CHAPTER

ONE

INTRODUCTION

- *Combinatorics quickref*
- *Introduction to combinatorics in Sage*

CHAPTER

TWO

TOPICS

- *Algebraic combinatorics*
  - *Combinatorial Hopf algebras*
  - *Cluster algebras and quivers*
  - *Crystals*
  - *Root systems*
  - *Symmetric functions*
  - *Fully commutative elements of Coxeter groups*
- *Counting*
- *Enumerated sets*
- *Partitions, tableaux, and others*
- *Finite state machines, automata, transducers*
- *Posets*
- *Combinatorial species*
- *Combinatorial designs and incidence structures*
- *Combinatorics on words*
- *A bijectionist's toolkit*

CHAPTER

THREE

UTILITIES

- *Output functions*
- *Rankers*
- *Combinatorial maps*
- *Miscellaneous*

CHAPTER

FOUR

MODULES

4.1 Comprehensive module list

4.1.1 sage.combinat

A bijectionist's toolkit

AUTHORS:

- Alexander Grosz, Tobias Kietreiber, Stephan Pfannerer and Martin Rubey (2020-2022): Initial version

Quick reference

set_statistics()	Declare statistics that are preserved by the bijection.
set_value_restrictions()	Restrict the values of the statistic on an element.
set_constant_blocks()	Declare that the statistic is constant on some sets.
set_distributions()	Restrict the distribution of values of the statistic on some elements.
set_intertwining_relations()	Declare that the statistic intertwines with other maps.
set_quadratic_relation()	Declare that the statistic satisfies a certain relation.
set_homomesic()	Declare that the statistic is homomesic with respect to a given set partition.
statistics_table()	Print a table collecting information on the given statistics.
statistics_fibers()	Collect elements with the same statistics.
constant_blocks()	Return the blocks on which the statistic is constant.
solutions_iterator()	Iterate over all possible solutions.
possible_values()	Return all possible values for a given element.
minimal_subdistributions_iterator()	Iterate over the minimal subdistributions.
minimal_subdistributions_blocks_iterator()	Iterate over the minimal subdistributions.

A guided tour

Consider the following combinatorial statistics on a permutation:

- wex, the number of weak excedences,
- fix, the number of fixed points,
- des, the number of descents (after appending 0),
- adj, the number of adjacencies (after appending 0), and
- $llis$, the length of a longest increasing subsequence.

Moreover, let rot be action of rotation on a permutation, i.e., the conjugation with the long cycle.

It is known that there must exist a statistic s on permutations, which is equidistributed with $llis$ but additionally invariant under rot. However, at least very small cases do not contradict the possibility that one can even find a statistic s, invariant under rot and such that $(s, wex, fix) \sim (llis, des, adj)$. Let us check this for permutations of size at most 3:

```
sage: N = 3
sage: A = B = [pi for n in range(N+1) for pi in Permutations(n)]
sage: def alpha1(p): return len(p.weak_excedences())
sage: def alpha2(p): return len(p.fixed_points())
sage: def beta1(p): return len(p.descents(final_descent=True)) if p else 0
sage: def beta2(p): return len([e for e, f in zip(p, p[1:]+[0]) if e == f+1])
sage: tau = Permutation.longest_increasing_subsequence_length
sage: def rotate_permutation(p):
....:     cycle = Permutation(tuple(range(1, len(p)+1)))
....:     return Permutation([cycle.inverse()(p(cycle(i))) for i in range(1,␣
↪len(p)+1)])
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_statistics((len, len), (alpha1, beta1), (alpha2, beta2))
sage: a, b = bij.statistics_table()
sage: table(a, header_row=True, frame=True)
```

a	α_1(a)	α_2(a)	α_3(a)
[]	0	0	0
[1]	1	1	1

 [2, 3, 1]: 2,
 [3, 1, 2]: 3,
 [3, 2, 1]: 2}
```

On the other hand, we can check that there is no rotation invariant statistic on non-crossing set partitions which is equidistributed with the Strahler number on ordered trees:

```
sage: N = 8
sage: A = [SetPartition(d.to_noncrossing_partition()) for n in range(N) for d in␣
↪DyckWords(n)]
sage: B = [t for n in range(1, N+1) for t in OrderedTrees(n)]
sage: def theta(m): return SetPartition([[i % m.size() + 1 for i in b] for b in m])
```

```
>>> from sage.all import *
>>> N = Integer(8)
>>> A = [SetPartition(d.to_noncrossing_partition()) for n in range(N) for d in␣
↪DyckWords(n)]
>>> B = [t for n in range(Integer(1), N+Integer(1)) for t in OrderedTrees(n)]
>>> def theta(m): return SetPartition([[i % m.size() + Integer(1) for i in b] for b␣
↪in m])
```

Code for the Strahler number can be obtained from FindStat. The following code is equivalent to `tau = find-stat(397)`:

```
sage: def tau(T):
....:     if len(T) == 0:
....:         return 1
....:     else:
....:         l = [tau(S) for S in T]
....:         m = max(l)
....:         if l.count(m) == 1:
....:             return m
....:         return m+1
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_statistics((lambda a: a.size(), lambda b: b.number_of_nodes()-1))
```

(continues on next page)

(continued from previous page)

```
sage: from sage.combinat.cyclic_sieving_phenomenon import orbit_decomposition
sage: bij.set_constant_blocks(orbit_decomposition(A, theta))
sage: list(bij.solutions_iterator())
[]
```

```
>>> from sage.all import *
>>> def tau(T):
...     if len(T) == Integer(0):
...         return Integer(1)
...     else:
...         l = [tau(S) for S in T]
...         m = max(l)
...         if l.count(m) == Integer(1):
...             return m
...         return m+Integer(1)
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_statistics((lambda a: a.size(), lambda b: b.number_of_nodes()-Integer(1)))
>>> from sage.combinat.cyclic_sieving_phenomenon import orbit_decomposition
>>> bij.set_constant_blocks(orbit_decomposition(A, theta))
>>> list(bij.solutions_iterator())
[]
```

Next we demonstrate how to search for a bijection. To do so, we identify s and S:

```
sage: N = 4
sage: A = [dyck_word for n in range(1, N) for dyck_word in DyckWords(n)]
sage: B = [binary_tree for n in range(1, N) for binary_tree in BinaryTrees(n)]
sage: concat_path = lambda D1, D2: DyckWord(list(D1) + list(D2))
sage: concat_tree = lambda B1, B2: concat_path(B1.to_dyck_word(),
....:                                          B2.to_dyck_word()).to_binary_tree()
sage: bij = Bijectionist(A, B)
sage: bij.set_intertwining_relations((2, concat_path, concat_tree))
sage: bij.set_statistics((lambda d: d.semilength(), lambda t: t.number_of_nodes()))
sage: for D in sorted(bij.minimal_subdistributions_iterator(), key=lambda x:␣
↪(len(x[0][0]), x)):
....:     ascii_art(D)
( [ /\ ], [ o ] )
(           [ o   ] )
(           [  \  ] )
( [ /\/\ ], [   o ] )
(           [   o ] )

>>> bij = Bijectionist(A, B)
>>> bij.set_intertwining_relations((Integer(2), concat_path, concat_tree))
>>> bij.set_statistics((lambda d: d.semilength(), lambda t: t.number_of_nodes()))
>>> for D in sorted(bij.minimal_subdistributions_iterator(), key=lambda x:␣
↪(len(x[Integer(0)][Integer(0)]), x)):
...     ascii_art(D)
( [ /\ ], [ o ] )
(           [ o   ] )
(           [  \  ] )
( [ /\/\ ], [   o ] )
(           [   o ] )
( [  /\  ]  [  /  ] )
( [ /  \ ], [ o   ] )
(             [ o     ] )
(             [  \    ] )
(             [   o   ] )
(             [    \  ] )
( [ /\/\/\ ], [     o ] )
(             [ o   ] )
(             [  \  ] )
(             [   o ] )
( [    /\  ]  [  /  ] )
( [ /\/  \ ], [ o   ] )
(             [   o   ] )
( [  /\    ]  [  / \  ] )
( [ /  \/\ ], [ o   o ] )
(                     [   o,     o ] )
(                     [  /      /  ] )
( [           /\   ]  [ o      o   ] )
( [  /\/\    /  \  ]  [  \    /    ] )
( [ /    \, /    \ ], [   o  o     ] )
```

The output is in a form suitable for FindStat:

```
sage: findmap(list(bij.minimal_subdistributions_iterator()))           # optional --␣
```

(continues on next page)

class sage.combinat.bijectionist.**Bijectionist**(*A*, *B*, *tau=None*, *alpha_beta=()*, *P=None*, *pi_rho=()*, *phi_psi=()*, *Q=None*, *elements_distributions=()*, *value_restrictions=()*, *solver=None*, *key=None*)

Bases: SageObject

A toolbox to list all possible bijections between two finite sets under various constraints.

INPUT:

- `A`, `B` – sets of equal size, given as a list
- `tau` – (optional) a function from `B` to `Z`, in case of `None`, the identity map `lambda x: x` is used
- `alpha_beta` – (optional) a list of pairs of statistics `alpha` from `A` to `W` and `beta` from `B` to `W`
- `P` – (optional) a partition of `A`
- `pi_rho` – (optional) a list of triples `(k, pi, rho)`, where
  - `pi` – a `k`-ary operation composing objects in `A` and
  - `rho` – a `k`-ary function composing statistic values in `Z`
- `elements_distributions` – (optional) a list of pairs `(tA, tZ)`, specifying the distributions of `tA`
- `value_restrictions` – (optional) a list of pairs `(a, tZ)`, restricting the possible values of `a`
- `solver` – (optional) the backend used to solve the mixed integer linear programs

`W` and `Z` can be arbitrary sets. As a natural example we may think of the natural numbers or tuples of integers.

We are looking for a statistic $s : A \to Z$ and a bijection $S : A \to B$ such that

- $s = \tau \circ S$: the statistics s and τ are equidistributed and S is an intertwining bijection.
- $\alpha = \beta \circ S$: the statistics α and β are equidistributed and S is an intertwining bijection.
- s is constant on the blocks of P.
- $s(\pi(a_1, \ldots, a_k)) = \rho(s(a_1), \ldots, s(a_k))$.

Additionally, we may require that

- $s(a) \in Z_a$ for specified sets $Z_a \subseteq Z$, and
- $s|_{\tilde{A}}$ has a specified distribution for specified sets $\tilde{A} \subset A$.

If τ is the identity, the two unknown functions s and S coincide. Although we do not exclude other bijective choices for τ, they probably do not make sense.

If we want that S is graded, i.e. if elements of A and B have a notion of size and S should preserve this size, we can add grading statistics as α and β. Since α and β will be equidistributed with S as an intertwining bijection, S will then also be graded.

In summary, we have the following two commutative diagrams, where s and S are unknown functions.

$$\begin{array}{ccccc} & & A & & \\ & \alpha\swarrow & S\downarrow & \searrow s & \\ W & \xleftarrow{\beta} & B & \xrightarrow{\tau} & Z \end{array} \qquad \begin{array}{ccc} A^k & \xrightarrow{\pi} & A \\ \downarrow s^k & & \downarrow s \\ Z^k & \xrightarrow{\rho} & Z \end{array}$$

Note

If τ is the identity map, the partition P of A necessarily consists only of singletons.

Note

The order of invocation of the methods with prefix `set`, i.e., *set_statistics()*, *set_intertwining_relations()*, *set_constant_blocks()*, etc., is irrelevant. Calling any of these methods a second time overrides the previous specification.

constant_blocks(*singletons=False*, *optimal=False*)

Return the set partition P of A such that $s : A \to Z$ is known to be constant on the blocks of P.

INPUT:

- `singletons` – boolean (default: `False`); whether or not to include singleton blocks in the output
- `optimal` – boolean (default: `False`); whether or not to compute the coarsest possible partition

Note

computing the coarsest possible partition may be computationally expensive, but may speed up generating solutions.

EXAMPLES:

```
sage: A = B = ["a", "b", "c"]
sage: bij = Bijectionist(A, B, lambda x: 0)
sage: bij.set_constant_blocks([["a", "b"]])
sage: bij.constant_blocks()
{{'a', 'b'}}

sage: bij.constant_blocks(singletons=True)
{{'a', 'b'}, {'c'}}
```

```
>>> from sage.all import *
>>> A = B = ["a", "b", "c"]
>>> bij = Bijectionist(A, B, lambda x: Integer(0))
>>> bij.set_constant_blocks([["a", "b"]])
>>> bij.constant_blocks()
{{'a', 'b'}}
```

(continues on next page)

(continued from previous page)

```
>>> bij.constant_blocks(singletons=True)
{{'a', 'b'}, {'c'}}
```

minimal_subdistributions_blocks_iterator()

Return all representatives of minimal subsets $\tilde{P}$ of P together with submultisets $\tilde{Z}$ with $s(\tilde{P}) = \tilde{Z}$ as multisets.

Warning

If there are several solutions with the same support (i.e., the sets of block representatives are the same), only one of these will be found, even if the distributions are different, see the doctest below. To find all solutions, use *minimal_subdistributions_iterator()*, which is, however, computationally more expensive.

EXAMPLES:

```
sage: A = B = [permutation for n in range(3) for permutation in␣
↪Permutations(n)]
sage: bij = Bijectionist(A, B, len)
sage: bij.set_statistics((len, len))
sage: for sol in bij.solutions_iterator():
....:     print(sol)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 2}
sage: sorted(bij.minimal_subdistributions_blocks_iterator())
[([[]], [0]), ([[1]], [1]), ([[1, 2]], [2]), ([[2, 1]], [2])]
```

```
>>> from sage.all import *
>>> A = B = [permutation for n in range(Integer(3)) for permutation in␣
↪Permutations(n)]
>>> bij = Bijectionist(A, B, len)
>>> bij.set_statistics((len, len))
>>> for sol in bij.solutions_iterator():
...     print(sol)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 2}
>>> sorted(bij.minimal_subdistributions_blocks_iterator())
[([[]], [0]), ([[1]], [1]), ([[1, 2]], [2]), ([[2, 1]], [2])]
```

Another example:

```
sage: N = 2; A = B = [dyck_word for n in range(N+1) for dyck_word in␣
↪DyckWords(n)]
sage: def tau(D): return D.number_of_touch_points()

```

An example with two elements of the same block in a subdistribution:

```
sage: A = B = ["a", "b", "c", "d", "e"]
sage: tau = {"a": 1, "b": 1, "c": 2, "d": 2, "e": 3}.get
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_constant_blocks([["a", "b"]])
sage: bij.set_value_restrictions(("a", [1, 2]))
sage: bij.constant_blocks(optimal=True)
{{'a', 'b'}}
sage: list(bij.minimal_subdistributions_blocks_iterator())
[(['b', 'b', 'c', 'd', 'e'], [1, 1, 2, 2, 3])]
```

```
>>> from sage.all import *
>>> A = B = ["a", "b", "c", "d", "e"]
>>> tau = {"a": Integer(1), "b": Integer(1), "c": Integer(2), "d": Integer(2),
↪ "e": Integer(3)}.get
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_constant_blocks([["a", "b"]])
>>> bij.set_value_restrictions(("a", [Integer(1), Integer(2)]))
>>> bij.constant_blocks(optimal=True)
{{'a', 'b'}}
>>> list(bij.minimal_subdistributions_blocks_iterator())
[(['b', 'b', 'c', 'd', 'e'], [1, 1, 2, 2, 3])]
```

An example with overlapping minimal subdistributions:

```
sage: A = B = ["a", "b", "c", "d", "e"]
sage: tau = {"a": 1, "b": 1, "c": 2, "d": 2, "e": 3}.get
```

(continues on next page)

(continued from previous page)

```
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_distributions((["a", "b"], [1, 2]), (["a", "c", "d"], [1, 2,␣
↪3]))
sage: sorted(bij.solutions_iterator(), key=lambda d: tuple(sorted(d.items())))
[{'a': 1, 'b': 2, 'c': 2, 'd': 3, 'e': 1},
 {'a': 1, 'b': 2, 'c': 3, 'd': 2, 'e': 1},
 {'a': 2, 'b': 1, 'c': 1, 'd': 3, 'e': 2},
 {'a': 2, 'b': 1, 'c': 3, 'd': 1, 'e': 2}]
sage: bij.constant_blocks(optimal=True)
{{'a', 'e'}}
sage: list(bij.minimal_subdistributions_blocks_iterator())
[(['a', 'b'], [1, 2]), (['a', 'c', 'd'], [1, 2, 3])]
```

```
>>> from sage.all import *
>>> A = B = ["a", "b", "c", "d", "e"]
>>> tau = {"a": Integer(1), "b": Integer(1), "c": Integer(2), "d": Integer(2),
↪ "e": Integer(3)}.get
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_distributions((["a", "b"], [Integer(1), Integer(2)]), (["a", "c",
↪"d"], [Integer(1), Integer(2), Integer(3)]))
>>> sorted(bij.solutions_iterator(), key=lambda d: tuple(sorted(d.items())))
[{'a': 1, 'b': 2, 'c': 2, 'd': 3, 'e': 1},
 {'a': 1, 'b': 2, 'c': 3, 'd': 2, 'e': 1},
 {'a': 2, 'b': 1, 'c': 1, 'd': 3, 'e': 2},
 {'a': 2, 'b': 1, 'c': 3, 'd': 1, 'e': 2}]
>>> bij.constant_blocks(optimal=True)
{{'a', 'e'}}
>>> list(bij.minimal_subdistributions_blocks_iterator())
[(['a', 'b'], [1, 2]), (['a', 'c', 'd'], [1, 2, 3])]
```

Fedor Petrov's example from https://mathoverflow.net/q/424187:

```
sage: A = B = ["a"+str(i) for i in range(1, 9)] + ["b"+str(i) for i in␣
↪range(3, 9)] + ["d"]
sage: tau = {b: 0 if i < 10 else 1 for i, b in enumerate(B)}.get
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_constant_blocks([["a"+str(i), "b"+str(i)] for i in range(1, 9)␣
↪if "b"+str(i) in A])
sage: d = [0]*8+[1]*4
sage: bij.set_distributions((A[:8] + A[8+2:-1], d), (A[:8] + A[8:-3], d))
sage: sorted([s[a] for a in A] for s in bij.solutions_iterator())
[[0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0, 1],
 [0, 1, 0, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 1, 0],
 [0, 1, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0],
 [0, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 1, 0],
 [0, 1, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 1, 0, 0],

 [1, 0, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0],
 [1, 0, 1, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 1, 0],
 [1, 0, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 1, 0, 0],
 [1, 1, 0, 0, 0, 1, 0, 0, 0, 0, 0, 1, 0, 0, 1],
 [1, 1, 0, 0, 1, 0, 0, 0, 0, 0, 1, 0, 0, 0, 1]]
```

(continues on next page)

(continued from previous page)

```
sage: sorted(bij.minimal_subdistributions_blocks_iterator())        # random
[(['a1', 'a2', 'a3', 'a4', 'a5', 'a5', 'a6', 'a6', 'a7', 'a7', 'a8', 'a8'],
  [0, 0, 0, 0, 0, 0, 0, 0, 1, 1, 1, 1]),
 (['a3', 'a4', 'd'], [0, 0, 1]),
 (['a7', 'a8', 'd'], [0, 0, 1])]
```

```
>>> from sage.all import *
>>> A = B = ["a"+str(i) for i in range(Integer(1), Integer(9))] + ["b"+str(i)␣
↪for i in range(Integer(3), Integer(9))] + ["d"]
>>> tau = {b: Integer(0) if i < Integer(10) else Integer(1) for i, b in␣
↪enumerate(B)}.get
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_constant_blocks([["a"+str(i), "b"+str(i)] for i in␣
↪range(Integer(1), Integer(9)) if "b"+str(i) in A])
>>> d = [Integer(0)]*Integer(8)+[Integer(1)]*Integer(4)
>>> bij.set_distributions((A[:Integer(8)] + A[Integer(8)+Integer(2):-
↪Integer(1)], d), (A[:Integer(8)] + A[Integer(8):-Integer(3)], d))
>>> sorted([s[a] for a in A] for s in bij.solutions_iterator())
[[0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0, 1],
 [0, 1, 0, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 1, 0],
 [0, 1, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0],
 [0, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 1, 0],
 [0, 1, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 1, 0, 0],
 [1, 0, 0, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 1, 0],
 [1, 0, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0],
 [1, 0, 1, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 1, 0],
 [1, 0, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 1, 0, 0],
 [1, 1, 0, 0, 0, 1, 0, 0, 0, 0, 0, 1, 0, 0, 1],
 [1, 1, 0, 0, 1, 0, 0, 0, 0, 0, 1, 0, 0, 0, 1]]

>>> sorted(bij.minimal_subdistributions_blocks_iterator())        # random
[(['a1', 'a2', 'a3', 'a4', 'a5', 'a5', 'a6', 'a6', 'a7', 'a7', 'a8', 'a8'],
  [0, 0, 0, 0, 0, 0, 0, 0, 1, 1, 1, 1]),
 (['a3', 'a4', 'd'], [0, 0, 1]),
 (['a7', 'a8', 'd'], [0, 0, 1])]
```

The following solution is not found, because it happens to have the same support as the other:

```
sage: D = set(A).difference(['b7', 'b8', 'd'])
sage: sorted(a.replace("b", "a") for a in D)
['a1', 'a2', 'a3', 'a3', 'a4', 'a4', 'a5', 'a5', 'a6', 'a6', 'a7', 'a8']
sage: set(tuple(sorted(s[a] for a in D)) for s in bij.solutions_iterator())
{(0, 0, 0, 0, 0, 0, 0, 0, 1, 1, 1, 1)}
```

```
>>> from sage.all import *
>>> D = set(A).difference(['b7', 'b8', 'd'])
>>> sorted(a.replace("b", "a") for a in D)
['a1', 'a2', 'a3', 'a3', 'a4', 'a4', 'a5', 'a5', 'a6', 'a6', 'a7', 'a8']
>>> set(tuple(sorted(s[a] for a in D)) for s in bij.solutions_iterator())
{(0, 0, 0, 0, 0, 0, 0, 0, 1, 1, 1, 1)}
```

But it is, by design, included here:

```
sage: sorted(D) in [d for d, _ in bij.minimal_subdistributions_iterator()]
True
```

```
>>> from sage.all import *
>>> sorted(D) in [d for d, _ in bij.minimal_subdistributions_iterator()]
True
```

minimal_subdistributions_iterator()

Return all minimal subsets $\tilde{A}$ of A together with submultisets $\tilde{Z}$ with $s(\tilde{A}) = \tilde{Z}$ as multisets.

EXAMPLES:

```
sage: A = B = [permutation for n in range(3) for permutation in␣
↪Permutations(n)]
sage: bij = Bijectionist(A, B, len)
sage: bij.set_statistics((len, len))
sage: for sol in bij.solutions_iterator():
....:     print(sol)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 2}
sage: sorted(bij.minimal_subdistributions_iterator())
[([[]], [0]), ([[1]], [1]), ([[1, 2]], [2]), ([[2, 1]], [2])]
```

```
>>> from sage.all import *
>>> A = B = [permutation for n in range(Integer(3)) for permutation in␣
↪Permutations(n)]
>>> bij = Bijectionist(A, B, len)
>>> bij.set_statistics((len, len))
>>> for sol in bij.solutions_iterator():
...     print(sol)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 2}
>>> sorted(bij.minimal_subdistributions_iterator())
[([[]], [0]), ([[1]], [1]), ([[1, 2]], [2]), ([[2, 1]], [2])]
```

Another example:

```
sage: N = 2; A = B = [dyck_word for n in range(N+1) for dyck_word in␣
↪DyckWords(n)]
sage: def tau(D): return D.number_of_touch_points()
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_statistics((lambda d: d.semilength(), lambda d: d.semilength()))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(solution)
{[]: 0, [1, 0]: 1, [1, 0, 1, 0]: 1, [1, 1, 0, 0]: 2}
{[]: 0, [1, 0]: 1, [1, 0, 1, 0]: 2, [1, 1, 0, 0]: 1}
sage: for subdistribution in sorted(bij.minimal_subdistributions_iterator()):
....:     print(subdistribution)
([[]], [0])
([[1, 0]], [1])
([[1, 0, 1, 0], [1, 1, 0, 0]], [1, 2])
```

```
>>> from sage.all import *
>>> N = Integer(2); A = B = [dyck_word for n in range(N+Integer(1)) for dyck_
↪word in DyckWords(n)]
>>> def tau(D): return D.number_of_touch_points()
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_statistics((lambda d: d.semilength(), lambda d: d.semilength()))
>>> for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
...     print(solution)
{[]: 0, [1, 0]: 1, [1, 0, 1, 0]: 1, [1, 1, 0, 0]: 2}
{[]: 0, [1, 0]: 1, [1, 0, 1, 0]: 2, [1, 1, 0, 0]: 1}
>>> for subdistribution in sorted(bij.minimal_subdistributions_iterator()):
...     print(subdistribution)
([[]], [0])
([[1, 0]], [1])
([[1, 0, 1, 0], [1, 1, 0, 0]], [1, 2])
```

An example with two elements of the same block in a subdistribution:

```
sage: A = B = ["a", "b", "c", "d", "e"]
sage: tau = {"a": 1, "b": 1, "c": 2, "d": 2, "e": 3}.get
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_constant_blocks([["a", "b"]])
sage: bij.set_value_restrictions(("a", [1, 2]))
sage: bij.constant_blocks(optimal=True)
{{'a', 'b'}}
sage: list(bij.minimal_subdistributions_iterator())
[(['a', 'b', 'c', 'd', 'e'], [1, 1, 2, 2, 3])]
```

```
>>> from sage.all import *
>>> A = B = ["a", "b", "c", "d", "e"]
>>> tau = {"a": Integer(1), "b": Integer(1), "c": Integer(2), "d": Integer(2),
↪ "e": Integer(3)}.get
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_constant_blocks([["a", "b"]])
>>> bij.set_value_restrictions(("a", [Integer(1), Integer(2)]))
>>> bij.constant_blocks(optimal=True)
{{'a', 'b'}}
>>> list(bij.minimal_subdistributions_iterator())
[(['a', 'b', 'c', 'd', 'e'], [1, 1, 2, 2, 3])]
```

possible_values(*p=None*, *optimal=False*)

Return for each block the values of s compatible with the imposed restrictions.

INPUT:

- `p` – (optional) a block of P, or an element of a block of P, or a list of these
- `optimal` – boolean (default: `False`); whether or not to compute the minimal possible set of statistic values

Note

Computing the minimal possible set of statistic values may be computationally expensive.

Todo

currently, calling this method with `optimal=True` does not update the internal dictionary, because this would interfere with the variables of the MILP.

EXAMPLES:

```
sage: A = B = ["a", "b", "c", "d"]
sage: tau = {"a": 1, "b": 1, "c": 1, "d": 2}.get
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_constant_blocks([["a", "b"]])
sage: bij.possible_values(A)
{'a': {1, 2}, 'b': {1, 2}, 'c': {1, 2}, 'd': {1, 2}}
sage: bij.possible_values(A, optimal=True)
{'a': {1}, 'b': {1}, 'c': {1, 2}, 'd': {1, 2}}
```

```
>>> from sage.all import *
>>> A = B = ["a", "b", "c", "d"]
>>> tau = {"a": Integer(1), "b": Integer(1), "c": Integer(1), "d": Integer(2)}
↪.get
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_constant_blocks([["a", "b"]])
>>> bij.possible_values(A)
{'a': {1, 2}, 'b': {1, 2}, 'c': {1, 2}, 'd': {1, 2}}
>>> bij.possible_values(A, optimal=True)
{'a': {1}, 'b': {1}, 'c': {1, 2}, 'd': {1, 2}}
```

The internal dictionary is not updated:

```
sage: bij.possible_values(A)
{'a': {1, 2}, 'b': {1, 2}, 'c': {1, 2}, 'd': {1, 2}}
```

```
>>> from sage.all import *
>>> bij.possible_values(A)
{'a': {1, 2}, 'b': {1, 2}, 'c': {1, 2}, 'd': {1, 2}}
```

set_constant_blocks(P)

Declare that $s : A \to Z$ is constant on each block of P.

Warning

Any restriction imposed by a previous invocation of *set_constant_blocks()* will be overwritten, including restrictions discovered by *set_intertwining_relations()* and *solutions_iterator()*!

A common example is to use the orbits of a bijection acting on A. This can be achieved using the function *orbit_decomposition()*.

INPUT:

- `P` – set partition of A, singletons may be omitted

EXAMPLES:

Initially the partitions are set to singleton blocks. The current partition can be reviewed using *constant_blocks()*:

```
sage: A = B = 'abcd'
sage: bij = Bijectionist(A, B, lambda x: B.index(x) % 2)
sage: bij.constant_blocks()
{}

sage: bij.set_constant_blocks([['a', 'c']])
sage: bij.constant_blocks()
{{'a', 'c'}}
```

```
>>> from sage.all import *
>>> A = B = 'abcd'
>>> bij = Bijectionist(A, B, lambda x: B.index(x) % Integer(2))
>>> bij.constant_blocks()
{}

>>> bij.set_constant_blocks([['a', 'c']])
>>> bij.constant_blocks()
{{'a', 'c'}}
```

We now add a map that combines some blocks:

```
sage: def pi(p1, p2): return 'abcdefgh'[A.index(p1) + A.index(p2)]
sage: def rho(s1, s2): return (s1 + s2) % 2
sage: bij.set_intertwining_relations((2, pi, rho))
sage: list(bij.solutions_iterator())
[{'a': 0, 'b': 1, 'c': 0, 'd': 1}]
sage: bij.constant_blocks()
{{'a', 'c'}, {'b', 'd'}}
```

```
>>> from sage.all import *
>>> def pi(p1, p2): return 'abcdefgh'[A.index(p1) + A.index(p2)]
>>> def rho(s1, s2): return (s1 + s2) % Integer(2)
>>> bij.set_intertwining_relations((Integer(2), pi, rho))
>>> list(bij.solutions_iterator())
[{'a': 0, 'b': 1, 'c': 0, 'd': 1}]
>>> bij.constant_blocks()
{{'a', 'c'}, {'b', 'd'}}
```

Setting constant blocks overrides any previous assignment:

```
sage: bij.set_constant_blocks([['a', 'b']])
sage: bij.constant_blocks()
{{'a', 'b'}}
```

```
>>> from sage.all import *
>>> bij.set_constant_blocks([['a', 'b']])
>>> bij.constant_blocks()
{{'a', 'b'}}
```

If there is no solution, and the coarsest partition is requested, an error is raised:

```
sage: bij.constant_blocks(optimal=True)
Traceback (most recent call last):
...
StopIteration
```

```
>>> from sage.all import *
>>> bij.constant_blocks(optimal=True)
Traceback (most recent call last):
...
StopIteration
```

set_distributions(**elements_distributions*)

Specify the distribution of s for a subset of elements.

> **Warning**
>
> Any restriction imposed by a previous invocation of *set_distributions()* will be overwritten!

INPUT:

- one or more pairs of $(\tilde{A}, \tilde{Z})$, where $\tilde{A} \subseteq A$ and $\tilde{Z}$ is a list of values in Z of the same size as $\tilde{A}$

This method specifies that $\{s(a)|a \in \tilde{A}\}$ equals $\tilde{Z}$ as a multiset for each of the pairs.

When specifying several distributions, the subsets of A do not have to be disjoint.

ALGORITHM:

We add

$$\sum_{a \in \tilde{A}} x_{p(a),z} t^z = \sum_{z \in \tilde{Z}} t^z,$$

where $p(a)$ is the block containing a, for each given distribution as a vector equation to the MILP.

EXAMPLES:

```
sage: A = B = [permutation for n in range(4) for permutation in␣
↪Permutations(n)]
sage: tau = Permutation.longest_increasing_subsequence_length
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_statistics((len, len))
sage: bij.set_distributions(([Permutation([1, 2, 3]), Permutation([1, 3, 2])],
↪ [1, 3]))
sage: for sol in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(sol)
{[]: 0, [1]: 1, [1, 2]: 1, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 3, [2, 1, 3]:␣
↪2, [2, 3, 1]: 2, [3, 1, 2]: 2, [3, 2, 1]: 2}
{[]: 0, [1]: 1, [1, 2]: 1, [2, 1]: 2, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪2, [2, 3, 1]: 2, [3, 1, 2]: 2, [3, 2, 1]: 2}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 1, [1, 2, 3]: 1, [1, 3, 2]: 3, [2, 1, 3]:␣
↪2, [2, 3, 1]: 2, [3, 1, 2]: 2, [3, 2, 1]: 2}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 1, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪2, [2, 3, 1]: 2, [3, 1, 2]: 2, [3, 2, 1]: 2}
```

(continues on next page)

(continued from previous page)

```
sage: bij.constant_blocks(optimal=True)
{{[2, 1, 3], [2, 3, 1], [3, 1, 2], [3, 2, 1]}}
sage: sorted(bij.minimal_subdistributions_blocks_iterator(), key=lambda d:␣
↪(len(d[0]), d[0]))
[([[]], [0]),
 ([[1]], [1]),
 ([[2, 1, 3]], [2]),
 ([[1, 2], [2, 1]], [1, 2]),
 ([[1, 2, 3], [1, 3, 2]], [1, 3])]
```

```
>>> from sage.all import *
>>> A = B = [permutation for n in range(Integer(4)) for permutation in␣
↪Permutations(n)]

set_homomesic(Q)

Assert that the average of s on each block of Q is constant.

INPUT:

- `Q` – set partition of `A`

EXAMPLES:

```
sage: A = B = [1,2,3]
sage: bij = Bijectionist(A, B, lambda b: b % 3)
sage: bij.set_homomesic([[1,2], [3]])
sage: sorted(bij.solutions_iterator(), key=lambda d: tuple(sorted(d.items())))
```

(continues on next page)

(continued from previous page)

```
[{1: 0, 2: 2, 3: 1}, {1: 2, 2: 0, 3: 1}]
```

```
>>> from sage.all import *
>>> A = B = [Integer(1),Integer(2),Integer(3)]
>>> bij = Bijectionist(A, B, lambda b: b % Integer(3))
>>> bij.set_homomesic([[Integer(1),Integer(2)], [Integer(3)]])
>>> sorted(bij.solutions_iterator(), key=lambda d: tuple(sorted(d.items())))
[{1: 0, 2: 2, 3: 1}, {1: 2, 2: 0, 3: 1}]
```

set_intertwining_relations(*pi_rho)

Add restrictions of the form $s(\pi(a_1, \ldots, a_k)) = \rho(s(a_1), \ldots, s(a_k))$.

Warning

Any restriction imposed by a previous invocation of *set_intertwining_relations()* will be overwritten!

INPUT:

- pi_rho – one or more tuples $(k, \pi : A^k \to A, \rho : Z^k \to Z, \tilde{A})$ where $\tilde{A}$ (optional) is a k-ary function that returns true if and only if a k-tuple of objects in A is in the domain of π

ALGORITHM:

The relation

$$s(\pi(a_1, \ldots, a_k)) = \rho(s(a_1), \ldots, s(a_k))$$

for each pair (π, ρ) implies immediately that $s(\pi(a_1, \ldots, a_k))$ only depends on the blocks of $a_1, \ldots, a_k$.

The MILP formulation is as follows. Let $a_1, \ldots, a_k \in A$ and let $a = \pi(a_1, \ldots, a_k)$. Let $z_1, \ldots, z_k \in Z$ and let $z = \rho(z_1, \ldots, z_k)$. Suppose that $a_i \in p_i$ for all i and that $a \in p$.

We then want to model the implication

$$x_{p_1,z_1} = 1, \ldots, x_{p_k,z_k} = 1 \Rightarrow x_{p,z} = 1.$$

We achieve this by requiring

$$x_{p,z} \geq 1 - k + \sum_{i=1}^{k} x_{p_i,z_i}.$$

Note that z must be a possible value of p and each z_i must be a possible value of p_i.

EXAMPLES:

We can concatenate two permutations by increasing the values of the second permutation by the length of the first permutation:

```
sage: def concat(p1, p2): return Permutation(p1 + [i + len(p1) for i in p2])
```

```
>>> from sage.all import *
>>> def concat(p1, p2): return Permutation(p1 + [i + len(p1) for i in p2])
```

We may be interested in statistics on permutations which are equidistributed with the number of fixed points, such that concatenating permutations corresponds to adding statistic values:

```
sage: A = B = [permutation for n in range(4) for permutation in␣
↪Permutations(n)]
sage: bij = Bijectionist(A, B, Permutation.number_of_fixed_points)
sage: bij.set_statistics((len, len))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(solution)
...
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 0, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
...
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 1, [2, 1, 3]:␣
↪3, [2, 3, 1]: 0, [3, 1, 2]: 0, [3, 2, 1]: 1}
...

sage: bij.set_intertwining_relations((2, concat, lambda x, y: x + y))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(solution)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 0}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 0}
```

```
>>> from sage.all import *
>>> A = B = [permutation for n in range(Integer(4)) for permutation in␣
↪Permutations(n)]
>>> bij = Bijectionist(A, B, Permutation.number_of_fixed_points)
>>> bij.set_statistics((len, len))
>>> for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
...     print(solution)
...
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 0, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
...
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 1, [2, 1, 3]:␣
↪3, [2, 3, 1]: 0, [3, 1, 2]: 0, [3, 2, 1]: 1}
...

>>> bij.set_intertwining_relations((Integer(2), concat, lambda x, y: x + y))
>>> for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
...     print(solution)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 0}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 0}
```

The domain of the composition may be restricted. E.g., if we concatenate only permutations starting with a 1, we obtain fewer forced elements:

```
sage: in_domain = lambda p1, p2: (not p1 or p1(1) == 1) and (not p2 or p2(1)␣
↪== 1)
sage: bij.set_intertwining_relations((2, concat, lambda x, y: x + y, in_
↪domain))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(solution)
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 0}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣

↪0, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 0}
```

(continues on next page)

(continued from previous page)

```
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 0, [3, 2, 1]: 1}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 0, [3, 1, 2]: 1, [3, 2, 1]: 0}
{[]: 0, [1]: 1, [1, 2]: 2, [2, 1]: 0, [1, 2, 3]: 3, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 0, [3, 2, 1]: 0}
```

We can also restrict according to several composition functions. For example, we may additionally concatenate permutations by incrementing the elements of the first:

```
sage: skew_concat = lambda p1, p2: Permutation([i + len(p2) for i in p1] +␣
↪list(p2))
sage: bij.set_intertwining_relations((2, skew_concat, lambda x, y: x + y))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
....:     print(solution)
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 0, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 0, [1, 3, 2]: 1, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 0, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
```

```
>>> from sage.all import *
>>> skew_concat = lambda p1, p2: Permutation([i + len(p2) for i in p1] +␣
↪list(p2))
>>> bij.set_intertwining_relations((Integer(2), skew_concat, lambda x, y: x +␣
↪y))
>>> for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):
...     print(solution)
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 0, [1, 3, 2]: 0, [2, 1, 3]:␣
↪1, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 0, [1, 3, 2]: 1, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
{[]: 0, [1]: 1, [1, 2]: 0, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 0, [2, 1, 3]:␣
↪0, [2, 3, 1]: 1, [3, 1, 2]: 1, [3, 2, 1]: 3}
```

However, this yields no solution:

```
sage: bij.set_intertwining_relations((2, concat, lambda x, y: x + y), (2,␣
↪skew_concat, lambda x, y: x + y))
sage: list(bij.solutions_iterator())
[]
```

```
>>> from sage.all import *
>>> bij.set_intertwining_relations((Integer(2), concat, lambda x, y: x + y),␣
↪(Integer(2), skew_concat, lambda x, y: x + y))
>>> list(bij.solutions_iterator())
[]
```

set_quadratic_relation(**phi_psi*)

Add restrictions of the form $s \circ \psi \circ s = \phi$.

INPUT:

- `phi_psi` – (optional) a list of pairs (ϕ, ρ) where $\phi : A \to Z$ and $\psi : Z \to A$

ALGORITHM:

We add

$$x_{p(a),z} = x_{p(\psi(z)),\phi(a)}$$

for $a \in A$ and $z \in Z$ to the MILP, where $\phi : A \to Z$ and $\psi : Z \to A$. Note that, in particular, ϕ must be constant on blocks.

EXAMPLES:

```
sage: A = B = DyckWords(3)
sage: bij = Bijectionist(A, B)
sage: bij.set_statistics((lambda D: D.number_of_touch_points(), lambda D: D.
↪number_of_initial_rises()))
sage: ascii_art(sorted(bij.minimal_subdistributions_iterator()))
[ (             [   /\   ] )
[ (             [  /  \  ] )  ( [    /\    /\    ]  [  /\      /\/\  ] )
[ ( [ /\/\/\ ], [ /    \ ] ), ( [ /\/  \, /  \/\ ], [ /  \/\, /    \ ] ),

 ( [           /\   ]                       ) ]
 ( [  /\/\    /  \  ]  [            /\  ] ) ]
 ( [ /    \, /    \ ], [ /\/\/\, /\/  \ ] ) ]
sage: bij.set_quadratic_relation((lambda D: D, lambda D: D))
sage: ascii_art(sorted(bij.minimal_subdistributions_iterator()))
[ (             [   /\   ] )
[ (             [  /  \  ] )  ( [    /\  ]  [  /\/\  ] )
[ ( [ /\/\/\ ], [ /    \ ] ), ( [ /\/  \ ], [ /    \ ] ),

 ( [  /\    ]  [  /\    ] )  ( [  /\/\  ]  [    /\  ] )
 ( [ /  \/\ ], [ /  \/\ ] ), ( [ /    \ ], [ /\/  \ ] ),

 ( [   /\   ]             ) ]
 ( [  /  \  ]             ) ]
 ( [ /    \ ], [ /\/\/\ ] ) ]
```

```
>>> from sage.all import *
>>> A = B = DyckWords(Integer(3))
>>> bij = Bijectionist(A, B)

 ( [ /    \ ], [ /\/\/\ ] ) ]
```

set_semi_conjugacy(*pi_rho)

alias of *set_intertwining_relations()*.

set_statistics(*alpha_beta)

Set constraints of the form $\alpha = \beta \circ S$.

> **Warning**
>
> Any restriction imposed by a previous invocation of *set_statistics()* will be overwritten!

INPUT:

- alpha_beta – one or more pairs $(\alpha : A \to W, \beta : B \to W)$

If the statistics α and β are not equidistributed, an error is raised.

