294685, 13, 7561)
sage: m0**2 + m1**2 + m2**2 == 3*m0*m1*m2                                      #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> w0 = words.LowerChristoffelWord(Integer(4),Integer(7))
>>> w1, w2 = w0.standard_factorization()
>>> (m0,m1,m2) = (w.markoff_number() for w in (w0,w1,w2))                      #␣
↪needs sage.modules
>>> (m0,m1,m2)                                                                 #␣
↪needs sage.modules
(294685, 13, 7561)
>>> m0**Integer(2) + m1**Integer(2) + m2**Integer(2) == Integer(3)*m0*m1*m2  ␣
↪                                  # needs sage.modules
True
```

standard_factorization()

Return the standard factorization of the Christoffel word `self`.

The *standard factorization* of a Christoffel word w is the unique factorization of w into two Christoffel words.

EXAMPLES:

```
sage: w = words.LowerChristoffelWord(5,9)
sage: w
word: 00100100100101
sage: w1, w2 = w.standard_factorization()
sage: w1
word: 001
sage: w2
word: 00100100101
```

```
>>> from sage.all import *
>>> w = words.LowerChristoffelWord(Integer(5),Integer(9))
>>> w
word: 00100100100101
>>> w1, w2 = w.standard_factorization()
>>> w1
word: 001
>>> w2
word: 00100100101
```

```
sage: w = words.LowerChristoffelWord(51,37)
sage: w1, w2 = w.standard_factorization()
sage: w1
word: 0101011010101101011
```

(continues on next page)

(continued from previous page)

```
sage: w2
word: 0101011010101101011010101101010110101101...
sage: w1 * w2 == w
True
```

```
>>> from sage.all import *
>>> w = words.LowerChristoffelWord(Integer(51),Integer(37))
>>> w1, w2 = w.standard_factorization()
>>> w1
word: 0101011010101101011
>>> w2
word: 0101011010101101011010101101010110101101...
>>> w1 * w2 == w
True
```

class sage.combinat.words.word_generators.**WordGenerator**

Bases: object

Constructor of several famous words.

EXAMPLES:

```
sage: words.ThueMorseWord()
word: 0110100110010110100101100110100110010110...
```

```
>>> from sage.all import *
>>> words.ThueMorseWord()
word: 0110100110010110100101100110100110010110...
```

```
sage: words.FibonacciWord()
word: 0100101001001010010100100101001001010010...
```

```
>>> from sage.all import *
>>> words.FibonacciWord()
word: 0100101001001010010100100101001001010010...
```

```
sage: words.ChristoffelWord(5, 8)
word: 0010010100101
```

```
>>> from sage.all import *
>>> words.ChristoffelWord(Integer(5), Integer(8))
word: 0010010100101
```

```
sage: words.RandomWord(10, 4)     # not tested random
word: 1311131221
```

```
>>> from sage.all import *
>>> words.RandomWord(Integer(10), Integer(4))     # not tested random
word: 1311131221
```

```
sage: words.CodingOfRotationWord(alpha=0.618, beta=0.618)
word: 10101101011011010110101101101011011011011011...
```

```
>>> from sage.all import *
>>> words.CodingOfRotationWord(alpha=RealNumber('0.618'), beta=RealNumber('0.618
↪'))
word: 10101101011011010110101101101011011011011011...
```

```
sage: tm = WordMorphism('a->ab,b->ba')
sage: fib = WordMorphism('a->ab,b->a')
sage: tmword = words.ThueMorseWord([0, 1])
sage: from itertools import repeat
sage: words.s_adic(tmword, repeat('a'), {0:tm, 1:fib})
word: abbaababbaabbaabbaababbaababbaabbaababba...
```

```
>>> from sage.all import *
>>> tm = WordMorphism('a->ab,b->ba')
>>> fib = WordMorphism('a->ab,b->a')
>>> tmword = words.ThueMorseWord([Integer(0), Integer(1)])
>>> from itertools import repeat
>>> words.s_adic(tmword, repeat('a'), {Integer(0):tm, Integer(1):fib})
word: abbaababbaabbaabbaababbaababbaabbaababba...
```

Note

To see a list of all word constructors, type `words.` and then hit the `Tab` key. The documentation for each constructor includes information about each word, which provides a useful reference.

BaumSweetWord()

Return the Baum-Sweet Word.

The Baum-Sweet Sequence is an infinite word over the alphabet $\{0, 1\}$ defined by the following string substitution rules:

$00 \to 0000$

$01 \to 1001$

$10 \to 0100$

$11 \to 1101$

The substitution rule above can be considered as a morphism on the submonoid of $\{0, 1\}$ generated by $\{00, 01, 10, 11\}$ (which is a free monoid on these generators).

It is also defined as the concatenation of the terms from the Baum-Sweet Sequence:

$$b_n = \begin{cases} 0, & \text{if } n = 0 \\ 1, & \text{if } m \text{ is even} \\ b_{\frac{m-1}{2}}, & \text{if } m \text{ is odd} \end{cases}$$

where $n = m4^k$ and m is not divisible by 4 if $m \neq 0$.

The individual terms of the Baum-Sweet Sequence are also given by:

$$b_n = \begin{cases} 1, & \text{if the binary representation of} n \text{ contains no block of consecutive 0s of odd length} \\ 0, & \text{otherwise} \end{cases}$$

for $n > 0$ with $b_0 = 1$.

For more information see: Wikipedia article Baum-Sweet_sequence.

EXAMPLES:

Baum-Sweet Word:

```
sage: w = words.BaumSweetWord(); w
word: 11011001010010011001000001001001010010001...
```

```
>>> from sage.all import *
>>> w = words.BaumSweetWord(); w
word: 11011001010010011001000001001001010010001...
```

Block Definition:

```
sage: w = words.BaumSweetWord()
sage: f = lambda n: '1' if all(len(x)%2==0 for x in bin(n)[2:].split('1'))␣
↪else '0'
sage: all(f(i) == w[i] for i in range(1,100))
True
```

```
>>> from sage.all import *
>>> w = words.BaumSweetWord()
>>> f = lambda n: '1' if all(len(x)%Integer(2)==Integer(0) for x in␣
↪bin(n)[Integer(2):].split('1')) else '0'
>>> all(f(i) == w[i] for i in range(Integer(1),Integer(100)))
True
```

CharacteristicSturmianWord(*slope*, *alphabet=(0, 1)*, *bits=None*)

Return the characteristic Sturmian word (also called standard Sturmian word) of given slope.

Over a binary alphabet $\{a, b\}$, the characteristic Sturmian word c_α of irrational slope α is the infinite word satisfying $s_{\alpha,0} = ac_\alpha$ and $s'_{\alpha,0} = bc_\alpha$, where $s_{\alpha,0}$ and $s'_{\alpha,0}$ are respectively the lower and upper mechanical words with slope α and intercept 0. Equivalently, for irrational α, $c_\alpha = s_{\alpha,\alpha} = s'_{\alpha,\alpha}$.

Let $\alpha = [0, d_1 + 1, d_2, d_3, \ldots]$ be the continued fraction expansion of α. It has been shown that the characteristic Sturmian word of slope α is also the limit of the sequence: $s_0 = b, s_1 = a, \ldots, s_{n+1} = s_n^{d_n} s_{n-1}$ for $n > 0$.

See Section 2.1 of [Loth02] for more details.

INPUT:

- `slope` – the slope of the word. It can be one of the following:
  - real number in $]0, 1[$
  - iterable over the continued fraction expansion of a real number in $]0, 1[$
- `alphabet` – any container of length two that is suitable to build an instance of OrderedAlphabet (`list`, `tuple`, `str`, ...)

- `bits` – integer (optional and considered only if `slope` is a real number); the number of bits to consider when computing the continued fraction

OUTPUT: word

ALGORITHM:

Let $[0, d_1 + 1, d_2, d_3, \ldots]$ be the continued fraction expansion of α. Then, the characteristic Sturmian word of slope α is the limit of the sequence: $s_0 = b$, $s_1 = a$ and $s_{n+1} = s_n^{d_n} s_{n-1}$ for $n > 0$.

EXAMPLES:

From real slope:

```
sage: words.CharacteristicSturmianWord(1/golden_ratio^2)                    #␣
↪needs sage.symbolic
word: 0100101001001010010100100101001001010010...
sage: words.CharacteristicSturmianWord(4/5)                                 #␣
↪needs sage.rings.real_mpfr
word: 11110
sage: words.CharacteristicSturmianWord(5/14)                                #␣
↪needs sage.rings.real_mpfr
word: 01001001001001
sage: words.CharacteristicSturmianWord(pi - 3)                              #␣
↪needs sage.symbolic
word: 0000001000000100000010000001000000100000...
```

```
>>> from sage.all import *
>>> words.CharacteristicSturmianWord(Integer(1)/golden_ratio**Integer(2))     ␣
↪               # needs sage.symbolic
word: 0100101001001010010100100101001001010010...
>>> words.CharacteristicSturmianWord(Integer(4)/Integer(5))                   ␣
↪              # needs sage.rings.real_mpfr
word: 11110
>>> words.CharacteristicSturmianWord(Integer(5)/Integer(14))                  ␣
↪              # needs sage.rings.real_mpfr
word: 01001001001001
>>> words.CharacteristicSturmianWord(pi - Integer(3))                         ␣
↪     # needs sage.symbolic
word: 0000001000000100000010000001000000100000...
```

From an iterator of the continued fraction expansion of a real:

```
sage: def cf():
....:   yield 0
....:   yield 2
....:   while True: yield 1
sage: F = words.CharacteristicSturmianWord(cf()); F                         #␣
↪needs sage.rings.real_mpfr
word: 0100101001001010010100100101001001010010...
sage: Fib = words.FibonacciWord(); Fib
word: 0100101001001010010100100101001001010010...
sage: F[:10000] == Fib[:10000]                                              #␣
↪needs sage.rings.real_mpfr
True
```

```
>>> from sage.all import *
>>> def cf():
...   yield Integer(0)
...   yield Integer(2)
...   while True: yield Integer(1)
>>> F = words.CharacteristicSturmianWord(cf()); F                              #␣
↪needs sage.rings.real_mpfr
word: 0100101001001010010100100101001001010010...
>>> Fib = words.FibonacciWord(); Fib
word: 0100101001001010010100100101001001010010...
>>> F[:Integer(10000)] == Fib[:Integer(10000)]                                  ␣
↪              # needs sage.rings.real_mpfr
True
```

The alphabet may be specified:

```
sage: words.CharacteristicSturmianWord(cf(), 'rs')                             #␣
↪needs sage.rings.real_mpfr
word: rsrrsrsrrsrrsrsrrsrsrrsrrsrsrrsrrsrsrrsr...
```

```
>>> from sage.all import *
>>> words.CharacteristicSturmianWord(cf(), 'rs')                               #␣
↪needs sage.rings.real_mpfr
word: rsrrsrsrrsrrsrsrrsrsrrsrrsrsrrsrrsrsrrsr...
```

The characteristic sturmian word of slope $(\sqrt{3}-1)/2$:

```
sage: words.CharacteristicSturmianWord((sqrt(3)-1)/2)                          #␣
↪needs sage.symbolic
word: 0100100101001001001010010010010100100101...
```

```
>>> from sage.all import *
>>> words.CharacteristicSturmianWord((sqrt(Integer(3))-Integer(1))/
↪Integer(2))                          # needs sage.symbolic
word: 0100100101001001001010010010010100100101...
```

The same word defined from the continued fraction expansion of $(\sqrt{3}-1)/2$:

```
sage: from itertools import cycle, chain
sage: it = chain([0], cycle([2, 1]))
sage: words.CharacteristicSturmianWord(it)
word: 0100100101001001001010010010010100100101...
```

```
>>> from sage.all import *
>>> from itertools import cycle, chain
>>> it = chain([Integer(0)], cycle([Integer(2), Integer(1)]))
>>> words.CharacteristicSturmianWord(it)
word: 0100100101001001001010010010010100100101...
```

The first terms of the standard sequence of the characteristic sturmian word of slope $(\sqrt{3}-1)/2$:

```
sage: words.CharacteristicSturmianWord([0,2])
word: 01
```

(continues on next page)

(continued from previous page)

```

ChristoffelWord

alias of *LowerChristoffelWord*

CodingOfRotationWord(*alpha*, *beta*, *x=0*, *alphabet=(0, 1)*)

Return the infinite word obtained from the coding of rotation of parameters (α, β, x) over the given two-letter alphabet.

The *coding of rotation* corresponding to the parameters (α, β, x) is the symbolic sequence $u = (u_n)_{n\geq 0}$ defined over the binary alphabet $\{0, 1\}$ by $u_n = 1$ if $x + n\alpha \in [0, \beta[$ and $u_n = 0$ otherwise. See [AC03].

EXAMPLES:

```
sage: alpha = 0.45
sage: beta = 0.48
sage: words.CodingOfRotationWord(0.45, 0.48)
word: 1101010101001010101011010101010010101010...
```

```
>>> from sage.all import *
>>> alpha = RealNumber('0.45')
>>> beta = RealNumber('0.48')
>>> words.CodingOfRotationWord(RealNumber('0.45'), RealNumber('0.48'))
word: 1101010101001010101011010101010010101010...
```

```
sage: words.CodingOfRotationWord(0.45, 0.48, alphabet='xy')
word: yyxyxyxyxyxyxyxyxyxyxyyxyxyxyxyxyxyxyxyxyx...
```

```
>>> from sage.all import *
>>> words.CodingOfRotationWord(RealNumber('0.45'), RealNumber('0.48'),␣
↪alphabet='xy')
word: yyxyxyxyxyxyxyxyxyxyxyyxyxyxyxyxyxyxyxyxyx...
```

FibonacciWord(*alphabet=(0, 1)*, *construction_method='recursive'*)

Return the Fibonacci word on the given two-letter alphabet.

INPUT:

- `alphabet` – any container of length two that is suitable to build an instance of OrderedAlphabet (`list`, `tuple`, `str`, ...)
- `construction_method` – can be any of the following: "recursive", "fixed point", "function" (see below for definitions)

Recursive construction: the Fibonacci word is the limit of the following sequence of words: $S_0 = 0$, $S_1 = 01$, $S_n = S_{n-1}S_{n-2}$ for $n \geq 2$.

Fixed point construction: the Fibonacci word is the fixed point of the morphism: $0 \mapsto 01$ and $1 \mapsto 0$. Hence, it can be constructed by the following read-write process:

1. beginning at the first letter of 01,
2. if the next letter is 0, append 01 to the word;
3. if the next letter is 1, append 1 to the word;
4. move to the next letter of the word.

Function: Over the alphabet $\{1, 2\}$, the n-th letter of the Fibonacci word is $\lfloor(n+2)\varphi\rfloor - \lfloor(n+1)\varphi\rfloor$ where $\varphi = (1+\sqrt{5})/2$ is the golden ratio.

EXAMPLES:

```
sage: w = words.FibonacciWord(construction_method='recursive'); w
word: 01001010010010100101001001010010010100101...
```

```
>>> from sage.all import *
>>> w = words.FibonacciWord(construction_method='recursive'); w
word: 01001010010010100101001001010010010100101...
```

```
sage: v = words.FibonacciWord(construction_method='recursive', alphabet='ab');
↪ v
word: abaababaabaababaababaabaababaabaababaababaaba...
```

```
>>> from sage.all import *
>>> v = words.FibonacciWord(construction_method='recursive', alphabet='ab'); v
word: abaababaabaababaababaabaababaabaababaababaaba...
```

```
sage: u = words.FibonacciWord(construction_method="fixed point"); u
word: 01001010010010100101001001010010010100101...
```

```
>>> from sage.all import *
>>> u = words.FibonacciWord(construction_method="fixed point"); u
word: 0100101001001010010100100101001001010010...
```

```
sage: words.FibonacciWord(construction_method="fixed point", alphabet=[4, 1])
word: 4144141441441414414414414414414414414414...
```

```
>>> from sage.all import *

↪needs sage.symbolic
word: abaababaabaababaababaabaababaabaababaaba...
```

FixedPointOfMorphism(*morphism*, *first_letter*)

Return the fixed point of the morphism beginning with `first_letter`.

A *fixed point* of a morphism φ is a word w such that $\varphi(w) = w$.

INPUT:

- `morphism` – endomorphism prolongable on `first_letter`. It must be something that WordMorphism's constructor understands (dict, str, …).
- `first_letter` – the first letter of the fixed point

OUTPUT: the fixed point of the morphism beginning with `first_letter`

EXAMPLES:

```
sage: mu = {0:[0,1], 1:[1,0]}
sage: tm = words.FixedPointOfMorphism(mu,0); tm
word: 0110100110010110100101100110100110010110...
sage: TM = words.ThueMorseWord()
sage: tm[:1000] == TM[:1000]                                                    #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> mu = {Integer(0):[Integer(0),Integer(1)], Integer(1):[Integer(1),
↪Integer(0)]}
```

(continues on next page)

(continued from previous page)

```
>>> tm = words.FixedPointOfMorphism(mu,Integer(0)); tm
word: 01101001100101101001011001101001100100110...

```

```
sage: fp = words.FixedPointOfMorphism('a->abc,b->,c->','a'); fp
word: abc
```

```
>>> from sage.all import *
>>> fp = words.FixedPointOfMorphism('a->abc,b->,c->','a'); fp
word: abc
```

KolakoskiWord(*alphabet=(1, 2)*)

Return the Kolakoski word over the given alphabet and starting with the first letter of the alphabet.

Let $A = \{a, b\}$ be an alphabet, where a and b are two distinct positive integers. The Kolakoski word $K_{a,b}$ over A and starting with a is the unique infinite word w such that $w = \Delta(w)$, where $\Delta(w)$ is the word encoding the runs of w (see `delta()` method on words for more details).

Note that $K_{a,b} \neq K_{b,a}$. On the other hand, the words $K_{a,b}$ and $K_{b,a}$ are the unique two words over A that are fixed by Δ.

Also note that the Kolakoski word is also known as the Oldenburger word.

INPUT:

- `alphabet` – (default: (1,2)) an iterable of two positive integers

OUTPUT: infinite word

EXAMPLES:

The usual Kolakoski word:

```
sage: w = words.KolakoskiWord()
sage: w
word: 122112122122112112212112122112112122122 1...
sage: w.delta()
word: 122112122122112112212112122112112122122 1...
```

```
>>> from sage.all import *
>>> w = words.KolakoskiWord()
>>> w
word: 122112122122112112212112122112112122122 1...
>>> w.delta()
word: 122112122122112112212112122112112122122 1...
```

The other Kolakoski word on the same alphabet:

```
sage: w = words.KolakoskiWord(alphabet = (2,1))
sage: w
word: 221121221221121122121121221121121221221 1...
sage: w.delta()
word: 221121221221121122121121221121121221221 1...
```

```
>>> from sage.all import *
>>> w = words.KolakoskiWord(alphabet = (Integer(2),Integer(1)))
>>> w
word: 221121221221121122121121221121121221221 1...
>>> w.delta()
word: 221121221221121122121121221121121221221 1...
```

It is naturally generalized to any two integers alphabet:

```
sage: w = words.KolakoskiWord(alphabet = (2,5))
sage: w
word: 225522222555552255225522555552222255552 2...
sage: w.delta()
word: 225522222555552255225522555552222255552 2...
```

```
>>> from sage.all import *
>>> w = words.KolakoskiWord(alphabet = (Integer(2),Integer(5)))
>>> w
word: 225522222555552255225522555552222255552 2...
>>> w.delta()
word: 225522222555552255225522555552222255552 2...
```

LowerChristoffelWord

alias of *LowerChristoffelWord*

LowerMechanicalWord(*alpha*, *rho=0*, *alphabet=None*)

Return the lower mechanical word with slope α and intercept ρ

The lower mechanical word $s_{\alpha,\rho}$ with slope α and intercept ρ is defined by $s_{\alpha,\rho}(n) = \lfloor \alpha(n+1) + \rho \rfloor - \lfloor \alpha n + \rho \rfloor$. [Loth02]

INPUT:

- `alpha` – real number such that $0 \leq \alpha \leq 1$
- `rho` – real number (default: 0)
- `alphabet` – iterable of two elements or `None` (default: `None`)

OUTPUT: infinite word

EXAMPLES:

```
sage: words.LowerMechanicalWord(1/golden_ratio^2)                              #␣
↪needs sage.symbolic
word: 0010010100100101001010010010100100101001...
sage: words.LowerMechanicalWord(1/5)                                           #␣
↪needs sage.symbolic
word: 0000100001000010000100001000010000100001...
sage: words.LowerMechanicalWord(1/pi)                                          #␣
↪needs sage.symbolic
word: 0001001001001001001001000100100100100100...
```

```
>>> from sage.all import *
>>> words.LowerMechanicalWord(Integer(1)/golden_ratio**Integer(2))             ␣
↪               # needs sage.symbolic
word: 0010010100100101001010010010100100101001...
>>> words.LowerMechanicalWord(Integer(1)/Integer(5))                           ␣
↪              # needs sage.symbolic
word: 0000100001000010000100001000010000100001...
>>> words.LowerMechanicalWord(Integer(1)/pi)                                   ␣
↪     # needs sage.symbolic
word: 0001001001001001001001000100100100100100...
```

MinimalSmoothPrefix(*n*)

This function finds and returns the minimal smooth prefix of length `n`.

See [BMP2007] for a definition.

INPUT:

- `n` – the desired length of the prefix

OUTPUT: word; the prefix

> **Note**
>
> Be patient, this function can take a really long time if asked for a large prefix.

EXAMPLES:

```
sage: words.MinimalSmoothPrefix(10)
word: 1212212112
```

```
>>> from sage.all import *
>>> words.MinimalSmoothPrefix(Integer(10))
word: 1212212112
```

PalindromicDefectWord(*k=1*, *alphabet='ab'*)

Return the finite word $w = ab^k ab^{k-1} aab^{k-1} ab^k a$.

As described by Brlek, Hamel, Nivat and Reutenauer in [BHNR2004], this finite word w is such that the infinite periodic word w^ω has palindromic defect `k`.

INPUT:

- `k` – positive integer (default: 1)
- `alphabet` – iterable of size two (default: `'ab'`)

OUTPUT: finite word

EXAMPLES:

```
sage: words.PalindromicDefectWord(10)
word: abbbbbbbbbbabbbbbbbbbaabbbbbbbbbbabbbbbbb...
```

```
>>> from sage.all import *
>>> words.PalindromicDefectWord(Integer(10))
word: abbbbbbbbbbabbbbbbbbbaabbbbbbbbbbabbbbbbb...
```

```
sage: w = words.PalindromicDefectWord(3)
sage: w
word: abbbabbaabbabbba
sage: w.defect()
0
sage: (w^2).defect()
3
sage: (w^3).defect()
3
```

```
>>> from sage.all import *
>>> w = words.PalindromicDefectWord(Integer(3))
>>> w
word: abbbabbaabbabbba
>>> w.defect()
0
>>> (w**Integer(2)).defect()
3
>>> (w**Integer(3)).defect()
3
```

On other alphabets:

```
sage: words.PalindromicDefectWord(3, alphabet='cd')
word: cdddcddccddcdddc
sage: words.PalindromicDefectWord(3, alphabet=['c', 3])
word: c333c33cc33c333c
```

```
>>> from sage.all import *
>>> words.PalindromicDefectWord(Integer(3), alphabet='cd')
word: cdddcddccddcdddc
>>> words.PalindromicDefectWord(Integer(3), alphabet=['c', Integer(3)])
word: c333c33cc33c333c
```

RandomWord(*n*, *m=2*, *alphabet=None*)

Return a random word of length n over the given m-letter alphabet.

INPUT:

- `n` – integer; the length of the word
- `m` – integer (default: 2); the size of the output alphabet
- `alphabet` – (default: $\{0, 1, ..., m-1\}$) any container of length m that is suitable to build an instance of OrderedAlphabet (`list`, `tuple`, `str`, ...)

EXAMPLES:

```
sage: words.RandomWord(10)          # random results
word: 0110100101
sage: words.RandomWord(10, 4)       # random results
word: 0322313320
sage: words.RandomWord(100, 7)      # random results
word: 26306440236425164426500256113000344133 10...
sage: words.RandomWord(100, 7, range(-3,4))  # random results
word: 1,3,-1,-1,3,2,2,0,1,-2,1,-1,-3,-2,2,0,3,0,-3,0,3,0,-2,-2,2,0,1,-3,2,-2,-
↪2,2,0,2,1,-2,-3,-2,-1,0,...
sage: words.RandomWord(100, 5, "abcde") # random results
word: acebeaaccdbedbbbdeadeebbdeeebeaaacbadaac...
sage: words.RandomWord(17, 5, "abcde")     # random results
word: dcacbbecbddebaadd
```

```
>>> from sage.all import *
>>> words.RandomWord(Integer(10))          # random results
word: 0110100101
>>> words.RandomWord(Integer(10), Integer(4))       # random results
word: 0322313320
>>> words.RandomWord(Integer(100), Integer(7))      # random results
word: 26306440236425164426500256113000344133 10...
>>> words.RandomWord(Integer(100), Integer(7), range(-Integer(3),Integer(4)))␣
↪ # random results
word: 1,3,-1,-1,3,2,2,0,1,-2,1,-1,-3,-2,2,0,3,0,-3,0,3,0,-2,-2,2,0,1,-3,2,-2,-
↪2,2,0,2,1,-2,-3,-2,-1,0,...
>>> words.RandomWord(Integer(100), Integer(5), "abcde") # random results
word: acebeaaccdbedbbbdeadeebbdeeebeaaacbadaac...
>>> words.RandomWord(Integer(17), Integer(5), "abcde")     # random results
word: dcacbbecbddebaadd
```

StandardEpisturmianWord(*directive_word*)

Return the standard episturmian word (or epistandard word) directed by directive_word. Over a 2-letter alphabet, this function gives characteristic Sturmian words.

An infinite word w over a finite alphabet A is said to be *standard episturmian* (or *epistandard*) iff there exists an infinite word $x_1x_2x_3\cdots$ over A (called the *directive word* of w) such that w is the limit as n goes to infinity of $Pal(x_1\cdots x_n)$, where Pal is the iterated palindromic closure function.

Note that an infinite word is *episturmian* if it has the same set of factors as some epistandard word.

See for instance [DJP2001], [JP2002], and [GJ2007].

INPUT:

- `directive_word` – an infinite word or a period of a periodic infinite word

EXAMPLES:

```
sage: Fibonacci = words.StandardEpisturmianWord(Words('ab')('ab')); Fibonacci
word: abaababaabaababaababaabaababaabaababaaba...
sage: Tribonacci = words.StandardEpisturmianWord(Words('abc')('abc'));␣
↪Tribonacci
word: abacabaabacababacabaabacabacabaabacababa...
sage: S = words.StandardEpisturmianWord(Words('abcd')('aabcabada')); S
word: aabaacaabaaabaacaabaabaacaabaaabaacaabaa...
sage: S = words.StandardEpisturmianWord(Fibonacci); S
word: abaababaabaababaababaabaababaabaababaabab...
sage: S[:25]
word: abaababaabaababaababaaba
sage: S = words.StandardEpisturmianWord(Tribonacci); S

↪episturmian word
```

ThueMorseWord(*alphabet=(0, 1)*, *base=2*)

Return the (Generalized) Thue-Morse word over the given alphabet.

There are several ways to define the Thue-Morse word t. We use the following definition: $t[n]$ is the sum modulo m of the digits in the given base expansion of n.

See [BmBGL07], [Brlek89], and [MH38].

INPUT:

- `alphabet` – (default: `(0, 1)`) any container that is suitable to build an instance of OrderedAlphabet (`list`, `tuple`, `str`, ...)
- `base` – integer (default: 2); greater than or equal to 2

EXAMPLES:

Thue-Morse word:

```
sage: t = words.ThueMorseWord(); t
word: 0110100110010110100101100110100110010110...
```

```
>>> from sage.all import *
>>> t = words.ThueMorseWord(); t
word: 0110100110010110100101100110100110010110...
```

Thue-Morse word on other alphabets:

```
sage: t = words.ThueMorseWord('ab'); t
word: abbabaabbaababbabaababbaabbabaabbaababba...
```

```
>>> from sage.all import *
>>> t = words.ThueMorseWord('ab'); t
word: abbabaabbaababbabaababbaabbabaabbaababba...
```

```
sage: t = words.ThueMorseWord(['L1', 'L2'])
sage: t[:8]
word: L1,L2,L2,L1,L2,L1,L1,L2
```

```
>>> from sage.all import *
>>> t = words.ThueMorseWord(['L1', 'L2'])
>>> t[:Integer(8)]
word: L1,L2,L2,L1,L2,L1,L1,L2
```

Generalized Thue Morse word:

```
sage: words.ThueMorseWord(alphabet=(0,1,2), base=2)
word: 0112122012202001122020012001011212202001...
sage: t = words.ThueMorseWord(alphabet=(0,1,2), base=5); t
word: 0120112012201200120112012120122012001201...
sage: t[100:130].critical_exponent()
10/3
```

```
>>> from sage.all import *
>>> words.ThueMorseWord(alphabet=(Integer(0),Integer(1),Integer(2)),␣
↪base=Integer(2))
word: 0112122012202001122020012001011212202001...
```

(continues on next page)

(continued from previous page)

```
>>> t = words.ThueMorseWord(alphabet=(Integer(0),Integer(1),Integer(2)),␣
↪base=Integer(5)); t
word: 012011201220120012011201212012201200120 1...
>>> t[Integer(100):Integer(130)].critical_exponent()
10/3
```

REFERENCES:

UpperChristoffelWord(*p*, *q*, *alphabet=(0, 1)*)

Return the upper Christoffel word of slope p/q, where p and q are relatively prime nonnegative integers, over the given alphabet.

The *upper Christoffel word of slope `p/q`* is equal to the reversal of the lower Christoffel word of slope p/q. Equivalently, if xuy is the lower Christoffel word of slope p/q, where x and y are letters, then yux is the upper Christoffel word of slope p/q (because u is a palindrome).

INPUT:

- `alphabet` – any container of length two that is suitable to build an instance of OrderedAlphabet (`list`, `tuple`, `str`, ...)

EXAMPLES:

```
sage: words.UpperChristoffelWord(1,0)
word: 1
```

```
>>> from sage.all import *
>>> words.UpperChristoffelWord(Integer(1),Integer(0))
word: 1
```

```
sage: words.UpperChristoffelWord(0,1)
word: 0
```

```
>>> from sage.all import *
>>> words.UpperChristoffelWord(Integer(0),Integer(1))
word: 0
```

```
sage: words.UpperChristoffelWord(1,1)
word: 10
```

```
>>> from sage.all import *
>>> words.UpperChristoffelWord(Integer(1),Integer(1))
word: 10
```

```
sage: words.UpperChristoffelWord(4,7)
word: 10100100100
```

```
>>> from sage.all import *
>>> words.UpperChristoffelWord(Integer(4),Integer(7))
word: 10100100100
```

UpperMechanicalWord(*alpha*, *rho=0*, *alphabet=None*)

Return the upper mechanical word with slope α and intercept ρ

The upper mechanical word $s'_{\alpha,\rho}$ with slope α and intercept ρ is defined by $s'_{\alpha,\rho}(n) = \lceil \alpha(n+1) + \rho \rceil - \lceil \alpha n + \rho \rceil$. [Loth02]

INPUT:

- `alpha` – real number such that $0 \leq \alpha \leq 1$
- `rho` – real number (default: 0)
- `alphabet` – iterable of two elements or `None` (default: `None`)

OUTPUT: infinite word

EXAMPLES:

```
sage: words.UpperMechanicalWord(1/golden_ratio^2)                              #␣
↪needs sage.symbolic
word: 10100101001001010010100100101001001010100100101001...
sage: words.UpperMechanicalWord(1/5)                                           #␣

```

```
>>> from sage.all import *
>>> for i in range(Integer(3)): words.fibonacci_tile(i)                       ␣
↪     # needs sage.modules
Path: 3210
Path: 323030101212
Path: 32303010303232123230323212101212321210 10...
```

s_adic(*sequence*, *letters*, *morphisms=None*)

Return the s-adic infinite word obtained from a sequence of morphisms applied on a letter.

DEFINITION (from [Fogg]):

Let w be a infinite word over an alphabet $A = A_0$. A standard representation of w is obtained from a sequence of substitutions $\sigma_k : A_{k+1} \to A_k$ and a sequence of letters $a_k \in A_k$ such that:

$$\lim_{k \to \infty} \sigma_0 \circ \sigma_1 \circ \cdots \sigma_k(a_k).$$

Given a set of substitutions S, we say that the representation is S-adic standard if the substitutions are chosen in S.

INPUT:

- `sequence` – an iterable sequence of indices or of morphisms. It may be finite or infinite. If `sequence` is infinite, the image of the $(i+1)$-th letter under the $(i+1)$-th morphism must start with the i-th letter.
- `letters` – a letter or a sequence of letters
- `morphisms` – dict, list, callable or `None` (default: `None`) an object that maps indices to morphisms. If `None`, then `sequence` must consist of morphisms.

OUTPUT: a word

EXAMPLES:

Let us define three morphisms and compute the first nested successive prefixes of the s-adic word:

```
sage: m1 = WordMorphism('e->gh,f->hg')
sage: m2 = WordMorphism('c->ef,d->e')
sage: m3 = WordMorphism('a->cd,b->dc')
sage: words.s_adic([m1],'e')
word: gh
sage: words.s_adic([m1,m2],'ec')
word: ghhg
sage: words.s_adic([m1,m2,m3],'eca')
word: ghhggh
```

```
>>> from sage.all import *
>>> m1 = WordMorphism('e->gh,f->hg')
>>> m2 = WordMorphism('c->ef,d->e')
>>> m3 = WordMorphism('a->cd,b->dc')
>>> words.s_adic([m1],'e')
word: gh
>>> words.s_adic([m1,m2],'ec')
word: ghhg
>>> words.s_adic([m1,m2,m3],'eca')
word: ghhggh
```

When the given sequence of morphism is finite, one may simply give the last letter, i.e. `'a'`, instead of giving all of them, i.e. `'eca'`:

```
sage: words.s_adic([m1,m2,m3],'a')
word: ghhggh
sage: words.s_adic([m1,m2,m3],'b')
word: ghghhg
```

```
>>> from sage.all import *
>>> words.s_adic([m1,m2,m3],'a')
word: ghhggh
>>> words.s_adic([m1,m2,m3],'b')
word: ghghhg
```

If the letters don't satisfy the hypothesis of the algorithm (nested prefixes), an error is raised:

```
sage: words.s_adic([m1,m2,m3],'ecb')
Traceback (most recent call last):
...
ValueError: the hypothesis of the algorithm used is not satisfied; the image␣
↪of the 3-th letter (=b) under the 3-th morphism (=a->cd, b->dc) should␣
↪start with the 2-th letter (=c)
```

```
>>> from sage.all import *
>>> words.s_adic([m1,m2,m3],'ecb')
Traceback (most recent call last):
...
ValueError: the hypothesis of the algorithm used is not satisfied; the image␣
↪of the 3-th letter (=b) under the 3-th morphism (=a->cd, b->dc) should␣
↪start with the 2-th letter (=c)
```

Let's define the Thue-Morse morphism and the Fibonacci morphism which will be used below to illustrate more examples and let's import the `repeat` tool from the `itertools`:

```
sage: tm = WordMorphism('a->ab,b->ba')
sage: fib = WordMorphism('a->ab,b->a')
sage: from itertools import repeat
```

```
>>> from sage.all import *
>>> tm = WordMorphism('a->ab,b->ba')
>>> fib = WordMorphism('a->ab,b->a')
>>> from itertools import repeat
```

Two trivial examples of infinite s-adic words:

```
sage: words.s_adic(repeat(tm),repeat('a'))
word: abbabaabbaababbabaababbaabbabaabbaababba...
```

```
>>> from sage.all import *
>>> words.s_adic(repeat(tm),repeat('a'))
word: abbabaabbaababbabaababbaabbabaabbaababba...
```

```
sage: words.s_adic(repeat(fib),repeat('a'))
word: abaababaabaababaababaabaababaabaababaaba...
```

```
>>> from sage.all import *
>>> words.s_adic(repeat(fib),repeat('a'))
word: abaababaabaababaababaabaababaabaababaaba...
```

A less trivial infinite s-adic word:

```
sage: D = {4:tm,5:fib}
sage: tmword = words.ThueMorseWord([4,5])
sage: it = (D[a] for a in tmword)
sage: words.s_adic(it, repeat('a'))
word: abbaababbaabbaabbaababbaababbaabbaababba...
```

```
>>> from sage.all import *
>>> D = {Integer(4):tm,Integer(5):fib}
>>> tmword = words.ThueMorseWord([Integer(4),Integer(5)])
>>> it = (D[a] for a in tmword)
>>> words.s_adic(it, repeat('a'))
word: abbaababbaabbaabbaababbaababbaabbaababba...
```

The same thing using a sequence of indices:

```
sage: tmword = words.ThueMorseWord([0,1])
sage: words.s_adic(tmword, repeat('a'), [tm,fib])
word: abbaababbaabbaabbaababbaababbaabbaababba...
```

```
>>> from sage.all import *
>>> tmword = words.ThueMorseWord([Integer(0),Integer(1)])
>>> words.s_adic(tmword, repeat('a'), [tm,fib])
word: abbaababbaabbaabbaababbaababbaabbaababba...
```

The correspondence of the indices may be given as a dict:

```
sage: words.s_adic(tmword, repeat('a'), {0:tm,1:fib})
word: abbaababbaabbaabbaababbaababbaabbaababba...
```

```
>>> from sage.all import *
>>> words.s_adic(tmword, repeat('a'), {Integer(0):tm,Integer(1):fib})
word: abbaababbaabbaabbaababbaababbaabbaababba...
```

because dict are more versatile for indices:

```
sage: tmwordTF = words.ThueMorseWord('TF')
sage: words.s_adic(tmwordTF, repeat('a'), {'T':tm,'F':fib})
word: abbaababbaabbaabbaababbaababbaabbaabaabba...
```

```
>>> from sage.all import *
>>> tmwordTF = words.ThueMorseWord('TF')
>>> words.s_adic(tmwordTF, repeat('a'), {'T':tm,'F':fib})
word: abbaababbaabbaabbaababbaababbaabbaabaabba...
```

or by a callable:

```
sage: f = lambda n: tm if n == 0 else fib
sage: words.s_adic(words.ThueMorseWord(), repeat('a'), f)
word: abbaababbaabbaabbaababbaababbaabbaabaabba...
```

```
>>> from sage.all import *
>>> f = lambda n: tm if n == Integer(0) else fib
>>> words.s_adic(words.ThueMorseWord(), repeat('a'), f)
word: abbaababbaabbaabbaababbaababbaabbaabaabba...
```

Random infinite s-adic words:

```
sage: from sage.misc.prandom import randint
sage: def it():
....:   while True: yield randint(0,1)
sage: words.s_adic(it(), repeat('a'), [tm,fib])  # random
word: abbaababababbaababbaabbaababbaababababbaabba...
sage: words.s_adic(it(), repeat('a'), [tm,fib])  # random
word: abbaababbaabbaababbaababbaabbaabaababbaabba...
sage: words.s_adic(it(), repeat('a'), [tm,fib])  # random
word: abaaababaabaabaaababaabaaababaaababaabaa...
```

```
>>> from sage.all import *
>>> from sage.misc.prandom import randint
>>> def it():
...   while True: yield randint(Integer(0),Integer(1))
>>> words.s_adic(it(), repeat('a'), [tm,fib])  # random
word: abbaababababbaababbaabbaababbaababababbaabba...
>>> words.s_adic(it(), repeat('a'), [tm,fib])  # random
word: abbaababbaabbaababbaababbaabbaabaababbaabba...
>>> words.s_adic(it(), repeat('a'), [tm,fib])  # random
word: abaaababaabaabaaababaabaaababaaababaabaa...
```

An example where the sequences cycle on two morphisms and two letters:

```
sage: G = WordMorphism('a->cd,b->dc')
sage: H = WordMorphism('c->ab,d->ba')
sage: from itertools import cycle
sage: words.s_adic([G,H],'ac')
word: cddc
sage: words.s_adic(cycle([G,H]),cycle('ac'))
word: cddcdccddccdcddcdccdcddccddcdccddccdcddc...
```

```
>>> from sage.all import *
>>> G = WordMorphism('a->cd,b->dc')
>>> H = WordMorphism('c->ab,d->ba')
>>> from itertools import cycle
>>> words.s_adic([G,H],'ac')
word: cddc
>>> words.s_adic(cycle([G,H]),cycle('ac'))
word: cddcdccddccdcddcdccdcddccddcdccddccdcddc...
```

The morphism $\sigma : a \mapsto ba, b \mapsto b$ can't satisfy the hypothesis of the nested prefixes, but one may compute arbitrarily long finite words having the limit $\sigma^\omega(a)$:

```
sage: sigma = WordMorphism('a->ba,b->b')
sage: words.s_adic(repeat(sigma),repeat('a'))
Traceback (most recent call last):
...
ValueError: the hypothesis of the algorithm used is not satisfied; the image␣
↪of the 2-th letter (=a) under the 2-th morphism (=a->ba, b->b) should start␣
↪with the 1-th letter (=a)
sage: words.s_adic([sigma],'a')
word: ba
sage: words.s_adic([sigma,sigma],'a')
word: bba
sage: words.s_adic([sigma]*3,'a')
word: bbba
sage: words.s_adic([sigma]*4,'a')
word: bbbba
sage: words.s_adic([sigma]*5,'a')
word: bbbbba
sage: words.s_adic([sigma]*6,'a')
word: bbbbbba
sage: words.s_adic([sigma]*7,'a')
word: bbbbbbba
```

```
>>> from sage.all import *
>>> sigma = WordMorphism('a->ba,b->b')
>>> words.s_adic(repeat(sigma),repeat('a'))
Traceback (most recent call last):
...
ValueError: the hypothesis of the algorithm used is not satisfied; the image␣
↪of the 2-th letter (=a) under the 2-th morphism (=a->ba, b->b) should start␣
↪with the 1-th letter (=a)
>>> words.s_adic([sigma],'a')
word: ba
>>> words.s_adic([sigma,sigma],'a')
word: bba
>>> words.s_adic([sigma]*Integer(3),'a')
word: bbba
>>> words.s_adic([sigma]*Integer(4),'a')
word: bbbba
>>> words.s_adic([sigma]*Integer(5),'a')
word: bbbbba
>>> words.s_adic([sigma]*Integer(6),'a')
```

(continues on next page)

(continued from previous page)

```
word: bbbbbba
>>> words.s_adic([sigma]*Integer(7),'a')
word: bbbbbbba
```

The following examples illustrates an S-adic word defined over an infinite set S of morphisms x_h:

```
sage: x = lambda h:WordMorphism({1:[2],2:[3]+[1]*(h+1),3:[3]+[1]*h})
sage: for h in [0,1,2,3]:
....:     print("{} {}".format(h, x(h)))
0 1->2, 2->31, 3->3
1 1->2, 2->311, 3->31
2 1->2, 2->3111, 3->311
3 1->2, 2->31111, 3->3111
sage: w = Word(lambda n : valuation(n+1, 2) ); w
word: 0102010301020104010201030102010501020103...
sage: s = words.s_adic(w, repeat(3), x); s
word: 3232232232322322322322322322322322322232...
sage: prefixe = s[:10000]
sage: list(map(prefixe.number_of_factors, range(15)))
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15]
sage: [_[i+1] - _[i] for i in range(len(_)-1)]
[1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1]
```

```
>>> from sage.all import *
>>> x = lambda h:WordMorphism({Integer(1):[Integer(2)],
↪Integer(2):[Integer(3)]+[Integer(1)]*(h+Integer(1)),
↪Integer(3):[Integer(3)]+[Integer(1)]*h})
>>> for h in [Integer(0),Integer(1),Integer(2),Integer(3)]:
...     print("{} {}".format(h, x(h)))
0 1->2, 2->31, 3->3
1 1->2, 2->311, 3->31
2 1->2, 2->3111, 3->311
3 1->2, 2->31111, 3->3111
>>> w = Word(lambda n : valuation(n+Integer(1), Integer(2)) ); w
word: 0102010301020104010201030102010501020103...
>>> s = words.s_adic(w, repeat(Integer(3)), x); s
word: 3232232232322322322322322322322322322232...
>>> prefixe = s[:Integer(10000)]
>>> list(map(prefixe.number_of_factors, range(Integer(15))))
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15]
>>> [_[i+Integer(1)] - _[i] for i in range(len(_)-Integer(1))]
[1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1]
```

AUTHORS:

- Sébastien Labbé (2009-12-18): initial version

Datatypes for finite words

class sage.combinat.words.word_datatypes.**WordDatatype**

Bases: object

The generic WordDatatype class.

Any word datatype must contain two attributes (at least):

- `_parent`
- `_hash`

They are automatically defined here and it's not necessary (and forbidden) to define them anywhere else.

class sage.combinat.words.word_datatypes.**WordDatatype_list**

Bases: *WordDatatype*

Datatype class for words defined by lists.

length()

Return the length of the word.

EXAMPLES:

```
sage: w = Word([0,1,1,0])
sage: w.length()
4
```

```
>>> from sage.all import *
>>> w = Word([Integer(0),Integer(1),Integer(1),Integer(0)])
>>> w.length()
4
```

number_of_letter_occurrences(*a*)

Return the number of occurrences of the letter `a` in the word `self`.

INPUT:

- `a` – a letter

OUTPUT: integer

EXAMPLES:

```
sage: w = Word([0,1,1,0,1])
sage: w.number_of_letter_occurrences(0)
2
sage: w.number_of_letter_occurrences(1)
3
sage: w.number_of_letter_occurrences(2)
0
```

```
>>> from sage.all import *
>>> w = Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1)])
>>> w.number_of_letter_occurrences(Integer(0))
2
>>> w.number_of_letter_occurrences(Integer(1))
3
>>> w.number_of_letter_occurrences(Integer(2))
0
```

See also

sage.combinat.words.finite_word.FiniteWord_class.number_of_factor_occurrences()

class sage.combinat.words.word_datatypes.**WordDatatype_str**

Bases: *WordDatatype*

Datatype for words defined by strings.

find(*sub*, *start=0*, *end=None*)

Return the index of the first occurrence of sub in self, such that sub is contained within self[start:end]. Returns -1 on failure.

INPUT:

- `sub` – string or word to search for
- `start` – nonnegative integer (default: 0) specifying the position from which to start the search.
- `end` – nonnegative integer (default: `None`); specifying the position at which the search must stop. If `None`, then the search is performed up to the end of the string.

OUTPUT: nonnegative integer or -1

EXAMPLES:

```
sage: w = Word("abbabaababababa")
sage: w.find("a")
0
sage: w.find("a", 4)
5
sage: w.find("a", 4, 5)
-1
```

```
>>> from sage.all import *
>>> w = Word("abbabaababababa")
>>> w.find("a")
0
>>> w.find("a", Integer(4))
5
>>> w.find("a", Integer(4), Integer(5))
-1
```

has_prefix(*other*)

Test whether `self` has `other` as a prefix.

INPUT:

- `other` – a word (an instance of *Word_class*) or a `str`

OUTPUT: boolean

EXAMPLES:

```
sage: w = Word("abbabaababababa")
sage: u = Word("abbab")
sage: w.has_prefix(u)
True
```

(continues on next page)

(continued from previous page)

```
sage: u.has_prefix(w)
False
sage: u.has_prefix("abbab")
True
```

```
>>> from sage.all import *
>>> w = Word("abbabaababababa")
>>> u = Word("abbab")
>>> w.has_prefix(u)
True
>>> u.has_prefix(w)
False
>>> u.has_prefix("abbab")
True
```

has_suffix(*other*)

Test whether `self` has `other` as a suffix.

INPUT:

- `other` – a word (an instance of *Word_class*) or a `str`

OUTPUT: boolean

EXAMPLES:

```
sage: w = Word("abbabaababababa")
sage: u = Word("ababa")
sage: w.has_suffix(u)
True
sage: u.has_suffix(w)
False
sage: u.has_suffix("ababa")
True
```

```
>>> from sage.all import *
>>> w = Word("abbabaababababa")
>>> u = Word("ababa")
>>> w.has_suffix(u)
True
>>> u.has_suffix(w)
False
>>> u.has_suffix("ababa")
True
```

is_prefix(*other*)

Test whether `self` is a prefix of `other`.

INPUT:

- `other` – a word (an instance of *Word_class*) or a `str`

OUTPUT: boolean

EXAMPLES:

```
sage: w = Word("abbabaababababa")
sage: u = Word("abbab")
sage: w.is_prefix(u)
False
sage: u.is_prefix(w)
True
sage: u.is_prefix("abbabaababababa")
True
```

```
>>> from sage.all import *
>>> w = Word("abbabaababababa")
>>> u = Word("abbab")
>>> w.is_prefix(u)
False
>>> u.is_prefix(w)
True
>>> u.is_prefix("abbabaababababa")
True
```

is_suffix(*other*)

Test whether `self` is a suffix of `other`.

INPUT:

- `other` – a word (an instance of *Word_class*) or a `str`

OUTPUT: boolean

EXAMPLES:

```
sage: w = Word("abbabaababababa")
sage: u = Word("ababa")
sage: w.is_suffix(u)
False
sage: u.is_suffix(w)
True
sage: u.is_suffix("abbabaababababa")
True
```

```
>>> from sage.all import *
>>> w = Word("abbabaababababa")
>>> u = Word("ababa")
>>> w.is_suffix(u)
False
>>> u.is_suffix(w)
True
>>> u.is_suffix("abbabaababababa")
True
```

length()

Return the length of the word.

EXAMPLES:

```
sage: w = Word("abbabaababababa")
sage: w.length()
13
```

```
>>> from sage.all import *
>>> w = Word("abbabaababababa")
>>> w.length()
13
```

number_of_letter_occurrences(*letter*)

Count the number of occurrences of `letter`.

INPUT:

- `letter` – a letter

OUTPUT: integer

EXAMPLES:

```
sage: w = Word("abbabaababababa")
sage: w.number_of_letter_occurrences('a')
7
sage: w.number_of_letter_occurrences('b')
6
sage: w.number_of_letter_occurrences('c')
0
```

```
>>> from sage.all import *
>>> w = Word("abbabaababababa")
>>> w.number_of_letter_occurrences('a')
7
>>> w.number_of_letter_occurrences('b')
6
>>> w.number_of_letter_occurrences('c')
0
```

```
sage: w.number_of_letter_occurrences('abb')
0
```

```
>>> from sage.all import *
>>> w.number_of_letter_occurrences('abb')
0
```

See also

sage.combinat.words.finite_word.FiniteWord_class.number_of_factor_occurrences()

partition(*sep*)

Search for the separator sep in S, and return the part before it, the separator itself, and the part after it. The concatenation of the terms in the list gives back the initial word.

See also the split method.

> **Note**
>
> This just wraps Python's builtin `str.partition()` for `str`.

INPUT:

- `sep` – string or word

EXAMPLES:

```
sage: w = Word("MyTailorIsPoor")
sage: w.partition("Tailor")
[word: My, word: Tailor, word: IsPoor]
```

```
>>> from sage.all import *
>>> w = Word("MyTailorIsPoor")
>>> w.partition("Tailor")
[word: My, word: Tailor, word: IsPoor]
```

```
sage: w = Word("32303010303232123230323212101212321210 10")
sage: l = w.partition("323")
sage: print(l)
[word: , word: 323, word: 03010303232123230323212101212321210 10]
sage: sum(l, Word('')) == w
True
```

```
>>> from sage.all import *
>>> w = Word("32303010303232123230323212101212321210 10")
>>> l = w.partition("323")
>>> print(l)
[word: , word: 323, word: 03010303232123230323212101212321210 10]
>>> sum(l, Word('')) == w
True
```

If the separator is not a string an error is raised:

```
sage: w = Word("le papa du papa du papa etait un petit pioupiou")
sage: w.partition(Word(['p','a','p','a']))
Traceback (most recent call last):
...
ValueError: the separator must be a string
```

```
>>> from sage.all import *
>>> w = Word("le papa du papa du papa etait un petit pioupiou")
>>> w.partition(Word(['p','a','p','a']))
Traceback (most recent call last):
...
ValueError: the separator must be a string
```

rfind(*sub*, *start=0*, *end=None*)

Return the index of the last occurrence of sub in self, such that sub is contained within self[start:end]. Returns -1 on failure.

INPUT:

- `sub` – string or word to search for
- `start` – nonnegative integer (default: 0) specifying the position at which the search must stop.
- `end` – nonnegative integer (default: `None`); specifying the position from which to start the search. If `None`, then the search is performed up to the end of the string.

OUTPUT: nonnegative integer or -1

EXAMPLES:

```
sage: w = Word("abbabaababababa")
sage: w.rfind("a")
12
sage: w.rfind("a", 4, 8)
6
sage: w.rfind("a", 4, 5)
-1
```

```
>>> from sage.all import *
>>> w = Word("abbabaababababa")
>>> w.rfind("a")
12
>>> w.rfind("a", Integer(4), Integer(8))
6
>>> w.rfind("a", Integer(4), Integer(5))
-1
```

split(*sep=None*, *maxsplit=None*)

Return a list of words, using sep as a delimiter string. If maxsplit is given, at most maxsplit splits are done.

See also the partition method.

Note

This just wraps Python's builtin `str.split()` for `str`.

INPUT:

- `sep` – string or word (default: `None`)
- `maxsplit` – positive integer (default: `None`)

OUTPUT: list of words

EXAMPLES:

You can split along white space to find words in a sentence:

```
sage: w = Word("My tailor is poor")
sage: w.split(" ")
[word: My, word: tailor, word: is, word: poor]
```

```
>>> from sage.all import *
>>> w = Word("My tailor is poor")
>>> w.split(" ")
[word: My, word: tailor, word: is, word: poor]
```

The python behavior is kept when no argument is given:

```
sage: w.split()
[word: My, word: tailor, word: is, word: poor]
```

```
>>> from sage.all import *
>>> w.split()
[word: My, word: tailor, word: is, word: poor]
```

You can split in two words letters to get the length of blocks in the other letter:

```
sage: w = Word("ababbabaaba")
sage: w.split('a')
[word: , word: b, word: bb, word: b, word: , word: b, word: ]
sage: w.split('b')
[word: a, word: a, word: , word: a, word: aa, word: a]
```

```
>>> from sage.all import *
>>> w = Word("ababbabaaba")
>>> w.split('a')
[word: , word: b, word: bb, word: b, word: , word: b, word: ]
>>> w.split('b')
[word: a, word: a, word: , word: a, word: aa, word: a]
```

You can split along words:

```
sage: w = Word("32303010303232123230323 21")
sage: w.split("32")
[word: , word: 30301030, word: , word: 12, word: 30, word: , word: 1]
```

```
>>> from sage.all import *
>>> w = Word("32303010303232123230323 21")
>>> w.split("32")
[word: , word: 30301030, word: , word: 12, word: 30, word: , word: 1]
```

If the separator is not a string a `ValueError` is raised:

```
sage: w = Word("le papa du papa du papa etait un petit pioupiou")
sage: w.split(Word(['p','a','p','a']))
Traceback (most recent call last):
...
ValueError: the separator must be a string
```

```
>>> from sage.all import *
>>> w = Word("le papa du papa du papa etait un petit pioupiou")
>>> w.split(Word(['p','a','p','a']))
Traceback (most recent call last):
...
ValueError: the separator must be a string
```

class sage.combinat.words.word_datatypes.**WordDatatype_tuple**

Bases: *WordDatatype*

Datatype class for words defined by tuples.

length()

Return the length of the word.

EXAMPLES:

```
sage: w = Word((0,1,1,0))
sage: w.length()
4
```

```
>>> from sage.all import *
>>> w = Word((Integer(0),Integer(1),Integer(1),Integer(0)))
>>> w.length()
4
```

Datatypes for words defined by iterators and callables

class sage.combinat.words.word_infinite_datatypes.**WordDatatype_callable**(*parent*, *callable*, *length=None*)

Bases: *WordDatatype*

Datatype for a word defined by a callable.

class sage.combinat.words.word_infinite_datatypes.**WordDatatype_callable_with_caching**(*parent*, *callable*, *length=None*)

Bases: *WordDatatype_callable*

Datatype for a word defined by a callable.

flush()

Empty the associated cache of letters.

EXAMPLES:

The first 40 (by default) values are always cached:

```
sage: w = words.ThueMorseWord()
sage: w._letter_cache
{0: 0, 1: 1, 2: 1, 3: 0, 4: 1, 5: 0, 6: 0, 7: 1, 8: 1, 9: 0, 10: 0, 11: 1,␣
↪12: 0, 13: 1, 14: 1, 15: 0, 16: 1, 17: 0, 18: 0, 19: 1, 20: 0, 21: 1, 22: 1,
↪ 23: 0, 24: 0, 25: 1, 26: 1, 27: 0, 28: 1, 29: 0, 30: 0, 31: 1, 32: 1, 33:␣
↪0, 34: 0, 35: 1, 36: 0, 37: 1, 38: 1, 39: 0}
sage: w[100]
1
sage: w._letter_cache
{0: 0, 1: 1, 2: 1, 3: 0, 4: 1, 5: 0, 6: 0, 7: 1, 8: 1, 9: 0, 10: 0, 11: 1,␣
↪12: 0, 13: 1, 14: 1, 15: 0, 16: 1, 17: 0, 18: 0, 19: 1, 20: 0, 21: 1, 22: 1,
↪ 23: 0, 24: 0, 25: 1, 26: 1, 27: 0, 28: 1, 29: 0, 30: 0, 31: 1, 32: 1, 33:␣
↪0, 34: 0, 35: 1, 36: 0, 37: 1, 38: 1, 39: 0, 100: 1}
sage: w.flush()
sage: w._letter_cache
{}
```

```
>>> from sage.all import *
>>> w = words.ThueMorseWord()
>>> w._letter_cache
{0: 0, 1: 1, 2: 1, 3: 0, 4: 1, 5: 0, 6: 0, 7: 1, 8: 1, 9: 0, 10: 0, 11: 1,␣
↪12: 0, 13: 1, 14: 1, 15: 0, 16: 1, 17: 0, 18: 0, 19: 1, 20: 0, 21: 1, 22: 1,
↪ 23: 0, 24: 0, 25: 1, 26: 1, 27: 0, 28: 1, 29: 0, 30: 0, 31: 1, 32: 1, 33:␣
↪0, 34: 0, 35: 1, 36: 0, 37: 1, 38: 1, 39: 0}
>>> w[Integer(100)]
1
>>> w._letter_cache
{0: 0, 1: 1, 2: 1, 3: 0, 4: 1, 5: 0, 6: 0, 7: 1, 8: 1, 9: 0, 10: 0, 11: 1,␣
↪12: 0, 13: 1, 14: 1, 15: 0, 16: 1, 17: 0, 18: 0, 19: 1, 20: 0, 21: 1, 22: 1,
↪ 23: 0, 24: 0, 25: 1, 26: 1, 27: 0, 28: 1, 29: 0, 30: 0, 31: 1, 32: 1, 33:␣
↪0, 34: 0, 35: 1, 36: 0, 37: 1, 38: 1, 39: 0, 100: 1}
>>> w.flush()
>>> w._letter_cache
{}
```

class sage.combinat.words.word_infinite_datatypes.**WordDatatype_iter**(*parent*, *iter*, *length=None*)

Bases: *WordDatatype*

INPUT:

- `parent` – a parent
- `iter` – an iterator
- `length` – (default: `None`) the length of the word

EXAMPLES:

```
sage: w = Word(iter("abbabaab"), length='unknown', caching=False); w
word: abbabaab
sage: isinstance(w, sage.combinat.words.word_infinite_datatypes.WordDatatype_iter)
True
sage: w.length() is None
False
sage: w.length()
8
sage: s = "abbabaabbaababbabaababbaabbabaabbaababbaabbabaabab"
sage: w = Word(iter(s), length='unknown', caching=False); w
word: abbabaabbaababbabaababbaabbabaabbaababba...
sage: w.length() is None
True
```

```
>>> from sage.all import *
>>> w = Word(iter("abbabaab"), length='unknown', caching=False); w
word: abbabaab
>>> isinstance(w, sage.combinat.words.word_infinite_datatypes.WordDatatype_iter)
True
>>> w.length() is None
False
>>> w.length()
8
```

(continues on next page)

(continued from previous page)

```
>>> s = "abbabaabbaababbabaabababbaabbabaabbaababbaabbabaabab"
>>> w = Word(iter(s), length='unknown', caching=False); w
word: abbabaabbaababbabaababbaabbabaabbaababba...
>>> w.length() is None
True
```

```
sage: w = Word(iter("abbabaab"), length='finite', caching=False); w
word: abbabaab
sage: isinstance(w, sage.combinat.words.word_infinite_datatypes.WordDatatype_iter)
True
sage: w.length()
8
sage: w = Word(iter("abbabaab"), length=8, caching=False); w
word: abbabaab
sage: isinstance(w, sage.combinat.words.word_infinite_datatypes.WordDatatype_iter)
True
sage: w.length()
8
```

```
>>> from sage.all import *
>>> w = Word(iter("abbabaab"), length='finite', caching=False); w
word: abbabaab
>>> isinstance(w, sage.combinat.words.word_infinite_datatypes.WordDatatype_iter)
True
>>> w.length()
8
>>> w = Word(iter("abbabaab"), length=Integer(8), caching=False); w
word: abbabaab
>>> isinstance(w, sage.combinat.words.word_infinite_datatypes.WordDatatype_iter)
True
>>> w.length()
8
```

class sage.combinat.words.word_infinite_datatypes.**WordDatatype_iter_with_caching**(*parent*, *iter*, *length=None*)

Bases: *WordDatatype_iter*

INPUT:

- `parent` – a parent
- `iter` – an iterator
- `length` – (default: `None`) the length of the word

EXAMPLES:

```
sage: import itertools
sage: Word(itertools.cycle("abbabaab"))
word: abbabaababbabaababbabaababbabaababbabaab...
sage: w = Word(iter("abbabaab"), length='finite'); w
word: abbabaab
sage: w.length()
```

(continues on next page)

(continued from previous page)

```
8
sage: w = Word(iter("abbabaab"), length='unknown'); w
word: abbabaab
sage: w.length()
8
sage: list(w)
['a', 'b', 'b', 'a', 'b', 'a', 'a', 'b']
sage: w.length()
8
sage: w = Word(iter("abbabaab"), length=8)
sage: w._len
8
```

```
>>> from sage.all import *
>>> import itertools
>>> Word(itertools.cycle("abbabaab"))
word: abbabaababbabaababbabaababbabaababbabaab...
>>> w = Word(iter("abbabaab"), length='finite'); w
word: abbabaab
>>> w.length()
8
>>> w = Word(iter("abbabaab"), length='unknown'); w
word: abbabaab
>>> w.length()
8
>>> list(w)
['a', 'b', 'b', 'a', 'b', 'a', 'a', 'b']
>>> w.length()
8
>>> w = Word(iter("abbabaab"), length=Integer(8))
>>> w._len
8
```

flush()

Delete the cached values.

EXAMPLES:

```
sage: from itertools import count
sage: w = Word(count())
sage: w._last_index, len(w._list)
(39, 40)
sage: w[43]
43
sage: w._last_index, len(w._list)
(43, 44)
sage: w.flush()
sage: w._last_index, w._list
(-1, [])
```

```
>>> from sage.all import *
>>> from itertools import count
```

(continues on next page)

(continued from previous page)

```
>>> w = Word(count())
>>> w._last_index, len(w._list)
(39, 40)
>>> w[Integer(43)]
43
>>> w._last_index, len(w._list)
(43, 44)
>>> w.flush()
>>> w._last_index, w._list
(-1, [])
```

Fast word datatype using an array of unsigned char

class sage.combinat.words.word_char.**WordDatatype_char**

Bases: *WordDatatype*

A Fast class for words represented by an array `unsigned char *`.

Currently, only handles letters in [0,255].

concatenate(*other*)

Concatenation of `self` and `other`.

EXAMPLES:

```
sage: W = Words([0,1,2])
sage: W([0,2,1]).concatenate([0,0,0])
word: 021000
```

```
>>> from sage.all import *
>>> W = Words([Integer(0),Integer(1),Integer(2)])
>>> W([Integer(0),Integer(2),Integer(1)]).concatenate([Integer(0),Integer(0),
↪Integer(0)])
word: 021000
```

has_prefix(*other*)

Test whether `other` is a prefix of `self`.

INPUT:

- `other` – a word or a sequence (e.g. tuple, list)

EXAMPLES:

```
sage: W = Words([0,1,2])
sage: w = W([0,1,1,0,1,2,0])
sage: w.has_prefix([0,1,1])
True
sage: w.has_prefix([0,1,2])
False
sage: w.has_prefix(w)
True
sage: w.has_prefix(w[:-1])
True
```

(continues on next page)

(continued from previous page)

```
sage: w.has_prefix(w[1:])
False
```

```
>>> from sage.all import *
>>> W = Words([Integer(0),Integer(1),Integer(2)])
>>> w = W([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(2),
↪Integer(0)])
>>> w.has_prefix([Integer(0),Integer(1),Integer(1)])
True
>>> w.has_prefix([Integer(0),Integer(1),Integer(2)])
False
>>> w.has_prefix(w)
True
>>> w.has_prefix(w[:-Integer(1)])
True
>>> w.has_prefix(w[Integer(1):])
False
```

is_empty()

Return whether the word is empty.

EXAMPLES:

```
sage: W = Words([0,1,2])
sage: W([0,1,2,2]).is_empty()
False
sage: W([]).is_empty()
True
```

```
>>> from sage.all import *
>>> W = Words([Integer(0),Integer(1),Integer(2)])
>>> W([Integer(0),Integer(1),Integer(2),Integer(2)]).is_empty()
False
>>> W([]).is_empty()
True
```

is_square()

Return `True` if `self` is a square, and `False` otherwise.

EXAMPLES:

```
sage: w = Word([n % 4 for n in range(48)], alphabet=[0,1,2,3])
sage: w.is_square()
True
```

```
>>> from sage.all import *
>>> w = Word([n % Integer(4) for n in range(Integer(48))],␣
↪alphabet=[Integer(0),Integer(1),Integer(2),Integer(3)])
>>> w.is_square()
True
```

```
sage: w = Word([n % 4 for n in range(49)], alphabet=[0,1,2,3])
sage: w.is_square()
False
sage: (w*w).is_square()
True
```

```
>>> from sage.all import *
>>> w = Word([n % Integer(4) for n in range(Integer(49))],␣
↪alphabet=[Integer(0),Integer(1),Integer(2),Integer(3)])
>>> w.is_square()
False
>>> (w*w).is_square()
True
```

length()

Return the length of the word as a Sage integer.

EXAMPLES:

```
sage: W = Words([0,1,2,3,4])
sage: w = W([0,1,2,0,3,2,1])
sage: w.length()
7
sage: type(w.length())
<class 'sage.rings.integer.Integer'>
sage: type(len(w))
<class 'int'>
```

```
>>> from sage.all import *
>>> W = Words([Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)])
>>> w = W([Integer(0),Integer(1),Integer(2),Integer(0),Integer(3),Integer(2),
↪Integer(1)])
>>> w.length()
7
>>> type(w.length())
<class 'sage.rings.integer.Integer'>
>>> type(len(w))
<class 'int'>
```

letters()

Return the list of letters that appear in this word, listed in the order of first appearance.

EXAMPLES:

```
sage: W = Words(5)
sage: W([1,3,1,2,2,3,1]).letters()
[1, 3, 2]
```

```
>>> from sage.all import *
>>> W = Words(Integer(5))
>>> W([Integer(1),Integer(3),Integer(1),Integer(2),Integer(2),Integer(3),
↪Integer(1)]).letters()
[1, 3, 2]
```

longest_common_prefix(*other*)

Return the longest common prefix of this word and `other`.

EXAMPLES:

```
sage: W = Words([0,1,2])
sage: W([0,1,0,2]).longest_common_prefix([0,1])
word: 01
sage: u = W([0,1,0,0,1])
sage: v = W([0,1,0,2])
sage: u.longest_common_prefix(v)
word: 010
sage: v.longest_common_prefix(u)
word: 010
```

```
>>> from sage.all import *
>>> W = Words([Integer(0),Integer(1),Integer(2)])
>>> W([Integer(0),Integer(1),Integer(0),Integer(2)]).longest_common_
↪prefix([Integer(0),Integer(1)])
word: 01
>>> u = W([Integer(0),Integer(1),Integer(0),Integer(0),Integer(1)])
>>> v = W([Integer(0),Integer(1),Integer(0),Integer(2)])
>>> u.longest_common_prefix(v)
word: 010
>>> v.longest_common_prefix(u)
word: 010
```

Using infinite words is also possible (and the return type is also a of the same type as `self`):

```
sage: W([0,1,0,0]).longest_common_prefix(words.FibonacciWord())
word: 0100
sage: type(_)
<class 'sage.combinat.words.word.FiniteWord_char'>
```

```
>>> from sage.all import *
>>> W([Integer(0),Integer(1),Integer(0),Integer(0)]).longest_common_
↪prefix(words.FibonacciWord())
word: 0100
>>> type(_)
<class 'sage.combinat.words.word.FiniteWord_char'>
```

An example of an intensive usage:

```
sage: W = Words([0,1])
sage: w = words.FibonacciWord()
sage: w = W(list(w[:5000]))
sage: L = [[len(w[n:].longest_common_prefix(w[n+fibonacci(i):])) for i in␣
↪needs sage.libs.pari
....:       for i in range(5,15)] for n in range(1,1000)]
sage: for n,l in enumerate(L):                                              #␣
↪needs sage.libs.pari
....:     if l.count(0) > 4:
....:         print("{} {}".format(n+1,l))
375 [0, 13, 0, 34, 0, 89, 0, 233, 0, 233]
```

(continues on next page)

(continued from previous page)

```
376 [0, 12, 0, 33, 0, 88, 0, 232, 0, 232]
608 [8, 0, 21, 0, 55, 0, 144, 0, 377, 0]
609 [7, 0, 20, 0, 54, 0, 143, 0, 376, 0]
985 [0, 13, 0, 34, 0, 89, 0, 233, 0, 610]
986 [0, 12, 0, 33, 0, 88, 0, 232, 0, 609]
```

```
>>> from sage.all import *
>>> W = Words([Integer(0),Integer(1)])
>>> w = words.FibonacciWord()
>>> w = W(list(w[:Integer(5000)]))
>>> L = [[len(w[n:].longest_common_prefix(w[n+fibonacci(i):]))                #␣
↪needs sage.libs.pari
...       for i in range(Integer(5),Integer(15))] for n in range(Integer(1),
↪Integer(1000))]
>>> for n,l in enumerate(L):                                                 #␣
↪needs sage.libs.pari
...     if l.count(Integer(0)) > Integer(4):
...         print("{} {}".format(n+Integer(1),l))
375 [0, 13, 0, 34, 0, 89, 0, 233, 0, 233]
376 [0, 12, 0, 33, 0, 88, 0, 232, 0, 232]
608 [8, 0, 21, 0, 55, 0, 144, 0, 377, 0]
609 [7, 0, 20, 0, 54, 0, 143, 0, 376, 0]
985 [0, 13, 0, 34, 0, 89, 0, 233, 0, 610]
986 [0, 12, 0, 33, 0, 88, 0, 232, 0, 609]
```

longest_common_suffix(*other*)

Return the longest common suffix between this word and `other`.

EXAMPLES:

```
sage: W = Words([0,1,2])
sage: W([0,1,0,2]).longest_common_suffix([2,0,2])
word: 02
sage: u = W([0,1,0,0,1])
sage: v = W([1,2,0,0,1])
sage: u.longest_common_suffix(v)
word: 001
sage: v.longest_common_suffix(u)
word: 001
```

```
>>> from sage.all import *
>>> W = Words([Integer(0),Integer(1),Integer(2)])
>>> W([Integer(0),Integer(1),Integer(0),Integer(2)]).longest_common_
↪suffix([Integer(2),Integer(0),Integer(2)])
word: 02
>>> u = W([Integer(0),Integer(1),Integer(0),Integer(0),Integer(1)])
>>> v = W([Integer(1),Integer(2),Integer(0),Integer(0),Integer(1)])
>>> u.longest_common_suffix(v)
word: 001
>>> v.longest_common_suffix(u)
word: 001
```

sage.combinat.words.word_char.**reversed_word_iterator**(*w*)

This function exists only because it is not possible to use yield in the special method __reversed__.

EXAMPLES:

```
sage: W = Words([0,1,2])
sage: w = W([0,1,0,0,1,2])
sage: list(reversed(w)) # indirect doctest
[2, 1, 0, 0, 1, 0]
```

```
>>> from sage.all import *
>>> W = Words([Integer(0),Integer(1),Integer(2)])
>>> w = W([Integer(0),Integer(1),Integer(0),Integer(0),Integer(1),Integer(2)])
>>> list(reversed(w)) # indirect doctest
[2, 1, 0, 0, 1, 0]
```

Finite word

AUTHORS:

- Arnaud Bergeron
- Amy Glen
- Sébastien Labbé
- Franco Saliola
- Julien Leroy (March 2010): reduced_rauzy_graph

EXAMPLES:

Creation of a finite word

Finite words from Python strings, lists and tuples:

```
sage: Word("abbabaab")
word: abbabaab
sage: Word([0, 1, 1, 0, 1, 0, 0, 1])
word: 01101001
sage: Word( ('a', 0, 5, 7, 'b', 9, 8) )
word: a057b98
```

```
>>> from sage.all import *
>>> Word("abbabaab")
word: abbabaab
>>> Word([Integer(0), Integer(1), Integer(1), Integer(0), Integer(1), Integer(0),␣
↪Integer(0), Integer(1)])
word: 01101001
>>> Word( ('a', Integer(0), Integer(5), Integer(7), 'b', Integer(9), Integer(8)) )
word: a057b98
```

Finite words from functions:

```
sage: f = lambda n : n%3
sage: Word(f, length=13)
word: 0120120120120
```

```
>>> from sage.all import *
>>> f = lambda n : n%Integer(3)
>>> Word(f, length=Integer(13))
word: 0120120120120
```

Finite words from iterators:

```
sage: from itertools import count
sage: Word(count(), length=10)
word: 0123456789
```

```
>>> from sage.all import *
>>> from itertools import count
>>> Word(count(), length=Integer(10))
word: 0123456789
```

```
sage: Word( iter('abbccdef') )
word: abbccdef
```

```
>>> from sage.all import *
>>> Word( iter('abbccdef') )
word: abbccdef
```

Finite words from words via concatenation:

```
sage: u = Word("abcccabba")
sage: v = Word([0, 4, 8, 8, 3])
sage: u * v
word: abcccabba04883
sage: v * u
word: 04883abcccabba
sage: u + v
word: abcccabba04883
sage: u^3 * v^(8/5)
word: abcccabbaabcccabbaabcccabba04883048
```

```
>>> from sage.all import *
>>> u = Word("abcccabba")
>>> v = Word([Integer(0), Integer(4), Integer(8), Integer(8), Integer(3)])
>>> u * v
word: abcccabba04883
>>> v * u
word: 04883abcccabba
>>> u + v
word: abcccabba04883
>>> u**Integer(3) * v**(Integer(8)/Integer(5))
word: abcccabbaabcccabbaabcccabba04883048
```

Finite words from infinite words:

```
sage: vv = v^Infinity
sage: vv[10000:10015]
word: 048830488304883
```

```
>>> from sage.all import *
>>> vv = v**Infinity
>>> vv[Integer(10000):Integer(10015)]
word: 048830488304883
```

Finite words in a specific combinatorial class:

```
sage: W = Words("ab")
sage: W
Finite and infinite words over {'a', 'b'}
sage: W("abbabaab")
word: abbabaab
sage: W(["a","b","b","a","b","a","a","b"])
word: abbabaab
sage: W( iter('ababab') )
word: ababab
```

```
>>> from sage.all import *
>>> W = Words("ab")
>>> W
Finite and infinite words over {'a', 'b'}
>>> W("abbabaab")
word: abbabaab
>>> W(["a","b","b","a","b","a","a","b"])
word: abbabaab
>>> W( iter('ababab') )
word: ababab
```

Finite word as the image under a morphism:

```
sage: m = WordMorphism({0:[4,4,5,0],5:[0,5,5],4:[4,0,0,0]})
sage: m(0)
word: 4450
sage: m(0, order=2)
word: 400040000554450
sage: m(0, order=3)
word: 40004450445044504000445044504450445044500550...
```

```
>>> from sage.all import *
>>> m = WordMorphism({Integer(0):[Integer(4),Integer(4),Integer(5),Integer(0)],
↪Integer(5):[Integer(0),Integer(5),Integer(5)],Integer(4):[Integer(4),Integer(0),
↪Integer(0),Integer(0)]})
>>> m(Integer(0))
word: 4450
>>> m(Integer(0), order=Integer(2))
word: 400040000554450
>>> m(Integer(0), order=Integer(3))
word: 40004450445044504000445044504450445044500550...
```

Note

The following two finite words have the same string representation:

```
sage: w = Word('010120')
sage: z = Word([0, 1, 0, 1, 2, 0])
sage: w
word: 010120
sage: z
word: 010120
```

```
>>> from sage.all import *
>>> w = Word('010120')
>>> z = Word([Integer(0), Integer(1), Integer(0), Integer(1), Integer(2),␣
↪Integer(0)])
>>> w
word: 010120
>>> z
word: 010120
```

but are not equal:

```
sage: w == z
False
```

```
>>> from sage.all import *
>>> w == z
False
```

Indeed, w and z are defined on different alphabets:

```
sage: w[2]
'0'
sage: z[2]
0
```

```
>>> from sage.all import *
>>> w[Integer(2)]
'0'
>>> z[Integer(2)]
0
```

Functions and algorithms

There are more than 100 functions defined on a finite word. Here are some of them:

```
sage: w = Word('abaabbba'); w
word: abaabbba
sage: w.is_palindrome()
False
sage: w.is_lyndon()
False
sage: w.number_of_factors()
28
sage: w.critical_exponent()
3
```

```
>>> from sage.all import *
>>> w = Word('abaabbba'); w
word: abaabbba
```

(continues on next page)

(continued from previous page)

```
>>> w.is_palindrome()
False
>>> w.is_lyndon()
False
>>> w.number_of_factors()
28
>>> w.critical_exponent()
3
```

```
sage: print(w.lyndon_factorization())
(ab, aabbb, a)
sage: print(w.crochemore_factorization())
(a, b, a, ab, bb, a)
```

```
>>> from sage.all import *
>>> print(w.lyndon_factorization())
(ab, aabbb, a)
>>> print(w.crochemore_factorization())
(a, b, a, ab, bb, a)
```

```
sage: st = w.suffix_tree()
sage: st
Implicit Suffix Tree of the word: abaabbba
sage: st.show(word_labels=True)                                                 #␣
↪needs sage.plot
```

```
>>> from sage.all import *
>>> st = w.suffix_tree()
>>> st
Implicit Suffix Tree of the word: abaabbba
>>> st.show(word_labels=True)                                                   #␣
↪needs sage.plot
```

```
sage: T = words.FibonacciWord('ab')
sage: T.longest_common_prefix(Word('abaababababbbbb'))
word: abaababa
```

```
>>> from sage.all import *
>>> T = words.FibonacciWord('ab')
>>> T.longest_common_prefix(Word('abaababababbbbb'))
word: abaababa
```

As matrix and many other sage objects, words have a parent:

```
sage: u = Word('xyxxyxyyy')
sage: u.parent()
Finite words over Set of Python objects of class 'object'
```

```
>>> from sage.all import *
>>> u = Word('xyxxyxyyy')
```

(continues on next page)

(continued from previous page)

```
>>> u.parent()
Finite words over Set of Python objects of class 'object'
```

```
sage: v = Word('xyxxyxyyy', alphabet='xy')
sage: v.parent()
Finite words over {'x', 'y'}
```

```
>>> from sage.all import *
>>> v = Word('xyxxyxyyy', alphabet='xy')
>>> v.parent()
Finite words over {'x', 'y'}
```

Factors and Rauzy Graphs

Enumeration of factors, the successive values returned by `next(it)` can appear in a different order depending on hardware. Therefore we mark the three first results of the test `random`. The important test is that the iteration stops properly on the fourth call:

```
sage: w = Word([4,5,6])^7
sage: it = w.factor_iterator(4)
sage: next(it) # random
word: 6456
sage: next(it) # random
word: 5645
sage: next(it) # random
word: 4564
sage: next(it)
Traceback (most recent call last):
...
StopIteration
```

```
>>> from sage.all import *
>>> w = Word([Integer(4),Integer(5),Integer(6)])**Integer(7)
>>> it = w.factor_iterator(Integer(4))
>>> next(it) # random
word: 6456
>>> next(it) # random
word: 5645
>>> next(it) # random
word: 4564
>>> next(it)
Traceback (most recent call last):
...
StopIteration
```

The set of factors:

```
sage: sorted(w.factor_set(3))
[word: 456, word: 564, word: 645]
sage: sorted(w.factor_set(4))
[word: 4564, word: 5645, word: 6456]
```

(continues on next page)

(continued from previous page)

```
sage: w.factor_set().cardinality()
61
```

```
>>> from sage.all import *
>>> sorted(w.factor_set(Integer(3)))
[word: 456, word: 564, word: 645]
>>> sorted(w.factor_set(Integer(4)))
[word: 4564, word: 5645, word: 6456]
>>> w.factor_set().cardinality()
61
```

Rauzy graphs:

```
sage: f = words.FibonacciWord()[:30]
sage: f.rauzy_graph(4)                                                          #␣
↪needs sage.graphs
Looped digraph on 5 vertices
sage: f.reduced_rauzy_graph(4)                                                  #␣
↪needs sage.graphs
Looped multi-digraph on 2 vertices
```

```
>>> from sage.all import *
>>> f = words.FibonacciWord()[:Integer(30)]
>>> f.rauzy_graph(Integer(4))                                                   ␣
↪     # needs sage.graphs
Looped digraph on 5 vertices
>>> f.reduced_rauzy_graph(Integer(4))                                           ␣
↪     # needs sage.graphs
Looped multi-digraph on 2 vertices
```

Left-special and bispecial factors:

```
sage: f.number_of_left_special_factors(7)
1
sage: f.bispecial_factors()
[word: , word: 0, word: 010, word: 010010, word: 01001010010]
```

```
>>> from sage.all import *
>>> f.number_of_left_special_factors(Integer(7))
1
>>> f.bispecial_factors()
[word: , word: 0, word: 010, word: 010010, word: 01001010010]
```

class sage.combinat.words.finite_word.**CallableFromListOfWords**(*words*)

Bases: `tuple`

A class to create a callable from a list of words. The concatenation of a list of words is obtained by creating a word from this callable.

class sage.combinat.words.finite_word.**Factorization**(*iterable=()*, */* *(Positional-only parameter separator (PEP 570))*)

Bases: `list`

A list subclass having a nicer representation for factorization of words.

class sage.combinat.words.finite_word.**FiniteWord_class**

Bases: *Word_class*

BWT()

Return the Burrows-Wheeler Transform (BWT) of `self`.

The *Burrows-Wheeler transform* of a finite word w is obtained from w by first listing the conjugates of w in lexicographic order and then concatenating the final letters of the conjugates in this order. See [BW1994].

EXAMPLES:

```
sage: Word('abaccaaba').BWT()
word: cbaabaaca
sage: Word('abaab').BWT()
word: bbaaa
sage: Word('bbabbaca').BWT()
word: cbbbbaaa
sage: Word('aabaab').BWT()
word: bbaaaa
sage: Word().BWT()
word:
sage: Word('a').BWT()
word: a
```

```
>>> from sage.all import *
>>> Word('abaccaaba').BWT()
word: cbaabaaca
>>> Word('abaab').BWT()
word: bbaaa
>>> Word('bbabbaca').BWT()
word: cbbbbaaa
>>> Word('aabaab').BWT()
word: bbaaaa
>>> Word().BWT()
word:
>>> Word('a').BWT()
word: a
```

LZ_decomposition()

alias of *crochemore_factorization()*.

abelian_complexity(*n*)

Return the number of abelian vectors of factors of length `n` of `self`.

EXAMPLES:

```
sage: w = words.FibonacciWord()[:100]
sage: [w.abelian_complexity(i) for i in range(20)]
[1, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2]
```

```
>>> from sage.all import *
>>> w = words.FibonacciWord()[:Integer(100)]
>>> [w.abelian_complexity(i) for i in range(Integer(20))]
[1, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2, 2]
```

```
sage: w = words.ThueMorseWord()[:100]
sage: [w.abelian_complexity(i) for i in range(20)]
[1, 2, 3, 2, 3, 2, 3, 2, 3, 2, 3, 2, 3, 2, 3, 2, 3, 2, 3, 2]
```

```
>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(100)]
>>> [w.abelian_complexity(i) for i in range(Integer(20))]
[1, 2, 3, 2, 3, 2, 3, 2, 3, 2, 3, 2, 3, 2, 3, 2, 3, 2, 3, 2]
```

abelian_vector()

Return the abelian vector of `self` counting the occurrences of each letter.

The vector is defined w.r.t. the order of the alphabet of the parent. See also *evaluation_dict()*.

INPUT:

- `self` – word having a parent on a finite alphabet

OUTPUT: list

EXAMPLES:

```
sage: W = Words('ab')
sage: W('aaabbbbb').abelian_vector()
[3, 5]
sage: W('a').abelian_vector()
[1, 0]
sage: W().abelian_vector()
[0, 0]
```

```
>>> from sage.all import *
>>> W = Words('ab')
>>> W('aaabbbbb').abelian_vector()
[3, 5]
>>> W('a').abelian_vector()
[1, 0]
>>> W().abelian_vector()
[0, 0]
```

The result depends on the alphabet of the parent:

```
sage: W = Words('abc')
sage: W('aabaa').abelian_vector()
[4, 1, 0]
```

```
>>> from sage.all import *
>>> W = Words('abc')
>>> W('aabaa').abelian_vector()
[4, 1, 0]
```

abelian_vectors(*n*)

Return the abelian vectors of factors of length `n` of `self`.

The vectors are defined w.r.t. the order of the alphabet of the parent.

OUTPUT: a set of tuples

EXAMPLES:

```
sage: W = Words([0,1,2])
sage: w = W([0,1,1,0,1,2,0,2,0,2])
sage: w.abelian_vectors(3)
{(1, 0, 2), (1, 1, 1), (1, 2, 0), (2, 0, 1)}
sage: w[:5].abelian_vectors(3)
{(1, 2, 0)}
sage: w[5:].abelian_vectors(3)
{(1, 0, 2), (2, 0, 1)}
```

```
>>> from sage.all import *
>>> W = Words([Integer(0),Integer(1),Integer(2)])
>>> w = W([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(2),
↪Integer(0),Integer(2),Integer(0),Integer(2)])
>>> w.abelian_vectors(Integer(3))
{(1, 0, 2), (1, 1, 1), (1, 2, 0), (2, 0, 1)}
>>> w[:Integer(5)].abelian_vectors(Integer(3))
{(1, 2, 0)}
>>> w[Integer(5):].abelian_vectors(Integer(3))
{(1, 0, 2), (2, 0, 1)}
```

```
sage: w = words.FibonacciWord()[:100]
sage: sorted(w.abelian_vectors(0))
[(0, 0)]
sage: sorted(w.abelian_vectors(1))
[(0, 1), (1, 0)]
sage: sorted(w.abelian_vectors(7))
[(4, 3), (5, 2)]
```

```
>>> from sage.all import *
>>> w = words.FibonacciWord()[:Integer(100)]
>>> sorted(w.abelian_vectors(Integer(0)))
[(0, 0)]
>>> sorted(w.abelian_vectors(Integer(1)))
[(0, 1), (1, 0)]
>>> sorted(w.abelian_vectors(Integer(7)))
[(4, 3), (5, 2)]
```

The word must be defined with a parent on a finite alphabet:

```
sage: from itertools import count
sage: w = Word(count(), alphabet=NN)
sage: w[:2].abelian_vectors(2)
Traceback (most recent call last):
...
TypeError: The alphabet of the parent is infinite; define the
word with a parent on a finite alphabet
```

```
>>> from sage.all import *
>>> from itertools import count
>>> w = Word(count(), alphabet=NN)
>>> w[:Integer(2)].abelian_vectors(Integer(2))
```

(continues on next page)

(continued from previous page)

```
Traceback (most recent call last):
...
TypeError: The alphabet of the parent is infinite; define the
word with a parent on a finite alphabet
```

apply_permutation_to_letters(*permutation*)

Return the word obtained by applying the permutation `permutation` of the alphabet of `self` to each letter of `self`.

EXAMPLES:

```
sage: w = Words('abcd')('abcd')
sage: p = [2,1,4,3]
sage: w.apply_permutation_to_letters(p)
word: badc
sage: u = Words('dabc')('abcd')
sage: u.apply_permutation_to_letters(p)
word: dcba
sage: w.apply_permutation_to_letters(Permutation(p))
word: badc
sage: w.apply_permutation_to_letters(PermutationGroupElement(p))            #␣
↪needs sage.groups
word: badc
```

```
>>> from sage.all import *
>>> w = Words('abcd')('abcd')
>>> p = [Integer(2),Integer(1),Integer(4),Integer(3)]
>>> w.apply_permutation_to_letters(p)
word: badc
>>> u = Words('dabc')('abcd')
>>> u.apply_permutation_to_letters(p)
word: dcba
>>> w.apply_permutation_to_letters(Permutation(p))
word: badc
>>> w.apply_permutation_to_letters(PermutationGroupElement(p))            #␣
↪needs sage.groups
word: badc
```

apply_permutation_to_positions(*permutation*)

Return the word obtained by permuting the positions of the letters in `self` according to the permutation `permutation`.

EXAMPLES:

```
sage: w = Words('abcd')('abcd')
sage: w.apply_permutation_to_positions([2,1,4,3])
word: badc
sage: u = Words('dabc')('abcd')
sage: u.apply_permutation_to_positions([2,1,4,3])
word: badc
sage: w.apply_permutation_to_positions(Permutation([2,1,4,3]))
word: badc
sage: w.apply_permutation_to_positions(PermutationGroupElement([2,1,4,3]))  #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.groups
word: badc
sage: Word([1,2,3,4]).apply_permutation_to_positions([3,4,2,1])
word: 3421
```

```
>>> from sage.all import *
>>> w = Words('abcd')('abcd')
>>> w.apply_permutation_to_positions([Integer(2),Integer(1),Integer(4),
↪Integer(3)])
word: badc
>>> u = Words('dabc')('abcd')
>>> u.apply_permutation_to_positions([Integer(2),Integer(1),Integer(4),
↪Integer(3)])
word: badc
>>> w.apply_permutation_to_positions(Permutation([Integer(2),Integer(1),
↪Integer(4),Integer(3)]))
word: badc
>>> w.apply_permutation_to_positions(PermutationGroupElement([Integer(2),
↪Integer(1),Integer(4),Integer(3)]))  # needs sage.groups
word: badc
>>> Word([Integer(1),Integer(2),Integer(3),Integer(4)]).apply_permutation_to_
↪positions([Integer(3),Integer(4),Integer(2),Integer(1)])
word: 3421
```

balance()

Return the balance of `self`.

The balance of a word is the smallest number q such that `self` is q-balanced [FV2002].

A finite or infinite word w is said to be *q-balanced* if for any two factors u, v of w of the same length, the difference between the number of x's in each of u and v is at most q for all letters x in the alphabet of w. A 1-balanced word is simply said to be balanced. See Chapter 2 of [Lot2002].

OUTPUT: integer

EXAMPLES:

```
sage: Word('1111111').balance()
0
sage: Word('001010101011').balance()
2
sage: Word('0101010101').balance()
1
```

```
>>> from sage.all import *
>>> Word('1111111').balance()
0
>>> Word('001010101011').balance()
2
>>> Word('0101010101').balance()
1
```

```
sage: w = Word('11112222')
sage: w.is_balanced(2)
False
sage: w.is_balanced(3)
False
sage: w.is_balanced(4)
True
sage: w.is_balanced(5)
True
sage: w.balance()
4
```

```
>>> from sage.all import *
>>> w = Word('11112222')
>>> w.is_balanced(Integer(2))
False
>>> w.is_balanced(Integer(3))
False
>>> w.is_balanced(Integer(4))
True
>>> w.is_balanced(Integer(5))
True
>>> w.balance()
4
```

bispecial_factors(*n=None*)

Return the bispecial factors (of length `n`).

A factor u of a word w is *bispecial* if it is right special and left special.

INPUT:

- `n` – integer (default: `None`); if `None`, it returns all bispecial factors

OUTPUT: list of words

EXAMPLES:

```
sage: w = words.FibonacciWord()[:30]
sage: w.bispecial_factors()
[word: , word: 0, word: 010, word: 010010, word: 01001010010]
```

```
>>> from sage.all import *
>>> w = words.FibonacciWord()[:Integer(30)]
>>> w.bispecial_factors()
[word: , word: 0, word: 010, word: 010010, word: 01001010010]
```

```
sage: w = words.ThueMorseWord()[:30]
sage: for i in range(10):
....:     print("{} {}".format(i, sorted(w.bispecial_factors(i))))
0 [word: ]
1 [word: 0, word: 1]
2 [word: 01, word: 10]
3 [word: 010, word: 101]
```

(continues on next page)

(continued from previous page)

```
4 [word: 0110, word: 1001]
5 []
6 [word: 011001, word: 100110]
7 []
8 [word: 10010110]
9 []
```

```
>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(30)]
>>> for i in range(Integer(10)):
...     print("{} {}".format(i, sorted(w.bispecial_factors(i))))
0 [word: ]
1 [word: 0, word: 1]
2 [word: 01, word: 10]
3 [word: 010, word: 101]
4 [word: 0110, word: 1001]
5 []
6 [word: 011001, word: 100110]
7 []
8 [word: 10010110]
9 []
```

bispecial_factors_iterator(*n=None*)

Return an iterator over the bispecial factors (of length `n`).

A factor u of a word w is *bispecial* if it is right special and left special.

INPUT:

- `n` – integer (default: `None`); if `None`, it returns an iterator over all bispecial factors

EXAMPLES:

```
sage: w = words.ThueMorseWord()[:30]
sage: for i in range(10):
....:     for u in sorted(w.bispecial_factors_iterator(i)):
....:         print("{} {}".format(i,u))
0
1 0
1 1
2 01
2 10
3 010
3 101
4 0110
4 1001
6 011001
6 100110
8 10010110
```

```
>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(30)]
>>> for i in range(Integer(10)):
```

(continues on next page)

(continued from previous page)

```
...     for u in sorted(w.bispecial_factors_iterator(i)):
...         print("{} {}".format(i,u))
0
1 0
1 1
2 01
2 10
3 010
3 101
4 0110
4 1001
6 011001
6 100110
8 10010110
```

```
sage: key = lambda u : (len(u), u)
sage: for u in sorted(w.bispecial_factors_iterator(), key=key): u
word:
word: 0
word: 1
word: 01
word: 10
word: 010
word: 101
word: 0110
word: 1001
word: 011001
word: 100110
word: 10010110
```

```
>>> from sage.all import *
>>> key = lambda u : (len(u), u)
>>> for u in sorted(w.bispecial_factors_iterator(), key=key): u
word:
word: 0
word: 1
word: 01
word: 10
word: 010
word: 101
word: 0110
word: 1001
word: 011001
word: 100110
word: 10010110
```

border()

Return the longest word that is both a proper prefix and a proper suffix of `self`.

EXAMPLES:

```
sage: Word('121212').border()
```

(continues on next page)

(continued from previous page)

```
word: 1212
sage: Word('12321').border()
word: 1
sage: Word().border() is None
True
```

```
>>> from sage.all import *
>>> Word('121212').border()
word: 1212
>>> Word('12321').border()
word: 1
>>> Word().border() is None
True
```

charge(*check=True*)

Return the charge of `self`. This is defined as follows.

If w is a permutation of length n, (in other words, the evaluation of w is $(1, 1, \ldots, 1)$), the statistic charge(w) is given by $\sum_{i=1}^{n} c_i(w)$ where $c_1(w) = 0$ and $c_i(w)$ is defined recursively by setting p_i equal to 1 if i appears to the right of $i-1$ in w and 0 otherwise. Then we set $c_i(w) = c_{i-1}(w) + p_i$.

EXAMPLES:

```
sage: Word([1, 2, 3]).charge()
3
sage: Word([3, 5, 1, 4, 2]).charge() == 0 + 1 + 1 + 2 + 2
True
```

```
>>> from sage.all import *
>>> Word([Integer(1), Integer(2), Integer(3)]).charge()
3
>>> Word([Integer(3), Integer(5), Integer(1), Integer(4), Integer(2)]).
↪charge() == Integer(0) + Integer(1) + Integer(1) + Integer(2) + Integer(2)
True
```

If w is not a permutation, but the evaluation of w is a partition, the charge of w is defined to be the sum of its charge subwords (each of which will be a permutation). The first charge subword is found by starting at the end of w and moving left until the first 1 is found. This is marked, and we continue to move to the left until the first 2 is found, wrapping around from the beginning of the word back to the end, if necessary. We mark this 2, and continue on until we have marked the largest letter in w. The marked letters, with relative order preserved, form the first charge subword of w. This subword is removed, and the next charge subword is found in the same manner from the remaining letters. In the following example, $w1, w2, w3$ are the charge subwords of w.

EXAMPLES:

```
sage: w = Word([5,2,3,4,4,1,1,1,2,2,3])
sage: w1 = Word([5, 2, 4, 1, 3])
sage: w2 = Word([3, 4, 1, 2])
sage: w3 = Word([1, 2])
sage: w.charge() == w1.charge() + w2.charge() + w3.charge()
True
```

```
>>> from sage.all import *
>>> w = Word([Integer(5),Integer(2),Integer(3),Integer(4),Integer(4),
↪Integer(1),Integer(1),Integer(1),Integer(2),Integer(2),Integer(3)])
>>> w1 = Word([Integer(5), Integer(2), Integer(4), Integer(1), Integer(3)])
>>> w2 = Word([Integer(3), Integer(4), Integer(1), Integer(2)])
>>> w3 = Word([Integer(1), Integer(2)])
>>> w.charge() == w1.charge() + w2.charge() + w3.charge()
True
```

Finally, if w does not have partition content, we apply the Lascoux-Schützenberger standardization operators s_i in such a manner as to obtain a word with partition content. (The word we obtain is independent of the choice of operators.) The charge is then defined to be the charge of this word:

```
sage: Word([3,3,2,1,1]).charge()
0
sage: Word([1,2,3,1,2]).charge()
2
```

```
>>> from sage.all import *
>>> Word([Integer(3),Integer(3),Integer(2),Integer(1),Integer(1)]).charge()
0
>>> Word([Integer(1),Integer(2),Integer(3),Integer(1),Integer(2)]).charge()
2
```

Note that this differs from the definition of charge given in Macdonald's book. The difference amounts to a choice of reading a word from left-to-right or right-to-left. The choice in Sage was made to agree with the definition of a reading word of a tableau in Sage, and seems to be the more common convention in the literature.

See [Mac1995], [LLM2003], and [LLT].

cocharge()

Return the cocharge of `self`. For a word w, this can be defined as $n_{ev} - ch(w)$, where $ch(w)$ is the charge of w and ev is the evaluation of w, and n_{ev} is $\sum_{i<j} min(ev_i, ev_j)$.

EXAMPLES:

```
sage: Word([1,2,3]).cocharge()
0
sage: Word([3,2,1]).cocharge()
3
sage: Word([1,1,2]).cocharge()
0
sage: Word([2,1,2]).cocharge()
1
```

```
>>> from sage.all import *
>>> Word([Integer(1),Integer(2),Integer(3)]).cocharge()
0
>>> Word([Integer(3),Integer(2),Integer(1)]).cocharge()
3
>>> Word([Integer(1),Integer(1),Integer(2)]).cocharge()
0
```

(continues on next page)

(continued from previous page)

```
>>> Word([Integer(2),Integer(1),Integer(2)]).cocharge()
1
```

coerce(*other*)

Try to return a pair of words with a common parent; raise an exception if this is not possible.

This function begins by checking if both words have the same parent. If this is the case, then no work is done and both words are returned as-is.

Otherwise it will attempt to convert `other` to the domain of `self`. If that fails, it will attempt to convert `self` to the domain of `other`. If both attempts fail, it raises a `TypeError` to signal failure.

EXAMPLES:

```
sage: W1 = Words('abc'); W2 = Words('ab')
sage: w1 = W1('abc'); w2 = W2('abba'); w3 = W1('baab')
sage: w1.parent() is w2.parent()
False
sage: a, b = w1.coerce(w2)
sage: a.parent() is b.parent()
True
sage: w1.parent() is w2.parent()
False
```

```
>>> from sage.all import *
>>> W1 = Words('abc'); W2 = Words('ab')
>>> w1 = W1('abc'); w2 = W2('abba'); w3 = W1('baab')
>>> w1.parent() is w2.parent()
False
>>> a, b = w1.coerce(w2)
>>> a.parent() is b.parent()
True
>>> w1.parent() is w2.parent()
False
```

colored_vector(*x=0*, *y=0*, *width='default'*, *height=1*, *cmap='hsv'*, *thickness=1*, *label=None*)

Return a vector (Graphics object) illustrating `self`. Each letter is represented by a coloured rectangle.

If the parent of `self` is a class of words over a finite alphabet, then each letter in the alphabet is assigned a unique colour, and this colour will be the same every time this method is called. This is especially useful when plotting and comparing words defined on the same alphabet.

If the alphabet is infinite, then the letters appearing in the word are used as the alphabet.

INPUT:

- `x` – (default: `0`) bottom left x-coordinate of the vector
- `y` – (default: `0`) bottom left y-coordinate of the vector
- `width` – (default: `'default'`) width of the vector. By default, the width is the length of `self`.
- `height` – (default: `1`) height of the vector
- `thickness` – (default: `1`) thickness of the contour
- `cmap` – (default: `'hsv'`) color map; for available color map names type: `import matplotlib.cm; list(matplotlib.cm.datad)`

- `label` – string (default: `None`); a label to add on the colored vector

OUTPUT: Graphics

EXAMPLES:

```
sage: # needs sage.plot
sage: Word(range(20)).colored_vector()
Graphics object consisting of 21 graphics primitives
sage: Word(range(100)).colored_vector(0,0,10,1)
Graphics object consisting of 101 graphics primitives
sage: Words(range(100))(range(10)).colored_vector()
Graphics object consisting of 11 graphics primitives
sage: w = Word('abbabaab')
sage: w.colored_vector()
Graphics object consisting of 9 graphics primitives
sage: w.colored_vector(cmap='autumn')
Graphics object consisting of 9 graphics primitives
sage: Word(range(20)).colored_vector(label='Rainbow')
Graphics object consisting of 23 graphics primitives
```

```
>>> from sage.all import *
>>> # needs sage.plot
>>> Word(range(Integer(20))).colored_vector()
Graphics object consisting of 21 graphics primitives
>>> Word(range(Integer(100))).colored_vector(Integer(0),Integer(0),
↪Integer(10),Integer(1))
Graphics object consisting of 101 graphics primitives
>>> Words(range(Integer(100)))(range(Integer(10))).colored_vector()
Graphics object consisting of 11 graphics primitives
>>> w = Word('abbabaab')
>>> w.colored_vector()
Graphics object consisting of 9 graphics primitives
>>> w.colored_vector(cmap='autumn')
Graphics object consisting of 9 graphics primitives
>>> Word(range(Integer(20))).colored_vector(label='Rainbow')
Graphics object consisting of 23 graphics primitives
```

When two words are defined under the same parent, same letters are mapped to same colors:

```
sage: W = Words(range(20))
sage: w = W(range(20))
sage: y = W(range(10,20))
sage: y.colored_vector(y=1, x=10) + w.colored_vector()                    #␣
↪needs sage.plot
Graphics object consisting of 32 graphics primitives
```

```
>>> from sage.all import *
>>> W = Words(range(Integer(20)))
>>> w = W(range(Integer(20)))
>>> y = W(range(Integer(10),Integer(20)))
>>> y.colored_vector(y=Integer(1), x=Integer(10)) + w.colored_vector()       ␣
↪              # needs sage.plot
Graphics object consisting of 32 graphics primitives
```

commutes_with(*other*)

Return `True` if `self` commutes with `other`, and `False` otherwise.

EXAMPLES:

```
sage: Word('12').commutes_with(Word('12'))
True
sage: Word('12').commutes_with(Word('11'))
False
sage: Word().commutes_with(Word('21'))
True
```

```
>>> from sage.all import *
>>> Word('12').commutes_with(Word('12'))
True
>>> Word('12').commutes_with(Word('11'))
False
>>> Word().commutes_with(Word('21'))
True
```

complete_return_words(*fact*)

Return the set of complete return words of `fact` in `self`.

This is the set of all factors starting by the given factor and ending just after the next occurrence of this factor. See for instance [JV2000].

INPUT:

- `fact` – a non-empty finite word

OUTPUT: a Python set of finite words

EXAMPLES:

```
sage: s = Word('21331233213231').complete_return_words(Word('2'))
sage: sorted(s)
[word: 2132, word: 213312, word: 2332]
sage: Word('').complete_return_words(Word('213'))
set()
sage: Word('121212').complete_return_words(Word('1212'))
{word: 121212}
```

```
>>> from sage.all import *
>>> s = Word('21331233213231').complete_return_words(Word('2'))
>>> sorted(s)
[word: 2132, word: 213312, word: 2332]
>>> Word('').complete_return_words(Word('213'))
set()
>>> Word('121212').complete_return_words(Word('1212'))
{word: 121212}
```

concatenate(*other*)

Return the concatenation of `self` and `other`.

INPUT:

- `other` – a word over the same alphabet as `self`

EXAMPLES:

Concatenation may be made using + or * operations:

```
sage: w = Word('abadafd')
sage: y = Word([5,3,5,8,7])
sage: w * y
word: abadafd53587
sage: w + y
word: abadafd53587
sage: w.concatenate(y)
word: abadafd53587
```

```
>>> from sage.all import *
>>> w = Word('abadafd')
>>> y = Word([Integer(5),Integer(3),Integer(5),Integer(8),Integer(7)])
>>> w * y
word: abadafd53587
>>> w + y
word: abadafd53587
>>> w.concatenate(y)
word: abadafd53587
```

Both words must be defined over the same alphabet:

```
sage: z = Word('12223', alphabet = '123')
sage: z + y
Traceback (most recent call last):
...
ValueError: 5 not in alphabet
```

```
>>> from sage.all import *
>>> z = Word('12223', alphabet = '123')
>>> z + y
Traceback (most recent call last):
...
ValueError: 5 not in alphabet
```

Eventually, it should work:

```
sage: z = Word('12223', alphabet = '123')
sage: z + y                    #todo: not implemented
word: 1222353587
```

```
>>> from sage.all import *
>>> z = Word('12223', alphabet = '123')
>>> z + y                    #todo: not implemented
word: 1222353587
```

conjugate(*pos*)

Return the conjugate at `pos` of `self`.

`pos` can be any integer, the distance used is the modulo by the length of `self`.

EXAMPLES:

```
sage: Word('12112').conjugate(1)
word: 21121
sage: Word().conjugate(2)
word:
sage: Word('12112').conjugate(8)
word: 12121
sage: Word('12112').conjugate(-1)
word: 21211
```

```
>>> from sage.all import *
>>> Word('12112').conjugate(Integer(1))
word: 21121
>>> Word().conjugate(Integer(2))
word:
>>> Word('12112').conjugate(Integer(8))
word: 12121
>>> Word('12112').conjugate(-Integer(1))
word: 21211
```

conjugate_position(*other*)

Return the position where `self` is conjugate with `other`. Return `None` if there is no such position.

EXAMPLES:

```
sage: Word('12113').conjugate_position(Word('31211'))
1
sage: Word('12131').conjugate_position(Word('12113')) is None
True
sage: Word().conjugate_position(Word('123')) is None
True
```

```
>>> from sage.all import *
>>> Word('12113').conjugate_position(Word('31211'))
1
>>> Word('12131').conjugate_position(Word('12113')) is None
True
>>> Word().conjugate_position(Word('123')) is None
True
```

conjugates()

Return the list of unique conjugates of `self`.

EXAMPLES:

```
sage: Word(range(6)).conjugates()
[word: 012345,
 word: 123450,
 word: 234501,
 word: 345012,
 word: 450123,
 word: 501234]
sage: Word('cbbca').conjugates()
[word: cbbca, word: bbcac, word: bcacb, word: cacbb, word: acbbc]
```

```
>>> from sage.all import *
>>> Word(range(Integer(6))).conjugates()
[word: 012345,
 word: 123450,
 word: 234501,
 word: 345012,
 word: 450123,
 word: 501234]
>>> Word('cbbca').conjugates()
[word: cbbca, word: bbcac, word: bcacb, word: cacbb, word: acbbc]
```

The result contains each conjugate only once:

```
sage: Word('abcabc').conjugates()
[word: abcabc, word: bcabca, word: cabcab]
```

```
>>> from sage.all import *
>>> Word('abcabc').conjugates()
[word: abcabc, word: bcabca, word: cabcab]
```

conjugates_iterator()

Return an iterator over the conjugates of `self`.

EXAMPLES:

```
sage: it = Word(range(4)).conjugates_iterator()
sage: for w in it: w
word: 0123
word: 1230
word: 2301
word: 3012
```

```
>>> from sage.all import *
>>> it = Word(range(Integer(4))).conjugates_iterator()
>>> for w in it: w
word: 0123
word: 1230
word: 2301
word: 3012
```

content(*n=None*)

Return content of `self`.

INPUT:

- `n` – (optional) an integer specifying the maximal letter in the alphabet

OUTPUT: list where the i-th entry indicates the multiplicity of the i-th letter in the alphabet in `self`

EXAMPLES:

```
sage: w = Word([1,2,4,3,2,2,2])
sage: w.content()
[1, 4, 1, 1]
sage: w = Word([3,1])
```

(continues on next page)

(continued from previous page)

```
sage: w.content()
[1, 1]
sage: w.content(n=3)
[1, 0, 1]
sage: w = Word([2,4],alphabet=[1,2,3,4])
sage: w.content(n=3)
[0, 1, 0]
sage: w.content()
[0, 1, 0, 1]
```

```
>>> from sage.all import *
>>> w = Word([Integer(1),Integer(2),Integer(4),Integer(3),Integer(2),
...Integer(2),Integer(2)])
>>> w.content()
[1, 4, 1, 1]
>>> w = Word([Integer(3),Integer(1)])
>>> w.content()
[1, 1]
>>> w.content(n=Integer(3))
[1, 0, 1]
>>> w = Word([Integer(2),Integer(4)],alphabet=[Integer(1),Integer(2),
...Integer(3),Integer(4)])
>>> w.content(n=Integer(3))
[0, 1, 0]
>>> w.content()
[0, 1, 0, 1]
```

count(*letter*)

alias of *number_of_letter_occurrences()*.

critical_exponent()

Return the critical exponent of `self`.

The *critical exponent* of a word is the supremum of the order of all its (finite) factors. See [Dej1972].

Note

The implementation here uses the suffix tree to enumerate all the factors. It should be improved (especially when the critical exponent is larger than 2).

EXAMPLES:

```
sage: Word('aaba').critical_exponent()
2
sage: Word('aabaa').critical_exponent()
2
sage: Word('aabaaba').critical_exponent()
7/3
sage: Word('ab').critical_exponent()
1
sage: Word('aba').critical_exponent()
```

(continues on next page)

(continued from previous page)

```
3/2
sage: words.ThueMorseWord()[:20].critical_exponent()
2
```

```
>>> from sage.all import *
>>> Word('aaba').critical_exponent()
2
>>> Word('aabaa').critical_exponent()
2
>>> Word('aabaaba').critical_exponent()
7/3
>>> Word('ab').critical_exponent()
1
>>> Word('aba').critical_exponent()
3/2
>>> words.ThueMorseWord()[:Integer(20)].critical_exponent()
2
```

For the Fibonacci word, the critical exponent is known to be $(5 + \sqrt(5))/2$. With a prefix of length 500, we obtain a lower bound:

```
sage: words.FibonacciWord()[:500].critical_exponent()
320/89
```

```
>>> from sage.all import *
>>> words.FibonacciWord()[:Integer(500)].critical_exponent()
320/89
```

It is an error to compute the critical exponent of the empty word:

```
sage: Word('').critical_exponent()
Traceback (most recent call last):
...
ValueError: no critical exponent for empty word
```

```
>>> from sage.all import *
>>> Word('').critical_exponent()
Traceback (most recent call last):
...
ValueError: no critical exponent for empty word
```

crochemore_factorization()

Return the Crochemore factorization of `self` as an ordered list of factors.

The *Crochemore factorization* or the *Lempel-Ziv decomposition* of a finite word w is the unique factorization: $(x_1, x_2, \ldots, x_n)$ of w with each x_i satisfying either: C1. x_i is a letter that does not appear in $u = x_1 \ldots x_{i-1}$; C2. x_i is the longest prefix of $v = x_i \ldots x_n$ that also has an occurrence beginning within $u = x_1 \ldots x_{i-1}$. See [Cro1983].

EXAMPLES:

```
sage: x = Word('abababb')
sage: x.crochemore_factorization()
```

(continues on next page)

(continued from previous page)

```
(a, b, abab, b)
sage: mul(x.crochemore_factorization()) == x
True
sage: y = Word('abaababacabba')
sage: y.crochemore_factorization()
(a, b, a, aba, ba, c, ab, ba)
sage: mul(y.crochemore_factorization()) == y
True
sage: x = Word([0,1,0,1,0,1,1])
sage: x.crochemore_factorization()
(0, 1, 0101, 1)
sage: mul(x.crochemore_factorization()) == x
True
```

```
>>> from sage.all import *
>>> x = Word('abababb')
>>> x.crochemore_factorization()
(a, b, abab, b)
>>> mul(x.crochemore_factorization()) == x
True
>>> y = Word('abaababacabba')
>>> y.crochemore_factorization()
(a, b, a, aba, ba, c, ab, ba)
>>> mul(y.crochemore_factorization()) == y
True
>>> x = Word([Integer(0),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(1)])
>>> x.crochemore_factorization()
(0, 1, 0101, 1)
>>> mul(x.crochemore_factorization()) == x
True
```

defect(*f=None*)

Return the defect of `self`.

The *defect* of a finite word w is given by the difference between the maximum number of possible palindromic factors in a word of length $|w|$ and the actual number of palindromic factors contained in w. It is well known that the maximum number of palindromic factors in w is $|w| + 1$ (see [DJP2001]).

An optional involution on letters `f` can be given. In that case, the *f-palindromic defect* (or *pseudopalindromic defect*, or *theta-palindromic defect*) of w is returned. It is a generalization of defect to f-palindromes. More precisely, the defect is $D(w) = |w| + 1 - g_f(w) - |PAL_f(w)|$, where $PAL_f(w)$ denotes the set of f-palindromic factors of w (including the empty word) and $g_f(w)$ is the number of pairs $\{a, f(a)\}$ such that a is a letter, a is not equal to $f(a)$, and a or $f(a)$ occurs in w. In the case of usual palindromes (i.e., for `f` not given or equal to the identity), $g_f(w) = 0$ for all w. See [BHNR2004] for usual palindromes and [Star2011] for f-palindromes.

INPUT:

- `f` – involution (default: `None`) on the alphabet of `self`. It must be callable on letters as well as words (e.g. `WordMorphism`). The default value corresponds to usual palindromes, i.e., `f` equal to the identity.

OUTPUT:

an integer – If `f` is `None`, the palindromic defect of `self`; otherwise, the `f`-palindromic defect of `self`.

EXAMPLES:

```
sage: Word('ara').defect()
0
sage: Word('abcacba').defect()
1
```

```
>>> from sage.all import *
>>> Word('ara').defect()
0
>>> Word('abcacba').defect()
1
```

It is known that Sturmian words (see [DJP2001]) have zero defect:

```
sage: words.FibonacciWord()[:100].defect()
0

sage: sa = WordMorphism('a->ab,b->b')
sage: sb = WordMorphism('a->a,b->ba')
sage: w = (sa*sb*sb*sa*sa*sa*sb).fixed_point('a')
sage: w[:30].defect()                                                       #␣
↪needs sage.modules
0
sage: w[110:140].defect()                                                   #␣
↪needs sage.modules
0
```

```
>>> from sage.all import *
>>> words.FibonacciWord()[:Integer(100)].defect()
0

>>> sa = WordMorphism('a->ab,b->b')
>>> sb = WordMorphism('a->a,b->ba')
>>> w = (sa*sb*sb*sa*sa*sa*sb).fixed_point('a')
>>> w[:Integer(30)].defect()                                                ␣
↪     # needs sage.modules
0
>>> w[Integer(110):Integer(140)].defect()                                   ␣
↪              # needs sage.modules
0
```

It is even conjectured that the defect of an aperiodic word which is a fixed point of a primitive morphism is either 0 or infinite (see [BBGL2008]):

```
sage: w = words.ThueMorseWord()
sage: w[:50].defect()                                                       #␣
↪needs sage.modules
12
sage: w[:100].defect()                                                      #␣
↪needs sage.modules
16
sage: w[:300].defect()                                                      #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.modules
52
```

```
>>> from sage.all import *
>>> w = words.ThueMorseWord()
>>> w[:Integer(50)].defect()                                                  ␣
↪     # needs sage.modules
12
>>> w[:Integer(100)].defect()                                                 ␣
↪     # needs sage.modules
16
>>> w[:Integer(300)].defect()                                                 ␣
↪     # needs sage.modules
52
```

For generalized defect with an involution different from the identity, there is always a letter which is not a palindrome! This is the reason for the modification of the definition:

```
sage: f = WordMorphism('a->b,b->a')
sage: Word('a').defect(f)
0
sage: Word('ab').defect(f)
0
sage: Word('aa').defect(f)
1
sage: Word('abbabaabbaababba').defect(f)
3
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->b,b->a')
>>> Word('a').defect(f)
0
>>> Word('ab').defect(f)
0
>>> Word('aa').defect(f)
1
>>> Word('abbabaabbaababba').defect(f)
3
```

```
sage: f = WordMorphism('a->b,b->a,c->c')
sage: Word('cabc').defect(f)
0
sage: Word('abcaab').defect(f)
2
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->b,b->a,c->c')
>>> Word('cabc').defect(f)
0
>>> Word('abcaab').defect(f)
2
```

Other examples:

```
sage: Word('000000000000').defect()
0
sage: Word('011010011001').defect()
2
sage: Word('0101001010001').defect()
0
sage: Word().defect()
0
sage: Word('abbabaabbaababba').defect()
2
```

```
>>> from sage.all import *
>>> Word('000000000000').defect()
0
>>> Word('011010011001').defect()
2
>>> Word('0101001010001').defect()
0
>>> Word().defect()
0
>>> Word('abbabaabbaababba').defect()
2
```

deg_inv_lex_less(*other*, *weights=None*)

Return `True` if the word `self` is degree inverse lexicographically less than `other`.

EXAMPLES:

```
sage: Word([1,2,4]).deg_inv_lex_less(Word([1,3,2]))
False
sage: Word([3,2,1]).deg_inv_lex_less(Word([1,2,3]))
True
```

```
>>> from sage.all import *
>>> Word([Integer(1),Integer(2),Integer(4)]).deg_inv_lex_
↪less(Word([Integer(1),Integer(3),Integer(2)]))
False
>>> Word([Integer(3),Integer(2),Integer(1)]).deg_inv_lex_
↪less(Word([Integer(1),Integer(2),Integer(3)]))
True
```

deg_lex_less(*other*, *weights=None*)

Return `True` if `self` is degree lexicographically less than `other`, and `False` otherwise. The weight of each letter in the ordered alphabet is given by `weights`, which defaults to `[1, 2, 3, ...]`.

EXAMPLES:

```
sage: Word([1,2,3]).deg_lex_less(Word([1,3,2]))
True
sage: Word([3,2,1]).deg_lex_less(Word([1,2,3]))
False
sage: W = Words(range(5))
```

(continues on next page)

(continued from previous page)

```
sage: W([1,2,4]).deg_lex_less(W([1,3,2]))
False
sage: Word("abba").deg_lex_less(Word("abbb"), dict(a=1,b=2))
True
sage: Word("abba").deg_lex_less(Word("baba"), dict(a=1,b=2))
True
sage: Word("abba").deg_lex_less(Word("aaba"), dict(a=1,b=2))
False
sage: Word("abba").deg_lex_less(Word("aaba"), dict(a=1,b=0))
True
```

```
>>> from sage.all import *
>>> Word([Integer(1),Integer(2),Integer(3)]).deg_lex_less(Word([Integer(1),
↪Integer(3),Integer(2)]))
True
>>> Word([Integer(3),Integer(2),Integer(1)]).deg_lex_less(Word([Integer(1),
↪Integer(2),Integer(3)]))
False
>>> W = Words(range(Integer(5)))
>>> W([Integer(1),Integer(2),Integer(4)]).deg_lex_less(W([Integer(1),
↪Integer(3),Integer(2)]))
False
>>> Word("abba").deg_lex_less(Word("abbb"), dict(a=Integer(1),b=Integer(2)))
True
>>> Word("abba").deg_lex_less(Word("baba"), dict(a=Integer(1),b=Integer(2)))
True
>>> Word("abba").deg_lex_less(Word("aaba"), dict(a=Integer(1),b=Integer(2)))
False
>>> Word("abba").deg_lex_less(Word("aaba"), dict(a=Integer(1),b=Integer(0)))
True
```

deg_rev_lex_less(*other*, *weights=None*)

Return `True` if `self` is degree reverse lexicographically less than `other`.

EXAMPLES:

```
sage: Word([3,2,1]).deg_rev_lex_less(Word([1,2,3]))
False
sage: Word([1,2,4]).deg_rev_lex_less(Word([1,3,2]))
False
sage: Word([1,2,3]).deg_rev_lex_less(Word([1,2,4]))
True
```

```
>>> from sage.all import *
>>> Word([Integer(3),Integer(2),Integer(1)]).deg_rev_lex_
↪less(Word([Integer(1),Integer(2),Integer(3)]))
False
>>> Word([Integer(1),Integer(2),Integer(4)]).deg_rev_lex_
↪less(Word([Integer(1),Integer(3),Integer(2)]))
False
>>> Word([Integer(1),Integer(2),Integer(3)]).deg_rev_lex_
↪less(Word([Integer(1),Integer(2),Integer(4)]))
```

(continues on next page)

(continued from previous page)

```
True
```

degree(*weights=None*)

Return the weighted degree of `self`, where the weighted degree of each letter in the ordered alphabet is given by `weights`, which defaults to `[1, 2, 3, ...]`.

INPUT:

- `weights` – list or tuple, or dictionary keyed by the letters occurring in `self`

EXAMPLES:

```
sage: Word([1,2,3]).degree()
6
sage: Word([3,2,1]).degree()
6
sage: Words("ab")("abba").degree()
6
sage: Words("ab")("abba").degree([0,2])
4
sage: Words("ab")("abba").degree([-1,-1])
-4
sage: Words("ab")("aabba").degree([1,1])
5
sage: Words([1,2,4])([1,2,4]).degree()
6
sage: Word([1,2,4]).degree()
7
sage: Word("aabba").degree({'a':1,'b':2})
7
sage: Word([0,1,0]).degree({0:17,1:0})
34
```

```
>>> from sage.all import *
>>> Word([Integer(1),Integer(2),Integer(3)]).degree()
6
>>> Word([Integer(3),Integer(2),Integer(1)]).degree()
6
>>> Words("ab")("abba").degree()
6
>>> Words("ab")("abba").degree([Integer(0),Integer(2)])
4
>>> Words("ab")("abba").degree([-Integer(1),-Integer(1)])
-4
>>> Words("ab")("aabba").degree([Integer(1),Integer(1)])
5
>>> Words([Integer(1),Integer(2),Integer(4)])([Integer(1),Integer(2),
↪Integer(4)]).degree()
6
>>> Word([Integer(1),Integer(2),Integer(4)]).degree()
7
>>> Word("aabba").degree({'a':Integer(1),'b':Integer(2)})
7
```

(continues on next page)

(continued from previous page)

```
>>> Word([Integer(0),Integer(1),Integer(0)]).degree({Integer(0):Integer(17),
↪Integer(1):Integer(0)})
34
```

delta()

Return the image of `self` under the delta morphism.

The delta morphism, also known as the run-length encoding, is the word composed of the length of consecutive runs of the same letter in a given word.

EXAMPLES:

```
sage: W = Words('0123456789')
sage: W('22112122').delta()
word: 22112
sage: W('555008').delta()
word: 321
sage: W().delta()
word:
sage: Word('aabbabaa').delta()
word: 22112
```

```
>>> from sage.all import *
>>> W = Words('0123456789')
>>> W('22112122').delta()
word: 22112
>>> W('555008').delta()
word: 321
>>> W().delta()
word:
>>> Word('aabbabaa').delta()
word: 22112
```

delta_derivate(*W=None*)

Return the derivative under delta for `self`.

EXAMPLES:

```
sage: W = Words('12')
sage: W('12211').delta_derivate()
word: 22
sage: W('1').delta_derivate(Words([1]))
word: 1
sage: W('2112').delta_derivate()
word: 2
sage: W('2211').delta_derivate()
word: 22
sage: W('112').delta_derivate()
word: 2
sage: W('11222').delta_derivate(Words([1, 2, 3]))
word: 3
```

```
>>> from sage.all import *
>>> W = Words('12')
>>> W('12211').delta_derivate()
word: 22
>>> W('1').delta_derivate(Words([Integer(1)]))
word: 1
>>> W('2112').delta_derivate()
word: 2
>>> W('2211').delta_derivate()
word: 22
>>> W('112').delta_derivate()
word: 2
>>> W('11222').delta_derivate(Words([Integer(1), Integer(2), Integer(3)]))
word: 3
```

delta_derivate_left(*W=None*)

Return the derivative under delta for `self`.

EXAMPLES:

```
sage: W = Words('12')
sage: W('12211').delta_derivate_left()
word: 22
sage: W('1').delta_derivate_left(Words([1]))
word: 1
sage: W('2112').delta_derivate_left()
word: 21
sage: W('2211').delta_derivate_left()
word: 22
sage: W('112').delta_derivate_left()
word: 21
sage: W('11222').delta_derivate_left(Words([1, 2, 3]))
word: 3
```

```
>>> from sage.all import *
>>> W = Words('12')
>>> W('12211').delta_derivate_left()
word: 22
>>> W('1').delta_derivate_left(Words([Integer(1)]))
word: 1
>>> W('2112').delta_derivate_left()
word: 21
>>> W('2211').delta_derivate_left()
word: 22
>>> W('112').delta_derivate_left()
word: 21
>>> W('11222').delta_derivate_left(Words([Integer(1), Integer(2),␣
↪Integer(3)]))
word: 3
```

delta_derivate_right(*W=None*)

Return the right derivative under delta for `self`.

EXAMPLES:

```
sage: W = Words('12')
sage: W('12211').delta_derivate_right()
word: 122
sage: W('1').delta_derivate_right(Words([1]))
word: 1
sage: W('2112').delta_derivate_right()
word: 12
sage: W('2211').delta_derivate_right()
word: 22
sage: W('112').delta_derivate_right()
word: 2
sage: W('11222').delta_derivate_right(Words([1, 2, 3]))
word: 23
```

```
>>> from sage.all import *
>>> W = Words('12')
>>> W('12211').delta_derivate_right()
word: 122
>>> W('1').delta_derivate_right(Words([Integer(1)]))
word: 1
>>> W('2112').delta_derivate_right()
word: 12
>>> W('2211').delta_derivate_right()
word: 22
>>> W('112').delta_derivate_right()
word: 2
>>> W('11222').delta_derivate_right(Words([Integer(1), Integer(2),␣
↪Integer(3)]))
word: 23
```

delta_inv(*W=None*, *s=None*)

Lift `self` via the delta operator to obtain a word containing the letters in alphabet (default: `[0, 1]`). The letters used in the construction start with `s` (default: `alphabet[0]`) and cycle through alphabet.

INPUT:

- `alphabet` – an iterable
- `s` – an object in the iterable

EXAMPLES:

```
sage: W = Words([1, 2])
sage: W([2, 2, 1, 1]).delta_inv()
word: 112212
sage: W([1, 1, 1, 1]).delta_inv(Words('123'))
word: 1231
sage: W([2, 2, 1, 1, 2]).delta_inv(s=2)
word: 22112122
```

```
>>> from sage.all import *
>>> W = Words([Integer(1), Integer(2)])
>>> W([Integer(2), Integer(2), Integer(1), Integer(1)]).delta_inv()
word: 112212
```

(continues on next page)

(continued from previous page)

```
>>> W([Integer(1), Integer(1), Integer(1), Integer(1)]).delta_inv(Words('123
↪'))
word: 1231
>>> W([Integer(2), Integer(2), Integer(1), Integer(1), Integer(2)]).delta_
↪inv(s=Integer(2))
word: 22112122
```

evaluation()

alias of *abelian_vector()*.

evaluation_dict()

Return a dictionary keyed by the letters occurring in `self` with values the number of occurrences of the letter.

EXAMPLES:

```
sage: Word([2,1,4,2,3,4,2]).evaluation_dict()
{1: 1, 2: 3, 3: 1, 4: 2}
sage: Word('badbcdb').evaluation_dict()
{'a': 1, 'b': 3, 'c': 1, 'd': 2}
sage: Word().evaluation_dict()
{}
```

```
>>> from sage.all import *
>>> Word([Integer(2),Integer(1),Integer(4),Integer(2),Integer(3),Integer(4),
↪Integer(2)]).evaluation_dict()
{1: 1, 2: 3, 3: 1, 4: 2}
>>> Word('badbcdb').evaluation_dict()
{'a': 1, 'b': 3, 'c': 1, 'd': 2}
>>> Word().evaluation_dict()
{}
```

```
sage: f = Word('1213121').evaluation_dict() # keys appear in random order
{'1': 4, '2': 2, '3': 1}
```

```
>>> from sage.all import *
>>> f = Word('1213121').evaluation_dict() # keys appear in random order
{'1': 4, '2': 2, '3': 1}
```

evaluation_partition()

Return the evaluation of the word w as a partition.

EXAMPLES:

```
sage: Word("acdabda").evaluation_partition()
[3, 2, 1, 1]
sage: Word([2,1,4,2,3,4,2]).evaluation_partition()
[3, 2, 1, 1]
```

```
>>> from sage.all import *
>>> Word("acdabda").evaluation_partition()
[3, 2, 1, 1]
>>> Word([Integer(2),Integer(1),Integer(4),Integer(2),Integer(3),Integer(4),
```

(continues on next page)

(continued from previous page)

```
↪Integer(2)]).evaluation_partition()
[3, 2, 1, 1]
```

evaluation_sparse()

Return a list representing the evaluation of `self`. The entries of the list are two-element lists `[a, n]`, where `a` is a letter occurring in `self` and `n` is the number of occurrences of `a` in `self`.

EXAMPLES:

```
sage: sorted(Word([4,4,2,5,2,1,4,1]).evaluation_sparse())
[(1, 2), (2, 2), (4, 3), (5, 1)]
sage: sorted(Word("abcaccab").evaluation_sparse())
[('a', 3), ('b', 2), ('c', 3)]
```

```
>>> from sage.all import *
>>> sorted(Word([Integer(4),Integer(4),Integer(2),Integer(5),Integer(2),
↪Integer(1),Integer(4),Integer(1)]).evaluation_sparse())
[(1, 2), (2, 2), (4, 3), (5, 1)]
>>> sorted(Word("abcaccab").evaluation_sparse())
[('a', 3), ('b', 2), ('c', 3)]
```

exponent()

Return the exponent of `self`.

OUTPUT: integer; the exponent

EXAMPLES:

```
sage: Word('1231').exponent()
1
sage: Word('121212').exponent()
3
sage: Word().exponent()
0
```

```
>>> from sage.all import *
>>> Word('1231').exponent()
1
>>> Word('121212').exponent()
3
>>> Word().exponent()
0
```

factor_complexity(*n*)

Return the number of distinct factors of length `n` of `self`.

INPUT:

- `n` – the length of the factors

EXAMPLES:

```
sage: w = words.FibonacciWord()[:100]
sage: [w.factor_complexity(i) for i in range(20)]
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20]
```

```
>>> from sage.all import *
>>> w = words.FibonacciWord()[:Integer(100)]
>>> [w.factor_complexity(i) for i in range(Integer(20))]
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20]
```

```
sage: w = words.ThueMorseWord()[:1000]
sage: [w.factor_complexity(i) for i in range(20)]
[1, 2, 4, 6, 10, 12, 16, 20, 22, 24, 28, 32, 36, 40, 42, 44, 46, 48, 52, 56]
```

```
>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(1000)]
>>> [w.factor_complexity(i) for i in range(Integer(20))]
[1, 2, 4, 6, 10, 12, 16, 20, 22, 24, 28, 32, 36, 40, 42, 44, 46, 48, 52, 56]
```

factor_iterator(*n=None*)

Generate distinct factors of `self`.

INPUT:

- `n` – integer or `None`

OUTPUT:

If `n` is an integer, returns an iterator over all distinct factors of length `n`. If `n` is `None`, returns an iterator generating all distinct factors.

EXAMPLES:

```
sage: w = Word('1213121')
sage: sorted( w.factor_iterator(0) )
[word: ]
sage: sorted( w.factor_iterator(10) )
[]
sage: sorted( w.factor_iterator(1) )
[word: 1, word: 2, word: 3]
sage: sorted( w.factor_iterator(4) )
[word: 1213, word: 1312, word: 2131, word: 3121]
sage: sorted( w.factor_iterator() )
[word: , word: 1, word: 12, word: 121, word: 1213, word: 12131, word: 121312,␣
↪word: 1213121, word: 13, word: 131, word: 1312, word: 13121, word: 2, word:␣
↪21, word: 213, word: 2131, word: 21312, word: 213121, word: 3, word: 31,␣
↪word: 312, word: 3121]
```

```
>>> from sage.all import *
>>> w = Word('1213121')
>>> sorted( w.factor_iterator(Integer(0)) )
[word: ]
>>> sorted( w.factor_iterator(Integer(10)) )
[]
>>> sorted( w.factor_iterator(Integer(1)) )
[word: 1, word: 2, word: 3]
>>> sorted( w.factor_iterator(Integer(4)) )
[word: 1213, word: 1312, word: 2131, word: 3121]
>>> sorted( w.factor_iterator() )
```

(continues on next page)

(continued from previous page)

```
[word: , word: 1, word: 12, word: 121, word: 1213, word: 12131, word: 121312,␣
↪word: 1213121, word: 13, word: 131, word: 1312, word: 13121, word: 2, word:␣

>>> sorted( xxx.factor_iterator() )
```

(continues on next page)

(continued from previous page)

```
[word: , word: x, word: xx, word: xxx]
```

```
sage: e = Word()
sage: sorted( e.factor_iterator(0) )
[word: ]
sage: sorted( e.factor_iterator(17) )
[]
sage: sorted( e.factor_iterator() )
[word: ]
```

```
>>> from sage.all import *
>>> e = Word()
>>> sorted( e.factor_iterator(Integer(0)) )
[word: ]
>>> sorted( e.factor_iterator(Integer(17)) )
[]
>>> sorted( e.factor_iterator() )
[word: ]
```

factor_set (*n=None*, *algorithm='suffix tree'*)

Return the set of factors (of length `n`) of `self`.

INPUT:

- `n` – integer or `None` (default: `None`)
- `algorithm` – string (default: `'suffix tree'`), takes the following values:
  - `'suffix tree'` – construct and use the suffix tree of the word
  - `'naive'` – algorithm uses a sliding window

OUTPUT:

If `n` is an integer, returns the set of all distinct factors of length `n`. If `n` is `None`, returns the set of all distinct factors.

EXAMPLES:

```
sage: w = Word('121')
sage: sorted(w.factor_set())
[word: , word: 1, word: 12, word: 121, word: 2, word: 21]
sage: sorted(w.factor_set(algorithm='naive'))
[word: , word: 1, word: 12, word: 121, word: 2, word: 21]
```

```
>>> from sage.all import *
>>> w = Word('121')
>>> sorted(w.factor_set())
[word: , word: 1, word: 12, word: 121, word: 2, word: 21]
>>> sorted(w.factor_set(algorithm='naive'))
[word: , word: 1, word: 12, word: 121, word: 2, word: 21]
```

```
sage: w = Word('1213121')
sage: for i in range(w.length()): sorted(w.factor_set(i))
[word: ]
```

(continues on next page)

(continued from previous page)

```
[word: 1, word: 2, word: 3]
[word: 12, word: 13, word: 21, word: 31]
[word: 121, word: 131, word: 213, word: 312]
[word: 1213, word: 1312, word: 2131, word: 3121]
[word: 12131, word: 13121, word: 21312]
[word: 121312, word: 213121]
```

```
>>> from sage.all import *
>>> w = Word('1213121')
>>> for i in range(w.length()): sorted(w.factor_set(i))
[word: ]
[word: 1, word: 2, word: 3]
[word: 12, word: 13, word: 21, word: 31]
[word: 121, word: 131, word: 213, word: 312]
[word: 1213, word: 1312, word: 2131, word: 3121]
[word: 12131, word: 13121, word: 21312]
[word: 121312, word: 213121]
```

```
sage: w = Word([1,2,1,2,3])
sage: s = w.factor_set()
sage: sorted(s)
[word: , word: 1, word: 12, word: 121, word: 1212, word: 12123, word: 123,␣
↪word: 2, word: 21, word: 212, word: 2123, word: 23, word: 3]
```

```
>>> from sage.all import *
>>> w = Word([Integer(1),Integer(2),Integer(1),Integer(2),Integer(3)])
>>> s = w.factor_set()
>>> sorted(s)
[word: , word: 1, word: 12, word: 121, word: 1212, word: 12123, word: 123,␣
↪word: 2, word: 21, word: 212, word: 2123, word: 23, word: 3]
```

find(*sub*, *start=0*, *end=None*)

Return the index of the first occurrence of `sub` in `self`, such that `sub` is contained within `self[start:end]`. Return -1 on failure.

INPUT:

- `sub` – string, list, tuple or word to search for
- `start` – nonnegative integer (default: 0) specifying the position from which to start the search
- `end` – nonnegative integer (default: `None`); specifying the position at which the search must stop. If `None`, then the search is performed up to the end of the string.

OUTPUT: nonnegative integer or -1

EXAMPLES:

```
sage: w = Word([0,1,0,0,1])
sage: w.find(Word([1,0]))
1
```

```
>>> from sage.all import *
>>> w = Word([Integer(0),Integer(1),Integer(0),Integer(0),Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> w.find(Word([Integer(1),Integer(0)]))
1
```

The `sub` argument can also be a tuple or a list:

```
sage: w.find([1,0])
1
sage: w.find((1,0))
1
```

```
>>> from sage.all import *
>>> w.find([Integer(1),Integer(0)])
1
>>> w.find((Integer(1),Integer(0)))
1
```

Examples using `start` and `end`:

```
sage: w.find(Word([0,1]), start=1)
3
sage: w.find(Word([0,1]), start=1, end=5)
3
sage: w.find(Word([0,1]), start=1, end=4) == -1
True
sage: w.find(Word([1,1])) == -1
True
sage: w.find("aa")
-1
```

```
>>> from sage.all import *
>>> w.find(Word([Integer(0),Integer(1)]), start=Integer(1))
3
>>> w.find(Word([Integer(0),Integer(1)]), start=Integer(1), end=Integer(5))
3
>>> w.find(Word([Integer(0),Integer(1)]), start=Integer(1), end=Integer(4))␣
↪== -Integer(1)
True
>>> w.find(Word([Integer(1),Integer(1)])) == -Integer(1)
True
>>> w.find("aa")
-1
```

Instances of `Word_str` handle string inputs as well:

```
sage: w = Word('abac')
sage: w.find('a')
0
sage: w.find('ba')
1
```

```
>>> from sage.all import *
>>> w = Word('abac')
```

(continues on next page)

(continued from previous page)

```
>>> w.find('a')
0
>>> w.find('ba')
1
```

foata_bijection()

Return word `self` under the Foata bijection.

The Foata bijection ϕ is a bijection on the set of words of given content (by a slight generalization of Section 2 in [FS1978]). It can be defined by induction on the size of the word: Given a word $w_1 w_2 \cdots w_n$, start with $\phi(w_1) = w_1$. At the i-th step, if $\phi(w_1 w_2 \cdots w_i) = v_1 v_2 \cdots v_i$, we define $\phi(w_1 w_2 \cdots w_i w_{i+1})$ by placing w_{i+1} on the end of the word $v_1 v_2 \cdots v_i$ and breaking the word up into blocks as follows. If $w_{i+1} \geq v_i$, place a vertical line to the right of each v_k for which $w_{i+1} \geq v_k$. Otherwise, if $w_{i+1} < v_i$, place a vertical line to the right of each v_k for which $w_{i+1} < v_k$. In either case, place a vertical line at the start of the word as well. Now, within each block between vertical lines, cyclically shift the entries one place to the right.

For instance, to compute $\phi([4, 1, 5, 4, 2, 2, 3])$, the sequence of words is

- 4,
- $|4|1 \to 41$,
- $|4|1|5 \to 415$,
- $|415|4 \to 5414$,
- $|5|4|14|2 \to 54412$,
- $|5441|2|2 \to 154422$,
- $|1|5442|2|3 \to 1254423$.

So $\phi([4, 1, 5, 4, 2, 2, 3]) = [1, 2, 5, 4, 4, 2, 3]$.

See also

Foata bijection on Permutations.

EXAMPLES:

```
sage: w = Word([2,2,2,1,1,1])
sage: w.foata_bijection()
word: 112221
sage: w = Word([2,2,1,2,2,2,1,1,2,1])
sage: w.foata_bijection()
word: 2122212211
sage: w = Word([4,1,5,4,2,2,3])
sage: w.foata_bijection()
word: 1254423
```

```
>>> from sage.all import *
>>> w = Word([Integer(2),Integer(2),Integer(2),Integer(1),Integer(1),
↪Integer(1)])
>>> w.foata_bijection()
word: 112221
>>> w = Word([Integer(2),Integer(2),Integer(1),Integer(2),Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(2),Integer(1),Integer(1),Integer(2),Integer(1)])
>>> w.foata_bijection()
word: 2122212211
>>> w = Word([Integer(4),Integer(1),Integer(5),Integer(4),Integer(2),
↪Integer(2),Integer(3)])
>>> w.foata_bijection()
word: 1254423
```

good_suffix_table()

Return a table of the maximum skip you can do in order not to miss a possible occurrence of `self` in a word.

This is a part of the Boyer-Moore algorithm to find factors. See [BM1977].

EXAMPLES:

```
sage: Word('121321').good_suffix_table()
[5, 5, 5, 5, 3, 3, 1]
sage: Word('12412').good_suffix_table()
[3, 3, 3, 3, 3, 1]
```

```
>>> from sage.all import *
>>> Word('121321').good_suffix_table()
[5, 5, 5, 5, 3, 3, 1]
>>> Word('12412').good_suffix_table()
[3, 3, 3, 3, 3, 1]
```

has_period(p)

Return `True` if `self` has the period p, `False` otherwise.

Note

By convention, integers greater than the length of `self` are periods of `self`.

INPUT:

- `p` – integer to check if it is a period of `self`

EXAMPLES:

```
sage: w = Word('ababa')
sage: w.has_period(2)
True
sage: w.has_period(3)
False
sage: w.has_period(4)
True
sage: w.has_period(-1)
False
sage: w.has_period(5)
True
sage: w.has_period(6)
True
```

```
>>> from sage.all import *
>>> w = Word('ababa')
>>> w.has_period(Integer(2))
True
>>> w.has_period(Integer(3))
False
>>> w.has_period(Integer(4))
True
>>> w.has_period(-Integer(1))
False
>>> w.has_period(Integer(5))
True
>>> w.has_period(Integer(6))
True
```

has_prefix(*other*)

Test whether `self` has `other` as a prefix.

INPUT:

- `other` – a word, or data describing a word

OUTPUT: boolean

EXAMPLES:

```
sage: w = Word("abbabaababababa")
sage: u = Word("abbab")
sage: w.has_prefix(u)
True
sage: u.has_prefix(w)
False
sage: u.has_prefix("abbab")
True
```

```
>>> from sage.all import *
>>> w = Word("abbabaababababa")
>>> u = Word("abbab")
>>> w.has_prefix(u)
True
>>> u.has_prefix(w)
False
>>> u.has_prefix("abbab")
True
```

```
sage: w = Word([0,1,1,0,1,0,0,1,0,1,0,1,0])
sage: u = Word([0,1,1,0,1])
sage: w.has_prefix(u)
True
sage: u.has_prefix(w)
False
sage: u.has_prefix([0,1,1,0,1])
True
```

```
>>> from sage.all import *
>>> w = Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),
↪Integer(0),Integer(0),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0)])
>>> u = Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1)])
>>> w.has_prefix(u)
True
>>> u.has_prefix(w)
False
>>> u.has_prefix([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1)])
True
```

has_suffix(*other*)

Test whether `self` has `other` as a suffix.

> **Note**
>
> Some word datatype classes, like *WordDatatype_str*, override this method.

INPUT:

- `other` – a word, or data describing a word

OUTPUT: boolean

EXAMPLES:

```
sage: w = Word("abbabaababababa")
sage: u = Word("ababa")
sage: w.has_suffix(u)
True
sage: u.has_suffix(w)
False
sage: u.has_suffix("ababa")
True
```

```
>>> from sage.all import *
>>> w = Word("abbabaababababa")
>>> u = Word("ababa")
>>> w.has_suffix(u)
True
>>> u.has_suffix(w)
False
>>> u.has_suffix("ababa")
True
```

```
sage: w = Word([0,1,1,0,1,0,0,1,0,1,0,1,0])
sage: u = Word([0,1,0,1,0])
sage: w.has_suffix(u)
True
sage: u.has_suffix(w)
False
```

(continues on next page)

(continued from previous page)

```
sage: u.has_suffix([0,1,0,1,0])
True
```

```
>>> from sage.all import *
>>> w = Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),
↪Integer(0),Integer(0),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0)])
>>> u = Word([Integer(0),Integer(1),Integer(0),Integer(1),Integer(0)])
>>> w.has_suffix(u)
True
>>> u.has_suffix(w)
False
>>> u.has_suffix([Integer(0),Integer(1),Integer(0),Integer(1),Integer(0)])
True
```

implicit_suffix_tree()

Return the implicit suffix tree of `self`.

The *suffix tree* of a word w is a compactification of the suffix trie for w. The compactification removes all nodes that have exactly one incoming edge and exactly one outgoing edge. It consists of two components: a tree and a word. Thus, instead of labelling the edges by factors of w, we can label them by indices of the occurrence of the factors in w.

Type `sage.combinat.words.suffix_trees.ImplicitSuffixTree?` for more information.

EXAMPLES:

```
sage: w = Word("cacao")
sage: w.implicit_suffix_tree()
Implicit Suffix Tree of the word: cacao
```

```
>>> from sage.all import *
>>> w = Word("cacao")
>>> w.implicit_suffix_tree()
Implicit Suffix Tree of the word: cacao
```

```
sage: w = Word([0,1,0,1,1])
sage: w.implicit_suffix_tree()
Implicit Suffix Tree of the word: 01011
```

```
>>> from sage.all import *
>>> w = Word([Integer(0),Integer(1),Integer(0),Integer(1),Integer(1)])
>>> w.implicit_suffix_tree()
Implicit Suffix Tree of the word: 01011
```

inv_lex_less(*other*)

Return `True` if `self` is inverse lexicographically less than `other`.

EXAMPLES:

```
sage: Word([1,2,4]).inv_lex_less(Word([1,3,2]))
False
```

(continues on next page)

(continued from previous page)

```
sage: Word([3,2,1]).inv_lex_less(Word([1,2,3]))
True
```

```
>>> from sage.all import *
>>> Word([Integer(1),Integer(2),Integer(4)]).inv_lex_less(Word([Integer(1),
↪Integer(3),Integer(2)]))
False
>>> Word([Integer(3),Integer(2),Integer(1)]).inv_lex_less(Word([Integer(1),
↪Integer(2),Integer(3)]))
True
```

inversions()

Return a list of the inversions of `self`. An inversion is a pair (i, j) of nonnegative integers $i < j$ such that `self[i] > self[j]`.

EXAMPLES:

```
sage: Word([1,2,3,2,2,1]).inversions()
[[1, 5], [2, 3], [2, 4], [2, 5], [3, 5], [4, 5]]
sage: Words([3,2,1])([1,2,3,2,2,1]).inversions()
[[0, 1], [0, 2], [0, 3], [0, 4], [1, 2]]
sage: Word('abbaba').inversions()
[[1, 3], [1, 5], [2, 3], [2, 5], [4, 5]]
sage: Words('ba')('abbaba').inversions()
[[0, 1], [0, 2], [0, 4], [3, 4]]
```

```
>>> from sage.all import *
>>> Word([Integer(1),Integer(2),Integer(3),Integer(2),Integer(2),Integer(1)]).
↪inversions()
[[1, 5], [2, 3], [2, 4], [2, 5], [3, 5], [4, 5]]
>>> Words([Integer(3),Integer(2),Integer(1)])([Integer(1),Integer(2),
↪Integer(3),Integer(2),Integer(2),Integer(1)]).inversions()
[[0, 1], [0, 2], [0, 3], [0, 4], [1, 2]]
>>> Word('abbaba').inversions()
[[1, 3], [1, 5], [2, 3], [2, 5], [4, 5]]
>>> Words('ba')('abbaba').inversions()
[[0, 1], [0, 2], [0, 4], [3, 4]]
```

is_balanced(*q=1*)

Return `True` if `self` is `q`-balanced, and `False` otherwise.

A finite or infinite word w is said to be *q-balanced* if for any two factors u, v of w of the same length, the difference between the number of x's in each of u and v is at most q for all letters x in the alphabet of w. A 1-balanced word is simply said to be balanced. See for instance [CFZ2000] and Chapter 2 of [Lot2002].

INPUT:

- `q` – integer (default: 1); the balance level

EXAMPLES:

```
sage: Word('1213121').is_balanced()
True
sage: Word('1122').is_balanced()
```

(continues on next page)

(continued from previous page)

```
False
sage: Word('121333121').is_balanced()
False
sage: Word('121333121').is_balanced(2)
False
sage: Word('121333121').is_balanced(3)
True
sage: Word('121122121').is_balanced()
False
sage: Word('121122121').is_balanced(2)
True
```

```
>>> from sage.all import *
>>> Word('1213121').is_balanced()
True
>>> Word('1122').is_balanced()
False
>>> Word('121333121').is_balanced()
False
>>> Word('121333121').is_balanced(Integer(2))
False
>>> Word('121333121').is_balanced(Integer(3))
True
>>> Word('121122121').is_balanced()
False
>>> Word('121122121').is_balanced(Integer(2))
True
```

is_cadence(*seq*)

Return `True` if `seq` is a cadence of `self`, and `False` otherwise.

A *cadence* is an increasing sequence of indexes that all map to the same letter.

EXAMPLES:

```
sage: Word('121132123').is_cadence([0, 2, 6])
True
sage: Word('121132123').is_cadence([0, 1, 2])
False
sage: Word('121132123').is_cadence([])
True
```

```
>>> from sage.all import *
>>> Word('121132123').is_cadence([Integer(0), Integer(2), Integer(6)])
True
>>> Word('121132123').is_cadence([Integer(0), Integer(1), Integer(2)])
False
>>> Word('121132123').is_cadence([])
True
```

is_christoffel()

Return `True` if `self` is a Christoffel word, and `False` otherwise.

The *Christoffel word* of slope p/q is obtained from the Cayley graph of $\mathbf{Z}/(p+q)\mathbf{Z}$ with generator q as follows. If $u \to v$ is an edge in the Cayley graph, then, $v = u + p \mod p + q$. Let a,`b` be the alphabet of w. Label the edge $u \to v$ by a if $u < v$ and b otherwise. The Christoffel word is the word obtained by reading the edge labels along the cycle beginning from 0.

Equivalently, w is a Christoffel word iff w is a symmetric non-empty word and $w[1 : n-1]$ is a palindrome.

See for instance [Ber2007] and [BLRS2009].

INPUT:

- `self` – word

OUTPUT: boolean; `True` if `self` is a Christoffel word, `False` otherwise

EXAMPLES:

```
sage: Word('00100101').is_christoffel()
True
sage: Word('aab').is_christoffel()
True
sage: Word().is_christoffel()
False
sage: Word('123123123').is_christoffel()
False
sage: Word('00100').is_christoffel()
False
sage: Word('0').is_christoffel()
True
```

```
>>> from sage.all import *
>>> Word('00100101').is_christoffel()
True
>>> Word('aab').is_christoffel()
True
>>> Word().is_christoffel()
False
>>> Word('123123123').is_christoffel()
False
>>> Word('00100').is_christoffel()
False
>>> Word('0').is_christoffel()
True
```

is_conjugate_with(*other*)

Return `True` if `self` is a conjugate of `other`, and `False` otherwise.

INPUT:

- `other` – a finite word

OUTPUT: boolean

EXAMPLES:

```
sage: w = Word([0..20])
sage: z = Word([7..20] + [0..6])
sage: w
```

(continues on next page)

(continued from previous page)

```
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20
sage: z
word: 7,8,9,10,11,12,13,14,15,16,17,18,19,20,0,1,2,3,4,5,6
sage: w.is_conjugate_with(z)
True
sage: z.is_conjugate_with(w)
True
sage: u = Word([4]*21)
sage: u.is_conjugate_with(w)
False
sage: u.is_conjugate_with(z)
False
```

```
>>> from sage.all import *
>>> w = Word((ellipsis_range(Integer(0),Ellipsis,Integer(20))))
>>> z = Word((ellipsis_range(Integer(7),Ellipsis,Integer(20))) + (ellipsis_
↪range(Integer(0),Ellipsis,Integer(6))))
>>> w
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20
>>> z
word: 7,8,9,10,11,12,13,14,15,16,17,18,19,20,0,1,2,3,4,5,6
>>> w.is_conjugate_with(z)
True
>>> z.is_conjugate_with(w)
True
>>> u = Word([Integer(4)]*Integer(21))
>>> u.is_conjugate_with(w)
False
>>> u.is_conjugate_with(z)
False
```

Both words must be finite:

```
sage: w = Word(iter([2]*100),length='unknown')
sage: z = Word([2]*100)
sage: z.is_conjugate_with(w) #TODO: Not implemented for word of unknown length
True
sage: wf = Word(iter([2]*100),length='finite')
sage: z.is_conjugate_with(wf)
True
sage: wf.is_conjugate_with(z)
True
```

```
>>> from sage.all import *
>>> w = Word(iter([Integer(2)]*Integer(100)),length='unknown')
>>> z = Word([Integer(2)]*Integer(100))
>>> z.is_conjugate_with(w) #TODO: Not implemented for word of unknown length
True
>>> wf = Word(iter([Integer(2)]*Integer(100)),length='finite')
>>> z.is_conjugate_with(wf)
True
>>> wf.is_conjugate_with(z)
```

(continues on next page)

(continued from previous page)

```
True
```

is_cube()

Return `True` if `self` is a cube, and `False` otherwise.

EXAMPLES:

```
sage: Word('012012012').is_cube()
True
sage: Word('01010101').is_cube()
False
sage: Word().is_cube()
True
sage: Word('012012').is_cube()
False
```

```
>>> from sage.all import *
>>> Word('012012012').is_cube()
True
>>> Word('01010101').is_cube()
False
>>> Word().is_cube()
True
>>> Word('012012').is_cube()
False
```

is_cube_free()

Return `True` if `self` does not contain cubes, and `False` otherwise.

EXAMPLES:

```
sage: Word('12312').is_cube_free()
True
sage: Word('32221').is_cube_free()
False
sage: Word().is_cube_free()
True
```

```
>>> from sage.all import *
>>> Word('12312').is_cube_free()
True
>>> Word('32221').is_cube_free()
False
>>> Word().is_cube_free()
True
```

is_empty()

Return `True` if the length of `self` is zero, and `False` otherwise.

EXAMPLES:

```
sage: Word([]).is_empty()
True
```

(continues on next page)

(continued from previous page)

```
sage: Word('a').is_empty()
False
```

```
>>> from sage.all import *
>>> Word([]).is_empty()
True
>>> Word('a').is_empty()
False
```

is_factor(*other*)

Return `True` if `self` is a factor of `other`, and `False` otherwise.

A finite word $u \in A^*$ is a *factor* of a finite word $v \in A^*$ if there exists $p, s \in A^*$ such that $v = pus$.

EXAMPLES:

```
sage: u = Word('2113')
sage: w = Word('123121332131233121132123')
sage: u.is_factor(w)
True
sage: u = Word('321')
sage: w = Word('1231241231312312312')
sage: u.is_factor(w)
False
```

```
>>> from sage.all import *
>>> u = Word('2113')
>>> w = Word('123121332131233121132123')
>>> u.is_factor(w)
True
>>> u = Word('321')
>>> w = Word('1231241231312312312')
>>> u.is_factor(w)
False
```

The empty word is factor of another word:

```
sage: Word().is_factor(Word())
True
sage: Word().is_factor(Word('a'))
True
sage: Word().is_factor(Word([1,2,3]))
True
sage: Word().is_factor(Word(lambda n:n, length=5))
True
```

```
>>> from sage.all import *
>>> Word().is_factor(Word())
True
>>> Word().is_factor(Word('a'))
True
>>> Word().is_factor(Word([Integer(1),Integer(2),Integer(3)]))
```

(continues on next page)

(continued from previous page)

```
True
>>> Word().is_factor(Word(lambda n:n, length=Integer(5)))
True
```

is_finite()

Return `True`.

EXAMPLES:

```
sage: Word([]).is_finite()
True
sage: Word('a').is_finite()
True
```

```
>>> from sage.all import *
>>> Word([]).is_finite()
True
>>> Word('a').is_finite()
True
```

is_full(*f=None*)

Return `True` if `self` has defect 0, and `False` otherwise.

A word is *full* (or *rich*) if its defect is zero (see [BHNR2004]).

If `f` is given, then the `f`-palindromic defect is used (see [PeSt2011]).

INPUT:

- `f` – involution (default: `None`) on the alphabet of `self`; it must be callable on letters as well as words (e.g. `WordMorphism`)

OUTPUT:

boolean – If `f` is `None`, whether `self` is full; otherwise, whether `self` is full of `f`-palindromes.

EXAMPLES:

```
sage: words.ThueMorseWord()[:100].is_full()
False
sage: words.FibonacciWord()[:100].is_full()
True
sage: Word('000000000000000').is_full()
True
sage: Word('011010011001').is_full()
False
sage: Word('2194').is_full()
True
sage: Word().is_full()
True
```

```
>>> from sage.all import *
>>> words.ThueMorseWord()[:Integer(100)].is_full()
False
>>> words.FibonacciWord()[:Integer(100)].is_full()
```

(continues on next page)

(continued from previous page)

```
True
>>> Word('000000000000000').is_full()
True
>>> Word('011010011001').is_full()
False
>>> Word('2194').is_full()
True
>>> Word().is_full()
True
```

```
sage: f = WordMorphism('a->b,b->a')
sage: Word().is_full(f)
True
sage: w = Word('ab')
sage: w.is_full()
True
sage: w.is_full(f)
True
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->b,b->a')
>>> Word().is_full(f)
True
>>> w = Word('ab')
>>> w.is_full()
True
>>> w.is_full(f)
True
```

```
sage: f = WordMorphism('a->b,b->a')
sage: Word('abab').is_full(f)
True
sage: Word('abba').is_full(f)
False
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->b,b->a')
>>> Word('abab').is_full(f)
True
>>> Word('abba').is_full(f)
False
```

A simple example of an infinite word full of f-palindromes:

```
sage: p = WordMorphism({0:'abc',1:'ab'})
sage: f = WordMorphism('a->b,b->a,c->c')
sage: p(words.FibonacciWord()[:50]).is_full(f)
True
sage: p(words.FibonacciWord()[:150]).is_full(f)
True
```

```
>>> from sage.all import *
>>> p = WordMorphism({Integer(0):'abc',Integer(1):'ab'})
>>> f = WordMorphism('a->b,b->a,c->c')
>>> p(words.FibonacciWord()[:Integer(50)]).is_full(f)
True
>>> p(words.FibonacciWord()[:Integer(150)]).is_full(f)
True
```

is_lyndon()

Return `True` if `self` is a Lyndon word, and `False` otherwise.

A *Lyndon word* is a non-empty word that is lexicographically smaller than each of its proper suffixes (for the given order on its alphabet). That is, w is a Lyndon word if w is non-empty and for each factorization $w = uv$ (with u, v both non-empty), we have $w < v$.

Equivalently, w is a Lyndon word iff w is a non-empty word that is lexicographically smaller than each of its proper conjugates for the given order on its alphabet.

See for instance [Lot1983].

EXAMPLES:

```
sage: Word('123132133').is_lyndon()
True
sage: Word().is_lyndon()
False
sage: Word('122112').is_lyndon()
False
```

```
>>> from sage.all import *
>>> Word('123132133').is_lyndon()
True
>>> Word().is_lyndon()
False
>>> Word('122112').is_lyndon()
False
```

is_overlap()

Return `True` if `self` is an overlap, and `False` otherwise.

EXAMPLES:

```
sage: Word('12121').is_overlap()
True
sage: Word('123').is_overlap()
False
sage: Word('1231').is_overlap()
False
sage: Word('123123').is_overlap()
False
sage: Word('1231231').is_overlap()
True
sage: Word().is_overlap()
False
```

```
>>> from sage.all import *
>>> Word('12121').is_overlap()
True
>>> Word('123').is_overlap()
False
>>> Word('1231').is_overlap()
False
>>> Word('123123').is_overlap()
False
>>> Word('1231231').is_overlap()
True
>>> Word().is_overlap()
False
```

is_palindrome(*f=None*)

Return `True` if `self` is a palindrome (or a `f`-palindrome), and `False` otherwise.

Let $f : \Sigma \to \Sigma$ be an involution that extends to a morphism on Σ^*. We say that $w \in \Sigma^*$ is a *`f`-palindrome* if $w = f(\tilde{w})$ [Lab2008]. Also called *`f`-pseudo-palindrome* [AZZ2005].

INPUT:

- `f` – involution (default: `None`) on the alphabet of `self`. It must be callable on letters as well as words (e.g. *WordMorphism*). The default value corresponds to usual palindromes, i.e., `f` equal to the identity.

EXAMPLES:

```
sage: Word('esope reste ici et se repose').is_palindrome()
False
sage: Word('esoperesteicietserepose').is_palindrome()
True
sage: Word('I saw I was I').is_palindrome()
True
sage: Word('abbcbba').is_palindrome()
True
sage: Word('abcbdba').is_palindrome()
False
```

```
>>> from sage.all import *
>>> Word('esope reste ici et se repose').is_palindrome()
False
>>> Word('esoperesteicietserepose').is_palindrome()
True
>>> Word('I saw I was I').is_palindrome()
True
>>> Word('abbcbba').is_palindrome()
True
>>> Word('abcbdba').is_palindrome()
False
```

Some f-palindromes:

```
sage: f = WordMorphism('a->b,b->a')
sage: Word('aababb').is_palindrome(f)
True
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->b,b->a')
>>> Word('aababb').is_palindrome(f)
True
```

```
sage: f = WordMorphism('a->b,b->a,c->c')
sage: Word('abacbacbab').is_palindrome(f)
True
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->b,b->a,c->c')
>>> Word('abacbacbab').is_palindrome(f)
True
```

```
sage: f = WordMorphism({'a':'b','b':'a'})
sage: Word('aababb').is_palindrome(f)
True
```

```
>>> from sage.all import *
>>> f = WordMorphism({'a':'b','b':'a'})
>>> Word('aababb').is_palindrome(f)
True
```

```
sage: f = WordMorphism({0:[1],1:[0]})
sage: w = words.ThueMorseWord()[:8]; w
word: 01101001
sage: w.is_palindrome(f)
True
```

```
>>> from sage.all import *
>>> f = WordMorphism({Integer(0):[Integer(1)],Integer(1):[Integer(0)]})
>>> w = words.ThueMorseWord()[:Integer(8)]; w
word: 01101001
>>> w.is_palindrome(f)
True
```

The word must be in the domain of the involution:

```
sage: f = WordMorphism('a->a')
sage: Word('aababb').is_palindrome(f)
Traceback (most recent call last):
...
KeyError: 'b'
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->a')
>>> Word('aababb').is_palindrome(f)
Traceback (most recent call last):
...
KeyError: 'b'
```

is_prefix(*other*)

Return `True` if `self` is a prefix of `other`, and `False` otherwise.

EXAMPLES:

```
sage: w = Word('0123456789')
sage: y = Word('012345')
sage: y.is_prefix(w)
True
sage: w.is_prefix(y)
False
sage: w.is_prefix(Word())
False
sage: Word().is_prefix(w)
True
sage: Word().is_prefix(Word())
True
```

```
>>> from sage.all import *
>>> w = Word('0123456789')
>>> y = Word('012345')
>>> y.is_prefix(w)
True
>>> w.is_prefix(y)
False
>>> w.is_prefix(Word())
False
>>> Word().is_prefix(w)
True
>>> Word().is_prefix(Word())
True
```

is_primitive()

Return `True` if `self` is primitive, and `False` otherwise.

A finite word w is *primitive* if it is not a positive integer power of a shorter word.

EXAMPLES:

```
sage: Word('1231').is_primitive()
True
sage: Word('111').is_primitive()
False
```

```
>>> from sage.all import *
>>> Word('1231').is_primitive()
True
>>> Word('111').is_primitive()
False
```

is_proper_prefix(*other*)

Return `True` if `self` is a proper prefix of `other`, and `False` otherwise.