ALGORITHM:

We add

$$\sum_{a \in A, z \in Z} x_{p(a),z} s^z t^{\alpha(a)} = \sum_{b \in B} s^{\tau(b)} t(\beta(b))$$

as a matrix equation to the MILP.

EXAMPLES:

We look for bijections S on permutations such that the number of weak exceedences of $S(\pi)$ equals the number of descents of π, and statistics s, such that the number of fixed points of $S(\pi)$ equals $s(\pi)$:

```
sage: N = 4; A = B = [permutation for n in range(N) for permutation in␣
↪Permutations(n)]
sage: def wex(p): return len(p.weak_excedences())
sage: def fix(p): return len(p.fixed_points())
sage: def des(p): return len(p.descents(final_descent=True)) if p else 0
sage: def adj(p): return len([e for e, f in zip(p, p[1:]+[0]) if e == f+1])
sage: bij = Bijectionist(A, B, fix)
sage: bij.set_statistics((wex, des), (len, len))
sage: for solution in sorted(list(bij.solutions_iterator()), key=lambda d:␣
↪tuple(sorted(d.items()))):

Calling this with non-equidistributed statistics yields an error:

```
sage: bij = Bijectionist(A, B, fix)
sage: bij.set_statistics((wex, fix))
Traceback (most recent call last):
...
ValueError: statistics alpha and beta are not equidistributed
```

```
>>> from sage.all import *
>>> bij = Bijectionist(A, B, fix)
>>> bij.set_statistics((wex, fix))
Traceback (most recent call last):
...
ValueError: statistics alpha and beta are not equidistributed
```

set_value_restrictions(**value_restrictions*)

Restrict the set of possible values $s(a)$ for a given element a.

> **Warning**
>
> Any restriction imposed by a previous invocation of *set_value_restrictions()* will be overwritten!

INPUT:

- `value_restrictions` – one or more pairs $(a \in A, \tilde{Z} \subseteq Z)$

EXAMPLES:

We may want to restrict the value of a given element to a single or multiple values. We do not require that the specified values are in the image of τ. In some cases, the restriction may not be able to provide a better solution, as for size 3 in the following example.

```
sage: A = B = [permutation for n in range(4) for permutation in␣
↪Permutations(n)]
sage: tau = Permutation.longest_increasing_subsequence_length
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_statistics((len, len))
sage: bij.set_value_restrictions((Permutation([1, 2]), [1]),
....:                            (Permutation([3, 2, 1]), [2, 3, 4]))
sage: for sol in sorted(bij.solutions_iterator(), key=lambda d: sorted(d.
↪items())):
```

(continues on next page)

(continued from previous page)

```
....:     print(sol)
{[]: 0, [1]: 1, [1, 2]: 1, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 2, [2, 1, 3]:␣
↪2, [2, 3, 1]: 2, [3, 1, 2]: 2, [3, 2, 1]: 3}
{[]: 0, [1]: 1, [1, 2]: 1, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 2, [2, 1, 3]:␣
↪2, [2, 3, 1]: 2, [3, 1, 2]: 3, [3, 2, 1]: 2}
{[]: 0, [1]: 1, [1, 2]: 1, [2, 1]: 2, [1, 2, 3]: 1, [1, 3, 2]: 2, [2, 1, 3]:␣

However, an error occurs if the set of possible values is empty. In this example, the image of τ under any legal bijection is disjoint to the specified values.

solutions_iterator()

An iterator over all solutions of the problem.

OUTPUT: an iterator over all possible mappings $s : A \to Z$

ALGORITHM:

We solve an integer linear program with a binary variable $x_{p,z}$ for each partition block $p \in P$ and each statistic value $z \in Z$:

- $x_{p,z} = 1$ if and only if $s(a) = z$ for all $a \in p$.

Then we add the constraint $\sum_{x \in V} x < |V|$, where V is the set containing all x with $x = 1$, that is, those indicator variables representing the current solution. Therefore, a solution of this new program must be different from all those previously obtained.

INTEGER LINEAR PROGRAM:

- Let $m_w(p)$, for a block p of P, be the multiplicity of the value w in W under α, that is, the number of elements $a \in p$ with $\alpha(a) = w$.
- Let $n_w(z)$ be the number of elements $b \in B$ with $\beta(b) = w$ and $\tau(b) = z$ for $w \in W$, $z \in Z$.
- Let k be the arity of a pair (π, ρ) in an intertwining relation.

and the following constraints:

- because every block is assigned precisely one value, for all $p \in P$,

$$\sum_z x_{p,z} = 1.$$

- because the statistics s and τ and also α and β are equidistributed, for all $w \in W$ and $z \in Z$,

$$\sum_p m_w(p) x_{p,z} = n_w(z).$$

- for each intertwining relation $s(\pi(a_1, \ldots, a_k)) = \rho(s(a_1), \ldots, s(a_r))$, and for all k-combinations of blocks $p_i \in P$ such that there exist $(a_1, \ldots, a_k) \in p_1 \times \cdots \times p_k$ with $\pi(a_1, \ldots, a_k) \in W$ and $z = \rho(z_1, \ldots, z_k)$,

$$x_{p,z} \geq 1 - k + \sum_{i=1}^{k} x_{p_i,z_i}.$$

- for each distribution restriction, i.e. a set of elements $\tilde{A}$ and a distribution of values given by integers d_z representing the multiplicity of each $z \in Z$, and $r_p = |p \cap \tilde{A}|$ indicating the relative size of block p in the set of elements of the distribution,

$$\sum_p r_p x_{p,z} = d_z.$$

EXAMPLES:

```
sage: A = B = 'abc'
sage: bij = Bijectionist(A, B, lambda x: B.index(x) % 2, solver='GLPK')
sage: next(bij.solutions_iterator())
{'a': 0, 'b': 1, 'c': 0}

sage: list(bij.solutions_iterator())
[{'a': 0, 'b': 1, 'c': 0},
 {'a': 1, 'b': 0, 'c': 0},
 {'a': 0, 'b': 0, 'c': 1}]

sage: N = 4
sage: A = B = [permutation for n in range(N) for permutation in␣
↪Permutations(n)]
```

```
>>> from sage.all import *
>>> A = B = 'abc'
>>> bij = Bijectionist(A, B, lambda x: B.index(x) % Integer(2), solver='GLPK')
>>> next(bij.solutions_iterator())
{'a': 0, 'b': 1, 'c': 0}

>>> list(bij.solutions_iterator())
[{'a': 0, 'b': 1, 'c': 0},
 {'a': 1, 'b': 0, 'c': 0},
 {'a': 0, 'b': 0, 'c': 1}]

>>> N = Integer(4)
>>> A = B = [permutation for n in range(N) for permutation in Permutations(n)]
```

Let τ be the number of non-left-to-right-maxima of a permutation:

```
sage: def tau(pi):
....:     pi = list(pi)
....:     i = count = 0
....:     for j in range(len(pi)):
....:         if pi[j] > i:
....:             i = pi[j]
....:         else:
....:             count += 1
....:     return count
```

```
>>> from sage.all import *
>>> def tau(pi):
...     pi = list(pi)
...     i = count = Integer(0)
...     for j in range(len(pi)):
...         if pi[j] > i:
...             i = pi[j]
...         else:
...             count += Integer(1)
```

(continues on next page)

(continued from previous page)

```
...     return count
```

We look for a statistic which is constant on conjugacy classes:

```
sage: P = [list(a) for n in range(N) for a in Permutations(n).conjugacy_
↪classes()]

sage: bij = Bijectionist(A, B, tau, solver='GLPK')
sage: bij.set_statistics((len, len))
sage: bij.set_constant_blocks(P)
sage: for solution in bij.solutions_iterator():
....:     print(solution)
{[]: 0, [1]: 0, [1, 2]: 1, [2, 1]: 0, [1, 2, 3]: 0, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [3, 2, 1]: 1, [2, 3, 1]: 2, [3, 1, 2]: 2}
{[]: 0, [1]: 0, [1, 2]: 0, [2, 1]: 1, [1, 2, 3]: 0, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [3, 2, 1]: 1, [2, 3, 1]: 2, [3, 1, 2]: 2}
```

```
>>> from sage.all import *
>>> P = [list(a) for n in range(N) for a in Permutations(n).conjugacy_
↪classes()]

>>> bij = Bijectionist(A, B, tau, solver='GLPK')
>>> bij.set_statistics((len, len))
>>> bij.set_constant_blocks(P)
>>> for solution in bij.solutions_iterator():
...     print(solution)
{[]: 0, [1]: 0, [1, 2]: 1, [2, 1]: 0, [1, 2, 3]: 0, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [3, 2, 1]: 1, [2, 3, 1]: 2, [3, 1, 2]: 2}
{[]: 0, [1]: 0, [1, 2]: 0, [2, 1]: 1, [1, 2, 3]: 0, [1, 3, 2]: 1, [2, 1, 3]:␣
↪1, [3, 2, 1]: 1, [2, 3, 1]: 2, [3, 1, 2]: 2}
```

Changing or re-setting problem parameters clears the internal cache. Setting the verbosity prints the MILP which is solved.:

    statistics: 1 <= x_1 <= 1
    statistics: 0 <= <= 0
    statistics: 0 <= <= 0
    statistics: 1 <= x_2 + x_4 <= 1
    statistics: 1 <= x_3 + x_5 <= 1
    statistics: 0 <= <= 0
    statistics: 1 <= x_6 + 3 x_9 + 2 x_12 <= 1
    statistics: 3 <= x_7 + 3 x_10 + 2 x_13 <= 3
    statistics: 2 <= x_8 + 3 x_11 + 2 x_14 <= 2
    veto: x_0 + x_1 + x_3 + x_4 + x_6 + x_10 + x_14 <= 6
    veto: x_0 + x_1 + x_2 + x_5 + x_6 + x_10 + x_14 <= 6

>>> set_verbose(Integer(0))
```

statistics_fibers()

Return a dictionary mapping statistic values in W to their preimages in A and B.

This is a (computationally) fast way to obtain a first impression which objects in A should be mapped to which objects in B.

EXAMPLES:

```
sage: A = B = [permutation for n in range(4) for permutation in␣
↪Permutations(n)]
sage: tau = Permutation.longest_increasing_subsequence_length
sage: def wex(p): return len(p.weak_excedences())
sage: def fix(p): return len(p.fixed_points())
sage: def des(p): return len(p.descents(final_descent=True)) if p else 0
sage: def adj(p): return len([e for e, f in zip(p, p[1:]+[0]) if e == f+1])
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_statistics((len, len), (wex, des), (fix, adj))
sage: table([[key, AB[0], AB[1]] for key, AB in bij.statistics_fibers().
↪items()])
  (0, 0, 0)   [[]]                                [[]]
  (1, 1, 1)   [[1]]                               [[1]]
  (2, 2, 2)   [[1, 2]]                            [[2, 1]]
  (2, 1, 0)   [[2, 1]]                            [[1, 2]]
  (3, 3, 3)   [[1, 2, 3]]                         [[3, 2, 1]]
  (3, 2, 1)   [[1, 3, 2], [2, 1, 3], [3, 2, 1]]   [[1, 3, 2], [2, 1, 3], [2,␣
↪3, 1]]
  (3, 2, 0)   [[2, 3, 1]]                         [[3, 1, 2]]
  (3, 1, 0)   [[3, 1, 2]]                         [[1, 2, 3]]
```

```
>>> from sage.all import *
>>> A = B = [permutation for n in range(Integer(4)) for permutation in␣
↪Permutations(n)]
>>> tau = Permutation.longest_increasing_subsequence_length
>>> def wex(p): return len(p.weak_excedences())
>>> def fix(p): return len(p.fixed_points())
>>> def des(p): return len(p.descents(final_descent=True)) if p else␣
↪Integer(0)
>>> def adj(p): return len([e for e, f in zip(p, p[Integer(1):]+[Integer(0)])␣
↪if e == f+Integer(1)])
>>> bij = Bijectionist(A, B, tau)
>>> bij.set_statistics((len, len), (wex, des), (fix, adj))
>>> table([[key, AB[Integer(0)], AB[Integer(1)]] for key, AB in bij.
↪statistics_fibers().items()])
  (0, 0, 0)   [[]]                                [[]]
  (1, 1, 1)   [[1]]                               [[1]]
  (2, 2, 2)   [[1, 2]]                            [[2, 1]]
  (2, 1, 0)   [[2, 1]]                            [[1, 2]]
  (3, 3, 3)   [[1, 2, 3]]                         [[3, 2, 1]]
  (3, 2, 1)   [[1, 3, 2], [2, 1, 3], [3, 2, 1]]   [[1, 3, 2], [2, 1, 3], [2,␣
↪3, 1]]
  (3, 2, 0)   [[2, 3, 1]]                         [[3, 1, 2]]
  (3, 1, 0)   [[3, 1, 2]]                         [[1, 2, 3]]
```

statistics_table(*header=True*)

Provide information about all elements of A with corresponding α values and all elements of B with corresponding β and τ values.

INPUT:

- `header` – boolean (default: `True`); whether to include a header with the standard Greek letters

OUTPUT:

A pair of lists suitable for `table`, where

- the first contains the elements of A together with the values of α
- the second contains the elements of B together with the values of τ and β

EXAMPLES:

```
sage: A = B = [permutation for n in range(4) for permutation in␣
↪Permutations(n)]
sage: tau = Permutation.longest_increasing_subsequence_length
sage: def wex(p): return len(p.weak_excedences())
sage: def fix(p): return len(p.fixed_points())
sage: def des(p): return len(p.descents(final_descent=True)) if p else 0
sage: def adj(p): return len([e for e, f in zip(p, p[1:]+[0]) if e == f+1])
sage: bij = Bijectionist(A, B, tau)
sage: bij.set_statistics((wex, des), (fix, adj))
sage: a, b = bij.statistics_table()
sage: table(a, header_row=True, frame=True)

```

Abstract recursive trees

The purpose of this class is to help implement trees with a specific structure on the children of each node. For instance, one could want to define a tree in which each node sees its children as linearly (see the *Ordered Trees* module) or cyclically ordered.

Tree structures

Conceptually, one can define a tree structure from any object that can contain others. Indeed, a list can contain lists which contain lists which contain lists, and thus define a tree … The same can be done with sets, or any kind of iterable objects.

While any iterable is sufficient to encode trees, it can prove useful to have other methods available like isomorphism tests (see next section), conversions to DiGraphs objects (see *as_digraph()*) or computation of the number of automorphisms constrained by the structure on children. Providing such methods is the whole purpose of the *AbstractTree* class.

As a result, the *AbstractTree* class is not meant to be instantiated, but extended. It is expected that classes extending this one may also inherit from classes representing iterables, for instance `ClonableArray` or `ClonableList`

Constrained Trees

The tree built from a specific container will reflect the properties of the container. Indeed, if `A` is an iterable class whose elements are linearly ordered, a class `B` extending both of *AbstractTree* and `A` will be such that the children of a node will be linearly ordered. If `A` behaves like a set (i.e. if there is no order on the elements it contains), then two trees will be considered as equal if one can be obtained from the other through permutations between the children of a same node (see next section).

Paths and ID

It is expected that each element of a set of children should be identified by its index in the container. This way, any node of the tree can be identified by a word describing a path from the root node.

Canonical labellings

Equality between instances of classes extending both *AbstractTree* and `A` is entirely defined by the equality defined on the elements of `A`. A canonical labelling of such a tree, however, should be such that two trees `a` and `b` satisfying `a == b` have the same canonical labellings. On the other hand, the canonical labellings of trees `a` and `b` satisfying `a != b` are expected to be different.

For this reason, the values returned by the *canonical_labelling* method heavily depend on the data structure used for a node's children and **should be overridden** by most of the classes extending *AbstractTree* if it is incoherent with the data structure.

Authors

- Florent Hivert (2010-2011): initial revision
- Frédéric Chapoton (2011): contributed some methods

class sage.combinat.abstract_tree.**AbstractClonableTree**

Bases: *AbstractTree*

Abstract Clonable Tree.

An abstract class for trees with clone protocol (see `list_clone`). It is expected that classes extending this one may also inherit from classes like `ClonableArray` or `ClonableList` depending whether one wants to build trees where adding a child is allowed.

> **Note**
>
> Due to the limitation of Cython inheritance, one cannot inherit here from `ClonableElement`, because it would prevent us from later inheriting from `ClonableArray` or `ClonableList`.

How should this class be extended ?

A class extending *AbstractClonableTree* should satisfy the following assumptions:

- An instantiable class extending *AbstractClonableTree* should also extend the `ClonableElement` class or one of its subclasses generally, at least `ClonableArray`.
- To respect the Clone protocol, the *AbstractClonableTree.check()* method should be overridden by the new class.

See also the assumptions in *AbstractTree*.

check()

Check that `self` is a correct tree.

This method does nothing. It is implemented here because many extensions of *AbstractClonableTree* also extend `sage.structure.list_clone.ClonableElement`, which requires it.

It should be overridden in subclasses in order to check that the characterizing property of the respective kind of tree holds (eg: two children for binary trees).

EXAMPLES:

```
sage: OrderedTree([[],[[]]]).check()
sage: BinaryTree([[],[],[]]).check()
```

```
sage: from sage.all import *
sage: OrderedTree([[],[[]]]).check()
sage: BinaryTree([[],[],[]]).check()
```

```
>>> from sage.all import *
>>> OrderedTree([[],[[]]]).check()
>>> BinaryTree([[],[],[]]).check()
```

class sage.combinat.abstract_tree.**AbstractLabelledClonableTree**(*parent*, *children*, *label=None*, *check=True*)

Bases: *AbstractLabelledTree*, *AbstractClonableTree*

Abstract Labelled Clonable Tree.

This class takes care of modification for the label by the clone protocol.

Note

Due to the limitation of Cython inheritance, one cannot inherit here from `ClonableArray`, because it would prevent us to inherit later from `ClonableList`.

map_labels(*f*)

Apply the function f to the labels of `self`.

This method returns a copy of `self` on which the function f has been applied on all labels (a label x is replaced by $f(x)$).

EXAMPLES:

```
sage: LT = LabelledOrderedTree
sage: t = LT([LT([],label=1),LT([],label=7)],label=3); t
3[1[], 7[]]
sage: t.map_labels(lambda z:z+1)
4[2[], 8[]]

sage: LBT = LabelledBinaryTree
sage: bt = LBT([LBT([],label=1),LBT([],label=4)],label=2); bt
2[1[., .], 4[., .]]
sage: bt.map_labels(lambda z:z+1)
3[2[., .], 5[., .]]
```

```
>>> from sage.all import *
>>> LT = LabelledOrderedTree
>>> t = LT([LT([],label=Integer(1)),LT([],label=Integer(7))],
↪label=Integer(3)); t
3[1[], 7[]]
>>> t.map_labels(lambda z:z+Integer(1))
4[2[], 8[]]

>>> LBT = LabelledBinaryTree
>>> bt = LBT([LBT([],label=Integer(1)),LBT([],label=Integer(4))],
↪label=Integer(2)); bt
2[1[., .], 4[., .]]
>>> bt.map_labels(lambda z:z+Integer(1))
3[2[., .], 5[., .]]
```

set_label(*path*, *label*)

Change the label of subtree indexed by `path` to `label`.

INPUT:

- `path` – `None` (default) or a path (list or tuple of children index in the tree)
- `label` – any sage object

OUTPUT: nothing, `self` is modified in place

Note

`self` must be in a mutable state. See `sage.structure.list_clone` for more details about mutability.

EXAMPLES:

```
sage: t = LabelledOrderedTree([[],[[],[]]])
sage: t.set_label((0,), 4)
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
sage: with t.clone() as t:
....:     t.set_label((0,), 4)
sage: t
None[4[], None[None[], None[]]]
sage: with t.clone() as t:
....:     t.set_label((1,0), label = 42)
sage: t
None[4[], None[42[], None[]]]
```

```
>>> from sage.all import *
>>> t = LabelledOrderedTree([[],[[],[]]])
>>> t.set_label((Integer(0),), Integer(4))
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
>>> with t.clone() as t:
...     t.set_label((Integer(0),), Integer(4))
>>> t
None[4[], None[None[], None[]]]
>>> with t.clone() as t:
...     t.set_label((Integer(1),Integer(0)), label = Integer(42))
>>> t
None[4[], None[42[], None[]]]
```

Todo

Do we want to implement the following syntactic sugar:

```
with t.clone() as tt:
    tt.labels[1,2] = 3 ?
```

set_root_label(*label*)

Set the label of the root of `self`.

INPUT:

- `label` – any Sage object

OUTPUT: none, `self` is modified in place

> **Note**
>
> `self` must be in a mutable state. See `sage.structure.list_clone` for more details about mutability.

EXAMPLES:

```
sage: t = LabelledOrderedTree([[],[[],[]]])
sage: t.set_root_label(3)
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
sage: with t.clone() as t:
....:     t.set_root_label(3)
sage: t.label()
3
sage: t
3[None[], None[None[], None[]]]
```

```
>>> from sage.all import *
>>> t = LabelledOrderedTree([[],[[],[]]])
>>> t.set_root_label(Integer(3))
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
>>> with t.clone() as t:
...     t.set_root_label(Integer(3))
>>> t.label()
3
>>> t
3[None[], None[None[], None[]]]
```

This also works for binary trees:

```
sage: bt = LabelledBinaryTree([[],[]])
sage: bt.set_root_label(3)
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
sage: with bt.clone() as bt:
....:     bt.set_root_label(3)
sage: bt.label()
3
sage: bt
3[None[., .], None[., .]]
```