EXAMPLES:

```
sage: Word('12').is_proper_prefix(Word('123'))
True
sage: Word('12').is_proper_prefix(Word('12'))
False
sage: Word().is_proper_prefix(Word('123'))
True
sage: Word('123').is_proper_prefix(Word('12'))
False
sage: Word().is_proper_prefix(Word())
False
```

```
>>> from sage.all import *
>>> Word('12').is_proper_prefix(Word('123'))
True
>>> Word('12').is_proper_prefix(Word('12'))
False
>>> Word().is_proper_prefix(Word('123'))
True
>>> Word('123').is_proper_prefix(Word('12'))
False
>>> Word().is_proper_prefix(Word())
False
```

is_proper_suffix(*other*)

Return `True` if `self` is a proper suffix of `other`, and `False` otherwise.

EXAMPLES:

```
sage: Word('23').is_proper_suffix(Word('123'))
True
sage: Word('12').is_proper_suffix(Word('12'))
False
sage: Word().is_proper_suffix(Word('123'))
True
sage: Word('123').is_proper_suffix(Word('12'))
False
```

```
>>> from sage.all import *
>>> Word('23').is_proper_suffix(Word('123'))
True
>>> Word('12').is_proper_suffix(Word('12'))
False
>>> Word().is_proper_suffix(Word('123'))
True
>>> Word('123').is_proper_suffix(Word('12'))
False
```

is_quasiperiodic()

Return `True` if `self` is quasiperiodic, and `False` otherwise.

A finite or infinite word w is *quasiperiodic* if it can be constructed by concatenations and superpositions of one of its proper factors u, which is called a *quasiperiod* of w. See for instance [AE1993], [Mar2004], and [GLR2008].

EXAMPLES:

```
sage: Word('abaababaabaababaaba').is_quasiperiodic()
True
sage: Word('abacaba').is_quasiperiodic()
False
sage: Word('a').is_quasiperiodic()
False
sage: Word().is_quasiperiodic()
False
sage: Word('abaaba').is_quasiperiodic()
True
```

```
>>> from sage.all import *
>>> Word('abaababaabaababaaba').is_quasiperiodic()
True
>>> Word('abacaba').is_quasiperiodic()
False
>>> Word('a').is_quasiperiodic()
False
>>> Word().is_quasiperiodic()
False
>>> Word('abaaba').is_quasiperiodic()
True
```

is_rich(*f=None*)

alias of *is_full()*.

is_smooth_prefix()

Return `True` if `self` is the prefix of a smooth word, and `False` otherwise.

Let $A_k = \{1, \ldots, k\}$, $k \geq 2$. An infinite word w in A_k^ω is said to be *smooth* if and only if for all positive integers m, $\Delta^m(w)$ is in A_k^ω, where $\Delta(w)$ is the word obtained from w by composing the length of consecutive runs of the same letter in w. See for instance [BL2003] and [BDLV2006].

INPUT:

- `self` – must be a word over the integers to get something other than `False`

OUTPUT: boolean; whether `self` is a smooth prefix or not

EXAMPLES:

```
sage: W = Words([1, 2])
sage: W([1, 1, 2, 2, 1, 2, 1, 1]).is_smooth_prefix()
True
sage: W([1, 2, 1, 2, 1, 2]).is_smooth_prefix()
False
```

```
>>> from sage.all import *
>>> W = Words([Integer(1), Integer(2)])
>>> W([Integer(1), Integer(1), Integer(2), Integer(2), Integer(1), Integer(2),
↪ Integer(1), Integer(1)]).is_smooth_prefix()
True
>>> W([Integer(1), Integer(2), Integer(1), Integer(2), Integer(1),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(2)]).is_smooth_prefix()
False
```

is_square()

Return `True` if `self` is a square, and `False` otherwise.

EXAMPLES:

```
sage: Word([1,0,0,1]).is_square()
False
sage: Word('1212').is_square()
True
sage: Word('1213').is_square()
False
sage: Word('12123').is_square()
False
sage: Word().is_square()
True
```

```
>>> from sage.all import *
>>> Word([Integer(1),Integer(0),Integer(0),Integer(1)]).is_square()
False
>>> Word('1212').is_square()
True
>>> Word('1213').is_square()
False
>>> Word('12123').is_square()
False
>>> Word().is_square()
True
```

is_square_free()

Return `True` if `self` does not contain squares, and `False` otherwise.

EXAMPLES:

```
sage: Word('12312').is_square_free()
True
sage: Word('31212').is_square_free()
False
sage: Word().is_square_free()
True
```

```
>>> from sage.all import *
>>> Word('12312').is_square_free()
True
>>> Word('31212').is_square_free()
False
>>> Word().is_square_free()
True
```

is_sturmian_factor()

Tell whether `self` is a factor of a Sturmian word.

The finite word `self` must be defined on a two-letter alphabet.

Equivalently, tells whether `self` is balanced. The advantage over the `is_balanced` method is that this one runs in linear time whereas `is_balanced` runs in quadratic time.

OUTPUT: boolean

EXAMPLES:

```
sage: w = Word('01110110110111011101',alphabet='01')
sage: w.is_sturmian_factor()
True
```

```
>>> from sage.all import *
>>> w = Word('01110110110111011101',alphabet='01')
>>> w.is_sturmian_factor()
True
```

```
sage: words.LowerMechanicalWord(random(),alphabet='01')[:100].is_sturmian_
↪factor()
True
sage: words.CharacteristicSturmianWord(random())[:100].is_sturmian_factor()  ␣
↪          # needs sage.rings.real_mpfr
True
```

```
>>> from sage.all import *
>>> words.LowerMechanicalWord(random(),alphabet='01')[:Integer(100)].is_
↪sturmian_factor()
True
>>> words.CharacteristicSturmianWord(random())[:Integer(100)].is_sturmian_
↪factor()             # needs sage.rings.real_mpfr
True
```

```
sage: w = Word('aabb',alphabet='ab')
sage: w.is_sturmian_factor()
False

sage: s1 = WordMorphism('a->ab,b->b')
sage: s2 = WordMorphism('a->ba,b->b')
sage: s3 = WordMorphism('a->a,b->ba')
sage: s4 = WordMorphism('a->a,b->ab')
sage: W = Words('ab')
sage: w = W('ab')
sage: for i in range(8): w = choice([s1,s2,s3,s4])(w)
sage: w.is_sturmian_factor()
True
```

```
>>> from sage.all import *
>>> w = Word('aabb',alphabet='ab')
>>> w.is_sturmian_factor()
False

>>> s1 = WordMorphism('a->ab,b->b')
```

(continues on next page)

(continued from previous page)

```
>>> s2 = WordMorphism('a->ba,b->b')
>>> s3 = WordMorphism('a->a,b->ba')
>>> s4 = WordMorphism('a->a,b->ab')
>>> W = Words('ab')
>>> w = W('ab')
>>> for i in range(Integer(8)): w = choice([s1,s2,s3,s4])(w)
>>> w.is_sturmian_factor()
True
```

Famous words:

```
sage: words.FibonacciWord()[:100].is_sturmian_factor()
True
sage: words.ThueMorseWord()[:1000].is_sturmian_factor()
False
sage: words.KolakoskiWord()[:1000].is_sturmian_factor()
False
```

```
>>> from sage.all import *
>>> words.FibonacciWord()[:Integer(100)].is_sturmian_factor()
True
>>> words.ThueMorseWord()[:Integer(1000)].is_sturmian_factor()
False
>>> words.KolakoskiWord()[:Integer(1000)].is_sturmian_factor()
False
```

See [Arn2002], [Ser1985], and [SU2009].

AUTHOR:

- Thierry Monteil

is_subword_of(*other*)

Return `True` if `self` is a subword of `other`, and `False` otherwise.

A finite word u is a *subword* of a finite word v if u is a subsequence of v. See Chapter 6 on Subwords in [Lot1997].

Some references define subword as a consecutive subsequence. Use *`is_factor()`* if this is what you need.

INPUT:

- `other` – a finite word

EXAMPLES:

```
sage: Word('bb').is_subword_of(Word('ababa'))
True
sage: Word('bbb').is_subword_of(Word('ababa'))
False
```

```
>>> from sage.all import *
>>> Word('bb').is_subword_of(Word('ababa'))
True
>>> Word('bbb').is_subword_of(Word('ababa'))
False
```

```
sage: Word().is_subword_of(Word('123'))
True
sage: Word('123').is_subword_of(Word('3211333213233321'))
True
sage: Word('321').is_subword_of(Word('11122211211222133111222332'))
False
```

```
>>> from sage.all import *
>>> Word().is_subword_of(Word('123'))
True
>>> Word('123').is_subword_of(Word('3211333213233321'))
True
>>> Word('321').is_subword_of(Word('11122211211222133111222332'))
False
```

See also

longest_common_subword() number_of_subword_occurrences() is_factor()

is_suffix(*other*)

Return `True` if `self` is a suffix of `other`, and `False` otherwise.

EXAMPLES:

```
sage: w = Word('0123456789')
sage: y = Word('56789')
sage: y.is_suffix(w)
True
sage: w.is_suffix(y)
False
sage: Word('579').is_suffix(w)
False
sage: Word().is_suffix(y)
True
sage: w.is_suffix(Word())
False
sage: Word().is_suffix(Word())
True
```

```
>>> from sage.all import *
>>> w = Word('0123456789')
>>> y = Word('56789')
>>> y.is_suffix(w)
True
>>> w.is_suffix(y)
False
>>> Word('579').is_suffix(w)
False
>>> Word().is_suffix(y)
True
>>> w.is_suffix(Word())
```

(continues on next page)

(continued from previous page)

```
False
>>> Word().is_suffix(Word())
True
```

is_symmetric(*f=None*)

Return `True` if `self` is symmetric (or `f`-symmetric), and `False` otherwise.

A word is *symmetric* (resp. *f-symmetric*) if it is the product of two palindromes (resp. *f*-palindromes). See [BHNR2004] and [DeLuca2006].

INPUT:

- `f` – involution (default: `None`) on the alphabet of `self`; it must be callable on letters as well as words (e.g. `WordMorphism`)

EXAMPLES:

```
sage: Word('abbabab').is_symmetric()
True
sage: Word('ababa').is_symmetric()
True
sage: Word('aababaabba').is_symmetric()
False
sage: Word('aabbbaababba').is_symmetric()
False
sage: f = WordMorphism('a->b,b->a')
sage: Word('aabbbaababba').is_symmetric(f)
True
```

```
>>> from sage.all import *
>>> Word('abbabab').is_symmetric()
True
>>> Word('ababa').is_symmetric()
True
>>> Word('aababaabba').is_symmetric()
False
>>> Word('aabbbaababba').is_symmetric()
False
>>> f = WordMorphism('a->b,b->a')
>>> Word('aabbbaababba').is_symmetric(f)
True
```

is_tangent()

Tell whether `self` is a tangent word.

The finite word `self` must be defined on a two-letter alphabet.

A binary word is said to be *tangent* if it can appear in infinitely many cutting sequences of a smooth curve, where each cutting sequence is observed on a progressively smaller grid.

This class of words strictly contains the class of 1-balanced words, and is strictly contained in the class of 2-balanced words.

This method runs in linear time.

OUTPUT: boolean

EXAMPLES:

```
sage: w = Word('01110110110111011101',alphabet='01')
sage: w.is_tangent()
True
```

```
>>> from sage.all import *
>>> w = Word('01110110110111011101',alphabet='01')
>>> w.is_tangent()
True
```

Some tangent words may not be balanced:

```
sage: Word('aabb',alphabet='ab').is_balanced()
False
sage: Word('aabb',alphabet='ab').is_tangent()
True
```

```
>>> from sage.all import *
>>> Word('aabb',alphabet='ab').is_balanced()
False
>>> Word('aabb',alphabet='ab').is_tangent()
True
```

Some 2-balanced words may not be tangent:

```
sage: Word('aaabb',alphabet='ab').is_tangent()
False
sage: Word('aaabb',alphabet='ab').is_balanced(2)
True
```

```
>>> from sage.all import *
>>> Word('aaabb',alphabet='ab').is_tangent()
False
>>> Word('aaabb',alphabet='ab').is_balanced(Integer(2))
True
```

Famous words:

```
sage: words.FibonacciWord()[:100].is_tangent()
True
sage: words.ThueMorseWord()[:1000].is_tangent()
True
sage: words.KolakoskiWord()[:1000].is_tangent()
False
```

```
>>> from sage.all import *
>>> words.FibonacciWord()[:Integer(100)].is_tangent()
True
>>> words.ThueMorseWord()[:Integer(1000)].is_tangent()
True
>>> words.KolakoskiWord()[:Integer(1000)].is_tangent()
False
```

See [Mon2010].

AUTHOR:

- Thierry Monteil

is_yamanouchi(*n=None*)

Return whether `self` is Yamanouchi.

A word w is Yamanouchi if, when read from right to left, it always has weakly more i's than $i+1$'s for all i that appear in w.

INPUT:

- `n` – (optional) an integer specifying the maximal letter in the alphabet

EXAMPLES:

```
sage: w = Word([1,2,4,3,2,2,2])
sage: w.is_yamanouchi()
False
sage: w = Word([2,3,4,3,1,2,1,1,2,1])
sage: w.is_yamanouchi()
True
sage: w = Word([3,1])
sage: w.is_yamanouchi(n=3)
False
sage: w.is_yamanouchi()
True
sage: w = Word([3,1],alphabet=[1,2,3])
sage: w.is_yamanouchi()
False
sage: w = Word([2,1,1,2])
sage: w.is_yamanouchi()
False
```

```
>>> from sage.all import *
>>> w = Word([Integer(1),Integer(2),Integer(4),Integer(3),Integer(2),
...Integer(2),Integer(2)])
>>> w.is_yamanouchi()
False
>>> w = Word([Integer(2),Integer(3),Integer(4),Integer(3),Integer(1),
...Integer(2),Integer(1),Integer(1),Integer(2),Integer(1)])
>>> w.is_yamanouchi()
True
>>> w = Word([Integer(3),Integer(1)])
>>> w.is_yamanouchi(n=Integer(3))
False
>>> w.is_yamanouchi()
True
>>> w = Word([Integer(3),Integer(1)],alphabet=[Integer(1),Integer(2),
...Integer(3)])
>>> w.is_yamanouchi()
False
>>> w = Word([Integer(2),Integer(1),Integer(1),Integer(2)])
>>> w.is_yamanouchi()
False
```

iterated_left_palindromic_closure(*f=None*)

Return the iterated left (f-)palindromic closure of self.

INPUT:

- f – involution (default: None) on the alphabet of self; it must be callable on letters as well as words (e.g. WordMorphism)

OUTPUT: word; the left iterated f-palindromic closure of self

EXAMPLES:

```
sage: Word('123').iterated_left_palindromic_closure()
word: 3231323
sage: f = WordMorphism('a->b,b->a')
sage: Word('ab').iterated_left_palindromic_closure(f=f)
word: abbaab
sage: Word('aab').iterated_left_palindromic_closure(f=f)
word: abbaabbaab
```

```
>>> from sage.all import *
>>> Word('123').iterated_left_palindromic_closure()
word: 3231323
>>> f = WordMorphism('a->b,b->a')
>>> Word('ab').iterated_left_palindromic_closure(f=f)
word: abbaab
>>> Word('aab').iterated_left_palindromic_closure(f=f)
word: abbaabbaab
```

lacunas(*f=None*)

Return the list of all the lacunas of self.

A *lacuna* is a position in a word where the longest (f-)palindromic suffix is not unioccurrent (see [BMBL2008]).

INPUT:

- f – involution (default: None) on the alphabet of self. It must be callable on letters as well as words (e.g. WordMorphism). The default value corresponds to usual palindromes, i.e., f equal to the identity.

OUTPUT: list of all the lacunas of self

EXAMPLES:

```
sage: w = Word([0,1,1,2,3,4,5,1,13,3])
sage: w.lacunas()
[7, 9]
sage: words.ThueMorseWord()[:100].lacunas()
[8, 9, 24, 25, 32, 33, 34, 35, 36, 37, 38, 39, 96, 97, 98, 99]
sage: f = WordMorphism({0:[1],1:[0]})
sage: words.ThueMorseWord()[:50].lacunas(f)
[0, 2, 4, 12, 16, 17, 18, 19, 48, 49]
```

```
>>> from sage.all import *
>>> w = Word([Integer(0),Integer(1),Integer(1),Integer(2),Integer(3),
↪Integer(4),Integer(5),Integer(1),Integer(13),Integer(3)])
>>> w.lacunas()
```

(continues on next page)

(continued from previous page)

```
[7, 9]
>>> words.ThueMorseWord()[:Integer(100)].lacunas()
[8, 9, 24, 25, 32, 33, 34, 35, 36, 37, 38, 39, 96, 97, 98, 99]
>>> f = WordMorphism({Integer(0):[Integer(1)],Integer(1):[Integer(0)]})
>>> words.ThueMorseWord()[:Integer(50)].lacunas(f)
[0, 2, 4, 12, 16, 17, 18, 19, 48, 49]
```

last_position_dict()

Return a dictionary that contains the last position of each letter in `self`.

EXAMPLES:

```
sage: Word('1231232').last_position_dict()
{'1': 3, '2': 6, '3': 5}
```

```
>>> from sage.all import *
>>> Word('1231232').last_position_dict()
{'1': 3, '2': 6, '3': 5}
```

left_special_factors(*n=None*)

Return the left special factors (of length `n`).

A factor u of a word w is *left special* if there are two distinct letters a and b such that au and bu are factors of w.

INPUT:

- `n` – integer (default: `None`); if `None`, it returns all left special factors

OUTPUT: list of words

EXAMPLES:

```
sage: alpha, beta, x = 0.54, 0.294, 0.1415
sage: w = words.CodingOfRotationWord(alpha, beta, x)[:40]
sage: for i in range(5):
....:     print("{} {}".format(i, sorted(w.left_special_factors(i))))
0 [word: ]
1 [word: 0]
2 [word: 00, word: 01]
3 [word: 000, word: 010]
4 [word: 0000, word: 0101]
```

```
>>> from sage.all import *
>>> alpha, beta, x = RealNumber('0.54'), RealNumber('0.294'), RealNumber('0.
↪1415')
>>> w = words.CodingOfRotationWord(alpha, beta, x)[:Integer(40)]
>>> for i in range(Integer(5)):
...     print("{} {}".format(i, sorted(w.left_special_factors(i))))
0 [word: ]
1 [word: 0]
2 [word: 00, word: 01]
3 [word: 000, word: 010]
4 [word: 0000, word: 0101]
```

left_special_factors_iterator(*n=None*)

Return an iterator over the left special factors (of length `n`).

A factor u of a word w is *left special* if there are two distinct letters a and b such that au and bu are factors of w.

INPUT:

- `n` – integer (default: `None`); if `None`, it returns an iterator over all left special factors

EXAMPLES:

```
sage: alpha, beta, x = 0.54, 0.294, 0.1415
sage: w = words.CodingOfRotationWord(alpha, beta, x)[:40]
sage: sorted(w.left_special_factors_iterator(3))
[word: 000, word: 010]
sage: sorted(w.left_special_factors_iterator(4))
[word: 0000, word: 0101]
sage: sorted(w.left_special_factors_iterator(5))
[word: 00000, word: 01010]
```

```
>>> from sage.all import *
>>> alpha, beta, x = RealNumber('0.54'), RealNumber('0.294'), RealNumber('0.
↪1415')
>>> w = words.CodingOfRotationWord(alpha, beta, x)[:Integer(40)]
>>> sorted(w.left_special_factors_iterator(Integer(3)))
[word: 000, word: 010]
>>> sorted(w.left_special_factors_iterator(Integer(4)))
[word: 0000, word: 0101]
>>> sorted(w.left_special_factors_iterator(Integer(5)))
[word: 00000, word: 01010]
```

length()

Return the length of `self`.

length_border()

Return the length of the border of `self`.

The *border* of a word is the longest word that is both a proper prefix and a proper suffix of `self`.

EXAMPLES:

```
sage: Word('121').length_border()
1
sage: Word('1').length_border()
0
sage: Word('1212').length_border()
2
sage: Word('111').length_border()
2
sage: Word().length_border() is None
True
```

```
>>> from sage.all import *
>>> Word('121').length_border()
1
```

(continues on next page)

(continued from previous page)

```
>>> Word('1').length_border()
0
>>> Word('1212').length_border()
2
>>> Word('111').length_border()
2
>>> Word().length_border() is None
True
```

length_maximal_palindrome(*j*, *m=None*, *f=None*)

Return the length of the longest palindrome centered at position `j`.

INPUT:

- `j` – rational; position of the symmetry axis of the palindrome. Must return an integer when doubled. It is an integer when the center of the palindrome is a letter.
- `m` – integer (default: `None`); minimal length of palindrome, if known. The parity of `m` can't be the same as the parity of `2j`.
- `f` – involution (default: `None`) on the alphabet; it must be callable on letters as well as words (e.g. `WordMorphism`)

OUTPUT: length of the longest `f`-palindrome centered at position `j`

EXAMPLES:

```
sage: Word('01001010').length_maximal_palindrome(3/2)
0
sage: Word('01101001').length_maximal_palindrome(3/2)
4
sage: Word('01010').length_maximal_palindrome(j=3, f='0->1,1->0')
0
sage: Word('01010').length_maximal_palindrome(j=2.5, f='0->1,1->0')
4
sage: Word('0222220').length_maximal_palindrome(3, f='0->1,1->0,2->2')
5
```

```
>>> from sage.all import *
>>> Word('01001010').length_maximal_palindrome(Integer(3)/Integer(2))
0
>>> Word('01101001').length_maximal_palindrome(Integer(3)/Integer(2))
4
>>> Word('01010').length_maximal_palindrome(j=Integer(3), f='0->1,1->0')
0
>>> Word('01010').length_maximal_palindrome(j=RealNumber('2.5'), f='0->1,1->0
↪')
4
>>> Word('0222220').length_maximal_palindrome(Integer(3), f='0->1,1->0,2->2')
5
```

```
sage: w = Word('abcdcbaxyzzyx')
sage: w.length_maximal_palindrome(3)
7
```

(continues on next page)

(continued from previous page)

```
sage: w.length_maximal_palindrome(3, 3)
7
sage: w.length_maximal_palindrome(3.5)
0
sage: w.length_maximal_palindrome(9.5)
6
sage: w.length_maximal_palindrome(9.5, 2)
6
```

```
>>> from sage.all import *
>>> w = Word('abcdcbaxyzzyx')
>>> w.length_maximal_palindrome(Integer(3))
7
>>> w.length_maximal_palindrome(Integer(3), Integer(3))
7
>>> w.length_maximal_palindrome(RealNumber('3.5'))
0
>>> w.length_maximal_palindrome(RealNumber('9.5'))
6
>>> w.length_maximal_palindrome(RealNumber('9.5'), Integer(2))
6
```

lengths_maximal_palindromes(*f=None*)

Return the length of maximal palindromes centered at each position.

INPUT:

- `f` – involution (default: `None`) on the alphabet of `self`; it must be callable on letters as well as words (e.g. `WordMorphism`)

OUTPUT: list; the length of the maximal palindrome (or `f`-palindrome) with a given symmetry axis (letter or space between two letters)

EXAMPLES:

```
sage: Word('01101001').lengths_maximal_palindromes()
[0, 1, 0, 1, 4, 1, 0, 3, 0, 3, 0, 1, 4, 1, 0, 1, 0]
sage: Word('00000').lengths_maximal_palindromes()
[0, 1, 2, 3, 4, 5, 4, 3, 2, 1, 0]
sage: Word('0').lengths_maximal_palindromes()
[0, 1, 0]
sage: Word('').lengths_maximal_palindromes()
[0]
sage: Word().lengths_maximal_palindromes()
[0]
sage: f = WordMorphism('a->b,b->a')
sage: Word('abbabaab').lengths_maximal_palindromes(f)
[0, 0, 2, 0, 0, 0, 2, 0, 8, 0, 2, 0, 0, 0, 2, 0, 0]
```

```
>>> from sage.all import *
>>> Word('01101001').lengths_maximal_palindromes()
[0, 1, 0, 1, 4, 1, 0, 3, 0, 3, 0, 1, 4, 1, 0, 1, 0]
>>> Word('00000').lengths_maximal_palindromes()
```

(continues on next page)

(continued from previous page)

```
[0, 1, 2, 3, 4, 5, 4, 3, 2, 1, 0]
>>> Word('0').lengths_maximal_palindromes()
[0, 1, 0]
>>> Word('').lengths_maximal_palindromes()
[0]
>>> Word().lengths_maximal_palindromes()
[0]
>>> f = WordMorphism('a->b,b->a')
>>> Word('abbabaab').lengths_maximal_palindromes(f)
[0, 0, 2, 0, 0, 0, 2, 0, 8, 0, 2, 0, 0, 0, 2, 0, 0]
```

lengths_unioccurrent_lps(*f=None*)

Return the list of the lengths of the unioccurrent longest (`f`)-palindromic suffixes (lps) for each non-empty prefix of `self`. No unioccurrent lps are indicated by `None`.

It corresponds to the function H_w defined in [BMBL2008] and [BMBFLR2008].

INPUT:

- `f` – involution (default: `None`) on the alphabet of `self`. It must be callable on letters as well as words (e.g. `WordMorphism`). The default value corresponds to usual palindromes, i.e., `f` equal to the identity.

OUTPUT:

a list – list of the length of the unioccurrent longest palindromic suffix (lps) for each non-empty prefix of `self`. No unioccurrent lps are indicated by `None`.

EXAMPLES:

```
sage: w = Word([0,1,1,2,3,4,5,1,13,3])
sage: w.lengths_unioccurrent_lps()
[1, 1, 2, 1, 1, 1, 1, None, 1, None]
sage: f = words.FibonacciWord()[:20]
sage: f.lengths_unioccurrent_lps() == f.lps_lengths()[1:]
True
sage: t = words.ThueMorseWord()
sage: t[:20].lengths_unioccurrent_lps()
[1, 1, 2, 4, 3, 3, 2, 4, None, None, 6, 8, 10, 12, 14, 16, 6, 8, 10, 12]
sage: f = WordMorphism({1:[0],0:[1]})
sage: t[:15].lengths_unioccurrent_lps(f)
[None, 2, None, 2, None, 4, 6, 8, 4, 6, 4, 6, None, 4, 6]
```

```
>>> from sage.all import *
>>> w = Word([Integer(0),Integer(1),Integer(1),Integer(2),Integer(3),
↪Integer(4),Integer(5),Integer(1),Integer(13),Integer(3)])
>>> w.lengths_unioccurrent_lps()
[1, 1, 2, 1, 1, 1, 1, None, 1, None]
>>> f = words.FibonacciWord()[:Integer(20)]
>>> f.lengths_unioccurrent_lps() == f.lps_lengths()[Integer(1):]
True
>>> t = words.ThueMorseWord()
>>> t[:Integer(20)].lengths_unioccurrent_lps()
[1, 1, 2, 4, 3, 3, 2, 4, None, None, 6, 8, 10, 12, 14, 16, 6, 8, 10, 12]
>>> f = WordMorphism({Integer(1):[Integer(0)],Integer(0):[Integer(1)]})
```

(continues on next page)

(continued from previous page)

```
>>> t[:Integer(15)].lengths_unioccurrent_lps(f)
[None, 2, None, 2, None, 4, 6, 8, 4, 6, 4, 6, None, 4, 6]
```

letters()

Return the list of letters that appear in this word, listed in the order of first appearance.

EXAMPLES:

```
sage: Word([0,1,1,0,1,0,0,1]).letters()
[0, 1]
sage: Word("cacao").letters()
['c', 'a', 'o']
```

```
>>> from sage.all import *
>>> Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1)]).letters()
[0, 1]
>>> Word("cacao").letters()
['c', 'a', 'o']
```

longest_backward_extension(x, y)

Compute the length of the longest factor of `self` that ends at `x` and that matches a factor that ends at `y`.

INPUT:

- `x`, `y` – positions in `self`

EXAMPLES:

```
sage: w = Word('0011001')
sage: w.longest_backward_extension(6, 2)
3
sage: w.longest_backward_extension(1, 4)
1
sage: w.longest_backward_extension(1, 3)
0
```

```
>>> from sage.all import *
>>> w = Word('0011001')
>>> w.longest_backward_extension(Integer(6), Integer(2))
3
>>> w.longest_backward_extension(Integer(1), Integer(4))
1
>>> w.longest_backward_extension(Integer(1), Integer(3))
0
```

The method also accepts negative positions indicating the distance from the end of the word (in order to be consist with how negative indices work with lists). For instance, for a word of length 7, using positions 6 and -5 is the same as using positions 6 and 2:

```
sage: w.longest_backward_extension(6, -5)
3
sage: w.longest_backward_extension(-6, 4)
1
```

```
>>> from sage.all import *
>>> w.longest_backward_extension(Integer(6), -Integer(5))
3
>>> w.longest_backward_extension(-Integer(6), Integer(4))
1
```

longest_common_subword(*other*)

Return a longest subword of `self` and `other`.

A subword of a word is a subset of the word's letters, read in the order in which they appear in the word.

For more information, see Wikipedia article Longest_common_subsequence_problem.

INPUT:

- `other` – a word

ALGORITHM:

For any indices i, j, we compute the longest common subword `lcs[i,j]` of `self[:i]` and `other[:j]`. This can be easily obtained as the longest of

- `lcs[i-1,j]`
- `lcs[i,j-1]`
- `lcs[i-1,j-1]+self[i]` if `self[i]==other[j]`

EXAMPLES:

```
sage: v1 = Word("abc")
sage: v2 = Word("ace")
sage: v1.longest_common_subword(v2)
word: ac

sage: w1 = Word("10101010101010101010101010101010101010101010")
sage: w2 = Word("00110011001100110011001100110011001100110011")
sage: w1.longest_common_subword(w2)
word: 00110011001100110011010101010
```

```
>>> from sage.all import *
>>> v1 = Word("abc")
>>> v2 = Word("ace")
>>> v1.longest_common_subword(v2)
word: ac

>>> w1 = Word("10101010101010101010101010101010101010101010")
>>> w2 = Word("00110011001100110011001100110011001100110011")
>>> w1.longest_common_subword(w2)
word: 00110011001100110011010101010
```

See also

is_subword_of()

longest_common_suffix(*other*)

Return the longest common suffix of `self` and `other`.

EXAMPLES:

```
sage: w = Word('112345678')
sage: u = Word('1115678')
sage: w.longest_common_suffix(u)
word: 5678
sage: u.longest_common_suffix(u)
word: 1115678
sage: u.longest_common_suffix(w)
word: 5678
sage: w.longest_common_suffix(w)
word: 112345678
sage: y = Word('549332345')
sage: w.longest_common_suffix(y)
word:
```

```
>>> from sage.all import *
>>> w = Word('112345678')
>>> u = Word('1115678')
>>> w.longest_common_suffix(u)
word: 5678
>>> u.longest_common_suffix(u)
word: 1115678
>>> u.longest_common_suffix(w)
word: 5678
>>> w.longest_common_suffix(w)
word: 112345678
>>> y = Word('549332345')
>>> w.longest_common_suffix(y)
word:
```

longest_forward_extension(*x*, *y*)

Compute the length of the longest factor of `self` that starts at `x` and that matches a factor that starts at `y`.

INPUT:

- `x`, `y` – positions in `self`

EXAMPLES:

```
sage: w = Word('0011001')
sage: w.longest_forward_extension(0, 4)
3
sage: w.longest_forward_extension(0, 2)
0
```

```
>>> from sage.all import *
>>> w = Word('0011001')
>>> w.longest_forward_extension(Integer(0), Integer(4))
3
>>> w.longest_forward_extension(Integer(0), Integer(2))
0
```

The method also accepts negative positions indicating the distance from the end of the word (in order to be consist with how negative indices work with lists). For instance, for a word of length 7, using positions -3 and 2 is the same as using positions 4 and 2:

```
sage: w.longest_forward_extension(1, -2)
2
sage: w.longest_forward_extension(4, -3)
3
```

```
>>> from sage.all import *
>>> w.longest_forward_extension(Integer(1), -Integer(2))
2
>>> w.longest_forward_extension(Integer(4), -Integer(3))
3
```

lps(*f=None*, *l=None*)

Return the longest palindromic (or `f`-palindromic) suffix of `self`.

INPUT:

- `f` – involution (default: `None`) on the alphabet of `self`. It must be callable on letters as well as words (e.g. `WordMorphism`)
- `l` – integer (default: `None`); the length of the longest palindrome suffix of `self[:-1]`, if known

OUTPUT: word; if `f` is `None`, the longest palindromic suffix of `self`. Otherwise, the longest `f`-palindromic suffix of `self`.

EXAMPLES:

```
sage: Word('0111').lps()
word: 111
sage: Word('011101').lps()
word: 101
sage: Word('6667').lps()
word: 7
sage: Word('abbabaab').lps()
word: baab
sage: Word().lps()
word:
sage: f = WordMorphism('a->b,b->a')
sage: Word('abbabaab').lps(f=f)
word: abbabaab
sage: w = Word('33412321')
sage: w.lps(l=3)
word: 12321
sage: Y = Word
sage: w = Y('01101001')
sage: w.lps(l=2)
word: 1001
sage: w.lps()
word: 1001
sage: w.lps(l=None)
word: 1001
sage: Y().lps(l=2)
Traceback (most recent call last):

word:
word: ba
word: ab
word: baba
word: bbabaa
word: abbabaab
```

lps_lengths(*f=None*)

Return the length of the longest palindromic suffix of each prefix.

INPUT:

- `f` – involution (default: `None`) on the alphabet of `self`. It must be callable on letters as well as words (e.g. `WordMorphism`).

OUTPUT: list; the length of the longest palindromic (or `f`-palindromic) suffix of each prefix of `self`

EXAMPLES:

```
sage: Word('01101001').lps_lengths()
[0, 1, 1, 2, 4, 3, 3, 2, 4]
sage: Word('00000').lps_lengths()
[0, 1, 2, 3, 4, 5]
sage: Word('0').lps_lengths()
[0, 1]
sage: Word('').lps_lengths()
```

(continues on next page)

(continued from previous page)

```
[0]
sage: Word().lps_lengths()
[0]
sage: f = WordMorphism('a->b,b->a')
sage: Word('abbabaab').lps_lengths(f)
[0, 0, 2, 0, 2, 2, 4, 6, 8]
```

```
>>> from sage.all import *
>>> Word('01101001').lps_lengths()
[0, 1, 1, 2, 4, 3, 3, 2, 4]
>>> Word('00000').lps_lengths()
[0, 1, 2, 3, 4, 5]
>>> Word('0').lps_lengths()
[0, 1]
>>> Word('').lps_lengths()
[0]
>>> Word().lps_lengths()
[0]
>>> f = WordMorphism('a->b,b->a')
>>> Word('abbabaab').lps_lengths(f)
[0, 0, 2, 0, 2, 2, 4, 6, 8]
```

lyndon_factorization()

Return the Lyndon factorization of `self`.

The *Lyndon factorization* of a finite word w is the unique factorization of w as a non-increasing product of Lyndon words, i.e., $w = l_1 \cdots l_n$ where each l_i is a Lyndon word and $l_1 \geq \cdots \geq l_n$. See for instance [Duv1983].

OUTPUT: the list $[l_1, \ldots, l_n]$ of factors obtained

EXAMPLES:

```
sage: Word('010010010001000').lyndon_factorization()
(01, 001, 001, 0001, 0, 0, 0)
sage: Words('10')('010010010001000').lyndon_factorization()
(0, 10010010001000)
sage: Word('abbababbaababba').lyndon_factorization()
(abb, ababb, aababb, a)
sage: Words('ba')('abbababbaababba').lyndon_factorization()
(a, bbababbaaba, bba)
sage: Word([1,2,1,3,1,2,1]).lyndon_factorization()
(1213, 12, 1)
```

```
>>> from sage.all import *
>>> Word('010010010001000').lyndon_factorization()
(01, 001, 001, 0001, 0, 0, 0)
>>> Words('10')('010010010001000').lyndon_factorization()
(0, 10010010001000)
>>> Word('abbababbaababba').lyndon_factorization()
(abb, ababb, aababb, a)
>>> Words('ba')('abbababbaababba').lyndon_factorization()
(a, bbababbaaba, bba)
```

(continues on next page)

(continued from previous page)

```
>>> Word([Integer(1),Integer(2),Integer(1),Integer(3),Integer(1),Integer(2),
↪Integer(1)]).lyndon_factorization()
(1213, 12, 1)
```

major_index(*final_descent=False*)

Return the major index of `self`.

The major index of a word w is the sum of the descents of w.

With the `final_descent` option, the last position of a non-empty word is also considered as a descent.

See also

major index on Permutations.

EXAMPLES:

```
sage: w = Word([2,1,3,3,2])
sage: w.major_index()
5
sage: w = Word([2,1,3,3,2])
sage: w.major_index(final_descent=True)
10
```

```
>>> from sage.all import *
>>> w = Word([Integer(2),Integer(1),Integer(3),Integer(3),Integer(2)])
>>> w.major_index()
5
>>> w = Word([Integer(2),Integer(1),Integer(3),Integer(3),Integer(2)])
>>> w.major_index(final_descent=True)
10
```

minimal_conjugate()

Return the lexicographically minimal conjugate of this word (see Wikipedia article Lexicographically_minimal_string_rotation).

EXAMPLES:

```
sage: Word('213').minimal_conjugate()
word: 132
sage: Word('11').minimal_conjugate()
word: 11
sage: Word('12112').minimal_conjugate()
word: 11212
sage: Word('211').minimal_conjugate()
word: 112
sage: Word('211211211').minimal_conjugate()
word: 112112112
```

```
>>> from sage.all import *
>>> Word('213').minimal_conjugate()
word: 132
```

(continues on next page)

(continued from previous page)

```
>>> Word('11').minimal_conjugate()
word: 11
>>> Word('12112').minimal_conjugate()
word: 11212
>>> Word('211').minimal_conjugate()
word: 112
>>> Word('211211211').minimal_conjugate()
word: 112112112
```

minimal_period()

Return the period of `self`.

Let A be an alphabet. An integer $p \geq 1$ is a *period* of a word $w = a_1 a_2 \cdots a_n$ where $a_i \in A$ if $a_i = a_{i+p}$ for $i = 1, \ldots, n-p$. The smallest period of w is called *the* period of w. See Chapter 1 of [Lot2002].

EXAMPLES:

```
sage: Word('aba').minimal_period()
2
sage: Word('abab').minimal_period()
2
sage: Word('ababa').minimal_period()
2
sage: Word('ababaa').minimal_period()
5
sage: Word('ababac').minimal_period()
6
sage: Word('aaaaaa').minimal_period()
1
sage: Word('a').minimal_period()
1
sage: Word().minimal_period()
1
```

```
>>> from sage.all import *
>>> Word('aba').minimal_period()
2
>>> Word('abab').minimal_period()
2
>>> Word('ababa').minimal_period()
2
>>> Word('ababaa').minimal_period()
5
>>> Word('ababac').minimal_period()
6
>>> Word('aaaaaa').minimal_period()
1
>>> Word('a').minimal_period()
1
>>> Word().minimal_period()
1
```

number_of_factor_occurrences(*other*)

Return the number of times `other` appears as a factor in `self`.

INPUT:

- `other` – a non empty word

EXAMPLES:

```
sage: w = Word('112332312313112332121123')
sage: w.number_of_factor_occurrences(Word('123'))
4
sage: w = Word('112332312313112332221123')
sage: w.number_of_factor_occurrences(Word('321'))
0
```

```
>>> from sage.all import *
>>> w = Word('112332312313112332121123')
>>> w.number_of_factor_occurrences(Word('123'))
4
>>> w = Word('112332312313112332221123')
>>> w.number_of_factor_occurrences(Word('321'))
0
```

```
sage: Word().number_of_factor_occurrences(Word('123'))
0
```

```
>>> from sage.all import *
>>> Word().number_of_factor_occurrences(Word('123'))
0
```

An error is raised for the empty word:

```
sage: Word('123').number_of_factor_occurrences(Word())
Traceback (most recent call last):
...
NotImplementedError: the factor must be non empty
```

```
>>> from sage.all import *
>>> Word('123').number_of_factor_occurrences(Word())
Traceback (most recent call last):
...
NotImplementedError: the factor must be non empty
```

number_of_factors(*n=None*, *algorithm='suffix tree'*)

Count the number of distinct factors of `self`.

INPUT:

- `n` – integer or `None`
- `algorithm` – string (default: `'suffix tree'`); takes the following values:
  - `'suffix tree'` – construct and use the suffix tree of the word
  - `'naive'` – algorithm uses a sliding window

OUTPUT:

If `n` is an integer, returns the number of distinct factors of length `n`. If `n` is `None`, returns the total number of distinct factors.

EXAMPLES:

```
sage: w = Word([1,2,1,2,3])
sage: w.number_of_factors()
13
sage: [w.number_of_factors(i) for i in range(6)]
[1, 3, 3, 3, 2, 1]
```

```
>>> from sage.all import *
>>> w = Word([Integer(1),Integer(2),Integer(1),Integer(2),Integer(3)])
>>> w.number_of_factors()
13
>>> [w.number_of_factors(i) for i in range(Integer(6))]
[1, 3, 3, 3, 2, 1]
```

```
sage: w = words.ThueMorseWord()[:100]
sage: [w.number_of_factors(i) for i in range(10)]
[1, 2, 4, 6, 10, 12, 16, 20, 22, 24]
```

```
>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(100)]
>>> [w.number_of_factors(i) for i in range(Integer(10))]
[1, 2, 4, 6, 10, 12, 16, 20, 22, 24]
```

```
sage: Word('1213121').number_of_factors()
22
sage: Word('1213121').number_of_factors(1)
3
```

```
>>> from sage.all import *
>>> Word('1213121').number_of_factors()
22
>>> Word('1213121').number_of_factors(Integer(1))
3
```

```
sage: Word('a'*100).number_of_factors()
101
sage: Word('a'*100).number_of_factors(77)
1
```

```
>>> from sage.all import *
>>> Word('a'*Integer(100)).number_of_factors()
101
>>> Word('a'*Integer(100)).number_of_factors(Integer(77))
1
```

```
sage: Word().number_of_factors()
1
```

(continues on next page)

(continued from previous page)

```
sage: Word().number_of_factors(17)
0
```

```
>>> from sage.all import *
>>> Word().number_of_factors()
1
>>> Word().number_of_factors(Integer(17))
0
```

```
sage: blueberry = Word("blueberry")
sage: blueberry.number_of_factors()
43
sage: [blueberry.number_of_factors(i) for i in range(10)]
[1, 6, 8, 7, 6, 5, 4, 3, 2, 1]
```

```
>>> from sage.all import *
>>> blueberry = Word("blueberry")
>>> blueberry.number_of_factors()
43
>>> [blueberry.number_of_factors(i) for i in range(Integer(10))]
[1, 6, 8, 7, 6, 5, 4, 3, 2, 1]
```

number_of_inversions()

Return the number of inversions in `self`.

An inversion of a word $w = w_1 \dots w_n$ is a pair of indices (i, j) with $i < j$ and $w_i > w_j$.

See also

number of inversions on Permutations.

EXAMPLES:

```
sage: w = Word([2,1,3,3,2])
sage: w.number_of_inversions()
3
```

```
>>> from sage.all import *
>>> w = Word([Integer(2),Integer(1),Integer(3),Integer(3),Integer(2)])
>>> w.number_of_inversions()
3
```

number_of_left_special_factors(n)

Return the number of left special factors of length n.

A factor u of a word w is *left special* if there are two distinct letters a and b such that au and bu are factors of w.

INPUT:

- `n` – integer

OUTPUT: nonnegative integer

EXAMPLES:

```
sage: w = words.FibonacciWord()[:100]
sage: [w.number_of_left_special_factors(i) for i in range(10)]
[1, 1, 1, 1, 1, 1, 1, 1, 1, 1]
```

```
>>> from sage.all import *
>>> w = words.FibonacciWord()[:Integer(100)]
>>> [w.number_of_left_special_factors(i) for i in range(Integer(10))]
[1, 1, 1, 1, 1, 1, 1, 1, 1, 1]
```

```
sage: w = words.ThueMorseWord()[:100]
sage: [w.number_of_left_special_factors(i) for i in range(10)]
[1, 2, 2, 4, 2, 4, 4, 2, 2, 4]
```

```
>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(100)]
>>> [w.number_of_left_special_factors(i) for i in range(Integer(10))]
[1, 2, 2, 4, 2, 4, 4, 2, 2, 4]
```

number_of_letter_occurrences(*letter*)

Return the number of occurrences of `letter` in `self`.

INPUT:

- `letter` – a letter

OUTPUT: integer

EXAMPLES:

```
sage: w = Word('abbabaab')
sage: w.number_of_letter_occurrences('a')
4
sage: w.number_of_letter_occurrences('ab')
0
```

```
>>> from sage.all import *
>>> w = Word('abbabaab')
>>> w.number_of_letter_occurrences('a')
4
>>> w.number_of_letter_occurrences('ab')
0
```

This methods is equivalent to `list(w).count(letter)` and `tuple(w).count(letter)`, thus `count` is an alias for the method `number_of_letter_occurrences`:

```
sage: list(w).count('a')
4
sage: w.count('a')
4
```

```
>>> from sage.all import *
>>> list(w).count('a')
```

(continues on next page)

(continued from previous page)

```
4
>>> w.count('a')
4
```

But notice that if `s` and `w` are strings, `Word(s).count(w)` counts the number occurrences of `w` as a letter in `Word(s)` which is not the same as `s.count(w)` which counts the number of occurrences of the string `w` inside `s`:

```
sage: s = 'abbabaab'
sage: s.count('ab')
3
sage: Word(s).count('ab')
0
```

```
>>> from sage.all import *
>>> s = 'abbabaab'
>>> s.count('ab')
3
>>> Word(s).count('ab')
0
```

See also

sage.combinat.words.finite_word.FiniteWord_class.number_of_factor_occurrences()

number_of_right_special_factors(*n*)

Return the number of right special factors of length `n`.

A factor u of a word w is *right special* if there are two distinct letters a and b such that ua and ub are factors of w.

INPUT:

- `n` – integer

OUTPUT: nonnegative integer

EXAMPLES:

```
sage: w = words.FibonacciWord()[:100]
sage: [w.number_of_right_special_factors(i) for i in range(10)]
[1, 1, 1, 1, 1, 1, 1, 1, 1, 1]
```

```
>>> from sage.all import *
>>> w = words.FibonacciWord()[:Integer(100)]
>>> [w.number_of_right_special_factors(i) for i in range(Integer(10))]
[1, 1, 1, 1, 1, 1, 1, 1, 1, 1]
```

```
sage: w = words.ThueMorseWord()[:100]
sage: [w.number_of_right_special_factors(i) for i in range(10)]
[1, 2, 2, 4, 2, 4, 4, 2, 2, 4]
```

```
>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(100)]
>>> [w.number_of_right_special_factors(i) for i in range(Integer(10))]
[1, 2, 2, 4, 2, 4, 4, 2, 2, 4]
```

number_of_subword_occurrences(*other*)

Return the number of times `other` appears in `self` as a subword.

This corresponds to the notion of $binomialcoefficient$ of two finite words whose properties are presented in the chapter of Lothaire's book written by Sakarovitch and Simon [Lot1997].

INPUT:

- `other` – finite word

EXAMPLES:

```
sage: tm = words.ThueMorseWord()
sage: u = Word([0,1,0,1])
sage: tm[:1000].number_of_subword_occurrences(u)
2604124996

sage: u = Word([0,1,0,1,1,0])
sage: tm[:100].number_of_subword_occurrences(u)
20370432
```

```
>>> from sage.all import *
>>> tm = words.ThueMorseWord()
>>> u = Word([Integer(0),Integer(1),Integer(0),Integer(1)])
>>> tm[:Integer(1000)].number_of_subword_occurrences(u)
2604124996

>>> u = Word([Integer(0),Integer(1),Integer(0),Integer(1),Integer(1),
↪Integer(0)])
>>> tm[:Integer(100)].number_of_subword_occurrences(u)
20370432
```

Note

This code, based on [MSSY2001], actually compute the number of occurrences of all prefixes of `self` as subwords in all prefixes of `other`. In particular, its complexity is bounded by `len(self) * len(other)`.

order()

Return the order of `self`.

Let $p(w)$ be the period of a word w. The positive rational number $|w|/p(w)$ is the *order* of w. See Chapter 8 of [Lot2002].

OUTPUT: rational; the order

EXAMPLES:

```
sage: Word('abaaba').order()
2
sage: Word('ababaaba').order()
8/5
sage: Word('a').order()
1
sage: Word('aa').order()
2
sage: Word().order()
0
```

```
>>> from sage.all import *
>>> Word('abaaba').order()
2
>>> Word('ababaaba').order()
8/5
>>> Word('a').order()
1
>>> Word('aa').order()
2
>>> Word().order()
0
```

overlap_partition(*other*, *delay=0*, *p=None*, *involution=None*)

Return the partition of the alphabet induced by the overlap of `self` and `other` with the given `delay`.

The partition of the alphabet is given by the equivalence relation obtained from the symmetric, reflexive and transitive closure of the set of pairs of letters $R_{u,v,d} = \{(u_k, v_{k-d}) : 0 \leq k < n, 0 \leq k - d < m\}$ where $u = u_0 u_1 \cdots u_{n-1}$, $v = v_0 v_1 \cdots v_{m-1}$ are two words on the alphabet A and d is an integer.

The equivalence relation defined by R is inspired from [Lab2008].

INPUT:

- `other` – word on the same alphabet as `self`
- `delay` – integer (default: 0)
- `p` – disjoint sets data structure (default: `None`), a partition of the alphabet into disjoint sets to start with. If `None`, each letter start in distinct equivalence classes.
- `involution` – callable (default: `None`); an involution on the alphabet. If `involution` is not `None`, the relation $R_{u,v,d} \cup R_{involution(u),involution(v),d}$ is considered.

OUTPUT: a disjoint set data structure

EXAMPLES:

```
sage: W = Words(list('abc012345'))
sage: u = W('abc')
sage: v = W('01234')
sage: u.overlap_partition(v)
{{'0', 'a'}, {'1', 'b'}, {'2', 'c'}, {'3'}, {'4'}, {'5'}}
sage: u.overlap_partition(v, 2)
{{'0', 'c'}, {'1'}, {'2'}, {'3'}, {'4'}, {'5'}, {'a'}, {'b'}}
sage: u.overlap_partition(v, -1)
{{'0'}, {'1', 'a'}, {'2', 'b'}, {'3', 'c'}, {'4'}, {'5'}}
```

```
>>> from sage.all import *
>>> W = Words(list('abc012345'))
>>> u = W('abc')
>>> v = W('01234')
>>> u.overlap_partition(v)
{{'0', 'a'}, {'1', 'b'}, {'2', 'c'}, {'3'}, {'4'}, {'5'}}
>>> u.overlap_partition(v, Integer(2))
{{'0', 'c'}, {'1'}, {'2'}, {'3'}, {'4'}, {'5'}, {'a'}, {'b'}}
>>> u.overlap_partition(v, -Integer(1))
{{'0'}, {'1', 'a'}, {'2', 'b'}, {'3', 'c'}, {'4'}, {'5'}}
```

You can re-use the same disjoint set and do more than one overlap:

```
sage: p = u.overlap_partition(v, 2)
sage: p
{{'0', 'c'}, {'1'}, {'2'}, {'3'}, {'4'}, {'5'}, {'a'}, {'b'}}
sage: u.overlap_partition(v, 1, p)
{{'0', '1', 'b', 'c'}, {'2'}, {'3'}, {'4'}, {'5'}, {'a'}}
```

```
>>> from sage.all import *
>>> p = u.overlap_partition(v, Integer(2))
>>> p
{{'0', 'c'}, {'1'}, {'2'}, {'3'}, {'4'}, {'5'}, {'a'}, {'b'}}
>>> u.overlap_partition(v, Integer(1), p)
{{'0', '1', 'b', 'c'}, {'2'}, {'3'}, {'4'}, {'5'}, {'a'}}
```

The function `overlap_partition` can be used to study equations on words. For example, if a word w overlaps itself with delay d, then d is a period of w:

```
sage: W = Words(range(20))
sage: w = W(range(14)); w
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13
sage: d = 5
sage: p = w.overlap_partition(w, d)
sage: m = WordMorphism(p.element_to_root_dict())
sage: w2 = m(w); w2
word: 56789567895678
sage: w2.minimal_period() == d
True
```

```
>>> from sage.all import *
>>> W = Words(range(Integer(20)))
>>> w = W(range(Integer(14))); w
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13
>>> d = Integer(5)
>>> p = w.overlap_partition(w, d)
>>> m = WordMorphism(p.element_to_root_dict())
>>> w2 = m(w); w2
word: 56789567895678
>>> w2.minimal_period() == d
True
```

If a word is equal to its reversal, then it is a palindrome:

```
sage: W = Words(range(20))
sage: w = W(range(17)); w
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16
sage: p = w.overlap_partition(w.reversal(), 0)
sage: m = WordMorphism(p.element_to_root_dict())
sage: w2 = m(w); w2
word: 01234567876543210
sage: w2.parent()
Finite words over {0, 1, 2, 3, 4, 5, 6, 7, 8, 17, 18, 19}
sage: w2.is_palindrome()
True
```

```
>>> from sage.all import *
>>> W = Words(range(Integer(20)))
>>> w = W(range(Integer(17))); w
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16
>>> p = w.overlap_partition(w.reversal(), Integer(0))
>>> m = WordMorphism(p.element_to_root_dict())
>>> w2 = m(w); w2
word: 01234567876543210
>>> w2.parent()
Finite words over {0, 1, 2, 3, 4, 5, 6, 7, 8, 17, 18, 19}
>>> w2.is_palindrome()
True
```

If the reversal of a word w is factor of its square w^2, then w is symmetric, i.e. the product of two palindromes:

```
sage: W = Words(range(10))
sage: w = W(range(10)); w
word: 0123456789
sage: p = (w*w).overlap_partition(w.reversal(), 4)
sage: m = WordMorphism(p.element_to_root_dict())
sage: w2 = m(w); w2
word: 0110456654
sage: w2.is_symmetric()
True
```

```
>>> from sage.all import *
>>> W = Words(range(Integer(10)))
>>> w = W(range(Integer(10))); w
word: 0123456789
>>> p = (w*w).overlap_partition(w.reversal(), Integer(4))
>>> m = WordMorphism(p.element_to_root_dict())
>>> w2 = m(w); w2
word: 0110456654
>>> w2.is_symmetric()
True
```

If the image of the reversal of a word w under an involution f is factor of its square w^2, then w is f-symmetric:

```
sage: W = Words([-11,-9,..,11])
sage: w = W([1,3,..,11])
sage: w
```

(continues on next page)

(continued from previous page)

```
word: 1,3,5,7,9,11
sage: inv = lambda x:-x
sage: f = WordMorphism(dict( (a, inv(a)) for a in W.alphabet()))
sage: p = (w*w).overlap_partition(f(w).reversal(), 2, involution=f)
sage: m = WordMorphism(p.element_to_root_dict())
sage: m(w)
word: 1,-1,5,7,-7,-5
sage: m(w).is_symmetric(f)
True
```

```
>>> from sage.all import *
>>> W = Words((ellipsis_range(-Integer(11),-Integer(9),Ellipsis,Integer(11))))
>>> w = W((ellipsis_range(Integer(1),Integer(3),Ellipsis,Integer(11))))
>>> w
word: 1,3,5,7,9,11
>>> inv = lambda x:-x
>>> f = WordMorphism(dict( (a, inv(a)) for a in W.alphabet()))
>>> p = (w*w).overlap_partition(f(w).reversal(), Integer(2), involution=f)
>>> m = WordMorphism(p.element_to_root_dict())
>>> m(w)
word: 1,-1,5,7,-7,-5
>>> m(w).is_symmetric(f)
True
```

palindrome_prefixes()

Return a list of all palindrome prefixes of `self`.

EXAMPLES:

```
sage: w = Word('abaaba')
sage: w.palindrome_prefixes()
[word: , word: a, word: aba, word: abaaba]
sage: w = Word('abbbbbbbbbb')
sage: w.palindrome_prefixes()
[word: , word: a]
```

```
>>> from sage.all import *
>>> w = Word('abaaba')
>>> w.palindrome_prefixes()
[word: , word: a, word: aba, word: abaaba]
>>> w = Word('abbbbbbbbbb')
>>> w.palindrome_prefixes()
[word: , word: a]
```

palindromes(*f=None*)

Return the set of all palindromic (or `f`-palindromic) factors of `self`.

INPUT:

- `f` – involution (default: `None`) on the alphabet of `self`; it must be callable on letters as well as words (e.g. `WordMorphism`).

OUTPUT: a set – If `f` is `None`, the set of all palindromic factors of `self`; otherwise, the set of all `f`-palindromic factors of `self`

EXAMPLES:

```
sage: sorted(Word('01101001').palindromes())
[word: , word: 0, word: 00, word: 010, word: 0110, word: 1, word: 1001, word:␣
↪101, word: 11]
sage: sorted(Word('00000').palindromes())
[word: , word: 0, word: 00, word: 000, word: 0000, word: 00000]
sage: sorted(Word('0').palindromes())
[word: , word: 0]
sage: sorted(Word('').palindromes())

[word: , word: ab, word: abbabaab, word: ba, word: baba, word: bbabaa]
```

palindromic_closure(*side='right'*, *f=None*)

Return the shortest palindrome having `self` as a prefix (or as a suffix if `side` is `'left'`).

See [DeLuca2006].

INPUT:

- `side` – `'right'` or `'left'` (default: `'right'`) the direction of the closure
- `f` – involution (default: `None`) on the alphabet of `self`; it must be callable on letters as well as words (e.g. `WordMorphism`)

OUTPUT:

a word – If `f` is `None`, the right palindromic closure of `self`; otherwise, the right `f`-palindromic closure of `self`. If `side` is `'left'`, the left palindromic closure.

EXAMPLES:

```
sage: Word('1233').palindromic_closure()
word: 123321
sage: Word('12332').palindromic_closure()
word: 123321
sage: Word('0110343').palindromic_closure()
```

(continues on next page)

(continued from previous page)

```
word: 01103430110
sage: Word('0110343').palindromic_closure(side='left')
word: 3430110343
sage: Word('01105678').palindromic_closure(side='left')
word: 876501105678
sage: w = Word('abbaba')
sage: w.palindromic_closure()
word: abbababba
```

```
>>> from sage.all import *
>>> Word('1233').palindromic_closure()
word: 123321
>>> Word('12332').palindromic_closure()
word: 123321
>>> Word('0110343').palindromic_closure()
word: 01103430110
>>> Word('0110343').palindromic_closure(side='left')
word: 3430110343
>>> Word('01105678').palindromic_closure(side='left')
word: 876501105678
>>> w = Word('abbaba')
>>> w.palindromic_closure()
word: abbababba
```

```
sage: f = WordMorphism('a->b,b->a')
sage: w.palindromic_closure(f=f)
word: abbabaab
sage: w.palindromic_closure(f=f, side='left')
word: babaabbaba
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->b,b->a')
>>> w.palindromic_closure(f=f)
word: abbabaab
>>> w.palindromic_closure(f=f, side='left')
word: babaabbaba
```

palindromic_complexity(*n*)

Return the number of distinct palindromic factors of length `n` of `self`.

INPUT:

- `n` – the length of the factors

EXAMPLES:

```
sage: w = words.FibonacciWord()[:100]
sage: [w.palindromic_complexity(i) for i in range(20)]
[1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2]
```

```
>>> from sage.all import *
>>> w = words.FibonacciWord()[:Integer(100)]
```

(continues on next page)

(continued from previous page)

```
>>> [w.palindromic_complexity(i) for i in range(Integer(20))]
[1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2, 1, 2]
```

```
sage: w = words.ThueMorseWord()[:1000]
sage: [w.palindromic_complexity(i) for i in range(20)]
[1, 2, 2, 2, 2, 0, 4, 0, 4, 0, 4, 0, 4, 0, 2, 0, 2, 0, 4, 0]
```

```
>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(1000)]
>>> [w.palindromic_complexity(i) for i in range(Integer(20))]
[1, 2, 2, 2, 2, 0, 4, 0, 4, 0, 4, 0, 4, 0, 2, 0, 2, 0, 4, 0]
```

palindromic_lacunas_study (*f=None*)

Return interesting statistics about longest (`f`-)palindromic suffixes and lacunas of `self` (see [BMBL2008] and [BMBFLR2008]).

Note that a word w has at most $|w|+1$ different palindromic factors (see [DJP2001]). For f-palindromes (or pseudopalindromes or theta-palindromes), the maximum number of f-palindromic factors is $|w|+1-g_f(w)$, where $g_f(w)$ is the number of pairs $\{a, f(a)\}$ such that a is a letter, a is not equal to $f(a)$, and a or $f(a)$ occurs in w, see [Star2011].

INPUT:

- `f` – involution (default: `None`) on the alphabet of `self`. It must be callable on letters as well as words (e.g. `WordMorphism`). The default value corresponds to usual palindromes, i.e., `f` equal to the identity.

OUTPUT:

- `list` – list of the length of the longest palindromic suffix (lps) for each non-empty prefix of `self`
- `list` – list of all the lacunas, i.e. positions where there is no unioccurrent lps
- `set` – set of palindromic factors of `self`

EXAMPLES:

```
sage: a,b,c = Word('abbabaabbaab').palindromic_lacunas_study()
sage: a
[1, 1, 2, 4, 3, 3, 2, 4, 2, 4, 6, 8]
sage: b
[8, 9]
sage: c          # random order
set([word: , word: b, word: bab, word: abba, word: bb, word: aa, word:␣
↪baabbaab, word: baab, word: aba, word: aabbaa, word: a])
```

```
>>> from sage.all import *
>>> a,b,c = Word('abbabaabbaab').palindromic_lacunas_study()
>>> a
[1, 1, 2, 4, 3, 3, 2, 4, 2, 4, 6, 8]
>>> b
[8, 9]
>>> c          # random order
set([word: , word: b, word: bab, word: abba, word: bb, word: aa, word:␣
↪baabbaab, word: baab, word: aba, word: aabbaa, word: a])
```

```
sage: f = WordMorphism('a->b,b->a')
sage: a,b,c = Word('abbababaab').palindromic_lacunas_study(f=f)
sage: a
[0, 2, 0, 2, 2, 4, 6, 8]
sage: b
[0, 2, 4]
sage: c           # random order
set([word: , word: ba, word: baba, word: ab, word: bbabaa, word: abbababaab])
sage: c == set([Word(), Word('ba'), Word('baba'), Word('ab'), Word('bbabaa'),␣
↪Word('abbababaab')])
True
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->b,b->a')
>>> a,b,c = Word('abbababaab').palindromic_lacunas_study(f=f)
>>> a
[0, 2, 0, 2, 2, 4, 6, 8]
>>> b
[0, 2, 4]
>>> c           # random order
set([word: , word: ba, word: baba, word: ab, word: bbabaa, word: abbababaab])
>>> c == set([Word(), Word('ba'), Word('baba'), Word('ab'), Word('bbabaa'),␣
↪Word('abbababaab')])
True
```

periods(*divide_length=False*)

Return a list containing the periods of `self` between 1 and $n-1$, where n is the length of `self`.

INPUT:

- `divide_length` – boolean (default: `False`); when set to `True`, then only periods that divide the length of `self` are considered

OUTPUT: list of positive integers

EXAMPLES:

```
sage: w = Word('ababab')
sage: w.periods()
[2, 4]
sage: w.periods(divide_length=True)
[2]
sage: w = Word('ababa')
sage: w.periods()
[2, 4]
sage: w.periods(divide_length=True)
[]
```

```
>>> from sage.all import *
>>> w = Word('ababab')
>>> w.periods()
[2, 4]
>>> w.periods(divide_length=True)
[2]
```

(continues on next page)

(continued from previous page)

```
>>> w = Word('ababa')
>>> w.periods()
[2, 4]
>>> w.periods(divide_length=True)
[]
```

phi()

Apply the phi function to `self` and return the result. This is the word obtained by taking the first letter of the words obtained by iterating delta on `self`.

OUTPUT: a word – the result of the phi function

EXAMPLES:

```
sage: W = Words([1, 2])
sage: W([2,2,1,1,2,1,2,2,1,2,2,1,1,2]).phi()
word: 222222
sage: W([2,1,2,2,1,2,2,1,2,1]).phi()
word: 212113
sage: W().phi()
word:
sage: Word([2,1,2,2,1,2,2,1,2,1]).phi()
word: 212113
sage: Word([2,3,1,1,2,1,2,3,1,2,2,3,1,2]).phi()
word: 21215
sage: Word("aabbabaabaabba").phi()
word: a22222
sage: w = Word([2,3,1,1,2,1,2,3,1,2,2,3,1,2])
```

```
>>> from sage.all import *
>>> W = Words([Integer(1), Integer(2)])
>>> W([Integer(2),Integer(2),Integer(1),Integer(1),Integer(2),Integer(1),
↪Integer(2),Integer(2),Integer(1),Integer(2),Integer(2),Integer(1),
↪Integer(1),Integer(2)]).phi()
word: 222222
>>> W([Integer(2),Integer(1),Integer(2),Integer(2),Integer(1),Integer(2),
↪Integer(2),Integer(1),Integer(2),Integer(1)]).phi()
word: 212113
>>> W().phi()
word:
>>> Word([Integer(2),Integer(1),Integer(2),Integer(2),Integer(1),Integer(2),
↪Integer(2),Integer(1),Integer(2),Integer(1)]).phi()
word: 212113
>>> Word([Integer(2),Integer(3),Integer(1),Integer(1),Integer(2),Integer(1),
↪Integer(2),Integer(3),Integer(1),Integer(2),Integer(2),Integer(3),
↪Integer(1),Integer(2)]).phi()
word: 21215
>>> Word("aabbabaabaabba").phi()
word: a22222
>>> w = Word([Integer(2),Integer(3),Integer(1),Integer(1),Integer(2),
↪Integer(1),Integer(2),Integer(3),Integer(1),Integer(2),Integer(2),
↪Integer(3),Integer(1),Integer(2)])
```

See [BL2003] and [BDLV2006].

phi_inv(*W=None*)

Apply the inverse of the phi function to `self`.

INPUT:

- `self` – a word over the integers
- `W` – a parent object of words defined over integers

OUTPUT: a word – the inverse of the phi function

EXAMPLES:

```
sage: W = Words([1, 2])
sage: W([2, 2, 2, 2, 1, 2]).phi_inv()
word: 22112122
sage: W([2, 2, 2]).phi_inv(Words([2, 3]))
word: 2233
```

```
>>> from sage.all import *
>>> W = Words([Integer(1), Integer(2)])
>>> W([Integer(2), Integer(2), Integer(2), Integer(2), Integer(1),␣
↪Integer(2)]).phi_inv()
word: 22112122
>>> W([Integer(2), Integer(2), Integer(2)]).phi_inv(Words([Integer(2),␣
↪Integer(3)]))
word: 2233
```

prefix_function_table()

Return a vector containing the length of the proper prefix-suffixes for all the non-empty prefixes of `self`.

EXAMPLES:

```
sage: Word('121321').prefix_function_table()
[0, 0, 1, 0, 0, 1]
sage: Word('1241245').prefix_function_table()
[0, 0, 0, 1, 2, 3, 0]
sage: Word().prefix_function_table()
[]
```

```
>>> from sage.all import *
>>> Word('121321').prefix_function_table()
[0, 0, 1, 0, 0, 1]
>>> Word('1241245').prefix_function_table()
[0, 0, 0, 1, 2, 3, 0]
>>> Word().prefix_function_table()
[]
```

primitive()

Return the primitive of `self`.

EXAMPLES:

```
sage: Word('12312').primitive()
word: 12312
sage: Word('121212').primitive()
word: 12
```

```
>>> from sage.all import *
>>> Word('12312').primitive()
word: 12312
>>> Word('121212').primitive()
word: 12
```

primitive_length()

Return the length of the primitive of `self`.

EXAMPLES:

```
sage: Word('1231').primitive_length()
4
sage: Word('121212').primitive_length()
2
```

```
>>> from sage.all import *
>>> Word('1231').primitive_length()
4
>>> Word('121212').primitive_length()
2
```

quasiperiods()

Return the quasiperiods of `self` as a list ordered from shortest to longest.

Let w be a finite or infinite word. A *quasiperiod* of w is a proper factor u of w such that the occurrences of u in w entirely cover w, i.e., every position of w falls within some occurrence of u in w. See for instance [AE1993], [Mar2004], and [GLR2008].

EXAMPLES:

```
sage: Word('abaababaabaababaaba').quasiperiods()
[word: aba, word: abaaba, word: abaababaaba]
sage: Word('abaaba').quasiperiods()
[word: aba]
sage: Word('abacaba').quasiperiods()
[]
```

```
>>> from sage.all import *
>>> Word('abaababaabaababaaba').quasiperiods()
[word: aba, word: abaaba, word: abaababaaba]
>>> Word('abaaba').quasiperiods()
[word: aba]
>>> Word('abacaba').quasiperiods()
[]
```

rauzy_graph(n)

Return the Rauzy graph of the factors of length `n` of `self`.

The vertices are the factors of length n and there is an edge from u to v if $ua = bv$ is a factor of length $n+1$ for some letters a and b.

INPUT:

- `n` – integer

EXAMPLES:

```
sage: w = Word(range(10)); w
word: 0123456789
sage: g = w.rauzy_graph(3); g                                                 #␣
↪needs sage.graphs
Looped digraph on 8 vertices
sage: WordOptions(identifier='')
sage: g.vertices(sort=True)                                                   #␣
↪needs sage.graphs
[012, 123, 234, 345, 456, 567, 678, 789]
sage: g.edges(sort=True)                                                      #␣
↪needs sage.graphs
[(012, 123, 3),
 (123, 234, 4),
 (234, 345, 5),
 (345, 456, 6),
 (456, 567, 7),
 (567, 678, 8),
 (678, 789, 9)]
sage: WordOptions(identifier='word: ')
```

```
>>> from sage.all import *
>>> w = Word(range(Integer(10))); w
word: 0123456789
>>> g = w.rauzy_graph(Integer(3)); g                                          ␣
↪     # needs sage.graphs
Looped digraph on 8 vertices
>>> WordOptions(identifier='')
>>> g.vertices(sort=True)                                                   #␣
↪needs sage.graphs
[012, 123, 234, 345, 456, 567, 678, 789]
>>> g.edges(sort=True)                                                      #␣
↪needs sage.graphs
[(012, 123, 3),
 (123, 234, 4),
 (234, 345, 5),
 (345, 456, 6),
 (456, 567, 7),
 (567, 678, 8),
 (678, 789, 9)]
>>> WordOptions(identifier='word: ')
```

```
sage: f = words.FibonacciWord()[:100]
sage: f.rauzy_graph(8)                                                        #␣
↪needs sage.graphs
Looped digraph on 9 vertices
```

```
>>> from sage.all import *
>>> f = words.FibonacciWord()[:Integer(100)]
>>> f.rauzy_graph(Integer(8))                                                 ␣
↪     # needs sage.graphs
Looped digraph on 9 vertices
```

```
sage: w = Word('1111111')
sage: g = w.rauzy_graph(3)                                                  #␣
↪needs sage.graphs
sage: g.edges(sort=True)                                                    #␣
↪needs sage.graphs
[(word: 111, word: 111, word: 1)]
```

```
>>> from sage.all import *
>>> w = Word('1111111')
>>> g = w.rauzy_graph(Integer(3))                                           ␣
↪     # needs sage.graphs
>>> g.edges(sort=True)                                                     #␣
↪needs sage.graphs
[(word: 111, word: 111, word: 1)]
```

```
sage: w = Word('111')
sage: for i in range(5): w.rauzy_graph(i)                                   #␣
↪needs sage.graphs
Looped multi-digraph on 1 vertex
Looped digraph on 1 vertex
Looped digraph on 1 vertex
Looped digraph on 1 vertex
Looped digraph on 0 vertices
```

```
>>> from sage.all import *
>>> w = Word('111')
>>> for i in range(Integer(5)): w.rauzy_graph(i)                            ␣
↪     # needs sage.graphs
Looped multi-digraph on 1 vertex
Looped digraph on 1 vertex
Looped digraph on 1 vertex
Looped digraph on 1 vertex
Looped digraph on 0 vertices
```

Multi-edges are allowed for the empty word:

```
sage: W = Words('abcde')
sage: w = W('abc')
sage: w.rauzy_graph(0)                                                      #␣
↪needs sage.graphs
Looped multi-digraph on 1 vertex
sage: _.edges(sort=True)                                                    #␣
↪needs sage.graphs
[(word: , word: , word: a),
 (word: , word: , word: b),
 (word: , word: , word: c)]
```

```
>>> from sage.all import *
>>> W = Words('abcde')
>>> w = W('abc')
>>> w.rauzy_graph(Integer(0))                                               ␣
↪     # needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
Looped multi-digraph on 1 vertex
>>> _.edges(sort=True)                                                    #␣
↪needs sage.graphs
[(word: , word: , word: a),
 (word: , word: , word: b),
 (word: , word: , word: c)]
```

reduced_rauzy_graph(*n*)

Return the reduced Rauzy graph of order `n` of `self`.

INPUT:

- `n` – nonnegative integer; every vertex of a reduced Rauzy graph of order `n` is a factor of length `n` of `self`

OUTPUT: a looped multi-digraph

DEFINITION:

For infinite periodic words (resp. for finite words of type $u^i u[0:j]$), the reduced Rauzy graph of order n (resp. for n smaller or equal to $(i-1)|u|+j$) is the directed graph whose unique vertex is the prefix p of length n of `self` and which has an only edge which is a loop on p labelled by $w[n+1:|w|]p$ where w is the unique return word to p.

In other cases, it is the directed graph defined as followed. Let G_n be the Rauzy graph of order n of `self`. The vertices are the vertices of G_n that are either special or not prolongable to the right or to the left. For each couple (u, v) of such vertices and each directed path in G_n from u to v that contains no other vertices that are special, there is an edge from u to v in the reduced Rauzy graph of order n whose label is the label of the path in G_n.

Note

In the case of infinite recurrent non-periodic words, this definition corresponds to the following one that can be found in [BDLGZ2009] and [BPS2008] where a simple path is a path that begins with a special factor, ends with a special factor and contains no other vertices that are special:

The reduced Rauzy graph of factors of length n is obtained from G_n by replacing each simple path $P = v_1 v_2 ... v_\ell$ with an edge $v_1 v_\ell$ whose label is the concatenation of the labels of the edges of P.

EXAMPLES:

```
sage: w = Word(range(10)); w
word: 0123456789
sage: g = w.reduced_rauzy_graph(3); g                                     #␣
↪needs sage.graphs
Looped multi-digraph on 2 vertices
sage: g.vertices(sort=True)                                               #␣
↪needs sage.graphs
[word: 012, word: 789]
sage: g.edges(sort=True)                                                  #␣
↪needs sage.graphs
[(word: 012, word: 789, word: 3456789)]
```

```
>>> from sage.all import *
>>> w = Word(range(Integer(10))); w
```

(continues on next page)

(continued from previous page)

```
word: 0123456789
>>> g = w.reduced_rauzy_graph(Integer(3)); g
↪     # needs sage.graphs
Looped multi-digraph on 2 vertices
>>> g.vertices(sort=True)
↪needs sage.graphs
[word: 012, word: 789]
>>> g.edges(sort=True)
↪needs sage.graphs
[(word: 012, word: 789, word: 3456789)]
```

For the Fibonacci word:

```
sage: f = words.FibonacciWord()[:100]
sage: g = f.reduced_rauzy_graph(8);g
↪needs sage.graphs
Looped multi-digraph on 2 vertices
sage: g.vertices(sort=True)
↪needs sage.graphs
[word: 01001010, word: 01010010]
sage: g.edges(sort=True)
↪needs sage.graphs
[(word: 01001010, word: 01010010, word: 010),
 (word: 01010010, word: 01001010, word: 01010),
 (word: 01010010, word: 01001010, word: 10)]
```

```
>>> from sage.all import *
>>> f = words.FibonacciWord()[:Integer(100)]
>>> g = f.reduced_rauzy_graph(Integer(8));g
↪     # needs sage.graphs
Looped multi-digraph on 2 vertices
>>> g.vertices(sort=True)
↪needs sage.graphs
[word: 01001010, word: 01010010]
>>> g.edges(sort=True)
↪needs sage.graphs
[(word: 01001010, word: 01010010, word: 010),
 (word: 01010010, word: 01001010, word: 01010),
 (word: 01010010, word: 01001010, word: 10)]
```

For periodic words:

```
sage: from itertools import cycle
sage: w = Word(cycle('abcd'))[:100]
sage: g = w.reduced_rauzy_graph(3)
↪needs sage.graphs
sage: g.edges(sort=True)
↪needs sage.graphs
[(word: abc, word: abc, word: dabc)]
```

```
>>> from sage.all import *
>>> from itertools import cycle
```

(continues on next page)

(continued from previous page)

```
>>> w = Word(cycle('abcd'))[:Integer(100)]
>>> g = w.reduced_rauzy_graph(Integer(3))                                    ␣
↪     # needs sage.graphs
>>> g.edges(sort=True)                                                       #␣
↪needs sage.graphs
[(word: abc, word: abc, word: dabc)]
```

```
sage: w = Word('111')
sage: for i in range(5): w.reduced_rauzy_graph(i)                            #␣
↪needs sage.graphs
Looped digraph on 1 vertex
Looped digraph on 1 vertex
Looped digraph on 1 vertex
Looped multi-digraph on 1 vertex
Looped multi-digraph on 0 vertices
```

```
>>> from sage.all import *
>>> w = Word('111')
>>> for i in range(Integer(5)): w.reduced_rauzy_graph(i)                     ␣
↪     # needs sage.graphs
Looped digraph on 1 vertex
Looped digraph on 1 vertex
Looped digraph on 1 vertex
Looped multi-digraph on 1 vertex
Looped multi-digraph on 0 vertices
```

For ultimately periodic words:

```
sage: sigma = WordMorphism('a->abcd,b->cd,c->cd,d->cd')
sage: w = sigma.fixed_point('a')[:100]; w                                    #␣
↪needs sage.modules
word: abcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcd...
sage: g = w.reduced_rauzy_graph(5)                                           #␣
↪needs sage.graphs
sage: g.vertices(sort=True)                                                  #␣
↪needs sage.graphs
[word: abcdc, word: cdcdc]
sage: g.edges(sort=True)                                                     #␣
↪needs sage.graphs
[(word: abcdc, word: cdcdc, word: dc), (word: cdcdc, word: cdcdc, word: dc)]
```

```
>>> from sage.all import *
>>> sigma = WordMorphism('a->abcd,b->cd,c->cd,d->cd')
>>> w = sigma.fixed_point('a')[:Integer(100)]; w                             ␣
↪     # needs sage.modules
word: abcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcdcd...
>>> g = w.reduced_rauzy_graph(Integer(5))                                    ␣
↪     # needs sage.graphs
>>> g.vertices(sort=True)                                                    #␣
↪needs sage.graphs
[word: abcdc, word: cdcdc]
```

(continues on next page)

(continued from previous page)

```

↪needs sage.graphs
[(word: abcdc, word: cdcdc, word: dc), (word: cdcdc, word: cdcdc, word: dc)]
```

AUTHOR:

Julien Leroy (March 2010): initial version

return_words(*fact*)

Return the set of return words of `fact` in `self`.

This is the set of all factors starting by the given factor and ending just before the next occurrence of this factor. See [Dur1998] and [HZ1999].

INPUT:

- `fact` – a non-empty finite word

OUTPUT: a Python set of finite words

EXAMPLES:

```
sage: Word('21331233213231').return_words(Word('2'))
{word: 213, word: 21331, word: 233}
sage: Word().return_words(Word('213'))
set()
sage: Word('121212').return_words(Word('1212'))
{word: 12}
```

```
>>> from sage.all import *
>>> Word('21331233213231').return_words(Word('2'))
{word: 213, word: 21331, word: 233}
>>> Word().return_words(Word('213'))
set()
>>> Word('121212').return_words(Word('1212'))
{word: 12}
```

```
sage: TM = words.ThueMorseWord()[:1000]
sage: sorted(TM.return_words(Word([0])))
[word: 0, word: 01, word: 011]
```

```
>>> from sage.all import *
>>> TM = words.ThueMorseWord()[:Integer(1000)]
>>> sorted(TM.return_words(Word([Integer(0)])))
[word: 0, word: 01, word: 011]
```

return_words_derivate(*fact*)

Return the word generated by mapping a letter to each occurrence of the return words for the given factor dropping any dangling prefix and suffix. See for instance [Dur1998].

EXAMPLES:

```
sage: Word('12131221312313122').return_words_derivate(Word('1'))
word: 123242
```

```
>>> from sage.all import *
>>> Word('12131221312313122').return_words_derivate(Word('1'))
word: 123242
```

rev_lex_less(*other*)

Return `True` if the word `self` is reverse lexicographically less than `other`.

EXAMPLES:

```
sage: Word([1,2,4]).rev_lex_less(Word([1,3,2]))
True
sage: Word([3,2,1]).rev_lex_less(Word([1,2,3]))
False
```

```
>>> from sage.all import *
>>> Word([Integer(1),Integer(2),Integer(4)]).rev_lex_less(Word([Integer(1),
↪Integer(3),Integer(2)]))
True
>>> Word([Integer(3),Integer(2),Integer(1)]).rev_lex_less(Word([Integer(1),
↪Integer(2),Integer(3)]))
False
```

reversal()

Return the reversal of `self`.

EXAMPLES:

```
sage: Word('124563').reversal()
word: 365421
```

```
>>> from sage.all import *
>>> Word('124563').reversal()
word: 365421
```

rfind(*sub*, *start=0*, *end=None*)

Return the index of the last occurrence of `sub` in `self`, such that `sub` is contained within `self[start:end]`. Return `-1` on failure.

INPUT:

- `sub` – string, list, tuple or word to search for
- `start` – nonnegative integer (default: 0); specifying the position at which the search must stop
- `end` – nonnegative integer (default: `None`); specifying the position from which to start the search. If `None`, then the search is performed up to the end of the string.