```
>>> from sage.all import *
>>> bt = LabelledBinaryTree([[],[]])
```

(continues on next page)

(continued from previous page)

```
>>> bt.set_root_label(Integer(3))
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
>>> with bt.clone() as bt:
...     bt.set_root_label(Integer(3))
>>> bt.label()
3
>>> bt
3[None[., .], None[., .]]
```

class sage.combinat.abstract_tree.**AbstractLabelledTree**(*parent*, *children*, *label=None*, *check=True*)

Bases: *AbstractTree*

Abstract Labelled Tree.

Typically a class for labelled trees is constructed by inheriting from a class for unlabelled trees and *AbstractLabelledTree*.

How should this class be extended ?

A class extending *AbstractLabelledTree* should respect the following assumptions:

- For a labelled tree `T` the call `T.parent().unlabelled_trees()` should return a parent for unlabelled trees of the same kind: for example,
  - if `T` is a binary labelled tree, `T.parent()` is `LabelledBinaryTrees()` and `T.parent().unlabelled_trees()` is `BinaryTrees()`
  - if `T` is an ordered labelled tree, `T.parent()` is `LabelledOrderedTrees()` and `T.parent().unlabelled_trees()` is `OrderedTrees()`
- In the same vein, the class of `T` should contain an attribute `_UnLabelled` which should be the class for the corresponding unlabelled trees.

See also the assumptions in *AbstractTree*.

See also

AbstractTree

as_digraph(*immutable=False*)

Return a directed graph version of `self`.

Warning

At this time, the output makes sense only if `self` is a labelled binary tree with no repeated labels and no `None` labels.

INPUT:

- `immutable` – boolean (default: `False`); whether to return an immutable or a mutable graph

EXAMPLES:

```
sage: LT = LabelledOrderedTrees()
sage: t1 = LT([LT([],label=6),LT([],label=1)],label=9)
sage: t1.as_digraph()
Digraph on 3 vertices

sage: t = BinaryTree([[None, None],[[],None]])
sage: lt = t.canonical_labelling()
sage: d1 = lt.as_digraph(); d1
Digraph on 4 vertices
sage: d2 = lt.as_digraph(immutable=True); d2
Digraph on 4 vertices
sage: d1.is_isomorphic(d2)
True
```

```
>>> from sage.all import *
>>> LT = LabelledOrderedTrees()
>>> t1 = LT([LT([],label=Integer(6)),LT([],label=Integer(1))],
↪label=Integer(9))
>>> t1.as_digraph()
Digraph on 3 vertices

>>> t = BinaryTree([[None, None],[[],None]])
>>> lt = t.canonical_labelling()
>>> d1 = lt.as_digraph(); d1
Digraph on 4 vertices
>>> d2 = lt.as_digraph(immutable=True); d2
Digraph on 4 vertices
>>> d1.is_isomorphic(d2)
True
```

label(*path=None*)

Return the label of `self`.

INPUT:

- `path` – `None` (default) or a path (list or tuple of children index in the tree)

OUTPUT: the label of the subtree indexed by `path`

EXAMPLES:

```
sage: t = LabelledOrderedTree([[],[]], label = 3)
sage: t.label()
3
sage: t[0].label()
sage: t = LabelledOrderedTree([LabelledOrderedTree([], 5),[]], label = 3)
sage: t.label()
3
sage: t[0].label()
5
sage: t[1].label()
sage: t.label([0])
5
```

```
>>> from sage.all import *
>>> t = LabelledOrderedTree([[],[]], label = Integer(3))
>>> t.label()
3
>>> t[Integer(0)].label()
>>> t = LabelledOrderedTree([LabelledOrderedTree([], Integer(5)),[]], label =␣
↪Integer(3))
>>> t.label()
3
>>> t[Integer(0)].label()
5
>>> t[Integer(1)].label()
>>> t.label([Integer(0)])
5
```

labels()

Return the list of labels of `self`.

EXAMPLES:

```
sage: LT = LabelledOrderedTree
sage: t = LT([LT([],label='b'),LT([],label='c')],label='a')
sage: t.labels()
['a', 'b', 'c']

sage: LBT = LabelledBinaryTree
sage: LBT([LBT([],label=1),LBT([],label=4)],label=2).labels()
[2, 1, 4]
```

```
>>> from sage.all import *
>>> LT = LabelledOrderedTree
>>> t = LT([LT([],label='b'),LT([],label='c')],label='a')
>>> t.labels()
['a', 'b', 'c']

>>> LBT = LabelledBinaryTree
>>> LBT([LBT([],label=Integer(1)),LBT([],label=Integer(4))],label=Integer(2)).
↪labels()
[2, 1, 4]
```

leaf_labels()

Return the list of labels of the leaves of `self`.

In case of a labelled binary tree, these "leaves" are not actually the leaves of the binary trees, but the nodes whose both children are leaves!

EXAMPLES:

```
sage: LT = LabelledOrderedTree
sage: t = LT([LT([],label='b'),LT([],label='c')],label='a')
sage: t.leaf_labels()
['b', 'c']

sage: LBT = LabelledBinaryTree
```

(continues on next page)

(continued from previous page)

```
sage: bt = LBT([LBT([],label='b'),LBT([],label='c')],label='a')
sage: bt.leaf_labels()
['b', 'c']
sage: LBT([], label='1').leaf_labels()
['1']
sage: LBT(None).leaf_labels()
[]
```

```
>>> from sage.all import *
>>> LT = LabelledOrderedTree
>>> t = LT([LT([],label='b'),LT([],label='c')],label='a')
>>> t.leaf_labels()
['b', 'c']

>>> LBT = LabelledBinaryTree
>>> bt = LBT([LBT([],label='b'),LBT([],label='c')],label='a')
>>> bt.leaf_labels()
['b', 'c']
>>> LBT([], label='1').leaf_labels()
['1']
>>> LBT(None).leaf_labels()
[]
```

shape()

Return the unlabelled tree associated to `self`.

EXAMPLES:

```
sage: t = LabelledOrderedTree([[],[[]]], label = 25).shape(); t
[[], [[]]]

sage: LabelledBinaryTree([[],[[],[]]], label = 25).shape()
[[., .], [[., .], [., .]]]

sage: LRT = LabelledRootedTree
sage: tb = LRT([],label='b')
sage: LRT([tb, tb], label='a').shape()
[[], []]
```

```
>>> from sage.all import *
>>> t = LabelledOrderedTree([[],[[]]], label = Integer(25)).shape(); t
[[], [[]]]

>>> LabelledBinaryTree([[],[[],[]]], label = Integer(25)).shape()
[[., .], [[., .], [., .]]]

>>> LRT = LabelledRootedTree
>>> tb = LRT([],label='b')
>>> LRT([tb, tb], label='a').shape()
[[], []]
```

class sage.combinat.abstract_tree.**AbstractTree**

Bases: `object`

Abstract Tree.

There is no data structure defined here, as this class is meant to be extended, not instantiated.

How should this class be extended?

A class extending *AbstractTree* should respect several assumptions:

- For a tree `T`, the call `iter(T)` should return an iterator on the children of the root `T`.
- The *canonical_labelling* method should return the same value for trees that are considered equal (see the "canonical labellings" section in the documentation of the *AbstractTree* class).
- For a tree `T` the call `T.parent().labelled_trees()` should return a parent for labelled trees of the same kind: for example,
  - if `T` is a binary tree, `T.parent()` is `BinaryTrees()` and `T.parent().labelled_trees()` is `LabelledBinaryTrees()`
  - if `T` is an ordered tree, `T.parent()` is `OrderedTrees()` and `T.parent().labelled_trees()` is `LabelledOrderedTrees()`

breadth_first_order_traversal(*action=None*)

Run the breadth-first post-order traversal algorithm and subject every node encountered to some procedure `action`. The algorithm is:

```
queue <- [ root ];
while the queue is not empty:
    node <- pop( queue );
    manipulate the node;
    prepend to the queue the list of all subtrees of
        the node (from the rightmost to the leftmost).
```

INPUT:

- `action` – (optional) a function which takes a node as input, and does something during the exploration

OUTPUT:

`None`. (This is *not* an iterator.)

EXAMPLES:

For example, on the following binary tree b:

```
|    ___3_____       |
|   /         \      |
|  1          _7_    |
|   \        /   \   |
|    2      5     8  |
|          / \       |
|         4   6      |
```

the breadth-first order traversal algorithm explores b in the following order of nodes: $3, 1, 7, 2, 5, 8, 4, 6$.

canonical_labelling(*shift=1*)

Return a labelled version of `self`.

The actual canonical labelling is currently unspecified. However, it is guaranteed to have labels in $1...n$ where n is the number of nodes of the tree. Moreover, two (unlabelled) trees compare as equal if and only if their canonical labelled trees compare as equal.

EXAMPLES:

```
sage: t = OrderedTree([[], [[], [[], []], [[], []]], [[], []]])
sage: t.canonical_labelling()
1[2[], 3[4[], 5[6[], 7[]], 8[9[], 10[]]], 11[12[], 13[]]]

sage: BinaryTree([]).canonical_labelling()
1[., .]
sage: BinaryTree([[],[[],[]]]).canonical_labelling()
2[1[., .], 4[3[., .], 5[., .]]]
```

```
>>> from sage.all import *
>>> t = OrderedTree([[], [[], [[], []], [[], []]], [[], []]])
>>> t.canonical_labelling()
1[2[], 3[4[], 5[6[], 7[]], 8[9[], 10[]]], 11[12[], 13[]]]

>>> BinaryTree([]).canonical_labelling()
1[., .]
>>> BinaryTree([[],[[],[]]]).canonical_labelling()
2[1[., .], 4[3[., .], 5[., .]]]
```

contour_traversal(*first_action=None*, *middle_action=None*, *final_action=None*, *leaf_action=None*)

Run the counterclockwise contour traversal algorithm (iterative implementation) and subject every node encountered to some procedure `first_action`, `middle_action` or `final_action` each time it reaches it.

ALGORITHM:

- if the root is a leaf, apply $leaf_action$
- **else**
  - apply $first_action$ to the root
  - iteratively apply $middle_action$ to the root and traverse each subtree from the leftmost one to the rightmost one
  - apply $final_action$ to the root

INPUT:

- `first_action` – (optional) a function which takes a node as input, and does something the first time it is reached during exploration
- `middle_action` – (optional) a function which takes a node as input, and does something each time it explore one of its children
- `final_action` – (optional) a function which takes a node as input, and does something the last time it is reached during exploration
- `leaf_action` – (optional) a function which takes a leaf as input, and does something when it is reached during exploration.

OUTPUT:

`None`. (This is *not* an iterator.)

depth()

Return the depth of `self`.

EXAMPLES:

```
sage: OrderedTree().depth()
1
sage: OrderedTree([]).depth()
1
sage: OrderedTree([[],[]]).depth()
2
sage: OrderedTree([[],[[]]]).depth()
3
sage: OrderedTree([[], [[], [[], []], [[], []]], [[], []]]).depth()
4

sage: BinaryTree().depth()
0
sage: BinaryTree([[],[[],[]]]).depth()
3
```

```
>>> from sage.all import *
>>> OrderedTree().depth()
1
>>> OrderedTree([]).depth()
1
>>> OrderedTree([[],[]]).depth()
2
>>> OrderedTree([[],[[]]]).depth()
3
>>> OrderedTree([[], [[], [[], []], [[], []]], [[], []]]).depth()
4

>>> BinaryTree().depth()
0
>>> BinaryTree([[],[[],[]]]).depth()
3
```

iterative_post_order_traversal(*action=None*)

Run the depth-first post-order traversal algorithm (iterative implementation) and subject every node encountered to some procedure `action`. The algorithm is:

```
explore each subtree (by the algorithm) from the
    leftmost one to the rightmost one;
then manipulate the root with function `action` (in the
    case of a binary tree, only if the root is not a leaf).
```

INPUT:

- `action` – (optional) a function which takes a node as input, and does something during the exploration

OUTPUT:

`None`. (This is *not* an iterator.)

See also

- *post_order_traversal_iter()*

iterative_pre_order_traversal(*action=None*)

Run the depth-first pre-order traversal algorithm (iterative implementation) and subject every node encountered to some procedure `action`. The algorithm is:

```
manipulate the root with function `action` (in the case
    of a binary tree, only if the root is not a leaf);
then explore each subtree (by the algorithm) from the
    leftmost one to the rightmost one.
```

INPUT:

- `action` – (optional) a function which takes a node as input, and does something during the exploration

OUTPUT:

`None`. (This is *not* an iterator.)

See also

- *pre_order_traversal_iter()*
- *pre_order_traversal()*

node_number()

alias of *number_of_nodes()*.

node_number_at_depth(*depth*)

alias of *number_of_nodes_at_depth()*.

node_number_to_the_right(*path*)

alias of *number_of_nodes_to_the_right()*.

number_of_nodes()

Return the number of nodes of `self`.

See also

number_of_nodes_at_depth(), *number_of_nodes_to_the_right()*

EXAMPLES:

```
sage: OrderedTree().number_of_nodes()
1
sage: OrderedTree([]).number_of_nodes()
1
sage: OrderedTree([[],[]]).number_of_nodes()
3
sage: OrderedTree([[],[[]]]).number_of_nodes()
4
sage: OrderedTree([[], [[], [[], []], [[], [[]]], [[], [[]]]]).number_of_nodes()
13
```

```
>>> from sage.all import *
>>> OrderedTree().number_of_nodes()
1
>>> OrderedTree([]).number_of_nodes()
1
>>> OrderedTree([[],[]]).number_of_nodes()
3
>>> OrderedTree([[],[[]]]).number_of_nodes()
4
>>> OrderedTree([[], [[], [[], []], [[], [[]]], [[], [[]]]]).number_of_nodes()
13
```

EXAMPLES:

```
sage: BinaryTree(None).number_of_nodes()
0
sage: BinaryTree([]).number_of_nodes()
1
sage: BinaryTree([[], None]).number_of_nodes()
2
sage: BinaryTree([[None, [[], []]], None]).number_of_nodes()
5
```

```
>>> from sage.all import *
>>> BinaryTree(None).number_of_nodes()
0
>>> BinaryTree([]).number_of_nodes()
1
>>> BinaryTree([[], None]).number_of_nodes()
2
>>> BinaryTree([[None, [[], []]], None]).number_of_nodes()
5
```

number_of_nodes_at_depth(*depth*)

Return the number of nodes at a given depth.

This counts all nodes that are at the given depth.

Here the root is considered to have depth 0.

INPUT:

- `depth` – integer

See also

number_of_nodes(), *number_of_nodes_to_the_right()*, *paths_at_depth()*

EXAMPLES:

```
sage: T = OrderedTree([[[], [[]]], [[], [[[[]]]], []])
sage: ascii_art(T)
    ___o_____
   /    /   /
```

(continues on next page)

(continued from previous page)

```
  o_   o_ o
 / /  / /
o o  o o
  |    |
  o    o
       |
       o
sage: [T.number_of_nodes_at_depth(i) for i in range(6)]
[1, 3, 4, 2, 1, 0]
```

```
>>> from sage.all import *
>>> T = OrderedTree([[[], [[]]], [[], [[[]]]], []])
>>> ascii_art(T)
    ___o____
   /    /  /
  o_   o_ o
 / /  / /
o o  o o
  |    |
  o    o
       |
       o
>>> [T.number_of_nodes_at_depth(i) for i in range(Integer(6))]
[1, 3, 4, 2, 1, 0]
```

number_of_nodes_to_the_right (*path*)

Return the number of nodes at the same depth and to the right of the node identified by `path`.

This counts the nodes that are at the same depth as the given one, and strictly to its right.

See also

number_of_nodes(), *number_of_nodes_at_depth()*, *paths_to_the_right()*

EXAMPLES:

```
sage: T = OrderedTree([[[], [[]]], [[], [[[]]]], []])
sage: ascii_art(T)
    ___o____
   /    /  /
  o_   o_ o
 / /  / /
o o  o o
  |    |
  o    o
       |
       o
sage: T.number_of_nodes_to_the_right(())
0
sage: T.number_of_nodes_to_the_right((0,))
2
```

(continues on next page)

(continued from previous page)

```
sage: T.number_of_nodes_to_the_right((0,1))
2
sage: T.number_of_nodes_to_the_right((0,1,0))
1

sage: T = OrderedTree([])
sage: T.number_of_nodes_to_the_right(())
0
```

```
>>> from sage.all import *
>>> T = OrderedTree([[[[], [[]]], [[], [[[]]]], []])
>>> ascii_art(T)
    ___o____
   /    /  /
  o_   o_ o
 / /  / /
o o  o o
  |    |
  o    o
       |
       o
>>> T.number_of_nodes_to_the_right(())
0
>>> T.number_of_nodes_to_the_right((Integer(0),))
2
>>> T.number_of_nodes_to_the_right((Integer(0),Integer(1)))
2
>>> T.number_of_nodes_to_the_right((Integer(0),Integer(1),Integer(0)))
1

>>> T = OrderedTree([])
>>> T.number_of_nodes_to_the_right(())
0
```

paths()

Return a generator for all paths to nodes of `self`.

OUTPUT:

This method returns a list of sequences of integers. Each of these sequences represents a path from the root node to some node. For instance, $(1, 3, 2, 5, 0, 3)$ represents the node obtained by choosing the 1st child of the root node (in the ordering returned by `iter`), then the 3rd child of its child, then the 2nd child of the latter, etc. (where the labelling of the children is zero-based).

The root element is represented by the empty tuple `()`.

See also

paths_at_depth(), *paths_to_the_right()*

EXAMPLES:

```
sage: list(OrderedTree([]).paths())
[()]
sage: list(OrderedTree([[],[[]]]).paths())
[(), (0,), (1,), (1, 0)]

sage: list(BinaryTree([[],[[],[]]]).paths())
[(), (0,), (1,), (1, 0), (1, 1)]
```

```
>>> from sage.all import *
>>> list(OrderedTree([]).paths())
[()]
>>> list(OrderedTree([[],[[]]]).paths())
[(), (0,), (1,), (1, 0)]

>>> list(BinaryTree([[],[[],[]]]).paths())
[(), (0,), (1,), (1, 0), (1, 1)]
```

paths_at_depth(*depth*, *path=[]*)

Return a generator for all paths at a fixed depth.

This iterates over all paths for nodes that are at the given depth.

Here the root is considered to have depth 0.

INPUT:

- `depth` – integer
- `path` – (optional) list; given path used in the recursion

Warning

The `path` option should not be used directly.

See also

paths(), *paths_to_the_right()*, *number_of_nodes_at_depth()*

EXAMPLES:

```
sage: T = OrderedTree([[[], [[], [[]]]], [], [[[],[]]], [], []])
sage: ascii_art(T)
    _______o________
   /     /   /   / /
  _o__   o   o   o o
 /   /       |
```

o   o_      o_
   / /     / /
  o o     o o
    |
    o
>>> list(T.paths_at_depth(Integer(0)))
[()]
>>> list(T.paths_at_depth(Integer(2)))
[(0, 0), (0, 1), (2, 0)]
>>> list(T.paths_at_depth(Integer(4)))
[(0, 1, 1, 0)]
>>> list(T.paths_at_depth(Integer(5)))
[]

>>> T2 = OrderedTree([])
>>> list(T2.paths_at_depth(Integer(0)))
[()]
```

paths_to_the_right(*path*)

Return a generator of paths for all nodes at the same depth and to the right of the node identified by `path`.

This iterates over the paths for nodes that are at the same depth as the given one, and strictly to its right.

INPUT:

- `path` – any path in the tree

See also

paths(), *paths_at_depth()*, *number_of_nodes_to_the_right()*

EXAMPLES:

```
sage: T = OrderedTree([[[], [[]]], [[], [[[]]]], []])
sage: ascii_art(T)

  |    |
  o    o
       |
       o
>>> g = T.paths_to_the_right(())
>>> list(g)
[]
```

(continues on next page)

(continued from previous page)

```
>>> g = T.paths_to_the_right((Integer(0),))
>>> list(g)
[(1,), (2,)]

>>> g = T.paths_to_the_right((Integer(0),Integer(1)))
>>> list(g)
[(1, 0), (1, 1)]

>>> g = T.paths_to_the_right((Integer(0),Integer(1),Integer(0)))
>>> list(g)
[(1, 1, 0)]

>>> g = T.paths_to_the_right((Integer(1),Integer(2)))
>>> list(g)
[]
```

post_order_traversal(*action=None*)

Run the depth-first post-order traversal algorithm (recursive implementation) and subject every node encountered to some procedure `action`. The algorithm is:

```
explore each subtree (by the algorithm) from the
    leftmost one to the rightmost one;
then manipulate the root with function `action` (in the
    case of a binary tree, only if the root is not a leaf).
```

INPUT:

- `action` – (optional) a function which takes a node as input, and does something during the exploration

OUTPUT:

`None`. (This is *not* an iterator.)

See also

- *post_order_traversal_iter()*
- *iterative_post_order_traversal()*

post_order_traversal_iter()

The depth-first post-order traversal iterator.