OUTPUT: nonnegative integer or -1

EXAMPLES:

```
sage: w = Word([0,1,0,0,1])
sage: w.rfind(Word([0,1]))
3
```

```
>>> from sage.all import *
>>> w = Word([Integer(0),Integer(1),Integer(0),Integer(0),Integer(1)])
>>> w.rfind(Word([Integer(0),Integer(1)]))
3
```

The `sub` parameter can also be a list or a tuple:

```
sage: w.rfind([0,1])
3
sage: w.rfind((0,1))
3
```

```
>>> from sage.all import *
>>> w.rfind([Integer(0),Integer(1)])
3
>>> w.rfind((Integer(0),Integer(1)))
3
```

Examples using the argument `start` and `end`:

```
sage: w.rfind(Word([0,1]), end=4)
0
sage: w.rfind(Word([0,1]), end=5)
3
sage: w.rfind(Word([0,0]), start=2, end=5)
2
sage: w.rfind(Word([0,0]), start=3, end=5)
-1
```

```
>>> from sage.all import *
>>> w.rfind(Word([Integer(0),Integer(1)]), end=Integer(4))
0
>>> w.rfind(Word([Integer(0),Integer(1)]), end=Integer(5))
3
>>> w.rfind(Word([Integer(0),Integer(0)]), start=Integer(2), end=Integer(5))
2
>>> w.rfind(Word([Integer(0),Integer(0)]), start=Integer(3), end=Integer(5))
-1
```

Instances of `Word_str` handle string inputs as well:

```
sage: w = Word('abac')
sage: w.rfind('a')
2
sage: w.rfind(Word('a'))
2
sage: w.rfind([0,1])
-1
```

```
>>> from sage.all import *
>>> w = Word('abac')
>>> w.rfind('a')
```

(continues on next page)

(continued from previous page)

```
2
>>> w.rfind(Word('a'))
2
>>> w.rfind([Integer(0),Integer(1)])
-1
```

right_special_factors(*n=None*)

Return the right special factors (of length `n`).

A factor u of a word w is *right special* if there are two distinct letters a and b such that ua and ub are factors of w.

INPUT:

- `n` – integer (default: `None`); if `None`, it returns all right special factors

OUTPUT: list of words

EXAMPLES:

```
sage: w = words.ThueMorseWord()[:30]
sage: for i in range(5):
....:     print("{} {}".format(i, sorted(w.right_special_factors(i))))
0 [word: ]
1 [word: 0, word: 1]
2 [word: 01, word: 10]
3 [word: 001, word: 010, word: 101, word: 110]
4 [word: 0110, word: 1001]
```

```
>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(30)]
>>> for i in range(Integer(5)):
...     print("{} {}".format(i, sorted(w.right_special_factors(i))))
0 [word: ]
1 [word: 0, word: 1]
2 [word: 01, word: 10]
3 [word: 001, word: 010, word: 101, word: 110]
4 [word: 0110, word: 1001]
```

right_special_factors_iterator(*n=None*)

Return an iterator over the right special factors (of length `n`).

A factor u of a word w is *right special* if there are two distinct letters a and b such that ua and ub are factors of w.

INPUT:

- `n` – integer (default: `None`); if `None`, it returns an iterator over all right special factors

EXAMPLES:

```
sage: alpha, beta, x = 0.61, 0.54, 0.3
sage: w = words.CodingOfRotationWord(alpha, beta, x)[:40]
sage: sorted(w.right_special_factors_iterator(3))
[word: 010, word: 101]
sage: sorted(w.right_special_factors_iterator(4))
```

(continues on next page)

(continued from previous page)

```
[word: 0101, word: 1010]
sage: sorted(w.right_special_factors_iterator(5))
[word: 00101, word: 11010]
```

```
>>> from sage.all import *
>>> alpha, beta, x = RealNumber('0.61'), RealNumber('0.54'), RealNumber('0.3')
>>> w = words.CodingOfRotationWord(alpha, beta, x)[:Integer(40)]
>>> sorted(w.right_special_factors_iterator(Integer(3)))
[word: 010, word: 101]
>>> sorted(w.right_special_factors_iterator(Integer(4)))
[word: 0101, word: 1010]
>>> sorted(w.right_special_factors_iterator(Integer(5)))
[word: 00101, word: 11010]
```

robinson_schensted()

Return the semistandard tableau and standard tableau pair obtained by running the Robinson-Schensted algorithm on `self`.

This can also be done by running *RSK()* on `self`.

EXAMPLES:

```
sage: Word([1,1,3,1,2,3,1]).robinson_schensted()
[[[1, 1, 1, 1, 3], [2], [3]], [[1, 2, 3, 5, 6], [4], [7]]]
```

```
>>> from sage.all import *
>>> Word([Integer(1),Integer(1),Integer(3),Integer(1),Integer(2),Integer(3),
↪Integer(1)]).robinson_schensted()
[[[1, 1, 1, 1, 3], [2], [3]], [[1, 2, 3, 5, 6], [4], [7]]]
```

schuetzenberger_involution(*n=None*)

Return the Schützenberger involution of the word `self`, which is obtained by reverting the word and then complementing all letters within the underlying ordered alphabet. If `n` is specified, the underlying alphabet is assumed to be $[1, 2, \ldots, n]$. If no alphabet is specified, n is the maximal letter appearing in `self`.

INPUT:

- `self` – a word
- `n` – integer specifying the maximal letter in the alphabet (optional)

OUTPUT: a word, the Schützenberger involution of `self`

EXAMPLES:

```
sage: w = Word([9,7,4,1,6,2,3])
sage: v = w.schuetzenberger_involution(); v
word: 7849631
sage: v.parent()
Finite words over Set of Python objects of class 'object'

sage: w = Word([1,2,3],alphabet=[1,2,3,4,5])
sage: v = w.schuetzenberger_involution();v
word: 345
sage: v.parent()
```

(continues on next page)

(continued from previous page)

```
Finite words over {1, 2, 3, 4, 5}

sage: w = Word([1,2,3])
sage: v = w.schuetzenberger_involution(n=5);v
word: 345
sage: v.parent()
Finite words over Set of Python objects of class 'object'

sage: w = Word([11,32,69,2,53,1,2,3,18,41])
sage: w.schuetzenberger_involution()
word: 29,52,67,68,69,17,68,1,38,59

sage: w = Word([],alphabet=[1,2,3,4,5])
sage: w.schuetzenberger_involution()
word:

sage: w = Word([])
sage: w.schuetzenberger_involution()
word:
```

```
>>> from sage.all import *
>>> w = Word([Integer(9),Integer(7),Integer(4),Integer(1),Integer(6),
↪Integer(2),Integer(3)])
>>> v = w.schuetzenberger_involution(); v
word: 7849631
>>> v.parent()
Finite words over Set of Python objects of class 'object'

>>> w = Word([Integer(1),Integer(2),Integer(3)],alphabet=[Integer(1),
↪Integer(2),Integer(3),Integer(4),Integer(5)])
>>> v = w.schuetzenberger_involution();v
word: 345
>>> v.parent()
Finite words over {1, 2, 3, 4, 5}

>>> w = Word([Integer(1),Integer(2),Integer(3)])
>>> v = w.schuetzenberger_involution(n=Integer(5));v
word: 345
>>> v.parent()
Finite words over Set of Python objects of class 'object'

↪Integer(1),Integer(2),Integer(3),Integer(18),Integer(41)])
>>> w.schuetzenberger_involution()
word: 29,52,67,68,69,17,68,1,38,59

>>> w = Word([],alphabet=[Integer(1),Integer(2),Integer(3),Integer(4),
↪Integer(5)])
>>> w.schuetzenberger_involution()
word:

>>> w = Word([])
```

(continues on next page)

(continued from previous page)

```
>>> w.schuetzenberger_involution()
word:
```

shifted_shuffle(*other*, *shift=None*)

Return the combinatorial class representing the shifted shuffle product between words `self` and `other`. This is the same as the shuffle product of `self` with the word obtained from `other` by incrementing its values (i.e. its letters) by the given `shift`.

INPUT:

- `other` – finite word over the integers
- `shift` – integer or `None` (default: `None`); added to each letter of `other`. When `shift` is `None`, it is replaced by `self.length()`

OUTPUT: combinatorial class of shifted shuffle products of `self` and `other`

EXAMPLES:

```
sage: w = Word([0,1,1])
sage: sp = w.shifted_shuffle(w); sp
Shuffle product of word: 011 and word: 344
sage: sp = w.shifted_shuffle(w, 2); sp
Shuffle product of word: 011 and word: 233
sage: sp.cardinality()
20
sage: WordOptions(identifier='')
sage: sp.list()
[011233, 012133, 012313, 012331, 021133, 021313, 021331, 023113, 023131,␣
↪023311, 201133, 201313, 201331, 203113, 203131, 203311, 230113, 230131,␣
↪230311, 233011]
sage: WordOptions(identifier='word: ')
sage: y = Word('aba')
sage: y.shifted_shuffle(w,2)
Traceback (most recent call last):
...
ValueError: for shifted shuffle, words must only contain integers as letters
```

```
>>> from sage.all import *
>>> w = Word([Integer(0),Integer(1),Integer(1)])
>>> sp = w.shifted_shuffle(w); sp
Shuffle product of word: 011 and word: 344
>>> sp = w.shifted_shuffle(w, Integer(2)); sp
Shuffle product of word: 011 and word: 233
>>> sp.cardinality()
20
>>> WordOptions(identifier='')
>>> sp.list()
[011233, 012133, 012313, 012331, 021133, 021313, 021331, 023113, 023131,␣
↪023311, 201133, 201313, 201331, 203113, 203131, 203311, 230113, 230131,␣
↪230311, 233011]
>>> WordOptions(identifier='word: ')
>>> y = Word('aba')
>>> y.shifted_shuffle(w,Integer(2))
```

(continues on next page)

(continued from previous page)

```
Traceback (most recent call last):
...
ValueError: for shifted shuffle, words must only contain integers as letters
```

shuffle(*other*, *overlap=0*)

Return the combinatorial class representing the shuffle product between words `self` and `other`. This consists of all words of length `self.length()+other.length()` that have both `self` and `other` as subwords.

If `overlap` is nonzero, then the combinatorial class representing the shuffle product with overlaps is returned. The calculation of the shift in each overlap is done relative to the order of the alphabet. For example, a shifted by a is b in the alphabet $[a, b, c]$ and 0 shifted by 1 in $[0, 1, 2, 3]$ is 2.

INPUT:

- `other` – finite word
- `overlap` – (default: `0`) integer or `True`

OUTPUT: combinatorial class of shuffle product of `self` and `other`

EXAMPLES:

```
sage: ab = Word("ab")
sage: cd = Word("cd")
sage: sp = ab.shuffle(cd); sp
Shuffle product of word: ab and word: cd
sage: sp.cardinality()
6
sage: sp.list()
[word: abcd, word: acbd, word: acdb, word: cabd, word: cadb, word: cdab]
sage: w = Word([0,1])
sage: u = Word([2,3])
sage: w.shuffle(w)
Shuffle product of word: 01 and word: 01
sage: u.shuffle(u)
Shuffle product of word: 23 and word: 23
sage: w.shuffle(u)
Shuffle product of word: 01 and word: 23
sage: sp2 = w.shuffle(u,2); sp2
Overlapping shuffle product of word: 01 and word: 23 with 2 overlaps
sage: list(sp2)
[word: 24]
```

```
>>> from sage.all import *
>>> ab = Word("ab")
>>> cd = Word("cd")
>>> sp = ab.shuffle(cd); sp
Shuffle product of word: ab and word: cd
>>> sp.cardinality()
6
>>> sp.list()
[word: abcd, word: acbd, word: acdb, word: cabd, word: cadb, word: cdab]
>>> w = Word([Integer(0),Integer(1)])
>>> u = Word([Integer(2),Integer(3)])
>>> w.shuffle(w)
```

(continues on next page)

(continued from previous page)

```
Shuffle product of word: 01 and word: 01
>>> u.shuffle(u)
Shuffle product of word: 23 and word: 23
>>> w.shuffle(u)
Shuffle product of word: 01 and word: 23
>>> sp2 = w.shuffle(u,Integer(2)); sp2
Overlapping shuffle product of word: 01 and word: 23 with 2 overlaps
>>> list(sp2)
[word: 24]
```

squares()

Return a set of all distinct squares of `self`.

EXAMPLES:

```
sage: sorted(Word('cacao').squares())
[word: , word: caca]
sage: sorted(Word('1111').squares())
[word: , word: 11, word: 1111]
sage: w = Word('001100011010')
sage: sorted(w.squares())
[word: , word: 00, word: 00110011, word: 01100110, word: 1010, word: 11]
```

```
>>> from sage.all import *
>>> sorted(Word('cacao').squares())
[word: , word: caca]
>>> sorted(Word('1111').squares())
[word: , word: 11, word: 1111]
>>> w = Word('001100011010')
>>> sorted(w.squares())
[word: , word: 00, word: 00110011, word: 01100110, word: 1010, word: 11]
```

standard_factorization()

Return the standard factorization of `self`.

The *standard factorization* of a word w of length greater than 1 is the factorization $w = uv$ where v is the longest proper suffix of w that is a Lyndon word.

Note that if w is a Lyndon word of length greater than 1 with standard factorization $w = uv$, then u and v are also Lyndon words and $u < v$.

See for instance [CFL1958], [Duv1983] and [Lot2002].

INPUT:

- `self` – finite word of length greater than 1

OUTPUT: 2-tuple (u, v)

EXAMPLES:

```
sage: Words('01')('0010110011').standard_factorization()
(word: 001011, word: 0011)
sage: Words('123')('1223312').standard_factorization()
(word: 12233, word: 12)
```

(continues on next page)

(continued from previous page)

```
sage: Word([3,2,1]).standard_factorization()
(word: 32, word: 1)
```

```
>>> from sage.all import *
>>> Words('01')('0010110011').standard_factorization()
(word: 001011, word: 0011)
>>> Words('123')('1223312').standard_factorization()
(word: 12233, word: 12)
>>> Word([Integer(3),Integer(2),Integer(1)]).standard_factorization()
(word: 32, word: 1)
```

```
sage: w = Word('0010110011',alphabet='01')
sage: w.standard_factorization()
(word: 001011, word: 0011)
sage: w = Word('0010110011',alphabet='10')
sage: w.standard_factorization()
(word: 001011001, word: 1)
sage: w = Word('1223312',alphabet='123')
sage: w.standard_factorization()
(word: 12233, word: 12)
```

```
>>> from sage.all import *
>>> w = Word('0010110011',alphabet='01')
>>> w.standard_factorization()
(word: 001011, word: 0011)
>>> w = Word('0010110011',alphabet='10')
>>> w.standard_factorization()
(word: 001011001, word: 1)
>>> w = Word('1223312',alphabet='123')
>>> w.standard_factorization()
(word: 12233, word: 12)
```

standard_permutation()

Return the standard permutation of the word `self` on the ordered alphabet. It is defined as the permutation with exactly the same inversions as `self`. Equivalently, it is the permutation of minimal length whose inverse sorts `self`.

EXAMPLES:

```
sage: w = Word([1,2,3,2,2,1]); w
word: 123221
sage: p = w.standard_permutation(); p
[1, 3, 6, 4, 5, 2]
sage: v = Word(p.inverse().action(w)); v
word: 112223
sage: [q for q in Permutations(w.length())
....:       if q.length() <= p.length() and
....:       q.inverse().action(w) == list(v)]
[[1, 3, 6, 4, 5, 2]]
```

```
>>> from sage.all import *
```

(continues on next page)

(continued from previous page)

```
>>> w = Word([Integer(1),Integer(2),Integer(3),Integer(2),Integer(2),
↪Integer(1)]); w
word: 123221
>>> p = w.standard_permutation(); p
[1, 3, 6, 4, 5, 2]
>>> v = Word(p.inverse().action(w)); v
word: 112223
>>> [q for q in Permutations(w.length())
...       if q.length() <= p.length() and
...       q.inverse().action(w) == list(v)]
[[1, 3, 6, 4, 5, 2]]
```

```
sage: w = Words([1,2,3])([1,2,3,2,2,1,2,1]); w
word: 12322121
sage: p = w.standard_permutation(); p
[1, 4, 8, 5, 6, 2, 7, 3]
sage: Word(p.inverse().action(w))
word: 11122223
```

```
>>> from sage.all import *
>>> w = Words([Integer(1),Integer(2),Integer(3)])([Integer(1),Integer(2),
↪Integer(3),Integer(2),Integer(2),Integer(1),Integer(2),Integer(1)]); w
word: 12322121
>>> p = w.standard_permutation(); p
[1, 4, 8, 5, 6, 2, 7, 3]
>>> Word(p.inverse().action(w))
word: 11122223
```

```
sage: w = Words([3,2,1])([1,2,3,2,2,1,2,1]); w
word: 12322121
sage: p = w.standard_permutation(); p
[6, 2, 1, 3, 4, 7, 5, 8]
sage: Word(p.inverse().action(w))
word: 32222111
```

```
>>> from sage.all import *
>>> w = Words([Integer(3),Integer(2),Integer(1)])([Integer(1),Integer(2),
↪Integer(3),Integer(2),Integer(2),Integer(1),Integer(2),Integer(1)]); w
word: 12322121
>>> p = w.standard_permutation(); p
[6, 2, 1, 3, 4, 7, 5, 8]
>>> Word(p.inverse().action(w))
word: 32222111
```

```
sage: w = Words('ab')('abbaba'); w
word: abbaba
sage: p = w.standard_permutation(); p
[1, 4, 5, 2, 6, 3]
sage: Word(p.inverse().action(w))
word: aaabbb
```

```
>>> from sage.all import *
>>> w = Words('ab')('abbaba'); w
word: abbaba
>>> p = w.standard_permutation(); p
[1, 4, 5, 2, 6, 3]
>>> Word(p.inverse().action(w))
word: aaabbb
```

```
sage: w = Words('ba')('abbaba'); w
word: abbaba
sage: p = w.standard_permutation(); p
[4, 1, 2, 5, 3, 6]
sage: Word(p.inverse().action(w))
word: bbbaaa
```

```
>>> from sage.all import *
>>> w = Words('ba')('abbaba'); w
word: abbaba
>>> p = w.standard_permutation(); p
[4, 1, 2, 5, 3, 6]
>>> Word(p.inverse().action(w))
word: bbbaaa
```

sturmian_desubstitute_as_possible()

Sturmian-desubstitute the word `self` as much as possible.

The finite word `self` must be defined on a two-letter alphabet or use at most two letters.

It can be Sturmian desubstituted if one letter appears isolated: the Sturmian desubstitution consists in removing one letter per run of the non-isolated letter. The accelerated Sturmian desubstitution consists in removing a run equal to the length of the shortest inner run from any run of the non-isolated letter (including possible leading and trailing runs even if they have shorter length). The (accelerated) Sturmian desubstitution is done as much as possible. A word is a factor of a Sturmian word if, and only if, the result is the empty word.

OUTPUT: a finite word defined on a two-letter alphabet

EXAMPLES:

```
sage: u = Word('10111101101110111',alphabet='01') ; u
word: 10111101101110111
sage: v = u.sturmian_desubstitute_as_possible() ; v
word: 01100101
sage: v == v.sturmian_desubstitute_as_possible()
True

sage: Word('azaazaaazaaazaazaaaz', alphabet='az').sturmian_desubstitute_as_
↪possible()
word:
```

```
>>> from sage.all import *
>>> u = Word('10111101101110111',alphabet='01') ; u
word: 10111101101110111
>>> v = u.sturmian_desubstitute_as_possible() ; v
word: 01100101
```

(continues on next page)

(continued from previous page)

```
>>> v == v.sturmian_desubstitute_as_possible()
True

>>> Word('azaazaaazaaazaazaaaz', alphabet='az').sturmian_desubstitute_as_
↪possible()
word:
```

AUTHOR:

- Thierry Monteil

subword_complementaries(*other*)

Return the possible complementaries `other` minus `self` if `self` is a subword of `other` (empty list otherwise). The complementary is made of all the letters that are in `other` once we removed the letters of `self`. There can be more than one.

To check whether `self` is a subword of `other` (without knowing its complementaries), use `self.is_subword_of(other)`, and to count the number of occurrences of `self` in `other`, use `other.number_of_subword_occurrences(self)`.

INPUT:

- `other` – finite word

OUTPUT: list of all the complementary subwords of `self` in `other`

EXAMPLES:

```
sage: Word('tamtam').subword_complementaries(Word('ta'))
[]

sage: Word('mta').subword_complementaries(Word('tamtam'))
[word: tam]

sage: Word('ta').subword_complementaries(Word('tamtam'))
[word: mtam, word: amtm, word: tamm]

sage: Word('a').subword_complementaries(Word('a'))
[word: ]
```

```
>>> from sage.all import *
>>> Word('tamtam').subword_complementaries(Word('ta'))
[]

>>> Word('mta').subword_complementaries(Word('tamtam'))
[word: tam]

>>> Word('ta').subword_complementaries(Word('tamtam'))
[word: mtam, word: amtm, word: tamm]

>>> Word('a').subword_complementaries(Word('a'))
[word: ]
```

suffix_tree()

Alias for `implicit_suffix_tree()`.

EXAMPLES:

```
sage: Word('abbabaab').suffix_tree()
Implicit Suffix Tree of the word: abbabaab
```

```
>>> from sage.all import *
>>> Word('abbabaab').suffix_tree()
Implicit Suffix Tree of the word: abbabaab
```

suffix_trie()

Return the suffix trie of `self`.

The *suffix trie* of a finite word w is a data structure representing the factors of w. It is a tree whose edges are labelled with letters of w, and whose leafs correspond to suffixes of w.

Type `sage.combinat.words.suffix_trees.SuffixTrie?` for more information.

EXAMPLES:

```
sage: w = Word("cacao")
sage: w.suffix_trie()
Suffix Trie of the word: cacao
```

```
>>> from sage.all import *
>>> w = Word("cacao")
>>> w.suffix_trie()
Suffix Trie of the word: cacao
```

```
sage: w = Word([0,1,0,1,1])
sage: w.suffix_trie()
Suffix Trie of the word: 01011
```

```
>>> from sage.all import *
>>> w = Word([Integer(0),Integer(1),Integer(0),Integer(1),Integer(1)])
>>> w.suffix_trie()
Suffix Trie of the word: 01011
```

swap(*i*, *j=None*)

Return the word w with entries at positions `i` and `j` swapped. By default, `j = i+1`.

EXAMPLES:

```
sage: Word([1,2,3]).swap(0,2)
word: 321
sage: Word([1,2,3]).swap(1)
word: 132
sage: Word("abba").swap(1,-1)
word: aabb
```

```
>>> from sage.all import *
>>> Word([Integer(1),Integer(2),Integer(3)]).swap(Integer(0),Integer(2))
word: 321
>>> Word([Integer(1),Integer(2),Integer(3)]).swap(Integer(1))
word: 132
```

(continues on next page)

(continued from previous page)

```
>>> Word("abba").swap(Integer(1),-Integer(1))
word: aabb
```

swap_decrease(*i*)

Return the word with positions `i` and `i+1` exchanged if `self[i] < self[i+1]`. Otherwise, it returns `self`.

EXAMPLES:

```
sage: w = Word([1,3,2])
sage: w.swap_decrease(0)
word: 312
sage: w.swap_decrease(1)
word: 132
sage: w.swap_decrease(1) is w
True
sage: Words("ab")("abba").swap_decrease(0)
word: baba
sage: Words("ba")("abba").swap_decrease(0)
word: abba
```

```
>>> from sage.all import *
>>> w = Word([Integer(1),Integer(3),Integer(2)])
>>> w.swap_decrease(Integer(0))
word: 312
>>> w.swap_decrease(Integer(1))
word: 132
>>> w.swap_decrease(Integer(1)) is w
True
>>> Words("ab")("abba").swap_decrease(Integer(0))
word: baba
>>> Words("ba")("abba").swap_decrease(Integer(0))
word: abba
```

swap_increase(*i*)

Return the word with positions `i` and `i+1` exchanged if `self[i] > self[i+1]`. Otherwise, it returns `self`.

EXAMPLES:

```
sage: w = Word([1,3,2])
sage: w.swap_increase(1)
word: 123
sage: w.swap_increase(0)
word: 132
sage: w.swap_increase(0) is w
True
sage: Words("ab")("abba").swap_increase(0)
word: abba
sage: Words("ba")("abba").swap_increase(0)
word: baba
```

```
>>> from sage.all import *
>>> w = Word([Integer(1),Integer(3),Integer(2)])
>>> w.swap_increase(Integer(1))
word: 123
>>> w.swap_increase(Integer(0))
word: 132
>>> w.swap_increase(Integer(0)) is w
True
>>> Words("ab")("abba").swap_increase(Integer(0))
word: abba
>>> Words("ba")("abba").swap_increase(Integer(0))
word: baba
```

to_integer_list()

Return a list of integers from `[0,1,...,self.length()-1]` in the same relative order as the letters in `self` in the parent.

EXAMPLES:

```
sage: from itertools import count
sage: w = Word('abbabaab')
sage: w.to_integer_list()
[0, 1, 1, 0, 1, 0, 0, 1]
sage: w = Word(iter("cacao"), length='finite')
sage: w.to_integer_list()
[1, 0, 1, 0, 2]
sage: w = Words([3,2,1])([2,3,3,1])
sage: w.to_integer_list()
[1, 0, 0, 2]
```

```
>>> from sage.all import *
>>> from itertools import count
>>> w = Word('abbabaab')
>>> w.to_integer_list()
[0, 1, 1, 0, 1, 0, 0, 1]
>>> w = Word(iter("cacao"), length='finite')
>>> w.to_integer_list()
[1, 0, 1, 0, 2]
>>> w = Words([Integer(3),Integer(2),Integer(1)])([Integer(2),Integer(3),
↪Integer(3),Integer(1)])
>>> w.to_integer_list()
[1, 0, 0, 2]
```

to_integer_word()

Return a word over the alphabet `[0,1,...,self.length()-1]` whose letters are in the same relative order as the letters of `self` in the parent.

EXAMPLES:

```
sage: from itertools import count
sage: w = Word('abbabaab')
sage: w.to_integer_word()
word: 01101001
```

(continues on next page)

(continued from previous page)

```
sage: w = Word(iter("cacao"), length='finite')
sage: w.to_integer_word()
word: 10102

sage: w = Words([3,2,1])([2,3,3,1])
sage: w.to_integer_word()
word: 1002
```

```
>>> from sage.all import *
>>> from itertools import count
>>> w = Word('abbabaab')
>>> w.to_integer_word()
word: 01101001
>>> w = Word(iter("cacao"), length='finite')
>>> w.to_integer_word()
word: 10102

>>> w = Words([Integer(3),Integer(2),Integer(1)])([Integer(2),Integer(3),
↪Integer(3),Integer(1)])
>>> w.to_integer_word()
word: 1002
```

to_monoid_element()

Return `self` as an element of the free monoid with the same alphabet as `self`.

EXAMPLES:

```
sage: w = Word('aabb')
sage: w.to_monoid_element()
a^2*b^2
sage: W = Words('abc')
sage: w = W(w)
sage: w.to_monoid_element()
a^2*b^2
```

```
>>> from sage.all import *
>>> w = Word('aabb')
>>> w.to_monoid_element()
a^2*b^2
>>> W = Words('abc')
>>> w = W(w)
>>> w.to_monoid_element()
a^2*b^2
```

to_ordered_set_partition()

Return the ordered set partition correspond to `self`.

If w is a finite word of length n, then the corresponding ordered set partition is an ordered set partition $(P_1, P_2, \ldots, P_k)$ of $\{1, 2, \ldots, n\}$, where each block P_i is the set of positions at which the i-th smallest letter occurring in w occurs in w.

EXAMPLES:

```
sage: w = Word('abbabaab')
sage: w.to_ordered_set_partition()
[{1, 4, 6, 7}, {2, 3, 5, 8}]
sage: Word([-10, 3, -10, 2]).to_ordered_set_partition()
[{1, 3}, {4}, {2}]
sage: Word([]).to_ordered_set_partition()
[]
sage: Word('aaaaa').to_ordered_set_partition()
[{1, 2, 3, 4, 5}]
```

```
>>> from sage.all import *
>>> w = Word('abbabaab')
>>> w.to_ordered_set_partition()
[{1, 4, 6, 7}, {2, 3, 5, 8}]
>>> Word([-Integer(10), Integer(3), -Integer(10), Integer(2)]).to_ordered_set_
↪partition()
[{1, 3}, {4}, {2}]
>>> Word([]).to_ordered_set_partition()
[]
>>> Word('aaaaa').to_ordered_set_partition()
[{1, 2, 3, 4, 5}]
```

topological_entropy(*n*)

Return the topological entropy for the factors of length `n`.

The topological entropy of a sequence u is defined as the exponential growth rate of the complexity of u as the length increases: $H_{top}(u) = \lim_{n\to\infty} \frac{\log_d(p_u(n))}{n}$ where d denotes the cardinality of the alphabet and $p_u(n)$ is the complexity function, i.e. the number of factors of length n in the sequence u [Fog2002].

INPUT:

- `self` – a word defined over a finite alphabet
- `n` – positive integer

OUTPUT: real number (a symbolic expression)

EXAMPLES:

```
sage: W = Words([0, 1])
sage: w = W([0, 1, 0, 0, 0, 1, 1, 0, 0, 1, 0, 1])
sage: t = w.topological_entropy(3); t                                          #␣
↪needs sage.symbolic
1/3*log(7)/log(2)
sage: n(t)                                                                     #␣
↪needs sage.symbolic
0.935784974019201
```

```
>>> from sage.all import *
>>> W = Words([Integer(0), Integer(1)])
>>> w = W([Integer(0), Integer(1), Integer(0), Integer(0), Integer(0),␣
↪Integer(1), Integer(1), Integer(0), Integer(0), Integer(1), Integer(0),␣
↪Integer(1)])
>>> t = w.topological_entropy(Integer(3)); t                                   ␣
↪     # needs sage.symbolic
```

(continues on next page)

(continued from previous page)

```
1/3*log(7)/log(2)
>>> n(t)                                                                    #␣
↪needs sage.symbolic
0.935784974019201
```

```
sage: w = words.ThueMorseWord()[:100]
sage: topo = w.topological_entropy
sage: for i in range(0, 41, 5):                                             #␣
↪needs sage.symbolic
....:     print("{} {}".format(i, n(topo(i), digits=5)))
0 1.0000
5 0.71699
10 0.48074
15 0.36396
20 0.28774
25 0.23628
30 0.20075
35 0.17270
40 0.14827
```

```
>>> from sage.all import *
>>> w = words.ThueMorseWord()[:Integer(100)]
>>> topo = w.topological_entropy
>>> for i in range(Integer(0), Integer(41), Integer(5)):                    ␣
↪                       # needs sage.symbolic
...     print("{} {}".format(i, n(topo(i), digits=Integer(5))))
0 1.0000
5 0.71699
10 0.48074
15 0.36396
20 0.28774
25 0.23628
30 0.20075
35 0.17270
40 0.14827
```

If no alphabet is specified, an error is raised:

```
sage: w = Word(range(20))
sage: w.topological_entropy(3)
Traceback (most recent call last):
...
TypeError: the word must be defined over a finite alphabet
```

```
>>> from sage.all import *
>>> w = Word(range(Integer(20)))
>>> w.topological_entropy(Integer(3))
Traceback (most recent call last):
...
TypeError: the word must be defined over a finite alphabet
```

The following is ok:

```
sage: W = Words(range(20))
sage: w = W(range(20))
sage: w.topological_entropy(3)                                                  #␣
↪needs sage.symbolic
1/3*log(18)/log(20)
```

```
>>> from sage.all import *
>>> W = Words(range(Integer(20)))
>>> w = W(range(Integer(20)))
>>> w.topological_entropy(Integer(3))                                           ␣
↪     # needs sage.symbolic
1/3*log(18)/log(20)
```

sage.combinat.words.finite_word.**evaluation_dict**(*w*)

Return a dictionary keyed by the letters occurring in `w` with values the number of occurrences of the letter.

INPUT:

- `w` – a word

sage.combinat.words.finite_word.**word_to_ordered_set_partition**(*w*)

Return the ordered set partition corresponding to a finite word w.

If w is a finite word of length n, then the corresponding ordered set partition is an ordered set partition $(P_1, P_2, \ldots, P_k)$ of $\{1, 2, \ldots, n\}$, where each block P_i is the set of positions at which the i-th smallest letter occurring in w occurs in w. (Positions are 1-based.)

This is the same functionality that *to_ordered_set_partition()* provides, but without the wrapping: The input w can be given as a list or tuple, not necessarily as a word; and the output is returned as a list of lists (which are the blocks of the ordered set partition in increasing order), not as an ordered set partition.

EXAMPLES:

```
sage: from sage.combinat.words.finite_word import word_to_ordered_set_partition
sage: word_to_ordered_set_partition([3, 6, 3, 1])
[[4], [1, 3], [2]]
sage: word_to_ordered_set_partition((1, 3, 3, 7))
[[1], [2, 3], [4]]
sage: word_to_ordered_set_partition("noob")
[[4], [1], [2, 3]]
sage: word_to_ordered_set_partition(Word("hell"))
[[2], [1], [3, 4]]
sage: word_to_ordered_set_partition([1])
[[1]]
sage: word_to_ordered_set_partition([])
[]
```

```
>>> from sage.all import *
>>> from sage.combinat.words.finite_word import word_to_ordered_set_partition
>>> word_to_ordered_set_partition([Integer(3), Integer(6), Integer(3),␣
↪Integer(1)])
[[4], [1, 3], [2]]
>>> word_to_ordered_set_partition((Integer(1), Integer(3), Integer(3),␣
↪Integer(7)))
[[1], [2, 3], [4]]
```

(continues on next page)

(continued from previous page)

```
>>> word_to_ordered_set_partition("noob")
[[4], [1], [2, 3]]
>>> word_to_ordered_set_partition(Word("hell"))
[[2], [1], [3, 4]]
>>> word_to_ordered_set_partition([Integer(1)])
[[1]]
>>> word_to_ordered_set_partition([])
[]
```

Infinite word

AUTHORS:

- Sebastien Labbe
- Franco Saliola

EXAMPLES:

Creation of an infinite word

Periodic infinite words:

```
sage: v = Word([0, 4, 8, 8, 3])
sage: vv = v^Infinity
sage: vv
word: 048830488304883048830488304883048830488304883...
```

```
>>> from sage.all import *
>>> v = Word([Integer(0), Integer(4), Integer(8), Integer(8), Integer(3)])
>>> vv = v**Infinity
>>> vv
word: 048830488304883048830488304883048830488304883...
```

Infinite words from a function $f : \mathbb{N} \to A$ over an alphabet A:

```
sage: Word(lambda n: n%3)
word: 012012012012012012012012012012012012012012...
```

```
>>> from sage.all import *
>>> Word(lambda n: n%Integer(3))
word: 012012012012012012012012012012012012012012...
```

```
sage: def t(n):
....:     return add(Integer(n).digits(base=2)) % 2
sage: Word(t, alphabet = [0, 1])
word: 011010011001011010010110011010011001011010...
```

```
>>> from sage.all import *
>>> def t(n):
...     return add(Integer(n).digits(base=Integer(2))) % Integer(2)
>>> Word(t, alphabet = [Integer(0), Integer(1)])
word: 011010011001011010010110011010011001011010...
```

or as a one-liner:

```
sage: Word(lambda n : add(Integer(n).digits(base=2)) % 2, alphabet = [0, 1])
word: 01101001100101101001011001101001100100110...
```

```
>>> from sage.all import *
>>> Word(lambda n : add(Integer(n).digits(base=Integer(2))) % Integer(2), alphabet =␣
↪[Integer(0), Integer(1)])
word: 01101001100101101001011001101001100100110...
```

Infinite words from iterators:

```
sage: from itertools import count,repeat
sage: Word( repeat(4) )
word: 44444444444444444444444444444444444444444...
sage: Word( count() )
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,28,29,
↪30,31,32,33,34,35,36,37,38,39,...
```

```
>>> from sage.all import *
>>> from itertools import count,repeat
>>> Word( repeat(Integer(4)) )
word: 44444444444444444444444444444444444444444...
>>> Word( count() )
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,28,29,
↪30,31,32,33,34,35,36,37,38,39,...
```

Infinite words from morphism

For example, let $A = \{a, b\}$ and $\mu : A^* \to A^*$ be the morphism defined by $a \mapsto ab, b \mapsto ba$:

```
sage: mu = WordMorphism('a->ab,b->ba'); mu
WordMorphism: a->ab, b->ba
sage: mu.fixed_point('a')
word: abbabaabbaababbabaababbaabbabaabbaababba...
```

```
>>> from sage.all import *
>>> mu = WordMorphism('a->ab,b->ba'); mu
WordMorphism: a->ab, b->ba
>>> mu.fixed_point('a')
word: abbabaabbaababbabaababbaabbabaabbaababba...
```

Infinite words in a specific combinatorial class:

```
sage: W = InfiniteWords("ab"); W
Infinite words over {'a', 'b'}
sage: f = lambda n : 'a' if n % 2 == 1 else 'b'
sage: W(f)
word: bababababababababababababababababababa...
```

```
>>> from sage.all import *
>>> W = InfiniteWords("ab"); W
Infinite words over {'a', 'b'}
```

(continues on next page)

(continued from previous page)

```
>>> f = lambda n : 'a' if n % Integer(2) == Integer(1) else 'b'
>>> W(f)
word: babababababababababababababababababababa...
```

class sage.combinat.words.infinite_word.**InfiniteWord_class**

Bases: *Word_class*

length()

Return the length of `self`.

EXAMPLES:

```
sage: f = lambda n : n % 6
sage: w = Word(f); w
word: 012345012345012345012345012345012345012345...
sage: w.length()
+Infinity
```

```
>>> from sage.all import *
>>> f = lambda n : n % Integer(6)
>>> w = Word(f); w
word: 012345012345012345012345012345012345012345...
>>> w.length()
+Infinity
```

Lyndon words

sage.combinat.words.lyndon_word.**LyndonWord**(*data*, *check=True*)

Construction of a Lyndon word.

INPUT:

- `data` – list
- `check` – boolean (default: `True`); if `True`, check that the input data represents a Lyndon word

OUTPUT: a Lyndon word

EXAMPLES:

```
sage: LyndonWord([1,2,2])
word: 122
sage: LyndonWord([1,2,3])
word: 123
sage: LyndonWord([2,1,2,3])
Traceback (most recent call last):
...
ValueError: not a Lyndon word
```

```
>>> from sage.all import *
>>> LyndonWord([Integer(1),Integer(2),Integer(2)])
word: 122
>>> LyndonWord([Integer(1),Integer(2),Integer(3)])
word: 123
```

(continues on next page)

(continued from previous page)

```
>>> LyndonWord([Integer(2),Integer(1),Integer(2),Integer(3)])
Traceback (most recent call last):
...
ValueError: not a Lyndon word
```

If `check` is `False`, then no verification is done:

```
sage: LyndonWord([2,1,2,3], check=False)
word: 2123
```

```
>>> from sage.all import *
>>> LyndonWord([Integer(2),Integer(1),Integer(2),Integer(3)], check=False)
word: 2123
```

`sage.combinat.words.lyndon_word.`**`LyndonWords`**(*e=None*, *k=None*)

Return the combinatorial class of Lyndon words.

A Lyndon word w is a word that is lexicographically less than all of its rotations. Equivalently, whenever w is split into two non-empty substrings, w is lexicographically less than the right substring.

See Wikipedia article Lyndon_word

INPUT:

- no input at all

or

- `e` – integer; size of alphabet
- `k` – integer; length of the words

or

- `e` – a weak composition

OUTPUT: a combinatorial class of Lyndon words

EXAMPLES:

```
sage: LyndonWords()
Lyndon words
```

```
>>> from sage.all import *
>>> LyndonWords()
Lyndon words
```

If e is an integer, then e specifies the length of the alphabet; k must also be specified in this case:

```
sage: LW = LyndonWords(3, 4); LW
Lyndon words from an alphabet of size 3 of length 4
sage: LW.first()
word: 1112
sage: LW.last()
word: 2333
sage: LW.random_element()  # random                                          #␣
↪needs sage.libs.pari
```

(continues on next page)

(continued from previous page)

```
word: 1232
sage: LW.cardinality()                                                    #␣
↪needs sage.libs.pari
18
```

```
>>> from sage.all import *
>>> LW = LyndonWords(Integer(3), Integer(4)); LW
Lyndon words from an alphabet of size 3 of length 4
>>> LW.first()
word: 1112
>>> LW.last()
word: 2333
>>> LW.random_element()  # random                                          #␣
↪needs sage.libs.pari
word: 1232
>>> LW.cardinality()                                                      #␣
↪needs sage.libs.pari
18
```

If e is a (weak) composition, then it returns the class of Lyndon words that have evaluation e:

```
sage: LyndonWords([2, 0, 1]).list()
[word: 113]
sage: LyndonWords([2, 0, 1, 0, 1]).list()
[word: 1135, word: 1153, word: 1315]
sage: LyndonWords([2, 1, 1]).list()
[word: 1123, word: 1132, word: 1213]
```

```
>>> from sage.all import *
>>> LyndonWords([Integer(2), Integer(0), Integer(1)]).list()
[word: 113]
>>> LyndonWords([Integer(2), Integer(0), Integer(1), Integer(0), Integer(1)]).
↪list()
[word: 1135, word: 1153, word: 1315]
>>> LyndonWords([Integer(2), Integer(1), Integer(1)]).list()
[word: 1123, word: 1132, word: 1213]
```

class sage.combinat.words.lyndon_word.**LyndonWords_class**(*alphabet=None*)

Bases: UniqueRepresentation, Parent

The set of all Lyndon words.

class sage.combinat.words.lyndon_word.**LyndonWords_evaluation**(*e*)

Bases: UniqueRepresentation, Parent

The set of Lyndon words on a fixed multiset of letters.

EXAMPLES:

```
sage: L = LyndonWords([1,2,1])
sage: L
Lyndon words with evaluation [1, 2, 1]
sage: L.list()
[word: 1223, word: 1232, word: 1322]
```

```
>>> from sage.all import *
>>> L = LyndonWords([Integer(1),Integer(2),Integer(1)])
>>> L
Lyndon words with evaluation [1, 2, 1]
>>> L.list()
[word: 1223, word: 1232, word: 1322]
```

cardinality()

Return the number of Lyndon words with the evaluation e.

EXAMPLES:

```
sage: LyndonWords([]).cardinality()
0
sage: LyndonWords([2,2]).cardinality()                                  #␣
↪needs sage.libs.pari
1
sage: LyndonWords([2,3,2]).cardinality()                                #␣
↪needs sage.libs.pari
30
```

```
>>> from sage.all import *
>>> LyndonWords([]).cardinality()
0
>>> LyndonWords([Integer(2),Integer(2)]).cardinality()                  ␣
↪              # needs sage.libs.pari
1
>>> LyndonWords([Integer(2),Integer(3),Integer(2)]).cardinality()       ␣
↪                       # needs sage.libs.pari
30
```

Check to make sure that the count matches up with the number of Lyndon words generated:

```
sage: comps = [[],[2,2],[3,2,7],[4,2]] + Compositions(4).list()
sage: lws = [LyndonWords(comp) for comp in comps]
sage: all(lw.cardinality() == len(lw.list()) for lw in lws)             #␣
↪needs sage.libs.pari
True
```

```
>>> from sage.all import *
>>> comps = [[],[Integer(2),Integer(2)],[Integer(3),Integer(2),Integer(7)],
↪[Integer(4),Integer(2)]] + Compositions(Integer(4)).list()
>>> lws = [LyndonWords(comp) for comp in comps]
>>> all(lw.cardinality() == len(lw.list()) for lw in lws)               #␣
↪needs sage.libs.pari
True
```

class sage.combinat.words.lyndon_word.**LyndonWords_nk**(n, k)

Bases: UniqueRepresentation, Parent

Lyndon words of fixed length k over the alphabet $\{1, 2, \ldots, n\}$.

INPUT:

- n – the size of the alphabet

- k – the length of the words

EXAMPLES:

```
sage: L = LyndonWords(3, 4)
sage: L.list()
[word: 1112,
 word: 1113,
 word: 1122,
 word: 1123,
 ...
 word: 1333,
 word: 2223,
 word: 2233,
 word: 2333]
```

```
>>> from sage.all import *
>>> L = LyndonWords(Integer(3), Integer(4))
>>> L.list()
[word: 1112,
 word: 1113,
 word: 1122,
 word: 1123,
 ...
 word: 1333,
 word: 2223,
 word: 2233,
 word: 2333]
```

cardinality()

sage.combinat.words.lyndon_word.**StandardBracketedLyndonWords**(*n*, *k*)

Return the combinatorial class of standard bracketed Lyndon words from [1, …, n] of length k.

These are in one to one correspondence with the Lyndon words and form a basis for the subspace of degree k of the free Lie algebra of rank n.

EXAMPLES:

```
sage: SBLW33 = StandardBracketedLyndonWords(3,3); SBLW33
Standard bracketed Lyndon words from an alphabet of size 3 of length 3
sage: SBLW33.first()
[1, [1, 2]]
sage: SBLW33.last()
[[2, 3], 3]
sage: SBLW33.cardinality()
8
sage: SBLW33.random_element() in SBLW33
True
```

```
>>> from sage.all import *
>>> SBLW33 = StandardBracketedLyndonWords(Integer(3),Integer(3)); SBLW33
Standard bracketed Lyndon words from an alphabet of size 3 of length 3
>>> SBLW33.first()
[1, [1, 2]]
```

(continues on next page)

(continued from previous page)

```
>>> SBLW33.last()
[[2, 3], 3]
>>> SBLW33.cardinality()
8
>>> SBLW33.random_element() in SBLW33
True
```

class sage.combinat.words.lyndon_word.**StandardBracketedLyndonWords_nk**(n, k)

Bases: UniqueRepresentation, Parent

cardinality()

EXAMPLES:

```
sage: StandardBracketedLyndonWords(3, 3).cardinality()
8
sage: StandardBracketedLyndonWords(3, 4).cardinality()
18
```

```
>>> from sage.all import *
>>> StandardBracketedLyndonWords(Integer(3), Integer(3)).cardinality()
8
>>> StandardBracketedLyndonWords(Integer(3), Integer(4)).cardinality()
18
```

sage.combinat.words.lyndon_word.**standard_bracketing**(lw)

Return the standard bracketing of a Lyndon word `lw`.

EXAMPLES:

```
sage: import sage.combinat.words.lyndon_word as lyndon_word
sage: [lyndon_word.standard_bracketing(u) for u in LyndonWords(3,3)]
[[1, [1, 2]],
 [1, [1, 3]],
 [[1, 2], 2],
 [1, [2, 3]],
 [[1, 3], 2],
 [[1, 3], 3],
 [2, [2, 3]],
 [[2, 3], 3]]
```

```
>>> from sage.all import *
>>> import sage.combinat.words.lyndon_word as lyndon_word
>>> [lyndon_word.standard_bracketing(u) for u in LyndonWords(Integer(3),
↪Integer(3))]
[[1, [1, 2]],
 [1, [1, 3]],
 [[1, 2], 2],
 [1, [2, 3]],
 [[1, 3], 2],
 [[1, 3], 3],
 [2, [2, 3]],
 [[2, 3], 3]]
```

sage.combinat.words.lyndon_word.**standard_unbracketing**(*sblw*)

Return flattened `sblw` if it is a standard bracketing of a Lyndon word, otherwise raise an error.

EXAMPLES:

```
sage: from sage.combinat.words.lyndon_word import standard_unbracketing
sage: standard_unbracketing([1, [2, 3]])
word: 123
sage: standard_unbracketing([[1, 2], 3])
Traceback (most recent call last):
...
ValueError: not a standard bracketing of a Lyndon word
```

```
>>> from sage.all import *
>>> from sage.combinat.words.lyndon_word import standard_unbracketing
>>> standard_unbracketing([Integer(1), [Integer(2), Integer(3)]])
word: 123
>>> standard_unbracketing([[Integer(1), Integer(2)], Integer(3)])
Traceback (most recent call last):
...
ValueError: not a standard bracketing of a Lyndon word
```

Morphic words

This modules implements morphic words (letter-to-letter coding of fixed point of a morphism).

AUTHORS:

- Jana Lepsova (January 2021): initial version

EXAMPLES:

Creation of the fixed point of a morphism:

```
sage: m = WordMorphism('a->abc,b->baba,c->ca')
sage: w = m.fixed_point('a'); w
word: abcbabacababaabcbabaabccaabcbabaabcbabaa...
sage: w.length()
+Infinity
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->abc,b->baba,c->ca')
>>> w = m.fixed_point('a'); w
word: abcbabacababaabcbabaabccaabcbabaabcbabaa...
>>> w.length()
+Infinity
```

Computing the n-th letter of a fixed point is fast as it is using the abstract numeration system associated to the morphism and the starting letter, see chapter 3 of the book [BR2010b]:

```
sage: w[10000000]                                                           #␣
↪needs sage.modules
'b'
```

```
>>> from sage.all import *
>>> w[Integer(10000000)]
↪      # needs sage.modules
'b'
```

class sage.combinat.words.morphic.**WordDatatype_morphic**(*parent*, *morphism*, *letter*, *coding=None*, *length=+Infinity*)

Bases: *WordDatatype_callable*

Datatype for a morphic word defined by a morphism, a starting letter and a coding.

representation(*n*)

Return the representation of the integer n in the numeration system associated to the morphism.

INPUT:

- n – nonnegative integer

OUTPUT: list

EXAMPLES:

```
sage: m = WordMorphism('a->ab,b->a')
sage: w = m.fixed_point('a')
sage: w.representation(5)                                                   #␣
↪needs sage.modules
[1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->ab,b->a')
>>> w = m.fixed_point('a')
>>> w.representation(Integer(5))                                            ␣
↪      # needs sage.modules
[1, 0, 0, 0]
```

When the morphic word is finite:

```
sage: m = WordMorphism("a->ab,b->,c->cdab,d->dcab")
sage: w = m.fixed_point("a")
sage: w.representation(0)                                                   #␣
↪needs sage.modules
[]
sage: w.representation(1)                                                   #␣
↪needs sage.modules
[1]
sage: w.representation(2)                                                   #␣
↪needs sage.modules
Traceback (most recent call last):
...
IndexError: index (=2) out of range, the fixed point is finite and has length␣
↪2
```

```
>>> from sage.all import *
>>> m = WordMorphism("a->ab,b->,c->cdab,d->dcab")
>>> w = m.fixed_point("a")
```

(continues on next page)

(continued from previous page)

```
>>> w.representation(Integer(0))
↪     # needs sage.modules
[]
>>> w.representation(Integer(1))
↪     # needs sage.modules
[1]
>>> w.representation(Integer(2))
↪     # needs sage.modules
Traceback (most recent call last):
...
IndexError: index (=2) out of range, the fixed point is finite and has length
↪2
```

Set of words

To define a new class of words, please refer to the documentation file: sage/combinat/words/notes/word_inheritance_howto.rst

AUTHORS:

- Franco Saliola (2008-12-17): merged into sage
- Sebastien Labbe (2008-12-17): merged into sage
- Arnaud Bergeron (2008-12-17): merged into sage
- Sebastien Labbe (2009-07-21): Improved morphism iterator (Issue #6571).
- Vincent Delecroix (2015): classes simplifications (Issue #19619)

EXAMPLES:

```
sage: Words()
Finite and infinite words over Set of Python objects of class 'object'
sage: Words(4)
Finite and infinite words over {1, 2, 3, 4}
sage: Words(4,5)
Words of length 5 over {1, 2, 3, 4}

sage: FiniteWords('ab')
Finite words over {'a', 'b'}
sage: InfiniteWords('natural numbers')
Infinite words over Non negative integers
```

```
>>> from sage.all import *
>>> Words()
Finite and infinite words over Set of Python objects of class 'object'
>>> Words(Integer(4))
Finite and infinite words over {1, 2, 3, 4}
>>> Words(Integer(4),Integer(5))
Words of length 5 over {1, 2, 3, 4}

>>> FiniteWords('ab')
Finite words over {'a', 'b'}
```

(continues on next page)

(continued from previous page)

```
>>> InfiniteWords('natural numbers')
Infinite words over Non negative integers
```

class sage.combinat.words.words.**AbstractLanguage**(*alphabet=None*, *category=None*)

Bases: Parent

Abstract base class.

This is *not* to be used by any means. This class gather previous features of set of words (prior to Issue #19619). In the future that class might simply disappear or become a common base class for all languages. In the latter case, its name would possibly change to Language.

alphabet()

EXAMPLES:

```
sage: Words(NN).alphabet()
Non negative integer semiring

sage: InfiniteWords([1,2,3]).alphabet()
{1, 2, 3}
sage: InfiniteWords('ab').alphabet()
{'a', 'b'}

sage: FiniteWords([1,2,3]).alphabet()
{1, 2, 3}
sage: FiniteWords().alphabet()
Set of Python objects of class 'object'
```

```
>>> from sage.all import *
>>> Words(NN).alphabet()
Non negative integer semiring

>>> InfiniteWords([Integer(1),Integer(2),Integer(3)]).alphabet()
{1, 2, 3}
>>> InfiniteWords('ab').alphabet()
{'a', 'b'}

>>> FiniteWords([Integer(1),Integer(2),Integer(3)]).alphabet()
{1, 2, 3}
>>> FiniteWords().alphabet()
Set of Python objects of class 'object'
```

identity_morphism()

Return the identity morphism from self to itself.

EXAMPLES:

```
sage: W = Words('ab')
sage: W.identity_morphism()
WordMorphism: a->a, b->b
```

```
>>> from sage.all import *
>>> W = Words('ab')
```

(continues on next page)

(continued from previous page)

```
>>> W.identity_morphism()
WordMorphism: a->a, b->b
```

```
sage: W = Words(range(3))
sage: W.identity_morphism()
WordMorphism: 0->0, 1->1, 2->2
```

```
>>> from sage.all import *
>>> W = Words(range(Integer(3)))
>>> W.identity_morphism()
WordMorphism: 0->0, 1->1, 2->2
```

There is no support yet for infinite alphabet:

```
sage: W = Words(alphabet=Alphabet(name='NN'))
sage: W
Finite and infinite words over Non negative integers
sage: W.identity_morphism()
Traceback (most recent call last):
...
NotImplementedError: size of alphabet must be finite
```

```
>>> from sage.all import *
>>> W = Words(alphabet=Alphabet(name='NN'))
>>> W
Finite and infinite words over Non negative integers
>>> W.identity_morphism()
Traceback (most recent call last):
...
NotImplementedError: size of alphabet must be finite
```

class sage.combinat.words.words.**FiniteOrInfiniteWords**(*alphabet*)

Bases: *AbstractLanguage*

INPUT:

- `alphabet` – the underlying alphabet

cardinality()

Return the cardinality of this set of words.

EXAMPLES:

```
sage: Words('abcd').cardinality()
+Infinity
sage: Words('a').cardinality()
+Infinity
sage: Words('').cardinality()
1
```

```
>>> from sage.all import *
>>> Words('abcd').cardinality()
+Infinity
```

(continues on next page)

(continued from previous page)

```
>>> Words('a').cardinality()
+Infinity
>>> Words('').cardinality()
1
```

factors()

alias of *finite_words()*.

finite_words()

Return the set of finite words.

EXAMPLES:

```
sage: Words('ab').finite_words()
Finite words over {'a', 'b'}
```

```
>>> from sage.all import *
>>> Words('ab').finite_words()
Finite words over {'a', 'b'}
```

infinite_words()

Return the set of infinite words.

EXAMPLES:

```
sage: Words('ab').infinite_words()
Infinite words over {'a', 'b'}
```

```
>>> from sage.all import *
>>> Words('ab').infinite_words()
Infinite words over {'a', 'b'}
```

iterate_by_length(*length*)

Return an iterator over the words of given length.

EXAMPLES:

```
sage: [w.string_rep() for w in Words('ab').iterate_by_length(3)]
['aaa', 'aab', 'aba', 'abb', 'baa', 'bab', 'bba', 'bbb']
```

```
>>> from sage.all import *
>>> [w.string_rep() for w in Words('ab').iterate_by_length(Integer(3))]
['aaa', 'aab', 'aba', 'abb', 'baa', 'bab', 'bba', 'bbb']
```

shift()

alias of *infinite_words()*.

class sage.combinat.words.words.**FiniteWords**(*alphabet=None*, *category=None*)

Bases: *AbstractLanguage*

The set of finite words over a fixed alphabet.

EXAMPLES:

```
sage: W = FiniteWords('ab')
sage: W
Finite words over {'a', 'b'}
```

```
>>> from sage.all import *
>>> W = FiniteWords('ab')
>>> W
Finite words over {'a', 'b'}
```

cardinality()

Return the cardinality of this set.

EXAMPLES:

```
sage: FiniteWords('').cardinality()
1
sage: FiniteWords('a').cardinality()
+Infinity
```

```
>>> from sage.all import *
>>> FiniteWords('').cardinality()
1
>>> FiniteWords('a').cardinality()
+Infinity
```

factors()

Return itself.

EXAMPLES:

```
sage: FiniteWords('ab').factors()
Finite words over {'a', 'b'}
```

```
>>> from sage.all import *
>>> FiniteWords('ab').factors()
Finite words over {'a', 'b'}
```

is_empty()

Return `False`, because the empty word is in the set.

iter_morphisms(*arg=None*, *codomain=None*, *min_length=1*)

Iterate over all morphisms with domain `self` and the given codomain.

INPUT:

- `arg` – (default: `None`) it can be one of the following:
  - `None` – then the method iterates through all morphisms
  - tuple (a, b) of two integers – it specifies the range `range(a, b)` of values to consider for the sum of the length of the image of each letter in the alphabet
  - list of nonnegative integers – the length of the list must be equal to the size of the alphabet, and the i-th integer of `arg` determines the length of the word mapped to by the i-th letter of the (ordered) alphabet
- `codomain` – (default: `None`) a combinatorial class of words; by default, `codomain` is `self`

- `min_length` – nonnegative integer (default: 1); if `arg` is not specified, then iterate through all the morphisms where the length of the images of each letter in the alphabet is at least `min_length`. This is ignored if `arg` is a list.

OUTPUT: iterator

EXAMPLES:

Iterator over all non-erasing morphisms:

```
sage: W = FiniteWords('ab')
sage: it = W.iter_morphisms()
sage: for _ in range(7): next(it)
WordMorphism: a->a, b->a
WordMorphism: a->a, b->b
WordMorphism: a->b, b->a
WordMorphism: a->b, b->b
WordMorphism: a->aa, b->a
WordMorphism: a->aa, b->b
WordMorphism: a->ab, b->a
```

```
>>> from sage.all import *
>>> W = FiniteWords('ab')
>>> it = W.iter_morphisms()
>>> for _ in range(Integer(7)): next(it)
WordMorphism: a->a, b->a
WordMorphism: a->a, b->b
WordMorphism: a->b, b->a
WordMorphism: a->b, b->b
WordMorphism: a->aa, b->a
WordMorphism: a->aa, b->b
WordMorphism: a->ab, b->a
```

Iterator over all morphisms including erasing morphisms:

```
sage: W = FiniteWords('ab')
sage: it = W.iter_morphisms(min_length=0)
sage: for _ in range(7): next(it)
WordMorphism: a->, b->
WordMorphism: a->a, b->
WordMorphism: a->b, b->
WordMorphism: a->, b->a
WordMorphism: a->, b->b
WordMorphism: a->aa, b->
WordMorphism: a->ab, b->
```

```
>>> from sage.all import *
>>> W = FiniteWords('ab')
>>> it = W.iter_morphisms(min_length=Integer(0))
>>> for _ in range(Integer(7)): next(it)
WordMorphism: a->, b->
WordMorphism: a->a, b->
WordMorphism: a->b, b->
WordMorphism: a->, b->a
WordMorphism: a->, b->b
```

(continues on next page)

(continued from previous page)

```
WordMorphism: a->aa, b->
WordMorphism: a->ab, b->
```

Iterator over morphisms where the sum of the lengths of the images of the letters is in a specific range:

```
sage: for m in W.iter_morphisms((0, 3), min_length=0): m
WordMorphism: a->aa, b->
WordMorphism: a->ab, b->
WordMorphism: a->ba, b->
WordMorphism: a->bb, b->
WordMorphism: a->a, b->a
WordMorphism: a->a, b->b
WordMorphism: a->b, b->a
WordMorphism: a->b, b->b
WordMorphism: a->a, b->
WordMorphism: a->b, b->
WordMorphism: a->, b->aa
WordMorphism: a->, b->ab
WordMorphism: a->, b->ba
WordMorphism: a->, b->bb
WordMorphism: a->, b->a
WordMorphism: a->, b->b
WordMorphism: a->, b->
```

```
>>> from sage.all import *
>>> for m in W.iter_morphisms((Integer(0), Integer(3)), min_
↪length=Integer(0)): m
WordMorphism: a->aa, b->
WordMorphism: a->ab, b->
WordMorphism: a->ba, b->
WordMorphism: a->bb, b->
WordMorphism: a->a, b->a
WordMorphism: a->a, b->b
WordMorphism: a->b, b->a
WordMorphism: a->b, b->b
WordMorphism: a->a, b->
WordMorphism: a->b, b->
WordMorphism: a->, b->aa
WordMorphism: a->, b->ab
WordMorphism: a->, b->ba
WordMorphism: a->, b->bb
WordMorphism: a->, b->a
WordMorphism: a->, b->b
WordMorphism: a->, b->
```

```
sage: for m in W.iter_morphisms( (2, 4) ): m
WordMorphism: a->aa, b->a
WordMorphism: a->aa, b->b
WordMorphism: a->ab, b->a
WordMorphism: a->ab, b->b
WordMorphism: a->ba, b->a
WordMorphism: a->ba, b->b
```

(continues on next page)

(continued from previous page)

```
WordMorphism: a->bb, b->a
WordMorphism: a->bb, b->b
WordMorphism: a->a, b->aa
WordMorphism: a->a, b->ab
WordMorphism: a->a, b->ba
WordMorphism: a->a, b->bb
WordMorphism: a->b, b->aa
WordMorphism: a->b, b->ab
WordMorphism: a->b, b->ba
WordMorphism: a->b, b->bb
WordMorphism: a->a, b->a
WordMorphism: a->a, b->b
WordMorphism: a->b, b->a
WordMorphism: a->b, b->b
```

```
>>> from sage.all import *
>>> for m in W.iter_morphisms( (Integer(2), Integer(4)) ): m
WordMorphism: a->aa, b->a
WordMorphism: a->aa, b->b
WordMorphism: a->ab, b->a
WordMorphism: a->ab, b->b
WordMorphism: a->ba, b->a
WordMorphism: a->ba, b->b
WordMorphism: a->bb, b->a
WordMorphism: a->bb, b->b
WordMorphism: a->a, b->aa
WordMorphism: a->a, b->ab
WordMorphism: a->a, b->ba
WordMorphism: a->a, b->bb
WordMorphism: a->b, b->aa
WordMorphism: a->b, b->ab
WordMorphism: a->b, b->ba
WordMorphism: a->b, b->bb
WordMorphism: a->a, b->a
WordMorphism: a->a, b->b
WordMorphism: a->b, b->a
WordMorphism: a->b, b->b
```

Iterator over morphisms with specific image lengths:

```
sage: for m in W.iter_morphisms([0, 0]): m
WordMorphism: a->, b->
sage: for m in W.iter_morphisms([0, 1]): m
WordMorphism: a->, b->a
WordMorphism: a->, b->b
sage: for m in W.iter_morphisms([2, 1]): m
WordMorphism: a->aa, b->a
WordMorphism: a->aa, b->b
WordMorphism: a->ab, b->a
WordMorphism: a->ab, b->b
WordMorphism: a->ba, b->a
WordMorphism: a->ba, b->b
```

(continues on next page)

(continued from previous page)

```
WordMorphism: a->bb, b->a
WordMorphism: a->bb, b->b
sage: for m in W.iter_morphisms([2, 2]): m
WordMorphism: a->aa, b->aa
WordMorphism: a->aa, b->ab
WordMorphism: a->aa, b->ba
WordMorphism: a->aa, b->bb
WordMorphism: a->ab, b->aa
WordMorphism: a->ab, b->ab
WordMorphism: a->ab, b->ba
WordMorphism: a->ab, b->bb
WordMorphism: a->ba, b->aa
WordMorphism: a->ba, b->ab
WordMorphism: a->ba, b->ba
WordMorphism: a->ba, b->bb
WordMorphism: a->bb, b->aa
WordMorphism: a->bb, b->ab
WordMorphism: a->bb, b->ba
WordMorphism: a->bb, b->bb
```

```
>>> from sage.all import *
>>> for m in W.iter_morphisms([Integer(0), Integer(0)]): m
WordMorphism: a->, b->
>>> for m in W.iter_morphisms([Integer(0), Integer(1)]): m
WordMorphism: a->, b->a
WordMorphism: a->, b->b
>>> for m in W.iter_morphisms([Integer(2), Integer(1)]): m
WordMorphism: a->aa, b->a
WordMorphism: a->aa, b->b
WordMorphism: a->ab, b->a
WordMorphism: a->ab, b->b
WordMorphism: a->ba, b->a
WordMorphism: a->ba, b->b
WordMorphism: a->bb, b->a
WordMorphism: a->bb, b->b
>>> for m in W.iter_morphisms([Integer(2), Integer(2)]): m
WordMorphism: a->aa, b->aa
WordMorphism: a->aa, b->ab
WordMorphism: a->aa, b->ba
WordMorphism: a->aa, b->bb
WordMorphism: a->ab, b->aa
WordMorphism: a->ab, b->ab
WordMorphism: a->ab, b->ba
WordMorphism: a->ab, b->bb
WordMorphism: a->ba, b->aa
WordMorphism: a->ba, b->ab
WordMorphism: a->ba, b->ba
WordMorphism: a->ba, b->bb
WordMorphism: a->bb, b->aa
WordMorphism: a->bb, b->ab
WordMorphism: a->bb, b->ba
WordMorphism: a->bb, b->bb
```

The codomain may be specified as well:

```
sage: Y = FiniteWords('xyz')
sage: for m in W.iter_morphisms([0, 2], codomain=Y): m
WordMorphism: a->, b->xx
WordMorphism: a->, b->xy
WordMorphism: a->, b->xz
WordMorphism: a->, b->yx
WordMorphism: a->, b->yy
WordMorphism: a->, b->yz
WordMorphism: a->, b->zx
WordMorphism: a->, b->zy
WordMorphism: a->, b->zz
sage: for m in Y.iter_morphisms([0,2,1], codomain=W): m
WordMorphism: x->, y->aa, z->a
WordMorphism: x->, y->aa, z->b
WordMorphism: x->, y->ab, z->a
WordMorphism: x->, y->ab, z->b
WordMorphism: x->, y->ba, z->a
WordMorphism: x->, y->ba, z->b
WordMorphism: x->, y->bb, z->a
WordMorphism: x->, y->bb, z->b
sage: it = W.iter_morphisms(codomain=Y)
sage: for _ in range(10): next(it)
WordMorphism: a->x, b->x
WordMorphism: a->x, b->y
WordMorphism: a->x, b->z
WordMorphism: a->y, b->x
WordMorphism: a->y, b->y
WordMorphism: a->y, b->z
WordMorphism: a->z, b->x
WordMorphism: a->z, b->y
WordMorphism: a->z, b->z
WordMorphism: a->xx, b->x
```

```
>>> from sage.all import *
>>> Y = FiniteWords('xyz')
>>> for m in W.iter_morphisms([Integer(0), Integer(2)], codomain=Y): m
WordMorphism: a->, b->xx
WordMorphism: a->, b->xy
WordMorphism: a->, b->xz
WordMorphism: a->, b->yx
WordMorphism: a->, b->yy
WordMorphism: a->, b->yz
WordMorphism: a->, b->zx
WordMorphism: a->, b->zy
WordMorphism: a->, b->zz
>>> for m in Y.iter_morphisms([Integer(0),Integer(2),Integer(1)],␣
↪codomain=W): m
WordMorphism: x->, y->aa, z->a
WordMorphism: x->, y->aa, z->b
WordMorphism: x->, y->ab, z->a
WordMorphism: x->, y->ab, z->b
```

(continues on next page)

(continued from previous page)

```
WordMorphism: x->, y->ba, z->a
WordMorphism: x->, y->ba, z->b
WordMorphism: x->, y->bb, z->a
WordMorphism: x->, y->bb, z->b
>>> it = W.iter_morphisms(codomain=Y)
>>> for _ in range(Integer(10)): next(it)
WordMorphism: a->x, b->x
WordMorphism: a->x, b->y
WordMorphism: a->x, b->z
WordMorphism: a->y, b->x
WordMorphism: a->y, b->y
WordMorphism: a->y, b->z
WordMorphism: a->z, b->x
WordMorphism: a->z, b->y
WordMorphism: a->z, b->z
WordMorphism: a->xx, b->x
```

iterate_by_length(*l=1*)

Return an iterator over all the words of `self` of length *l*.

INPUT:

- `l` – integer (default: 1); the length of the desired words

EXAMPLES:

```
sage: W = FiniteWords('ab')
sage: list(W.iterate_by_length(1))
[word: a, word: b]
sage: list(W.iterate_by_length(2))
[word: aa, word: ab, word: ba, word: bb]
sage: list(W.iterate_by_length(3))
[word: aaa,
 word: aab,
 word: aba,
 word: abb,
 word: baa,
 word: bab,
 word: bba,
 word: bbb]
sage: list(W.iterate_by_length('a'))
Traceback (most recent call last):
...
TypeError: the parameter l (='a') must be an integer
```

```
>>> from sage.all import *
>>> W = FiniteWords('ab')
>>> list(W.iterate_by_length(Integer(1)))
[word: a, word: b]
>>> list(W.iterate_by_length(Integer(2)))
[word: aa, word: ab, word: ba, word: bb]
>>> list(W.iterate_by_length(Integer(3)))
[word: aaa,
```

(continues on next page)

(continued from previous page)

```
 word: aab,
 word: aba,
 word: abb,
 word: baa,
 word: bab,
 word: bba,
 word: bbb]
>>> list(W.iterate_by_length('a'))
Traceback (most recent call last):
...
TypeError: the parameter l (='a') must be an integer
```

random_element(*length=None*, **args*, ***kwds*)

Return a random finite word on the given alphabet.

INPUT:

- `length` – (optional) the length of the word; if not set, will use a uniformly random number between 0 and 10
- all other argument are transmitted to the random generator of the alphabet

EXAMPLES:

```
sage: W = FiniteWords(5)
sage: W.random_element() # random
word: 5114325445423521544531411434451152142155...

sage: W = FiniteWords(ZZ)
sage: W.random_element() # random
word: 5,-1,-1,-1,0,0,0,0,-3,-11
sage: W.random_element(length=4, x=0, y=4) # random
word: 1003
```

```
>>> from sage.all import *
>>> W = FiniteWords(Integer(5))
>>> W.random_element() # random
word: 5114325445423521544531411434451152142155...

>>> W = FiniteWords(ZZ)
>>> W.random_element() # random
word: 5,-1,-1,-1,0,0,0,0,-3,-11
>>> W.random_element(length=Integer(4), x=Integer(0), y=Integer(4)) # random
word: 1003
```

shift()

Return the set of infinite words on the same alphabet.

EXAMPLES:

```
sage: FiniteWords('ab').shift()
Infinite words over {'a', 'b'}
```

```
>>> from sage.all import *
>>> FiniteWords('ab').shift()
Infinite words over {'a', 'b'}
```

class sage.combinat.words.words.**InfiniteWords**(*alphabet=None*, *category=None*)

Bases: *AbstractLanguage*

cardinality()

Return the cardinality of this set.

EXAMPLES:

```
sage: InfiniteWords('ab').cardinality()
+Infinity
sage: InfiniteWords('a').cardinality()
1
sage: InfiniteWords('').cardinality()
0
```

```
>>> from sage.all import *
>>> InfiniteWords('ab').cardinality()
+Infinity
>>> InfiniteWords('a').cardinality()
1
>>> InfiniteWords('').cardinality()
0
```

factors()

Return the set of finite words on the same alphabet.

EXAMPLES:

```
sage: InfiniteWords('ab').factors()
Finite words over {'a', 'b'}
```

```
>>> from sage.all import *
>>> InfiniteWords('ab').factors()
Finite words over {'a', 'b'}
```

random_element(**args*, ***kwds*)

Return a random infinite word.

EXAMPLES:

```
sage: W = InfiniteWords('ab')
sage: W.random_element() # random
word: abbbabbaabbbabbabbaabaabbabbbbbbbbbaabbbb...

sage: W = InfiniteWords(ZZ)
sage: W.random_element(x=2,y=4) # random
word: 33332233222322333332233232232222233233233...
```

```
>>> from sage.all import *
>>> W = InfiniteWords('ab')
>>> W.random_element() # random
word: abbbabbaabbbabbabbaabaabbabbbbbbbbbaabbbb...

>>> W = InfiniteWords(ZZ)
>>> W.random_element(x=Integer(2),y=Integer(4)) # random
word: 3333223322232233333223323223222233233233...
```

shift()

Return itself.

EXAMPLES:

```
sage: InfiniteWords('ab').shift()
Infinite words over {'a', 'b'}
```

```
>>> from sage.all import *
>>> InfiniteWords('ab').shift()
Infinite words over {'a', 'b'}
```

sage.combinat.words.words.**Words**(*alphabet=None*, *length=None*, *finite=True*, *infinite=True*)

Return the combinatorial class of words of length k over an alphabet.

EXAMPLES:

```
sage: Words()
Finite and infinite words over Set of Python objects of class 'object'
sage: Words(length=7)
Words of length 7 over Set of Python objects of class 'object'
sage: Words(5)
Finite and infinite words over {1, 2, 3, 4, 5}
sage: Words(5, 3)
Words of length 3 over {1, 2, 3, 4, 5}
sage: Words(5, infinite=False)
Finite words over {1, 2, 3, 4, 5}
sage: Words(5, finite=False)
Infinite words over {1, 2, 3, 4, 5}
sage: Words('ab')
Finite and infinite words over {'a', 'b'}
sage: Words('ab', 2)
Words of length 2 over {'a', 'b'}
sage: Words('ab', infinite=False)
Finite words over {'a', 'b'}
sage: Words('ab', finite=False)
Infinite words over {'a', 'b'}
sage: Words('positive integers', finite=False)
Infinite words over Positive integers
sage: Words('natural numbers')
Finite and infinite words over Non negative integers
```

```
>>> from sage.all import *
>>> Words()
```

(continues on next page)

(continued from previous page)

```
Finite and infinite words over Set of Python objects of class 'object'
>>> Words(length=Integer(7))
Words of length 7 over Set of Python objects of class 'object'
>>> Words(Integer(5))
Finite and infinite words over {1, 2, 3, 4, 5}
>>> Words(Integer(5), Integer(3))
Words of length 3 over {1, 2, 3, 4, 5}
>>> Words(Integer(5), infinite=False)
Finite words over {1, 2, 3, 4, 5}
>>> Words(Integer(5), finite=False)
Infinite words over {1, 2, 3, 4, 5}
>>> Words('ab')
Finite and infinite words over {'a', 'b'}
>>> Words('ab', Integer(2))
Words of length 2 over {'a', 'b'}
>>> Words('ab', infinite=False)
Finite words over {'a', 'b'}
>>> Words('ab', finite=False)
Infinite words over {'a', 'b'}
>>> Words('positive integers', finite=False)
Infinite words over Positive integers
>>> Words('natural numbers')
Finite and infinite words over Non negative integers
```

class sage.combinat.words.words.**Words_n**(*words*, *n*)

Bases: Parent

The set of words of fixed length on a given alphabet.

alphabet()

Return the underlying alphabet.

EXAMPLES:

```
sage: Words([0,1], 4).alphabet()
{0, 1}
```

```
>>> from sage.all import *
>>> Words([Integer(0),Integer(1)], Integer(4)).alphabet()
{0, 1}
```

cardinality()

Return the number of words of length n from alphabet.

EXAMPLES:

```
sage: Words(['a','b','c'], 4).cardinality()
81
sage: Words(3, 4).cardinality()
81
sage: Words(0,0).cardinality()
1
sage: Words(5,0).cardinality()
```

(continues on next page)

(continued from previous page)

```
1
sage: Words(['a','b','c'],0).cardinality()
1
sage: Words(0,1).cardinality()
0
sage: Words(5,1).cardinality()
5
sage: Words(['a','b','c'],1).cardinality()
3
sage: Words(7,13).cardinality()
96889010407
sage: Words(['a','b','c','d','e','f','g'],13).cardinality()
96889010407
```

```
>>> from sage.all import *
>>> Words(['a','b','c'], Integer(4)).cardinality()
81
>>> Words(Integer(3), Integer(4)).cardinality()
81
>>> Words(Integer(0),Integer(0)).cardinality()
1
>>> Words(Integer(5),Integer(0)).cardinality()
1
>>> Words(['a','b','c'],Integer(0)).cardinality()
1
>>> Words(Integer(0),Integer(1)).cardinality()
0
>>> Words(Integer(5),Integer(1)).cardinality()
5
>>> Words(['a','b','c'],Integer(1)).cardinality()
3
>>> Words(Integer(7),Integer(13)).cardinality()
96889010407
>>> Words(['a','b','c','d','e','f','g'],Integer(13)).cardinality()
96889010407
```

iterate_by_length(*length*)

All words in this class are of the same length, so use iterator instead.

list()

Return a list of all the words contained in `self`.

EXAMPLES:

```
sage: Words(0,0).list()
[word: ]
sage: Words(5,0).list()
[word: ]
sage: Words(['a','b','c'],0).list()
[word: ]
sage: Words(5,1).list()
[word: 1, word: 2, word: 3, word: 4, word: 5]
```

(continues on next page)

(continued from previous page)

```
sage: Words(['a','b','c'],2).list()
[word: aa, word: ab, word: ac, word: ba, word: bb, word: bc, word: ca, word:␣
↪cb, word: cc]
```

```
>>> from sage.all import *
>>> Words(Integer(0),Integer(0)).list()
[word: ]
>>> Words(Integer(5),Integer(0)).list()
[word: ]
>>> Words(['a','b','c'],Integer(0)).list()
[word: ]
>>> Words(Integer(5),Integer(1)).list()
[word: 1, word: 2, word: 3, word: 4, word: 5]
>>> Words(['a','b','c'],Integer(2)).list()
[word: aa, word: ab, word: ac, word: ba, word: bb, word: bc, word: ca, word:␣
↪cb, word: cc]
```

random_element(**args*, ***kwds*)

Return a random word in this set.

EXAMPLES:

```
sage: W = Words('ab', 4)
sage: W.random_element()  # random
word: bbab
sage: W.random_element() in W
True

sage: W = Words(ZZ, 5)
sage: W.random_element()  # random
word: 1,2,2,-1,12
sage: W.random_element() in W
True
```

```
>>> from sage.all import *
>>> W = Words('ab', Integer(4))
>>> W.random_element()  # random
word: bbab
>>> W.random_element() in W
True

>>> W = Words(ZZ, Integer(5))
>>> W.random_element()  # random
word: 1,2,2,-1,12
>>> W.random_element() in W
True
```

Shuffle product of words

See also

The module *sage.combinat.shuffle* contains a more general implementation of shuffle product.

class sage.combinat.words.shuffle_product.**ShuffleProduct_shifted**(*w1*, *w2*, *check=True*)

Bases: *ShuffleProduct_w1w2*

Shifted shuffle product of `w1` with `w2`.

This is the shuffle product of `w1` with the word obtained by adding the length of `w1` to every letter of `w2`.

Note that this class is meant to be used for words; it misbehaves when `w1` is a permutation or composition.

INPUT:

- `check` – boolean (default: `True`); whether to check that all words in the shuffle product belong to the correct parent

EXAMPLES:

```
sage: from sage.combinat.words.shuffle_product import ShuffleProduct_shifted
sage: w, u = Word([1,2]), Word([3,4])
sage: S = ShuffleProduct_shifted(w,u)
sage: S == loads(dumps(S))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.words.shuffle_product import ShuffleProduct_shifted
>>> w, u = Word([Integer(1),Integer(2)]), Word([Integer(3),Integer(4)])
>>> S = ShuffleProduct_shifted(w,u)
>>> S == loads(dumps(S))
True
```

class sage.combinat.words.shuffle_product.**ShuffleProduct_w1w2**(*w1*, *w2*, *check=True*)

Bases: `Parent`, `UniqueRepresentation`

The shuffle product of the two words `w1` and `w2`.

If u and v are two words, then the *shuffle product* of u and v is a certain multiset of words defined as follows: Let a and b be the lengths of u and v, respectively. For every a-element subset I of $\{1, 2, \cdots, a+b\}$, let $w(I)$ be the length-$a+b$ word such that:

- for every $1 \leq k \leq a$, the i_k-th letter of $w(I)$ is the k-th letter of u, where i_k is the k-th smallest element of I;
- for every $1 \leq l \leq b$, the j_l-th letter of $w(I)$ is the l-th letter of v, where j_l is the l-th smallest element of $\{1, 2, \cdots, a+b\} \setminus I$.

The shuffle product of u and v is then the multiset of all $w(I)$ with I ranging over the a-element subsets of $\{1, 2, \cdots, a+b\}$.

INPUT:

- `check` – boolean (default: `True`); whether to check that all words in the shuffle product belong to the correct parent

EXAMPLES:

```
sage: from sage.combinat.words.shuffle_product import ShuffleProduct_w1w2
sage: W = Words([1,2,3,4])
sage: s = ShuffleProduct_w1w2(W([1,2]),W([3,4]))
sage: sorted(s)
[word: 1234, word: 1324, word: 1342, word: 3124,
 word: 3142, word: 3412]
sage: s == loads(dumps(s))
True
sage: TestSuite(s).run()

sage: s = ShuffleProduct_w1w2(W([1,4,3]),W([2]))
sage: sorted(s)
[word: 1243, word: 1423, word: 1432, word: 2143]

sage: s = ShuffleProduct_w1w2(W([1,4,3]),W([]))
sage: sorted(s)
[word: 143]
```

```
>>> from sage.all import *
>>> from sage.combinat.words.shuffle_product import ShuffleProduct_w1w2
>>> W = Words([Integer(1),Integer(2),Integer(3),Integer(4)])
>>> s = ShuffleProduct_w1w2(W([Integer(1),Integer(2)]),W([Integer(3),Integer(4)]))
>>> sorted(s)
[word: 1234, word: 1324, word: 1342, word: 3124,
 word: 3142, word: 3412]
>>> s == loads(dumps(s))
True
>>> TestSuite(s).run()

>>> s = ShuffleProduct_w1w2(W([Integer(1),Integer(4),Integer(3)]),W([Integer(2)]))
>>> sorted(s)
[word: 1243, word: 1423, word: 1432, word: 2143]

>>> s = ShuffleProduct_w1w2(W([Integer(1),Integer(4),Integer(3)]),W([]))
>>> sorted(s)
[word: 143]
```

cardinality()

Return the number of words in the shuffle product of `w1` and `w2`.

This is understood as a multiset cardinality, not as a set cardinality; it does not count the distinct words only.

It is given by $\binom{l_1+l_2}{l_1}$, where l_1 is the length of `w1` and where l_2 is the length of `w2`.

EXAMPLES:

```
sage: from sage.combinat.words.shuffle_product import ShuffleProduct_w1w2
sage: w, u = map(Words("abcd"), ["ab", "cd"])
sage: S = ShuffleProduct_w1w2(w,u)
sage: S.cardinality()
6

sage: w, u = map(Words("ab"), ["ab", "ab"])
sage: S = ShuffleProduct_w1w2(w,u)
```

(continues on next page)

(continued from previous page)

```
sage: S.cardinality()
6
```

```
>>> from sage.all import *
>>> from sage.combinat.words.shuffle_product import ShuffleProduct_w1w2
>>> w, u = map(Words("abcd"), ["ab", "cd"])
>>> S = ShuffleProduct_w1w2(w,u)
>>> S.cardinality()
6

>>> w, u = map(Words("ab"), ["ab", "ab"])
>>> S = ShuffleProduct_w1w2(w,u)
>>> S.cardinality()
6
```

Suffix tries and suffix trees

class sage.combinat.words.suffix_trees.**DecoratedSuffixTree**(*w*)

Bases: *ImplicitSuffixTree*

The decorated suffix tree of a word.

A *decorated suffix tree* of a word w is the suffix tree of w marked with the end point of all squares in the w.

The symbol `$` is appended to `w` to ensure that each final state is a leaf of the suffix tree.

INPUT:

- `w` – a finite word

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import DecoratedSuffixTree
sage: w = Word('0011001')
sage: DecoratedSuffixTree(w)
Decorated suffix tree of : 0011001$
sage: w = Word('0011001', '01')
sage: DecoratedSuffixTree(w)
Decorated suffix tree of : 0011001$
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import DecoratedSuffixTree
>>> w = Word('0011001')
>>> DecoratedSuffixTree(w)
Decorated suffix tree of : 0011001$
>>> w = Word('0011001', '01')
>>> DecoratedSuffixTree(w)
Decorated suffix tree of : 0011001$
```

ALGORITHM:

When using `'pair'` as output, the squares are retrieved in linear time. The algorithm is an implementation of the one proposed in [DS2004].

square_vocabulary(*output='pair'*)

Return the list of distinct squares of `self.word`.

Two types of outputs are available *pair* and *word*. The algorithm is only truly linear if *output* is set to *pair*. A pair is a tuple (i, l) that indicates the factor `self.word()[i:i+l]`. The option `'word'` return word objects.

INPUT:

- `output` – (default: `'pair'`) either `'pair'` or `'word'`

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import DecoratedSuffixTree
sage: w = Word('aabb')
sage: sorted(DecoratedSuffixTree(w).square_vocabulary())
[(0, 0), (0, 2), (2, 2)]
sage: w = Word('00110011010')
sage: sorted(DecoratedSuffixTree(w).square_vocabulary(output='word'))
[word: , word: 00, word: 00110011, word: 01100110, word: 1010, word: 11]
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import DecoratedSuffixTree
>>> w = Word('aabb')
>>> sorted(DecoratedSuffixTree(w).square_vocabulary())
[(0, 0), (0, 2), (2, 2)]
>>> w = Word('00110011010')
>>> sorted(DecoratedSuffixTree(w).square_vocabulary(output='word'))
[word: , word: 00, word: 00110011, word: 01100110, word: 1010, word: 11]
```

class sage.combinat.words.suffix_trees.**ImplicitSuffixTree**(*word*)

Bases: `SageObject`

Construct the implicit suffix tree of a word w.

The suffix tree of a word w is a compactification of the suffix trie for w. The compactification removes all nodes that have exactly one incoming edge and exactly one outgoing edge. It consists of two components: a tree and a word. Thus, instead of labelling the edges by factors of w, we can labelled them by indices of the occurrence of the factors in w.

The following is a straightforward implementation of Ukkonen's on-line algorithm for constructing the implicit suffix tree [Ukko1995]. It constructs the suffix tree for w[:i] from that of w[:i-1].

GENERAL IDEA. The suffix tree of w[:i+1] can be obtained from that of w[:i] by visiting each node corresponding to a suffix of w[:i] and modifying the tree by applying one of two rules (either append a new node to the tree, or split an edge into two). The "active state" is the node where the algorithm begins and the "suffix link" carries us to the next node that needs to be dealt with.

TREE. The tree is modelled as an automaton, which is stored as a dictionary of dictionaries: it is keyed by the nodes of the tree, and the corresponding dictionary is keyed by pairs (i, j) of integers representing the word w[i-1:j]. This makes it faster to look up a particular transition beginning at a specific node.

STATES/NODES. The states will always be -1, 0, 1, …, n. The state -1 is special and is only used for the purposes of the algorithm. All transitions map -1 to 0, so this information is not explicitly stored in the transition function.

EXPLICIT/IMPLICIT NODES. By definition, some of the nodes will not be states, but merely locations along an edge; these are called implicit nodes. A node r (implicit or explicit) is referenced as a pair (s,(k,p)) where s is an ancestor of r and w[k-1:p] is the word read by transitioning from s to r in the suffix trie. A reference pair is canonical if s is the closest ancestor of r.

SUFFIX LINK. The algorithm makes use of a map from (some) nodes to other nodes, called the suffix link. This is stored as a dictionary.

ACTIVE STATE. We store as ._active_state the active state of the tree, the state where the algorithm will begin when processing the next letter.

RUNNING TIME. The running time and storage space of the algorithm is linear in the length of the word w (whereas for a suffix tree it is quadratic).

REFERENCES:

- [Ukko1995]

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: w = Words("aco")("cacao")
sage: t = ImplicitSuffixTree(w); t
Implicit Suffix Tree of the word: cacao
sage: ababb = Words([0,1])([0,1,0,1,1])
sage: s = ImplicitSuffixTree(ababb); s
Implicit Suffix Tree of the word: 01011
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> w = Words("aco")("cacao")
>>> t = ImplicitSuffixTree(w); t
Implicit Suffix Tree of the word: cacao
>>> ababb = Words([Integer(0),Integer(1)])([Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(1)])
>>> s = ImplicitSuffixTree(ababb); s
Implicit Suffix Tree of the word: 01011
```

LZ_decomposition()

Return a list of index of the beginning of the block of the Lempel-Ziv decomposition of `self.word`

The *Lempel-Ziv decomposition* is the factorisation $u_1...u_k$ of a word $w = x_1...x_n$ such that u_i is the longest prefix of $u_i...u_k$ that has an occurrence starting before u_i or a letter if this prefix is empty.

OUTPUT:

Return a list `iB` of index such that the blocks of the decomposition are `self.word()[iB[k]:iB[k+1]]`

EXAMPLES:

```
sage: w = Word('abababb')
sage: T = w.suffix_tree()
sage: T.LZ_decomposition()
[0, 1, 2, 6, 7]
sage: w = Word('abaababacabba')
sage: T = w.suffix_tree()
sage: T.LZ_decomposition()
[0, 1, 2, 3, 6, 8, 9, 11, 13]
sage: w = Word([0, 0, 0, 1, 1, 0, 1])
sage: T = w.suffix_tree()
sage: T.LZ_decomposition()
[0, 1, 3, 4, 5, 7]
sage: w = Word('0000100101')
```

(continues on next page)

(continued from previous page)

```
sage: T = w.suffix_tree()
sage: T.LZ_decomposition()
[0, 1, 4, 5, 9, 10]
```

```
>>> from sage.all import *
>>> w = Word('abababb')
>>> T = w.suffix_tree()
>>> T.LZ_decomposition()
[0, 1, 2, 6, 7]
>>> w = Word('abaababacabba')
>>> T = w.suffix_tree()
>>> T.LZ_decomposition()
[0, 1, 2, 3, 6, 8, 9, 11, 13]
>>> w = Word([Integer(0), Integer(0), Integer(0), Integer(1), Integer(1),␣
↪Integer(0), Integer(1)])
>>> T = w.suffix_tree()
>>> T.LZ_decomposition()
[0, 1, 3, 4, 5, 7]
>>> w = Word('0000100101')
>>> T = w.suffix_tree()
>>> T.LZ_decomposition()
[0, 1, 4, 5, 9, 10]
```

active_state()

Return the active state of the suffix tree.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: W = Words([0,1,2])
sage: t = ImplicitSuffixTree(W([0,1,0,1,2]))
sage: t.active_state()
(0, (6, 6))
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> W = Words([Integer(0),Integer(1),Integer(2)])
>>> t = ImplicitSuffixTree(W([Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(2)]))
>>> t.active_state()
(0, (6, 6))
```

edge_iterator()

Return an iterator over the edges of the suffix tree.

The edge from u to v labelled by (i, j) is yielded as the tuple $(u, v, (i, j))$.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: sorted( ImplicitSuffixTree(Word("aaaaa")).edge_iterator() )
[(0, 1, (0, None))]
sage: sorted( ImplicitSuffixTree(Word([0,1,0,1])).edge_iterator() )
```

(continues on next page)

(continued from previous page)

```
[(0, 1, (0, None)), (0, 2, (1, None))]
sage: sorted( ImplicitSuffixTree(Word()).edge_iterator() )
[]
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> sorted( ImplicitSuffixTree(Word("aaaaa")).edge_iterator() )
[(0, 1, (0, None))]
>>> sorted( ImplicitSuffixTree(Word([Integer(0),Integer(1),Integer(0),
↪Integer(1)])).edge_iterator() )
[(0, 1, (0, None)), (0, 2, (1, None))]
>>> sorted( ImplicitSuffixTree(Word()).edge_iterator() )
[]
```

factor_iterator(*n=None*)

Generate distinct factors of `self`.

INPUT:

- `n` – integer or `None`

OUTPUT:

If `n` is an integer, returns an iterator over all distinct factors of length `n`. If `n` is `None`, returns an iterator generating all distinct factors.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: sorted( ImplicitSuffixTree(Word("cacao")).factor_iterator() )
[word: , word: a, word: ac, word: aca, word: acao, word: ao, word: c, word:␣
↪ca, word: cac, word: caca, word: cacao, word: cao, word: o]
sage: sorted( ImplicitSuffixTree(Word("cacao")).factor_iterator(1) )
[word: a, word: c, word: o]
sage: sorted( ImplicitSuffixTree(Word("cacao")).factor_iterator(2) )
[word: ac, word: ao, word: ca]
sage: sorted( ImplicitSuffixTree(Word([0,0,0])).factor_iterator() )
[word: , word: 0, word: 00, word: 000]
sage: sorted( ImplicitSuffixTree(Word([0,0,0])).factor_iterator(2) )
[word: 00]
sage: sorted( ImplicitSuffixTree(Word([0,0,0])).factor_iterator(0) )
[word: ]
sage: sorted( ImplicitSuffixTree(Word()).factor_iterator() )
[word: ]
sage: sorted( ImplicitSuffixTree(Word()).factor_iterator(2) )
[]
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> sorted( ImplicitSuffixTree(Word("cacao")).factor_iterator() )
[word: , word: a, word: ac, word: aca, word: acao, word: ao, word: c, word:␣
↪ca, word: cac, word: caca, word: cacao, word: cao, word: o]
>>> sorted( ImplicitSuffixTree(Word("cacao")).factor_iterator(Integer(1)) )
[word: a, word: c, word: o]
```

(continues on next page)

(continued from previous page)

```
>>> sorted( ImplicitSuffixTree(Word("cacao")).factor_iterator(Integer(2)) )
[word: ac, word: ao, word: ca]
>>> sorted( ImplicitSuffixTree(Word([Integer(0),Integer(0),Integer(0)])).
↪factor_iterator() )
[word: , word: 0, word: 00, word: 000]
>>> sorted( ImplicitSuffixTree(Word([Integer(0),Integer(0),Integer(0)])).
↪factor_iterator(Integer(2)) )
[word: 00]
>>> sorted( ImplicitSuffixTree(Word([Integer(0),Integer(0),Integer(0)])).
↪factor_iterator(Integer(0)) )
[word: ]
>>> sorted( ImplicitSuffixTree(Word()).factor_iterator() )
[word: ]
>>> sorted( ImplicitSuffixTree(Word()).factor_iterator(Integer(2)) )
[]
```

leftmost_covering_set()

Compute the leftmost covering set of square pairs in `self.word()`. Return a square as a pair `(i,l)` designating factor `self.word()[i:i+l]`.

A leftmost covering set is a set such that the leftmost occurrence (j, l) of a square in `self.word()` is covered by a pair (i, l) in the set for all types of squares. We say that (j, l) is covered by (i, l) if (i, l) (i+1,l), ldots, (j,l)` are all squares.

The set is returned in the form of a list `P` such that `P[i]` contains all the lengths of squares starting at `i` in the set. The lists `P[i]` are sorted in decreasing order.

The algorithm used is described in [DS2004].

EXAMPLES:

```
sage: w = Word('abaabaabbaaabaaba')
sage: T = w.suffix_tree()
sage: T.leftmost_covering_set()
[[6], [6], [2], [], [], [], [], [2], [], [], [6, 2], [], [], [], [], [], []]
sage: w = Word('abaca')
sage: T = w.suffix_tree()
sage: T.leftmost_covering_set()
[[], [], [], [], []]
sage: T = Word('aaaaa').suffix_tree()
sage: T.leftmost_covering_set()
[[4, 2], [], [], [], []]
```

```
>>> from sage.all import *
>>> w = Word('abaabaabbaaabaaba')
>>> T = w.suffix_tree()
>>> T.leftmost_covering_set()
[[6], [6], [2], [], [], [], [], [2], [], [], [6, 2], [], [], [], [], [], []]
>>> w = Word('abaca')
>>> T = w.suffix_tree()
>>> T.leftmost_covering_set()
[[], [], [], [], []]
>>> T = Word('aaaaa').suffix_tree()
```

(continues on next page)

(continued from previous page)

```
>>> T.leftmost_covering_set()
[[4, 2], [], [], [], []]
```

number_of_factors(*n=None*)

Count the number of distinct factors of `self.word()`.

INPUT:

- `n` – integer or `None`

OUTPUT:

If `n` is an integer, returns the number of distinct factors of length `n`. If `n` is `None`, returns the total number of distinct factors.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: t = ImplicitSuffixTree(Word([1,2,1,3,1,2,1]))
sage: t.number_of_factors()
22
sage: t.number_of_factors(1)
3
sage: t.number_of_factors(9)
0
sage: t.number_of_factors(0)
1
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> t = ImplicitSuffixTree(Word([Integer(1),Integer(2),Integer(1),Integer(3),
↪Integer(1),Integer(2),Integer(1)]))
>>> t.number_of_factors()
22
>>> t.number_of_factors(Integer(1))
3
>>> t.number_of_factors(Integer(9))
0
>>> t.number_of_factors(Integer(0))
1
```

```
sage: t = ImplicitSuffixTree(Word("cacao"))
sage: t.number_of_factors()
13
sage: list(map(t.number_of_factors, range(10)))
[1, 3, 3, 3, 2, 1, 0, 0, 0, 0]
```

```
>>> from sage.all import *
>>> t = ImplicitSuffixTree(Word("cacao"))
>>> t.number_of_factors()
13
>>> list(map(t.number_of_factors, range(Integer(10))))
[1, 3, 3, 3, 2, 1, 0, 0, 0, 0]
```

```
sage: t = ImplicitSuffixTree(Word("c"*1000))
sage: t.number_of_factors()
1001
sage: t.number_of_factors(17)
1
sage: t.number_of_factors(0)
1
```

```
>>> from sage.all import *
>>> t = ImplicitSuffixTree(Word("c"*Integer(1000)))
>>> t.number_of_factors()
1001
>>> t.number_of_factors(Integer(17))
1
>>> t.number_of_factors(Integer(0))
1
```

```
sage: ImplicitSuffixTree(Word()).number_of_factors()
1
```

```
>>> from sage.all import *
>>> ImplicitSuffixTree(Word()).number_of_factors()
1
```

```
sage: blueberry = ImplicitSuffixTree(Word("blueberry"))
sage: blueberry.number_of_factors()
43
sage: list(map(blueberry.number_of_factors, range(10)))
[1, 6, 8, 7, 6, 5, 4, 3, 2, 1]
```

```
>>> from sage.all import *
>>> blueberry = ImplicitSuffixTree(Word("blueberry"))
>>> blueberry.number_of_factors()
43
>>> list(map(blueberry.number_of_factors, range(Integer(10))))
[1, 6, 8, 7, 6, 5, 4, 3, 2, 1]
```

plot(*word_labels=False*, *layout='tree'*, *tree_root=0*, *tree_orientation='up'*, *vertex_colors=None*, *edge_labels=True*, **args*, ***kwds*)

Return a Graphics object corresponding to the transition graph of the suffix tree.

INPUT:

- `word_labels` – boolean (default: `False`); if `False`, labels the edges by pairs (i, j); if `True`, labels the edges by `word[i:j]`
- `layout` – (default: `'tree'`)
- `tree_root` – (default: 0)
- `tree_orientation` – (default: `'up'`)
- `vertex_colors` – (default: `None`)
- `edge_labels` – (default: `True`)

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: ImplicitSuffixTree(Word('cacao')).plot(word_labels=True)              #␣
↪needs sage.graphs sage.plot
Graphics object consisting of 23 graphics primitives
sage: ImplicitSuffixTree(Word('cacao')).plot(word_labels=False)             #␣
↪needs sage.graphs sage.plot
Graphics object consisting of 23 graphics primitives
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> ImplicitSuffixTree(Word('cacao')).plot(word_labels=True)              #␣
↪needs sage.graphs sage.plot
Graphics object consisting of 23 graphics primitives
>>> ImplicitSuffixTree(Word('cacao')).plot(word_labels=False)             #␣
↪needs sage.graphs sage.plot
Graphics object consisting of 23 graphics primitives
```

process_letter(*letter*)

Modify the current implicit suffix tree producing the implicit suffix tree for `self.word() + letter`.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: w = Words("aco")("cacao")
sage: t = ImplicitSuffixTree(w[:-1]); t
Implicit Suffix Tree of the word: caca
sage: t.process_letter(w[-1]); t
Implicit Suffix Tree of the word: cacao
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> w = Words("aco")("cacao")
>>> t = ImplicitSuffixTree(w[:-Integer(1)]); t
Implicit Suffix Tree of the word: caca
>>> t.process_letter(w[-Integer(1)]); t
Implicit Suffix Tree of the word: cacao
```

```
sage: W = Words([0,1])
sage: s = ImplicitSuffixTree(W([0,1,0,1])); s
Implicit Suffix Tree of the word: 0101
sage: s.process_letter(W([1])[0]); s
Implicit Suffix Tree of the word: 01011
```

```
>>> from sage.all import *
>>> W = Words([Integer(0),Integer(1)])
>>> s = ImplicitSuffixTree(W([Integer(0),Integer(1),Integer(0),Integer(1)]));␣
↪s
Implicit Suffix Tree of the word: 0101
>>> s.process_letter(W([Integer(1)])[Integer(0)]); s
Implicit Suffix Tree of the word: 01011
```

show(*word_labels=None*, **args*, ***kwds*)

Display the output of `plot()`.

INPUT:

- `word_labels` – (default: `None`) if `False`, labels the edges by pairs (i, j); if `True`, labels the edges by `word[i:j]`

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: w = Words("cao")("cacao")
sage: t = ImplicitSuffixTree(w)
sage: t.show(word_labels=True)                                                  #␣
↪needs sage.plot
sage: t.show(word_labels=False)                                                 #␣
↪needs sage.plot
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> w = Words("cao")("cacao")
>>> t = ImplicitSuffixTree(w)
>>> t.show(word_labels=True)                                                    #␣
↪needs sage.plot
>>> t.show(word_labels=False)                                                   #␣
↪needs sage.plot
```

states()

Return the states (explicit nodes) of the suffix tree.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: W = Words([0,1,2])
sage: t = ImplicitSuffixTree(W([0,1,0,1,2]))
sage: t.states()
[0, 1, 2, 3, 4, 5, 6, 7]
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> W = Words([Integer(0),Integer(1),Integer(2)])
>>> t = ImplicitSuffixTree(W([Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(2)]))
>>> t.states()
[0, 1, 2, 3, 4, 5, 6, 7]
```

suffix_link(*state*)

Evaluate the suffix link map of the implicit suffix tree on `state`.

Note that the suffix link is not defined for all states.

The suffix link of a state x' that corresponds to the suffix x is defined to be -1 is x' is the root (0) and y' otherwise, where y' is the state corresponding to the suffix `x[1:]`.

INPUT:

- `state` – a state

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: W = Words([0,1,2])
sage: t = ImplicitSuffixTree(W([0,1,0,1,2]))
sage: t.suffix_link(3)
5
sage: t.suffix_link(5)
0
sage: t.suffix_link(0)
-1
sage: t.suffix_link(-1)
Traceback (most recent call last):
    ...
TypeError: there is no suffix link from -1
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> W = Words([Integer(0),Integer(1),Integer(2)])
>>> t = ImplicitSuffixTree(W([Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(2)]))
>>> t.suffix_link(Integer(3))
5
>>> t.suffix_link(Integer(5))
0
>>> t.suffix_link(Integer(0))
-1
>>> t.suffix_link(-Integer(1))
Traceback (most recent call last):
    ...
TypeError: there is no suffix link from -1
```

suffix_walk(*edge*, *l*)

Return the state of "w" if the input state is "aw".

If the input state `(edge, l)` is path labeled "aw" with "a" a letter, the output is the state which is path labeled "w".

INPUT:

- `edge` – the edge containing the state
- `l` – the string-depth of the state on edge (`l`>0)

OUTPUT:

Return `("explicit", end_node)` if the state of w is an explicit state and `("implicit", edge, d)` is obtained by reading `d` letters on `edge`.

EXAMPLES:

```
sage: T = Word('00110111011').suffix_tree()
sage: T.suffix_walk((0, 5), 1)
('explicit', 0)
sage: T.suffix_walk((7, 3), 1)
('implicit', (9, 4), 1)
```

```
>>> from sage.all import *
>>> T = Word('00110111011').suffix_tree()
>>> T.suffix_walk((Integer(0), Integer(5)), Integer(1))
('explicit', 0)
>>> T.suffix_walk((Integer(7), Integer(3)), Integer(1))
('implicit', (9, 4), 1)
```

to_digraph(*word_labels=False*)

Return a `DiGraph` object of the transition graph of the suffix tree.

INPUT:

- `word_labels` – boolean (default: `False`); if `False`, labels the edges by pairs (i, j). If `True`, labels the edges by `word[i:j]`

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: W = Words([0,1,2])
sage: t = ImplicitSuffixTree(W([0,1,0,1,2]))
sage: t.to_digraph()                                                    #␣
↪needs sage.graphs
Digraph on 8 vertices
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> W = Words([Integer(0),Integer(1),Integer(2)])
>>> t = ImplicitSuffixTree(W([Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(2)]))
>>> t.to_digraph()                                                      #␣
↪needs sage.graphs
Digraph on 8 vertices
```

to_explicit_suffix_tree()

Convert `self` to an explicit suffix tree.

It is obtained by processing an end of string letter as if it were a regular letter, except that no new leaf nodes are created (thus, the only thing that happens is that some implicit nodes become explicit).

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: w = Words("aco")("cacao")
sage: t = ImplicitSuffixTree(w)
sage: t.to_explicit_suffix_tree()
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> w = Words("aco")("cacao")
>>> t = ImplicitSuffixTree(w)
>>> t.to_explicit_suffix_tree()
```

```
sage: W = Words([0,1])
sage: s = ImplicitSuffixTree(W([0,1,0,1,1]))
sage: s.to_explicit_suffix_tree()
```

```
>>> from sage.all import *
>>> W = Words([Integer(0),Integer(1)])
>>> s = ImplicitSuffixTree(W([Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(1)]))
>>> s.to_explicit_suffix_tree()
```

transition_function(*word*, *node=0*)

Return the node obtained by starting from `node` and following the edges labelled by the letters of `word`.

OUTPUT:

`("explicit", end_node)` if we end at `end_node`, or `("implicit", edge, d)` if we end d spots along an edge.

INPUT:

- `word` – a word
- `node` – (default: 0) starting node

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: W = Words([0,1,2])
sage: t = ImplicitSuffixTree(W([0,1,0,1,2]))
sage: t.transition_function(W([0,1,0]))
('implicit', (3, 1), 1)
sage: t.transition_function(W([0,1,2]))
('explicit', 4)
sage: t.transition_function(W([0,1,2]), 5)
('explicit', 2)
sage: t.transition_function(W([0,1]), 5)
('implicit', (5, 2), 2)
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> W = Words([Integer(0),Integer(1),Integer(2)])
>>> t = ImplicitSuffixTree(W([Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(2)]))
>>> t.transition_function(W([Integer(0),Integer(1),Integer(0)]))
('implicit', (3, 1), 1)
>>> t.transition_function(W([Integer(0),Integer(1),Integer(2)]))
('explicit', 4)
>>> t.transition_function(W([Integer(0),Integer(1),Integer(2)]), Integer(5))
('explicit', 2)
>>> t.transition_function(W([Integer(0),Integer(1)]), Integer(5))
('implicit', (5, 2), 2)
```

transition_function_dictionary()

Return the transition function as a dictionary of dictionaries.

The format is consistent with the input format for `DiGraph`.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree
sage: W = Words("aco")
sage: t = ImplicitSuffixTree(W("cac"))
sage: t.transition_function_dictionary()
{0: {1: (0, None), 2: (1, None)}}
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree
>>> W = Words("aco")
>>> t = ImplicitSuffixTree(W("cac"))
>>> t.transition_function_dictionary()
{0: {1: (0, None), 2: (1, None)}}
```

```
sage: W = Words([0,1])
sage: t = ImplicitSuffixTree(W([0,1,0]))
sage: t.transition_function_dictionary()
{0: {1: (0, None), 2: (1, None)}}
```

```
>>> from sage.all import *
>>> W = Words([Integer(0),Integer(1)])
>>> t = ImplicitSuffixTree(W([Integer(0),Integer(1),Integer(0)]))
>>> t.transition_function_dictionary()
{0: {1: (0, None), 2: (1, None)}}
```

trie_type_dict()

Return a dictionary in a format compatible with that of the suffix trie transition function.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree,␣
↪SuffixTrie
sage: W = Words("ab")
sage: t = ImplicitSuffixTree(W("aba"))
sage: d = t.trie_type_dict()
sage: len(d)
5
sage: d                       # random
{(4, word: b): 5, (0, word: a): 4, (0, word: b): 3, (5, word: a): 1, (3,␣
↪word: a): 2}
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree,␣
↪SuffixTrie
>>> W = Words("ab")
>>> t = ImplicitSuffixTree(W("aba"))
>>> d = t.trie_type_dict()
>>> len(d)
5
>>> d                       # random
{(4, word: b): 5, (0, word: a): 4, (0, word: b): 3, (5, word: a): 1, (3,␣
↪word: a): 2}
```

uncompactify()

Return the tree obtained from `self` by splitting edges so that they are labelled by exactly one letter.

The resulting tree is isomorphic to the suffix trie.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import ImplicitSuffixTree,␣
↪SuffixTrie
sage: abbab = Words("ab")("abbab")
sage: s = SuffixTrie(abbab)
sage: t = ImplicitSuffixTree(abbab)
sage: t.uncompactify().is_isomorphic(s.to_digraph())                    #␣
↪needs sage.graphs
True
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import ImplicitSuffixTree,␣
↪SuffixTrie
>>> abbab = Words("ab")("abbab")
>>> s = SuffixTrie(abbab)
>>> t = ImplicitSuffixTree(abbab)
>>> t.uncompactify().is_isomorphic(s.to_digraph())                      #␣
↪needs sage.graphs
True
```

word()

Return the word whose implicit suffix tree this is.

class sage.combinat.words.suffix_trees.**SuffixTrie**(*word*)

Bases: SageObject

Construct the suffix trie of the word w.

The suffix trie of a finite word w is a data structure representing the factors of w. It is a tree whose edges are labelled with letters of w, and whose leafs correspond to suffixes of w.

This is a straightforward implementation of Algorithm 1 from [Ukko1995]. It constructs the suffix trie of w[:i] from that of w[:i-1].

A suffix trie is modelled as a deterministic finite-state automaton together with the suffix_link map. The set of states corresponds to factors of the word (below we write x' for the state corresponding to x); these are always 0, 1, …. The state 0 is the initial state, and it corresponds to the empty word. For the purposes of the algorithm, there is also an auxiliary state -1. The transition function t is defined as:

```
t(-1,a) = 0 for all letters a; and
t(x',a) = y' for all x',y' \in Q such that y = xa,
```

and the suffix link function is defined as:

```
suffix_link(0) = -1;
suffix_link(x') = y', if x = ay for some letter a.
```

REFERENCES:

- [Ukko1995]

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("cao")("cacao")
sage: t = SuffixTrie(w); t
Suffix Trie of the word: cacao
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import SuffixTrie
>>> w = Words("cao")("cacao")
>>> t = SuffixTrie(w); t
Suffix Trie of the word: cacao
```

```
sage: e = Words("ab")()
sage: t = SuffixTrie(e); t
Suffix Trie of the word:
sage: t.process_letter("a"); t
Suffix Trie of the word: a
sage: t.process_letter("b"); t
Suffix Trie of the word: ab
sage: t.process_letter("a"); t
Suffix Trie of the word: aba
```

```
>>> from sage.all import *
>>> e = Words("ab")()
>>> t = SuffixTrie(e); t
Suffix Trie of the word:
>>> t.process_letter("a"); t
Suffix Trie of the word: a
>>> t.process_letter("b"); t
Suffix Trie of the word: ab
>>> t.process_letter("a"); t
Suffix Trie of the word: aba
```

active_state()

Return the active state of the suffix trie.

This is the state corresponding to the word as a suffix of itself.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("cao")("cacao")
sage: t = SuffixTrie(w)
sage: t.active_state()
8
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import SuffixTrie
>>> w = Words("cao")("cacao")
>>> t = SuffixTrie(w)
>>> t.active_state()
8
```

```
sage: u = Words([0,1])([0,1,1,0,1,0,0,1])
sage: s = SuffixTrie(u)
sage: s.active_state()
22
```

```
>>> from sage.all import *
>>> u = Words([Integer(0),Integer(1)])([Integer(0),Integer(1),Integer(1),
↪Integer(0),Integer(1),Integer(0),Integer(0),Integer(1)])
>>> s = SuffixTrie(u)
>>> s.active_state()
22
```

final_states()

Return the set of final states of the suffix trie.

These are the states corresponding to the suffixes of `self.word()`. They are obtained be repeatedly following the suffix link from the active state until we reach 0.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("cao")("cacao")
sage: t = SuffixTrie(w)
sage: t.final_states() == Set([8, 9, 10, 11, 12, 0])
True
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import SuffixTrie
>>> w = Words("cao")("cacao")
>>> t = SuffixTrie(w)
>>> t.final_states() == Set([Integer(8), Integer(9), Integer(10), Integer(11),
↪ Integer(12), Integer(0)])
True
```

has_suffix(*word*)

Return `True` if and only if `word` is a suffix of `self.word()`.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("cao")("cacao")
sage: t = SuffixTrie(w)
sage: [t.has_suffix(w[i:]) for i in range(w.length()+1)]
[True, True, True, True, True, True]
sage: [t.has_suffix(w[:i]) for i in range(w.length()+1)]
[True, False, False, False, False, True]
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import SuffixTrie
>>> w = Words("cao")("cacao")
>>> t = SuffixTrie(w)
>>> [t.has_suffix(w[i:]) for i in range(w.length()+Integer(1))]
[True, True, True, True, True, True]
```

(continues on next page)

(continued from previous page)

```
>>> [t.has_suffix(w[:i]) for i in range(w.length()+Integer(1))]
[True, False, False, False, False, True]
```

node_to_word(*state=0*)

Return the word obtained by reading the edge labels from 0 to `state`.

INPUT:

- `state` – (default: 0) a state

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("abc")("abcba")
sage: t = SuffixTrie(w)
sage: t.node_to_word(10)
word: abcba
sage: t.node_to_word(7)
word: abcb
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import SuffixTrie
>>> w = Words("abc")("abcba")
>>> t = SuffixTrie(w)
>>> t.node_to_word(Integer(10))
word: abcba
>>> t.node_to_word(Integer(7))
word: abcb
```

plot(*layout='tree'*, *tree_root=0*, *tree_orientation='up'*, *vertex_colors=None*, *edge_labels=True*, **args*, ***kwds*)

Return a Graphics object corresponding to the transition graph of the suffix trie.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: SuffixTrie(Word("cacao")).plot()                                  #␣
↪needs sage.plot
Graphics object consisting of 38 graphics primitives
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import SuffixTrie
>>> SuffixTrie(Word("cacao")).plot()                                    #␣
↪needs sage.plot
Graphics object consisting of 38 graphics primitives
```

process_letter(*letter*)

Modify `self` to produce the suffix trie for `self.word() + letter`.

> **Note**
>
> `letter` must occur within the alphabet of the word.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("ab")("ababba")
sage: t = SuffixTrie(w); t
Suffix Trie of the word: ababba
sage: t.process_letter("a"); t
Suffix Trie of the word: ababbaa
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import SuffixTrie
>>> w = Words("ab")("ababba")
>>> t = SuffixTrie(w); t
Suffix Trie of the word: ababba
>>> t.process_letter("a"); t
Suffix Trie of the word: ababbaa
```

show(**args*, ***kwds*)

Display the output of *plot()*.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("cao")("cac")
sage: t = SuffixTrie(w)
sage: t.show()                                                              #␣
↪needs sage.plot
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import SuffixTrie
>>> w = Words("cao")("cac")
>>> t = SuffixTrie(w)
>>> t.show()                                                                #␣
↪needs sage.plot
```

states()

Return the states of the automaton defined by the suffix trie.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words([0,1])([0,1,1])
sage: t = SuffixTrie(w)
sage: t.states()
[0, 1, 2, 3, 4]
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import SuffixTrie
>>> w = Words([Integer(0),Integer(1)])([Integer(0),Integer(1),Integer(1)])
>>> t = SuffixTrie(w)
>>> t.states()
[0, 1, 2, 3, 4]
```

```
sage: u = Words("aco")("cacao")
sage: s = SuffixTrie(u)
```

(continues on next page)

(continued from previous page)

```
sage: s.states()
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11]
```

```
>>> from sage.all import *
>>> u = Words("aco")("cacao")
>>> s = SuffixTrie(u)
>>> s.states()
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11]
```

suffix_link(*state*)

Evaluate the suffix link map of the suffix trie on `state`.

Note that the suffix link map is not defined on -1.

INPUT:

- `state` – a state

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("cao")("cacao")
sage: t = SuffixTrie(w)
sage: list(map(t.suffix_link, range(13)))
[-1, 0, 3, 0, 5, 1, 7, 2, 9, 10, 11, 12, 0]
sage: t.suffix_link(0)
-1
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import SuffixTrie
>>> w = Words("cao")("cacao")
>>> t = SuffixTrie(w)
>>> list(map(t.suffix_link, range(Integer(13))))
[-1, 0, 3, 0, 5, 1, 7, 2, 9, 10, 11, 12, 0]
>>> t.suffix_link(Integer(0))
-1
```

to_digraph()

Return a `DiGraph` object of the transition graph of the suffix trie.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("cao")("cac")
sage: t = SuffixTrie(w)
sage: d = t.to_digraph(); d                                                 #␣
↪needs sage.graphs
Digraph on 6 vertices
sage: d.adjacency_matrix()                                                  #␣
↪needs sage.graphs sage.modules
[0 1 0 1 0 0]
[0 0 1 0 0 0]
[0 0 0 0 1 0]
[0 0 0 0 0 1]
```

(continues on next page)

(continued from previous page)

```
[0 0 0 0 0 0]
[0 0 0 0 0 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import SuffixTrie
>>> w = Words("cao")("cac")
>>> t = SuffixTrie(w)
>>> d = t.to_digraph(); d                                                    #␣
↪needs sage.graphs
Digraph on 6 vertices
>>> d.adjacency_matrix()                                                     #␣
↪needs sage.graphs sage.modules
[0 1 0 1 0 0]
[0 0 1 0 0 0]
[0 0 0 0 1 0]
[0 0 0 0 0 1]
[0 0 0 0 0 0]
[0 0 0 0 0 0]
```

transition_function(*node*, *word*)

Return the state reached by beginning at `node` and following the arrows in the transition graph labelled by the letters of `word`.

INPUT:

- `node` – a node
- `word` – a word

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words([0,1])([0,1,0,1,1])
sage: t = SuffixTrie(w)
sage: all(t.transition_function(u, letter) == v
....:     for (u, letter), v in t._transition_function.items())
True
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import SuffixTrie
>>> w = Words([Integer(0),Integer(1)])([Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(1)])
>>> t = SuffixTrie(w)
>>> all(t.transition_function(u, letter) == v
...     for (u, letter), v in t._transition_function.items())
True
```

word()

Return the word whose suffix tree this is.

EXAMPLES:

```
sage: from sage.combinat.words.suffix_trees import SuffixTrie
sage: w = Words("abc")("abcba")
```

(continues on next page)

(continued from previous page)

```
sage: t = SuffixTrie(w)
sage: t.word()
word: abcba
sage: t.word() == w
True
```

```
>>> from sage.all import *
>>> from sage.combinat.words.suffix_trees import SuffixTrie
>>> w = Words("abc")("abcba")
>>> t = SuffixTrie(w)
>>> t.word()
word: abcba
>>> t.word() == w
True
```

User-customizable options for words

sage.combinat.words.word_options.**WordOptions**(***kwargs*)

Set the global options for elements of the word class. The defaults are for words to be displayed in list notation.

INPUT:

- `display` – 'string' (default), or 'list', words are displayed in string or list notation
- `truncate` – boolean (default: `True`); whether to truncate the string output of long words (see truncate_length below)
- `truncate_length` – integer (default: 40); if the length of the word is greater than this integer, then the word is truncated
- `letter_separator` – string (default: `','`); if the string representation of letters have length greater than 1, then the letters are separated by this string in the string representation of the word

If no parameters are set, then the function returns a copy of the options dictionary.

EXAMPLES:

```
sage: w = Word([2,1,3,12])
sage: u = Word("abba")
sage: WordOptions(display='list')
sage: w
word: [2, 1, 3, 12]
sage: u
word: ['a', 'b', 'b', 'a']
sage: WordOptions(display='string')
sage: w
word: 2,1,3,12
sage: u
word: abba
```

```
>>> from sage.all import *
>>> w = Word([Integer(2),Integer(1),Integer(3),Integer(12)])
>>> u = Word("abba")
>>> WordOptions(display='list')
>>> w
```

(continues on next page)

(continued from previous page)

```
word: [2, 1, 3, 12]
>>> u
word: ['a', 'b', 'b', 'a']
>>> WordOptions(display='string')
>>> w
word: 2,1,3,12
>>> u
word: abba
```

Word classes

AUTHORS:

class sage.combinat.words.word.**FiniteWord_callable**(*parent*, *callable*, *length=None*)

Bases: *WordDatatype_callable*, *FiniteWord_class*

Finite word represented by a callable.

For such word w, type `w.` and hit `Tab` key to see the list of functions defined on w.

EXAMPLES:

```
sage: f = lambda n : 3 if n > 8 else 6
sage: w = Word(f, length=30, caching=False)
sage: w
word: 666666666333333333333333333333
sage: w.is_symmetric()
True
```

```
>>> from sage.all import *
>>> f = lambda n : Integer(3) if n > Integer(8) else Integer(6)
>>> w = Word(f, length=Integer(30), caching=False)
>>> w
word: 666666666333333333333333333333
>>> w.is_symmetric()
True
```

class sage.combinat.words.word.**FiniteWord_callable_with_caching**(*parent*, *callable*, *length=None*)

Bases: *WordDatatype_callable_with_caching*, *FiniteWord_class*

Finite word represented by a callable (with caching).

For such word w, type `w.` and hit `Tab` key to see the list of functions defined on w.

EXAMPLES:

```
sage: f = lambda n : n % 3
sage: w = Word(f, length=32)
sage: w
```

(continues on next page)

(continued from previous page)

```
word: 012012012012012012012012012012012
sage: w.border()
word: 01201201201201201201201201201
```

```
>>> from sage.all import *
>>> f = lambda n : n % Integer(3)
>>> w = Word(f, length=Integer(32))
>>> w
word: 01201201201201201201201201201201
>>> w.border()
word: 01201201201201201201201201201
```

class sage.combinat.words.word.**FiniteWord_char**

Bases: *WordDatatype_char*, *FiniteWord_class*

Finite word represented by an array `unsigned char *` (i.e. integers between 0 and 255).

For any word `w`, type `w.<TAB>` to see the functions that can be applied to `w`.

EXAMPLES:

```
sage: W = Words(range(20))

sage: w = W(list(range(1, 10)) * 2)
sage: type(w)
<class 'sage.combinat.words.word.FiniteWord_char'>
sage: w
word: 123456789123456789

sage: w.is_palindrome()
False
sage: (w*w[::-1]).is_palindrome()
True
sage: (w[:-1:]*w[::-1]).is_palindrome()
True

sage: w.is_lyndon()
False
sage: W(list(range(10)) + [10, 10]).is_lyndon()
True

sage: w.is_square_free()
False
sage: w[:-1].is_square_free()
True

sage: u = W([randint(0,10) for i in range(10)])
sage: (u*u).is_square()
True
sage: (u*u*u).is_cube()
True

sage: len(w.factor_set())
```

(continues on next page)

(continued from previous page)

```
127
sage: w.rauzy_graph(5)                                                          #␣
↪needs sage.graphs
Looped digraph on 9 vertices

sage: u = W([1,2,3])
sage: w.first_occurrence(u)
0
sage: w.first_occurrence(u, start=1)
9
```

```
>>> from sage.all import *
>>> W = Words(range(Integer(20)))

>>> w = W(list(range(Integer(1), Integer(10))) * Integer(2))
>>> type(w)
<class 'sage.combinat.words.word.FiniteWord_char'>
>>> w
word: 123456789123456789

>>> w.is_palindrome()
False
>>> (w*w[::-Integer(1)]).is_palindrome()
True
>>> (w[:-Integer(1):]*w[::-Integer(1)]).is_palindrome()
True

>>> w.is_lyndon()
False
>>> W(list(range(Integer(10))) + [Integer(10), Integer(10)]).is_lyndon()
True

>>> w.is_square_free()
False
>>> w[:-Integer(1)].is_square_free()
True

>>> u = W([randint(Integer(0),Integer(10)) for i in range(Integer(10))])
>>> (u*u).is_square()
True
>>> (u*u*u).is_cube()
True

>>> len(w.factor_set())
127
>>> w.rauzy_graph(Integer(5))                                                   ␣
↪     # needs sage.graphs
Looped digraph on 9 vertices

>>> u = W([Integer(1),Integer(2),Integer(3)])
>>> w.first_occurrence(u)
0
```

(continues on next page)

(continued from previous page)

```
>>> w.first_occurrence(u, start=Integer(1))
9
```

class sage.combinat.words.word.**FiniteWord_iter**(*parent*, *iter*, *length=None*)

Bases: *WordDatatype_iter*, *FiniteWord_class*

Finite word represented by an iterator.

For such word w, type `w.` and hit `Tab` key to see the list of functions defined on w.

EXAMPLES:

```
sage: w = Word(iter(range(10)), caching=False)
sage: w
word: 0123456789
sage: w.finite_differences()
word: 111111111
```

```
>>> from sage.all import *
>>> w = Word(iter(range(Integer(10))), caching=False)
>>> w
word: 0123456789
>>> w.finite_differences()
word: 111111111
```

class sage.combinat.words.word.**FiniteWord_iter_with_caching**(*parent*, *iter*, *length=None*)

Bases: *WordDatatype_iter_with_caching*, *FiniteWord_class*

Finite word represented by an iterator (with caching).

For such word w, type `w.` and hit `Tab` key to see the list of functions defined on w.

EXAMPLES:

```
sage: w = Word(iter('abcdef'))
sage: w.conjugate(2)
word: cdefab
```

```
>>> from sage.all import *
>>> w = Word(iter('abcdef'))
>>> w.conjugate(Integer(2))
word: cdefab
```

class sage.combinat.words.word.**FiniteWord_list**

Bases: *WordDatatype_list*, *FiniteWord_class*

Finite word represented by a Python list.

For any word w, type `w.` and hit `Tab` key to see the list of functions defined on w.

EXAMPLES:

```
sage: w = Word(range(10))
sage: w.iterated_right_palindromic_closure()
word: 0102010301020104010201030102010501020103...
```

```
>>> from sage.all import *
>>> w = Word(range(Integer(10)))
>>> w.iterated_right_palindromic_closure()
word: 0102010301020104010201030102010501020103...
```

class sage.combinat.words.word.**FiniteWord_morphic**(*parent*, *morphism*, *letter*, *coding=None*, *length=+Infinity*)

Bases: *WordDatatype_morphic*, *FiniteWord_class*

Finite morphic word.

For such word w, type `w.` and hit `Tab` key to see the list of functions defined on w.

EXAMPLES:

```
sage: m = WordMorphism("a->ab,b->")
sage: w = m.fixed_point("a")
sage: w
word: ab
```

```
>>> from sage.all import *
>>> m = WordMorphism("a->ab,b->")
>>> w = m.fixed_point("a")
>>> w
word: ab
```

class sage.combinat.words.word.**FiniteWord_str**

Bases: *WordDatatype_str*, *FiniteWord_class*

Finite word represented by a Python str.

For such word w, type `w.` and hit `Tab` key to see the list of functions defined on w.

EXAMPLES:

```
sage: w = Word('abcdef')
sage: w.is_square()
False
```

```
>>> from sage.all import *
>>> w = Word('abcdef')
>>> w.is_square()
False
```

class sage.combinat.words.word.**FiniteWord_tuple**

Bases: *WordDatatype_tuple*, *FiniteWord_class*

Finite word represented by a Python tuple.

For such word w, type `w.` and hit `Tab` key to see the list of functions defined on w.

EXAMPLES:

```
sage: w = Word(())
sage: w.is_empty()
True
```

```
>>> from sage.all import *
>>> w = Word(())
>>> w.is_empty()
True
```

class sage.combinat.words.word.**InfiniteWord_callable**(*parent*, *callable*, *length=None*)

Bases: *WordDatatype_callable*, *InfiniteWord_class*

Infinite word represented by a callable.

For such word w, type `w.` and hit `Tab` key to see the list of functions defined on w.

Infinite words behave like a Python list : they can be sliced using square braquets to define for example a prefix or a factor.

EXAMPLES:

```
sage: w = Word(lambda n:n, caching=False)
sage: w
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,
↪28,29,30,31,32,33,34,35,36,37,38,39,...
sage: w.iterated_right_palindromic_closure()
word: 0102010301020104010201030102010501020103...
```

```
>>> from sage.all import *
>>> w = Word(lambda n:n, caching=False)
>>> w
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,
↪28,29,30,31,32,33,34,35,36,37,38,39,...
>>> w.iterated_right_palindromic_closure()
word: 0102010301020104010201030102010501020103...
```

class sage.combinat.words.word.**InfiniteWord_callable_with_caching**(*parent*, *callable*, *length=None*)

Bases: *WordDatatype_callable_with_caching*, *InfiniteWord_class*

Infinite word represented by a callable (with caching).

For such word w, type `w.` and hit `Tab` key to see the list of functions defined on w.

Infinite words behave like a Python list : they can be sliced using square braquets to define for example a prefix or a factor.

EXAMPLES:

```
sage: w = Word(lambda n:n)
sage: factor = w[4:13]
sage: factor
word: 4,5,6,7,8,9,10,11,12
```

```
>>> from sage.all import *
>>> w = Word(lambda n:n)
>>> factor = w[Integer(4):Integer(13)]
>>> factor
word: 4,5,6,7,8,9,10,11,12
```

class sage.combinat.words.word.**InfiniteWord_iter**(*parent*, *iter*, *length=None*)

Bases: *WordDatatype_iter*, *InfiniteWord_class*

Infinite word represented by an iterable.

For such word w, type `w.` and hit `Tab` key to see the list of functions defined on w.

Infinite words behave like a Python list : they can be sliced using square braquets to define for example a prefix or a factor.

EXAMPLES:

```
sage: from itertools import chain, cycle
sage: w = Word(chain('letsgo', cycle('forever')), caching=False)
sage: w
word: letsgoforeverforeverforeverforeverforeve...
sage: prefix = w[:100]
sage: prefix
word: letsgoforeverforeverforeverforeverforeverforeve...
sage: prefix.is_lyndon()
False
```

```
>>> from sage.all import *
>>> from itertools import chain, cycle
>>> w = Word(chain('letsgo', cycle('forever')), caching=False)
>>> w
word: letsgoforeverforeverforeverforeverforeve...
>>> prefix = w[:Integer(100)]
>>> prefix
word: letsgoforeverforeverforeverforeverforeverforeve...
>>> prefix.is_lyndon()
False
```

class sage.combinat.words.word.**InfiniteWord_iter_with_caching**(*parent*, *iter*, *length=None*)

Bases: *WordDatatype_iter_with_caching*, *InfiniteWord_class*

Infinite word represented by an iterable (with caching).

For such word w, type `w.` and hit `Tab` key to see the list of functions defined on w.

Infinite words behave like a Python list : they can be sliced using square braquets to define for example a prefix or a factor.

EXAMPLES:

```
sage: from itertools import cycle
sage: w = Word(cycle([9,8,4]))
sage: w
word: 984984984984984984984984984984984984984984...
sage: prefix = w[:23]
sage: prefix
word: 98498498498498498498498
sage: prefix.minimal_period()
3
```

```
>>> from sage.all import *
>>> from itertools import cycle
```

(continues on next page)

(continued from previous page)

```
>>> w = Word(cycle([Integer(9),Integer(8),Integer(4)]))
>>> w
word: 9849849849849849849849849849849849849849...
>>> prefix = w[:Integer(23)]
>>> prefix
word: 98498498498498498498498
>>> prefix.minimal_period()
3
```

class sage.combinat.words.word.**InfiniteWord_morphic**(*parent*, *morphism*, *letter*, *coding=None*, *length=+Infinity*)

Bases: *WordDatatype_morphic*, *InfiniteWord_class*

Morphic word of infinite length.

For such word w, type `w.` and hit `Tab` key to see the list of functions defined on w.

Infinite words behave like a Python list : they can be sliced using square braquets to define for example a prefix or a factor.

EXAMPLES:

```
sage: m = WordMorphism('a->ab,b->a')
sage: w = m.fixed_point('a')
sage: w
word: abaababaabaababaabababaabaababaabaababaaba...
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->ab,b->a')
>>> w = m.fixed_point('a')
>>> w
word: abaababaabaababaabababaabaababaabaababaaba...
```

sage.combinat.words.word.**Word**(*data=None*, *alphabet=None*, *length=None*, *datatype=None*, *caching=True*, *RSK_data=None*)

Construct a word.

INPUT:

- `data` – (default: `None`) list, string, tuple, iterator, free monoid element, `None` (shorthand for `[]`), or a callable defined on `[0,1,...,length]`
- `alphabet` – any argument accepted by Words
- `length` – (default: `None`) this is dependent on the type of data. It is ignored for words defined by lists, strings, tuples, etc., because they have a naturally defined length. For callables, this defines the domain of definition, which is assumed to be `[0, 1, 2, ..., length-1]`. For iterators: Infinity if you know the iterator will not terminate (default); `'unknown'` if you do not know whether the iterator terminates; `'finite'` if you know that the iterator terminates, but do not know the length.
- `datatype` – (default: `None`) `None`, `'list'`, `'str'`, `'tuple'`, `'iter'`, `'callable'`; if `None`, then the function tries to guess this from the data
- `caching` – boolean (default: `True`); whether to keep a cache of the letters computed by an iterator or callable
- `RSK_data` – (default: `None`) semistandard and a standard Young tableau to run the inverse RSK bijection on

Note

Be careful when defining words using callables and iterators. It appears that islice does not pickle correctly causing various errors when reloading. Also, most iterators do not support copying and should not support pickling by extension.

EXAMPLES:

Empty word:

```
sage: Word()
word:
```

```
>>> from sage.all import *
>>> Word()
word:
```

Word with string:

```
sage: Word("abbabaab")
word: abbabaab
```

```
>>> from sage.all import *
>>> Word("abbabaab")
word: abbabaab
```

Word with string constructed from other types:

```
sage: Word([0,1,1,0,1,0,0,1], datatype='str')
word: 01101001
sage: Word((0,1,1,0,1,0,0,1), datatype='str')
word: 01101001
```

```
>>> from sage.all import *
>>> Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1)], datatype='str')
word: 01101001
>>> Word((Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1)), datatype='str')
word: 01101001
```

Word with list:

```
sage: Word([0,1,1,0,1,0,0,1])
word: 01101001
```

```
>>> from sage.all import *
>>> Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1)])
word: 01101001
```

Word with list constructed from other types:

```
sage: Word("01101001", datatype='list')
word: 01101001
sage: Word((0,1,1,0,1,0,0,1), datatype='list')
word: 01101001
```

```
>>> from sage.all import *
>>> Word("01101001", datatype='list')
word: 01101001
>>> Word((Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1)), datatype='list')
word: 01101001
```

Word with tuple:

```
sage: Word((0,1,1,0,1,0,0,1))
word: 01101001
```

```
>>> from sage.all import *
>>> Word((Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1)))
word: 01101001
```

Word with tuple constructed from other types:

```
sage: Word([0,1,1,0,1,0,0,1], datatype='tuple')
word: 01101001
sage: Word("01101001", datatype='str')
word: 01101001
```

```
>>> from sage.all import *
>>> Word([Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1)], datatype='tuple')
word: 01101001
>>> Word("01101001", datatype='str')
word: 01101001
```

Word with iterator:

```
sage: from itertools import count
sage: Word(count())
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,
↪28,29,30,31,32,33,34,35,36,37,38,39,...
sage: Word(iter("abbabaab")) # iterators default to infinite words
word: abbabaab
sage: Word(iter("abbabaab"), length='unknown')
word: abbabaab
sage: Word(iter("abbabaab"), length='finite')
word: abbabaab
```

```
>>> from sage.all import *
>>> from itertools import count
>>> Word(count())
```

(continues on next page)

(continued from previous page)

```
word: 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17,18,19,20,21,22,23,24,25,26,27,
↪28,29,30,31,32,33,34,35,36,37,38,39,...
>>> Word(iter("abbabaab")) # iterators default to infinite words
word: abbabaab
>>> Word(iter("abbabaab"), length='unknown')
word: abbabaab
>>> Word(iter("abbabaab"), length='finite')
word: abbabaab
```

Word with function (a 'callable'):

```
sage: f = lambda n : add(Integer(n).digits(2)) % 2
sage: Word(f)
word: 01101001100101101001011001101001100110010110...
sage: Word(f, length=8)
word: 01101001
```

```
>>> from sage.all import *
>>> f = lambda n : add(Integer(n).digits(Integer(2))) % Integer(2)
>>> Word(f)
word: 01101001100101101001011001101001100110010110...
>>> Word(f, length=Integer(8))
word: 01101001
```

Word over a string with a parent:

```
sage: w = Word("abbabaab", alphabet='abc'); w
word: abbabaab
sage: w.parent()
Finite words over {'a', 'b', 'c'}
```

```
>>> from sage.all import *
>>> w = Word("abbabaab", alphabet='abc'); w
word: abbabaab
>>> w.parent()
Finite words over {'a', 'b', 'c'}
```

Word from a free monoid element:

```
sage: M.<x,y,z> = FreeMonoid(3)
sage: Word(x^3*y*x*z^2*x)
word: xxxyxzzx
```

```
>>> from sage.all import *
>>> M = FreeMonoid(Integer(3), names=('x', 'y', 'z',)); (x, y, z,) = M._first_
↪ngens(3)
>>> Word(x**Integer(3)*y*x*z**Integer(2)*x)
word: xxxyxzzx
```

The default parent is the combinatorial class of all words:

```
sage: w = Word("abbabaab"); w
word: abbabaab
sage: w.parent()
Finite words over Set of Python objects of class 'object'
```

```
>>> from sage.all import *
>>> w = Word("abbabaab"); w
word: abbabaab
>>> w.parent()
Finite words over Set of Python objects of class 'object'
```

We can also input a semistandard tableau and a standard tableau to obtain a word from the inverse RSK algorithm using the `RSK_data` option:

```
sage: p = Tableau([[1,2,2],[3]]); q = Tableau([[1,2,4],[3]])
sage: Word(RSK_data=[p, q])
word: 1322
```

```
>>> from sage.all import *
>>> p = Tableau([[Integer(1),Integer(2),Integer(2)],[Integer(3)]]); q =␣
↪Tableau([[Integer(1),Integer(2),Integer(4)],[Integer(3)]])
>>> Word(RSK_data=[p, q])
word: 1322
```

class sage.combinat.words.word.**Word_iter**(*parent*, *iter*, *length=None*)

Bases: *WordDatatype_iter*, *Word_class*

Word of unknown length (finite or infinite) represented by an iterable.

For such word w, type `w.` and hit `Tab` key to see the list of functions defined on w.

Words behave like a Python list : they can be sliced using square braquets to define for example a prefix or a factor.

EXAMPLES:

```
sage: w = Word(iter([1,1,4,9]*1000), length='unknown', caching=False)
sage: w
word: 11491149114911491149114911491149114911491149...
sage: w.delta()
word: 21121121121121121121121121121121121121121121...
```

```
>>> from sage.all import *
>>> w = Word(iter([Integer(1),Integer(1),Integer(4),Integer(9)]*Integer(1000)),␣
↪length='unknown', caching=False)
>>> w
word: 11491149114911491149114911491149114911491149...
>>> w.delta()
word: 21121121121121121121121121121121121121121121...
```

class sage.combinat.words.word.**Word_iter_with_caching**(*parent*, *iter*, *length=None*)

Bases: *WordDatatype_iter_with_caching*, *Word_class*

Word of unknown length (finite or infinite) represented by an iterable (with caching).

For such word w, type `w.` and hit `Tab` key to see the list of functions defined on w.

Words behave like a Python list : they can be sliced using square braquets to define for example a prefix or a factor.

EXAMPLES:

```
sage: w = Word(iter([1,2,3]*1000), length='unknown')
sage: w
word: 123123123123123123123123123123123123...
sage: w.finite_differences(mod=2)
word: 110110110110110110110110110110110110...
```

```
>>> from sage.all import *
>>> w = Word(iter([Integer(1),Integer(2),Integer(3)]*Integer(1000)), length=
↪'unknown')
>>> w
word: 123123123123123123123123123123123123...
>>> w.finite_differences(mod=Integer(2))
word: 110110110110110110110110110110110110...
```

Word morphisms/substitutions

This module implements morphisms over finite and infinite words.

AUTHORS:

- Sébastien Labbé (2007-06-01): initial version
- Sébastien Labbé (2008-07-01): merged into sage-words
- Sébastien Labbé (2008-12-17): merged into sage
- Sébastien Labbé (2009-02-03): words next generation
- Sébastien Labbé (2009-11-20): allowing the choice of the datatype of the image. Doc improvements.
- Stepan Starosta (2012-11-09): growing letters

EXAMPLES:

Creation of a morphism from a dictionary or a string:

```
sage: n = WordMorphism({0:[0,2,2,1],1:[0,2],2:[2,2,1]})
```

```
>>> from sage.all import *
>>> n = WordMorphism({Integer(0):[Integer(0),Integer(2),Integer(2),Integer(1)],
↪Integer(1):[Integer(0),Integer(2)],Integer(2):[Integer(2),Integer(2),Integer(1)]})
```

```
sage: m = WordMorphism('x->xyxsxss,s->xyss,y->ys')
```

```
>>> from sage.all import *
>>> m = WordMorphism('x->xyxsxss,s->xyss,y->ys')
```

```
sage: n
WordMorphism: 0->0221, 1->02, 2->221
sage: m
WordMorphism: s->xyss, x->xyxsxss, y->ys
```

```
>>> from sage.all import *
>>> n
WordMorphism: 0->0221, 1->02, 2->221
>>> m
WordMorphism: s->xyss, x->xyxsxss, y->ys
```

The codomain may be specified:

```
sage: WordMorphism({0:[0,2,2,1],1:[0,2],2:[2,2,1]}, codomain=Words([0,1,2,3,4]))
WordMorphism: 0->0221, 1->02, 2->221
```

```
>>> from sage.all import *
>>> WordMorphism({Integer(0):[Integer(0),Integer(2),Integer(2),Integer(1)],
↪Integer(1):[Integer(0),Integer(2)],Integer(2):[Integer(2),Integer(2),Integer(1)]},␣
↪codomain=Words([Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)]))
WordMorphism: 0->0221, 1->02, 2->221
```

Power of a morphism:

```
sage: n^2
WordMorphism: 0->022122122102, 1->0221221, 2->22122102
```

```
>>> from sage.all import *
>>> n**Integer(2)
WordMorphism: 0->022122122102, 1->0221221, 2->22122102
```

Image under a morphism:

```
sage: m('y')
word: ys
sage: m('xxxsy')
word: xyxsxssxyxsxssxyxsxssxyssys
```

```
>>> from sage.all import *
>>> m('y')
word: ys
>>> m('xxxsy')
word: xyxsxssxyxsxssxyxsxssxyssys
```

Iterated image under a morphism:

```
sage: m('y', 3)
word: ysxyssxyxsxssysxyssxyss
```

```
>>> from sage.all import *
>>> m('y', Integer(3))
word: ysxyssxyxsxssysxyssxyss
```

See more examples in the documentation of the call method (`m.__call__?`).

Infinite fixed point of morphism:

```
sage: fix = m.fixed_point('x')
sage: fix
word: xyxsxssysxyxsxssxyssxyxsxssxyssxyssysxys...
sage: fix.length()
+Infinity
```

```
>>> from sage.all import *
>>> fix = m.fixed_point('x')
>>> fix
word: xyxsxssysxyxsxssxyssxyxsxssxyssxyssysxys...
>>> fix.length()
+Infinity
```

Incidence matrix:

```
sage: matrix(m)                                                          #␣
↪needs sage.modules
[2 3 1]
[1 3 0]
[1 1 1]
```

```
>>> from sage.all import *
>>> matrix(m)                                                            #␣
↪needs sage.modules
[2 3 1]
[1 3 0]
[1 1 1]
```

Many other functionalities…:

```
sage: m.is_identity()
False
sage: m.is_endomorphism()
True
```

```
>>> from sage.all import *
>>> m.is_identity()
False
>>> m.is_endomorphism()
True
```

class sage.combinat.words.morphism.**PeriodicPointIterator**(*m*, *cycle*)

Bases: object

(Lazy) constructor of the periodic points of a word morphism.

This class is mainly used in *WordMorphism.periodic_point* and *WordMorphism.periodic_points*.

EXAMPLES:

```
sage: from sage.combinat.words.morphism import PeriodicPointIterator
sage: s = WordMorphism('a->bacca,b->cba,c->aab')
sage: p = PeriodicPointIterator(s, ['a','b','c'])
sage: p._cache[0]
```

(continues on next page)

(continued from previous page)

```
lazy list ['a', 'a', 'b', ...]
sage: p._cache[1]
lazy list ['b', 'a', 'c', ...]
sage: p._cache[2]
lazy list ['c', 'b', 'a', ...]
```

```
>>> from sage.all import *
>>> from sage.combinat.words.morphism import PeriodicPointIterator
>>> s = WordMorphism('a->bacca,b->cba,c->aab')
>>> p = PeriodicPointIterator(s, ['a','b','c'])
>>> p._cache[Integer(0)]
lazy list ['a', 'a', 'b', ...]
>>> p._cache[Integer(1)]
lazy list ['b', 'a', 'c', ...]
>>> p._cache[Integer(2)]
lazy list ['c', 'b', 'a', ...]
```

get_iterator(*i*)

Internal method.

EXAMPLES:

```
sage: from sage.combinat.words.morphism import PeriodicPointIterator
sage: s = WordMorphism('a->bacca,b->cba,c->aab')
sage: p = PeriodicPointIterator(s, ['a','b','c'])
sage: p.get_iterator(0)
<generator object ...get_iterator at ...>
```

```
>>> from sage.all import *
>>> from sage.combinat.words.morphism import PeriodicPointIterator
>>> s = WordMorphism('a->bacca,b->cba,c->aab')
>>> p = PeriodicPointIterator(s, ['a','b','c'])
>>> p.get_iterator(Integer(0))
<generator object ...get_iterator at ...>
```

class sage.combinat.words.morphism.**WordMorphism**(*data*, *domain=None*, *codomain=None*)

Bases: SageObject

WordMorphism class.

INPUT:

- data – dictionary or string or an instance of WordMorphism, the map giving the image of letters
- domain – (optional:None) set of words over a given alphabet. If None, the domain alphabet is computed from data and is *sorted*.
- codomain – (optional:None) set of words over a given alphabet. If None, the codomain alphabet is computed from data and is *sorted*.

Note

When the domain or the codomain are not explicitly given, it is expected that the letters are comparable because the alphabets of the domain and of the codomain are sorted.

EXAMPLES:

From a dictionary:

```
sage: n = WordMorphism({0:[0,2,2,1],1:[0,2],2:[2,2,1]})
sage: n
WordMorphism: 0->0221, 1->02, 2->221
```

```
>>> from sage.all import *
>>> n = WordMorphism({Integer(0):[Integer(0),Integer(2),Integer(2),Integer(1)],
↪Integer(1):[Integer(0),Integer(2)],Integer(2):[Integer(2),Integer(2),
↪Integer(1)]})
>>> n
WordMorphism: 0->0221, 1->02, 2->221
```

From a string with `'->'` as separation:

```
sage: m = WordMorphism('x->xyxsxss,s->xyss,y->ys')
sage: m
WordMorphism: s->xyss, x->xyxsxss, y->ys
sage: m.domain()
Finite words over {'s', 'x', 'y'}
sage: m.codomain()
Finite words over {'s', 'x', 'y'}
```

```
>>> from sage.all import *
>>> m = WordMorphism('x->xyxsxss,s->xyss,y->ys')
>>> m
WordMorphism: s->xyss, x->xyxsxss, y->ys
>>> m.domain()
Finite words over {'s', 'x', 'y'}
>>> m.codomain()
Finite words over {'s', 'x', 'y'}
```

Specifying the domain and codomain:

```
sage: W = FiniteWords([0,1,2])
sage: d = {0:[0,1], 1:[0,1,0], 2:[0]}
sage: m = WordMorphism(d, domain=W, codomain=W)
sage: m([0]).parent()
Finite words over {0, 1, 2}
```

```
>>> from sage.all import *
>>> W = FiniteWords([Integer(0),Integer(1),Integer(2)])
>>> d = {Integer(0):[Integer(0),Integer(1)], Integer(1):[Integer(0),Integer(1),
↪Integer(0)], Integer(2):[Integer(0)]}
>>> m = WordMorphism(d, domain=W, codomain=W)
>>> m([Integer(0)]).parent()
Finite words over {0, 1, 2}
```

When the alphabet is non-sortable, the domain and/or codomain must be explicitly given:

```
sage: W = FiniteWords(['a',6])
sage: d = {'a':['a',6,'a'],6:[6,6,6,'a']}
```

(continues on next page)

(continued from previous page)

```
sage: WordMorphism(d, domain=W, codomain=W)
WordMorphism: 6->666a, a->a6a
```

```
>>> from sage.all import *
>>> W = FiniteWords(['a',Integer(6)])
>>> d = {'a':['a',Integer(6),'a'],Integer(6):[Integer(6),Integer(6),Integer(6),'a
↪']}
>>> WordMorphism(d, domain=W, codomain=W)
WordMorphism: 6->666a, a->a6a
```

abelian_rotation_subspace()

Return the subspace on which the incidence matrix of `self` acts by roots of unity.

EXAMPLES:

```
sage: # needs sage.modules
sage: WordMorphism('0->1,1->0').abelian_rotation_subspace()
Vector space of degree 2 and dimension 2 over Rational Field
Basis matrix:
[1 0]
[0 1]
sage: WordMorphism('0->01,1->10').abelian_rotation_subspace()
Vector space of degree 2 and dimension 0 over Rational Field
Basis matrix:
[]
sage: WordMorphism('0->01,1->1').abelian_rotation_subspace()
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[0 1]
sage: WordMorphism('1->122,2->211').abelian_rotation_subspace()
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[ 1 -1]
sage: WordMorphism('0->1,1->102,2->3,3->4,4->2').abelian_rotation_subspace()
Vector space of degree 5 and dimension 3 over Rational Field
Basis matrix:
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> WordMorphism('0->1,1->0').abelian_rotation_subspace()
Vector space of degree 2 and dimension 2 over Rational Field
Basis matrix:
[1 0]
[0 1]
>>> WordMorphism('0->01,1->10').abelian_rotation_subspace()
Vector space of degree 2 and dimension 0 over Rational Field
Basis matrix:
[]
>>> WordMorphism('0->01,1->1').abelian_rotation_subspace()
```

(continues on next page)

(continued from previous page)

```
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[0 1]
>>> WordMorphism('1->122,2->211').abelian_rotation_subspace()
Vector space of degree 2 and dimension 1 over Rational Field
Basis matrix:
[ 1 -1]
>>> WordMorphism('0->1,1->102,2->3,3->4,4->2').abelian_rotation_subspace()
Vector space of degree 5 and dimension 3 over Rational Field
Basis matrix:
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]
```

The domain needs to be equal to the codomain:

```
sage: WordMorphism('0->1,1->',codomain=Words('01')).abelian_rotation_
↪subspace()          # needs sage.modules
Vector space of degree 2 and dimension 0 over Rational Field
Basis matrix:
[]
```

```
>>> from sage.all import *
>>> WordMorphism('0->1,1->',codomain=Words('01')).abelian_rotation_subspace()␣
↪        # needs sage.modules
Vector space of degree 2 and dimension 0 over Rational Field
Basis matrix:
[]
```

codomain()

Return the codomain of `self`.

EXAMPLES:

```
sage: WordMorphism('a->ab,b->a').codomain()
Finite words over {'a', 'b'}
sage: WordMorphism('6->ab,y->5,0->asd').codomain()
Finite words over {'5', 'a', 'b', 'd', 's'}
```

```
>>> from sage.all import *
>>> WordMorphism('a->ab,b->a').codomain()
Finite words over {'a', 'b'}
>>> WordMorphism('6->ab,y->5,0->asd').codomain()
Finite words over {'5', 'a', 'b', 'd', 's'}
```

conjugate(*pos*)

Return the morphism where the image of the letter by `self` is conjugated of parameter `pos`.

INPUT:

- `pos` – integer

EXAMPLES:

```
sage: m = WordMorphism('a->abcde')
sage: m.conjugate(0) == m
True
sage: m.conjugate(1)
WordMorphism: a->bcdea
sage: m.conjugate(3)
WordMorphism: a->deabc
sage: WordMorphism('').conjugate(4)
WordMorphism:
sage: m = WordMorphism('a->abcde,b->xyz')
sage: m.conjugate(2)
WordMorphism: a->cdeab, b->zxy
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->abcde')
>>> m.conjugate(Integer(0)) == m
True
>>> m.conjugate(Integer(1))
WordMorphism: a->bcdea
>>> m.conjugate(Integer(3))
WordMorphism: a->deabc
>>> WordMorphism('').conjugate(Integer(4))
WordMorphism:
>>> m = WordMorphism('a->abcde,b->xyz')
>>> m.conjugate(Integer(2))
WordMorphism: a->cdeab, b->zxy
```

domain()

Return domain of `self`.

EXAMPLES:

```
sage: WordMorphism('a->ab,b->a').domain()
Finite words over {'a', 'b'}
sage: WordMorphism('b->ba,a->ab').domain()
Finite words over {'a', 'b'}
sage: WordMorphism('6->ab,y->5,0->asd').domain()
Finite words over {'0', '6', 'y'}
```

```
>>> from sage.all import *
>>> WordMorphism('a->ab,b->a').domain()
Finite words over {'a', 'b'}
>>> WordMorphism('b->ba,a->ab').domain()
Finite words over {'a', 'b'}
>>> WordMorphism('6->ab,y->5,0->asd').domain()
Finite words over {'0', '6', 'y'}
```

dual_map(*k=1*)

Return the dual map E_k^* of `self` (see [1]).

> **Note**
>
> It is actually implemented only for $k = 1$.

INPUT:

- `self` – unimodular endomorphism defined on integers `1, 2, \ldots, d`
- `k` – integer (default: 1)

OUTPUT: an instance of E1Star - the dual map

EXAMPLES:

```
sage: sigma = WordMorphism({1: [2], 2: [3], 3: [1,2]})
sage: sigma.dual_map()                                                      #␣
↪needs sage.modules
E_1^*(1->2, 2->3, 3->12)
```

```
>>> from sage.all import *
>>> sigma = WordMorphism({Integer(1): [Integer(2)], Integer(2): [Integer(3)],␣
↪Integer(3): [Integer(1),Integer(2)]})
>>> sigma.dual_map()                                                        #␣
↪needs sage.modules
E_1^*(1->2, 2->3, 3->12)
```

```
sage: sigma.dual_map(k=2)
Traceback (most recent call last):
...
NotImplementedError: the dual map E_k^* is implemented only for k = 1 (not 2)
```

```
>>> from sage.all import *
>>> sigma.dual_map(k=Integer(2))
Traceback (most recent call last):
...
NotImplementedError: the dual map E_k^* is implemented only for k = 1 (not 2)
```

REFERENCES:

- [1] Sano, Y., Arnoux, P. and Ito, S., Higher dimensional extensions of substitutions and their dual maps, Journal d'Analyse Mathématique 83 (2001), 183-206.

extend_by(*other*)

Return `self` extended by `other`.

Let $\varphi_1 : A^* \to B^*$ and $\varphi_2 : C^* \to D^*$ be two morphisms. A morphism $\mu : (A \cup C)^* \to (B \cup D)^*$ corresponds to φ_1 *extended by* φ_2 if $\mu(a) = \varphi_1(a)$ if $a \in A$ and $\mu(a) = \varphi_2(a)$ otherwise.

INPUT:

- `other` – a WordMorphism

OUTPUT: WordMorphism

EXAMPLES:

```
sage: m = WordMorphism('a->ab,b->ba')
sage: n = WordMorphism({'0':'1','1':'0','a':'5'})
sage: m.extend_by(n)
WordMorphism: 0->1, 1->0, a->ab, b->ba
sage: n.extend_by(m)
WordMorphism: 0->1, 1->0, a->5, b->ba
sage: m.extend_by(m)
WordMorphism: a->ab, b->ba
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->ab,b->ba')
>>> n = WordMorphism({'0':'1','1':'0','a':'5'})
>>> m.extend_by(n)
WordMorphism: 0->1, 1->0, a->ab, b->ba
>>> n.extend_by(m)
WordMorphism: 0->1, 1->0, a->5, b->ba
>>> m.extend_by(m)
WordMorphism: a->ab, b->ba
```

fixed_point (*letter*)

Return the fixed point of `self` beginning by the given `letter`.

A fixed point of morphism φ is a word w such that $\varphi(w) = w$.

INPUT:

- `self` – an endomorphism (or more generally a self-composable morphism), must be prolongable on `letter`
- `letter` – in the domain of `self`, the first letter of the fixed point

OUTPUT: `word` – the fixed point of `self` beginning with `letter`

EXAMPLES:

```
sage: W = FiniteWords('abc')
```

```
>>> from sage.all import *
>>> W = FiniteWords('abc')
```

1. Infinite fixed point:

```
sage: WordMorphism('a->ab,b->ba').fixed_point(letter='a')
word: abbabaabbaababbabaababbaabbabaabbaababba...
sage: WordMorphism('a->ab,b->a').fixed_point(letter='a')
word: abaababaabaababaababaabaababaabaababaaba...
sage: WordMorphism('a->ab,b->b,c->ba', codomain=W).fixed_point(letter='a')
word: abbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbb...
```

```
>>> from sage.all import *
>>> WordMorphism('a->ab,b->ba').fixed_point(letter='a')
word: abbabaabbaababbabaababbaabbabaabbaababba...
>>> WordMorphism('a->ab,b->a').fixed_point(letter='a')
word: abaababaabaababaababaabaababaabaababaaba...
```

(continues on next page)

(continued from previous page)

```
>>> WordMorphism('a->ab,b->b,c->ba', codomain=W).fixed_point(letter='a')
word: abbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbb...
```

2. Infinite fixed point of an erasing morphism:

```
sage: WordMorphism('a->ab,b->,c->ba', codomain=W).fixed_point(letter='a')
word: ab
```

```
>>> from sage.all import *
>>> WordMorphism('a->ab,b->,c->ba', codomain=W).fixed_point(letter='a')
word: ab
```

3. Finite fixed point:

```
sage: WordMorphism('a->ab,b->b,c->ba', codomain=W).fixed_point(letter='b')
word: b
sage: _.parent()
Finite words over {'a', 'b', 'c'}

sage: WordMorphism('a->ab,b->cc,c->', codomain=W).fixed_point(letter='a')
word: abcc
sage: _.parent()
Finite words over {'a', 'b', 'c'}

sage: m = WordMorphism('a->abc,b->,c->')
sage: fp = m.fixed_point('a'); fp
word: abc

sage: m = WordMorphism('a->ba,b->')
sage: m('ba')
word: ba
sage: m.fixed_point('a') #todo: not implemented
word: ba
```

```
>>> from sage.all import *
>>> WordMorphism('a->ab,b->b,c->ba', codomain=W).fixed_point(letter='b')
word: b
>>> _.parent()
Finite words over {'a', 'b', 'c'}

>>> WordMorphism('a->ab,b->cc,c->', codomain=W).fixed_point(letter='a')
word: abcc
>>> _.parent()
Finite words over {'a', 'b', 'c'}

>>> m = WordMorphism('a->abc,b->,c->')
>>> fp = m.fixed_point('a'); fp
word: abc

>>> m = WordMorphism('a->ba,b->')
>>> m('ba')
word: ba
```

(continues on next page)

(continued from previous page)

```
>>> m.fixed_point('a') #todo: not implemented
word: ba
```

5. Fixed point of a power of a morphism:

```
sage: m = WordMorphism('a->ba,b->ab')
sage: (m^2).fixed_point(letter='a')
word: abbabaabbaababbabaababbaabbabaabbaababba...
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->ba,b->ab')
>>> (m**Integer(2)).fixed_point(letter='a')
word: abbabaabbaababbabaababbaabbabaabbaababba...
```

6. With a self-composable but not endomorphism

   sage: m = WordMorphism('a->cbc,b->bc,c->b') sage: m.is_endomorphism() False sage: m.fixed_point('b') word: bcbbcbcbbcbbcbcbbcbcbbcbbcbcbbcbbcbcbbcb…

fixed_points()

Return the list of all fixed points of `self`.

EXAMPLES:

```
sage: f = WordMorphism('a->ab,b->ba')
sage: for w in f.fixed_points(): print(w)
abbabaabbaababbabaababbaabbabaabbaababba...
baababbaabbabaababbabaabbaababbaabbabaab...

sage: f = WordMorphism('a->ab,b->c,c->a')
sage: for w in f.fixed_points(): print(w)
abcaababcabcaabcaababcaababcabcaababcabc...

sage: f = WordMorphism('a->ab,b->cab,c->bcc')
sage: for w in f.fixed_points(): print(w)
abcabbccabcabcabbccbccabcabbccabcabbccab...
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->ab,b->ba')
>>> for w in f.fixed_points(): print(w)
abbabaabbaababbabaababbaabbabaabbaababba...
baababbaabbabaababbabaabbaababbaabbabaab...

>>> f = WordMorphism('a->ab,b->c,c->a')
>>> for w in f.fixed_points(): print(w)
abcaababcabcaabcaababcaababcabcaababcabc...

>>> f = WordMorphism('a->ab,b->cab,c->bcc')
>>> for w in f.fixed_points(): print(w)
abcabbccabcabcabbccbccabcabbccabcabbccab...
```

This shows that issue Issue #13668 has been resolved:

```
sage: d = {1:[1,2],2:[2,3],3:[4],4:[5],5:[6],6:[7],7:[8],8:[9],9:[10],10:[1]}
sage: s = WordMorphism(d)
sage: s7 = s^7
sage: s7.fixed_points()
[word: 12232342..., word: 2,3,4,5,6,7,8...]
sage: s7r = s7.reversal()
sage: s7r.periodic_point(2)
word: 2,1,1,10,9,8,7,6,5,4,3,2,1,10,9,8,7,6,5,4,3,2,10,9,8,7,6,5,4,3,2,9,8,7,
↪6,5,4,3,2,8,...
```

```
>>> from sage.all import *
>>> d = {Integer(1):[Integer(1),Integer(2)],Integer(2):[Integer(2),
↪Integer(3)],Integer(3):[Integer(4)],Integer(4):[Integer(5)],
↪Integer(5):[Integer(6)],Integer(6):[Integer(7)],Integer(7):[Integer(8)],
↪Integer(8):[Integer(9)],Integer(9):[Integer(10)],Integer(10):[Integer(1)]}
>>> s = WordMorphism(d)
>>> s7 = s**Integer(7)
>>> s7.fixed_points()
[word: 12232342..., word: 2,3,4,5,6,7,8...]
>>> s7r = s7.reversal()
>>> s7r.periodic_point(Integer(2))
word: 2,1,1,10,9,8,7,6,5,4,3,2,1,10,9,8,7,6,5,4,3,2,10,9,8,7,6,5,4,3,2,9,8,7,
↪6,5,4,3,2,8,...
```

This shows that issue Issue #13668 has been resolved:

```
sage: s = "1->321331332133133,2->133321331332133133,3->
↪213313313332133133321331133"
sage: s = WordMorphism(s)
sage: (s^2).fixed_points()
[]
```

```
>>> from sage.all import *
>>> s = "1->321331332133133,2->133321331332133133,3->213313313332133133321331133133
↪"
>>> s = WordMorphism(s)
>>> (s**Integer(2)).fixed_points()
[]
```

growing_letters()

Return the list of growing letters.

See *is_growing()* for more information.

EXAMPLES:

```
sage: WordMorphism('0->01,1->10').growing_letters()
['0', '1']
sage: WordMorphism('0->01,1->1').growing_letters()
['0']
sage: WordMorphism('0->01,1->0,2->1',codomain=Words('012')).growing_letters()
['0', '1', '2']
sage: WordMorphism('a->b,b->a').growing_letters()
```

(continues on next page)

(continued from previous page)

```
[]
sage: WordMorphism('a->b,b->c,c->d,d->c', codomain=Words('abcd')).growing_
↪letters()
[]
```

```
>>> from sage.all import *
>>> WordMorphism('0->01,1->10').growing_letters()
['0', '1']
>>> WordMorphism('0->01,1->1').growing_letters()
['0']
>>> WordMorphism('0->01,1->0,2->1',codomain=Words('012')).growing_letters()
['0', '1', '2']
>>> WordMorphism('a->b,b->a').growing_letters()
[]
>>> WordMorphism('a->b,b->c,c->d,d->c', codomain=Words('abcd')).growing_
↪letters()
[]
```

has_conjugate_in_classP(*f=None*)

Return `True` if `self` has a conjugate in class f-P.

DEFINITION : Let A be an alphabet. We say that a primitive substitution S is in the *class P* if there exists a palindrome p and for each $b \in A$ a palindrome q_b such that $S(b) = pq_b$ for all $b \in A$. [1]

Let f be an involution on A. We say that a morphism φ is in class f-P if there exists an f-palindrome p and for each $\alpha \in A$ there exists an f-palindrome q_α such that $\varphi(\alpha) = pq_\alpha$. [2]

INPUT:

- `f` – involution (default: `None`) on the alphabet of `self`; it must be callable on letters as well as words (e.g. WordMorphism)

REFERENCES:

- [1] Hof, A., O. Knill et B. Simon, Singular continuous spectrum for palindromic Schrödinger operators, Commun. Math. Phys. 174 (1995) 149-159.
- [2] Labbé, Sébastien. Propriétés combinatoires des f-palindromes, Mémoire de maitrise en Mathématiques, Montréal, UQAM, 2008, 109 pages.