This method iters each node following the depth-first post-order traversal algorithm (recursive implementation). The algorithm is:

```
explore each subtree (by the algorithm) from the
    leftmost one to the rightmost one;
then yield the root (in the case of binary trees, only if
    it is not a leaf).
```

EXAMPLES:

For example on the following binary tree b:

```
|   ___3____       |
|  /         \     |
| 1          _7_   |
|  \        /   \  |
|   2      5     8 |
|         / \      |
|        4   6     |
```

(only the nodes are shown), the depth-first post-order traversal algorithm explores b in the following order of nodes: $2, 1, 4, 6, 5, 8, 7, 3$.

For another example, consider the labelled tree:

```
|      __1____ |
|     /  /   / |
|    2  6   8_ |
|    |  |  / / |
|    3_ 7 9 10 |
|   / /        |
|  4 5         |
```

The algorithm explores this tree in the following order: $4, 5, 3, 2, 7, 6, 9, 10, 8, 1$.

pre_order_traversal(*action=None*)

Run the depth-first pre-order traversal algorithm (recursive implementation) and subject every node encountered to some procedure `action`. The algorithm is:

```
manipulate the root with function `action` (in the case
    of a binary tree, only if the root is not a leaf);
then explore each subtree (by the algorithm) from the
    leftmost one to the rightmost one.
```

INPUT:

- `action` – (optional) a function which takes a node as input, and does something during the exploration

OUTPUT:

`None`. (This is *not* an iterator.)

EXAMPLES:

For example, on the following binary tree b:

```
|   ___3____       |
|  /         \     |
| 1          _7_   |
|  \        /   \  |
|   2      5     8 |
|         / \      |
|        4   6     |
```

the depth-first pre-order traversal algorithm explores b in the following order of nodes: $3, 1, 2, 7, 5, 4, 6, 8$.

Another example:

```
|      __1____ |
|     /  /   / |
|    2  6   8_ |
|    |  |  / / |
|    3_ 7 9 10 |
|   / /        |
|  4 5         |
```

The algorithm explores this tree in the following order: $1, 2, 3, 4, 5, 6, 7, 8, 9, 10$.

See also

- *pre_order_traversal_iter()*
- *iterative_pre_order_traversal()*

pre_order_traversal_iter()

The depth-first pre-order traversal iterator.

This method iters each node following the depth-first pre-order traversal algorithm (recursive implementation). The algorithm is:

```
yield the root (in the case of binary trees, if it is not
    a leaf);
then explore each subtree (by the algorithm) from the
    leftmost one to the rightmost one.
```

EXAMPLES:

For example, on the following binary tree b:

```
|    ___3____       |
|   /        \      |
|  1          _7_   |
|   \        /   \  |
|    2      5     8 |
|          / \      |
|         4   6     |
```

(only the nodes shown), the depth-first pre-order traversal algorithm explores b in the following order of nodes: $3, 1, 2, 7, 5, 4, 6, 8$.

Another example:

```
|      __1____ |
|     /  /   / |
|    2  6   8_ |
|    |  |  / / |
|    3_ 7 9 10 |
|   / /        |
|  4 5         |
```

The algorithm explores this labelled tree in the following order: $1, 2, 3, 4, 5, 6, 7, 8, 9, 10$.

subtrees()

Return a generator for all nonempty subtrees of `self`.

The number of nonempty subtrees of a tree is its number of nodes. (The word "nonempty" makes a difference only in the case of binary trees. For ordered trees, for example, all trees are nonempty.)

EXAMPLES:

```
sage: list(OrderedTree([]).subtrees())
[[]]
sage: list(OrderedTree([[],[[]]]).subtrees())
[[[], [[]]], [], [[]], []]

sage: list(OrderedTree([[],[[]]]).canonical_labelling().subtrees())
[1[2[], 3[4[]]], 2[], 3[4[]], 4[]]

sage: list(BinaryTree([[],[[],[]]]).subtrees())
[[[., .], [[., .], [., .]]], [., .], [[., .], [., .]], [., .], [., .]]

sage: v = BinaryTree([[],[]])
sage: list(v.canonical_labelling().subtrees())
[2[1[., .], 3[., .]], 1[., .], 3[., .]]
```

```
>>> from sage.all import *
>>> list(OrderedTree([]).subtrees())
[[]]
>>> list(OrderedTree([[],[[]]]).subtrees())
[[[], [[]]], [], [[]], []]

>>> list(OrderedTree([[],[[]]]).canonical_labelling().subtrees())
[1[2[], 3[4[]]], 2[], 3[4[]], 4[]]

>>> list(BinaryTree([[],[[],[]]]).subtrees())
[[[., .], [[., .], [., .]]], [., .], [[., .], [., .]], [., .], [., .]]

>>> v = BinaryTree([[],[]])
>>> list(v.canonical_labelling().subtrees())
[2[1[., .], 3[., .]], 1[., .], 3[., .]]
```

to_hexacode()

Transform a tree into a hexadecimal string.

The definition of the hexacode is recursive. The first letter is the valence of the root as a hexadecimal (up to 15), followed by the concatenation of the hexacodes of the subtrees.

This method only works for trees where every vertex has valency at most 15.

See *from_hexacode()* for the reverse transformation.

EXAMPLES:

```
sage: from sage.combinat.abstract_tree import from_hexacode
sage: LT = LabelledOrderedTrees()
sage: from_hexacode('2010', LT).to_hexacode()
'2010'
sage: LT.an_element().to_hexacode()
```

(continues on next page)

(continued from previous page)

```
'3020010'
sage: t = from_hexacode('a0000000000000000', LT)
sage: t.to_hexacode()
'a0000000000'

sage: OrderedTrees(6).an_element().to_hexacode()
'500000'
```

```
>>> from sage.all import *
>>> from sage.combinat.abstract_tree import from_hexacode
>>> LT = LabelledOrderedTrees()
>>> from_hexacode('2010', LT).to_hexacode()
'2010'
>>> LT.an_element().to_hexacode()
'3020010'
>>> t = from_hexacode('a0000000000000000', LT)
>>> t.to_hexacode()
'a0000000000'

>>> OrderedTrees(Integer(6)).an_element().to_hexacode()
'500000'
```

tree_factorial()

Return the tree-factorial of `self`.

Definition:

The tree-factorial $T!$ of a tree T is the product $\prod_{v \in T} \#\text{children}(v)$.

EXAMPLES:

```
sage: LT = LabelledOrderedTrees()
sage: t = LT([LT([],label=6),LT([],label=1)],label=9)
sage: t.tree_factorial()
3

sage: BinaryTree([[],[[],[]]]).tree_factorial()
15
```

```
>>> from sage.all import *
>>> LT = LabelledOrderedTrees()
>>> t = LT([LT([],label=Integer(6)),LT([],label=Integer(1))],label=Integer(9))
>>> t.tree_factorial()
3

>>> BinaryTree([[],[[],[]]]).tree_factorial()
15
```

sage.combinat.abstract_tree.**from_hexacode**(*ch*, *parent=None*, *label='@'*)

Transform a hexadecimal string into a tree.

INPUT:

- `ch` – a hexadecimal string

- `parent` – kind of trees to be produced. If `None`, this will be `LabelledOrderedTrees`
- `label` – a label (default: `'@'`) to be used for every vertex of the tree

See *AbstractTree.to_hexacode()* for the description of the encoding

See *AbstractTree.to_hexacode()* and this function's implementation for the decoding algorithm.

EXAMPLES:

```
sage: from sage.combinat.abstract_tree import from_hexacode
sage: from_hexacode('12000', LabelledOrderedTrees())
@[@[@[], @[]]]
sage: from_hexacode('12000')
@[@[@[], @[]]]

sage: from_hexacode('1200', LabelledOrderedTrees())
@[@[@[], @[]]]
```

```
>>> from sage.all import *
>>> from sage.combinat.abstract_tree import from_hexacode
>>> from_hexacode('12000', LabelledOrderedTrees())
@[@[@[], @[]]]
>>> from_hexacode('12000')
@[@[@[], @[]]]

>>> from_hexacode('1200', LabelledOrderedTrees())
@[@[@[], @[]]]
```

It can happen that only a prefix of the word is used:

```
sage: from_hexacode('a'+14*'0', LabelledOrderedTrees())
@[@[], @[], @[], @[], @[], @[], @[], @[], @[], @[]]
```

```
>>> from sage.all import *
>>> from_hexacode('a'+Integer(14)*'0', LabelledOrderedTrees())
@[@[], @[], @[], @[], @[], @[], @[], @[], @[], @[]]
```

One can choose the label:

```
sage: from_hexacode('1200', LabelledOrderedTrees(), label='o')
o[o[o[], o[]]]
```

```
>>> from sage.all import *
>>> from_hexacode('1200', LabelledOrderedTrees(), label='o')
o[o[o[], o[]]]
```

One can also create other kinds of trees:

```
sage: from_hexacode('1200', OrderedTrees())
[[[], []]]
```

```
>>> from sage.all import *
>>> from_hexacode('1200', OrderedTrees())
[[[], []]]
```

Affine permutations

class sage.combinat.affine_permutation.**AffinePermutation**(*parent*, *lst*, *check=True*)

Bases: ClonableArray

An affine permutation, represented in the window notation, and considered as a bijection from **Z** to **Z**.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
```

apply_simple_reflection(*i*, *side='right'*)

Apply a simple reflection.

INPUT:

- `i` – integer
- `side` – (default: `'right'`) determines whether to apply the reflection on the `'right'` or `'left'`

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.apply_simple_reflection(3)
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
sage: p.apply_simple_reflection(11)
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
sage: p.apply_simple_reflection(3, 'left')
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
sage: p.apply_simple_reflection(11, 'left')
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),␣
↪Integer(9)])
>>> p.apply_simple_reflection(Integer(3))
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
>>> p.apply_simple_reflection(Integer(11))
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
>>> p.apply_simple_reflection(Integer(3), 'left')
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
>>> p.apply_simple_reflection(Integer(11), 'left')
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
```

grassmannian_quotient(*i=0*, *side='right'*)

Return the Grassmannian quotient.

Factors `self` into a unique product of a Grassmannian and a finite-type element. Returns a tuple containing the Grassmannian and finite elements, in order according to `side`.

INPUT:

- `i` – (default: 0) an element of the index set; the descent checked for

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: gq=p.grassmannian_quotient()
sage: gq
(Type A affine permutation with window [-1, 0, 3, 4, 5, 6, 9, 10],
 Type A affine permutation with window [3, 1, 2, 6, 5, 4, 8, 7])
sage: gq[0].is_i_grassmannian()
True
sage: 0 not in gq[1].reduced_word()
True
sage: prod(gq)==p
True

sage: gqLeft=p.grassmannian_quotient(side='left')
sage: 0 not in gqLeft[0].reduced_word()
True
sage: gqLeft[1].is_i_grassmannian(side='left')
True
sage: prod(gqLeft)==p
True
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> gq=p.grassmannian_quotient()
>>> gq
(Type A affine permutation with window [-1, 0, 3, 4, 5, 6, 9, 10],
 Type A affine permutation with window [3, 1, 2, 6, 5, 4, 8, 7])
>>> gq[Integer(0)].is_i_grassmannian()
True
>>> Integer(0) not in gq[Integer(1)].reduced_word()
True
>>> prod(gq)==p
True

>>> gqLeft=p.grassmannian_quotient(side='left')
>>> Integer(0) not in gqLeft[Integer(0)].reduced_word()
True
>>> gqLeft[Integer(1)].is_i_grassmannian(side='left')
True
>>> prod(gqLeft)==p
True
```

index_set()

Index set of the affine permutation group.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: A.index_set()
(0, 1, 2, 3, 4, 5, 6, 7)
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> A.index_set()
(0, 1, 2, 3, 4, 5, 6, 7)
```

is_i_grassmannian(*i=0*, *side='right'*)

Test whether `self` is i-grassmannian, i.e., either is the identity or has `i` as the sole descent.

INPUT:

- `i` – an element of the index set
- `side` – determines the side on which to check the descents

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.is_i_grassmannian()
False
sage: q = A.from_word([3,2,1,0])
sage: q.is_i_grassmannian()
True
sage: q = A.from_word([2,3,4,5])
sage: q.is_i_grassmannian(5)
True
sage: q.is_i_grassmannian(2, side='left')
True
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.is_i_grassmannian()
False
>>> q = A.from_word([Integer(3),Integer(2),Integer(1),Integer(0)])
>>> q.is_i_grassmannian()
True
>>> q = A.from_word([Integer(2),Integer(3),Integer(4),Integer(5)])
>>> q.is_i_grassmannian(Integer(5))
True
>>> q.is_i_grassmannian(Integer(2), side='left')
True
```

is_one()

Test whether the affine permutation is the identity.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.is_one()
False
sage: q = A.one()
sage: q.is_one()
True
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.is_one()
False
>>> q = A.one()
>>> q.is_one()
True
```

lower_covers(*side='right'*)

Return lower covers of `self`.

The set of affine permutations of one less length related by multiplication by a simple transposition on the indicated side. These are the elements that `self` covers in weak order.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.lower_covers()
[Type A affine permutation with window [-1, 3, 0, 6, 5, 4, 10, 9],
 Type A affine permutation with window [3, -1, 0, 5, 6, 4, 10, 9],
 Type A affine permutation with window [3, -1, 0, 6, 4, 5, 10, 9],
 Type A affine permutation with window [3, -1, 0, 6, 5, 4, 9, 10]]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.lower_covers()
[Type A affine permutation with window [-1, 3, 0, 6, 5, 4, 10, 9],
 Type A affine permutation with window [3, -1, 0, 5, 6, 4, 10, 9],
 Type A affine permutation with window [3, -1, 0, 6, 4, 5, 10, 9],
 Type A affine permutation with window [3, -1, 0, 6, 5, 4, 9, 10]]
```

reduced_word()

Return a reduced word for the affine permutation.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.reduced_word()
[0, 7, 4, 1, 0, 7, 5, 4, 2, 1]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.reduced_word()
[0, 7, 4, 1, 0, 7, 5, 4, 2, 1]
```

signature()

Signature of the affine permutation, $(-1)^l$, where l is the length of the permutation.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.signature()
1
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.signature()
1
```

to_weyl_group_element()

The affine Weyl group element corresponding to the affine permutation.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.to_weyl_group_element()
[ 0 -1  0  1  0  0  1  0]
[ 1 -1  0  1  0  0  1 -1]
[ 1 -1  0  1  0  0  0  0]
[ 0  0  0  1  0  0  0  0]
[ 0  0  0  1  0 -1  1  0]
[ 0  0  0  1 -1  0  1  0]
[ 0  0  0  0  0  0  1  0]
[ 0 -1  1  0  0  0  1  0]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.to_weyl_group_element()
[ 0 -1  0  1  0  0  1  0]
[ 1 -1  0  1  0  0  1 -1]
[ 1 -1  0  1  0  0  0  0]
[ 0  0  0  1  0  0  0  0]
[ 0  0  0  1  0 -1  1  0]
[ 0  0  0  1 -1  0  1  0]
```

(continues on next page)

(continued from previous page)

```
[ 0  0  0  0  0  0  1  0]
[ 0 -1  1  0  0  0  1  0]
```

sage.combinat.affine_permutation.**AffinePermutationGroup**(*cartan_type*)

Wrapper function for specific affine permutation groups.

These are combinatorial implementations of the affine Weyl groups of types A, B, C, D, and G as permutations of the set of all integers. the basic algorithms are derived from [BB2005] and [Eri1995].

EXAMPLES:

```
sage: ct = CartanType(['A',7,1])
sage: A = AffinePermutationGroup(ct)
sage: A
The group of affine permutations of type ['A', 7, 1]
```

```
>>> from sage.all import *
>>> ct = CartanType(['A',Integer(7),Integer(1)])
>>> A = AffinePermutationGroup(ct)
>>> A
The group of affine permutations of type ['A', 7, 1]
```

We define an element of `A`:

```
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
```

```
>>> from sage.all import *
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
```

We find the value $p(1)$, considering p as a bijection on the integers. This is the same as calling the *value()* method:

```
sage: p.value(1)
3
sage: p(1) == p.value(1)
True
```

```
>>> from sage.all import *
>>> p.value(Integer(1))
3
>>> p(Integer(1)) == p.value(Integer(1))
True
```

We can also find the position of the integer 3 in p considered as a sequence, equivalent to finding $p^{-1}(3)$:

```
sage: p.position(3)
1
```

(continues on next page)

(continued from previous page)

```
sage: (p^-1)(3)
1
```

```
>>> from sage.all import *
>>> p.position(Integer(3))
1
>>> (p**-Integer(1))(Integer(3))
1
```

Since the affine permutation group is a group, we demonstrate its group properties:

```
sage: A.one()
Type A affine permutation with window [1, 2, 3, 4, 5, 6, 7, 8]

sage: q = A([0, 2, 3, 4, 5, 6, 7, 9])
sage: p * q
Type A affine permutation with window [1, -1, 0, 6, 5, 4, 10, 11]
sage: q * p
Type A affine permutation with window [3, -1, 1, 6, 5, 4, 10, 8]

sage: p^-1
Type A affine permutation with window [0, -1, 1, 6, 5, 4, 10, 11]
sage: p^-1 * p == A.one()
True
sage: p * p^-1 == A.one()
True
```

```
>>> from sage.all import *
>>> A.one()
Type A affine permutation with window [1, 2, 3, 4, 5, 6, 7, 8]

>>> q = A([Integer(0), Integer(2), Integer(3), Integer(4), Integer(5), Integer(6),
↪ Integer(7), Integer(9)])
>>> p * q
Type A affine permutation with window [1, -1, 0, 6, 5, 4, 10, 11]
>>> q * p
Type A affine permutation with window [3, -1, 1, 6, 5, 4, 10, 8]

>>> p**-Integer(1)
Type A affine permutation with window [0, -1, 1, 6, 5, 4, 10, 11]
>>> p**-Integer(1) * p == A.one()
True
>>> p * p**-Integer(1) == A.one()
True
```

If we decide we prefer the Weyl Group implementation of the affine Weyl group, we can easily get it:

```
sage: p.to_weyl_group_element()
[ 0 -1  0  1  0  0  1  0]
[ 1 -1  0  1  0  0  1 -1]
[ 1 -1  0  1  0  0  0  0]
[ 0  0  0  1  0  0  0  0]
```

(continues on next page)

(continued from previous page)

```
[ 0  0  0  1  0 -1  1  0]
[ 0  0  0  1 -1  0  1  0]
[ 0  0  0  0  0  0  1  0]
[ 0 -1  1  0  0  0  1  0]
```

```
>>> from sage.all import *
>>> p.to_weyl_group_element()
[ 0 -1  0  1  0  0  1  0]
[ 1 -1  0  1  0  0  1 -1]
[ 1 -1  0  1  0  0  0  0]
[ 0  0  0  1  0  0  0  0]
[ 0  0  0  1  0 -1  1  0]
[ 0  0  0  1 -1  0  1  0]
[ 0  0  0  0  0  0  1  0]
[ 0 -1  1  0  0  0  1  0]
```

We can find a reduced word and do all of the other things one expects in a Coxeter group:

```
sage: p.has_right_descent(1)
True
sage: p.apply_simple_reflection(1)
Type A affine permutation with window [-1, 3, 0, 6, 5, 4, 10, 9]
sage: p.apply_simple_reflection(0)
Type A affine permutation with window [1, -1, 0, 6, 5, 4, 10, 11]
sage: p.reduced_word()
[0, 7, 4, 1, 0, 7, 5, 4, 2, 1]
sage: p.length()
10
```

```
>>> from sage.all import *
>>> p.has_right_descent(Integer(1))
True
>>> p.apply_simple_reflection(Integer(1))
Type A affine permutation with window [-1, 3, 0, 6, 5, 4, 10, 9]
>>> p.apply_simple_reflection(Integer(0))
Type A affine permutation with window [1, -1, 0, 6, 5, 4, 10, 11]
>>> p.reduced_word()
[0, 7, 4, 1, 0, 7, 5, 4, 2, 1]
>>> p.length()
10
```

The following methods are particular to type A. We can check if the element is fully commutative:

```
sage: p.is_fully_commutative()
False
sage: q.is_fully_commutative()
True
```

```
>>> from sage.all import *
>>> p.is_fully_commutative()
False
```

(continues on next page)

(continued from previous page)

```
>>> q.is_fully_commutative()
True
```

We can also compute the affine Lehmer code of the permutation, a weak composition with $k+1$ entries:

```
sage: p.to_lehmer_code()
[0, 3, 3, 0, 1, 2, 0, 1]
```

```
>>> from sage.all import *
>>> p.to_lehmer_code()
[0, 3, 3, 0, 1, 2, 0, 1]
```

Once we have the Lehmer code, we can obtain a k-bounded partition by sorting the Lehmer code, and then reading the row lengths. There is a unique 0-Grassmanian (dominant) affine permutation associated to this k-bounded partition, and a k-core as well.

```
sage: p.to_bounded_partition()
[5, 3, 2]
sage: p.to_dominant()
Type A affine permutation with window [-2, -1, 1, 3, 4, 8, 10, 13]
sage: p.to_core()
[5, 3, 2]
```

```
>>> from sage.all import *
>>> p.to_bounded_partition()
[5, 3, 2]
>>> p.to_dominant()
Type A affine permutation with window [-2, -1, 1, 3, 4, 8, 10, 13]
>>> p.to_core()
[5, 3, 2]
```

Finally, we can take a reduced word for p and insert it to find a standard composition tableau associated uniquely to that word:

```
sage: p.tableau_of_word(p.reduced_word())
[[], [1, 6, 9], [2, 7, 10], [], [3], [4, 8], [], [5]]
```

```
>>> from sage.all import *
>>> p.tableau_of_word(p.reduced_word())
[[], [1, 6, 9], [2, 7, 10], [], [3], [4, 8], [], [5]]
```

We can also form affine permutation groups in types B, C, D, and G:

```
sage: B = AffinePermutationGroup(['B',4,1])
sage: B.an_element()
Type B affine permutation with window [-1, 3, 4, 11]

sage: C = AffinePermutationGroup(['C',4,1])
sage: C.an_element()
Type C affine permutation with window [2, 3, 4, 10]

sage: D = AffinePermutationGroup(['D',4,1])
```

(continues on next page)

(continued from previous page)

```
sage: D.an_element()
Type D affine permutation with window [-1, 3, 11, 5]

sage: G = AffinePermutationGroup(['G',2,1])
sage: G.an_element()
Type G affine permutation with window [0, 4, -1, 8, 3, 7]
```

```
>>> from sage.all import *
>>> B = AffinePermutationGroup(['B',Integer(4),Integer(1)])
>>> B.an_element()
Type B affine permutation with window [-1, 3, 4, 11]

>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> C.an_element()
Type C affine permutation with window [2, 3, 4, 10]

>>> D = AffinePermutationGroup(['D',Integer(4),Integer(1)])
>>> D.an_element()
Type D affine permutation with window [-1, 3, 11, 5]

>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> G.an_element()
Type G affine permutation with window [0, 4, -1, 8, 3, 7]
```

class sage.combinat.affine_permutation.**AffinePermutationGroupGeneric**(*cartan_type*)

Bases: UniqueRepresentation, Parent

The generic affine permutation group class, in which we define all type-free methods for the specific affine permutation groups.

cartan_matrix()

Return the Cartan matrix of `self`.

EXAMPLES:

```
sage: AffinePermutationGroup(['A',7,1]).cartan_matrix()
[ 2 -1  0  0  0  0  0 -1]
[-1  2 -1  0  0  0  0  0]
[ 0 -1  2 -1  0  0  0  0]
[ 0  0 -1  2 -1  0  0  0]
[ 0  0  0 -1  2 -1  0  0]
[ 0  0  0  0 -1  2 -1  0]
[ 0  0  0  0  0 -1  2 -1]
[-1  0  0  0  0  0 -1  2]
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['A',Integer(7),Integer(1)]).cartan_matrix()
[ 2 -1  0  0  0  0  0 -1]
[-1  2 -1  0  0  0  0  0]
[ 0 -1  2 -1  0  0  0  0]
[ 0  0 -1  2 -1  0  0  0]
[ 0  0  0 -1  2 -1  0  0]
[ 0  0  0  0 -1  2 -1  0]
```

(continues on next page)

(continued from previous page)

```
[ 0  0  0  0  0 -1  2 -1]
[-1  0  0  0  0  0 -1  2]
```

cartan_type()

Return the Cartan type of `self`.

EXAMPLES:

```
sage: AffinePermutationGroup(['A',7,1]).cartan_type()
['A', 7, 1]
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['A',Integer(7),Integer(1)]).cartan_type()
['A', 7, 1]
```

classical()

Return the finite permutation group.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: A.classical()
Symmetric group of order 8! as a permutation group
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> A.classical()
Symmetric group of order 8! as a permutation group
```

from_word(*w*)

Build an affine permutation from a given word. Note: Already in category as `from_reduced_word`, but this is less typing!

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: A.from_word([0, 7, 4, 1, 0, 7, 5, 4, 2, 1])
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> A.from_word([Integer(0), Integer(7), Integer(4), Integer(1), Integer(0),␣
↪Integer(7), Integer(5), Integer(4), Integer(2), Integer(1)])
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
```

index_set()

EXAMPLES:

```
sage: AffinePermutationGroup(['A',7,1]).index_set()
(0, 1, 2, 3, 4, 5, 6, 7)
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['A',Integer(7),Integer(1)]).index_set()
(0, 1, 2, 3, 4, 5, 6, 7)
```

is_crystallographic()

Tell whether the affine permutation group is crystallographic.

EXAMPLES:

```
sage: AffinePermutationGroup(['A',7,1]).is_crystallographic()
True
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['A',Integer(7),Integer(1)]).is_crystallographic()
True
```

random_element(*n=None*)

Return a random affine permutation of length `n`.

If `n` is not specified, then `n` is chosen as a random nonnegative integer in $[0, 1000]$.

Starts at the identity, then chooses an upper cover at random. Not very uniform: actually constructs a uniformly random reduced word of length n. Thus we most likely get elements with lots of reduced words!

For the actual code, see `sage.categories.coxeter_groups.CoxeterGroups.ParentMethods.random_element_of_length()`.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: A.random_element() # random
Type A affine permutation with window [-12, 16, 19, -1, -2, 10, -3, 9]
sage: p = A.random_element(10)
sage: p.length() == 10
True
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> A.random_element() # random
Type A affine permutation with window [-12, 16, 19, -1, -2, 10, -3, 9]
>>> p = A.random_element(Integer(10))
>>> p.length() == Integer(10)
True
```

rank()

Rank of the affine permutation group, equal to $k + 1$.

EXAMPLES:

```
sage: AffinePermutationGroup(['A',7,1]).rank()
8
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['A',Integer(7),Integer(1)]).rank()
8
```

reflection_index_set()

EXAMPLES:

```
sage: AffinePermutationGroup(['A',7,1]).reflection_index_set()
(0, 1, 2, 3, 4, 5, 6, 7)
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['A',Integer(7),Integer(1)]).reflection_index_set()
(0, 1, 2, 3, 4, 5, 6, 7)
```

weyl_group()

Return the Weyl Group of the same type as `self`.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: A.weyl_group()
Weyl Group of type ['A', 7, 1] (as a matrix group acting on the root space)
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> A.weyl_group()
Weyl Group of type ['A', 7, 1] (as a matrix group acting on the root space)
```

class sage.combinat.affine_permutation.**AffinePermutationGroupTypeA**(*cartan_type*)

Bases: *AffinePermutationGroupGeneric*

Element

alias of *AffinePermutationTypeA*

from_lehmer_code(*C*, *typ='decreasing'*, *side='right'*)

Return the affine permutation with the supplied Lehmer code (a weak composition with $k+1$ parts, at least one of which is 0).

INPUT:

- `typ` – `'increasing'` or `'decreasing'` (default: `'decreasing'`); type of product
- `side` – `'right'` or `'left'` (default: `'right'`); whether the decomposition is from the right or left

EXAMPLES:

```
sage: import itertools
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.to_lehmer_code()
[0, 3, 3, 0, 1, 2, 0, 1]
sage: A.from_lehmer_code(p.to_lehmer_code()) == p
True
sage: orders = ('increasing','decreasing')
sage: sides = ('left','right')
sage: all(A.from_lehmer_code(p.to_lehmer_code(o,s),o,s) == p
....:     for o,s in itertools.product(orders,sides))
True
```

```
>>> from sage.all import *
>>> import itertools
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.to_lehmer_code()
[0, 3, 3, 0, 1, 2, 0, 1]
>>> A.from_lehmer_code(p.to_lehmer_code()) == p
True
>>> orders = ('increasing','decreasing')
>>> sides = ('left','right')
>>> all(A.from_lehmer_code(p.to_lehmer_code(o,s),o,s) == p
...     for o,s in itertools.product(orders,sides))
True
```

one()

Return the identity element.

EXAMPLES:

```
sage: AffinePermutationGroup(['A',7,1]).one()
Type A affine permutation with window [1, 2, 3, 4, 5, 6, 7, 8]
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['A',Integer(7),Integer(1)]).one()
Type A affine permutation with window [1, 2, 3, 4, 5, 6, 7, 8]
```

class sage.combinat.affine_permutation.**AffinePermutationGroupTypeB**(*cartan_type*)

Bases: *AffinePermutationGroupTypeC*

Element

alias of *AffinePermutationTypeB*

class sage.combinat.affine_permutation.**AffinePermutationGroupTypeC**(*cartan_type*)

Bases: *AffinePermutationGroupGeneric*

Element

alias of *AffinePermutationTypeC*

one()

Return the identity element.

EXAMPLES:

```
sage: ct = CartanType(['C',4,1])
sage: C = AffinePermutationGroup(ct)
sage: C.one()
Type C affine permutation with window [1, 2, 3, 4]
sage: C.one()*C.one()==C.one()
True
```

```
>>> from sage.all import *
>>> ct = CartanType(['C',Integer(4),Integer(1)])
>>> C = AffinePermutationGroup(ct)
```

(continues on next page)

(continued from previous page)

```
>>> C.one()
Type C affine permutation with window [1, 2, 3, 4]
>>> C.one()*C.one()==C.one()
True
```

class sage.combinat.affine_permutation.**AffinePermutationGroupTypeD**(*cartan_type*)

Bases: *AffinePermutationGroupTypeC*

Element

alias of *AffinePermutationTypeD*

class sage.combinat.affine_permutation.**AffinePermutationGroupTypeG**(*cartan_type*)

Bases: *AffinePermutationGroupGeneric*

Element

alias of *AffinePermutationTypeG*

one()

Return the identity element.

EXAMPLES:

```
sage: AffinePermutationGroup(['G',2,1]).one()
Type G affine permutation with window [1, 2, 3, 4, 5, 6]
```

```
>>> from sage.all import *
>>> AffinePermutationGroup(['G',Integer(2),Integer(1)]).one()
Type G affine permutation with window [1, 2, 3, 4, 5, 6]
```

class sage.combinat.affine_permutation.**AffinePermutationTypeA**(*parent*, *lst*, *check=True*)

Bases: *AffinePermutation*

apply_simple_reflection_left(*i*)

Apply the simple reflection to the values i, $i+1$.

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.apply_simple_reflection_left(3)
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
sage: p.apply_simple_reflection_left(11)
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),␣
↪Integer(9)])
>>> p.apply_simple_reflection_left(Integer(3))
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
>>> p.apply_simple_reflection_left(Integer(11))
Type A affine permutation with window [4, -1, 0, 6, 5, 3, 10, 9]
```

apply_simple_reflection_right(*i*)

Apply the simple reflection to positions i, $i+1$.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.apply_simple_reflection_right(3)
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
sage: p.apply_simple_reflection_right(11)
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),␣
↪Integer(9)])
>>> p.apply_simple_reflection_right(Integer(3))
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
>>> p.apply_simple_reflection_right(Integer(11))
Type A affine permutation with window [3, -1, 6, 0, 5, 4, 10, 9]
```

check()

Check that `self` is an affine permutation.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
sage: q = A([1,2,3])  # indirect doctest
Traceback (most recent call last):
...
ValueError: length of list must be k+1=8
sage: q = A([1,2,3,4,5,6,7,0])  # indirect doctest
Traceback (most recent call last):
...
ValueError: window does not sum to 36
sage: q = A([1,1,3,4,5,6,7,9])  # indirect doctest
Traceback (most recent call last):
...
ValueError: entries must have distinct residues
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p
Type A affine permutation with window [3, -1, 0, 6, 5, 4, 10, 9]
>>> q = A([Integer(1),Integer(2),Integer(3)])  # indirect doctest
Traceback (most recent call last):
...
ValueError: length of list must be k+1=8
>>> q = A([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),Integer(6),
```

(continues on next page)

(continued from previous page)

```
↪Integer(7),Integer(0)])  # indirect doctest
Traceback (most recent call last):
...
ValueError: window does not sum to 36
>>> q = A([Integer(1),Integer(1),Integer(3),Integer(4),Integer(5),Integer(6),
↪Integer(7),Integer(9)])  # indirect doctest
Traceback (most recent call last):
...
ValueError: entries must have distinct residues
```

flip_automorphism()

The Dynkin diagram automorphism which fixes s_0 and reverses all other indices.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.flip_automorphism()
Type A affine permutation with window [0, -1, 5, 4, 3, 9, 10, 6]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.flip_automorphism()
Type A affine permutation with window [0, -1, 5, 4, 3, 9, 10, 6]
```

has_left_descent(*i*)

Determine whether there is a descent at `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.has_left_descent(1)
True
sage: p.has_left_descent(9)
True
sage: p.has_left_descent(0)
True
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),␣
↪Integer(9)])
>>> p.has_left_descent(Integer(1))
True
>>> p.has_left_descent(Integer(9))
True
>>> p.has_left_descent(Integer(0))
True
```

has_right_descent(*i*)

Determine whether there is a descent at `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.has_right_descent(1)
True
sage: p.has_right_descent(9)
True
sage: p.has_right_descent(0)
False
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),␣
↪Integer(9)])
>>> p.has_right_descent(Integer(1))
True
>>> p.has_right_descent(Integer(9))
True
>>> p.has_right_descent(Integer(0))
False
```

is_fully_commutative()

Determine whether `self` is fully commutative.

This means that it has no reduced word with a braid.

This uses a specific algorithm.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.is_fully_commutative()
False
sage: q = A([-3, -2, 0, 7, 9, 2, 11, 12])
sage: q.is_fully_commutative()
True
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.is_fully_commutative()
False
>>> q = A([-Integer(3), -Integer(2), Integer(0), Integer(7), Integer(9),␣
↪Integer(2), Integer(11), Integer(12)])
>>> q.is_fully_commutative()
True
```

maximal_cyclic_decomposition(*typ='decreasing'*, *side='right'*, *verbose=False*)

Find the unique maximal decomposition of `self` into cyclically decreasing/increasing elements.

INPUT:

- `typ` – `'increasing'` or `'decreasing'` (default: `'decreasing'`); chooses whether to find increasing or decreasing sets
- `side` – `'right'` or `'left'` (default: `'right'`) chooses whether to find maximal sets starting from the left or the right
- `verbose` – boolean (default: `False`); print extra information while finding the decomposition

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.maximal_cyclic_decomposition()
[[0, 7], [4, 1, 0], [7, 5, 4, 2, 1]]
sage: p.maximal_cyclic_decomposition(side='left')
[[1, 0, 7, 5, 4], [1, 0, 5], [2, 1]]
sage: p.maximal_cyclic_decomposition(typ='increasing', side='right')
[[1], [5, 0, 1, 2], [4, 5, 7, 0, 1]]
sage: p.maximal_cyclic_decomposition(typ='increasing', side='left')
[[0, 1, 2, 4, 5], [4, 7, 0, 1], [7]]
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),␣
↪Integer(9)])
>>> p.maximal_cyclic_decomposition()
[[0, 7], [4, 1, 0], [7, 5, 4, 2, 1]]
>>> p.maximal_cyclic_decomposition(side='left')
[[1, 0, 7, 5, 4], [1, 0, 5], [2, 1]]
>>> p.maximal_cyclic_decomposition(typ='increasing', side='right')
[[1], [5, 0, 1, 2], [4, 5, 7, 0, 1]]
>>> p.maximal_cyclic_decomposition(typ='increasing', side='left')
[[0, 1, 2, 4, 5], [4, 7, 0, 1], [7]]
```

maximal_cyclic_factor(*typ='decreasing'*, *side='right'*, *verbose=False*)

For an affine permutation x, find the unique maximal subset A of the index set such that $x = yd_A$ is a reduced product.

INPUT:

- `typ` – `'increasing'` or `'decreasing'` (default: `'decreasing'`); chooses whether to find increasing or decreasing sets
- `side` – `'right'` or `'left'` (default: `'right'`); chooses whether to find maximal sets starting from the left or the right
- `verbose` – boolean; if `True`, outputs information about how the cyclically increasing element was found

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.maximal_cyclic_factor()
[7, 5, 4, 2, 1]
sage: p.maximal_cyclic_factor(side='left')
```

(continues on next page)

(continued from previous page)

```
[1, 0, 7, 5, 4]
sage: p.maximal_cyclic_factor('increasing','right')
[4, 5, 7, 0, 1]
sage: p.maximal_cyclic_factor('increasing','left')
[0, 1, 2, 4, 5]
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),␣
↪Integer(9)])
>>> p.maximal_cyclic_factor()
[7, 5, 4, 2, 1]
>>> p.maximal_cyclic_factor(side='left')
[1, 0, 7, 5, 4]
>>> p.maximal_cyclic_factor('increasing','right')
[4, 5, 7, 0, 1]
>>> p.maximal_cyclic_factor('increasing','left')
[0, 1, 2, 4, 5]
```

position(i)

Find the position `j` such the `self.value(j) == i`.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.position(3)
1
sage: p.position(11)
9
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.position(Integer(3))
1
>>> p.position(Integer(11))
9
```

promotion()

The Dynkin diagram automorphism which sends s_i to s_{i+1}.

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.promotion()
Type A affine permutation with window [2, 4, 0, 1, 7, 6, 5, 11]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.promotion()
Type A affine permutation with window [2, 4, 0, 1, 7, 6, 5, 11]
```

tableau_of_word(*w*, *typ='decreasing'*, *side='right'*, *alpha=None*)

Finds a tableau on the Lehmer code of `self` corresponding to the given reduced word.

For a full description of this algorithm, see [Den2012].

INPUT:

- `w` – a reduced word for `self`
- `typ` – `'increasing'` or `'decreasing'`; the type of Lehmer code used
- `side` – `'right'` or `'left'`
- `alpha` – a content vector; `w` should be of type `alpha`; specifying `alpha` produces semistandard tableaux

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.tableau_of_word(p.reduced_word())
[[], [1, 6, 9], [2, 7, 10], [], [3], [4, 8], [], [5]]
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: w = p.reduced_word(); w
[0, 7, 4, 1, 0, 7, 5, 4, 2, 1]
sage: alpha = [5,3,2]
sage: p.tableau_of_word(p.reduced_word(), alpha=alpha)
[[], [1, 2, 3], [1, 2, 3], [], [1], [1, 2], [], [1]]
sage: p.tableau_of_word(p.reduced_word(), side='left')
[[1, 4, 9], [6], [], [], [3, 7], [8], [], [2, 5, 10]]
sage: p.tableau_of_word(p.reduced_word(), typ='increasing', side='right')
[[9, 10], [1, 2], [], [], [3, 4], [8], [], [5, 6, 7]]
sage: p.tableau_of_word(p.reduced_word(), typ='increasing', side='left')
[[1, 2], [4, 5, 6], [9, 10], [], [3], [7, 8], [], []]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.tableau_of_word(p.reduced_word())
[[], [1, 6, 9], [2, 7, 10], [], [3], [4, 8], [], [5]]
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> w = p.reduced_word(); w
[0, 7, 4, 1, 0, 7, 5, 4, 2, 1]
>>> alpha = [Integer(5),Integer(3),Integer(2)]
>>> p.tableau_of_word(p.reduced_word(), alpha=alpha)
[[], [1, 2, 3], [1, 2, 3], [], [1], [1, 2], [], [1]]
>>> p.tableau_of_word(p.reduced_word(), side='left')
```

(continues on next page)

(continued from previous page)

```
[[1, 4, 9], [6], [], [], [3, 7], [8], [], [2, 5, 10]]
>>> p.tableau_of_word(p.reduced_word(), typ='increasing', side='right')
[[9, 10], [1, 2], [], [], [3, 4], [8], [], [5, 6, 7]]
>>> p.tableau_of_word(p.reduced_word(), typ='increasing', side='left')
[[1, 2], [4, 5, 6], [9, 10], [], [3], [7, 8], [], []]
```

to_bounded_partition(*typ='decreasing'*, *side='right'*)

Return the k-bounded partition associated to the dominant element obtained by sorting the Lehmer code.

INPUT:

- `typ` – `'increasing'` or `'decreasing'` (default: `'decreasing'`); chooses whether to find increasing or decreasing sets
- `side` – `'right'` or `'left'` (default: `'right'`); chooses whether to find maximal sets starting from the left or the right

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',2,1])
sage: p = A.from_lehmer_code([4,1,0])
sage: p.to_bounded_partition()
[2, 1, 1, 1]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(2),Integer(1)])
>>> p = A.from_lehmer_code([Integer(4),Integer(1),Integer(0)])
>>> p.to_bounded_partition()
[2, 1, 1, 1]
```

to_core(*typ='decreasing'*, *side='right'*)

Return the core associated to the dominant element obtained by sorting the Lehmer code.

INPUT:

- `typ` – `'increasing'` or `'decreasing'` (default: `'decreasing'`.)
- `side` – `'right'` or `'left'` (default: `'right'`.) Chooses whether to find maximal sets starting from the left or the right

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',2,1])
sage: p = A.from_lehmer_code([4,1,0])
sage: p.to_bounded_partition()
[2, 1, 1, 1]
sage: p.to_core()
[4, 2, 1, 1]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(2),Integer(1)])
>>> p = A.from_lehmer_code([Integer(4),Integer(1),Integer(0)])
>>> p.to_bounded_partition()
[2, 1, 1, 1]
>>> p.to_core()
[4, 2, 1, 1]
```

to_dominant(*typ='decreasing'*, *side='right'*)

Find the Lehmer code and then sort it. Return the affine permutation with the given sorted Lehmer code.

This element is 0-dominant.