EXAMPLES:

```
sage: fibo = WordMorphism('a->ab,b->a')
sage: fibo.has_conjugate_in_classP()
True
sage: (fibo^2).is_in_classP()
False
sage: (fibo^2).has_conjugate_in_classP()
True
```

```
>>> from sage.all import *
>>> fibo = WordMorphism('a->ab,b->a')
>>> fibo.has_conjugate_in_classP()
True
>>> (fibo**Integer(2)).is_in_classP()
```

(continues on next page)

(continued from previous page)

```
False
>>> (fibo**Integer(2)).has_conjugate_in_classP()
True
```

has_left_conjugate()

Return `True` if all the non empty images of `self` begins with the same letter.

EXAMPLES:

```
sage: m = WordMorphism('a->abcde,b->xyz')
sage: m.has_left_conjugate()
False
sage: WordMorphism('b->xyz').has_left_conjugate()
True
sage: WordMorphism('').has_left_conjugate()
True
sage: WordMorphism('a->,b->xyz').has_left_conjugate()
True
sage: WordMorphism('a->abbab,b->abb').has_left_conjugate()
True
sage: WordMorphism('a->abbab,b->abb,c->').has_left_conjugate()
True
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->abcde,b->xyz')
>>> m.has_left_conjugate()
False
>>> WordMorphism('b->xyz').has_left_conjugate()
True
>>> WordMorphism('').has_left_conjugate()
True
>>> WordMorphism('a->,b->xyz').has_left_conjugate()
True
>>> WordMorphism('a->abbab,b->abb').has_left_conjugate()
True
>>> WordMorphism('a->abbab,b->abb,c->').has_left_conjugate()
True
```

has_right_conjugate()

Return `True` if all the non empty images of `self` ends with the same letter.

EXAMPLES:

```
sage: m = WordMorphism('a->abcde,b->xyz')
sage: m.has_right_conjugate()
False
sage: WordMorphism('b->xyz').has_right_conjugate()
True
sage: WordMorphism('').has_right_conjugate()
True
sage: WordMorphism('a->,b->xyz').has_right_conjugate()
True
sage: WordMorphism('a->abbab,b->abb').has_right_conjugate()
```

(continues on next page)

(continued from previous page)

```
True
sage: WordMorphism('a->abbab,b->abb,c->').has_right_conjugate()
True
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->abcde,b->xyz')
>>> m.has_right_conjugate()
False
>>> WordMorphism('b->xyz').has_right_conjugate()
True
>>> WordMorphism('').has_right_conjugate()
True
>>> WordMorphism('a->,b->xyz').has_right_conjugate()
True
>>> WordMorphism('a->abbab,b->abb').has_right_conjugate()
True
>>> WordMorphism('a->abbab,b->abb,c->').has_right_conjugate()
True
```

image(*letter*)

Return the image of a letter.

INPUT:

- `letter` – a letter in the domain alphabet

OUTPUT: word

Note

The letter is assumed to be in the domain alphabet (no check done). Hence, this method is faster than the `__call__` method suitable for words input.

EXAMPLES:

```
sage: m = WordMorphism('a->ab,b->ac,c->a')
sage: m.image('b')
word: ac
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->ab,b->ac,c->a')
>>> m.image('b')
word: ac
```

```
sage: s = WordMorphism({('a', 1):[('a', 1), ('a', 2)], ('a', 2):[('a', 1)]})
sage: s.image(('a',1))
word: ('a', 1),('a', 2)
```

```
>>> from sage.all import *
>>> s = WordMorphism({('a', Integer(1)):[('a', Integer(1)), ('a',␣
↪Integer(2))], ('a', Integer(2)):[('a', Integer(1))]})
```

(continues on next page)

(continued from previous page)

```
>>> s.image(('a',Integer(1)))
word: ('a', 1),('a', 2)
```

```
sage: s = WordMorphism({'b':[1,2], 'a':(2,3,4), 'z':[9,8,7]})
sage: s.image('b')
word: 12
sage: s.image('a')
word: 234
sage: s.image('z')
word: 987
```

```
>>> from sage.all import *
>>> s = WordMorphism({'b':[Integer(1),Integer(2)], 'a':(Integer(2),Integer(3),
↪Integer(4)), 'z':[Integer(9),Integer(8),Integer(7)]})
>>> s.image('b')
word: 12
>>> s.image('a')
word: 234
>>> s.image('z')
word: 987
```

images()

Return the list of all the images of the letters of the alphabet under `self`.

EXAMPLES:

```
sage: sorted(WordMorphism('a->ab,b->a').images())
[word: a, word: ab]
sage: sorted(WordMorphism('6->ab,y->5,0->asd').images())
[word: 5, word: ab, word: asd]
```

```
>>> from sage.all import *
>>> sorted(WordMorphism('a->ab,b->a').images())
[word: a, word: ab]
>>> sorted(WordMorphism('6->ab,y->5,0->asd').images())
[word: 5, word: ab, word: asd]
```

immortal_letters()

Return the list of immortal letters.

A letter a is *immortal* for the morphism s if the length of the iterates of $|s^n(a)|$ is larger than zero as n goes to infinity.

Requires this morphism to be self-composable.

EXAMPLES:

```
sage: WordMorphism('a->a').immortal_letters()
['a']
sage: WordMorphism('a->b,b->a').immortal_letters()
['a', 'b']
sage: WordMorphism('a->abcd,b->cd,c->dd,d->').immortal_letters()
['a']
```

(continues on next page)

(continued from previous page)

```
sage: WordMorphism('a->bc,b->cac,c->de,d->,e->').immortal_letters()
['a', 'b']
sage: WordMorphism('a->', domain=Words('a'), codomain=Words('a')).immortal_
↪letters()
[]

sage: WordMorphism('a->').immortal_letters()
[]
```

```
>>> from sage.all import *
>>> WordMorphism('a->a').immortal_letters()
['a']
>>> WordMorphism('a->b,b->a').immortal_letters()
['a', 'b']
>>> WordMorphism('a->abcd,b->cd,c->dd,d->').immortal_letters()
['a']
>>> WordMorphism('a->bc,b->cac,c->de,d->,e->').immortal_letters()
['a', 'b']
>>> WordMorphism('a->', domain=Words('a'), codomain=Words('a')).immortal_
↪letters()
[]

>>> WordMorphism('a->').immortal_letters()
[]
```

incidence_matrix()

Return the incidence matrix of the morphism. The order of the rows and column are given by the order defined on the alphabet of the domain and the codomain.

The matrix returned is over the integers. If a different ring is desired, use either the `change_ring` function or the `matrix` function.

EXAMPLES:

```
sage: m = WordMorphism('a->abc,b->a,c->c')
sage: m.incidence_matrix()                                                  #␣
↪needs sage.modules
[1 1 0]
[1 0 0]
[1 0 1]
sage: m = WordMorphism('a->abc,b->a,c->c,d->abbccccabca,e->abc')
sage: m.incidence_matrix()                                                  #␣
↪needs sage.modules
[1 1 0 3 1]
[1 0 0 3 1]
[1 0 1 5 1]
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->abc,b->a,c->c')
>>> m.incidence_matrix()                                                    #␣
↪needs sage.modules
[1 1 0]
```

(continues on next page)

(continued from previous page)

```
[1 0 0]
[1 0 1]
>>> m = WordMorphism('a->abc,b->a,c->c,d->abbccccabca,e->abc')
>>> m.incidence_matrix()                                                    #␣
↪needs sage.modules
[1 1 0 3 1]
[1 0 0 3 1]
[1 0 1 5 1]
```

infinite_repetitions_primitive_roots(*w=None*, *allow_growing=None*)

Return the set of primitive roots (up to conjugacy) of infinite repetitions from the language $\{m^n(w)|n \geq 0\}$, where m is this morphism and w is a word inputted as a parameter.

Requires this morphism to be an endomorphism.

The word v^ω is an infinite repetition (in other words, an infinite periodic factor) of a language, if v is a non-empty word and for each positive integer k the word v^k is a factor of some word from the language. It turns out that a language created by iterating a morphism has a finite number of primitive roots of infinite repetitions.

If v is a primitive root of an infinite repetition, then all its conjugations are also primitive roots of an infinite repetition. For simplicity's sake this method returns only the lexicographically minimal one from each conjugacy class.

INPUT:

- `w` – finite iterable (default: `self.domain().alphabet()`); represents a word used to start the language
- `allow_growing` – boolean or `None` (default: `None`); if `False`, return only the primitive roots that contain no growing letters. If `True`, return only the primitive roots that contain at least one growing letter. If `None`, return both.

ALGORITHM:

The algorithm used is described in detail in [KS2015].

EXAMPLES:

```
sage: m = WordMorphism('a->aba,b->aba,c->cd,d->e,e->d')
sage: inf_reps = m.infinite_repetitions_primitive_roots('ac')
sage: sorted(inf_reps)
[word: aab, word: de]
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->aba,b->aba,c->cd,d->e,e->d')
>>> inf_reps = m.infinite_repetitions_primitive_roots('ac')
>>> sorted(inf_reps)
[word: aab, word: de]
```

`allow_growing` parameter:

```
sage: sorted(m.infinite_repetitions_primitive_roots('ac', True))
[word: aab]
sage: sorted(m.infinite_repetitions_primitive_roots('ac', False))
[word: de]
```

```
>>> from sage.all import *
>>> sorted(m.infinite_repetitions_primitive_roots('ac', True))
[word: aab]
>>> sorted(m.infinite_repetitions_primitive_roots('ac', False))
[word: de]
```

Incomplete check that these words are indeed the primitive roots of infinite repetitions:

```
sage: SL = m._language_naive(10, Word('ac'))
sage: all(x in SL for x in inf_reps)
True
sage: all(x^2 in SL for x in inf_reps)
True
sage: all(x^3 in SL for x in inf_reps)
True
```

```
>>> from sage.all import *
>>> SL = m._language_naive(Integer(10), Word('ac'))
>>> all(x in SL for x in inf_reps)
True
>>> all(x**Integer(2) in SL for x in inf_reps)
True
>>> all(x**Integer(3) in SL for x in inf_reps)
True
```

Large example:

```
sage: m = WordMorphism('a->1b5,b->fcg,c->dae,d->432,e->678,f->f,g->g,1->2,2->
↪3,3->4,4->1,5->6,6->7,7->8,8->5')
sage: sorted(m.infinite_repetitions_primitive_roots('a'))
[word: 1432f2143f3214f4321f, word: 5678g8567g7856g6785g]
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->1b5,b->fcg,c->dae,d->432,e->678,f->f,g->g,1->2,2->3,
↪3->4,4->1,5->6,6->7,7->8,8->5')
>>> sorted(m.infinite_repetitions_primitive_roots('a'))
[word: 1432f2143f3214f4321f, word: 5678g8567g7856g6785g]
```

is_empty()

Return `True` if the cardinality of the domain is zero and `False` otherwise.

EXAMPLES:

```
sage: WordMorphism('').is_empty()
True
sage: WordMorphism('a->a').is_empty()
False
```

```
>>> from sage.all import *
>>> WordMorphism('').is_empty()
True
>>> WordMorphism('a->a').is_empty()
False
```

is_endomorphism()

Return whether `self` is an endomorphism, that is if the domain coincide with the codomain.

EXAMPLES:

```
sage: WordMorphism('a->ab,b->a').is_endomorphism()
True
sage: WordMorphism('6->ab,y->5,0->asd').is_endomorphism()
False
sage: WordMorphism('a->a,b->aa,c->aaa').is_endomorphism()
False
sage: Wabc = Words('abc')
sage: m = WordMorphism('a->a,b->aa,c->aaa',codomain = Wabc)
sage: m.is_endomorphism()
True
```

```
>>> from sage.all import *
>>> WordMorphism('a->ab,b->a').is_endomorphism()
True
>>> WordMorphism('6->ab,y->5,0->asd').is_endomorphism()
False
>>> WordMorphism('a->a,b->aa,c->aaa').is_endomorphism()
False
>>> Wabc = Words('abc')
>>> m = WordMorphism('a->a,b->aa,c->aaa',codomain = Wabc)
>>> m.is_endomorphism()
True
```

We check that Issue #8674 is fixed:

```
sage: P = WordPaths('abcd')                                                 #␣
↪needs sage.modules
sage: m = WordMorphism('a->adab,b->ab,c->cbcd,d->cd',                       #␣
↪needs sage.modules
....:                   domain=P, codomain=P)
sage: m.is_endomorphism()                                                   #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> P = WordPaths('abcd')                                                 #␣
↪needs sage.modules
>>> m = WordMorphism('a->adab,b->ab,c->cbcd,d->cd',                       #␣
↪needs sage.modules
...                    domain=P, codomain=P)
>>> m.is_endomorphism()                                                   #␣
↪needs sage.modules
True
```

is_erasing()

Return `True` if `self` is an erasing morphism, i.e. the image of a letter is the empty word.

EXAMPLES:

```
sage: WordMorphism('a->ab,b->a').is_erasing()
False
sage: WordMorphism('6->ab,y->5,0->asd').is_erasing()
False
sage: WordMorphism('6->ab,y->5,0->asd,7->').is_erasing()
True
sage: WordMorphism('').is_erasing()
False
```

```
>>> from sage.all import *
>>> WordMorphism('a->ab,b->a').is_erasing()
False
>>> WordMorphism('6->ab,y->5,0->asd').is_erasing()
False
>>> WordMorphism('6->ab,y->5,0->asd,7->').is_erasing()
True
>>> WordMorphism('').is_erasing()
False
```

is_growing(*letter=None*)

Return `True` if `letter` is a growing letter.

A letter a is *growing* for the morphism s if the length of the iterates of $|s^n(a)|$ tend to infinity as n goes to infinity.

INPUT:

- `letter` – `None` or a letter in the domain of `self`

Note

If letter is `None`, this returns `True` if `self` is everywhere growing, i.e., all letters are growing letters (see [CassNic10]), and that `self` **must** be an endomorphism.

EXAMPLES:

```
sage: WordMorphism('0->01,1->1').is_growing('0')
True
sage: WordMorphism('0->01,1->1').is_growing('1')
False
sage: m2 = WordMorphism({0:[0,1],1:[1]})
sage: m2.is_growing(0)
True
sage: WordMorphism('0->01,1->10').is_growing()
True
sage: WordMorphism('0->1,1->2,2->01').is_growing()
True
sage: WordMorphism('0->01,1->1').is_growing()
False
```

```
>>> from sage.all import *
>>> WordMorphism('0->01,1->1').is_growing('0')
True
```

(continues on next page)

(continued from previous page)

```
>>> WordMorphism('0->01,1->1').is_growing('1')
False
>>> m2 = WordMorphism({Integer(0):[Integer(0),Integer(1)],
↪Integer(1):[Integer(1)]})
>>> m2.is_growing(Integer(0))
True
>>> WordMorphism('0->01,1->10').is_growing()
True
>>> WordMorphism('0->1,1->2,2->01').is_growing()
True
>>> WordMorphism('0->01,1->1').is_growing()
False
```

The domain needs to be equal to the codomain:

```
sage: WordMorphism('0->01,1->0,2->1',codomain=Words('012')).is_growing()
True
```

```
>>> from sage.all import *
>>> WordMorphism('0->01,1->0,2->1',codomain=Words('012')).is_growing()
True
```

Test of erasing morphisms:

```
sage: WordMorphism('0->01,1->').is_growing('0')
False
sage: m = WordMorphism('a->bc,b->bcc,c->',codomain=Words('abc'))
sage: m.is_growing('a')
False
sage: m.is_growing('b')
False
sage: m.is_growing('c')
False
```

```
>>> from sage.all import *
>>> WordMorphism('0->01,1->').is_growing('0')
False
>>> m = WordMorphism('a->bc,b->bcc,c->',codomain=Words('abc'))
>>> m.is_growing('a')
False
>>> m.is_growing('b')
False
>>> m.is_growing('c')
False
```

REFERENCES:

is_identity()

Return `True` if `self` is the identity morphism.

EXAMPLES:

```
sage: m = WordMorphism('a->a,b->b,c->c,d->e')
sage: m.is_identity()
False
sage: WordMorphism('a->a,b->b,c->c').is_identity()
True
sage: WordMorphism('a->a,b->b,c->cb').is_identity()
False
sage: m = WordMorphism('a->b,b->c,c->a')
sage: (m^2).is_identity()
False
sage: (m^3).is_identity()
True
sage: (m^4).is_identity()
False
sage: WordMorphism('').is_identity()
True
sage: WordMorphism({0:[0],1:[1]}).is_identity()
True
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->a,b->b,c->c,d->e')
>>> m.is_identity()
False
>>> WordMorphism('a->a,b->b,c->c').is_identity()
True
>>> WordMorphism('a->a,b->b,c->cb').is_identity()
False
>>> m = WordMorphism('a->b,b->c,c->a')
>>> (m**Integer(2)).is_identity()
False
>>> (m**Integer(3)).is_identity()
True
>>> (m**Integer(4)).is_identity()
False
>>> WordMorphism('').is_identity()
True
>>> WordMorphism({Integer(0):[Integer(0)],Integer(1):[Integer(1)]}).is_
↪identity()
True
```

We check that Issue #8618 is fixed:

```
sage: t = WordMorphism({'a1':['a2'], 'a2':['a1']})
sage: (t*t).is_identity()
True
```

```
>>> from sage.all import *
>>> t = WordMorphism({'a1':['a2'], 'a2':['a1']})
>>> (t*t).is_identity()
True
```

is_in_classP (*f=None*)

Return `True` if `self` is in class P (or f-P).

DEFINITION : Let A be an alphabet. We say that a primitive substitution S is in the *class P* if there exists a palindrome p and for each $b \in A$ a palindrome q_b such that $S(b) = pq_b$ for all $b \in A$. [1]

Let f be an involution on A. "We say that a morphism φ is in class f-P if there exists an f-palindrome p and for each $\alpha \in A$ there exists an f-palindrome q_α such that $\varphi(\alpha) = pq_\alpha$. [2]

INPUT:

- `f` – involution (default: `None`) on the alphabet of `self`; it must be callable on letters as well as words (e.g. WordMorphism)

REFERENCES:

- [1] Hof, A., O. Knill et B. Simon, Singular continuous spectrum for palindromic Schrödinger operators, Commun. Math. Phys. 174 (1995) 149-159.
- [2] Labbe, Sebastien. Proprietes combinatoires des f-palindromes, Memoire de maitrise en Mathematiques, Montreal, UQAM, 2008, 109 pages.

EXAMPLES:

```
sage: WordMorphism('a->bbaba,b->bba').is_in_classP()
True
sage: tm = WordMorphism('a->ab,b->ba')
sage: tm.is_in_classP()
False
sage: f = WordMorphism('a->b,b->a')
sage: tm.is_in_classP(f=f)
True
sage: (tm^2).is_in_classP()
True
sage: (tm^2).is_in_classP(f=f)
False
sage: fibo = WordMorphism('a->ab,b->a')
sage: fibo.is_in_classP()
True
sage: fibo.is_in_classP(f=f)
False
sage: (fibo^2).is_in_classP()
False
sage: f = WordMorphism('a->b,b->a,c->c')
sage: WordMorphism('a->acbcc,b->acbab,c->acbba').is_in_classP(f)
True
```

```
>>> from sage.all import *
>>> WordMorphism('a->bbaba,b->bba').is_in_classP()
True
>>> tm = WordMorphism('a->ab,b->ba')
>>> tm.is_in_classP()
False
>>> f = WordMorphism('a->b,b->a')
>>> tm.is_in_classP(f=f)
True
>>> (tm**Integer(2)).is_in_classP()
True
>>> (tm**Integer(2)).is_in_classP(f=f)
False
```

(continues on next page)

(continued from previous page)

```
>>> fibo = WordMorphism('a->ab,b->a')
>>> fibo.is_in_classP()
True
>>> fibo.is_in_classP(f=f)
False
>>> (fibo**Integer(2)).is_in_classP()
False
>>> f = WordMorphism('a->b,b->a,c->c')
>>> WordMorphism('a->acbcc,b->acbab,c->acbba').is_in_classP(f)
True
```

is_injective()

Return whether this morphism is injective.

ALGORITHM:

Uses a version of Wikipedia article Sardinas–Patterson_algorithm. Time complexity is on average quadratic with regards to the size of the morphism.

EXAMPLES:

```
sage: WordMorphism('a->0,b->10,c->110,d->111').is_injective()
True
sage: WordMorphism('a->00,b->01,c->012,d->20001').is_injective()
False
```

```
>>> from sage.all import *
>>> WordMorphism('a->0,b->10,c->110,d->111').is_injective()
True
>>> WordMorphism('a->00,b->01,c->012,d->20001').is_injective()
False
```

is_involution()

Return `True` if `self` is an involution, i.e. its square is the identity.

INPUT:

- `self` – an endomorphism

EXAMPLES:

```
sage: WordMorphism('a->b,b->a').is_involution()
True
sage: WordMorphism('a->b,b->ba').is_involution()
False
sage: WordMorphism({0:[1],1:[0]}).is_involution()
True
```

```
>>> from sage.all import *
>>> WordMorphism('a->b,b->a').is_involution()
True
>>> WordMorphism('a->b,b->ba').is_involution()
False
>>> WordMorphism({Integer(0):[Integer(1)],Integer(1):[Integer(0)]}).is_
```

(continues on next page)

(continued from previous page)

```
↪involution()
True
```

is_primitive()

Return `True` if `self` is primitive.

A morphism φ is *primitive* if there exists an positive integer k such that for all $\alpha \in \Sigma$, $\varphi^k(\alpha)$ contains all the letters of Σ.

INPUT:

- `self` – an endomorphism

ALGORITHM:

Exercices 8.7.8, p.281 in [1]: (c) Let $y(M)$ be the least integer e such that M^e has all positive entries. Prove that, for all primitive matrices M, we have $y(M) \leq (d-1)^2 + 1$. (d) Prove that the bound $y(M) \leq (d-1)^2 + 1$ is best possible.

EXAMPLES:

```
sage: tm = WordMorphism('a->ab,b->ba')
sage: tm.is_primitive()                                                    #␣
↪needs sage.modules
True
sage: fibo = WordMorphism('a->ab,b->a')
sage: fibo.is_primitive()                                                  #␣
↪needs sage.modules
True
sage: m = WordMorphism('a->bb,b->aa')
sage: m.is_primitive()                                                     #␣
↪needs sage.modules
False
sage: f = WordMorphism({0:[1],1:[0]})
sage: f.is_primitive()                                                     #␣
↪needs sage.modules
False
```

```
>>> from sage.all import *
>>> tm = WordMorphism('a->ab,b->ba')
>>> tm.is_primitive()                                                      #␣
↪needs sage.modules
True
>>> fibo = WordMorphism('a->ab,b->a')
>>> fibo.is_primitive()                                                    #␣
↪needs sage.modules
True
>>> m = WordMorphism('a->bb,b->aa')
>>> m.is_primitive()                                                       #␣
↪needs sage.modules
False
>>> f = WordMorphism({Integer(0):[Integer(1)],Integer(1):[Integer(0)]})
>>> f.is_primitive()                                                       #␣
↪needs sage.modules
False
```

```
sage: s = WordMorphism('a->b,b->c,c->ab')
sage: s.is_primitive()                                                      #␣
↪needs sage.modules
True
sage: s = WordMorphism('a->b,b->c,c->d,d->e,e->f,f->g,g->h,h->ab')
sage: s.is_primitive()                                                      #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> s = WordMorphism('a->b,b->c,c->ab')
>>> s.is_primitive()                                                        #␣
↪needs sage.modules
True
>>> s = WordMorphism('a->b,b->c,c->d,d->e,e->f,f->g,g->h,h->ab')
>>> s.is_primitive()                                                        #␣
↪needs sage.modules
True
```

REFERENCES:

- [1] Jean-Paul Allouche and Jeffrey Shallit, Automatic Sequences: Theory, Applications, Generalizations, Cambridge University Press, 2003.

is_prolongable(*letter*)

Return `True` if `self` is prolongable on `letter`.

A morphism φ is prolongable on a letter a if a is a prefix of $\varphi(a)$.

INPUT:

- `self` – its codomain must be an instance of Words
- `letter` – a letter in the domain alphabet

OUTPUT: boolean

EXAMPLES:

```
sage: WordMorphism('a->ab,b->a').is_prolongable(letter='a')
True
sage: WordMorphism('a->ab,b->a').is_prolongable(letter='b')
False
sage: WordMorphism('a->ba,b->ab').is_prolongable(letter='b')
False
sage: (WordMorphism('a->ba,b->ab')^2).is_prolongable(letter='b')
True
sage: WordMorphism('a->ba,b->').is_prolongable(letter='b')
False
sage: WordMorphism('a->bb,b->aac').is_prolongable(letter='a')
False
```

```
>>> from sage.all import *
>>> WordMorphism('a->ab,b->a').is_prolongable(letter='a')
True
>>> WordMorphism('a->ab,b->a').is_prolongable(letter='b')
```

(continues on next page)

(continued from previous page)

```
False
>>> WordMorphism('a->ba,b->ab').is_prolongable(letter='b')
False
>>> (WordMorphism('a->ba,b->ab')**Integer(2)).is_prolongable(letter='b')
True
>>> WordMorphism('a->ba,b->').is_prolongable(letter='b')
False
>>> WordMorphism('a->bb,b->aac').is_prolongable(letter='a')
False
```

We check that Issue #8595 is fixed:

```
sage: s = WordMorphism({('a', 1) : [('a', 1), ('a', 2)], ('a', 2) : [('a',␣
↪1)]})
sage: s.is_prolongable(('a',1))
True
```

```
>>> from sage.all import *
>>> s = WordMorphism({('a', Integer(1)) : [('a', Integer(1)), ('a',␣
↪Integer(2))], ('a', Integer(2)) : [('a', Integer(1))]})
>>> s.is_prolongable(('a',Integer(1)))
True
```

is_pushy(*w=None*)

Return whether the language $\{m^n(w)|n \geq 0\}$ is pushy, where m is this morphism and w is a word inputted as a parameter.

Requires this morphism to be an endomorphism.

A language created by iterating a morphism is pushy, if its words contain an infinite number of factors containing no growing letters. It turns out that this is equivalent to having at least one infinite repetition containing no growing letters.

See *infinite_repetitions_primitive_roots()* and *is_growing()*.

INPUT:

- `w` – finite iterable (default: `self.domain().alphabet()`); represents a word used to start the language

EXAMPLES:

```
sage: WordMorphism('a->abca,b->bc,c->').is_pushy()
False
sage: WordMorphism('a->abc,b->,c->bcb').is_pushy()
True
```

```
>>> from sage.all import *
>>> WordMorphism('a->abca,b->bc,c->').is_pushy()
False
>>> WordMorphism('a->abc,b->,c->bcb').is_pushy()
True
```

is_repetitive(*w=None*)

Return whether the language $\{m^n(w)|n \geq 0\}$ is repetitive, where m is this morphism and w is a word inputted as a parameter.

Requires this morphism to be an endomorphism.

A language is repetitive, if for each positive integer k there exists a word u such that u^k is a factor of some word of the language.

It turns out that for languages created by iterating a morphism this is equivalent to having at least one infinite repetition (this property is also known as strong repetitiveness).

See *infinite_repetitions_primitive_roots()*.

INPUT:

- `w` – finite iterable (default: `self.domain().alphabet()`); represents a word used to start the language

EXAMPLES:

This method can be used to check whether a purely morphic word is not k-power free for all positive integers k. For example, the language containing just the Thue-Morse word and its prefixes is not repetitive, since the Thue-Morse word is cube-free:

```
sage: WordMorphism('a->ab,b->ba').is_repetitive('a')
False
```

```
>>> from sage.all import *
>>> WordMorphism('a->ab,b->ba').is_repetitive('a')
False
```

Similarly, the Hanoi word is square-free:

```
sage: WordMorphism('a->aC,A->ac,b->cB,B->cb,c->bA,C->ba').is_repetitive('a')
False
```

```
>>> from sage.all import *
>>> WordMorphism('a->aC,A->ac,b->cB,B->cb,c->bA,C->ba').is_repetitive('a')
False
```

However, this method solves a more general problem, as it can be called on any morphism m and with any word w:

```
sage: WordMorphism('a->c,b->cda,c->a,d->abc').is_repetitive('bd')
True
```

```
>>> from sage.all import *
>>> WordMorphism('a->c,b->cda,c->a,d->abc').is_repetitive('bd')
True
```

is_self_composable()

Return whether the codomain of `self` is contained in the domain with the correct ordering.

For a morphism to be self-composable (i.e., `self * self` to be valid), the codomain alphabet must be included in the domain alphabet with the same relative ordering of letters.

EXAMPLES:

```
sage: f = WordMorphism('a->a,b->a')
sage: f.is_endomorphism()
False
```

(continues on next page)

(continued from previous page)

```
sage: f.is_self_composable()
True
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->a,b->a')
>>> f.is_endomorphism()
False
>>> f.is_self_composable()
True
```

Check that alphabet ordering matters:

```
sage: s = WordMorphism('a->ba,b->a', domain=Words('ab'),
....:                  codomain=Words('ba'))
sage: s.is_self_composable()
False
```

```
>>> from sage.all import *
>>> s = WordMorphism('a->ba,b->a', domain=Words('ab'),
...                  codomain=Words('ba'))
>>> s.is_self_composable()
False
```

is_unboundedly_repetitive(*w=None*)

Return whether the language $\{m^n(w)|n \geq 0\}$ is unboundedly repetitive, where m is this morphism and w is a word inputted as a parameter.

Requires this morphism to be an endomorphism.

A language created by iterating a morphism is unboundedly repetitive, if it has at least one infinite repetition containing at least one growing letter.

See *infinite_repetitions_primitive_roots()* and *is_growing()*.

INPUT:

- `w` – finite iterable (default: `self.domain().alphabet()`); represents a word used to start the language

EXAMPLES:

```
sage: WordMorphism('a->abca,b->bc,c->').is_unboundedly_repetitive()
True
sage: WordMorphism('a->abc,b->,c->bcb').is_unboundedly_repetitive()
False
```

```
>>> from sage.all import *
>>> WordMorphism('a->abca,b->bc,c->').is_unboundedly_repetitive()
True
>>> WordMorphism('a->abc,b->,c->bcb').is_unboundedly_repetitive()
False
```

is_uniform(*k=None*)

Return `True` if `self` is a k-uniform morphism.

Let k be a positive integer. A morphism ϕ is called k-uniform if for every letter α, we have $|\phi(\alpha)| = k$. In other words, all images have length k. A morphism is called uniform if it is k-uniform for some positive integer k.

INPUT:

- `k` – positive integer or `None`. If set to a positive integer, then the function return `True` if `self` is k-uniform. If set to `None`, then the function return `True` if `self` is uniform.

EXAMPLES:

```
sage: phi = WordMorphism('a->ab,b->a')
sage: phi.is_uniform()
False
sage: phi.is_uniform(k=1)
False
sage: tau = WordMorphism('a->ab,b->ba')
sage: tau.is_uniform()
True
sage: tau.is_uniform(k=1)
False
sage: tau.is_uniform(k=2)
True
```

```
>>> from sage.all import *
>>> phi = WordMorphism('a->ab,b->a')
>>> phi.is_uniform()
False
>>> phi.is_uniform(k=Integer(1))
False
>>> tau = WordMorphism('a->ab,b->ba')
>>> tau.is_uniform()
True
>>> tau.is_uniform(k=Integer(1))
False
>>> tau.is_uniform(k=Integer(2))
True
```

language(*n*, *u=None*)

Return the words of length `n` in the language generated by this substitution.

Given a non-erasing substitution s and a word u the DOL-language generated by s and u is the union of the factors of $s^n(u)$ where n is a nonnegative integer.

INPUT:

- `n` – nonnegative integer; length of the words in the language
- `u` – a word or `None` (default: `None`); if set to `None` some letter of the alphabet is used

OUTPUT: a Python set

EXAMPLES:

The fibonacci morphism:

```
sage: s = WordMorphism({0: [0,1], 1: [0]})
sage: sorted(s.language(3))                                                 #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.modules
[word: 001, word: 010, word: 100, word: 101]
sage: len(s.language(1000))                                                 #␣
↪needs sage.modules
1001
sage: all(len(s.language(n)) == n+1 for n in range(100))                    #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> s = WordMorphism({Integer(0): [Integer(0),Integer(1)], Integer(1):␣
↪[Integer(0)]})
>>> sorted(s.language(Integer(3)))                                          ␣
↪     # needs sage.modules
[word: 001, word: 010, word: 100, word: 101]
>>> len(s.language(Integer(1000)))                                          ␣
↪     # needs sage.modules
1001
>>> all(len(s.language(n)) == n+Integer(1) for n in range(Integer(100)))    ␣
↪              # needs sage.modules
True
```

A growing but non-primitive example. The DOL-languages generated by 0 and 2 are different:

```
sage: s = WordMorphism({0: [0,1], 1: [0], 2: [2,0,2]})

sage: u = s.fixed_point(0)
sage: A0 = u[:200].factor_set(5)                                            #␣
↪needs sage.modules
sage: B0 = s.language(5, [0])                                               #␣
↪needs sage.modules
sage: set(A0) == B0                                                         #␣
↪needs sage.modules
True

sage: v = s.fixed_point(2)
sage: A2 = v[:200].factor_set(5)                                            #␣
↪needs sage.modules
sage: B2 = s.language(5, [2])                                               #␣
↪needs sage.modules
sage: set(A2) == B2                                                         #␣
↪needs sage.modules
True

sage: len(A0), len(A2)                                                      #␣
↪needs sage.modules
(6, 20)
```

```
>>> from sage.all import *
>>> s = WordMorphism({Integer(0): [Integer(0),Integer(1)], Integer(1):␣
↪[Integer(0)], Integer(2): [Integer(2),Integer(0),Integer(2)]})
```

(continues on next page)

(continued from previous page)

```
>>> u = s.fixed_point(Integer(0))
>>> A0 = u[:Integer(200)].factor_set(Integer(5))                              ␣
↪              # needs sage.modules
>>> B0 = s.language(Integer(5), [Integer(0)])                                 ␣
↪              # needs sage.modules
>>> set(A0) == B0                                                            #␣
↪needs sage.modules
True

>>> v = s.fixed_point(Integer(2))
>>> A2 = v[:Integer(200)].factor_set(Integer(5))                              ␣
↪              # needs sage.modules
>>> B2 = s.language(Integer(5), [Integer(2)])                                 ␣
↪              # needs sage.modules
>>> set(A2) == B2                                                            #␣
↪needs sage.modules
True

>>> len(A0), len(A2)                                                         #␣
↪needs sage.modules
(6, 20)
```

The Chacon transformation (non-primitive):

```
sage: s = WordMorphism({0: [0,0,1,0], 1:[1]})
sage: sorted(s.language(10))                                                 #␣
↪needs sage.modules
[word: 0001000101,
 word: 0001010010,
 ...
 word: 1010010001,
 word: 1010010100]
```

```
>>> from sage.all import *
>>> s = WordMorphism({Integer(0): [Integer(0),Integer(0),Integer(1),
↪Integer(0)], Integer(1):[Integer(1)]})
>>> sorted(s.language(Integer(10)))                                           ␣
↪     # needs sage.modules
[word: 0001000101,
 word: 0001010010,
 ...
 word: 1010010001,
 word: 1010010100]
```

A non-extendable D0L-language (Thue-Morse with cube axiom). We check that factors from the axiom and early iterations are included:

```
sage: m = WordMorphism('0->01,1->10')
sage: Word('000') in m.language(3, Word('000'))
True
sage: Word('010101') in m.language(6, Word('000'))
True
```

```
>>> from sage.all import *
>>> m = WordMorphism('0->01,1->10')
>>> Word('000') in m.language(Integer(3), Word('000'))
True
>>> Word('010101') in m.language(Integer(6), Word('000'))
True
```

latex_layout(*layout=None*)

Get or set the actual latex layout (oneliner vs array).

INPUT:

- `layout` – string (default: `None`); can take one of the following values:
  - `None` – returns the actual latex layout; by default, the layout is `'array'`
  - `'oneliner'` – set the layout to `'oneliner'`
  - `'array'` – set the layout to `'array'`

EXAMPLES:

```
sage: s = WordMorphism('a->ab,b->ba')
sage: s.latex_layout()
'array'
sage: s.latex_layout('oneliner')
sage: s.latex_layout()
'oneliner'
```

```
>>> from sage.all import *
>>> s = WordMorphism('a->ab,b->ba')
>>> s.latex_layout()
'array'
>>> s.latex_layout('oneliner')
>>> s.latex_layout()
'oneliner'
```

letter_growth_types()

Return the mortal, polynomial and exponential growing letters.

The growth of $|s^n(a)|$ as n goes to ∞ is always of the form $\alpha^n n^\beta$ (where α is a Perron number and β an integer).

Without doing any linear algebra three cases can be differentiated: mortal (ultimately empty or $\alpha = 0$); polynomial ($\alpha = 1$); exponential ($\alpha > 1$). This is what is done in this method.

It requires this morphism to be an endomorphism.

OUTPUT:

The output is a 3-tuple of lists (mortal, polynomial, exponential) where:

- `mortal` – list of mortal letters
- `polynomial` – list of lists where `polynomial[i]` is the list of letters with growth n^i
- `exponential` – list of at least exponentionally growing letters

EXAMPLES:

```
sage: s = WordMorphism('a->abc,b->bc,c->c')
sage: mortal, poly, expo = s.letter_growth_types()
sage: mortal
[]
sage: poly
[['c'], ['b'], ['a']]
sage: expo
[]
```

```
>>> from sage.all import *
>>> s = WordMorphism('a->abc,b->bc,c->c')
>>> mortal, poly, expo = s.letter_growth_types()
>>> mortal
[]
>>> poly
[['c'], ['b'], ['a']]
>>> expo
[]
```

When three mortal letters (c, d, and e), and two letters (a, b) are not growing:

```
sage: s = WordMorphism('a->bc,b->cac,c->de,d->,e->')
sage: s^20
WordMorphism: a->cacde, b->debcde, c->, d->, e->
sage: mortal, poly, expo = s.letter_growth_types()
sage: mortal
['c', 'd', 'e']
sage: poly
[['a', 'b']]
sage: expo
[]
```

```
>>> from sage.all import *
>>> s = WordMorphism('a->bc,b->cac,c->de,d->,e->')
>>> s**Integer(20)
WordMorphism: a->cacde, b->debcde, c->, d->, e->
>>> mortal, poly, expo = s.letter_growth_types()
>>> mortal
['c', 'd', 'e']
>>> poly
[['a', 'b']]
>>> expo
[]
```

```

sage: mortal, poly, expo = s.letter_growth_types()
sage: mortal
[]
sage: poly
[['c'], ['b']]
sage: expo
['a', 'd']
```

```
>>> from sage.all import *
>>> s = WordMorphism('a->abcd,b->bc,c->c,d->a')
>>> mortal, poly, expo = s.letter_growth_types()
>>> mortal
[]
>>> poly
[['c'], ['b']]
>>> expo
['a', 'd']
```

list_of_conjugates()

Return the list of all the conjugate morphisms of `self`.

DEFINITION:

Recall from Lothaire [1] (Section 2.3.4) that φ is *right conjugate* of φ', noted $\varphi \triangleleft \varphi'$, if there exists $u \in \Sigma^*$ such that

$$\varphi(\alpha)u = u\varphi'(\alpha),$$

for all $\alpha \in \Sigma$, or equivalently that $\varphi(x)u = u\varphi'(x)$, for all words $x \in \Sigma^*$. Clearly, this relation is not symmetric so that we say that two morphisms φ and φ' are *conjugate*, noted $\varphi \bowtie \varphi'$, if $\varphi \triangleleft \varphi'$ or $\varphi' \triangleleft \varphi$. It is easy to see that conjugacy of morphisms is an equivalence relation.

REFERENCES:

- [1] M. Lothaire, Algebraic Combinatorics on words, Cambridge University Press, 2002.

EXAMPLES:

```
sage: m = WordMorphism('a->abbab,b->abb')
sage: m.list_of_conjugates()
[WordMorphism: a->babba, b->bab,
WordMorphism: a->abbab, b->abb,
WordMorphism: a->bbaba, b->bba,
WordMorphism: a->babab, b->bab,
WordMorphism: a->ababb, b->abb,
WordMorphism: a->babba, b->bba,
WordMorphism: a->abbab, b->bab]
sage: m = WordMorphism('a->aaa,b->aa')
sage: m.list_of_conjugates()
[WordMorphism: a->aaa, b->aa]
sage: WordMorphism('').list_of_conjugates()
[WordMorphism: ]
sage: m = WordMorphism('a->aba,b->aba')
sage: m.list_of_conjugates()
[WordMorphism: a->baa, b->baa,
WordMorphism: a->aab, b->aab,
WordMorphism: a->aba, b->aba]
sage: m = WordMorphism('a->abb,b->abbab,c->')
sage: m.list_of_conjugates()
[WordMorphism: a->bab, b->babba, c->,
WordMorphism: a->abb, b->abbab, c->,
WordMorphism: a->bba, b->bbaba, c->,
WordMorphism: a->bab, b->babab, c->,
```

(continues on next page)

(continued from previous page)

```
WordMorphism: a->abb, b->ababb, c->,
WordMorphism: a->bba, b->babba, c->,
WordMorphism: a->bab, b->abbab, c->]
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->abbab,b->abb')
>>> m.list_of_conjugates()
[WordMorphism: a->babba, b->bab,
WordMorphism: a->abbab, b->abb,
WordMorphism: a->bbaba, b->bba,
WordMorphism: a->babab, b->bab,
WordMorphism: a->ababb, b->abb,
WordMorphism: a->babba, b->bba,
WordMorphism: a->abbab, b->bab]
>>> m = WordMorphism('a->aaa,b->aa')
>>> m.list_of_conjugates()
[WordMorphism: a->aaa, b->aa]
>>> WordMorphism('').list_of_conjugates()

WordMorphism: a->bba, b->bbaba, c->,
WordMorphism: a->bab, b->babab, c->,
WordMorphism: a->abb, b->ababb, c->,
WordMorphism: a->bba, b->babba, c->,
WordMorphism: a->bab, b->abbab, c->]
```

partition_of_domain_alphabet()

Return a partition of the domain alphabet.

Let $\varphi : \Sigma^* \to \Sigma^*$ be an involution. There exists a triple of sets (A, B, C) such that

- $A \cup B \cup C = \Sigma$;
- A, B and C are mutually disjoint and
- $\varphi(A) = B, \varphi(B) = A, \varphi(C) = C$.

These sets are not unique.

INPUT:

- `self` – an involution

OUTPUT: a tuple of three sets

EXAMPLES:

```
sage: m = WordMorphism('a->b,b->a')
sage: m.partition_of_domain_alphabet()  # random ordering
({'a'}, {'b'}, {})
sage: m = WordMorphism('a->b,b->a,c->c')
sage: m.partition_of_domain_alphabet()  # random ordering
({'a'}, {'b'}, {'c'})
sage: m = WordMorphism('a->a,b->b,c->c')
sage: m.partition_of_domain_alphabet()  # random ordering
({}, {}, {'a', 'c', 'b'})
sage: m = WordMorphism('A->T,T->A,C->G,G->C')
sage: m.partition_of_domain_alphabet()  # random ordering
({'A', 'C'}, {'T', 'G'}, {})
sage: I = WordMorphism({0:oo,oo:0,1:-1,-1:1,2:-2,-2:2,3:-3,-3:3})
sage: I.partition_of_domain_alphabet()  # random ordering
({0, -1, -3, -2}, {1, 2, 3, +Infinity}, {})
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->b,b->a')
>>> m.partition_of_domain_alphabet()  # random ordering
({'a'}, {'b'}, {})
>>> m = WordMorphism('a->b,b->a,c->c')
>>> m.partition_of_domain_alphabet()  # random ordering
({'a'}, {'b'}, {'c'})
>>> m = WordMorphism('a->a,b->b,c->c')
>>> m.partition_of_domain_alphabet()  # random ordering
({}, {}, {'a', 'c', 'b'})
>>> m = WordMorphism('A->T,T->A,C->G,G->C')
>>> m.partition_of_domain_alphabet()  # random ordering
({'A', 'C'}, {'T', 'G'}, {})
>>> I = WordMorphism({Integer(0):oo,oo:Integer(0),Integer(1):-Integer(1),-
↪Integer(1):Integer(1),Integer(2):-Integer(2),-Integer(2):Integer(2),
↪Integer(3):-Integer(3),-Integer(3):Integer(3)})
>>> I.partition_of_domain_alphabet()  # random ordering
({0, -1, -3, -2}, {1, 2, 3, +Infinity}, {})
```

periodic_point(*letter*)

Return the periodic point of `self` that starts with `letter`.

EXAMPLES:

```
sage: f = WordMorphism('a->bab,b->ab')
sage: f.periodic_point('a')
word: abbababbababbababbababbababbababbababbababbaba...
sage: f.fixed_point('a')
Traceback (most recent call last):
...
TypeError: self must be prolongable on a
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->bab,b->ab')
>>> f.periodic_point('a')
word: abbababbababbababbababbababbababbababbababbaba...
>>> f.fixed_point('a')
```

(continues on next page)

(continued from previous page)

```
Traceback (most recent call last):
...
TypeError: self must be prolongable on a
```

Make sure that Issue #31759 is fixed:

```
sage: WordMorphism('a->b,b->a').periodic_point('a')
word: a
```

```
>>> from sage.all import *
>>> WordMorphism('a->b,b->a').periodic_point('a')
word: a
```

periodic_points()

Return the periodic points of `f` as a list of tuples where each tuple is a periodic orbit of `f`.

EXAMPLES:

```
sage: f = WordMorphism('a->aba,b->baa')
sage: for p in f.periodic_points():
....:     print("{} , {}".format(len(p), p[0]))
1 , ababaaababaaabaabaababaaababaaabaabaabab...
1 , baaabaabaababaaabaababaaabaababaaababaaa...

sage: f = WordMorphism('a->bab,b->aa')
sage: for p in f.periodic_points():
....:     print("{} , {}".format(len(p), p[0]))
2 , aababaaaababaabaabbabaababaabaabbabaababaa...
sage: f.fixed_points()
[]
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->aba,b->baa')
>>> for p in f.periodic_points():
...     print("{} , {}".format(len(p), p[Integer(0)]))
1 , ababaaababaaabaabaababaaababaaabaabaabab...
1 , baaabaabaababaaabaababaaabaababaaababaaa...

>>> f = WordMorphism('a->bab,b->aa')
>>> for p in f.periodic_points():
...     print("{} , {}".format(len(p), p[Integer(0)]))
2 , aababaaaababaabaabbabaababaabaabbabaababaa...
>>> f.fixed_points()
[]
```

This shows that issue Issue #13668 has been resolved:

```
sage: d = {1:[1,2],2:[2,3],3:[4],4:[5],5:[6],6:[7],7:[8],8:[9],9:[10],10:[1]}
sage: s = WordMorphism(d)
sage: s7 = s^7
sage: s7r = s7.reversal()
sage: for p in s7r.periodic_points(): p
```

(continues on next page)

(continued from previous page)

Make sure that Issue #31454 is fixed:

```
sage: WordMorphism('a->a,b->bb').periodic_points()
[[word: bbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbb...]]
```

```
>>> from sage.all import *
>>> WordMorphism('a->a,b->bb').periodic_points()
[[word: bbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbbb...]]
```

pisot_eigenvector_left()

Return the left eigenvector of the incidence matrix associated to the largest eigenvalue (in absolute value).

Unicity of the result is guaranteed when the multiplicity of the largest eigenvalue is one, for example when `self` is a Pisot irreductible substitution.

A substitution is Pisot irreducible if the characteristic polynomial of its incidence matrix is irreducible over **Q** and has all roots, except one, of modulus strictly smaller than 1.

INPUT:

- `self` – a Pisot irreducible substitution

EXAMPLES:

```
sage: m = WordMorphism('a->aaaabbc,b->aaabbc,c->aabc')
sage: matrix(m)                                                             #␣
↪needs sage.modules
[4 3 2]
[2 2 1]
[1 1 1]
sage: m.pisot_eigenvector_left()                                            #␣
↪needs sage.modules sage.rings.number_field
(1, 0.8392867552141611?, 0.5436890126920763?)

(1, 0.8392867552141611?, 0.5436890126920763?)
```

pisot_eigenvector_right()

Return the right eigenvector of the incidence matrix associated to the largest eigenvalue (in absolute value).

Unicity of the result is guaranteed when the multiplicity of the largest eigenvalue is one, for example when `self` is a Pisot irreductible substitution.

A substitution is Pisot irreducible if the characteristic polynomial of its incidence matrix is irreducible over **Q** and has all roots, except one, of modulus strictly smaller than 1.

INPUT:

- `self` – a Pisot irreducible substitution

EXAMPLES:

```
sage: m = WordMorphism('a->aaaabbc,b->aaabbc,c->aabc')
sage: matrix(m)                                                             #␣
↪needs sage.modules
[4 3 2]
[2 2 1]
[1 1 1]

```

rauzy_fractal_plot(*n=None*, *exchange=False*, *eig=None*, *translate=None*, *prec=53*, *colormap='hsv'*, *opacity=None*, *plot_origin=None*, *plot_basis=False*, *point_size=None*)

Return a plot of the Rauzy fractal associated with a substitution.

The substitution does not have to be irreducible. The usual definition of a Rauzy fractal requires that its dominant eigenvalue is a Pisot number but the present method doesn't require this, allowing to plot some interesting pictures in the non-Pisot case (see the examples below).

For more details about the definition of the fractal and the projection which is used, see Section 3.1 of [1].

Plots with less than 100,000 points take a few seconds, and several millions of points can be plotted in reasonable time.

Other ways to draw Rauzy fractals (and more generally projections of paths) can be found in *sage.combinat.words.paths.FiniteWordPath_all.plot_projection()* or in *sage.combinat.e_one_star()*.

OUTPUT: a Graphics object

INPUT:

- `n` – integer (default: `None`) The number of points used to plot the fractal. Default values: `1000` for a 1D fractal, `50000` for a 2D fractal, `10000` for a 3D fractal.
- `exchange` – boolean (default: `False`); plot the Rauzy fractal with domain exchange
- `eig` – a real element of `QQbar` of degree >= 2 (default: `None`); the eigenvalue used to plot the fractal. It must be an eigenvalue of `self.incidence_matrix()`. The one used by default the maximal eigenvalue of `self.incidence_matrix()` (usually a Pisot number), but for substitutions with more than 3 letters other interesting choices are sometimes possible.
- `translate` – list of vectors of `RR^size_alphabet`, or a dictionary from the alphabet to lists of vectors (default: `None`). Plot translated copies of the fractal. This option allows to plot tilings easily. The projection used for these vectors is the same as the projection used for the canonical basis to plot the fractal. If the input is a list, all the pieces will be translated and plotted. If the input is a dictionary, each piece will be translated and plotted accordingly to the vectors associated with each letter in the dictionary. Note: by default, the Rauzy fractal placed at the origin is not plotted with the `translate` option; the vector `(0,0,...,0)` has to be added manually.
- `prec` – integer (default: 53); the number of bits used in the floating point representations of the points of the fractal
- `colormap` – color map or dictionary (default: `'hsv'`). It can be one of the following:
  - `string` – a coloring map. For available coloring map names type: `sorted(colormaps)`
  - `dict` – dictionary of the alphabet mapped to colors
- `opacity` – dictionary from the alphabet to the real interval [0,1] (default: `None`); if none is specified, all letters are plotted with opacity `1`
- `plot_origin` – a couple `(k,c)` (default: `None`); if specified, mark the origin by a point of size `k` and color `c`
- `plot_basis` – boolean (default: `False`); plot the projection of the canonical basis with the fractal
- `point_size` – float (default: `None`); the size of the points used to plot the fractal

EXAMPLES:

1. The Rauzy fractal of the Tribonacci substitution:

```
sage: s = WordMorphism('1->12,2->13,3->1')
sage: s.rauzy_fractal_plot()        # long time
↪  # needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->12,2->13,3->1')
>>> s.rauzy_fractal_plot()        # long time
↪# needs sage.plot
Graphics object consisting of 3 graphics primitives
```

2. The "Hokkaido" fractal. We tweak the plot using the plotting options to get a nice reusable picture, in which we mark the origin by a black dot:

```
sage: s = WordMorphism('a->ab,b->c,c->d,d->e,e->a')
sage: G = s.rauzy_fractal_plot(n=100000, point_size=3,          # not␣
↪tested
....:                          plot_origin=(50,"black"))
sage: G.show(figsize=10, axes=false) # not tested
```

```
>>> from sage.all import *
>>> s = WordMorphism('a->ab,b->c,c->d,d->e,e->a')
>>> G = s.rauzy_fractal_plot(n=Integer(100000), point_size=Integer(3),  ␣
↪      # not tested
...                           plot_origin=(Integer(50),"black"))
>>> G.show(figsize=Integer(10), axes=false) # not tested
```

3. Another "Hokkaido" fractal and its domain exchange:

```
sage: s = WordMorphism({1:[2], 2:[4,3], 3:[4], 4:[5,3], 5:[6], 6:[1]})
sage: s.rauzy_fractal_plot()                                    # not␣
↪tested (> 1 second)
sage: s.rauzy_fractal_plot(exchange=True)                       # not␣
↪tested (> 1 second)
```

```
>>> from sage.all import *
>>> s = WordMorphism({Integer(1):[Integer(2)], Integer(2):[Integer(4),
↪Integer(3)], Integer(3):[Integer(4)], Integer(4):[Integer(5),
↪Integer(3)], Integer(5):[Integer(6)], Integer(6):[Integer(1)]})
>>> s.rauzy_fractal_plot()                                      # not␣
↪tested (> 1 second)
>>> s.rauzy_fractal_plot(exchange=True)                         # not␣
↪tested (> 1 second)
```

4. A three-dimensional Rauzy fractal:

```
sage: s = WordMorphism('1->12,2->13,3->14,4->1')
sage: s.rauzy_fractal_plot()                                    # not␣
↪tested (> 1 second)
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->12,2->13,3->14,4->1')
>>> s.rauzy_fractal_plot()                                          # not␣
↪tested (> 1 second)
```

5. A one-dimensional Rauzy fractal (very scattered):

```
sage: s = WordMorphism('1->2122,2->1')
sage: s.rauzy_fractal_plot().show(figsize=20)                       # not␣
↪tested (> 1 second)
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->2122,2->1')
>>> s.rauzy_fractal_plot().show(figsize=Integer(20))                    #␣
↪not tested (> 1 second)
```

6. A high resolution plot of a complicated fractal:

```
sage: s = WordMorphism('1->23,2->123,3->1122233')
sage: G = s.rauzy_fractal_plot(n=300000)                            # not␣
↪tested (> 1 second)
sage: G.show(axes=false, figsize=20)                                # not␣
↪tested (> 1 second)
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->23,2->123,3->1122233')
>>> G = s.rauzy_fractal_plot(n=Integer(300000))                         #␣
↪not tested (> 1 second)
>>> G.show(axes=false, figsize=Integer(20))                             #␣
↪not tested (> 1 second)
```

7. A nice colorful animation of a domain exchange:

```
sage: s = WordMorphism('1->21,2->3,3->4,4->25,5->6,6->7,7->1')
sage: L = [s.rauzy_fractal_plot(),                                  # not␣
↪tested (> 1 second)
....:      s.rauzy_fractal_plot(exchange=True)]
sage: animate(L, axes=false).show(delay=100)                        # not␣
↪tested (> 1 second)
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->21,2->3,3->4,4->25,5->6,6->7,7->1')
>>> L = [s.rauzy_fractal_plot(),                                    # not␣
↪tested (> 1 second)
...       s.rauzy_fractal_plot(exchange=True)]
>>> animate(L, axes=false).show(delay=Integer(100))                     #␣
↪not tested (> 1 second)
```

8. Plotting with only one color:

```
sage: s = WordMorphism('1->12,2->31,3->1')
sage: cm = {'1':'black', '2':'black', '3':'black'}
```

(continues on next page)

(continued from previous page)

```
sage: s.rauzy_fractal_plot(colormap=cm)                                    # not␣
↪tested (> 1 second)
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->12,2->31,3->1')
>>> cm = {'1':'black', '2':'black', '3':'black'}
>>> s.rauzy_fractal_plot(colormap=cm)                                  # not␣
↪tested (> 1 second)
```

9. Different fractals can be obtained by choosing another (non-Pisot) eigenvalue:

```
sage: s = WordMorphism('1->12,2->3,3->45,4->5,5->6,6->7,7->8,8->1')
sage: E = s.incidence_matrix().eigenvalues()                                ␣
↪  # needs sage.modules
sage: x = [x for x in E if -0.8 < x < -0.7][0]                              ␣
↪  # needs sage.modules
sage: s.rauzy_fractal_plot()                                               # not␣
↪tested (> 1 second)
sage: s.rauzy_fractal_plot(eig=x)                                          # not␣
↪tested (> 1 second)
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->12,2->3,3->45,4->5,5->6,6->7,7->8,8->1')
>>> E = s.incidence_matrix().eigenvalues()
↪# needs sage.modules
>>> x = [x for x in E if -RealNumber('0.8') < x < -RealNumber('0.7
↪')][Integer(0)]                                    # needs sage.modules
>>> s.rauzy_fractal_plot()                                               # not␣
↪tested (> 1 second)
>>> s.rauzy_fractal_plot(eig=x)                                          # not␣
↪tested (> 1 second)
```

10. A Pisot reducible substitution with seemingly overlapping tiles:

```
sage: s = WordMorphism({1:[1,2], 2:[2,3], 3:[4], 4:[5], 5:[6],
....:                   6:[7], 7:[8], 8:[9], 9:[10], 10:[1]})
sage: s.rauzy_fractal_plot()                                               # not␣
↪tested (> 1 second)
```

```
>>> from sage.all import *
>>> s = WordMorphism({Integer(1):[Integer(1),Integer(2)],␣
↪Integer(2):[Integer(2),Integer(3)], Integer(3):[Integer(4)],␣
↪Integer(4):[Integer(5)], Integer(5):[Integer(6)],
...                    Integer(6):[Integer(7)], Integer(7):[Integer(8)],␣
↪Integer(8):[Integer(9)], Integer(9):[Integer(10)],␣
↪Integer(10):[Integer(1)]})
>>> s.rauzy_fractal_plot()                                               # not␣
↪tested (> 1 second)
```

11. A non-Pisot reducible substitution with a strange Rauzy fractal:

```
sage: s = WordMorphism({1:[3,2], 2:[3,3], 3:[4], 4:[1]})
sage: s.rauzy_fractal_plot()                                    # not␣
↪tested (> 1 second)
```

```
>>> from sage.all import *
>>> s = WordMorphism({Integer(1):[Integer(3),Integer(2)],␣
↪Integer(2):[Integer(3),Integer(3)], Integer(3):[Integer(4)],␣
↪Integer(4):[Integer(1)]})
>>> s.rauzy_fractal_plot()                                    # not␣
↪tested (> 1 second)
```

12. A substitution with overlapping tiles. We use the options `colormap` and `opacity` to study how the tiles overlap:

```
sage: s = WordMorphism('1->213,2->4,3->5,4->1,5->21')
sage: s.rauzy_fractal_plot()                                    # not␣
↪tested (> 1 second)
sage: s.rauzy_fractal_plot(colormap={'1':'red', '4':'purple'})  # not␣
↪tested (> 1 second)
sage: s.rauzy_fractal_plot(n=150000,                            # not␣
↪tested (> 1 second)
....:                       opacity={'1':0.1,'2':1,'3':0.1,'4':0.1,'5':0.1}
↪)
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->213,2->4,3->5,4->1,5->21')
>>> s.rauzy_fractal_plot()                                    # not␣
↪tested (> 1 second)
>>> s.rauzy_fractal_plot(colormap={'1':'red', '4':'purple'})  # not␣
↪tested (> 1 second)
>>> s.rauzy_fractal_plot(n=Integer(150000),                          #␣
↪not tested (> 1 second)
...                       opacity={'1':RealNumber('0.1'),'2':Integer(1),'3
↪':RealNumber('0.1'),'4':RealNumber('0.1'),'5':RealNumber('0.1')})
```

13. Funny experiments by playing with the precision of the float numbers used to plot the fractal:

```
sage: s = WordMorphism('1->12,2->13,3->1')
sage: s.rauzy_fractal_plot(prec=6)                              # not␣
↪tested
sage: s.rauzy_fractal_plot(prec=9)                              # not␣
↪tested
sage: s.rauzy_fractal_plot(prec=15)                             # not␣
↪tested
sage: s.rauzy_fractal_plot(prec=19)                             # not␣
↪tested
sage: s.rauzy_fractal_plot(prec=25)                             # not␣
↪tested
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->12,2->13,3->1')
>>> s.rauzy_fractal_plot(prec=Integer(6))                            #␣
```

(continues on next page)

(continued from previous page)

```
↪not tested
>>> s.rauzy_fractal_plot(prec=Integer(9))                                    #␣
↪not tested
>>> s.rauzy_fractal_plot(prec=Integer(15))                                   #␣
↪not tested
>>> s.rauzy_fractal_plot(prec=Integer(19))                                   #␣
↪not tested
>>> s.rauzy_fractal_plot(prec=Integer(25))                                   #␣
↪not tested
```

14. Using the `translate` option to plot periodic tilings:

```
sage: s = WordMorphism('1->12,2->13,3->1')
sage: s.rauzy_fractal_plot(n=10000,                                  # not␣
↪tested (> 1 second)
....:                       translate=[(0,0,0),(-1,0,1),(0,-1,1),(1,-1,0),
....:                                  (1,0,-1),(0,1,-1),(-1,1,0)])
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->12,2->13,3->1')
>>> s.rauzy_fractal_plot(n=Integer(10000),                                   #␣
↪not tested (> 1 second)
...                       translate=[(Integer(0),Integer(0),Integer(0)),(-
↪Integer(1),Integer(0),Integer(1)),(Integer(0),-Integer(1),Integer(1)),
↪(Integer(1),-Integer(1),Integer(0)),
...                                  (Integer(1),Integer(0),-Integer(1)),
↪(Integer(0),Integer(1),-Integer(1)),(-Integer(1),Integer(1),
↪Integer(0))])
```

```
sage: t = WordMorphism("a->aC,b->d,C->de,d->a,e->ab")    # substitution␣
↪found by Julien Bernat
sage: V = [vector((0,0,1,0,-1)), vector((0,0,1,-1,0))]                    ␣
↪  # needs sage.modules
sage: S = set(map(tuple, [i*V[0] + j*V[1]                                 ␣
↪  # needs sage.modules
....:                     for i in [-1,0,1] for j in [-1,0,1]]))
sage: t.rauzy_fractal_plot(n=10000,                                  # not␣
↪tested (> 1 second)
....:                       translate=S, exchange=true)
```

```
>>> from sage.all import *
>>> t = WordMorphism("a->aC,b->d,C->de,d->a,e->ab")    # substitution␣
↪found by Julien Bernat
>>> V = [vector((Integer(0),Integer(0),Integer(1),Integer(0),-
↪Integer(1))), vector((Integer(0),Integer(0),Integer(1),-Integer(1),
↪Integer(0)))]                          # needs sage.modules
>>> S = set(map(tuple, [i*V[Integer(0)] + j*V[Integer(1)]                 ␣
↪                  # needs sage.modules
...                     for i in [-Integer(1),Integer(0),Integer(1)] for␣
↪j in [-Integer(1),Integer(0),Integer(1)]]))
>>> t.rauzy_fractal_plot(n=Integer(10000),                                  #␣
```

(continues on next page)

(continued from previous page)

```
↪not tested (> 1 second)
...                       translate=S, exchange=true)
```

15. Using the `translate` option to plot arbitrary tilings with the fractal pieces. This can be used for example to plot the self-replicating tiling of the Rauzy fractal:

```
sage: s = WordMorphism({1:[1,2], 2:[3], 3:[4,3], 4:[5], 5:[6], 6:[1]})
sage: s.rauzy_fractal_plot()                                    # not␣
↪tested (> 1 second)
sage: D = {1: [(0,0,0,0,0,0), (0,1,0,0,0,0)],
....:      3: [(0,0,0,0,0,0), (0,1,0,0,0,0)], 6: [(0,1,0,0,0,0)]}
sage: s.rauzy_fractal_plot(n=30000, translate=D)                 # not␣
↪tested (> 1 second)
```

```
>>> from sage.all import *
>>> s = WordMorphism({Integer(1):[Integer(1),Integer(2)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(4),Integer(3)],␣
↪Integer(4):[Integer(5)], Integer(5):[Integer(6)],␣
↪Integer(6):[Integer(1)]})
>>> s.rauzy_fractal_plot()                                      # not␣
↪tested (> 1 second)
>>> D = {Integer(1): [(Integer(0),Integer(0),Integer(0),Integer(0),
↪Integer(0),Integer(0)), (Integer(0),Integer(1),Integer(0),Integer(0),
↪Integer(0),Integer(0))],
...       Integer(3): [(Integer(0),Integer(0),Integer(0),Integer(0),
↪Integer(0),Integer(0)), (Integer(0),Integer(1),Integer(0),Integer(0),
↪Integer(0),Integer(0))], Integer(6): [(Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(0),Integer(0))]}
>>> s.rauzy_fractal_plot(n=Integer(30000), translate=D)                 #␣
↪not tested (> 1 second)
```

16. Plot the projection of the canonical basis with the fractal:

```
sage: s = WordMorphism({1:[2,1], 2:[3], 3:[6,4], 4:[5,1],
....:                   5:[6], 6:[7], 7:[8], 8:[9], 9:[1]})
sage: s.rauzy_fractal_plot(plot_basis=True)                      # not␣
↪tested (> 1 second)
```

```
>>> from sage.all import *
>>> s = WordMorphism({Integer(1):[Integer(2),Integer(1)],␣
↪Integer(2):[Integer(3)], Integer(3):[Integer(6),Integer(4)],␣
↪Integer(4):[Integer(5),Integer(1)],
...                   Integer(5):[Integer(6)], Integer(6):[Integer(7)],␣
↪Integer(7):[Integer(8)], Integer(8):[Integer(9)],␣
↪Integer(9):[Integer(1)]})
>>> s.rauzy_fractal_plot(plot_basis=True)                       # not␣
↪tested (> 1 second)
```

rauzy_fractal_points(*n=None*, *exchange=False*, *eig=None*, *translate=None*, *prec=53*)

Return a dictionary of list of points associated with the pieces of the Rauzy fractal of `self`.

INPUT:

See the method *rauzy_fractal_plot()* for a description of the options and more examples.

OUTPUT: dictionary of list of points

EXAMPLES:

The Rauzy fractal of the Tribonacci substitution and the number of points in the piece of the fractal associated with `'1'`, `'2'` and `'3'` are respectively:

```
sage: s = WordMorphism('1->12,2->13,3->1')
sage: D = s.rauzy_fractal_points(n=100)                                 #␣
↪needs sage.modules
sage: len(D['1'])                                                       #␣
↪needs sage.modules
54
sage: len(D['2'])                                                       #␣
↪needs sage.modules
30
sage: len(D['3'])                                                       #␣
↪needs sage.modules
16
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->12,2->13,3->1')
>>> D = s.rauzy_fractal_points(n=Integer(100))                              ␣
↪     # needs sage.modules
>>> len(D['1'])                                                        #␣
↪needs sage.modules
54
>>> len(D['2'])                                                        #␣
↪needs sage.modules
30
>>> len(D['3'])                                                        #␣
↪needs sage.modules
16
```

Timo Jolivet (2012-06-16)

rauzy_fractal_projection(*eig=None*, *prec=53*)

Return a dictionary giving the projection of the canonical basis.

See the method *rauzy_fractal_plot()* for more details about the projection.

INPUT:

- `eig` – a real element of `QQbar` of degree >= 2 (default: `None`). The eigenvalue used for the projection. It must be an eigenvalue of `self.incidence_matrix()`. The one used by default is the maximal eigenvalue of `self.incidence_matrix()` (usually a Pisot number), but for substitutions with more than 3 letters other interesting choices are sometimes possible.

- `prec` – integer (default: 53); the number of bits used in the floating point representations of the coordinates

OUTPUT:

dictionary, letter -> vector, giving the projection

EXAMPLES:

The projection for the Rauzy fractal of the Tribonacci substitution is:

```
sage: s = WordMorphism('1->12,2->13,3->1')
sage: s.rauzy_fractal_projection()                                              #␣
↪needs sage.modules
{'1': (1.00000000000000, 0.000000000000000),
 '2': (-1.41964337760708, -0.606290729207199),
 '3': (-0.771844506346038, 1.11514250803994)}
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->12,2->13,3->1')
>>> s.rauzy_fractal_projection()                                                #␣
↪needs sage.modules
{'1': (1.00000000000000, 0.000000000000000),
 '2': (-1.41964337760708, -0.606290729207199),
 '3': (-0.771844506346038, 1.11514250803994)}
```

AUTHOR:

Timo Jolivet (2012-06-16)

restrict_domain(*alphabet*)

Return a restriction of `self` to the given alphabet.

INPUT:

- `alphabet` – an iterable

OUTPUT: WordMorphism

EXAMPLES:

```
sage: m = WordMorphism('a->b,b->a')
sage: m.restrict_domain('a')
WordMorphism: a->b
sage: m.restrict_domain('')
WordMorphism:
sage: m.restrict_domain('A')
WordMorphism:
sage: m.restrict_domain('Aa')
WordMorphism: a->b
```

```
>>> from sage.all import *
>>> m = WordMorphism('a->b,b->a')
>>> m.restrict_domain('a')
WordMorphism: a->b
>>> m.restrict_domain('')
WordMorphism:
>>> m.restrict_domain('A')
```

(continues on next page)

(continued from previous page)

```
WordMorphism:
>>> m.restrict_domain('Aa')
WordMorphism: a->b
```

The input alphabet must be iterable:

```
sage: m.restrict_domain(66)
Traceback (most recent call last):
...
TypeError: 'sage.rings.integer.Integer' object is not iterable
```

```
>>> from sage.all import *
>>> m.restrict_domain(Integer(66))
Traceback (most recent call last):
...
TypeError: 'sage.rings.integer.Integer' object is not iterable
```

reversal()

Return the reversal of `self`.

EXAMPLES:

```
sage: WordMorphism('6->ab,y->5,0->asd').reversal()
WordMorphism: 0->dsa, 6->ba, y->5
sage: WordMorphism('a->ab,b->a').reversal()
WordMorphism: a->ba, b->a
```

```
>>> from sage.all import *
>>> WordMorphism('6->ab,y->5,0->asd').reversal()
WordMorphism: 0->dsa, 6->ba, y->5
>>> WordMorphism('a->ab,b->a').reversal()
WordMorphism: a->ba, b->a
```

simplify_alphabet_size(*Z=None*)

If this morphism is simplifiable, return morphisms h and k such that this morphism is simplifiable with respect to h and k, otherwise raise `ValueError`.

This method is quite fast if this morphism is non-injective, but very slow if it is injective.

Let $f : X^* \to Y^*$ be a morphism. Then f is simplifiable with respect to morphisms $h : X^* \to Z^*$ and $k : Z^* \to Y^*$, if $f = k \circ h$ and $|Z| < |X|$. If also $Y \subseteq X$, then the morphism $g : Z^* \to Z^* = h \circ k$ is a simplification of f (with respect to h and k).

Loosely speaking, a morphism is simplifiable if it contains "more letters than is needed". Non-injectivity implies simplifiability. Simplification preserves some properties of the original morphism (e.g. repetitiveness).

For more information see Section 3 in [KO2000].

INPUT:

- `Z` – iterable (default: `self.domain().alphabet()`) whose elements are used as an alphabet for the simplification

EXAMPLES:

Example of a simplifiable (non-injective) morphism:

```
sage: f = WordMorphism('a->aca,b->badc,c->acab,d->adc')
sage: h, k = f.simplify_alphabet_size('xyz'); h, k
(WordMorphism: a->x, b->zy, c->xz, d->y, WordMorphism: x->aca, y->adc, z->b)
sage: k * h == f
True
sage: g = h * k; g
WordMorphism: x->xxzx, y->xyxz, z->zy
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->aca,b->badc,c->acab,d->adc')
>>> h, k = f.simplify_alphabet_size('xyz'); h, k
(WordMorphism: a->x, b->zy, c->xz, d->y, WordMorphism: x->aca, y->adc, z->b)
>>> k * h == f
True
>>> g = h * k; g
WordMorphism: x->xxzx, y->xyxz, z->zy
```

Example of a simplifiable (injective) morphism:

```
sage: f = WordMorphism('a->abcc,b->abcd,c->abdc,d->abdd')
sage: h, k = f.simplify_alphabet_size('xyz'); h, k
(WordMorphism: a->xyy, b->xyz, c->xzy, d->xzz, WordMorphism: x->ab, y->c, z->
↪d)
sage: k * h == f
True
sage: g = h * k; g
WordMorphism: x->xyyxyz, y->xzy, z->xzz
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->abcc,b->abcd,c->abdc,d->abdd')
>>> h, k = f.simplify_alphabet_size('xyz'); h, k
(WordMorphism: a->xyy, b->xyz, c->xzy, d->xzz, WordMorphism: x->ab, y->c, z->
↪d)
>>> k * h == f
True
>>> g = h * k; g
WordMorphism: x->xyyxyz, y->xzy, z->xzz
```

Example of a non-simplifiable morphism:

```
sage: WordMorphism('a->aa').simplify_alphabet_size()
Traceback (most recent call last):
...
ValueError: self (a->aa) is not simplifiable
```

```
>>> from sage.all import *
>>> WordMorphism('a->aa').simplify_alphabet_size()
Traceback (most recent call last):
...
ValueError: self (a->aa) is not simplifiable
```

Example of an erasing morphism:

```
sage: f = WordMorphism('a->abc,b->cc,c->')
sage: h, k = f.simplify_alphabet_size(); h, k
(WordMorphism: a->a, b->b, c->, WordMorphism: a->abc, b->cc)
sage: k * h == f
True
sage: g = h * k; g
WordMorphism: a->ab, b->
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->abc,b->cc,c->')
>>> h, k = f.simplify_alphabet_size(); h, k
(WordMorphism: a->a, b->b, c->, WordMorphism: a->abc, b->cc)
>>> k * h == f
True
>>> g = h * k; g
WordMorphism: a->ab, b->
```

Example of a morphism, that is not an endomorphism:

```
sage: f = WordMorphism('a->xx,b->xy,c->yx,d->yy')
sage: h, k = f.simplify_alphabet_size(NN); h, k
(WordMorphism: a->00, b->01, c->10, d->11, WordMorphism: 0->x, 1->y)
sage: k * h == f
True
sage: len(k.domain().alphabet()) < len(f.domain().alphabet())
True
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->xx,b->xy,c->yx,d->yy')
>>> h, k = f.simplify_alphabet_size(NN); h, k
(WordMorphism: a->00, b->01, c->10, d->11, WordMorphism: 0->x, 1->y)
>>> k * h == f
True
>>> len(k.domain().alphabet()) < len(f.domain().alphabet())
True
```

simplify_until_injective()

Return a quadruplet (g, h, k, i), where g is an injective simplification of this morphism with respect to h, k and i.

Requires this morphism to be an endomorphism.

This methods basically calls *simplify_alphabet_size()* until the returned simplification is injective. If this morphism is already injective, a quadruplet (g, h, k, i) is still returned, where g is this morphism, h and k are the identity morphisms and i is 0.

Let $f : X^* \to Y^*$ be a morphism and $Y \subseteq X$. Then $g : Z^* \to Z^*$ is an injective simplification of f with respect to morphisms $h : X^* \to Z^*$ and $k : Z^* \to Y^*$ and a positive integer i, if g is injective, $|Z| < |X|$, $g^i = h \circ k$ and $f^i = k \circ h$.

For more information see Section 4 in [KO2000].

EXAMPLES:

```
sage: f = WordMorphism('a->abc,b->a,c->bc')
sage: g, h, k, i = f.simplify_until_injective(); g, h, k, i
(WordMorphism: a->aa, WordMorphism: a->aa, b->a, c->a, WordMorphism: a->abc,␣
↪2)
sage: g.is_injective()
True
sage: g**i == h * k
True
sage: f**i == k * h
True
```

```
>>> from sage.all import *
>>> f = WordMorphism('a->abc,b->a,c->bc')
>>> g, h, k, i = f.simplify_until_injective(); g, h, k, i
(WordMorphism: a->aa, WordMorphism: a->aa, b->a, c->a, WordMorphism: a->abc,␣
↪2)
>>> g.is_injective()
True
>>> g**i == h * k
True
>>> f**i == k * h
True
```

sage.combinat.words.morphism.**get_cycles**(*f*, *domain*)

Return the list of cycles of the function `f` contained in `domain`.

INPUT:

- `f` – function
- `domain` – iterable, a subdomain of the domain of definition of `f`

EXAMPLES:

```
sage: from sage.combinat.words.morphism import get_cycles
sage: get_cycles(lambda i: (i+1)%3, [0,1,2])
[(0, 1, 2)]
sage: get_cycles(lambda i: [0,0,0][i], [0,1,2])
[(0,)]
sage: get_cycles(lambda i: [1,1,1][i], [0,1,2])
[(1,)]
sage: get_cycles(lambda i: [2,3,0][i], [0,1,2])
[(0, 2)]
sage: d = {'a': 'a', 'b': 'b'}
sage: get_cycles(d.__getitem__, 'ba')
[('b',), ('a',)]
```

```
>>> from sage.all import *
>>> from sage.combinat.words.morphism import get_cycles
>>> get_cycles(lambda i: (i+Integer(1))%Integer(3), [Integer(0),Integer(1),
↪Integer(2)])
[(0, 1, 2)]
>>> get_cycles(lambda i: [Integer(0),Integer(0),Integer(0)][i], [Integer(0),
↪Integer(1),Integer(2)])
```

(continues on next page)

(continued from previous page)

```
[(0,)]
>>> get_cycles(lambda i: [Integer(1),Integer(1),Integer(1)][i], [Integer(0),
↪Integer(1),Integer(2)])
[(1,)]
>>> get_cycles(lambda i: [Integer(2),Integer(3),Integer(0)][i], [Integer(0),
↪Integer(1),Integer(2)])
[(0, 2)]
>>> d = {'a': 'a', 'b': 'b'}
>>> get_cycles(d.__getitem__, 'ba')
[('b',), ('a',)]
```

Word paths

This module implements word paths, which is an application of Combinatorics on Words to Discrete Geometry. A word path is the representation of a word as a discrete path in a vector space using a one-to-one correspondence between the alphabet and a set of vectors called steps. Many problems surrounding 2d lattice polygons (such as questions of self-intersection, area, inertia moment, etc.) can be solved in linear time (linear in the length of the perimeter) using theory from Combinatorics on Words.

On the square grid, the encoding of a path using a four-letter alphabet (for East, North, West and South directions) is also known as the Freeman chain code [1,2] (see [3] for further reading).

AUTHORS:

- Arnaud Bergeron (2008) : Initial version, path on the square grid
- Sébastien Labbé (2009-01-14) : New classes and hierarchy, doc and functions.

EXAMPLES:

The combinatorial class of all paths defined over three given steps:

```
sage: P = WordPaths('abc', steps=[(1,2), (-3,4), (0,-3)]); P
Word Paths over 3 steps
```

```
>>> from sage.all import *
>>> P = WordPaths('abc', steps=[(Integer(1),Integer(2)), (-Integer(3),Integer(4)),␣
↪(Integer(0),-Integer(3))]); P
Word Paths over 3 steps
```

This defines a one-to-one correspondence between alphabet and steps:

```
sage: d = P.letters_to_steps()
sage: sorted(d.items())
[('a', (1, 2)), ('b', (-3, 4)), ('c', (0, -3))]
```

```
>>> from sage.all import *
>>> d = P.letters_to_steps()
>>> sorted(d.items())
[('a', (1, 2)), ('b', (-3, 4)), ('c', (0, -3))]
```

Creation of a path from the combinatorial class P defined above:

```
sage: p = P('abaccba'); p
Path: abaccba
```

```
>>> from sage.all import *
>>> p = P('abaccba'); p
Path: abaccba
```

Many functions can be used on p: the coordinates of its trajectory, ask whether p is a closed path, plot it and many other:

```
sage: list(p.points())
[(0, 0), (1, 2), (-2, 6), (-1, 8), (-1, 5), (-1, 2), (-4, 6), (-3, 8)]
sage: p.is_closed()
False
sage: p.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```
>>> from sage.all import *
>>> list(p.points())
[(0, 0), (1, 2), (-2, 6), (-1, 8), (-1, 5), (-1, 2), (-4, 6), (-3, 8)]
>>> p.is_closed()
False
>>> p.plot()                                                                #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

To obtain a list of all the available word path specific functions, use `help(p)`:

```
sage: help(p)
Help on FiniteWordPath_2d_str in module sage.combinat.words.paths object:
...
Methods inherited from FiniteWordPath_2d:
...
Methods inherited from FiniteWordPath_all:
...
```

```
>>> from sage.all import *
>>> help(p)
Help on FiniteWordPath_2d_str in module sage.combinat.words.paths object:
...
Methods inherited from FiniteWordPath_2d:
...
Methods inherited from FiniteWordPath_all:
...
```

Since p is a finite word, many functions from the word library are available:

```
sage: p.crochemore_factorization()
(a, b, a, c, c, ba)
sage: p.is_palindrome()
False
sage: p[:3]
Path: aba
sage: len(p)
7
```

```
>>> from sage.all import *
>>> p.crochemore_factorization()
(a, b, a, c, c, ba)
>>> p.is_palindrome()
False
>>> p[:Integer(3)]
Path: aba
>>> len(p)
7
```

P also herits many functions from Words:

```
sage: P = WordPaths('rs', steps=[(1,2), (-1,4)]); P
Word Paths over 2 steps
sage: P.alphabet()
{'r', 's'}
sage: list(P.iterate_by_length(3))
[Path: rrr,
 Path: rrs,
 Path: rsr,
 Path: rss,
 Path: srr,
 Path: srs,
 Path: ssr,
 Path: sss]
```

```
>>> from sage.all import *
>>> P = WordPaths('rs', steps=[(Integer(1),Integer(2)), (-Integer(1),Integer(4))]); P
Word Paths over 2 steps
>>> P.alphabet()
{'r', 's'}
>>> list(P.iterate_by_length(Integer(3)))
[Path: rrr,
 Path: rrs,
 Path: rsr,
 Path: rss,
 Path: srr,
 Path: srs,
 Path: ssr,
 Path: sss]
```

When the number of given steps is half the size of alphabet, the opposite of vectors are used:

```
sage: P = WordPaths('abcd', [(1,0), (0,1)])
sage: sorted(P.letters_to_steps().items())
[('a', (1, 0)), ('b', (0, 1)), ('c', (-1, 0)), ('d', (0, -1))]
```

```
>>> from sage.all import *
>>> P = WordPaths('abcd', [(Integer(1),Integer(0)), (Integer(0),Integer(1))])
>>> sorted(P.letters_to_steps().items())
[('a', (1, 0)), ('b', (0, 1)), ('c', (-1, 0)), ('d', (0, -1))]
```

Some built-in combinatorial classes of paths:

```
sage: P = WordPaths('abAB', steps='square_grid'); P
Word Paths on the square grid
```

```
>>> from sage.all import *
>>> P = WordPaths('abAB', steps='square_grid'); P
Word Paths on the square grid
```

```
sage: D = WordPaths('()', steps='dyck'); D
Finite Dyck paths
sage: d = D('()()()(())'); d
Path: ()()()(())
sage: d.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```
>>> from sage.all import *
>>> D = WordPaths('()', steps='dyck'); D
Finite Dyck paths
>>> d = D('()()()(())'); d
Path: ()()()(())
>>> d.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```
sage: P = WordPaths('abcdef', steps='triangle_grid')
sage: p = P('babaddefadabcadefaadfafabacdefa')
sage: p.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```
>>> from sage.all import *
>>> P = WordPaths('abcdef', steps='triangle_grid')
>>> p = P('babaddefadabcadefaadfafabacdefa')
>>> p.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

Vector steps may be in more than 2 dimensions:

```
sage: d = [(1,0,0), (0,1,0), (0,0,1)]
sage: P = WordPaths(alphabet='abc', steps=d); P
Word Paths over 3 steps
sage: p = P('abcabcabcabcaabacabcababcacbabacacabcaccbcac')
sage: p.plot()                                                              #␣
↪needs sage.plot
Graphics3d Object
```

```
>>> from sage.all import *
>>> d = [(Integer(1),Integer(0),Integer(0)), (Integer(0),Integer(1),Integer(0)),␣
↪(Integer(0),Integer(0),Integer(1))]
>>> P = WordPaths(alphabet='abc', steps=d); P
```

(continues on next page)

(continued from previous page)

```
Word Paths over 3 steps
>>> p = P('abcabcabcabcaabacabcababcacbabacacabcaccbcac')
>>> p.plot()                                                                    #␣
↪needs sage.plot
Graphics3d Object
```

```
sage: d = [(1,3,5,1), (-5,1,-6,0), (0,0,1,9), (4,2,-1,0)]
sage: P = WordPaths(alphabet='rstu', steps=d); P
Word Paths over 4 steps
sage: p = P('rtusuusususuturrsust'); p
Path: rtusuusususuturrsust
sage: p.end_point()
(5, 31, -26, 30)
```

```
>>> from sage.all import *
>>> d = [(Integer(1),Integer(3),Integer(5),Integer(1)), (-Integer(5),Integer(1),-
↪Integer(6),Integer(0)), (Integer(0),Integer(0),Integer(1),Integer(9)), (Integer(4),
↪Integer(2),-Integer(1),Integer(0))]
>>> P = WordPaths(alphabet='rstu', steps=d); P
Word Paths over 4 steps
>>> p = P('rtusuusususuturrsust'); p
Path: rtusuusususuturrsust
>>> p.end_point()
(5, 31, -26, 30)
```

```
sage: CubePaths = WordPaths('abcABC', steps='cube_grid'); CubePaths
Word Paths on the cube grid
sage: CubePaths('abcabaabcabAAAAA').plot()                                      #␣
↪needs sage.plot
Graphics3d Object
```

```
>>> from sage.all import *
>>> CubePaths = WordPaths('abcABC', steps='cube_grid'); CubePaths
Word Paths on the cube grid
>>> CubePaths('abcabaabcabAAAAA').plot()                                        #␣
↪needs sage.plot
Graphics3d Object
```

The input data may be a str, a list, a tuple, a callable or a finite iterator:

```
sage: P = WordPaths([0, 1, 2, 3])
sage: P([0,1,2,3,2,1,2,3,2])
Path: 012321232
sage: P((0,1,2,3,2,1,2,3,2))
Path: 012321232
sage: P(lambda n:n%4, length=10)
Path: 0123012301
sage: P(iter([0,3,2,1]), length='finite')
Path: 0321
```

```
>>> from sage.all import *
>>> P = WordPaths([Integer(0), Integer(1), Integer(2), Integer(3)])
>>> P([Integer(0),Integer(1),Integer(2),Integer(3),Integer(2),Integer(1),Integer(2),
↪Integer(3),Integer(2)])
Path: 012321232
>>> P((Integer(0),Integer(1),Integer(2),Integer(3),Integer(2),Integer(1),Integer(2),
↪Integer(3),Integer(2)))
Path: 012321232
>>> P(lambda n:n%Integer(4), length=Integer(10))
Path: 0123012301
>>> P(iter([Integer(0),Integer(3),Integer(2),Integer(1)]), length='finite')
Path: 0321
```

class sage.combinat.words.paths.**FiniteWordPath_2d**

Bases: *FiniteWordPath_all*

animate()

Return an animation object illustrating the path growing step by step.

EXAMPLES:

```
sage: P = WordPaths('abAB')
sage: p = P('aaababbb')
sage: a = p.animate(); print(a)                                                #␣
↪needs sage.plot
Animation with 9 frames
sage: show(a)                          # long time, optional - imagemagick,␣
↪needs sage.plot
sage: show(a, delay=35, iterations=3)       # long time, optional -␣
↪imagemagick, needs sage.plot
```

```
>>> from sage.all import *
>>> P = WordPaths('abAB')
>>> p = P('aaababbb')
>>> a = p.animate(); print(a)                                                  #␣
↪needs sage.plot
Animation with 9 frames
>>> show(a)                          # long time, optional - imagemagick, needs␣
↪sage.plot
>>> show(a, delay=Integer(35), iterations=Integer(3))       # long time,␣
↪optional - imagemagick, needs sage.plot
```

```
sage: P = WordPaths('abcdef',steps='triangle')
sage: p =  P('abcdef')
sage: a = p.animate(); print(a)                                                #␣
↪needs sage.plot
Animation with 8 frames
sage: show(a)                          # long time, optional - imagemagick,␣
↪needs sage.plot
```

```
>>> from sage.all import *
>>> P = WordPaths('abcdef',steps='triangle')
>>> p =  P('abcdef')
>>> a = p.animate(); print(a)                                                  #␣
↪needs sage.plot
Animation with 8 frames
>>> show(a)                          # long time, optional - imagemagick, needs␣
↪sage.plot
```

If the path is closed, the plain polygon is added at the end of the animation:

```
sage: P = WordPaths('abAB')
sage: p = P('ababAbABABaB')
sage: a = p.animate(); print(a)                                                #␣
↪needs sage.plot
Animation with 14 frames
sage: show(a)                          # long time, optional - imagemagick,␣
↪needs sage.plot
```

```
>>> from sage.all import *
>>> P = WordPaths('abAB')
>>> p = P('ababAbABABaB')
>>> a = p.animate(); print(a)                                                  #␣
↪needs sage.plot
Animation with 14 frames
>>> show(a)                          # long time, optional - imagemagick, needs␣
↪sage.plot
```

Another example illustrating a Fibonacci tile:

```
sage: w = words.fibonacci_tile(2)
sage: a = w.animate(); print(a)                                                #␣
↪needs sage.plot
Animation with 54 frames
sage: show(a)                          # long time, optional - imagemagick,␣
↪needs sage.plot
```

```
>>> from sage.all import *
>>> w = words.fibonacci_tile(Integer(2))
>>> a = w.animate(); print(a)                                                  #␣
↪needs sage.plot
Animation with 54 frames
>>> show(a)                          # long time, optional - imagemagick, needs␣
↪sage.plot
```

The first 4 Fibonacci tiles in an animation:

```
sage: # needs sage.plot
sage: a = words.fibonacci_tile(0).animate()
sage: b = words.fibonacci_tile(1).animate()
sage: c = words.fibonacci_tile(2).animate()
sage: d = words.fibonacci_tile(3).animate()
sage: print(a*b*c*d)
Animation with 296 frames
sage: show(a*b*c*d)                  # long time, optional - imagemagick
```

```
>>> from sage.all import *
>>> # needs sage.plot
>>> a = words.fibonacci_tile(Integer(0)).animate()
>>> b = words.fibonacci_tile(Integer(1)).animate()
>>> c = words.fibonacci_tile(Integer(2)).animate()
>>> d = words.fibonacci_tile(Integer(3)).animate()
>>> print(a*b*c*d)
Animation with 296 frames
>>> show(a*b*c*d)                  # long time, optional - imagemagick
```

Note

If ImageMagick is not installed, you will get an error message like this:

```
convert: not found

Error: ImageMagick does not appear to be installed. Saving an
animation to a GIF file or displaying an animation requires
ImageMagick, so please install it and try again.
```

See www.imagemagick.org, for example.

area()

Return the area of a closed path.

INPUT:

- `self` – a closed path

EXAMPLES:

```
sage: P = WordPaths('abcd',steps=[(1,1),(-1,1),(-1,-1),(1,-1)])
sage: p = P('abcd')
sage: p.area()          #todo: not implemented
2
```

```
>>> from sage.all import *
>>> P = WordPaths('abcd',steps=[(Integer(1),Integer(1)),(-Integer(1),
↪Integer(1)),(-Integer(1),-Integer(1)),(Integer(1),-Integer(1))])
>>> p = P('abcd')
>>> p.area()          #todo: not implemented
2
```

height()

Return the height of `self`.

The height of a $2d$-path is merely the difference between the highest and the lowest y-coordinate of each points traced by it.

OUTPUT: nonnegative real number

EXAMPLES:

```
sage: Freeman = WordPaths('abAB')
sage: Freeman('aababaabbbAA').height()
5
```

```
>>> from sage.all import *
>>> Freeman = WordPaths('abAB')
>>> Freeman('aababaabbbAA').height()
5
```

The function is well-defined if `self` is not simple or close:

```
sage: Freeman('aabAAB').height()
1
sage: Freeman('abbABa').height()
2
```

```
>>> from sage.all import *
>>> Freeman('aabAAB').height()
1
>>> Freeman('abbABa').height()
2
```

This works for any $2d$-paths:

```
sage: Paths = WordPaths('ab', steps=[(1,0),(1,1)])
sage: p = Paths('abbaa')
sage: p.height()
2
sage: DyckPaths = WordPaths('ab', steps='dyck')
sage: p = DyckPaths('abaabb')
sage: p.height()
2
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.height()
2.59807621135332
```

```
>>> from sage.all import *
>>> Paths = WordPaths('ab', steps=[(Integer(1),Integer(0)),(Integer(1),
↪Integer(1))])
>>> p = Paths('abbaa')
>>> p.height()
2
>>> DyckPaths = WordPaths('ab', steps='dyck')
>>> p = DyckPaths('abaabb')
```

(continues on next page)

(continued from previous page)

```
>>> p.height()
2
>>> w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
>>> w.height()
2.59807621135332
```

height_vector()

Return the height at each point.

EXAMPLES:

```
sage: Paths = WordPaths('ab', steps=[(1,0),(0,1)])
sage: p = Paths('abbba')
sage: p.height_vector()
[0, 0, 1, 2, 3, 3]
```

```
>>> from sage.all import *
>>> Paths = WordPaths('ab', steps=[(Integer(1),Integer(0)),(Integer(0),
↪Integer(1))])
>>> p = Paths('abbba')
>>> p.height_vector()
[0, 0, 1, 2, 3, 3]
```

plot(*pathoptions={'rgbcolor': 'red', 'thickness': 3}*, *fill=True*, *filloptions={'rgbcolor': 'red', 'alpha': 0.2}*, *startpoint=True*, *startoptions={'rgbcolor': 'red', 'pointsize': 100}*, *endarrow=True*, *arrowoptions={'rgbcolor': 'red', 'arrowsize': 20, 'width': 3}*, *gridlines=False*, *gridoptions={}*)

Return a 2d Graphics illustrating the path.

INPUT:

- `pathoptions` – (dict, default:dict(rgbcolor='red',thickness=3)), options for the path drawing
- `fill` – boolean (default: `True`); if fill is `True` and if the path is closed, the inside is colored
- `filloptions` – (dict, default:dict(rgbcolor='red',alpha=0.2)), options for the inside filling
- `startpoint` – boolean (default: `True`); draw the start point?
- `startoptions` – (dict, default:dict(rgbcolor='red',pointsize=100)) options for the start point drawing
- `endarrow` – boolean (default: `True`); draw an arrow end at the end?
- `arrowoptions` – (dict, default:dict(rgbcolor='red',arrowsize=20, width=3)) options for the end point arrow
- `gridlines` – boolean (default: `False`); show gridlines?
- `gridoptions` – (dict, default: {}), options for the gridlines

EXAMPLES:

A non closed path on the square grid:

```
sage: P = WordPaths('abAB')
sage: P('abababAABAB').plot()                                                  #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```
>>> from sage.all import *
>>> P = WordPaths('abAB')
>>> P('abababAABAB').plot()                                                    #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

A closed path on the square grid:

```
sage: P('abababAABABB').plot()                                                #␣
↪needs sage.plot
Graphics object consisting of 4 graphics primitives
```

```
>>> from sage.all import *
>>> P('abababAABABB').plot()                                                  #␣
↪needs sage.plot
Graphics object consisting of 4 graphics primitives
```

A Dyck path:

```
sage: P = WordPaths('()', steps='dyck')
sage: P('()()()((()))').plot()                                                #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```
>>> from sage.all import *
>>> P = WordPaths('()', steps='dyck')
>>> P('()()()((()))').plot()                                                  #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

A path in the triangle grid:

```
sage: P = WordPaths('abcdef', steps='triangle_grid')
sage: P('abcdededefab').plot()                                                #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```
>>> from sage.all import *
>>> P = WordPaths('abcdef', steps='triangle_grid')
>>> P('abcdededefab').plot()                                                  #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

A polygon of length 220 that tiles the plane in two ways:

```
sage: P = WordPaths('abAB')
sage: P('aBababAbababaBaBABaBababaBaBABAbABABaBababaBaBABaBababAbababaBaBABaBababaBaBABA
↪bABABaBABAbAbabAbABABaBABAbABABaBababaBaBABAbABABaBABAbAbabAbABAbababaBababAbA
↪BAbAbabAbABABaBABAbAbabAbABAbAbababaBababAbababaBaBABaBababAbababaBababAbABAbAbab'
↪).plot()  # needs sage.plot
Graphics object consisting of 4 graphics primitives
```

```
>>> from sage.all import *
>>> P = WordPaths('abAB')
>>> P('aBababAbababaBaBABaBababaBaBABAbABABaBababaBaBABaBababAbababaBaBABaBababaBaBABAbA
↪BABaBABAbAbabAbABABaBABAbABABaBababaBaBABAbABABaBABAbAbabAbABAbAbabaBababAbABA
↪bAbabAbABABaBABAbAbabAbABAbAbabaBababAbababaBaBABaBababAbababaBababAbABAbAbab').
↪plot()  # needs sage.plot
Graphics object consisting of 4 graphics primitives
```

With gridlines:

```
sage: P('abababababab').plot(gridlines=True)                                    #␣
↪needs sage.plot
```

```
>>> from sage.all import *
>>> P('abababababab').plot(gridlines=True)                                      #␣
↪needs sage.plot
```

plot_directive_vector(*options={'rgbcolor': 'blue'}*)

Return an arrow 2d graphics that goes from the start of the path to the end.

INPUT:

- `options` – dictionary, default: {'rgbcolor': 'blue'} graphic options for the arrow

If the start is the same as the end, a single point is returned.

EXAMPLES:

```
sage: P = WordPaths('abcd'); P
Word Paths on the square grid
sage: p = P('aaaccaccacacacaccccccbbdd'); p
Path: aaaccaccacacacaccccccbbdd
sage: R = p.plot() + p.plot_directive_vector()                                  #␣
↪needs sage.plot
sage: R.axes(False)                                                             #␣
↪needs sage.plot
sage: R.set_aspect_ratio(1)                                                     #␣
↪needs sage.plot
sage: R.plot()                                                                  #␣
↪needs sage.plot
Graphics object consisting of 4 graphics primitives
```

```
>>> from sage.all import *
>>> P = WordPaths('abcd'); P
Word Paths on the square grid
>>> p = P('aaaccaccacacacaccccccbbdd'); p
Path: aaaccaccacacacaccccccbbdd
>>> R = p.plot() + p.plot_directive_vector()                                    #␣
↪needs sage.plot
>>> R.axes(False)                                                               #␣
↪needs sage.plot
>>> R.set_aspect_ratio(Integer(1))                                                ␣
↪     # needs sage.plot
>>> R.plot()                                                                    #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.plot
Graphics object consisting of 4 graphics primitives
```

width()

Return the width of `self`.

The height of a $2d$-path is merely the difference between the rightmost and the leftmost x-coordinate of each points traced by it.

OUTPUT: nonnegative real number

EXAMPLES:

```
sage: Freeman = WordPaths('abAB')
sage: Freeman('aababaabbbAA').width()
5
```

```
>>> from sage.all import *
>>> Freeman = WordPaths('abAB')
>>> Freeman('aababaabbbAA').width()
5
```

The function is well-defined if `self` is not simple or close:

```
sage: Freeman('aabAAB').width()
2
sage: Freeman('abbABa').width()
1
```

```
>>> from sage.all import *
>>> Freeman('aabAAB').width()
2
>>> Freeman('abbABa').width()
1
```

This works for any $2d$-paths:

```
sage: Paths = WordPaths('ab', steps=[(1,0),(1,1)])
sage: p = Paths('abbaa')
sage: p.width()
5
sage: DyckPaths = WordPaths('ab', steps='dyck')
sage: p = DyckPaths('abaabb')
sage: p.width()
6
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.width()
4.50000000000000
```

```
>>> from sage.all import *
>>> Paths = WordPaths('ab', steps=[(Integer(1),Integer(0)),(Integer(1),
↪Integer(1))])
>>> p = Paths('abbaa')
```

(continues on next page)

(continued from previous page)

```
>>> p.width()
5
>>> DyckPaths = WordPaths('ab', steps='dyck')
>>> p = DyckPaths('abaabb')
>>> p.width()
6
>>> w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
>>> w.width()
4.50000000000000
```

width_vector()

Return the width at each point.

EXAMPLES:

```
sage: Paths = WordPaths('ab', steps=[(1,0),(0,1)])
sage: p = Paths('abbba')
sage: p.width_vector()
[0, 1, 1, 1, 1, 2]
```

```
>>> from sage.all import *
>>> Paths = WordPaths('ab', steps=[(Integer(1),Integer(0)),(Integer(0),
↪Integer(1))])
>>> p = Paths('abbba')
>>> p.width_vector()
[0, 1, 1, 1, 1, 2]
```

xmax()

Return the maximum of the x-coordinates of the path.

EXAMPLES:

```
sage: P = WordPaths('0123')
sage: p = P('0101013332')
sage: p.xmax()
3
```

```
>>> from sage.all import *
>>> P = WordPaths('0123')
>>> p = P('0101013332')
>>> p.xmax()
3
```

This works for any $2d$-paths:

```
sage: Paths = WordPaths('ab', steps=[(1,-1),(-1,1)])
sage: p = Paths('ababa')
sage: p.xmax()
1
sage: DyckPaths = WordPaths('ab', steps='dyck')
sage: p = DyckPaths('abaabb')
sage: p.xmax()
6
```

(continues on next page)

(continued from previous page)

```
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.xmax()
4.50000000000000
```

```
>>> from sage.all import *
>>> Paths = WordPaths('ab', steps=[(Integer(1),-Integer(1)),(-Integer(1),
↪Integer(1))])
>>> p = Paths('ababa')
>>> p.xmax()
1
>>> DyckPaths = WordPaths('ab', steps='dyck')
>>> p = DyckPaths('abaabb')
>>> p.xmax()
6
>>> w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
>>> w.xmax()
4.50000000000000
```

xmin()

Return the minimum of the x-coordinates of the path.

EXAMPLES:

```
sage: P = WordPaths('0123')
sage: p = P('0101013332')
sage: p.xmin()
0
```

```
>>> from sage.all import *
>>> P = WordPaths('0123')
>>> p = P('0101013332')
>>> p.xmin()
0
```

This works for any $2d$-paths:

```
sage: Paths = WordPaths('ab', steps=[(1,0),(-1,1)])
sage: p = Paths('abbba')
sage: p.xmin()
-2
sage: DyckPaths = WordPaths('ab', steps='dyck')
sage: p = DyckPaths('abaabb')
sage: p.xmin()
0
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.xmin()
0.000000000000000
```

```
>>> from sage.all import *
>>> Paths = WordPaths('ab', steps=[(Integer(1),Integer(0)),(-Integer(1),
↪Integer(1))])
>>> p = Paths('abbba')
```

(continues on next page)

(continued from previous page)

```
>>> p.xmin()
-2
>>> DyckPaths = WordPaths('ab', steps='dyck')
>>> p = DyckPaths('abaabb')
>>> p.xmin()
0
>>> w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
>>> w.xmin()
0.000000000000000
```

ymax()

Return the maximum of the y-coordinates of the path.

EXAMPLES:

```
sage: P = WordPaths('0123')
sage: p = P('0101013332')
sage: p.ymax()
3
```

```
>>> from sage.all import *
>>> P = WordPaths('0123')
>>> p = P('0101013332')
>>> p.ymax()
3
```

This works for any $2d$-paths:

```
sage: Paths = WordPaths('ab', steps=[(1,-1),(-1,1)])
sage: p = Paths('ababa')
sage: p.ymax()
0
sage: DyckPaths = WordPaths('ab', steps='dyck')
sage: p = DyckPaths('abaabb')
sage: p.ymax()
2
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.ymax()
2.59807621135332
```

```
>>> from sage.all import *
>>> Paths = WordPaths('ab', steps=[(Integer(1),-Integer(1)),(-Integer(1),
↪Integer(1))])
>>> p = Paths('ababa')
>>> p.ymax()
0
>>> DyckPaths = WordPaths('ab', steps='dyck')
>>> p = DyckPaths('abaabb')
>>> p.ymax()
2
>>> w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
>>> w.ymax()
```

(continues on next page)

(continued from previous page)

```
2.59807621135332
```

ymin()

Return the minimum of the y-coordinates of the path.

EXAMPLES:

```
sage: P = WordPaths('0123')
sage: p = P('0101013332')
sage: p.ymin()
0
```

```
>>> from sage.all import *
>>> P = WordPaths('0123')
>>> p = P('0101013332')
>>> p.ymin()
0
```

This works for any $2d$-paths:

```
sage: Paths = WordPaths('ab', steps=[(1,-1),(-1,1)])
sage: p = Paths('ababa')
sage: p.ymin()
-1
sage: DyckPaths = WordPaths('ab', steps='dyck')
sage: p = DyckPaths('abaabb')
sage: p.ymin()
0
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.ymin()
0.000000000000000
```

```
>>> from sage.all import *
>>> Paths = WordPaths('ab', steps=[(Integer(1),-Integer(1)),(-Integer(1),
↪Integer(1))])
>>> p = Paths('ababa')
>>> p.ymin()
-1
>>> DyckPaths = WordPaths('ab', steps='dyck')
>>> p = DyckPaths('abaabb')
>>> p.ymin()
0
>>> w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
>>> w.ymin()
0.000000000000000
```

Bases: SageObject

directive_vector()

Return the directive vector of `self`.

The directive vector is the vector starting at the start point and ending at the end point of the path `self`.

EXAMPLES:

```
sage: WordPaths('abcdef')('abababab').directive_vector()
(6, 2*sqrt3)
sage: WordPaths('abAB')('abababab').directive_vector()
(4, 4)
sage: P = WordPaths('abcABC', steps='cube_grid')
sage: P('abababCC').directive_vector()
(4, 4, -2)
sage: WordPaths('abcdef')('abcdef').directive_vector()
(0, 0)
sage: P = WordPaths('abc', steps=[(1,3,7,9),(-4,1,0,0),(0,32,1,8)])
sage: P('abcababababacaacccbbcac').directive_vector()
(-16, 254, 63, 128)
```

```
>>> from sage.all import *
>>> WordPaths('abcdef')('abababab').directive_vector()
(6, 2*sqrt3)
>>> WordPaths('abAB')('abababab').directive_vector()
(4, 4)
>>> P = WordPaths('abcABC', steps='cube_grid')
>>> P('abababCC').directive_vector()
(4, 4, -2)
>>> WordPaths('abcdef')('abcdef').directive_vector()
(0, 0)
>>> P = WordPaths('abc', steps=[(Integer(1),Integer(3),Integer(7),Integer(9)),
↪(-Integer(4),Integer(1),Integer(0),Integer(0)),(Integer(0),Integer(32),
↪Integer(1),Integer(8))])
>>> P('abcababababcaaccc bbcac').directive_vector()
(-16, 254, 63, 128)
```

end_point()

Return the end point of the path.

EXAMPLES:

```
sage: WordPaths('abcdef')('abababab').end_point()
(6, 2*sqrt3)
sage: WordPaths('abAB')('abababab').end_point()
(4, 4)
sage: P = WordPaths('abcABC', steps='cube_grid')
sage: P('abababCC').end_point()
(4, 4, -2)
sage: WordPaths('abcdef')('abcdef').end_point()
(0, 0)
sage: P = WordPaths('abc', steps=[(1,3,7,9),(-4,1,0,0),(0,32,1,8)])
sage: P('abcababababcaaccc bbcac').end_point()
(-16, 254, 63, 128)
```

```
>>> from sage.all import *
>>> WordPaths('abcdef')('abababab').end_point()
(6, 2*sqrt3)
>>> WordPaths('abAB')('abababab').end_point()
(4, 4)
>>> P = WordPaths('abcABC', steps='cube_grid')
>>> P('abababCC').end_point()
(4, 4, -2)
>>> WordPaths('abcdef')('abcdef').end_point()
(0, 0)
>>> P = WordPaths('abc', steps=[(Integer(1),Integer(3),Integer(7),Integer(9)),
↪(-Integer(4),Integer(1),Integer(0),Integer(0)),(Integer(0),Integer(32),
↪Integer(1),Integer(8))])
>>> P('abcababababcaaccc bbcac').end_point()
(-16, 254, 63, 128)
```

is_closed()

Return `True` if the path is closed.

A path is closed if the origin and the end of the path are equal.

EXAMPLES:

```
sage: P = WordPaths('abcd', steps=[(1,0),(0,1),(-1,0),(0,-1)])
sage: P('abcd').is_closed()
True
sage: P('abc').is_closed()
False
sage: P().is_closed()
True
sage: P('aacacc').is_closed()
True
```

```
>>> from sage.all import *
>>> P = WordPaths('abcd', steps=[(Integer(1),Integer(0)),(Integer(0),
↪Integer(1)),(-Integer(1),Integer(0)),(Integer(0),-Integer(1))])
>>> P('abcd').is_closed()
True
>>> P('abc').is_closed()
False
>>> P().is_closed()
True
>>> P('aacacc').is_closed()
True
```

is_simple()

Return `True` if the path is simple.

A path is simple if all its points are distinct.

If the path is closed, the last point is not considered.

EXAMPLES:

```
sage: P = WordPaths('abcdef',steps='triangle_grid');P
Word Paths on the triangle grid
sage: P('abc').is_simple()
True
sage: P('abcde').is_simple()
True
sage: P('abcdef').is_simple()
True
sage: P('ad').is_simple()
True
sage: P('aabdee').is_simple()
False
```

```
>>> from sage.all import *
>>> P = WordPaths('abcdef',steps='triangle_grid');P
Word Paths on the triangle grid
>>> P('abc').is_simple()
True
>>> P('abcde').is_simple()
True
>>> P('abcdef').is_simple()
```

(continues on next page)

(continued from previous page)

```
True
>>> P('ad').is_simple()
True
>>> P('aabdee').is_simple()
False
```

is_tangent()

The is_tangent() method, which is implemented for words, has an extended meaning for word paths, which is not implemented yet.

AUTHOR:

- Thierry Monteil

plot_projection(*v=None*, *letters=None*, *color=None*, *ring=None*, *size=12*, *kind='right'*)

Return an image of the projection of the successive points of the path into the space orthogonal to the given vector.

INPUT:

- `self` – a word path in a 3 or 4 dimension vector space
- `v` – vector (default: `None`); if `None`, the directive vector (i.e. the end point minus starting point) of the path is considered.
- `letters` – iterable (default: `None`); of the letters to be projected. If `None`, then all the letters are considered.
- `color` – dictionary (default: `None`); of the letters mapped to colors. If `None`, automatic colors are chosen.
- `ring` – ring (default: `None`); where to do the computations. If `None`, RealField(53) is used.
- `size` – number (default: `12`); size of the points
- `kind` – string (default: `'right'`); either `'right'` or `'left'`. The color of a letter is given to the projected prefix to the right or the left of the letter.

OUTPUT: 2d or 3d Graphic object

EXAMPLES:

The Rauzy fractal:

```
sage: s = WordMorphism('1->12,2->13,3->1')
sage: D = s.fixed_point('1')
sage: v = s.pisot_eigenvector_right()
sage: P = WordPaths('123',[(1,0,0),(0,1,0),(0,0,1)])
sage: w = P(D[:200])
sage: w.plot_projection(v)  # long time (2s)
Graphics object consisting of 200 graphics primitives
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->12,2->13,3->1')
>>> D = s.fixed_point('1')
>>> v = s.pisot_eigenvector_right()
>>> P = WordPaths('123',[(Integer(1),Integer(0),Integer(0)),(Integer(0),
↪Integer(1),Integer(0)),(Integer(0),Integer(0),Integer(1))])
```

(continues on next page)

(continued from previous page)

```
>>> w = P(D[:Integer(200)])
>>> w.plot_projection(v)  # long time (2s)
Graphics object consisting of 200 graphics primitives
```

In this case, the abelianized vector doesn't give a good projection:

```
sage: w.plot_projection()  # long time (2s)
Graphics object consisting of 200 graphics primitives
```

```
>>> from sage.all import *
>>> w.plot_projection()  # long time (2s)
Graphics object consisting of 200 graphics primitives
```

You can project only the letters you want:

```
sage: w.plot_projection(v, letters='12')  # long time (2s)
Graphics object consisting of 168 graphics primitives
```

```
>>> from sage.all import *
>>> w.plot_projection(v, letters='12')  # long time (2s)
Graphics object consisting of 168 graphics primitives
```

You can increase or decrease the precision of the computations by changing the ring of the projection matrix:

```
sage: w.plot_projection(v, ring=RealField(20))  # long time (2s)
Graphics object consisting of 200 graphics primitives
```

```
>>> from sage.all import *
>>> w.plot_projection(v, ring=RealField(Integer(20)))  # long time (2s)
Graphics object consisting of 200 graphics primitives
```

You can change the size of the points:

```
sage: w.plot_projection(v, size=30)  # long time (2s)
Graphics object consisting of 200 graphics primitives
```

```
>>> from sage.all import *
>>> w.plot_projection(v, size=Integer(30))  # long time (2s)
Graphics object consisting of 200 graphics primitives
```

You can assign the color of a letter to the projected prefix to the right or the left of the letter:

```
sage: w.plot_projection(v, kind='left')  # long time (2s)
Graphics object consisting of 200 graphics primitives
```

```
>>> from sage.all import *
>>> w.plot_projection(v, kind='left')  # long time (2s)
Graphics object consisting of 200 graphics primitives
```

To remove the axis, do like this:

```
sage: r = w.plot_projection(v)                                                  #␣
↪needs sage.plot
sage: r.axes(False)                                                             #␣
↪needs sage.plot
sage: r                                 # long time (2s)                        #␣
↪needs sage.plot
Graphics object consisting of 200 graphics primitives
```

```
>>> from sage.all import *
>>> r = w.plot_projection(v)                                                    #␣
↪needs sage.plot
>>> r.axes(False)                                                               #␣
↪needs sage.plot
>>> r                                   # long time (2s)                        #␣
↪needs sage.plot
Graphics object consisting of 200 graphics primitives
```

You can assign different colors to each letter:

```
sage: color = {'1': 'purple', '2': (.2,.3,.4), '3': 'magenta'}
sage: w.plot_projection(v, color=color)     # long time (2s)                    #␣
↪needs sage.plot
Graphics object consisting of 200 graphics primitives
```

```
>>> from sage.all import *
>>> color = {'1': 'purple', '2': (RealNumber('.2'),RealNumber('.3'),
↪RealNumber('.4')), '3': 'magenta'}
>>> w.plot_projection(v, color=color)     # long time (2s)                     #␣
↪needs sage.plot
Graphics object consisting of 200 graphics primitives
```

The 3d-Rauzy fractal:

```
sage: s = WordMorphism('1->12,2->13,3->14,4->1')
sage: D = s.fixed_point('1')
sage: v = s.pisot_eigenvector_right()
sage: P = WordPaths('1234',[(1,0,0,0), (0,1,0,0), (0,0,1,0), (0,0,0,1)])
sage: w = P(D[:200])
sage: w.plot_projection(v)                                                      #␣
↪needs sage.plot
Graphics3d Object
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->12,2->13,3->14,4->1')
>>> D = s.fixed_point('1')
>>> v = s.pisot_eigenvector_right()
>>> P = WordPaths('1234',[(Integer(1),Integer(0),Integer(0),Integer(0)),␣
↪(Integer(0),Integer(1),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1),Integer(0)), (Integer(0),Integer(0),Integer(0),Integer(1))])
>>> w = P(D[:Integer(200)])
>>> w.plot_projection(v)                                                        #␣
↪needs sage.plot
Graphics3d Object
```

The dimension of vector space of the parent must be 3 or 4:

```
sage: P = WordPaths('ab', [(1, 0), (0, 1)])
sage: p = P('aabbabbab')
sage: p.plot_projection()                                                   #␣
↪needs sage.plot
Traceback (most recent call last):
...
TypeError: The dimension of the vector space (=2) must be 3 or 4
```

```
>>> from sage.all import *
>>> P = WordPaths('ab', [(Integer(1), Integer(0)), (Integer(0), Integer(1))])
>>> p = P('aabbabbab')
>>> p.plot_projection()                                                     #␣
↪needs sage.plot
Traceback (most recent call last):
...
TypeError: The dimension of the vector space (=2) must be 3 or 4
```

points(*include_last=True*)

Return an iterator yielding a list of points used to draw the path represented by this word.

INPUT:

- `include_last` – boolean (default: `True`); whether to include the last point

EXAMPLES:

A simple closed square:

```
sage: P = WordPaths('abAB')
sage: list(P('abAB').points())
[(0, 0), (1, 0), (1, 1), (0, 1), (0, 0)]
```

```
>>> from sage.all import *
>>> P = WordPaths('abAB')
>>> list(P('abAB').points())
[(0, 0), (1, 0), (1, 1), (0, 1), (0, 0)]
```

A simple closed square without the last point:

```
sage: list(P('abAB').points(include_last=False))
[(0, 0), (1, 0), (1, 1), (0, 1)]
```

```
>>> from sage.all import *
>>> list(P('abAB').points(include_last=False))
[(0, 0), (1, 0), (1, 1), (0, 1)]
```

```
sage: list(P('abaB').points())
[(0, 0), (1, 0), (1, 1), (2, 1), (2, 0)]
```

```
>>> from sage.all import *
>>> list(P('abaB').points())
[(0, 0), (1, 0), (1, 1), (2, 1), (2, 0)]
```

projected_path(*v=None*, *ring=None*)

Return the path projected into the space orthogonal to the given vector.

INPUT:

- `v` – vector (default: `None`); if `None`, the directive vector (i.e. the end point minus starting point) of the path is considered.
- `ring` – ring (default: `None`); where to do the computations. If `None`, RealField(53) is used.

OUTPUT: word path

EXAMPLES:

The projected path of the tribonacci word:

```
sage: s = WordMorphism('1->12,2->13,3->1')
sage: D = s.fixed_point('1')
sage: v = s.pisot_eigenvector_right()
sage: P = WordPaths('123',[(1,0,0),(0,1,0),(0,0,1)])
sage: w = P(D[:1000])
sage: p = w.projected_path(v)
sage: p
Path: 12131211213121213121112131213121121312121...
sage: p[:20].plot()                                                          #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->12,2->13,3->1')
>>> D = s.fixed_point('1')
>>> v = s.pisot_eigenvector_right()
>>> P = WordPaths('123',[(Integer(1),Integer(0),Integer(0)),(Integer(0),
↪Integer(1),Integer(0)),(Integer(0),Integer(0),Integer(1))])
>>> w = P(D[:Integer(1000)])
>>> p = w.projected_path(v)
>>> p
Path: 12131211213121213121112131213121121312121...
>>> p[:Integer(20)].plot()                                                   ␣
↪     # needs sage.plot
Graphics object consisting of 3 graphics primitives
```

The `ring` argument allows to change the precision of the projected steps:

```
sage: p = w.projected_path(v, RealField(10))
sage: p
Path: 12131211213121213121112131213121121312121...
sage: p.parent().letters_to_steps()
{'1': (-0.53, 0.00), '2': (0.75, -0.48), '3': (0.41, 0.88)}
```

```
>>> from sage.all import *
>>> p = w.projected_path(v, RealField(Integer(10)))
>>> p
Path: 12131211213121213121112131213121121312121...
>>> p.parent().letters_to_steps()
{'1': (-0.53, 0.00), '2': (0.75, -0.48), '3': (0.41, 0.88)}
```

projected_point_iterator(*v=None*, *ring=None*)

Return an iterator of the projection of the orbit points of the path into the space orthogonal to the given vector.

INPUT:

- `v` – vector (default: `None`); if `None`, the directive vector (i.e. the end point minus starting point) of the path is considered
- `ring` – ring (default: `None`); where to do the computations. If `None`, RealField(53) is used.

OUTPUT: iterator of points

EXAMPLES:

Projected points of the Rauzy fractal:

```
sage: s = WordMorphism('1->12,2->13,3->1')
sage: D = s.fixed_point('1')
sage: v = s.pisot_eigenvector_right()
sage: P = WordPaths('123',[(1,0,0),(0,1,0),(0,0,1)])
sage: w = P(D[:200])
sage: it = w.projected_point_iterator(v)
sage: for i in range(6): next(it)
(0.000000000000000, 0.000000000000000)
(-0.526233343362516, 0.000000000000000)
(0.220830337618112, -0.477656250512816)
(-0.305403005744404, -0.477656250512816)
(0.100767309386062, 0.400890564600664)
(-0.425466033976454, 0.400890564600664)
```

```
>>> from sage.all import *
>>> s = WordMorphism('1->12,2->13,3->1')
>>> D = s.fixed_point('1')
>>> v = s.pisot_eigenvector_right()
>>> P = WordPaths('123',[(Integer(1),Integer(0),Integer(0)),(Integer(0),
↪Integer(1),Integer(0)),(Integer(0),Integer(0),Integer(1))])
>>> w = P(D[:Integer(200)])
>>> it = w.projected_point_iterator(v)
>>> for i in range(Integer(6)): next(it)
(0.000000000000000, 0.000000000000000)
(-0.526233343362516, 0.000000000000000)
(0.220830337618112, -0.477656250512816)
(-0.305403005744404, -0.477656250512816)
(0.100767309386062, 0.400890564600664)
(-0.425466033976454, 0.400890564600664)
```

Projected points of a 2d path:

```
sage: P = WordPaths('ab','ne')
sage: p = P('aabbabbab')
sage: it = p.projected_point_iterator(ring=RealField(20))
sage: for i in range(8): next(it)
(0.00000)
(0.78087)
(1.5617)
(0.93704)
```

(continues on next page)

(continued from previous page)

```
(0.31235)
(1.0932)
(0.46852)
(-0.15617)
```

```
>>> from sage.all import *
>>> P = WordPaths('ab','ne')
>>> p = P('aabbabbab')
>>> it = p.projected_point_iterator(ring=RealField(Integer(20)))
>>> for i in range(Integer(8)): next(it)
(0.00000)
(0.78087)
(1.5617)
(0.93704)
(0.31235)
(1.0932)
(0.46852)
(-0.15617)
```

start_point()

Return the starting point of `self`.

OUTPUT: vector

EXAMPLES:

```
sage: WordPaths('abcdef')('abcdef').start_point()
(0, 0)
sage: WordPaths('abcdef', steps='cube_grid')('abcdef').start_point()
(0, 0, 0)
sage: P = WordPaths('ab', steps=[(1,0,0,0),(0,1,0,0)])
sage: P('abbba').start_point()
(0, 0, 0, 0)
```

```
>>> from sage.all import *
>>> WordPaths('abcdef')('abcdef').start_point()
(0, 0)
>>> WordPaths('abcdef', steps='cube_grid')('abcdef').start_point()
(0, 0, 0)
>>> P = WordPaths('ab', steps=[(Integer(1),Integer(0),Integer(0),Integer(0)),
↪(Integer(0),Integer(1),Integer(0),Integer(0))])
>>> P('abbba').start_point()
(0, 0, 0, 0)
```

tikz_trajectory()

Return the trajectory of `self` as a `tikz` string.

EXAMPLES:

```
sage: P = WordPaths('abcdef')
sage: p = P('abcde')
sage: p.tikz_trajectory()
```

(continues on next page)

(continued from previous page)

```
'(0.000, 0.000) -- (1.00, 0.000) -- (1.50, 0.866) -- (1.00, 1.73) -- (0.000,␣
↪1.73) -- (-0.500, 0.866)'
```

```
>>> from sage.all import *
>>> P = WordPaths('abcdef')
>>> p = P('abcde')
>>> p.tikz_trajectory()
'(0.000, 0.000) -- (1.00, 0.000) -- (1.50, 0.866) -- (1.00, 1.73) -- (0.000,␣
↪1.73) -- (-0.500, 0.866)'
```

class sage.combinat.words.paths.**FiniteWordPath_hexagonal_grid**(*parent*, **args*, ***kwds*)

Bases: *FiniteWordPath_triangle_grid*

INPUT:

- `parent` – a parent object inheriting from Words_all that has the alphabet attribute defined
- `*args`, `**kwds` – arguments accepted by AbstractWord

EXAMPLES:

```
sage: F = WordPaths('abcdef', steps='hexagon'); F
Word Paths on the hexagonal grid

Bases: *FiniteWordPath_2d*

area()

Return the area of a closed path.

INPUT:

- `self` – a closed path

EXAMPLES:

```
sage: P = WordPaths('abAB', steps='square_grid')
sage: P('abAB').area()
1
sage: P('aabbAABB').area()
4
sage: P('aabbABAB').area()
3
```

```
>>> from sage.all import *
>>> P = WordPaths('abAB', steps='square_grid')
>>> P('abAB').area()
1
>>> P('aabbAABB').area()
4
>>> P('aabbABAB').area()
3
```

The area of the Fibonacci tiles:

```
sage: [words.fibonacci_tile(i).area() for i in range(6)]
[1, 5, 29, 169, 985, 5741]
sage: [words.dual_fibonacci_tile(i).area() for i in range(6)]
[1, 5, 29, 169, 985, 5741]
sage: oeis(_)[0]                              # optional -- internet
A001653: Numbers k such that 2*k^2 - 1 is a square.
sage: _.first_terms()                         # optional -- internet

 44560482149,
 259717522849,
 1513744654945,
 ...
```

is_closed()

Return whether `self` represents a closed path.

EXAMPLES:

```
sage: P = WordPaths('abAB', steps='square_grid')
sage: P('aA').is_closed()
True
sage: P('abAB').is_closed()
True
sage: P('ababAABB').is_closed()
True
sage: P('aaabbbAABB').is_closed()
False
sage: P('ab').is_closed()
False
```

```
>>> from sage.all import *
>>> P = WordPaths('abAB', steps='square_grid')
>>> P('aA').is_closed()
```

(continues on next page)

(continued from previous page)

```
True
>>> P('abAB').is_closed()
True
>>> P('ababAABB').is_closed()
True
>>> P('aaabbbAABB').is_closed()
False
>>> P('ab').is_closed()
False
```

is_simple()

Return whether the path is simple.

A path is simple if all its points are distinct.

If the path is closed, the last point is not considered.

Note

The linear algorithm described in the thesis of Xavier Provençal should be implemented here.

EXAMPLES:

```
sage: P = WordPaths('abAB', steps='square_grid')
sage: P('abab').is_simple()
True
sage: P('abAB').is_simple()
True
sage: P('abA').is_simple()
True
sage: P('aabABB').is_simple()
False
sage: P().is_simple()
True
sage: P('A').is_simple()
True
sage: P('aA').is_simple()
True
sage: P('aaA').is_simple()
False
```

```
>>> from sage.all import *
>>> P = WordPaths('abAB', steps='square_grid')
>>> P('abab').is_simple()
True
>>> P('abAB').is_simple()
True
>>> P('abA').is_simple()
True
>>> P('aabABB').is_simple()
False
>>> P().is_simple()
```

(continues on next page)

(continued from previous page)

```
True
>>> P('A').is_simple()
True
>>> P('aA').is_simple()
True
>>> P('aaA').is_simple()
False
```

REFERENCES:

- Provençal, X., *Combinatoires des mots, géometrie discrète et pavages*, Thèse de doctorat en Mathématiques, Montréal, UQAM, septembre 2008, 115 pages.

tikz_trajectory()

Return the trajectory of `self` as a `tikz` string.

EXAMPLES:

```
sage: f = words.fibonacci_tile(1)
sage: f.tikz_trajectory()
'(0, 0) -- (0, -1) -- (-1, -1) -- (-1, -2) -- (0, -2) -- (0, -3) -- (1, -3) --
↪ (1, -2) -- (2, -2) -- (2, -1) -- (1, -1) -- (1, 0) -- (0, 0)'
```

```
>>> from sage.all import *
>>> f = words.fibonacci_tile(Integer(1))
>>> f.tikz_trajectory()
'(0, 0) -- (0, -1) -- (-1, -1) -- (-1, -2) -- (0, -2) -- (0, -3) -- (1, -3) --
↪ (1, -2) -- (2, -2) -- (2, -1) -- (1, -1) -- (1, 0) -- (0, 0)'
```

Bases: *WordDatatype_tuple*, *FiniteWordPath_square_grid*, *FiniteWord_class*

class sage.combinat.words.paths.**FiniteWordPath_triangle_grid**

Bases: *FiniteWordPath_2d*

xmax()

Return the maximum of the x-coordinates of the path.

EXAMPLES:

```
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.xmax()
4.50000000000000
sage: w = WordPaths('abcABC', steps='triangle')('ABAcacacababababcbcbAC')
sage: w.xmax()
4.00000000000000
```

```
>>> from sage.all import *
>>> w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
>>> w.xmax()
4.50000000000000
>>> w = WordPaths('abcABC', steps='triangle')('ABAcacacababababcbcbAC')
>>> w.xmax()
4.00000000000000
```

xmin()

Return the minimum of the x-coordinates of the path.

EXAMPLES:

```
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.xmin()
0.000000000000000
sage: w = WordPaths('abcABC', steps='triangle')('ABAcacacababababcbcbAC')
sage: w.xmin()
-3.00000000000000
```

```
>>> from sage.all import *
>>> w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
>>> w.xmin()
0.000000000000000
>>> w = WordPaths('abcABC', steps='triangle')('ABAcacacababababcbcbAC')
>>> w.xmin()
-3.00000000000000
```

ymax()

Return the maximum of the y-coordinates of the path.

EXAMPLES:

```
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.ymax()
2.59807621135332
sage: w = WordPaths('abcABC', steps='triangle')('ABAcacacababababcbcbAC')
sage: w.ymax()
8.66025403784439
```

```
>>> from sage.all import *
>>> w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
>>> w.ymax()
2.59807621135332
>>> w = WordPaths('abcABC', steps='triangle')('ABAcacacababababcbcbAC')
>>> w.ymax()
8.66025403784439
```

ymin()

Return the minimum of the y-coordinates of the path.

EXAMPLES:

```
sage: w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
sage: w.ymin()
0.000000000000000
sage: w = WordPaths('abcABC', steps='triangle')('ABAcacacababababcbcbAC')
sage: w.ymin()
-0.866025403784439
```

```
>>> from sage.all import *
>>> w = WordPaths('abcABC', steps='triangle')('ababcaaBC')
>>> w.ymin()
0.000000000000000
>>> w = WordPaths('abcABC', steps='triangle')('ABAcacacababababcbcbAC')
>>> w.ymin()
-0.866025403784439
```

class sage.combinat.words.paths.**FiniteWordPath_triangle_grid_callable**(*parent*, *callable*, *length=None*)

class sage.combinat.words.paths.**FiniteWordPath_triangle_grid_iter_with_caching**(*parent*, *iter*, *length=None*)

Bases: *WordDatatype_iter_with_caching*, *FiniteWordPath_triangle_grid*, *FiniteWord_class*

class sage.combinat.words.paths.**FiniteWordPath_triangle_grid_list**

Bases: *WordDatatype_list*, *FiniteWordPath_triangle_grid*, *FiniteWord_class*

class sage.combinat.words.paths.**FiniteWordPath_triangle_grid_str**

Bases: *WordDatatype_str*, *FiniteWordPath_triangle_grid*, *FiniteWord_class*

class sage.combinat.words.paths.**FiniteWordPath_triangle_grid_tuple**

Bases: *WordDatatype_tuple*, *FiniteWordPath_triangle_grid*, *FiniteWord_class*

sage.combinat.words.paths.**WordPaths**(*alphabet*, *steps=None*)

Return the combinatorial class of paths of the given type of steps.

INPUT:

- `alphabet` – ordered alphabet
- `steps` – (default: `None`) it can be one of the following:
  - an iterable ordered container of as many vectors as there are letters in the alphabet. The vectors are associated to the letters according to their order in steps. The vectors can be a tuple or anything that can be passed to vector function.
  - an iterable ordered container of k vectors where k is half the size of alphabet. The vectors and their opposites are associated to the letters according to their order in steps (given vectors first, opposite vectors after).
  - `None` – in this case, the type of steps are guessed from the length of alphabet
  - `'square_grid'` or `'square'` – (default when size of alphabet is 4) The order is : East, North, West, South.
  - `'triangle_grid'` or `'triangle'`
  - `'hexagonal_grid'` or `'hexagon'` – (default when size of alphabet is 6)
  - `'cube_grid'` or `'cube'`
  - `'north_east'`, `'ne'` or `'NE'` – (the default when size of alphabet is 2)
  - `'dyck'`

OUTPUT: the combinatorial class of all paths of the given type

EXAMPLES:

The steps can be given explicitly:

```
sage: WordPaths('abc', steps=[(1,2), (-1,4), (0,-3)])
Word Paths over 3 steps
```

```
>>> from sage.all import *
>>> WordPaths('abc', steps=[(Integer(1),Integer(2)), (-Integer(1),Integer(4)),␣
↪(Integer(0),-Integer(3))])
Word Paths over 3 steps
```

Different type of input alphabet:

```
sage: WordPaths(range(3), steps=[(1,2), (-1,4), (0,-3)])
Word Paths over 3 steps
sage: WordPaths(['cric','crac','croc'], steps=[(1,2), (1,4), (0,3)])
Word Paths over 3 steps
```

```
>>> from sage.all import *
>>> WordPaths(range(Integer(3)), steps=[(Integer(1),Integer(2)), (-Integer(1),
↪Integer(4)), (Integer(0),-Integer(3))])
Word Paths over 3 steps
>>> WordPaths(['cric','crac','croc'], steps=[(Integer(1),Integer(2)), (Integer(1),
↪Integer(4)), (Integer(0),Integer(3))])
Word Paths over 3 steps
```

Directions can be in three dimensions as well:

```
sage: WordPaths('ab', steps=[(1,2,2),(-1,4,2)])
Word Paths over 2 steps
```

```
>>> from sage.all import *
>>> WordPaths('ab', steps=[(Integer(1),Integer(2),Integer(2)),(-Integer(1),
↪Integer(4),Integer(2))])
Word Paths over 2 steps
```

When the number of given steps is half the size of alphabet, the opposite of vectors are used:

```
sage: P = WordPaths('abcd', [(1,0), (0,1)])
sage: P
Word Paths over 4 steps
sage: sorted(P.letters_to_steps().items())
[('a', (1, 0)), ('b', (0, 1)), ('c', (-1, 0)), ('d', (0, -1))]
```

```
>>> from sage.all import *
>>> P = WordPaths('abcd', [(Integer(1),Integer(0)), (Integer(0),Integer(1))])
>>> P
Word Paths over 4 steps
>>> sorted(P.letters_to_steps().items())
[('a', (1, 0)), ('b', (0, 1)), ('c', (-1, 0)), ('d', (0, -1))]
```

When no steps are given, default classes are returned:

```
sage: WordPaths('ab')
Word Paths in North and East steps
sage: WordPaths(range(4))
Word Paths on the square grid
sage: WordPaths(range(6))
Word Paths on the hexagonal grid
```

```
>>> from sage.all import *
>>> WordPaths('ab')
Word Paths in North and East steps
>>> WordPaths(range(Integer(4)))
Word Paths on the square grid
>>> WordPaths(range(Integer(6)))
Word Paths on the hexagonal grid
```

There are many type of built-in steps…

On a two letters alphabet:

```
sage: WordPaths('ab', steps='north_east')
Word Paths in North and East steps
sage: WordPaths('()', steps='dyck')
Finite Dyck paths
```

```
>>> from sage.all import *
>>> WordPaths('ab', steps='north_east')
```

(continues on next page)

(continued from previous page)

```
Word Paths in North and East steps
>>> WordPaths('()', steps='dyck')
Finite Dyck paths
```

On a four letters alphabet:

```
sage: WordPaths('ruld', steps='square_grid')
Word Paths on the square grid
```

```
>>> from sage.all import *
>>> WordPaths('ruld', steps='square_grid')
Word Paths on the square grid
```

On a six letters alphabet:

```
sage: WordPaths('abcdef', steps='hexagonal_grid')
Word Paths on the hexagonal grid
sage: WordPaths('abcdef', steps='triangle_grid')
Word Paths on the triangle grid
sage: WordPaths('abcdef', steps='cube_grid')
Word Paths on the cube grid
```

```
>>> from sage.all import *
>>> WordPaths('abcdef', steps='hexagonal_grid')
Word Paths on the hexagonal grid
>>> WordPaths('abcdef', steps='triangle_grid')
Word Paths on the triangle grid
>>> WordPaths('abcdef', steps='cube_grid')
Word Paths on the cube grid
```

class sage.combinat.words.paths.**WordPaths_all**(*alphabet*, *steps*)

Bases: *FiniteWords*

The combinatorial class of all paths, i.e of all words over an alphabet where each letter is mapped to a step (a vector).

letters_to_steps()

Return the dictionary mapping letters to vectors (steps).

EXAMPLES:

```
sage: d = WordPaths('ab').letters_to_steps()
sage: sorted(d.items())
[('a', (0, 1)), ('b', (1, 0))]
sage: d = WordPaths('abcd').letters_to_steps()
sage: sorted(d.items())
[('a', (1, 0)), ('b', (0, 1)), ('c', (-1, 0)), ('d', (0, -1))]
sage: d = WordPaths('abcdef').letters_to_steps()
sage: sorted(d.items())
[('a', (1, 0)),
 ('b', (1/2, 1/2*sqrt3)),
 ('c', (-1/2, 1/2*sqrt3)),
 ('d', (-1, 0)),
```

(continues on next page)

(continued from previous page)

```
 ('e', (-1/2, -1/2*sqrt3)),
 ('f', (1/2, -1/2*sqrt3))]
```

```
>>> from sage.all import *
>>> d = WordPaths('ab').letters_to_steps()
>>> sorted(d.items())
[('a', (0, 1)), ('b', (1, 0))]
>>> d = WordPaths('abcd').letters_to_steps()
>>> sorted(d.items())
[('a', (1, 0)), ('b', (0, 1)), ('c', (-1, 0)), ('d', (0, -1))]
>>> d = WordPaths('abcdef').letters_to_steps()
>>> sorted(d.items())
[('a', (1, 0)),
 ('b', (1/2, 1/2*sqrt3)),
 ('c', (-1/2, 1/2*sqrt3)),
 ('d', (-1, 0)),
 ('e', (-1/2, -1/2*sqrt3)),
 ('f', (1/2, -1/2*sqrt3))]
```

vector_space()

Return the vector space over which the steps of the paths are defined.

EXAMPLES:

```
sage: WordPaths('ab',steps='dyck').vector_space()
Ambient free module of rank 2 over the principal ideal domain Integer Ring
sage: WordPaths('ab',steps='north_east').vector_space()
Ambient free module of rank 2 over the principal ideal domain Integer Ring
sage: WordPaths('abcd',steps='square_grid').vector_space()
Ambient free module of rank 2 over the principal ideal domain Integer Ring
sage: WordPaths('abcdef',steps='hexagonal_grid').vector_space()
Vector space of dimension 2 over Number Field in sqrt3 with defining␣
↪polynomial x^2 - 3 with sqrt3 = 1.732050807568878?
sage: WordPaths('abcdef',steps='cube_grid').vector_space()
Ambient free module of rank 3 over the principal ideal domain Integer Ring
sage: WordPaths('abcdef',steps='triangle_grid').vector_space()
Vector space of dimension 2 over Number Field in sqrt3 with defining␣
↪polynomial x^2 - 3 with sqrt3 = 1.732050807568878?
```

```
>>> from sage.all import *
>>> WordPaths('ab',steps='dyck').vector_space()
Ambient free module of rank 2 over the principal ideal domain Integer Ring
>>> WordPaths('ab',steps='north_east').vector_space()
Ambient free module of rank 2 over the principal ideal domain Integer Ring
>>> WordPaths('abcd',steps='square_grid').vector_space()
Ambient free module of rank 2 over the principal ideal domain Integer Ring
>>> WordPaths('abcdef',steps='hexagonal_grid').vector_space()
Vector space of dimension 2 over Number Field in sqrt3 with defining␣
↪polynomial x^2 - 3 with sqrt3 = 1.732050807568878?
>>> WordPaths('abcdef',steps='cube_grid').vector_space()
Ambient free module of rank 3 over the principal ideal domain Integer Ring
>>> WordPaths('abcdef',steps='triangle_grid').vector_space()
```

(continues on next page)

(continued from previous page)

```
Vector space of dimension 2 over Number Field in sqrt3 with defining␣
↪polynomial x^2 - 3 with sqrt3 = 1.732050807568878?
```

class sage.combinat.words.paths.**WordPaths_cube_grid**(*alphabet*)

Bases: *WordPaths_all*

The combinatorial class of all paths on the cube grid.

class sage.combinat.words.paths.**WordPaths_dyck**(*alphabet*)

Bases: *WordPaths_all*

The combinatorial class of all Dyck paths.

class sage.combinat.words.paths.**WordPaths_hexagonal_grid**(*alphabet*)

Bases: *WordPaths_triangle_grid*

The combinatorial class of all paths on the hexagonal grid.

class sage.combinat.words.paths.**WordPaths_north_east**(*alphabet*)

Bases: *WordPaths_all*

The combinatorial class of all paths using North and East directions.

class sage.combinat.words.paths.**WordPaths_square_grid**(*alphabet*)

Bases: *WordPaths_all*

The combinatorial class of all paths on the square grid.

class sage.combinat.words.paths.**WordPaths_triangle_grid**(*alphabet*)

Bases: *WordPaths_all*

The combinatorial class of all paths on the triangle grid.

C-finite sequences

C-finite infinite sequences satisfy homogeneous linear recurrences with constant coefficients:

$$a_{n+d} = c_0 a_n + c_1 a_{n+1} + \cdots + c_{d-1} a_{n+d-1}, \quad d > 0.$$

They are completely defined by their ordinary generating function (o.g.f., which is always a `fraction` of `polynomials` over **Z** or **Q**).

EXAMPLES:

```
sage: fibo = CFiniteSequence(x/(1-x-x^2))        # the Fibonacci sequence
sage: fibo
C-finite sequence, generated by -x/(x^2 + x - 1)
sage: fibo.parent()
The ring of C-Finite sequences in x over Rational Field
sage: fibo.parent().category()
Category of commutative rings
sage: C.<x> = CFiniteSequences(QQ)
sage: fibo.parent() == C
True
sage: C
```

(continues on next page)

(continued from previous page)

```
The ring of C-Finite sequences in x over Rational Field
sage: C(x/(1-x-x^2))
C-finite sequence, generated by -x/(x^2 + x - 1)
sage: C(x/(1-x-x^2)) == fibo
True
sage: var('y')
y
sage: CFiniteSequence(y/(1-y-y^2))
C-finite sequence, generated by -y/(y^2 + y - 1)
sage: CFiniteSequence(y/(1-y-y^2)) == fibo
False
```

```
>>> from sage.all import *
>>> fibo = CFiniteSequence(x/(Integer(1)-x-x**Integer(2)))        # the Fibonacci␣
↪sequence
>>> fibo
C-finite sequence, generated by -x/(x^2 + x - 1)
>>> fibo.parent()
The ring of C-Finite sequences in x over Rational Field
>>> fibo.parent().category()
Category of commutative rings
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> fibo.parent() == C
True
>>> C
The ring of C-Finite sequences in x over Rational Field
>>> C(x/(Integer(1)-x-x**Integer(2)))
C-finite sequence, generated by -x/(x^2 + x - 1)
>>> C(x/(Integer(1)-x-x**Integer(2))) == fibo
True
>>> var('y')
y
>>> CFiniteSequence(y/(Integer(1)-y-y**Integer(2)))
C-finite sequence, generated by -y/(y^2 + y - 1)
>>> CFiniteSequence(y/(Integer(1)-y-y**Integer(2))) == fibo
False
```

Finite subsets of the sequence are accessible via python slices:

```
sage: fibo[137]                 #the 137th term of the Fibonacci sequence
19134702400093278081449423917
sage: fibo[137] == fibonacci(137)
True
sage: fibo[0:12]
[0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89]
sage: fibo[14:4:-2]
[377, 144, 55, 21, 8]
```

```
>>> from sage.all import *
>>> fibo[Integer(137)]                 #the 137th term of the Fibonacci sequence
19134702400093278081449423917
>>> fibo[Integer(137)] == fibonacci(Integer(137))
```

(continues on next page)

(continued from previous page)

```
True
>>> fibo[Integer(0):Integer(12)]
[0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89]
>>> fibo[Integer(14):Integer(4):-Integer(2)]
[377, 144, 55, 21, 8]
```

They can be created also from the coefficients and start values of a recurrence:

```
sage: r = C.from_recurrence([1,1],[0,1])
sage: r == fibo
True
```

```
>>> from sage.all import *
>>> r = C.from_recurrence([Integer(1),Integer(1)],[Integer(0),Integer(1)])
>>> r == fibo
True
```

Given enough values, the o.g.f. of a C-finite sequence can be guessed:

```
sage: r = C.guess([0,1,1,2,3,5,8])
sage: r == fibo
True
```

```
>>> from sage.all import *
>>> r = C.guess([Integer(0),Integer(1),Integer(1),Integer(2),Integer(3),Integer(5),
↪Integer(8)])
>>> r == fibo
True
```

- Ralf Stephan (2014): initial version

class sage.rings.cfinite_sequence.**CFiniteSequence**(*parent*, *ogf*)

Bases: FieldElement

Create a C-finite sequence given its ordinary generating function.

INPUT:

- ogf – a rational function, the ordinary generating function (can be an element from the symbolic ring, fraction field or polynomial ring)

OUTPUT: a CFiniteSequence object

EXAMPLES:

```
sage: CFiniteSequence((2-x)/(1-x-x^2))      # the Lucas sequence
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
sage: CFiniteSequence(x/(1-x)^3)            # triangular numbers
C-finite sequence, generated by -x/(x^3 - 3*x^2 + 3*x - 1)
```

```
>>> from sage.all import *
>>> CFiniteSequence((Integer(2)-x)/(Integer(1)-x-x**Integer(2)))      # the Lucas␣
↪sequence
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
>>> CFiniteSequence(x/(Integer(1)-x)**Integer(3))            # triangular numbers
C-finite sequence, generated by -x/(x^3 - 3*x^2 + 3*x - 1)
```

Polynomials are interpreted as finite sequences, or recurrences of degree 0:

```
sage: CFiniteSequence(x^2-4*x^5)
Finite sequence [1, 0, 0, -4], offset = 2
sage: CFiniteSequence(1)
Finite sequence [1], offset = 0
```

```
>>> from sage.all import *
>>> CFiniteSequence(x**Integer(2)-Integer(4)*x**Integer(5))
Finite sequence [1, 0, 0, -4], offset = 2
>>> CFiniteSequence(Integer(1))
Finite sequence [1], offset = 0
```

This implementation allows any polynomial fraction as o.g.f. by interpreting any power of x dividing the o.g.f. numerator or denominator as a right or left shift of the sequence offset:

```
sage: CFiniteSequence(x^2+3/x)
Finite sequence [3, 0, 0, 1], offset = -1
sage: CFiniteSequence(1/x+4/x^3)
Finite sequence [4, 0, 1], offset = -3
sage: P = LaurentPolynomialRing(QQ.fraction_field(), 'X')
sage: X=P.gen()
sage: CFiniteSequence(1/(1-X))
C-finite sequence, generated by -1/(X - 1)
```

```
>>> from sage.all import *
>>> CFiniteSequence(x**Integer(2)+Integer(3)/x)
Finite sequence [3, 0, 0, 1], offset = -1
>>> CFiniteSequence(Integer(1)/x+Integer(4)/x**Integer(3))
Finite sequence [4, 0, 1], offset = -3
>>> P = LaurentPolynomialRing(QQ.fraction_field(), 'X')
>>> X=P.gen()
>>> CFiniteSequence(Integer(1)/(Integer(1)-X))
C-finite sequence, generated by -1/(X - 1)
```

The o.g.f. is always normalized to get a denominator constant coefficient of $+1$:

```
sage: CFiniteSequence(1/(x-2))
C-finite sequence, generated by 1/(x - 2)
```

```
>>> from sage.all import *
>>> CFiniteSequence(Integer(1)/(x-Integer(2)))
C-finite sequence, generated by 1/(x - 2)
```

The given `ogf` is used to create an appropriate parent: it can be a symbolic expression, a polynomial , or a fraction field element as long as it can be coerced into a proper fraction field over the rationals:

```
sage: var('x')
x
sage: f1 = CFiniteSequence((2-x)/(1-x-x^2))
sage: P.<x> = QQ[]
sage: f2 = CFiniteSequence((2-x)/(1-x-x^2))
sage: f1 == f2
True
sage: f1.parent()
The ring of C-Finite sequences in x over Rational Field
sage: f1.ogf().parent()
Fraction Field of Univariate Polynomial Ring in x over Rational Field
sage: CFiniteSequence(log(x))
Traceback (most recent call last):
```

(continues on next page)

(continued from previous page)

```
...
TypeError: unable to convert log(x) to a rational
```

```
>>> from sage.all import *
>>> var('x')
x
>>> f1 = CFiniteSequence((Integer(2)-x)/(Integer(1)-x-x**Integer(2)))
>>> P = QQ['x']; (x,) = P._first_ngens(1)
>>> f2 = CFiniteSequence((Integer(2)-x)/(Integer(1)-x-x**Integer(2)))
>>> f1 == f2
True
>>> f1.parent()
The ring of C-Finite sequences in x over Rational Field
>>> f1.ogf().parent()
Fraction Field of Univariate Polynomial Ring in x over Rational Field
>>> CFiniteSequence(log(x))
Traceback (most recent call last):
...
TypeError: unable to convert log(x) to a rational
```

closed_form(*n='n'*)

Return a symbolic expression in `n`, which equals the n-th term of the sequence.

It is a well-known property of C-finite sequences `a_n` that they have a closed form of the type:

$$a_n = \sum_{i=1}^{d} c_i(n) \cdot r_i^n,$$

where `r_i` are the roots of the characteristic equation and `c_i(n)` is a polynomial (whose degree equals the multiplicity of `r_i` minus one). This is a natural generalization of Binet's formula for Fibonacci numbers. See, for instance, [KP2011, Theorem 4.1].

Note that if the o.g.f. has a polynomial part, that is, if the numerator degree is not strictly less than the denominator degree, then this closed form holds only when `n` exceeds the degree of that polynomial part. In that case, the returned expression will differ from the sequence for small `n`.

EXAMPLES:

```
sage: CFiniteSequence(1/(1-x)).closed_form()
1
sage: CFiniteSequence(x^2/(1-x)).closed_form()
1
sage: CFiniteSequence(1/(1-x^2)).closed_form()
1/2*(-1)^n + 1/2
sage: CFiniteSequence(1/(1+x^3)).closed_form()
1/3*(-1)^n + 1/3*(1/2*I*sqrt(3) + 1/2)^n + 1/3*(-1/2*I*sqrt(3) + 1/2)^n
sage: CFiniteSequence(1/(1-x)/(1-2*x)/(1-3*x)).closed_form()
9/2*3^n - 4*2^n + 1/2
```

```
>>> from sage.all import *
>>> CFiniteSequence(Integer(1)/(Integer(1)-x)).closed_form()
1
>>> CFiniteSequence(x**Integer(2)/(Integer(1)-x)).closed_form()
```

(continues on next page)

(continued from previous page)

```
1
>>> CFiniteSequence(Integer(1)/(Integer(1)-x**Integer(2))).closed_form()
1/2*(-1)^n + 1/2
>>> CFiniteSequence(Integer(1)/(Integer(1)+x**Integer(3))).closed_form()
1/3*(-1)^n + 1/3*(1/2*I*sqrt(3) + 1/2)^n + 1/3*(-1/2*I*sqrt(3) + 1/2)^n
>>> CFiniteSequence(Integer(1)/(Integer(1)-x)/(Integer(1)-Integer(2)*x)/
↪(Integer(1)-Integer(3)*x)).closed_form()
9/2*3^n - 4*2^n + 1/2
```

Binet's formula for the Fibonacci numbers:

```
sage: CFiniteSequence(x/(1-x-x^2)).closed_form()
sqrt(1/5)*(1/2*sqrt(5) + 1/2)^n - sqrt(1/5)*(-1/2*sqrt(5) + 1/2)^n
sage: [_.subs(n=k).full_simplify() for k in range(6)]
[0, 1, 1, 2, 3, 5]

sage: CFiniteSequence((4*x+3)/(1-2*x-5*x^2)).closed_form()
1/2*(sqrt(6) + 1)^n*(7*sqrt(1/6) + 3) - 1/2*(-sqrt(6) + 1)^n*(7*sqrt(1/6) - 3)
```

```
>>> from sage.all import *
>>> CFiniteSequence(x/(Integer(1)-x-x**Integer(2))).closed_form()
sqrt(1/5)*(1/2*sqrt(5) + 1/2)^n - sqrt(1/5)*(-1/2*sqrt(5) + 1/2)^n
>>> [_.subs(n=k).full_simplify() for k in range(Integer(6))]
[0, 1, 1, 2, 3, 5]

>>> CFiniteSequence((Integer(4)*x+Integer(3))/(Integer(1)-Integer(2)*x-
↪Integer(5)*x**Integer(2))).closed_form()
1/2*(sqrt(6) + 1)^n*(7*sqrt(1/6) + 3) - 1/2*(-sqrt(6) + 1)^n*(7*sqrt(1/6) - 3)
```

Examples with multiple roots:

```
sage: CFiniteSequence(x*(x^2+4*x+1)/(1-x)^5).closed_form()
1/4*n^4 + 1/2*n^3 + 1/4*n^2
sage: CFiniteSequence((1+2*x-x^2)/(1-x)^4/(1+x)^2).closed_form()
1/12*n^3 - 1/8*(-1)^n*(n + 1) + 3/4*n^2 + 43/24*n + 9/8
sage: CFiniteSequence(1/(1-x)^3/(1-2*x)^4).closed_form()
4/3*(n^3 - 3*n^2 + 20*n - 36)*2^n + 1/2*n^2 + 19/2*n + 49
sage: CFiniteSequence((x/(1-x-x^2))^2).closed_form()
1/5*(n - sqrt(1/5))*(1/2*sqrt(5) + 1/2)^n + 1/5*(n + sqrt(1/5))*(-1/2*sqrt(5)␣
↪+ 1/2)^n
```

```
>>> from sage.all import *
>>> CFiniteSequence(x*(x**Integer(2)+Integer(4)*x+Integer(1))/(Integer(1)-
↪x)**Integer(5)).closed_form()
1/4*n^4 + 1/2*n^3 + 1/4*n^2
>>> CFiniteSequence((Integer(1)+Integer(2)*x-x**Integer(2))/(Integer(1)-
↪x)**Integer(4)/(Integer(1)+x)**Integer(2)).closed_form()
1/12*n^3 - 1/8*(-1)^n*(n + 1) + 3/4*n^2 + 43/24*n + 9/8
>>> CFiniteSequence(Integer(1)/(Integer(1)-x)**Integer(3)/(Integer(1)-
↪Integer(2)*x)**Integer(4)).closed_form()
4/3*(n^3 - 3*n^2 + 20*n - 36)*2^n + 1/2*n^2 + 19/2*n + 49
>>> CFiniteSequence((x/(Integer(1)-x-x**Integer(2)))**Integer(2)).closed_
```

(continues on next page)

(continued from previous page)

```
↪form()
1/5*(n - sqrt(1/5))*(1/2*sqrt(5) + 1/2)^n + 1/5*(n + sqrt(1/5))*(-1/2*sqrt(5)␣
↪+ 1/2)^n
```

coefficients()

Return the coefficients of the recurrence representation of the C-finite sequence.

OUTPUT: list of values

EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: lucas = C((2-x)/(1-x-x^2))    # the Lucas sequence
sage: lucas.coefficients()
[1, 1]
```

```
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> lucas = C((Integer(2)-x)/(Integer(1)-x-x**Integer(2)))    # the Lucas␣
↪sequence
>>> lucas.coefficients()
[1, 1]
```

denominator()

Return the numerator of the o.g.f of `self`.

EXAMPLES:

```
sage: f = CFiniteSequence((2-x)/(1-x-x^2)); f
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
sage: f.denominator()
x^2 + x - 1
```

```
>>> from sage.all import *
>>> f = CFiniteSequence((Integer(2)-x)/(Integer(1)-x-x**Integer(2))); f
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
>>> f.denominator()
x^2 + x - 1
```

numerator()

Return the numerator of the o.g.f of `self`.

EXAMPLES:

```
sage: f = CFiniteSequence((2-x)/(1-x-x^2)); f
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
sage: f.numerator()
x - 2
```

```
>>> from sage.all import *
>>> f = CFiniteSequence((Integer(2)-x)/(Integer(1)-x-x**Integer(2))); f
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
>>> f.numerator()
x - 2
```

ogf()

Return the ordinary generating function associated with the CFiniteSequence.

This is always a fraction of polynomials in the base ring.

EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: r = C.from_recurrence([2],[1])
sage: r.ogf()
-1/2/(x - 1/2)
sage: C(0).ogf()
0
```

```
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> r = C.from_recurrence([Integer(2)],[Integer(1)])
>>> r.ogf()
-1/2/(x - 1/2)
>>> C(Integer(0)).ogf()
0
```

recurrence_repr()

Return a string with the recurrence representation of the C-finite sequence.

OUTPUT: string

EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: C((2-x)/(1-x-x^2)).recurrence_repr()
'homogeneous linear recurrence with constant coefficients of degree 2: a(n+2)␣
↪= a(n+1) + a(n), starting a(0...) = [2, 1]'
sage: C(x/(1-x)^3).recurrence_repr()
'homogeneous linear recurrence with constant coefficients of degree 3: a(n+3)␣
↪= 3*a(n+2) - 3*a(n+1) + a(n), starting a(1...) = [1, 3, 6]'
sage: C(1).recurrence_repr()
'Finite sequence [1], offset 0'
sage: r = C((-2*x^3 + x^2 - x + 1)/(2*x^2 - 3*x + 1))
sage: r.recurrence_repr()
'homogeneous linear recurrence with constant coefficients of degree 2: a(n+2)␣
↪= 3*a(n+1) - 2*a(n), starting a(0...) = [1, 2, 5, 9]'
sage: r = CFiniteSequence(x^3/(1-x-x^2))
sage: r.recurrence_repr()
'homogeneous linear recurrence with constant coefficients of degree 2: a(n+2)␣
↪= a(n+1) + a(n), starting a(3...) = [1, 1, 2, 3]'
```

```
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> C((Integer(2)-x)/(Integer(1)-x-x**Integer(2))).recurrence_repr()
'homogeneous linear recurrence with constant coefficients of degree 2: a(n+2)␣
↪= a(n+1) + a(n), starting a(0...) = [2, 1]'
>>> C(x/(Integer(1)-x)**Integer(3)).recurrence_repr()
'homogeneous linear recurrence with constant coefficients of degree 3: a(n+3)␣
↪= 3*a(n+2) - 3*a(n+1) + a(n), starting a(1...) = [1, 3, 6]'
```

(continues on next page)

(continued from previous page)

```
>>> C(Integer(1)).recurrence_repr()
'Finite sequence [1], offset 0'
>>> r = C((-Integer(2)*x**Integer(3) + x**Integer(2) - x + Integer(1))/
↪(Integer(2)*x**Integer(2) - Integer(3)*x + Integer(1)))
>>> r.recurrence_repr()
'homogeneous linear recurrence with constant coefficients of degree 2: a(n+2)␣
↪= 3*a(n+1) - 2*a(n), starting a(0...) = [1, 2, 5, 9]'
>>> r = CFiniteSequence(x**Integer(3)/(Integer(1)-x-x**Integer(2)))
>>> r.recurrence_repr()
'homogeneous linear recurrence with constant coefficients of degree 2: a(n+2)␣
↪= a(n+1) + a(n), starting a(3...) = [1, 1, 2, 3]'
```

series(*n*)

Return the Laurent power series associated with the CFiniteSequence, with precision n.

INPUT:

- `n` – nonnegative integer

EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: r = C.from_recurrence([-1,2],[0,1])
sage: s = r.series(4); s
x + 2*x^2 + 3*x^3 + 4*x^4 + O(x^5)
sage: type(s)
<class 'sage.rings.laurent_series_ring_element.LaurentSeries'>
```

```
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> r = C.from_recurrence([-Integer(1),Integer(2)],[Integer(0),Integer(1)])
>>> s = r.series(Integer(4)); s
x + 2*x^2 + 3*x^3 + 4*x^4 + O(x^5)
>>> type(s)
<class 'sage.rings.laurent_series_ring_element.LaurentSeries'>
```

sage.rings.cfinite_sequence.**CFiniteSequences**(*base_ring*, *names=None*, *category=None*)

Return the commutative ring of C-Finite sequences.

The ring is defined over a base ring (**Z** or **Q**) and each element is represented by its ordinary generating function (ogf) which is a rational function over the base ring.

INPUT:

- `base_ring` – the base ring to construct the fraction field representing the C-Finite sequences
- `names` – (optional) the list of variables

EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: C
The ring of C-Finite sequences in x over Rational Field
sage: C.an_element()
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
sage: C.category()
```

(continues on next page)

(continued from previous page)

```
Category of commutative rings
sage: C.one()
Finite sequence [1], offset = 0
sage: C.zero()
Constant infinite sequence 0.
sage: C(x)
Finite sequence [1], offset = 1
sage: C(1/x)
Finite sequence [1], offset = -1
sage: C((-x + 2)/(-x^2 - x + 1))
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
```

```
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> C
The ring of C-Finite sequences in x over Rational Field
>>> C.an_element()
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
>>> C.category()
Category of commutative rings
>>> C.one()
Finite sequence [1], offset = 0
>>> C.zero()
Constant infinite sequence 0.
>>> C(x)
Finite sequence [1], offset = 1
>>> C(Integer(1)/x)
Finite sequence [1], offset = -1
>>> C((-x + Integer(2))/(-x**Integer(2) - x + Integer(1)))
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
```

class sage.rings.cfinite_sequence.**CFiniteSequences_generic**(*polynomial_ring*, *category*)

Bases: Parent, UniqueRepresentation

The class representing the ring of C-Finite Sequences.

Element

alias of *CFiniteSequence*

an_element()

Return an element of C-Finite Sequences.

OUTPUT: the Lucas sequence

EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: C.an_element()
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
```

```
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> C.an_element()
C-finite sequence, generated by (x - 2)/(x^2 + x - 1)
```

fraction_field()

Return the fraction field used to represent the elements of `self`.

EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: C.fraction_field()
Fraction Field of Univariate Polynomial Ring in x over Rational Field
```

```
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> C.fraction_field()
Fraction Field of Univariate Polynomial Ring in x over Rational Field
```

from_recurrence(*coefficients*, *values*)

Create a C-finite sequence given the coefficients c and starting values a of a homogeneous linear recurrence.

$$a_{n+d} = c_0 a_n + c_1 a_{n+1} + \cdots + c_{d-1} a_{n+d-1}, \quad d \geq 0.$$

INPUT:

- `coefficients` – list of rationals
- `values` – start values, a list of rationals

OUTPUT: a CFiniteSequence object

EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: C.from_recurrence([1,1],[0,1])   # Fibonacci numbers
C-finite sequence, generated by -x/(x^2 + x - 1)
sage: C.from_recurrence([-1,2],[0,1])    # natural numbers
C-finite sequence, generated by x/(x^2 - 2*x + 1)
sage: r = C.from_recurrence([-1],[1])
sage: s = C.from_recurrence([-1],[1,-1])
sage: r == s
True
sage: r = C(x^3/(1-x-x^2))
sage: s = C.from_recurrence([1,1],[0,0,0,1,1])
sage: r == s
True
sage: C.from_recurrence(1,1)
Traceback (most recent call last):
...
ValueError: Wrong type for recurrence coefficient list.
```

```
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> C.from_recurrence([Integer(1),Integer(1)],[Integer(0),Integer(1)])   #␣
↪Fibonacci numbers
C-finite sequence, generated by -x/(x^2 + x - 1)
>>> C.from_recurrence([-Integer(1),Integer(2)],[Integer(0),Integer(1)])    #␣
↪natural numbers
C-finite sequence, generated by x/(x^2 - 2*x + 1)
```

(continues on next page)

(continued from previous page)

```
>>> r = C.from_recurrence([-Integer(1)],[Integer(1)])
>>> s = C.from_recurrence([-Integer(1)],[Integer(1),-Integer(1)])
>>> r == s
True
>>> r = C(x**Integer(3)/(Integer(1)-x-x**Integer(2)))
>>> s = C.from_recurrence([Integer(1),Integer(1)],[Integer(0),Integer(0),
↪Integer(0),Integer(1),Integer(1)])
>>> r == s
True
>>> C.from_recurrence(Integer(1),Integer(1))
Traceback (most recent call last):
...
ValueError: Wrong type for recurrence coefficient list.
```

gen(*i=0*)

Return the i-th generator of `self`.

INPUT:

- `i` – integer (default: 0)

EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: C.gen()
x
sage: x == C.gen()
True
```

```
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> C.gen()
x
>>> x == C.gen()
True
```

gens()

Return the generators of `self`.

EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: C.gens()
(x,)
```

```
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> C.gens()
(x,)
```

guess(*sequence*, *algorithm='sage'*)

Return the minimal CFiniteSequence that generates the sequence.

Assume the first value has index 0.