INPUT:

- `typ` – `'increasing'` or `'decreasing'` (default: `'decreasing'`) chooses whether to find increasing or decreasing sets
- `side` – `'right'` or `'left'` (default: `'right'`) chooses whether to find maximal sets starting from the left or the right

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.to_dominant()
Type A affine permutation with window [-2, -1, 1, 3, 4, 8, 10, 13]
sage: p.to_dominant(typ='increasing', side='left')
Type A affine permutation with window [3, 4, -1, 5, 0, 9, 6, 10]
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.to_dominant()
Type A affine permutation with window [-2, -1, 1, 3, 4, 8, 10, 13]
>>> p.to_dominant(typ='increasing', side='left')
Type A affine permutation with window [3, 4, -1, 5, 0, 9, 6, 10]
```

to_lehmer_code(*typ='decreasing'*, *side='right'*)

Return the affine Lehmer code.

There are four such codes; the options `typ` and `side` determine which code is generated. The codes generated are the shape of the maximal cyclic decompositions of `self` according to the given `typ` and `side` options.

INPUT:

- `typ` – `'increasing'` or `'decreasing'` (default: `'decreasing'`); chooses whether to find increasing or decreasing sets
- `side` – `'right'` or `'left'` (default: `'right'`) chooses whether to find maximal sets starting from the left or the right

EXAMPLES:

```
sage: import itertools
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: orders = ('increasing','decreasing')
sage: sides = ('left','right')
sage: for o,s in itertools.product(orders, sides):
....:   p.to_lehmer_code(o,s)
[2, 3, 2, 0, 1, 2, 0, 0]
[2, 2, 0, 0, 2, 1, 0, 3]
[3, 1, 0, 0, 2, 1, 0, 3]
[0, 3, 3, 0, 1, 2, 0, 1]
```

(continues on next page)

(continued from previous page)

```
sage: for a in itertools.product(orders, sides):
....:   A.from_lehmer_code(p.to_lehmer_code(a[0],a[1]), a[0],a[1])==p
True
True
True
True
```

```
>>> from sage.all import *
>>> import itertools
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> orders = ('increasing','decreasing')
>>> sides = ('left','right')
>>> for o,s in itertools.product(orders, sides):
...   p.to_lehmer_code(o,s)
[2, 3, 2, 0, 1, 2, 0, 0]
[2, 2, 0, 0, 2, 1, 0, 3]
[3, 1, 0, 0, 2, 1, 0, 3]
[0, 3, 3, 0, 1, 2, 0, 1]
>>> for a in itertools.product(orders, sides):
...   A.from_lehmer_code(p.to_lehmer_code(a[Integer(0)],a[Integer(1)]),␣
↪a[Integer(0)],a[Integer(1)])==p
True
True
True
True
```

to_type_a()

Return an embedding of `self` into the affine permutation group of type A. (For type A, just returns `self`.)

EXAMPLES:

```
sage: p = AffinePermutationGroup(['A',7,1])([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.to_type_a() is p
True
```

```
>>> from sage.all import *
>>> p = AffinePermutationGroup(['A',Integer(7),Integer(1)])([Integer(3), -
↪Integer(1), Integer(0), Integer(6), Integer(5), Integer(4), Integer(10),␣
↪Integer(9)])
>>> p.to_type_a() is p
True
```

value(*i*, *base_window=False*)

Return the image of the integer `i` under this permutation.

INPUT:

- `base_window` – boolean; indicating whether `i` is in the base window; if `True`, will run a bit faster, but the method will screw up if `i` is not actually in the index set

EXAMPLES:

```
sage: A = AffinePermutationGroup(['A',7,1])
sage: p = A([3, -1, 0, 6, 5, 4, 10, 9])
sage: p.value(1)
3
sage: p.value(9)
11
```

```
>>> from sage.all import *
>>> A = AffinePermutationGroup(['A',Integer(7),Integer(1)])
>>> p = A([Integer(3), -Integer(1), Integer(0), Integer(6), Integer(5),␣
↪Integer(4), Integer(10), Integer(9)])
>>> p.value(Integer(1))
3
>>> p.value(Integer(9))
11
```

class sage.combinat.affine_permutation.**AffinePermutationTypeB**(*parent*, *lst*, *check=True*)

Bases: *AffinePermutationTypeC*

apply_simple_reflection_left(*i*)

Apply the simple reflection indexed by `i` on values.

EXAMPLES:

```
sage: B = AffinePermutationGroup(['B',4,1])
sage: p = B([-5,1,6,-2])
sage: p.apply_simple_reflection_left(0)
Type B affine permutation with window [-5, -2, 6, 1]
sage: p.apply_simple_reflection_left(2)
Type B affine permutation with window [-5, 1, 7, -3]
sage: p.apply_simple_reflection_left(4)
Type B affine permutation with window [-4, 1, 6, -2]
```

```
>>> from sage.all import *
>>> B = AffinePermutationGroup(['B',Integer(4),Integer(1)])
>>> p = B([-Integer(5),Integer(1),Integer(6),-Integer(2)])
>>> p.apply_simple_reflection_left(Integer(0))
Type B affine permutation with window [-5, -2, 6, 1]
>>> p.apply_simple_reflection_left(Integer(2))
Type B affine permutation with window [-5, 1, 7, -3]
>>> p.apply_simple_reflection_left(Integer(4))
Type B affine permutation with window [-4, 1, 6, -2]
```

apply_simple_reflection_right(*i*)

Apply the simple reflection indexed by `i` on positions.

EXAMPLES:

```
sage: B = AffinePermutationGroup(['B',4,1])
sage: p = B([-5,1,6,-2])
sage: p.apply_simple_reflection_right(1)
Type B affine permutation with window [1, -5, 6, -2]
sage: p.apply_simple_reflection_right(0)
```

(continues on next page)

(continued from previous page)

```
Type B affine permutation with window [-1, 5, 6, -2]
sage: p.apply_simple_reflection_right(4)
Type B affine permutation with window [-5, 1, 6, 11]
```

```
>>> from sage.all import *
>>> B = AffinePermutationGroup(['B',Integer(4),Integer(1)])
>>> p = B([-Integer(5),Integer(1),Integer(6),-Integer(2)])
>>> p.apply_simple_reflection_right(Integer(1))
Type B affine permutation with window [1, -5, 6, -2]
>>> p.apply_simple_reflection_right(Integer(0))
Type B affine permutation with window [-1, 5, 6, -2]
>>> p.apply_simple_reflection_right(Integer(4))
Type B affine permutation with window [-5, 1, 6, 11]
```

check()

Check that `self` is an affine permutation.

EXAMPLES:

```
sage: B = AffinePermutationGroup(['B',4,1])
sage: x = B([-5,1,6,-2])
sage: x
Type B affine permutation with window [-5, 1, 6, -2]
```

```
>>> from sage.all import *
>>> B = AffinePermutationGroup(['B',Integer(4),Integer(1)])
>>> x = B([-Integer(5),Integer(1),Integer(6),-Integer(2)])
>>> x
Type B affine permutation with window [-5, 1, 6, -2]
```

has_left_descent(*i*)

Determine whether there is a descent at `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: B = AffinePermutationGroup(['B',4,1])
sage: p = B([-5,1,6,-2])
sage: [p.has_left_descent(i) for i in B.index_set()]
[True, True, False, False, True]
```

```
>>> from sage.all import *
>>> B = AffinePermutationGroup(['B',Integer(4),Integer(1)])
>>> p = B([-Integer(5),Integer(1),Integer(6),-Integer(2)])
>>> [p.has_left_descent(i) for i in B.index_set()]
[True, True, False, False, True]
```

has_right_descent(*i*)

Determine whether there is a descent at index `i`.

INPUT:

- i – integer

EXAMPLES:

```
sage: B = AffinePermutationGroup(['B',4,1])
sage: p = B([-5,1,6,-2])
sage: [p.has_right_descent(i) for i in B.index_set()]
[True, False, False, True, False]
```

```
>>> from sage.all import *
>>> B = AffinePermutationGroup(['B',Integer(4),Integer(1)])
>>> p = B([-Integer(5),Integer(1),Integer(6),-Integer(2)])
>>> [p.has_right_descent(i) for i in B.index_set()]
[True, False, False, True, False]
```

class sage.combinat.affine_permutation.**AffinePermutationTypeC**(*parent*, *lst*, *check=True*)

Bases: *AffinePermutation*

apply_simple_reflection_left(*i*)

Apply the simple reflection indexed by i on values.

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x = C([-1,5,3,7])
sage: for i in C.index_set(): x.apply_simple_reflection_left(i)
Type C affine permutation with window [1, 5, 3, 7]
Type C affine permutation with window [-2, 5, 3, 8]
Type C affine permutation with window [-1, 5, 2, 6]
Type C affine permutation with window [-1, 6, 4, 7]
Type C affine permutation with window [-1, 4, 3, 7]
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x = C([-Integer(1),Integer(5),Integer(3),Integer(7)])
>>> for i in C.index_set(): x.apply_simple_reflection_left(i)
Type C affine permutation with window [1, 5, 3, 7]
Type C affine permutation with window [-2, 5, 3, 8]
Type C affine permutation with window [-1, 5, 2, 6]
Type C affine permutation with window [-1, 6, 4, 7]
Type C affine permutation with window [-1, 4, 3, 7]
```

apply_simple_reflection_right(*i*)

Apply the simple reflection indexed by i on positions.

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x = C([-1,5,3,7])
sage: for i in C.index_set(): x.apply_simple_reflection_right(i)
Type C affine permutation with window [1, 5, 3, 7]
Type C affine permutation with window [5, -1, 3, 7]
Type C affine permutation with window [-1, 3, 5, 7]
Type C affine permutation with window [-1, 5, 7, 3]
Type C affine permutation with window [-1, 5, 3, 2]
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x = C([-Integer(1),Integer(5),Integer(3),Integer(7)])
>>> for i in C.index_set(): x.apply_simple_reflection_right(i)
Type C affine permutation with window [1, 5, 3, 7]
Type C affine permutation with window [5, -1, 3, 7]
Type C affine permutation with window [-1, 3, 5, 7]
Type C affine permutation with window [-1, 5, 7, 3]
Type C affine permutation with window [-1, 5, 3, 2]
```

check()

Check that `self` is an affine permutation.

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x = C([-1,5,3,7])
sage: x
Type C affine permutation with window [-1, 5, 3, 7]
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x = C([-Integer(1),Integer(5),Integer(3),Integer(7)])
>>> x
Type C affine permutation with window [-1, 5, 3, 7]
```

has_left_descent(*i*)

Determine whether there is a descent at `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x = C([-1,5,3,7])
sage: for i in C.index_set(): x.has_left_descent(i)
True
False
True
False
True
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x = C([-Integer(1),Integer(5),Integer(3),Integer(7)])
>>> for i in C.index_set(): x.has_left_descent(i)
True
False
True
False
True
```

has_right_descent(*i*)

Determine whether there is a descent at index `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x = C([-1,5,3,7])
sage: for i in C.index_set(): x.has_right_descent(i)
True
False
True
False
True
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x = C([-Integer(1),Integer(5),Integer(3),Integer(7)])
>>> for i in C.index_set(): x.has_right_descent(i)
True
False
True
False
True
```

position(*i*)

Find the position j such the `self.value(j)=i`.

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x = C.one()
sage: all(x.position(i) == i for i in range(-10,10))
True
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x = C.one()
>>> all(x.position(i) == i for i in range(-Integer(10),Integer(10)))
True
```

to_type_a()

Return an embedding of `self` into the affine permutation group of type A.

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x = C([-1,5,3,7])
sage: x.to_type_a()
Type A affine permutation with window [-1, 5, 3, 7, 2, 6, 4, 10, 9]
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x = C([-Integer(1),Integer(5),Integer(3),Integer(7)])
>>> x.to_type_a()
Type A affine permutation with window [-1, 5, 3, 7, 2, 6, 4, 10, 9]
```

value(*i*)

Return the image of the integer `i` under this permutation.

EXAMPLES:

```
sage: C = AffinePermutationGroup(['C',4,1])
sage: x = C.one()
sage: all(x.value(i) == i for i in range(-10,10))
True
```

```
>>> from sage.all import *
>>> C = AffinePermutationGroup(['C',Integer(4),Integer(1)])
>>> x = C.one()
>>> all(x.value(i) == i for i in range(-Integer(10),Integer(10)))
True
```

class sage.combinat.affine_permutation.**AffinePermutationTypeD**(*parent*, *lst*, *check=True*)

Bases: *AffinePermutationTypeC*

apply_simple_reflection_left(*i*)

Apply simple reflection indexed by `i` on values.

EXAMPLES:

```
sage: D = AffinePermutationGroup(['D',4,1])
sage: p = D([1,-6,5,-2])
sage: p.apply_simple_reflection_left(0)
Type D affine permutation with window [-2, -6, 5, 1]
sage: p.apply_simple_reflection_left(1)
Type D affine permutation with window [2, -6, 5, -1]
sage: p.apply_simple_reflection_left(4)
Type D affine permutation with window [1, -4, 3, -2]
```

```
>>> from sage.all import *
>>> D = AffinePermutationGroup(['D',Integer(4),Integer(1)])
>>> p = D([Integer(1),-Integer(6),Integer(5),-Integer(2)])
>>> p.apply_simple_reflection_left(Integer(0))
Type D affine permutation with window [-2, -6, 5, 1]
>>> p.apply_simple_reflection_left(Integer(1))
Type D affine permutation with window [2, -6, 5, -1]
>>> p.apply_simple_reflection_left(Integer(4))
Type D affine permutation with window [1, -4, 3, -2]
```

apply_simple_reflection_right(*i*)

Apply the simple reflection indexed by `i` on positions.

EXAMPLES:

```
sage: D = AffinePermutationGroup(['D',4,1])
sage: p = D([1,-6,5,-2])
sage: p.apply_simple_reflection_right(0)
Type D affine permutation with window [6, -1, 5, -2]
sage: p.apply_simple_reflection_right(1)
Type D affine permutation with window [-6, 1, 5, -2]
sage: p.apply_simple_reflection_right(4)
Type D affine permutation with window [1, -6, 11, 4]
```

```
>>> from sage.all import *
>>> D = AffinePermutationGroup(['D',Integer(4),Integer(1)])
>>> p = D([Integer(1),-Integer(6),Integer(5),-Integer(2)])
>>> p.apply_simple_reflection_right(Integer(0))
Type D affine permutation with window [6, -1, 5, -2]
>>> p.apply_simple_reflection_right(Integer(1))
Type D affine permutation with window [-6, 1, 5, -2]
>>> p.apply_simple_reflection_right(Integer(4))
Type D affine permutation with window [1, -6, 11, 4]
```

check()

Check that `self` is an affine permutation.

EXAMPLES:

```
sage: D = AffinePermutationGroup(['D',4,1])
sage: p = D([1,-6,5,-2])
sage: p
Type D affine permutation with window [1, -6, 5, -2]
```

```
>>> from sage.all import *
>>> D = AffinePermutationGroup(['D',Integer(4),Integer(1)])
>>> p = D([Integer(1),-Integer(6),Integer(5),-Integer(2)])
>>> p
Type D affine permutation with window [1, -6, 5, -2]
```

has_left_descent(*i*)

Determine whether there is a descent at `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: D = AffinePermutationGroup(['D',4,1])
sage: p = D([1,-6,5,-2])
sage: [p.has_left_descent(i) for i in D.index_set()]
[True, True, False, True, True]
```

```
>>> from sage.all import *
>>> D = AffinePermutationGroup(['D',Integer(4),Integer(1)])
>>> p = D([Integer(1),-Integer(6),Integer(5),-Integer(2)])
>>> [p.has_left_descent(i) for i in D.index_set()]
[True, True, False, True, True]
```

has_right_descent(*i*)

Determine whether there is a descent at index `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: D = AffinePermutationGroup(['D',4,1])
sage: p = D([1,-6,5,-2])
sage: [p.has_right_descent(i) for i in D.index_set()]
[True, True, False, True, False]
```

```
>>> from sage.all import *
>>> D = AffinePermutationGroup(['D',Integer(4),Integer(1)])
>>> p = D([Integer(1),-Integer(6),Integer(5),-Integer(2)])
>>> [p.has_right_descent(i) for i in D.index_set()]
[True, True, False, True, False]
```

class sage.combinat.affine_permutation.**AffinePermutationTypeG**(*parent*, *lst*, *check=True*)

Bases: *AffinePermutation*

apply_simple_reflection_left(*i*)

Apply simple reflection indexed by i on values.

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p = G([2, 10, -5, 12, -3, 5])
sage: p.apply_simple_reflection_left(0)
Type G affine permutation with window [0, 10, -7, 14, -3, 7]
sage: p.apply_simple_reflection_left(1)
Type G affine permutation with window [1, 9, -4, 11, -2, 6]
sage: p.apply_simple_reflection_left(2)
Type G affine permutation with window [3, 11, -5, 12, -4, 4]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> p = G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
>>> p.apply_simple_reflection_left(Integer(0))
Type G affine permutation with window [0, 10, -7, 14, -3, 7]
>>> p.apply_simple_reflection_left(Integer(1))
Type G affine permutation with window [1, 9, -4, 11, -2, 6]
>>> p.apply_simple_reflection_left(Integer(2))
Type G affine permutation with window [3, 11, -5, 12, -4, 4]
```

apply_simple_reflection_right(*i*)

Apply the simple reflection indexed by `i` on positions.

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p = G([2, 10, -5, 12, -3, 5])
```

(continues on next page)

(continued from previous page)

```
sage: p.apply_simple_reflection_right(0)
Type G affine permutation with window [-9, -1, -5, 12, 8, 16]
sage: p.apply_simple_reflection_right(1)
Type G affine permutation with window [10, 2, 12, -5, 5, -3]
sage: p.apply_simple_reflection_right(2)
Type G affine permutation with window [2, -5, 10, -3, 12, 5]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> p = G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
>>> p.apply_simple_reflection_right(Integer(0))
Type G affine permutation with window [-9, -1, -5, 12, 8, 16]
>>> p.apply_simple_reflection_right(Integer(1))
Type G affine permutation with window [10, 2, 12, -5, 5, -3]
>>> p.apply_simple_reflection_right(Integer(2))
Type G affine permutation with window [2, -5, 10, -3, 12, 5]
```

check()

Check that `self` is an affine permutation.

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p = G([2, 10, -5, 12, -3, 5])
sage: p
Type G affine permutation with window [2, 10, -5, 12, -3, 5]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> p = G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
>>> p
Type G affine permutation with window [2, 10, -5, 12, -3, 5]
```

has_left_descent(*i*)

Determine whether there is a descent at `i`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p = G([2, 10, -5, 12, -3, 5])
sage: [p.has_left_descent(i) for i in G.index_set()]
[False, True, False]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> p = G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
```

(continues on next page)

(continued from previous page)

```
>>> [p.has_left_descent(i) for i in G.index_set()]
[False, True, False]
```

has_right_descent(i)

Determine whether there is a descent at index i.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p = G([2, 10, -5, 12, -3, 5])
sage: [p.has_right_descent(i) for i in G.index_set()]
[False, False, True]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> p = G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
>>> [p.has_right_descent(i) for i in G.index_set()]
[False, False, True]
```

position(i)

Find the position `j` such the `self.value(j) == i`.

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p = G([2, 10, -5, 12, -3, 5])
sage: [p.position(i) for i in p]
[1, 2, 3, 4, 5, 6]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> p = G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
>>> [p.position(i) for i in p]
[1, 2, 3, 4, 5, 6]
```

to_type_a()

Return an embedding of `self` into the affine permutation group of type A.

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p = G([2, 10, -5, 12, -3, 5])
sage: p.to_type_a()
Type A affine permutation with window [2, 10, -5, 12, -3, 5]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> p = G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
>>> p.to_type_a()
Type A affine permutation with window [2, 10, -5, 12, -3, 5]
```

value(*i*, *base_window=False*)

Return the image of the integer `i` under this permutation.

INPUT:

- `base_window` – boolean indicating whether `i` is between 1 and $k+1$; if `True`, will run a bit faster, but the method will screw up if `i` is not actually in the index set

EXAMPLES:

```
sage: G = AffinePermutationGroup(['G',2,1])
sage: p = G([2, 10, -5, 12, -3, 5])
sage: [p.value(i) for i in [1..12]]
[2, 10, -5, 12, -3, 5, 8, 16, 1, 18, 3, 11]
```

```
>>> from sage.all import *
>>> G = AffinePermutationGroup(['G',Integer(2),Integer(1)])
>>> p = G([Integer(2), Integer(10), -Integer(5), Integer(12), -Integer(3),␣
↪Integer(5)])
>>> [p.value(i) for i in (ellipsis_range(Integer(1),Ellipsis,Integer(12)))]
[2, 10, -5, 12, -3, 5, 8, 16, 1, 18, 3, 11]
```

class sage.combinat.alternating_sign_matrix.**AlternatingSignMatrices**(n)

Bases: UniqueRepresentation, Parent

Class of all $n \times n$ alternating sign matrices.

An alternating sign matrix of size n is an $n \times n$ matrix of 0's, 1's and -1's such that the sum of each row and column is 1 and the nonzero entries in each row and column alternate in sign.

Alternating sign matrices of size n are in bijection with *monotone triangles* with n rows.

INPUT:

- n – integer; the size of the matrices

EXAMPLES:

This will create an instance to manipulate the alternating sign matrices of size 3:

```
sage: A = AlternatingSignMatrices(3)
sage: A
Alternating sign matrices of size 3
sage: A.cardinality()
7
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A
Alternating sign matrices of size 3
>>> A.cardinality()
7
```

Notably, this implementation allows to make a lattice of it:

```
sage: L = A.lattice()
sage: L
Finite lattice containing 7 elements
sage: L.category()
Category of facade finite enumerated distributive lattices
```

```
>>> from sage.all import *
>>> L = A.lattice()
>>> L
Finite lattice containing 7 elements
>>> L.category()
Category of facade finite enumerated distributive lattices
```

Element

alias of *AlternatingSignMatrix*

cardinality()

Return the cardinality of self.