INPUT:

- `sequence` – list of integers
- `algorithm` – string; one of - `'sage'` – the default is to use Sage's matrix kernel function - `'pari'` – use Pari's implementation of LLL - `'bm'` – use Sage's Berlekamp-Massey algorithm

OUTPUT: a CFiniteSequence, or 0 if none could be found

With the default kernel method, trailing zeroes are chopped off before a guessing attempt. This may reduce the data below the accepted length of six values.

EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: C.guess([1,2,4,8,16,32])
C-finite sequence, generated by -1/2/(x - 1/2)
sage: r = C.guess([1,2,3,4,5])
Traceback (most recent call last):
...
ValueError: sequence too short for guessing
```

```
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> C.guess([Integer(1),Integer(2),Integer(4),Integer(8),Integer(16),
↪Integer(32)])
C-finite sequence, generated by -1/2/(x - 1/2)
>>> r = C.guess([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)])
Traceback (most recent call last):
...
ValueError: sequence too short for guessing
```

With Berlekamp-Massey, if an odd number of values is given, the last one is dropped. So with an odd number of values the result may not generate the last value:

```
sage: r = C.guess([1,2,4,8,9], algorithm='bm'); r
C-finite sequence, generated by -1/2/(x - 1/2)
sage: r[0:5]
[1, 2, 4, 8, 16]
```

```
>>> from sage.all import *
>>> r = C.guess([Integer(1),Integer(2),Integer(4),Integer(8),Integer(9)],␣
↪algorithm='bm'); r
C-finite sequence, generated by -1/2/(x - 1/2)
>>> r[Integer(0):Integer(5)]
[1, 2, 4, 8, 16]
```

Using pari:

```
sage: r = C.guess([1, 1, 1, 2, 2, 3, 4, 5, 7, 9, 12, 16, 21, 28], algorithm=
↪'pari'); r
C-finite sequence, generated by (-x - 1)/(x^3 + x^2 - 1)
sage: r[0:5]
[1, 1, 1, 2, 2]
```

```
>>> from sage.all import *
>>> r = C.guess([Integer(1), Integer(1), Integer(1), Integer(2), Integer(2),␣
↪Integer(3), Integer(4), Integer(5), Integer(7), Integer(9), Integer(12),␣
↪Integer(16), Integer(21), Integer(28)], algorithm='pari'); r
C-finite sequence, generated by (-x - 1)/(x^3 + x^2 - 1)
>>> r[Integer(0):Integer(5)]
[1, 1, 1, 2, 2]
```

ngens()

Return the number of generators of `self`.

EXAMPLES:

```
sage: from sage.rings.cfinite_sequence import CFiniteSequences
sage: C.<x> = CFiniteSequences(QQ)
sage: C.ngens()
1
```

```
>>> from sage.all import *
>>> from sage.rings.cfinite_sequence import CFiniteSequences
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> C.ngens()
1
```

polynomial_ring()

Return the polynomial ring used to represent the elements of `self`.

EXAMPLES:

```
sage: C.<x> = CFiniteSequences(QQ)
sage: C.polynomial_ring()
Univariate Polynomial Ring in x over Rational Field
```

```
>>> from sage.all import *
>>> C = CFiniteSequences(QQ, names=('x',)); (x,) = C._first_ngens(1)
>>> C.polynomial_ring()
Univariate Polynomial Ring in x over Rational Field
```

Lazy Combinatorial Species

We regard a combinatorial species as a sequence of group actions of the symmetric groups $\mathfrak{S}_n$, for $n \in \mathbf{N}$.

Coefficients of lazy species are computed on demand. They have infinite precision, although equality can only be decided in special cases.

AUTHORS:

- Mainak Roy, Martin Rubey, Travis Scrimshaw (2024-2025)

EXAMPLES:

We can reproduce the molecular expansions from Appendix B in [GL2011] with little effort. The molecular expansion of the species of point determining graphs can be computed as the species of graphs composed with the compositional inverse of the species of non-empty sets:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: E = L.Sets()
sage: Ep = E.restrict(1)
sage: G = L.Graphs()
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> E = L.Sets()
>>> Ep = E.restrict(Integer(1))
>>> G = L.Graphs()
```

The molecular decomposition begins with:

```
sage: P = G(Ep.revert())
sage: P.truncate(6)
1 + X + E_2 + (E_3+X*E_2) + (E_4+X*E_3+E_2(E_2)+X^2*E_2+E_2(X^2))
+ (E_5+E_2*E_3+X*E_4+X*E_2^2+X^2*E_3+2*X*E_2(E_2)+P_5+5*X*E_2(X^2)+3*X^3*E_2)
```

```
>>> from sage.all import *
>>> P = G(Ep.revert())
>>> P.truncate(Integer(6))
1 + X + E_2 + (E_3+X*E_2) + (E_4+X*E_3+E_2(E_2)+X^2*E_2+E_2(X^2))
+ (E_5+E_2*E_3+X*E_4+X*E_2^2+X^2*E_3+2*X*E_2(E_2)+P_5+5*X*E_2(X^2)+3*X^3*E_2)
```

Note that [GL2011] write D_5 instead of P_5, and there is apparently a misprint: $XE_2(E_2) + 4X^3E_2$ should be $2XE_2(E_2) + 3X^3E_2$.

To compute the molecular decomposition of the species of connected graphs with no endpoints, we use Equation (3.3) in [GL2011]. Before that we need to define the species of connected graphs:

```
sage: Gc = Ep.revert()(G-1)
sage: E_2 = L(SymmetricGroup(2))
sage: Mc = Gc(X*E(-X)) + E_2(-X)
sage: E(Mc).truncate(5)
1 + X + E_2 + 2*E_3 + (2*E_4+E_2(E_2)+E_2^2+X*E_3)
```

```
>>> from sage.all import *
>>> Gc = Ep.revert()(G-Integer(1))
>>> E_2 = L(SymmetricGroup(Integer(2)))
>>> Mc = Gc(X*E(-X)) + E_2(-X)
>>> E(Mc).truncate(Integer(5))
1 + X + E_2 + 2*E_3 + (2*E_4+E_2(E_2)+E_2^2+X*E_3)
```

Note that [GL2011] apparently contains a misprint: $2XE_3$ should be $XE_3 + E_2^2$. Indeed, the graphs on four vertices without endpoints are the complete graph and the empty graph, the square, the diamond graph and the triangle with an extra isolated vertex.

To compute the molecular decomposition of the species of bi-point-determining graphs we use Corollary (4.6) in [GL2011]:

```
sage: B = G(2*Ep.revert() - X)
sage: B.truncate(6)
1 + X + E_2(X^2) + (P_5+5*X*E_2(X^2))
```

```
>>> from sage.all import *
>>> B = G(Integer(2)*Ep.revert() - X)
>>> B.truncate(Integer(6))
1 + X + E_2(X^2) + (P_5+5*X*E_2(X^2))
```

class sage.rings.lazy_species.**ArithmeticProductSpeciesElement**(F, G)

Bases: *LazyCombinatorialSpeciesElement*

Initialize the arithmetic product of species.

generating_series()

Return the (exponential) generating series of `self`.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: E = L.Sets()
sage: Ep = E.restrict(1)
sage: Ep.arithmetic_product(Ep).generating_series()
X + X^2 + 1/3*X^3 + 1/3*X^4 + 1/60*X^5 + 61/360*X^6 + O(X^7)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> E = L.Sets()
>>> Ep = E.restrict(Integer(1))
>>> Ep.arithmetic_product(Ep).generating_series()
X + X^2 + 1/3*X^3 + 1/3*X^4 + 1/60*X^5 + 61/360*X^6 + O(X^7)
```

We check Example 2.2 from [MM2008]:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: C = L.Cycles()
sage: Lp = X/(1 - X)
sage: C.arithmetic_product(Lp).generating_series()
X + 3/2*X^2 + 4/3*X^3 + 7/4*X^4 + 6/5*X^5 + 2*X^6 + O(X^7)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> C = L.Cycles()
>>> Lp = X/(Integer(1) - X)
>>> C.arithmetic_product(Lp).generating_series()
X + 3/2*X^2 + 4/3*X^3 + 7/4*X^4 + 6/5*X^5 + 2*X^6 + O(X^7)
```

structures(*labels*)

Iterate over the structures on the given set of labels.

This uses the rectangle description of the arithmetic product [MM2008].

EXAMPLES:

A rectangle is a structure in the arithmetic product of non-empty sets with itself. Arranging the blocks of the first set partition in rows, and the blocks of the second in columns, two rectangles are equal if one can be obtained from the other by permuting rows and columns.:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: E = L.Sets()
sage: R = E.arithmetic_product(E)
sage: list(R.structures([1, 2, 3, 4]))
[(((1, 2, 3, 4),), ((1,), (2,), (3,), (4,))),
 (((1, 2), (3, 4)), ((1, 3), (2, 4))),
 (((1, 2), (3, 4)), ((1, 4), (2, 3))),
 (((1, 4), (2, 3)), ((1, 2), (4, 3))),
 (((1, 4), (2, 3)), ((1, 3), (4, 2))),
 (((1, 3), (2, 4)), ((1, 2), (3, 4))),
 (((1, 3), (2, 4)), ((1, 4), (3, 2))),
 (((1,), (2,), (3,), (4,)), ((1, 2, 3, 4),))]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> E = L.Sets()
>>> R = E.arithmetic_product(E)
>>> list(R.structures([Integer(1), Integer(2), Integer(3), Integer(4)]))
[(((1, 2, 3, 4),), ((1,), (2,), (3,), (4,))),
 (((1, 2), (3, 4)), ((1, 3), (2, 4))),
 (((1, 2), (3, 4)), ((1, 4), (2, 3))),
 (((1, 4), (2, 3)), ((1, 2), (4, 3))),
 (((1, 4), (2, 3)), ((1, 3), (4, 2))),
 (((1, 3), (2, 4)), ((1, 2), (3, 4))),
 (((1, 3), (2, 4)), ((1, 4), (3, 2))),
 (((1,), (2,), (3,), (4,)), ((1, 2, 3, 4),))]
```

The arithmetic product can be regarded as an assembly of cloned structures. The structures corresponding to the rows are all isomorphic:

```
sage: E2 = E.restrict(2,2)
sage: list(E2.arithmetic_product(E2+X^2).structures([1, 2, 3, 4]))[:3]
[(((1, 2), (3, 4)), (((1, 3), (2, 4)), 'left')),
 (((1, 2), (3, 4)), ((X^2, (((2, 4),), ((1, 3),))), 'right')),
 (((1, 2), (3, 4)), ((X^2, (((1, 3),), ((2, 4),))), 'right'))]
```

```
>>> from sage.all import *
>>> E2 = E.restrict(Integer(2),Integer(2))
>>> list(E2.arithmetic_product(E2+X**Integer(2)).structures([Integer(1),␣
↪Integer(2), Integer(3), Integer(4)]))[:Integer(3)]
[(((1, 2), (3, 4)), (((1, 3), (2, 4)), 'left')),
 (((1, 2), (3, 4)), ((X^2, (((2, 4),), ((1, 3),))), 'right')),
 (((1, 2), (3, 4)), ((X^2, (((1, 3),), ((2, 4),))), 'right'))]
```

When the number of labels is prime, the rectangle is either a single row or a single column:

```
sage: C = L.Cycles()
sage: A = E.arithmetic_product(C)
sage: list(A.structures([1, 2, 3]))
[(((1, 2, 3),), ((1,), (2,), (3,))),
 (((1, 2, 3),), ((1,), (3,), (2,))),
 (((1,), (2,), (3,)), ((1, 2, 3),))]
```

```
>>> from sage.all import *
>>> C = L.Cycles()
>>> A = E.arithmetic_product(C)
>>> list(A.structures([Integer(1), Integer(2), Integer(3)]))
[(((1, 2, 3),), ((1,), (2,), (3,))),
 (((1, 2, 3),), ((1,), (3,), (2,))),
 (((1,), (2,), (3,)), ((1, 2, 3),))]
```

class sage.rings.lazy_species.**ChainSpecies**(*parent*)

Bases: *LazyCombinatorialSpeciesElement*, UniqueRepresentation

Initialize the species of chains.

cycle_index_series()

Return the cycle index series of the species of chains.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: L.Chains().cycle_index_series()[3]
1/2*p[1, 1, 1] + 1/2*p[2, 1]
sage: L.Chains().cycle_index_series()[4]
1/2*p[1, 1, 1, 1] + 1/2*p[2, 2]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> L.Chains().cycle_index_series()[Integer(3)]
1/2*p[1, 1, 1] + 1/2*p[2, 1]
>>> L.Chains().cycle_index_series()[Integer(4)]
1/2*p[1, 1, 1, 1] + 1/2*p[2, 2]
```

generating_series()

Return the (exponential) generating series of the species of chains.

This is $(1/(1-x)+1+x)/2$.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: L.Chains().generating_series().truncate(7)
1 + X + 1/2*X^2 + 1/2*X^3 + 1/2*X^4 + 1/2*X^5 + 1/2*X^6
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> L.Chains().generating_series().truncate(Integer(7))
1 + X + 1/2*X^2 + 1/2*X^3 + 1/2*X^4 + 1/2*X^5 + 1/2*X^6
```

isotype_generating_series()

Return the isotype generating series of the species of chains.

This is the geometric series '1/(1-x)'.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: L.Chains().isotype_generating_series().truncate(4)
1 + X + X^2 + X^3
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> L.Chains().isotype_generating_series().truncate(Integer(4))
1 + X + X^2 + X^3
```

structures(*labels*)

Iterate over the structures on the given set of labels.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(ZZ, "X")
sage: Ch = L.Chains()
sage: list(Ch.structures([1,2,3]))
[(1, 3, 2), (1, 2, 3), (2, 1, 3)]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(ZZ, "X")
>>> Ch = L.Chains()
>>> list(Ch.structures([Integer(1),Integer(2),Integer(3)]))
[(1, 3, 2), (1, 2, 3), (2, 1, 3)]
```

class sage.rings.lazy_species.**CompositionSpeciesElement**(*left*, **args*)

Bases: *LazyCombinatorialSpeciesElementGeneratingSeriesMixin*, *LazyCombinatorialSpeciesElement*

Initialize the composition of species.

cycle_index_series()

Return the cycle index series for this species.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: E = L.Sets()
sage: F = E(E.restrict(1))
sage: F.cycle_index_series()[5]
h[2, 2, 1] - h[3, 1, 1] + 3*h[3, 2] + 2*h[4, 1] + 2*h[5]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> E = L.Sets()
>>> F = E(E.restrict(Integer(1)))
>>> F.cycle_index_series()[Integer(5)]
h[2, 2, 1] - h[3, 1, 1] + 3*h[3, 2] + 2*h[4, 1] + 2*h[5]
```

generating_series()

Return the (exponential) generating series of `self`.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: E = L.Sets()
sage: F = E(E.restrict(1))
sage: F.generating_series()
1 + X + X^2 + 5/6*X^3 + 5/8*X^4 + 13/30*X^5 + 203/720*X^6 + O(X^7)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> E = L.Sets()
>>> F = E(E.restrict(Integer(1)))
>>> F.generating_series()
1 + X + X^2 + 5/6*X^3 + 5/8*X^4 + 13/30*X^5 + 203/720*X^6 + O(X^7)
```

structures(**labels*)

Iterate over the structures on the given set of labels.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: E = L.Sets()
sage: E1 = L.Sets().restrict(1)
sage: sorted(E(E1).structures([1,2,3]))
[((((1, 'X'),), ((2, 'X'),), ((3, 'X'),)), ((1,), (2,), (3,))),
 ((((1, 'X'),), ((2, 'X'), (3, 'X'))), ((1,), (2, 3))),
 ((((1, 'X'), (2, 'X')), ((3, 'X'),)), ((1, 2), (3,))),
 ((((1, 'X'), (2, 'X'), (3, 'X')),), ((1, 2, 3),)),
 ((((1, 'X'), (3, 'X')), ((2, 'X'),)), ((1, 3), (2,)))]

sage: C = L.Cycles()
sage: L.<X, Y> = LazyCombinatorialSpecies(QQ)
sage: sum(1 for s in C(X*Y).structures([1,2,3], [1,2,3]))
12

sage: C(X*Y).generating_series()[6]
1/3*X^3*Y^3

sage: sum(1 for s in E(X*Y).structures([1,2,3], ["a", "b", "c"]))
6
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> E = L.Sets()
>>> E1 = L.Sets().restrict(Integer(1))
>>> sorted(E(E1).structures([Integer(1),Integer(2),Integer(3)]))
[((((1, 'X'),), ((2, 'X'),), ((3, 'X'),)), ((1,), (2,), (3,))),
 ((((1, 'X'),), ((2, 'X'), (3, 'X'))), ((1,), (2, 3))),
 ((((1, 'X'), (2, 'X')), ((3, 'X'),)), ((1, 2), (3,))),
 ((((1, 'X'), (2, 'X'), (3, 'X')),), ((1, 2, 3),)),
 ((((1, 'X'), (3, 'X')), ((2, 'X'),)), ((1, 3), (2,)))]

>>> C = L.Cycles()
>>> L = LazyCombinatorialSpecies(QQ, names=('X', 'Y',)); (X, Y,) = L._first_
↪ngens(2)
```

(continues on next page)

(continued from previous page)

```
>>> sum(Integer(1) for s in C(X*Y).structures([Integer(1),Integer(2),
↪Integer(3)], [Integer(1),Integer(2),Integer(3)]))
12

>>> C(X*Y).generating_series()[Integer(6)]
1/3*X^3*Y^3

>>> sum(Integer(1) for s in E(X*Y).structures([Integer(1),Integer(2),
↪Integer(3)], ["a", "b", "c"]))
6
```

class sage.rings.lazy_species.**CycleSpecies**(*parent*)

Bases: *LazyCombinatorialSpeciesElement*, UniqueRepresentation

Initialize the species of cycles.

generating_series()

Return the (exponential) generating series of the species of cycles.

This is $-log(1-x)$.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: L.Cycles().generating_series()
X + 1/2*X^2 + 1/3*X^3 + 1/4*X^4 + 1/5*X^5 + 1/6*X^6 + 1/7*X^7 + O(X^8)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> L.Cycles().generating_series()
X + 1/2*X^2 + 1/3*X^3 + 1/4*X^4 + 1/5*X^5 + 1/6*X^6 + 1/7*X^7 + O(X^8)
```

isotype_generating_series()

Return the isotype generating series of the species of cycles.

This is $x/(1-x)$.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: L.Cycles().isotype_generating_series()
X + X^2 + X^3 + O(X^4)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> L.Cycles().isotype_generating_series()
X + X^2 + X^3 + O(X^4)
```

structures(*labels*)

Iterate over the structures on the given set of labels.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(ZZ, "X")
sage: C = L.Cycles()
sage: list(C.structures([]))
[]
sage: list(C.structures([1]))
[(1,)]
sage: list(C.structures([1,2]))
[(1, 2)]
sage: list(C.structures([1,2,3]))
[(1, 2, 3), (1, 3, 2)]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(ZZ, "X")
>>> C = L.Cycles()
>>> list(C.structures([]))
[]
>>> list(C.structures([Integer(1)]))
[(1,)]
>>> list(C.structures([Integer(1),Integer(2)]))
[(1, 2)]
>>> list(C.structures([Integer(1),Integer(2),Integer(3)]))
[(1, 2, 3), (1, 3, 2)]
```

class sage.rings.lazy_species.**DerivativeSpeciesElement**(*F*, *sort=0*)

Bases: *LazyCombinatorialSpeciesElement*

Initialize the derivative of `F`.

cycle_index_series()

Return the cycle index series of `self`.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: E = L.Sets()
sage: E.derivative().cycle_index_series() - E.cycle_index_series()
O^6
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> E = L.Sets()
>>> E.derivative().cycle_index_series() - E.cycle_index_series()
O^6
```

generating_series()

Return the exponential generating series of `self`.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: E = L.Sets()
sage: E.derivative().generating_series() - E.generating_series()
O(X^7)
```

(continues on next page)

(continued from previous page)

```
sage: Lin = 1 / (1 - X)
sage: Lin.derivative().generating_series() - (Lin^2).generating_series()
O(X^7)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> E = L.Sets()
>>> E.derivative().generating_series() - E.generating_series()
O(X^7)

>>> Lin = Integer(1) / (Integer(1) - X)
>>> Lin.derivative().generating_series() - (Lin**Integer(2)).generating_
↪series()
O(X^7)
```

class sage.rings.lazy_species.**FunctorialCompositionSpeciesElement**(*left*, **args*, *algorithm*)

Bases: *LazyCombinatorialSpeciesElement*

Initialize the functorial composition of species.

generating_series()

Return the (exponential) generating series of `self`.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: E = L.Sets()
sage: subsets = E^2
sage: pairs = E*E.restrict(2, 2)
sage: G = subsets.functorial_composition(pairs)
sage: G.generating_series()[9]
536870912/2835
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> E = L.Sets()
>>> subsets = E**Integer(2)
>>> pairs = E*E.restrict(Integer(2), Integer(2))
>>> G = subsets.functorial_composition(pairs)
>>> G.generating_series()[Integer(9)]
536870912/2835
```

class sage.rings.lazy_species.**GraphSpecies**(*parent*, *connected=False*)

Bases: *LazyCombinatorialSpeciesElementGeneratingSeriesMixin*, *LazyCombinatorialSpeciesElement*, UniqueRepresentation

Initialize the species of simple graphs.

INPUT:

- `connected` – boolean; whether the graphs should be connected

cycle_index_series()

Return the cycle index series of the species of simple graphs.

The cycle index series is computed using Proposition 2.2.7 in [BLL1998].

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: L.Graphs().cycle_index_series().truncate(4)
p[] + p[1] + (p[1,1]+p[2]) + (4/3*p[1,1,1]+2*p[2,1]+2/3*p[3])
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> L.Graphs().cycle_index_series().truncate(Integer(4))
p[] + p[1] + (p[1,1]+p[2]) + (4/3*p[1,1,1]+2*p[2,1]+2/3*p[3])
```

Check that the number of isomorphism types is computed quickly:

```
sage: L.Graphs().isotype_generating_series()[20]
64549012279579984185616463849074274944O
```

```
>>> from sage.all import *
>>> L.Graphs().isotype_generating_series()[Integer(20)]
64549012279579984185616463849074274944O
```

We can also compute the series for connected graphs:

```
sage: L.Graphs(connected=True).cycle_index_series().truncate(4)
p[1] + (1/2*p[1,1]+1/2*p[2]) + (2/3*p[1,1,1]+p[2,1]+1/3*p[3])

sage: L.Graphs(True).isotype_generating_series()[12]
164059830476
```

```
>>> from sage.all import *
>>> L.Graphs(connected=True).cycle_index_series().truncate(Integer(4))
p[1] + (1/2*p[1,1]+1/2*p[2]) + (2/3*p[1,1,1]+p[2,1]+1/3*p[3])

>>> L.Graphs(True).isotype_generating_series()[Integer(12)]
164059830476
```

generating_series()

Return the (exponential) generating series of the species of simple graphs.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: L.Graphs().generating_series().truncate(7)
1 + X + X^2 + 4/3*X^3 + 8/3*X^4 + 128/15*X^5 + 2048/45*X^6

sage: L.Graphs(connected=True).generating_series().truncate(7)
X + 1/2*X^2 + 2/3*X^3 + 19/12*X^4 + 91/15*X^5 + 1669/45*X^6
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> L.Graphs().generating_series().truncate(Integer(7))
1 + X + X^2 + 4/3*X^3 + 8/3*X^4 + 128/15*X^5 + 2048/45*X^6

>>> L.Graphs(connected=True).generating_series().truncate(Integer(7))
X + 1/2*X^2 + 2/3*X^3 + 19/12*X^4 + 91/15*X^5 + 1669/45*X^6
```

isotypes(*labels*)

Iterate over the isotypes on the given list of sizes.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: G = L.Graphs()
sage: list(G.isotypes(2))
[Graph on 2 vertices, Graph on 2 vertices]

sage: G = L.Graphs(connected=True)
sage: list(G.isotypes(2))
[Graph on 2 vertices]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> G = L.Graphs()
>>> list(G.isotypes(Integer(2)))
[Graph on 2 vertices, Graph on 2 vertices]

>>> G = L.Graphs(connected=True)
>>> list(G.isotypes(Integer(2)))
[Graph on 2 vertices]
```

class sage.rings.lazy_species.**HadamardProductSpeciesElement**(*left*, *other*)

Bases: *LazyCombinatorialSpeciesElement*

Initialize the Hadamard product of species.

generating_series()

Return the (exponential) generating series of `self`.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: E = L.Sets()
sage: E.hadamard_product(E).generating_series()
1 + X + 1/2*X^2 + 1/6*X^3 + 1/24*X^4 + 1/120*X^5 + 1/720*X^6 + O(X^7)

sage: C = L.Cycles()
sage: C.hadamard_product(C).generating_series()
X + 1/2*X^2 + 2/3*X^3 + 3/2*X^4 + 24/5*X^5 + 20*X^6 + O(X^7)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> E = L.Sets()
>>> E.hadamard_product(E).generating_series()
1 + X + 1/2*X^2 + 1/6*X^3 + 1/24*X^4 + 1/120*X^5 + 1/720*X^6 + O(X^7)

>>> C = L.Cycles()
>>> C.hadamard_product(C).generating_series()
X + 1/2*X^2 + 2/3*X^3 + 3/2*X^4 + 24/5*X^5 + 20*X^6 + O(X^7)
```

structures(**labels*)

Iterate over the structures on the given set of labels.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: E = L.Sets()
sage: C = L.Cycles()
sage: sorted(E.hadamard_product(C).structures([1,2,3]))
[((1, 2, 3), (1, 2, 3)), ((1, 2, 3), (1, 3, 2))]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> E = L.Sets()
>>> C = L.Cycles()
>>> sorted(E.hadamard_product(C).structures([Integer(1),Integer(2),
...Integer(3)]))
[((1, 2, 3), (1, 2, 3)), ((1, 2, 3), (1, 3, 2))]
```

class sage.rings.lazy_species.**LazyCombinatorialSpecies**(*base_ring*, *names*, *sparse*)

Bases: LazyCompletionGradedAlgebra

The ring of lazy species.

EXAMPLES:

We provide univariate and multivariate (mostly known as multisort) species:

```
sage: LazyCombinatorialSpecies(QQ, "X")
Lazy completion of Polynomial species in X over Rational Field

sage: LazyCombinatorialSpecies(QQ, "X, Y")
Lazy completion of Polynomial species in X, Y over Rational Field
```

```
>>> from sage.all import *
>>> LazyCombinatorialSpecies(QQ, "X")
Lazy completion of Polynomial species in X over Rational Field

>>> LazyCombinatorialSpecies(QQ, "X, Y")
Lazy completion of Polynomial species in X, Y over Rational Field
```

In the univariate case, several basic species are provided as methods:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: L.Sets()
Set species
sage: L.Cycles()
Cycle species
sage: L.OrientedSets()
Oriented Set species
sage: L.Polygons()
Polygon species
sage: L.Graphs()
Graph species
sage: L.SetPartitions()
Set Partition species
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> L.Sets()
Set species
>>> L.Cycles()
Cycle species
>>> L.OrientedSets()
Oriented Set species
>>> L.Polygons()
Polygon species
>>> L.Graphs()
Graph species
>>> L.SetPartitions()
Set Partition species
```

Element

alias of *LazyCombinatorialSpeciesElement*

class sage.rings.lazy_species.**LazyCombinatorialSpeciesElement**(*parent*, *coeff_stream*)

Bases: LazyCompletionGradedAlgebraElement

EXAMPLES:

Compute the molecular expansion of $E(-X)$:

```
sage: L = LazyCombinatorialSpecies(ZZ, "X")
sage: E = L(SymmetricGroup)
sage: E_inv = 1 / E
sage: E_inv
1 + (-X) + (-E_2+X^2) + (-E_3+2*X*E_2-X^3)
  + (-E_4+2*X*E_3+E_2^2-3*X^2*E_2+X^4)
  + (-E_5+2*X*E_4+2*E_2*E_3-3*X^2*E_3-3*X*E_2^2+4*X^3*E_2-X^5)
  + (-E_6+2*X*E_5+2*E_2*E_4-3*X^2*E_4+E_3^2-6*X*E_2*E_3+4*X^3*E_3-E_2^3+6*X^2*E_2^
↪2-5*X^4*E_2+X^6)
  + O^7
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(ZZ, "X")
>>> E = L(SymmetricGroup)
>>> E_inv = Integer(1) / E
>>> E_inv
1 + (-X) + (-E_2+X^2) + (-E_3+2*X*E_2-X^3)
  + (-E_4+2*X*E_3+E_2^2-3*X^2*E_2+X^4)
  + (-E_5+2*X*E_4+2*E_2*E_3-3*X^2*E_3-3*X*E_2^2+4*X^3*E_2-X^5)
  + (-E_6+2*X*E_5+2*E_2*E_4-3*X^2*E_4+E_3^2-6*X*E_2*E_3+4*X^3*E_3-E_2^3+6*X^2*E_2^
↪2-5*X^4*E_2+X^6)
  + O^7
```

Compare with the explicit formula:

```
sage: def coefficient(m):
....:     return sum((-1)^len(la) * multinomial((n := la.to_exp())) * prod(E[i]^
↪ni for i, ni in enumerate(n, 1)) for la in Partitions(m))
```

(continues on next page)

(continued from previous page)

```
sage: all(coefficient(m) == E_inv[m] for m in range(10))
True
```

```
>>> from sage.all import *
>>> def coefficient(m):
...     return sum((-Integer(1))**len(la) * multinomial((n := la.to_exp())) *␣
↪prod(E[i]**ni for i, ni in enumerate(n, Integer(1))) for la in Partitions(m))

>>> all(coefficient(m) == E_inv[m] for m in range(Integer(10)))
True
```

arithmetic_product(*other*)

Return the arithmetic product of `self` and `other`.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: E = L.Sets()
sage: Ep = E.restrict(1)
sage: Ep.arithmetic_product(Ep)
X + 2*E_2 + 2*E_3 + (2*E_4+Pb_4) + 2*E_5 + (2*E_6+2*P_6) + O^7
sage: C = L.Cycles()
sage: C.arithmetic_product(Ep)
X + 2*E_2 + (E_3+C_3) + (E_4+Pb_4+C_4) + (E_5+C_5) + (E_6+P_6+2*C_6) + O^7
sage: C.arithmetic_product(C)
X + 2*E_2 + 2*C_3 + (2*C_4+Pb_4) + 2*C_5 + 4*C_6 + O^7
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> E = L.Sets()
>>> Ep = E.restrict(Integer(1))
>>> Ep.arithmetic_product(Ep)
X + 2*E_2 + 2*E_3 + (2*E_4+Pb_4) + 2*E_5 + (2*E_6+2*P_6) + O^7
>>> C = L.Cycles()
>>> C.arithmetic_product(Ep)
X + 2*E_2 + (E_3+C_3) + (E_4+Pb_4+C_4) + (E_5+C_5) + (E_6+P_6+2*C_6) + O^7
>>> C.arithmetic_product(C)
X + 2*E_2 + 2*C_3 + (2*C_4+Pb_4) + 2*C_5 + 4*C_6 + O^7
```

combinatorial_logarithm()

Return the combinatorial logarithm of `self`.

This is the series reversion of the species of non-empty sets applied to `self - 1`.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: L.Sets().restrict(1).revert() - (1+X).combinatorial_logarithm()
O^7
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> L.Sets().restrict(Integer(1)).revert() - (Integer(1)+X).combinatorial_
```

(continues on next page)

(continued from previous page)

```
↪logarithm()
O^7
```

This method is much faster, however:

```
sage: (1+X).combinatorial_logarithm().generating_series()[10]
-1/10
```

```
>>> from sage.all import *
>>> (Integer(1)+X).combinatorial_logarithm().generating_series()[Integer(10)]
-1/10
```

compositional_inverse()

alias of *revert()*.

cycle_index_series()

Return the cycle index series for this species.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(ZZ, "X")
sage: E = L.Sets()
sage: h = SymmetricFunctions(QQ).h()
sage: LazySymmetricFunctions(h)(E.cycle_index_series())
h[] + h[1] + h[2] + h[3] + h[4] + h[5] + h[6] + O^7

sage: s = SymmetricFunctions(QQ).s()
sage: C = L.Cycles()
sage: s(C.cycle_index_series()[5])
s[1, 1, 1, 1, 1] + s[2, 2, 1] + 2*s[3, 1, 1] + s[3, 2] + s[5]

sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: E = L.Sets()
sage: L2.<X, Y> = LazyCombinatorialSpecies(QQ)
sage: E(X + Y).cycle_index_series()[3]
1/6*p[] # p[1, 1, 1] + 1/2*p[] # p[2, 1] + 1/3*p[] # p[3]
+ 1/2*p[1] # p[1, 1] + 1/2*p[1] # p[2] + 1/2*p[1, 1] # p[1]
+ 1/6*p[1, 1, 1] # p[] + 1/2*p[2] # p[1] + 1/2*p[2, 1] # p[]
+ 1/3*p[3] # p[]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(ZZ, "X")
>>> E = L.Sets()
>>> h = SymmetricFunctions(QQ).h()
>>> LazySymmetricFunctions(h)(E.cycle_index_series())
h[] + h[1] + h[2] + h[3] + h[4] + h[5] + h[6] + O^7

>>> s = SymmetricFunctions(QQ).s()
>>> C = L.Cycles()
>>> s(C.cycle_index_series()[Integer(5)])
s[1, 1, 1, 1, 1] + s[2, 2, 1] + 2*s[3, 1, 1] + s[3, 2] + s[5]
```

(continues on next page)

(continued from previous page)

```
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> E = L.Sets()
>>> L2 = LazyCombinatorialSpecies(QQ, names=('X', 'Y',)); (X, Y,) = L2._first_
↪ngens(2)
>>> E(X + Y).cycle_index_series()[Integer(3)]
1/6*p[] # p[1, 1, 1] + 1/2*p[] # p[2, 1] + 1/3*p[] # p[3]
+ 1/2*p[1] # p[1, 1] + 1/2*p[1] # p[2] + 1/2*p[1, 1] # p[1]
+ 1/6*p[1, 1, 1] # p[] + 1/2*p[2] # p[1] + 1/2*p[2, 1] # p[]
+ 1/3*p[3] # p[]
```

derivative(**args*)

Return the derivative species of `self`.

This is defined on objects as $F'[U] = F[U \sqcup \{*\}]$ where $*$ is a distinguished label not in U. If $\sigma : U \to V$ is a bijection, then $F'[\sigma]$ is obtained by applying F to the unique bijection $U \sqcup \{*\} \to V \sqcup \{*\}$ that agrees with σ on U and fixes $*$.

For a multisort species, the derivative with respect to sort i is defined by

$$\frac{\partial}{\partial X_i} F[U_1, \ldots, U_k] = F[U_1, \ldots, U_i \sqcup \{*\}, \ldots, U_k].$$

The arguments follow Sage's standard derivative syntax (see `sage.misc.derivative.derivative_parse()`). The sort generator may be omitted if the parent is unisort. It must be specified if the parent is multisort.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: (X^3).derivative()[2]
3*X^2
sage: Lin = 1 / (1 - X)
sage: Lin.derivative()[4] == (Lin^2)[4]
True
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> (X**Integer(3)).derivative()[Integer(2)]
3*X^2
>>> Lin = Integer(1) / (Integer(1) - X)
>>> Lin.derivative()[Integer(4)] == (Lin**Integer(2))[Integer(4)]
True
```

Partial derivatives of multisort lazy species are obtained by specifying a sort generator:

```
sage: L.<X, Y> = LazyCombinatorialSpecies(QQ)
sage: F = X^2 * Y^2
sage: F.derivative(X, 2)[2]
2*Y^2
sage: F.derivative(X, Y)[2]
4*X*Y
sage: F.derivative([X, Y])[2]
4*X*Y
sage: F.derivative(0) is F
```

(continues on next page)

(continued from previous page)

```
True
sage: X.derivative(Y)[0]
0
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X', 'Y',)); (X, Y,) = L._first_
↪ngens(2)
>>> F = X**Integer(2) * Y**Integer(2)
>>> F.derivative(X, Integer(2))[Integer(2)]
2*Y^2
>>> F.derivative(X, Y)[Integer(2)]
4*X*Y
>>> F.derivative([X, Y])[Integer(2)]
4*X*Y
>>> F.derivative(Integer(0)) is F
True
>>> X.derivative(Y)[Integer(0)]
0
```

functorial_composition(*algorithm*, **args*)

Return the functorial composition of F and G.

This is defined on objects as $F\Box G[U] = F[G[U]]$ and on bijections as $F\Box G[\sigma] = F[G[\sigma]]$.

Thus, $(F + G)\Box H = F\Box H + G\Box H$. Moreover, $(F \times G)\Box H = (F\Box H) \times (G\Box H)$.

The species of elements XE is a (left and right) neutral element.

The species of sets is an absorbing element on the left, that is, $E\Box G = E$. Moreover, $F\Box E = |F[1]|E$.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: F = L.Cycles()
sage: G = X^3
sage: F.functorial_composition(G)  # random
(3*C_3+8*X*E_2+15*X^3) + O^7
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> F = L.Cycles()
>>> G = X**Integer(3)
>>> F.functorial_composition(G)  # random
(3*C_3+8*X*E_2+15*X^3) + O^7
```

Graphs:

```
sage: E = L.Sets()
sage: subsets = E^2
sage: pairs = E * E.restrict(2, 2)
sage: G = subsets.functorial_composition(pairs)
sage: G[5] - L.Graphs()[5]
0
```

```
>>> from sage.all import *
>>> E = L.Sets()
>>> subsets = E**Integer(2)
>>> pairs = E * E.restrict(Integer(2), Integer(2))
>>> G = subsets.functorial_composition(pairs)
>>> G[Integer(5)] - L.Graphs()[Integer(5)]
0
```

Coverings:

```
sage: E = L.Sets()
sage: p = E^2
sage: pp = E * E.restrict(1)
sage: CovE = p.functorial_composition(pp)
sage: CovE.isotype_generating_series().truncate(5)  # long time
1 + 2*X + 6*X^2 + 40*X^3 + 1992*X^4
sage: oeis(CovE.isotype_generating_series()[:5])  # long time, optional --␣
↪internet
0: A000612: Number of P-equivalence classes of switching functions of n or␣
↪fewer variables, divided by 2.

sage: Cov = CovE * E.inverse()
sage: Cov.isotype_generating_series().truncate(5)  # long time
1 + X + 4*X^2 + 34*X^3 + 1952*X^4
sage: oeis(Cov.isotype_generating_series()[:5])  # long time, optional --␣
↪internet
0: A055621: Number of covers of an unlabeled n-set.
```

```
>>> from sage.all import *
>>> E = L.Sets()
>>> p = E**Integer(2)
>>> pp = E * E.restrict(Integer(1))
>>> CovE = p.functorial_composition(pp)
>>> CovE.isotype_generating_series().truncate(Integer(5))  # long time
1 + 2*X + 6*X^2 + 40*X^3 + 1992*X^4
>>> oeis(CovE.isotype_generating_series()[:Integer(5)])  # long time,␣
↪optional -- internet
0: A000612: Number of P-equivalence classes of switching functions of n or␣
↪fewer variables, divided by 2.

>>> Cov = CovE * E.inverse()
>>> Cov.isotype_generating_series().truncate(Integer(5))  # long time
1 + X + 4*X^2 + 34*X^3 + 1952*X^4
>>> oeis(Cov.isotype_generating_series()[:Integer(5)])  # long time, optional␣
↪-- internet
0: A055621: Number of covers of an unlabeled n-set.
```

The functorial composition of two atomic species is not necessarily molecular:

```
sage: C = L.Cycles()
sage: C.restrict(6,6).functorial_composition(C.restrict(4,4))[4]
4*X^2*E_2 + 3*X*C_3 + 2*X^4
```

```
>>> from sage.all import *
>>> C = L.Cycles()
>>> C.restrict(Integer(6),Integer(6)).functorial_composition(C.
↪restrict(Integer(4),Integer(4)))[Integer(4)]
4*X^2*E_2 + 3*X*C_3 + 2*X^4
```

Another special case which is easy to understand:

```
sage: [(X^factorial(k)).functorial_composition(X^k) - factorial(factorial(k)-
↪1)*X^k for k in range(4)]
[O^7, O^7, O^7, O^7]
```

```
>>> from sage.all import *
>>> [(X**factorial(k)).functorial_composition(X**k) - factorial(factorial(k)-
↪Integer(1))*X**k for k in range(Integer(4))]
[O^7, O^7, O^7, O^7]
```

If the stabilizer subgroups corresponding to the arguments have few subgroups, using the `subgroup` algorithm is feasible, whereas the `orbit` counting algorithm is not:

```
sage: C = L.Cycles()
sage: C.functorial_composition(X^4)  # random
(20437340160*E_2(X^2)+40874803200*X^2*E_2+11022480*X*C_3+122880*C_4␣

↪+1077167364089547583440*X^4) + O^7
```

generating_series()

Return the (exponential) generating series of `self`.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: E = L.Sets()
sage: E.generating_series()
1 + X + 1/2*X^2 + 1/6*X^3 + 1/24*X^4 + 1/120*X^5 + 1/720*X^6 + O(X^7)

sage: C = L.Cycles()
sage: C.generating_series()
X + 1/2*X^2 + 1/3*X^3 + 1/4*X^4 + 1/5*X^5 + 1/6*X^6 + 1/7*X^7 + O(X^8)

sage: L2.<X, Y> = LazyCombinatorialSpecies(QQ)
sage: E(X + Y).generating_series()
1 + (X+Y) + (1/2*X^2+X*Y+1/2*Y^2)
+ (1/6*X^3+1/2*X^2*Y+1/2*X*Y^2+1/6*Y^3)
+ (1/24*X^4+1/6*X^3*Y+1/4*X^2*Y^2+1/6*X*Y^3+1/24*Y^4)
+ (1/120*X^5+1/24*X^4*Y+1/12*X^3*Y^2+1/12*X^2*Y^3+1/24*X*Y^4+1/120*Y^5)
+ (1/720*X^6+1/120*X^5*Y+1/48*X^4*Y^2+1/36*X^3*Y^3+1/48*X^2*Y^4+1/120*X*Y^5+1/
↪720*Y^6)
```

(continues on next page)

(continued from previous page)

```

+ O(X,Y)^8
```

hadamard_product(*other*)

Return the Hadamard product of `self` and `other`.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: E = L.Sets()
sage: C = L.Cycles()
sage: S = E(C)
sage: S.hadamard_product(S)[4]
E_4 + 3*E_2(E_2) + 6*C_4 + Pb_4 + 6*E_2^2 + 6*E_2(X^2) + 4*X*C_3 + 16*X^4
```

```
>>> from sage.all import *
```

(continues on next page)

(continued from previous page)

```
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> E = L.Sets()
>>> C = L.Cycles()
>>> S = E(C)
>>> S.hadamard_product(S)[Integer(4)]
E_4 + 3*E_2(E_2) + 6*C_4 + Pb_4 + 6*E_2^2 + 6*E_2(X^2) + 4*X*C_3 + 16*X^4
```

isotype_generating_series()

Return the isotype generating series of `self`.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: E = L(SymmetricGroup)
sage: E.isotype_generating_series()
1 + X + X^2 + X^3 + X^4 + X^5 + X^6 + O(X^7)

sage: C = L(CyclicPermutationGroup, valuation=1)
sage: E(C).isotype_generating_series()
1 + X + 2*X^2 + 3*X^3 + 5*X^4 + 7*X^5 + 11*X^6 + O(X^7)

sage: L2.<X, Y> = LazyCombinatorialSpecies(QQ)
sage: E(X + Y).isotype_generating_series()
1 + (X+Y) + (X^2+X*Y+Y^2) + (X^3+X^2*Y+X*Y^2+Y^3)
+ (X^4+X^3*Y+X^2*Y^2+X*Y^3+Y^4)
+ (X^5+X^4*Y+X^3*Y^2+X^2*Y^3+X*Y^4+Y^5)
+ (X^6+X^5*Y+X^4*Y^2+X^3*Y^3+X^2*Y^4+X*Y^5+Y^6)
+ O(X,Y)^7

sage: C(X + Y).isotype_generating_series()

+ (X^6+X^5*Y+3*X^4*Y^2+4*X^3*Y^3+3*X^2*Y^4+X*Y^5+Y^6)
+ O(X,Y)^7
```

isotypes(**shape*)

Iterate over the isotypes on the given list of sizes.

Generically, this yields a list of tuples consisting of a molecular species and, if necessary, an index.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: E = L(SymmetricGroup)
sage: list(E.isotypes(3))
[(E_3,)]

sage: P = L(CyclicPermutationGroup, valuation=1)
sage: list(P.isotypes(3))
[(C_3,)]

sage: F = 1/(2-E)
sage: sorted(F.isotypes(3))
[(E_3,), (X*E_2, 0), (X*E_2, 1), (X^3,)]

sage: from sage.rings.species import PolynomialSpecies
sage: L = LazyCombinatorialSpecies(QQ, "X, Y")
sage: P = PolynomialSpecies(QQ, "X, Y")
sage: XY = L(P(PermutationGroup([], domain=[1, 2]), {0: [1], 1: [2]}))
sage: list((XY).isotypes(1, 1))
[(X*Y,)]

sage: list(E(XY).isotypes(2, 2))
[(E_2(X*Y),)]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> E = L(SymmetricGroup)
>>> list(E.isotypes(Integer(3)))
[(E_3,)]

>>> P = L(CyclicPermutationGroup, valuation=Integer(1))
>>> list(P.isotypes(Integer(3)))
[(C_3,)]

>>> F = Integer(1)/(Integer(2)-E)
>>> sorted(F.isotypes(Integer(3)))
[(E_3,), (X*E_2, 0), (X*E_2, 1), (X^3,)]
```

(continues on next page)

(continued from previous page)

```
>>> from sage.rings.species import PolynomialSpecies
>>> L = LazyCombinatorialSpecies(QQ, "X, Y")
>>> P = PolynomialSpecies(QQ, "X, Y")
>>> XY = L(P(PermutationGroup([], domain=[Integer(1), Integer(2)]),
↪{Integer(0): [Integer(1)], Integer(1): [Integer(2)]}))
>>> list((XY).isotypes(Integer(1), Integer(1)))
[(X*Y,)]

>>> list(E(XY).isotypes(Integer(2), Integer(2)))
[(E_2(X*Y),)]
```

polynomial(*degree=None*, *names=None*)

Return `self` as a polynomial if `self` is actually so or up to specified degree.

INPUT:

- `degree` – (optional) integer
- `names` – (default: name of the variables of the series) names of the variables

OUTPUT:

If `degree` is not `None`, the terms of the series of degree greater than `degree` are first truncated. If `degree` is `None` and the series is not a polynomial polynomial, a `ValueError` is raised.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(ZZ, "X")
sage: E = L(SymmetricGroup)
sage: E.polynomial(3)
1 + X + E_2 + E_3
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(ZZ, "X")
>>> E = L(SymmetricGroup)
>>> E.polynomial(Integer(3))
1 + X + E_2 + E_3
```

restrict(*min_degree=None*, *max_degree=None*)

Return the series obtained by keeping only terms of degree between `min_degree` and `max_degree`.

INPUT:

- `min_degree`, `max_degree` – (optional) integers indicating which degrees to keep

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(ZZ, "X")
sage: G = L.Graphs()
sage: list(G.isotypes(2))
[Graph on 2 vertices, Graph on 2 vertices]

sage: list(G.restrict(2, 2).isotypes(2))
[Graph on 2 vertices, Graph on 2 vertices]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(ZZ, "X")
>>> G = L.Graphs()
>>> list(G.isotypes(Integer(2)))
[Graph on 2 vertices, Graph on 2 vertices]

>>> list(G.restrict(Integer(2), Integer(2)).isotypes(Integer(2)))
[Graph on 2 vertices, Graph on 2 vertices]
```

revert()

Return the compositional inverse of `self`.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: E1 = L.Sets().restrict(1)
sage: g = E1.revert()
sage: g[:5]
[X, -E_2, -E_3 + X*E_2, -E_4 + E_2(E_2) + X*E_3 - X^2*E_2]

sage: E = L.Sets()
sage: P = E(X*E1(-X))*(1+X) - 1
sage: P.revert()[:5]
[X, X^2, X*E_2 + 2*X^3, X*E_3 + 2*X^2*E_2 + E_2(X^2) + 5*X^4]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> E1 = L.Sets().restrict(Integer(1))
>>> g = E1.revert()
>>> g[:Integer(5)]
[X, -E_2, -E_3 + X*E_2, -E_4 + E_2(E_2) + X*E_3 - X^2*E_2]

>>> E = L.Sets()
>>> P = E(X*E1(-X))*(Integer(1)+X) - Integer(1)
>>> P.revert()[:Integer(5)]
[X, X^2, X*E_2 + 2*X^3, X*E_3 + 2*X^2*E_2 + E_2(X^2) + 5*X^4]
```

structures(**labels*)

Iterate over the structures on the given set of labels.

Generically, this yields a list of pairs consisting of a molecular species and a relabelled representative of the cosets of corresponding groups.

The relabelling is such that the first few labels correspond to the first factor in the atomic decomposition, etc.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: E = L(SymmetricGroup)
sage: list(E.structures([1,2,3]))
[(E_3, ((1, 2, 3),))]

sage: C = L(CyclicPermutationGroup, valuation=1)
sage: list(C.structures([1,2,3]))
```

(continues on next page)

(continued from previous page)

```
[(C_3, ((1, 2, 3),)), (C_3, ((1, 3, 2),))]

sage: F = 1/(2-E)
sage: sorted(F.structures([1,2,3]))
[(E_3, ((1, 2, 3),)),
 (X*E_2, ((1,), (2, 3)), 0),
 (X*E_2, ((1,), (2, 3)), 1),
 (X*E_2, ((2,), (1, 3)), 0),
 (X*E_2, ((2,), (1, 3)), 1),
 (X*E_2, ((3,), (1, 2)), 0),
 (X*E_2, ((3,), (1, 2)), 1),
 (X^3, ((1,), (2,), (3,))),
 (X^3, ((1,), (3,), (2,))),
 (X^3, ((2,), (1,), (3,))),
 (X^3, ((2,), (3,), (1,))),
 (X^3, ((3,), (1,), (2,))),
 (X^3, ((3,), (2,), (1,)))]

sage: from sage.rings.species import PolynomialSpecies
sage: L = LazyCombinatorialSpecies(QQ, "X, Y")
sage: P = PolynomialSpecies(QQ, "X, Y")
sage: XY = L(P(PermutationGroup([], domain=[1, 2]), {0: [1], 1: [2]}))
sage: list((XY).structures([1], ["a"]))
[(X*Y, ((1,), ('a',)))]

sage: sorted(E(XY).structures([1,2], [3, 4]))
[((E_2, ((((1, 'X'), (3, 'Y')), ((2, 'X'), (4, 'Y'))),)),
  ((X*Y, ((1,), (3,))), (X*Y, ((2,), (4,))))),
 ((E_2, ((((1, 'X'), (4, 'Y')), ((2, 'X'), (3, 'Y'))),)),
  ((X*Y, ((1,), (4,))), (X*Y, ((2,), (3,)))))]

sage: list(XY.structures([], [1, 2]))
[]
```

```

>>> sorted(E(XY).structures([Integer(1),Integer(2)], [Integer(3),␣
↪Integer(4)]))
[((E_2, ((((1, 'X'), (3, 'Y')), ((2, 'X'), (4, 'Y'))),)),
  ((X*Y, ((1,), (3,))), (X*Y, ((2,), (4,)))),
 ((E_2, ((((1, 'X'), (4, 'Y')), ((2, 'X'), (3, 'Y'))),)),
  ((X*Y, ((1,), (4,))), (X*Y, ((2,), (3,))))]

>>> list(XY.structures([], [Integer(1), Integer(2)]))
[]
```

class sage.rings.lazy_species.**LazyCombinatorialSpeciesElementGeneratingSeriesMixin**

Bases: object

A lazy species element whose generating series are obtained by specializing the cycle index series rather than the molecular expansion.

generating_series()

Return the (exponential) generating series of `self`.

The series is obtained by applying the exponential specialization to the cycle index series.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: L.Graphs().generating_series().truncate(7)
1 + X + X^2 + 4/3*X^3 + 8/3*X^4 + 128/15*X^5 + 2048/45*X^6
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> L.Graphs().generating_series().truncate(Integer(7))
1 + X + X^2 + 4/3*X^3 + 8/3*X^4 + 128/15*X^5 + 2048/45*X^6
```

isotype_generating_series()

Return the isotype generating series of `self`.

The series is obtained by applying the principal specialization of order 1 to the cycle index series, that is, setting $x_1 = x$ and $x_k = 0$ for $k > 1$.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: L.Graphs().isotype_generating_series().truncate(8)
1 + X + 2*X^2 + 4*X^3 + 11*X^4 + 34*X^5 + 156*X^6 + 1044*X^7
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> L.Graphs().isotype_generating_series().truncate(Integer(8))
1 + X + 2*X^2 + 4*X^3 + 11*X^4 + 34*X^5 + 156*X^6 + 1044*X^7
```

class sage.rings.lazy_species.**LazyCombinatorialSpeciesMultivariate**(*base_ring*, *names*, *sparse*)

Bases: *LazyCombinatorialSpecies*

class sage.rings.lazy_species.**LazyCombinatorialSpeciesUnivariate**(*base_ring*, *names*, *sparse*)

Bases: *LazyCombinatorialSpecies*

Chains()

Return the species of chains.

Chains are linear orders up to reversal.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: Ch = L.Chains()
sage: set(Ch.isotypes(4))
{(E_2(X^2),)}
sage: list(Ch.structures(["a", "b", "c"]))
[('a', 'c', 'b'), ('a', 'b', 'c'), ('b', 'a', 'c')]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> Ch = L.Chains()
>>> set(Ch.isotypes(Integer(4)))
{(E_2(X^2),)}
>>> list(Ch.structures(["a", "b", "c"]))
[('a', 'c', 'b'), ('a', 'b', 'c'), ('b', 'a', 'c')]
```

Cycles()

Return the species of (oriented) cycles.

This species corresponds to the sequence of group actions having the cyclic groups as stabilizers.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: G = L.Cycles()
sage: set(G.isotypes(4))
{(C_4,)}
sage: set(G.structures(["a", "b", "c"]))
{('a', 'b', 'c'), ('a', 'c', 'b')}
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> G = L.Cycles()
```

(continues on next page)

(continued from previous page)

```
>>> set(G.isotypes(Integer(4)))
{(C_4,)}
>>> set(G.structures(["a", "b", "c"]))
{('a', 'b', 'c'), ('a', 'c', 'b')}
```

Graphs(*connected=False*)

Return the species of vertex labelled simple graphs.

INPUT:

- `connected` – boolean; whether the graphs should be connected

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: G = L.Graphs()
sage: set(G.isotypes(2))
{Graph on 2 vertices, Graph on 2 vertices}

sage: G.isotype_generating_series()[20]
64549012279579984185616463849074274944O
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> G = L.Graphs()
>>> set(G.isotypes(Integer(2)))
{Graph on 2 vertices, Graph on 2 vertices}

>>> G.isotype_generating_series()[Integer(20)]
64549012279579984185616463849074274944O
```

OrientedSets()

Return the species of oriented sets.

Oriented sets are total orders up to an even orientation.

This species corresponds to the sequence of group actions having the alternating groups as stabilizers.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: G = L.OrientedSets()
sage: set(G.isotypes(5))
{(Eo_5,)}
sage: set(G.structures(["a", 1, "b", 2]))
{(Eo_4, ((1, 2, 'a', 'b'),)), (Eo_4, ((1, 2, 'b', 'a'),))}
sage: G.generating_series()
1 + X + X^2 + 1/3*X^3 + 1/12*X^4 + 1/60*X^5 + 1/360*X^6 + O(X^7)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> G = L.OrientedSets()
>>> set(G.isotypes(Integer(5)))
{(Eo_5,)}
```

(continues on next page)

(continued from previous page)

```
>>> set(G.structures(["a", Integer(1), "b", Integer(2)]))
{(Eo_4, ((1, 2, 'a', 'b'),)), (Eo_4, ((1, 2, 'b', 'a'),))}
>>> G.generating_series()
1 + X + X^2 + 1/3*X^3 + 1/12*X^4 + 1/60*X^5 + 1/360*X^6 + O(X^7)
```

Polygons()

Return the species of polygons.

Polygons are cycles up to orientation.

This species corresponds to the sequence of group actions having the dihedral groups as stabilizers.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: G = L.Polygons()
sage: set(G.isotypes(5))
{(P_5,)}
sage: set(G.structures(["a", 1, "b", 2]))
{(E_2(E_2), ((1, 'a', 2, 'b'),)),
 (E_2(E_2), ((1, 'b', 2, 'a'),)),
 (E_2(E_2), ((1, 2, 'a', 'b'),))}
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> G = L.Polygons()
>>> set(G.isotypes(Integer(5)))
{(P_5,)}
>>> set(G.structures(["a", Integer(1), "b", Integer(2)]))
{(E_2(E_2), ((1, 'a', 2, 'b'),)),
 (E_2(E_2), ((1, 'b', 2, 'a'),)),
 (E_2(E_2), ((1, 2, 'a', 'b'),))}
```

SetPartitions()

Return the species of set partitions.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: G = L.SetPartitions()
sage: set(G.isotypes(4))
{[1, 1, 1, 1], [2, 1, 1], [2, 2], [3, 1], [4]}
sage: list(G.structures(["a", "b", "c"]))
[{{'a', 'b', 'c'}},
 {{'a', 'b'}, {'c'}},
 {{'a', 'c'}, {'b'}},
 {{'a'}, {'b', 'c'}},
 {{'a'}, {'b'}, {'c'}}]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> G = L.SetPartitions()
>>> set(G.isotypes(Integer(4)))
```

(continues on next page)

(continued from previous page)

```
{[1, 1, 1, 1], [2, 1, 1], [2, 2], [3, 1], [4]}
>>> list(G.structures(["a", "b", "c"]))
[{{'a', 'b', 'c'}},
 {{'a', 'b'}, {'c'}},
 {{'a', 'c'}, {'b'}},
 {{'a'}, {'b', 'c'}},
 {{'a'}, {'b'}, {'c'}}]
```

Sets()

Return the species of sets.

This species corresponds to the sequence of trivial group actions. Put differently, the stabilizers are the full symmetric groups.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: G = L.Sets()
sage: set(G.isotypes(4))
{(E_4,)}
sage: set(G.structures(["a", 1, x]))
{(1, 'a', x)}
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> G = L.Sets()
>>> set(G.isotypes(Integer(4)))
{(E_4,)}
>>> set(G.structures(["a", Integer(1), x]))
{(1, 'a', x)}
```

class sage.rings.lazy_species.**OrientedSetSpecies**(*parent*)

Bases: *LazyCombinatorialSpeciesElement*, UniqueRepresentation

Initialize the species of oriented sets.

class sage.rings.lazy_species.**PolygonSpecies**(*parent*)

Bases: *LazyCombinatorialSpeciesElement*, UniqueRepresentation

Initialize the species of polygons.

class sage.rings.lazy_species.**ProductSpeciesElement**(*left*, *right*)

Bases: *LazyCombinatorialSpeciesElement*

Initialize the product of two species.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: F = L.Sets() * L.SetPartitions()
sage: TestSuite(F).run(skip=['_test_category', '_test_pickling'])
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
```

(continues on next page)

(continued from previous page)

```
>>> F = L.Sets() * L.SetPartitions()
>>> TestSuite(F).run(skip=['_test_category', '_test_pickling'])
```

generating_series()

Return the (exponential) generating series of `self`.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: E = L.Sets()
sage: F = E*E
sage: F.generating_series()
1 + 2*X + 2*X^2 + 4/3*X^3 + 2/3*X^4 + 4/15*X^5 + 4/45*X^6 + O(X^7)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> E = L.Sets()
>>> F = E*E
>>> F.generating_series()
1 + 2*X + 2*X^2 + 4/3*X^3 + 2/3*X^4 + 4/15*X^5 + 4/45*X^6 + O(X^7)
```

isotype_generating_series()

Return the isotype generating series of `self`.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: E = L.Sets()
sage: F = E*E
sage: F.isotype_generating_series()
1 + 2*X + 3*X^2 + 4*X^3 + 5*X^4 + 6*X^5 + 7*X^6 + O(X^7)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> E = L.Sets()
>>> F = E*E
>>> F.isotype_generating_series()
1 + 2*X + 3*X^2 + 4*X^3 + 5*X^4 + 6*X^5 + 7*X^6 + O(X^7)
```

structures(**labels*)

Iterate over the structures on the given set of labels.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(ZZ, "X")
sage: E = L.Sets()
sage: C = L.Cycles()
sage: P = E * C
sage: list(P.structures([1,2]))
[((), (1, 2)), ((1,), (2,)), ((2,), (1,))]

sage: P = E * E
sage: list(P.structures([1,2]))
```

(continues on next page)

(continued from previous page)

```
[((), (1, 2)), ((1,), (2,)), ((2,), (1,)), ((1, 2), ())]

sage: L.<X, Y> = LazyCombinatorialSpecies(QQ)
sage: list((X*Y).structures([1], [2]))
[(X, ((1,),)), (Y, ((2,),))]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(ZZ, "X")
>>> E = L.Sets()
>>> C = L.Cycles()
>>> P = E * C
>>> list(P.structures([Integer(1),Integer(2)]))
[((), (1, 2)), ((1,), (2,)), ((2,), (1,))]

>>> P = E * E
>>> list(P.structures([Integer(1),Integer(2)]))
[((), (1, 2)), ((1,), (2,)), ((2,), (1,)), ((1, 2), ())]

>>> L = LazyCombinatorialSpecies(QQ, names=('X', 'Y',)); (X, Y,) = L._first_
↪ngens(2)
>>> list((X*Y).structures([Integer(1)], [Integer(2)]))
[(X, ((1,),)), (Y, ((2,),))]
```

class sage.rings.lazy_species.**RestrictedSpeciesElement**(*F*, *min_degree*, *max_degree*)

Bases: *LazyCombinatorialSpeciesElement*

Initialize the restriction of a species to the given degrees.

cycle_index_series()

Return the cycle index series for this species.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: E = L.Sets()
sage: E.restrict(1, 5).cycle_index_series()
h[1] + h[2] + h[3] + h[4] + h[5]

sage: E.restrict(1).cycle_index_series()
h[1] + h[2] + h[3] + h[4] + h[5] + h[6] + h[7] + O^8
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> E = L.Sets()
>>> E.restrict(Integer(1), Integer(5)).cycle_index_series()
h[1] + h[2] + h[3] + h[4] + h[5]

>>> E.restrict(Integer(1)).cycle_index_series()
h[1] + h[2] + h[3] + h[4] + h[5] + h[6] + h[7] + O^8
```

generating_series()

Return the (exponential) generating series of `self`.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: E = L.Sets()
sage: E.restrict(1, 5).generating_series()
X + 1/2*X^2 + 1/6*X^3 + 1/24*X^4 + 1/120*X^5
sage: E.restrict(1).generating_series()
X + 1/2*X^2 + 1/6*X^3 + 1/24*X^4 + 1/120*X^5 + 1/720*X^6 + 1/5040*X^7 + O(X^8)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> E = L.Sets()
>>> E.restrict(Integer(1), Integer(5)).generating_series()
X + 1/2*X^2 + 1/6*X^3 + 1/24*X^4 + 1/120*X^5
>>> E.restrict(Integer(1)).generating_series()
X + 1/2*X^2 + 1/6*X^3 + 1/24*X^4 + 1/120*X^5 + 1/720*X^6 + 1/5040*X^7 + O(X^8)
```

isotype_generating_series()

Return the isotype generating series of `self`.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: E = L.Sets()
sage: E.restrict(1, 5).isotype_generating_series()
X + X^2 + X^3 + X^4 + X^5

sage: E.restrict(1).isotype_generating_series()
X + X^2 + X^3 + O(X^4)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> E = L.Sets()
>>> E.restrict(Integer(1), Integer(5)).isotype_generating_series()
X + X^2 + X^3 + X^4 + X^5

>>> E.restrict(Integer(1)).isotype_generating_series()
X + X^2 + X^3 + O(X^4)
```

isotypes(**shape*)

Iterate over the isotypes on the given list of sizes.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: p = L.SetPartitions().restrict(2, 2)
sage: list(p.isotypes(3))
[]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> p = L.SetPartitions().restrict(Integer(2), Integer(2))
>>> list(p.isotypes(Integer(3)))
[]
```

structures(**labels*)

Iterate over the structures on the given set of labels.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(ZZ, "X")
sage: F = L.SetPartitions().restrict(3)
sage: list(F.structures([1]))
[]
sage: list(F.structures([1,2,3]))
[{{1, 2, 3}}, {{1, 2}, {3}}, {{1, 3}, {2}}, {{1}, {2, 3}}, {{1}, {2}, {3}}]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(ZZ, "X")
>>> F = L.SetPartitions().restrict(Integer(3))
>>> list(F.structures([Integer(1)]))
[]
>>> list(F.structures([Integer(1),Integer(2),Integer(3)]))
[{{1, 2, 3}}, {{1, 2}, {3}}, {{1, 3}, {2}}, {{1}, {2, 3}}, {{1}, {2}, {3}}]
```

class sage.rings.lazy_species.**SetPartitionSpecies**(*parent*)

Bases: *CompositionSpeciesElement*, UniqueRepresentation

Initialize the species of set partitions.

generating_series()

Return the (exponential) generating series of `self`.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(ZZ, "X")
sage: P = L.SetPartitions()
sage: P.generating_series()
1 + X + X^2 + 5/6*X^3 + 5/8*X^4 + 13/30*X^5 + 203/720*X^6 + O(X^7)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(ZZ, "X")
>>> P = L.SetPartitions()
>>> P.generating_series()
1 + X + X^2 + 5/6*X^3 + 5/8*X^4 + 13/30*X^5 + 203/720*X^6 + O(X^7)
```

isotype_generating_series()

Return the isotype generating series of `self`.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(ZZ, "X")
sage: P = L.SetPartitions()
sage: P.isotype_generating_series()
1 + X + 2*X^2 + 3*X^3 + 5*X^4 + 7*X^5 + 11*X^6 + O(X^7)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(ZZ, "X")
>>> P = L.SetPartitions()
```

(continues on next page)

(continued from previous page)

```
>>> P.isotype_generating_series()
1 + X + 2*X^2 + 3*X^3 + 5*X^4 + 7*X^5 + 11*X^6 + O(X^7)
```

isotypes(*labels*)

Iterate over the isotypes on the given list of sizes.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: p = L.SetPartitions()
sage: list(p.isotypes(3))
[[3], [2, 1], [1, 1, 1]]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> p = L.SetPartitions()
>>> list(p.isotypes(Integer(3)))
[[3], [2, 1], [1, 1, 1]]
```

structures(*labels*)

Iterate over the structures on the given set of labels.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(ZZ, "X")
sage: P = L.SetPartitions()
sage: list(P.structures([]))
[{}]
sage: list(P.structures([1]))
[{{1}}]
sage: list(P.structures([1,2]))
[{{1, 2}}, {{1}, {2}}]
sage: list(P.structures([1,2,3]))
[{{1, 2, 3}}, {{1, 2}, {3}}, {{1, 3}, {2}}, {{1}, {2, 3}}, {{1}, {2}, {3}}]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(ZZ, "X")
>>> P = L.SetPartitions()
>>> list(P.structures([]))
[{}]
>>> list(P.structures([Integer(1)]))
[{{1}}]
>>> list(P.structures([Integer(1),Integer(2)]))
[{{1, 2}}, {{1}, {2}}]
>>> list(P.structures([Integer(1),Integer(2),Integer(3)]))
[{{1, 2, 3}}, {{1, 2}, {3}}, {{1, 3}, {2}}, {{1}, {2, 3}}, {{1}, {2}, {3}}]
```

class sage.rings.lazy_species.**SetSpecies**(*parent*)

Bases: *LazyCombinatorialSpeciesElement*, UniqueRepresentation

Initialize the species of sets.

cycle_index_series()

Return the cycle index series of the species of sets.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: L.Sets().cycle_index_series()
h[] + h[1] + h[2] + h[3] + h[4] + h[5] + h[6] + O^7
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> L.Sets().cycle_index_series()
h[] + h[1] + h[2] + h[3] + h[4] + h[5] + h[6] + O^7
```

generating_series()

Return the (exponential) generating series of the species of sets.

This is the exponential.

EXAMPLES:

```
sage: L.<X> = LazyCombinatorialSpecies(QQ)
sage: L.Sets().generating_series()
1 + X + 1/2*X^2 + 1/6*X^3 + 1/24*X^4 + 1/120*X^5 + 1/720*X^6 + O(X^7)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, names=('X',)); (X,) = L._first_ngens(1)
>>> L.Sets().generating_series()
1 + X + 1/2*X^2 + 1/6*X^3 + 1/24*X^4 + 1/120*X^5 + 1/720*X^6 + O(X^7)
```

isotype_generating_series()

Return the isotype generating series of the species of sets.

This is the geometric series.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: L.Sets().isotype_generating_series()
1 + X + X^2 + O(X^3)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> L.Sets().isotype_generating_series()
1 + X + X^2 + O(X^3)
```

structures(*labels*)

Iterate over the structures on the given set of labels.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(ZZ, "X")
sage: E = L.Sets()
sage: list(E.structures([1,2,3]))
[(1, 2, 3)]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(ZZ, "X")
```

(continues on next page)

(continued from previous page)

```
>>> E = L.Sets()
>>> list(E.structures([Integer(1),Integer(2),Integer(3)]))
[(1, 2, 3)]
```

class sage.rings.lazy_species.**SumSpeciesElement**(*left*, *right*)

Bases: *LazyCombinatorialSpeciesElement*

Initialize the sum of two species.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: F = L.Sets() + L.SetPartitions()
sage: TestSuite(F).run(skip=['_test_category', '_test_pickling'])
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> F = L.Sets() + L.SetPartitions()
>>> TestSuite(F).run(skip=['_test_category', '_test_pickling'])
```

generating_series()

Return the (exponential) generating series of `self`.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: F = L.Sets() + L.SetPartitions()
sage: F.generating_series()
2 + 2*X + 3/2*X^2 + X^3 + 2/3*X^4 + 53/120*X^5 + 17/60*X^6 + O(X^7)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> F = L.Sets() + L.SetPartitions()
>>> F.generating_series()
2 + 2*X + 3/2*X^2 + X^3 + 2/3*X^4 + 53/120*X^5 + 17/60*X^6 + O(X^7)
```

isotype_generating_series()

Return the isotype generating series of `self`.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: F = L.Sets() + L.SetPartitions()
sage: F.isotype_generating_series()
2 + 2*X + 3*X^2 + 4*X^3 + 6*X^4 + 8*X^5 + 12*X^6 + O(X^7)
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> F = L.Sets() + L.SetPartitions()
>>> F.isotype_generating_series()
2 + 2*X + 3*X^2 + 4*X^3 + 6*X^4 + 8*X^5 + 12*X^6 + O(X^7)
```

structures(**labels*)

Iterate over the structures on the given set of labels.

EXAMPLES:

```
sage: L = LazyCombinatorialSpecies(QQ, "X")
sage: F = L.Sets() + L.SetPartitions()
sage: list(F.structures([1,2,3]))
[((1, 2, 3), 'left'),
 ({{1, 2, 3}}, 'right'),
 ({{1, 2}, {3}}, 'right'),
 ({{1, 3}, {2}}, 'right'),
 ({{1}, {2, 3}}, 'right'),
 ({{1}, {2}, {3}}, 'right')]
```

```
>>> from sage.all import *
>>> L = LazyCombinatorialSpecies(QQ, "X")
>>> F = L.Sets() + L.SetPartitions()
>>> list(F.structures([Integer(1),Integer(2),Integer(3)]))
[((1, 2, 3), 'left'),
 ({{1, 2, 3}}, 'right'),
 ({{1, 2}, {3}}, 'right'),
 ({{1, 3}, {2}}, 'right'),
 ({{1}, {2, 3}}, 'right'),
 ({{1}, {2}, {3}}, 'right')]
```

sage.rings.lazy_species.**fixed_points**(k, A, B)

Compute the number of fixed points of the action of B on S_n/A.

INPUT:

- `n` – the degree of the ambient symmetric group
- `A`, `B` – subgroups of S_n

EXAMPLES:

```
sage: from sage.rings.lazy_species import fixed_points
sage: C = SymmetricGroup(3).conjugacy_classes_subgroups()
sage: matrix([[fixed_points(3, A, B) for A in C] for B in C])
[6 3 2 1]
[0 1 0 1]
[0 0 2 1]
[0 0 0 1]
```

```
>>> from sage.all import *
>>> from sage.rings.lazy_species import fixed_points
>>> C = SymmetricGroup(Integer(3)).conjugacy_classes_subgroups()
>>> matrix([[fixed_points(Integer(3), A, B) for A in C] for B in C])
[6 3 2 1]
[0 1 0 1]
[0 0 2 1]
[0 0 0 1]
```

sage.rings.lazy_species.**fixed_points_factorized**(n, lA, B)

Compute the number of fixed points of the action of B on S_n/A, where A is the direct product of the given groups.

INPUT:

- `n` – the degree of the ambient symmetric group
- `lA` – a list of pairs (A_i, e_i), where A_i is a directly indecomposable subgroup of S_n and e_i its multiplicity in A
- `B` – a subgroup of S_n

EXAMPLES:

```
sage: from sage.rings.lazy_species import fixed_points_factorized
sage: C = SymmetricGroup(3).conjugacy_classes_subgroups()
sage: matrix([[fixed_points_factorized(3, [(A, 1)], B) for A in C] for B in C])
[6 3 2 1]
[0 1 0 1]
[0 0 2 1]
[0 0 0 1]
```

```
>>> from sage.all import *
>>> from sage.rings.lazy_species import fixed_points_factorized
>>> C = SymmetricGroup(Integer(3)).conjugacy_classes_subgroups()
>>> matrix([[fixed_points_factorized(Integer(3), [(A, Integer(1))], B) for A in␣
↪C] for B in C])
[6 3 2 1]
[0 1 0 1]
[0 0 2 1]
[0 0 0 1]
```

sage.rings.lazy_species.**weighted_compositions**(*n*, *d*, *weight_multiplicities*, *_w0=0*)

Return all compositions of n of weight d.

The weight of a composition $n_1, n_2, \ldots$ is $\sum_i w_i n_i$.

INPUT:

- `n` – nonnegative integer; the sum of the parts
- `d` – nonnegative integer; the total weight
- `weight_multiplicities` – iterable; `weight_multiplicities[i]` is the number of positions with weight `i+1`

Todo

Possibly this could be merged with *WeightedIntegerVectors*. However, that class does not support fixing the sum of the parts currently.

EXAMPLES:

```
sage: from sage.rings.lazy_species import weighted_compositions
sage: list(weighted_compositions(1, 1, [2,1]))
[[1, 0], [0, 1]]

sage: list(weighted_compositions(2, 1, [2,1]))
[]
```

(continues on next page)

(continued from previous page)

```
sage: list(weighted_compositions(1, 2, [2,1,1]))
[[0, 0, 1]]

sage: list(weighted_compositions(3, 4, [2,2]))
[[2, 0, 1, 0],
 [1, 1, 1, 0],
 [0, 2, 1, 0],
 [2, 0, 0, 1],
 [1, 1, 0, 1],
 [0, 2, 0, 1]]
```

```
>>> from sage.all import *
>>> from sage.rings.lazy_species import weighted_compositions
>>> list(weighted_compositions(Integer(1), Integer(1), [Integer(2),Integer(1)]))
[[1, 0], [0, 1]]

>>> list(weighted_compositions(Integer(2), Integer(1), [Integer(2),Integer(1)]))
[]

>>> list(weighted_compositions(Integer(1), Integer(2), [Integer(2),Integer(1),
↪Integer(1)]))
[[0, 0, 1]]

>>> list(weighted_compositions(Integer(3), Integer(4), [Integer(2),Integer(2)]))
[[2, 0, 1, 0],

sage.rings.lazy_species.**weighted_partitions_by_capacity**(*weights*, *capacities*)

Enumerate orbit representatives of weighted partitions.

INPUT:

- `weights` – list of positive integers $[w_0, \ldots, w_{N-1}]$
- `capacities` – list $[(c_1, m_1), \ldots, (c_r, m_r)]$

OUTPUT:

Yield tuples $(S_1, \ldots, S_M)$, each S_j a set of indices, such that the union of the S_j is $\{0, \ldots, N-1\}$ and the sum of the weights of the indices in each of $S_1, \ldots, S_{m_1}$ is always c_1, etc. Moreover, permutations of the first m_1 tuples $S_1, \ldots, S_{m_1}$ are considered indistinguishable, etc.

EXAMPLES:

```
sage: from sage.rings.lazy_species import weighted_partitions_by_capacity
sage: list(weighted_partitions_by_capacity([1,2,2,1,4], [[5,2]]))
[((4, 0), (1, 2, 3)), ((4, 3), (1, 2, 0))]

sage: list(weighted_partitions_by_capacity([2,2], [[2,1], [2,1]]))
[((0,), (1,)), ((1,), (0,))]
```

(continues on next page)

(continued from previous page)

```
sage: list(weighted_partitions_by_capacity([2,2], [[2,2]]))
[((0,), (1,))]

sage: list(weighted_partitions_by_capacity([1,2,2,2,3], [[3,2], [4,1]]))
[((4,), (1, 0), (2, 3)),
 ((4,), (2, 0), (1, 3)),
 ((4,), (3, 0), (1, 2))]

sage: list(weighted_partitions_by_capacity([1,1,1,2,2], [[2,2], [3,1]]))
[((3,), (4,), (0, 1, 2)),
 ((3,), (0, 1), (4, 2)),
 ((3,), (0, 2), (4, 1)),
 ((3,), (1, 2), (4, 0)),
 ((4,), (0, 1), (3, 2)),
 ((4,), (0, 2), (3, 1)),
 ((4,), (1, 2), (3, 0))]
```

```
>>> from sage.all import *
>>> from sage.rings.lazy_species import weighted_partitions_by_capacity
>>> list(weighted_partitions_by_capacity([Integer(1),Integer(2),Integer(2),
↪Integer(1),Integer(4)], [[Integer(5),Integer(2)]]))
[((4, 0), (1, 2, 3)), ((4, 3), (1, 2, 0))]

>>> list(weighted_partitions_by_capacity([Integer(2),Integer(2)], [[Integer(2),
↪Integer(1)], [Integer(2),Integer(1)]]))
[((0,), (1,)), ((1,), (0,))]

>>> list(weighted_partitions_by_capacity([Integer(2),Integer(2)], [[Integer(2),
↪Integer(2)]]))
[((0,), (1,))]

>>> list(weighted_partitions_by_capacity([Integer(1),Integer(2),Integer(2),
↪Integer(2),Integer(3)], [[Integer(3),Integer(2)], [Integer(4),Integer(1)]]))
[((4,), (1, 0), (2, 3)),
 ((4,), (2, 0), (1, 3)),
 ((4,), (3, 0), (1, 2))]

>>> list(weighted_partitions_by_capacity([Integer(1),Integer(1),Integer(1),
↪Integer(2),Integer(2)], [[Integer(2),Integer(2)], [Integer(3),Integer(1)]]))
[((3,), (4,), (0, 1, 2)),
 ((3,), (0, 1), (4, 2)),
 ((3,), (0, 2), (4, 1)),
 ((3,), (1, 2), (4, 0)),
 ((4,), (0, 1), (3, 2)),
 ((4,), (0, 2), (3, 1)),
 ((4,), (1, 2), (3, 0))]
```

sage.rings.lazy_species.**weighted_vector_compositions**(*n_vec*, *d*, *weight_multiplicities_vec*)

Return all compositions of the vector `n_vec` of weight `d`.

INPUT:

- `n_vec` – a k-tuple of non-negative integers
- `d` – a non-negative integer, the total weighted sum of the parts in all components
- `weight_multiplicities_vec` – k-tuple of iterables, where `weight_multiplicities_vec[j][i]` is the number of positions with weight $i+1$ in the j-th component

EXAMPLES:

```
sage: from sage.rings.lazy_species import weighted_vector_compositions
sage: list(weighted_vector_compositions([1,1], 2, [[2,1,1], [1,1,1]]))
[([1, 0], [1]), ([0, 1], [1])]

sage: list(weighted_vector_compositions([3,1], 4, [[2,1,0,0,1], [2,1,0,0,1]]))
[([3, 0], [1, 0]),
 ([3, 0], [0, 1]),
 ([2, 1], [1, 0]),
 ([2, 1], [0, 1]),
 ([1, 2], [1, 0]),
 ([1, 2], [0, 1]),
 ([0, 3], [1, 0]),
 ([0, 3], [0, 1])]
```

```
>>> from sage.all import *
>>> from sage.rings.lazy_species import weighted_vector_compositions
>>> list(weighted_vector_compositions([Integer(1),Integer(1)], Integer(2),␣
↪[[Integer(2),Integer(1),Integer(1)], [Integer(1),Integer(1),Integer(1)]]))
[([1, 0], [1]), ([0, 1], [1])]

>>> list(weighted_vector_compositions([Integer(3),Integer(1)], Integer(4),␣
↪[[Integer(2),Integer(1),Integer(0),Integer(0),Integer(1)], [Integer(2),
↪Integer(1),Integer(0),Integer(0),Integer(1)]]))
[([3, 0], [1, 0]),
 ([3, 0], [0, 1]),
 ([2, 1], [1, 0]),
 ([2, 1], [0, 1]),
 ([1, 2], [1, 0]),
 ([1, 2], [0, 1]),
 ([0, 3], [1, 0]),
 ([0, 3], [0, 1])]
```

In the following example, we obtain pairs of compositions, one of 3 and one of 2. In the first composition, the first 2 positions have weight one, there is no position of weight two, and the next position has weight 3. In the second composition, the first position has weight 1 and the second position has weight 2. The total weight is 7.:

```
sage: list(weighted_vector_compositions([3,2], 7, [[2,0,1], [1,1]]))
[([2, 0, 1], [2]),
 ([1, 1, 1], [2]),
 ([0, 2, 1], [2]),
 ([3, 0], [0, 2]),
 ([2, 1], [0, 2]),
 ([1, 2], [0, 2]),
 ([0, 3], [0, 2])]
```

```
>>> from sage.all import *
>>> list(weighted_vector_compositions([Integer(3),Integer(2)], Integer(7),␣
↪[[Integer(2),Integer(0),Integer(1)], [Integer(1),Integer(1)]]))
[([2, 0, 1], [2]),
 ([1, 1, 1], [2]),
 ([0, 2, 1], [2]),
 ([3, 0], [0, 2]),
 ([2, 1], [0, 2]),
 ([1, 2], [0, 2]),
 ([0, 3], [0, 2])]
```

Note

This list was initially created by executing in a Sage shell (`sage -sh`):

```
$ src/doc/en/reference/make_module_list.sh sage/combinat
```

The result was copy-pasted here, grouped by package.