The number of $n \times n$ alternating sign matrices is equal to

$$\prod_{k=0}^{n-1} \frac{(3k+1)!}{(n+k)!} = \frac{1!4!7!10!\cdots(3n-2)!}{n!(n+1)!(n+2)!(n+3)!\cdots(2n-1)!}$$

EXAMPLES:

```
sage: [AlternatingSignMatrices(n).cardinality() for n in range(11)]
[1, 1, 2, 7, 42, 429, 7436, 218348, 10850216, 911835460, 129534272700]
```

```
>>> from sage.all import *
>>> [AlternatingSignMatrices(n).cardinality() for n in range(Integer(11))]
[1, 1, 2, 7, 42, 429, 7436, 218348, 10850216, 911835460, 129534272700]
```

cover_relations()

Iterate on the cover relations between the alternating sign matrices.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: for a, b in A.cover_relations():
....:   eval('a, b')
(
[1 0 0]  [0 1 0]
[0 1 0]  [1 0 0]
[0 0 1], [0 0 1]
)
(
[1 0 0]  [1 0 0]
[0 1 0]  [0 0 1]
[0 0 1], [0 1 0]
)
(
[0 1 0]  [ 0  1  0]
[1 0 0]  [ 1 -1  1]
[0 0 1], [ 0  1  0]
)
(
[1 0 0]  [ 0  1  0]
[0 0 1]  [ 1 -1  1]
[0 1 0], [ 0  1  0]
)
(
[ 0  1  0]  [0 0 1]
[ 1 -1  1]  [1 0 0]
[ 0  1  0], [0 1 0]
)
(
[ 0  1  0]  [0 1 0]
[ 1 -1  1]  [0 0 1]
[ 0  1  0], [1 0 0]
)
(
[0 0 1]  [0 0 1]
[1 0 0]  [0 1 0]
[0 1 0], [1 0 0]
)
(
[0 1 0]  [0 0 1]
[0 0 1]  [0 1 0]
[1 0 0], [1 0 0]
)
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> for a, b in A.cover_relations():
...   eval('a, b')
```

(continues on next page)

(continued from previous page)

```
(
[1 0 0]  [0 1 0]
[0 1 0]  [1 0 0]
[0 0 1], [0 0 1]
)
(
[1 0 0]  [1 0 0]
[0 1 0]  [0 0 1]
[0 0 1], [0 1 0]
)
(
[0 1 0]  [ 0  1  0]
[1 0 0]  [ 1 -1  1]
[0 0 1], [ 0  1  0]
)
(
[1 0 0]  [ 0  1  0]
[0 0 1]  [ 1 -1  1]
[0 1 0], [ 0  1  0]
)
(
[ 0  1  0]  [0 0 1]
[ 1 -1  1]  [1 0 0]
[ 0  1  0], [0 1 0]
)
(
[ 0  1  0]  [0 1 0]
[ 1 -1  1]  [0 0 1]
[ 0  1  0], [1 0 0]
)
(
[0 0 1]  [0 0 1]
[1 0 0]  [0 1 0]
[0 1 0], [1 0 0]
)
(
[0 1 0]  [0 0 1]
[0 0 1]  [0 1 0]
[1 0 0], [1 0 0]
)
```

first()

Return the first alternating sign matrix.

EXAMPLES:

```
sage: AlternatingSignMatrices(5).first()
[1 0 0 0 0]
[0 1 0 0 0]
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]
```

```
>>> from sage.all import *
>>> AlternatingSignMatrices(Integer(5)).first()
[1 0 0 0 0]
[0 1 0 0 0]
[0 0 1 0 0]
[0 0 0 1 0]
[0 0 0 0 1]
```

from_contre_tableau(*comps*)

Return an alternating sign matrix from a contre-tableau.

EXAMPLES:

```
sage: ASM = AlternatingSignMatrices(3)
sage: ASM.from_contre_tableau([[1, 2, 3], [1, 2], [1]])
[0 0 1]
[0 1 0]
[1 0 0]
sage: ASM.from_contre_tableau([[1, 2, 3], [2, 3], [3]])
[1 0 0]
[0 1 0]
[0 0 1]
```

```
>>> from sage.all import *
>>> ASM = AlternatingSignMatrices(Integer(3))
>>> ASM.from_contre_tableau([[Integer(1), Integer(2), Integer(3)],␣
↪[Integer(1), Integer(2)], [Integer(1)]])
[0 0 1]
[0 1 0]
[1 0 0]
>>> ASM.from_contre_tableau([[Integer(1), Integer(2), Integer(3)],␣
↪[Integer(2), Integer(3)], [Integer(3)]])
[1 0 0]
[0 1 0]
[0 0 1]
```

from_corner_sum(*corner*)

Return an alternating sign matrix from a corner sum matrix.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A.from_corner_sum(matrix([[0,0,0,0],[0,1,1,1],[0,1,2,2],[0,1,2,3]]))
[1 0 0]
[0 1 0]
[0 0 1]
sage: A.from_corner_sum(matrix([[0,0,0,0],[0,0,1,1],[0,1,1,2],[0,1,2,3]]))
[ 0  1  0]
[ 1 -1  1]
[ 0  1  0]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
```

(continues on next page)

(continued from previous page)

```
>>> A.from_corner_sum(matrix([[Integer(0),Integer(0),Integer(0),Integer(0)],
↪[Integer(0),Integer(1),Integer(1),Integer(1)],[Integer(0),Integer(1),
↪Integer(2),Integer(2)],[Integer(0),Integer(1),Integer(2),Integer(3)]]))
[1 0 0]
[0 1 0]
[0 0 1]
>>> A.from_corner_sum(matrix([[Integer(0),Integer(0),Integer(0),Integer(0)],
↪[Integer(0),Integer(0),Integer(1),Integer(1)],[Integer(0),Integer(1),
↪Integer(1),Integer(2)],[Integer(0),Integer(1),Integer(2),Integer(3)]]))
[ 0  1  0]
[ 1 -1  1]
[ 0  1  0]
```

from_height_function(*height*)

Return an alternating sign matrix from a height function.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A.from_height_function(matrix([[0,1,2,3],[1,2,1,2],[2,3,2,1],[3,2,1,
↪0]]))
[0 0 1]
[1 0 0]
[0 1 0]
sage: A.from_height_function(matrix([[0,1,2,3],[1,2,1,2],[2,1,2,1],[3,2,1,
↪0]]))
[ 0  1  0]
[ 1 -1  1]
[ 0  1  0]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A.from_height_function(matrix([[Integer(0),Integer(1),Integer(2),
↪Integer(3)],[Integer(1),Integer(2),Integer(1),Integer(2)],[Integer(2),
↪Integer(3),Integer(2),Integer(1)],[Integer(3),Integer(2),Integer(1),
↪Integer(0)]]))
[0 0 1]
[1 0 0]
[0 1 0]
>>> A.from_height_function(matrix([[Integer(0),Integer(1),Integer(2),
↪Integer(3)],[Integer(1),Integer(2),Integer(1),Integer(2)],[Integer(2),
↪Integer(1),Integer(2),Integer(1)],[Integer(3),Integer(2),Integer(1),
↪Integer(0)]]))
[ 0  1  0]
[ 1 -1  1]
[ 0  1  0]
```

from_monotone_triangle(*triangle*, *check=True*)

Return an alternating sign matrix from a monotone triangle.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A.from_monotone_triangle([[3, 2, 1], [2, 1], [1]])
[1 0 0]
[0 1 0]
[0 0 1]
sage: A.from_monotone_triangle([[3, 2, 1], [3, 2], [3]])
[0 0 1]
[0 1 0]
[1 0 0]

sage: A.from_monotone_triangle([[3, 2, 1], [2, 2], [1]])
Traceback (most recent call last):
...
ValueError: not a valid triangle
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A.from_monotone_triangle([[Integer(3), Integer(2), Integer(1)],␣
↪[Integer(2), Integer(1)], [Integer(1)]])
[1 0 0]
[0 1 0]
[0 0 1]
>>> A.from_monotone_triangle([[Integer(3), Integer(2), Integer(1)],␣
↪[Integer(3), Integer(2)], [Integer(3)]])
[0 0 1]
[0 1 0]
[1 0 0]

>>> A.from_monotone_triangle([[Integer(3), Integer(2), Integer(1)],␣
↪[Integer(2), Integer(2)], [Integer(1)]])
Traceback (most recent call last):
...
ValueError: not a valid triangle
```

gyration_orbit_sizes()

Return the sizes of gyration orbits of `self`.

EXAMPLES:

```
sage: AlternatingSignMatrices(3).gyration_orbit_sizes()
[3, 2, 2]
sage: AlternatingSignMatrices(4).gyration_orbit_sizes()
[4, 8, 2, 8, 8, 8, 2, 2]

sage: A = AlternatingSignMatrices(5)
sage: li = [5,10,10,10,10,10,2,5,10,10,10,10,10,10,10,10,10,10,10,10,
....: 4,10,10,10,10,10,10,4,5,10,10,10,10,10,10,2,4,5,10,10,10,10,10,10,
....: 4,5,10,10,2,2]
sage: A.gyration_orbit_sizes() == li
True
```

```
>>> from sage.all import *
>>> AlternatingSignMatrices(Integer(3)).gyration_orbit_sizes()
[3, 2, 2]
>>> AlternatingSignMatrices(Integer(4)).gyration_orbit_sizes()
[4, 8, 2, 8, 8, 8, 2, 2]

>>> A = AlternatingSignMatrices(Integer(5))
>>> li = [Integer(5),Integer(10),Integer(10),Integer(10),Integer(10),
↪Integer(10),Integer(2),Integer(5),Integer(10),Integer(10),Integer(10),
↪Integer(10),Integer(10),Integer(10),Integer(10),Integer(10),Integer(10),
↪Integer(10),Integer(10),Integer(10),
... Integer(4),Integer(10),Integer(10),Integer(10),Integer(10),Integer(10),
↪Integer(10),Integer(4),Integer(5),Integer(10),Integer(10),Integer(10),
↪Integer(10),Integer(10),Integer(10),Integer(10),Integer(2),Integer(4),
↪Integer(5),Integer(10),Integer(10),Integer(10),Integer(10),Integer(10),
↪Integer(10),
... Integer(4),Integer(5),Integer(10),Integer(10),Integer(2),Integer(2)]
>>> A.gyration_orbit_sizes() == li
True
```

gyration_orbits()

Return the list of gyration orbits of `self`.

EXAMPLES:

```
sage: AlternatingSignMatrices(3).gyration_orbits()
((
  [1 0 0]  [0 0 1]  [ 0  1  0]
  [0 1 0]  [0 1 0]  [ 1 -1  1]
  [0 0 1], [1 0 0], [ 0  1  0]
 ),
 (
  [0 1 0]  [1 0 0]
  [1 0 0]  [0 0 1]
  [0 0 1], [0 1 0]
 ),
 (
  [0 0 1]  [0 1 0]
  [1 0 0]  [0 0 1]
  [0 1 0], [1 0 0]
 ))
```

```
>>> from sage.all import *
>>> AlternatingSignMatrices(Integer(3)).gyration_orbits()
((
  [1 0 0]  [0 0 1]  [ 0  1  0]
  [0 1 0]  [0 1 0]  [ 1 -1  1]
  [0 0 1], [1 0 0], [ 0  1  0]
 ),
 (
  [0 1 0]  [1 0 0]
  [1 0 0]  [0 0 1]
  [0 0 1], [0 1 0]
```

(continues on next page)

(continued from previous page)

```
 ),
 (
  [0 0 1]   [0 1 0]
  [1 0 0]   [0 0 1]
  [0 1 0], [1 0 0]
 ))
```

last()

Return the last alternating sign matrix.

EXAMPLES:

```
sage: AlternatingSignMatrices(5).last()
[0 0 0 0 1]
[0 0 0 1 0]
[0 0 1 0 0]
[0 1 0 0 0]
[1 0 0 0 0]
```

```
>>> from sage.all import *
>>> AlternatingSignMatrices(Integer(5)).last()
[0 0 0 0 1]
[0 0 0 1 0]
[0 0 1 0 0]
[0 1 0 0 0]
[1 0 0 0 0]
```

lattice()

Return the lattice of the alternating sign matrices of size n, created by `LatticePoset`.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: L = A.lattice()
sage: L
Finite lattice containing 7 elements
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> L = A.lattice()
>>> L
Finite lattice containing 7 elements
```

matrix_space()

Return the underlying matrix space.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A.matrix_space()
Full MatrixSpace of 3 by 3 dense matrices over Integer Ring
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A.matrix_space()
Full MatrixSpace of 3 by 3 dense matrices over Integer Ring
```

random_element()

Return a uniformly random alternating sign matrix.

EXAMPLES:

```
sage: AlternatingSignMatrices(7).random_element()  # random
[ 0  0  0  0  1  0  0]
[ 0  0  1  0 -1  0  1]
[ 0  0  0  0  1  0  0]
[ 0  1 -1  0  0  1  0]
[ 1 -1  1  0  0  0  0]
[ 0  0  0  1  0  0  0]
[ 0  1  0  0  0  0  0]
sage: a = AlternatingSignMatrices(5).random_element()
sage: bool(a.number_of_negative_ones()) or a.is_permutation()
True
```

```
>>> from sage.all import *
>>> AlternatingSignMatrices(Integer(7)).random_element()  # random
[ 0  0  0  0  1  0  0]
[ 0  0  1  0 -1  0  1]
[ 0  0  0  0  1  0  0]
[ 0  1 -1  0  0  1  0]
[ 1 -1  1  0  0  0  0]
[ 0  0  0  1  0  0  0]
[ 0  1  0  0  0  0  0]
>>> a = AlternatingSignMatrices(Integer(5)).random_element()
>>> bool(a.number_of_negative_ones()) or a.is_permutation()
True
```

This is done using a modified version of Propp and Wilson's "coupling from the past" algorithm. It creates a uniformly random Gelfand-Tsetlin triangle with top row $[n, n-1, \ldots 2, 1]$, and then converts it to an alternating sign matrix.

size()

Return the size of the matrices in `self`.

class sage.combinat.alternating_sign_matrix.**AlternatingSignMatrix**(*parent*, *asm*)

Bases: `Element`

An alternating sign matrix.

An alternating sign matrix is a square matrix of 0's, 1's and -1's such that the sum of each row and column is 1 and the nonzero entries in each row and column alternate in sign.

These were introduced in [MRR1983].

ASM_compatible(*B*)

Return `True` if `self` and `B` are compatible alternating sign matrices in the sense of [EKLP1992]. (If `self` is of size n, `B` must be of size $n+1$.)

In [EKLP1992], there is a notion of a pair of ASM's with sizes differing by 1 being compatible, in the sense that they can be combined to encode a tiling of the Aztec Diamond.

EXAMPLES:

```
sage: A = AlternatingSignMatrix(matrix([[0,0,1,0],[0,1,-1,1],[1,0,0,0],[0,0,1,
↪0]]))
sage: B = AlternatingSignMatrix(matrix([[0,0,1,0,0],[0,0,0,1,0],[1,0,0,-1,1],
↪[0,1,0,0,0],[0,0,0,1,0]]))
sage: A.ASM_compatible(B)
True
sage: A = AlternatingSignMatrix(matrix([[0,1,0],[1,-1,1],[0,1,0]]))
sage: B = AlternatingSignMatrix(matrix([[0,0,1,0],[0,0,0,1],[1,0,0,0],[0,1,0,
↪0]]))
sage: A.ASM_compatible(B)
False
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrix(matrix([[Integer(0),Integer(0),Integer(1),
↪Integer(0)],[Integer(0),Integer(1),-Integer(1),Integer(1)],[Integer(1),
↪Integer(0),Integer(0),Integer(0)],[Integer(0),Integer(0),Integer(1),
↪Integer(0)]]))
>>> B = AlternatingSignMatrix(matrix([[Integer(0),Integer(0),Integer(1),
↪Integer(0),Integer(0)],[Integer(0),Integer(0),Integer(0),Integer(1),
↪Integer(0)],[Integer(1),Integer(0),Integer(0),-Integer(1),Integer(1)],
↪[Integer(0),Integer(1),Integer(0),Integer(0),Integer(0)],[Integer(0),
↪Integer(0),Integer(0),Integer(1),Integer(0)]]))
>>> A.ASM_compatible(B)
True
>>> A = AlternatingSignMatrix(matrix([[Integer(0),Integer(1),Integer(0)],
↪[Integer(1),-Integer(1),Integer(1)],[Integer(0),Integer(1),Integer(0)]]))
>>> B = AlternatingSignMatrix(matrix([[Integer(0),Integer(0),Integer(1),
↪Integer(0)],[Integer(0),Integer(0),Integer(0),Integer(1)],[Integer(1),
↪Integer(0),Integer(0),Integer(0)],[Integer(0),Integer(1),Integer(0),
↪Integer(0)]]))
>>> A.ASM_compatible(B)
False
```

ASM_compatible_bigger()

Return all ASM's compatible with `self` that are of size one greater than `self`.

Given an $n \times n$ alternating sign matrix A, there are as many ASM's of size $n+1$ compatible with A as 2 raised to the power of the number of 1s in A [EKLP1992].

EXAMPLES:

```
sage: A = AlternatingSignMatrix([[1,0],[0,1]])
sage: A.ASM_compatible_bigger()
[
[ 0  1  0]  [1 0 0]  [0 1 0]  [1 0 0]
[ 1 -1  1]  [0 0 1]  [1 0 0]  [0 1 0]
[ 0  1  0], [0 1 0], [0 0 1], [0 0 1]
]
sage: B = AlternatingSignMatrix([[0,1],[1,0]])
sage: B.ASM_compatible_bigger()
```

(continues on next page)

(continued from previous page)

```
[
[0 0 1]  [0 0 1]  [0 1 0]  [ 0  1  0]
[0 1 0]  [1 0 0]  [0 0 1]  [ 1 -1  1]
[1 0 0], [0 1 0], [1 0 0], [ 0  1  0]
]

sage: B = AlternatingSignMatrix([[0,1,0],[1,-1,1],[0,1,0]])
sage: len(B.ASM_compatible_bigger()) == 2**4
True
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrix([[Integer(1),Integer(0)],[Integer(0),
↪Integer(1)]])
>>> A.ASM_compatible_bigger()
[
[ 0  1  0]  [1 0 0]  [0 1 0]  [1 0 0]
[ 1 -1  1]  [0 0 1]  [1 0 0]  [0 1 0]
[ 0  1  0], [0 1 0], [0 0 1], [0 0 1]
]
>>> B = AlternatingSignMatrix([[Integer(0),Integer(1)],[Integer(1),
↪Integer(0)]])
>>> B.ASM_compatible_bigger()
[
[0 0 1]  [0 0 1]  [0 1 0]  [ 0  1  0]
[0 1 0]  [1 0 0]  [0 0 1]  [ 1 -1  1]
[1 0 0], [0 1 0], [1 0 0], [ 0  1  0]
]

>>> B = AlternatingSignMatrix([[Integer(0),Integer(1),Integer(0)],[Integer(1),
↪-Integer(1),Integer(1)],[Integer(0),Integer(1),Integer(0)]])
>>> len(B.ASM_compatible_bigger()) == Integer(2)**Integer(4)
True
```

ASM_compatible_smaller()

Return the list of all ASMs compatible with `self` that are of size one smaller than `self`.

Given an alternating sign matrix A of size n, there are as many ASM's of size $n-1$ compatible with it as 2 raised to the power of the number of -1's in A [EKLP1992].

EXAMPLES:

```
sage: A = AlternatingSignMatrix(matrix([[0,0,1,0],[0,1,-1,1],[1,0,0,0],[0,0,1,
↪0]]))
sage: A.ASM_compatible_smaller()
[
[0 0 1]  [ 0  1  0]
[1 0 0]  [ 1 -1  1]
[0 1 0], [ 0  1  0]
]
sage: B = AlternatingSignMatrix(matrix([[1,0,0],[0,0,1],[0,1,0]]))
sage: B.ASM_compatible_smaller()
[
[1 0]
```

(continues on next page)

(continued from previous page)

```
[0 1]
]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrix(matrix([[Integer(0),Integer(0),Integer(1),
↪Integer(0)],[Integer(0),Integer(1),-Integer(1),Integer(1)],[Integer(1),
↪Integer(0),Integer(0),Integer(0)],[Integer(0),Integer(0),Integer(1),
↪Integer(0)]]))
>>> A.ASM_compatible_smaller()
[
[0 0 1]  [ 0  1  0]
[1 0 0]  [ 1 -1  1]
[0 1 0], [ 0  1  0]
]
>>> B = AlternatingSignMatrix(matrix([[Integer(1),Integer(0),Integer(0)],
↪[Integer(0),Integer(0),Integer(1)],[Integer(0),Integer(1),Integer(0)]]))
>>> B.ASM_compatible_smaller()
[
[1 0]
[0 1]
]
```

corner_sum_matrix()

Return the corner sum matrix of `self`.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).corner_sum_matrix()
[0 0 0 0]
[0 1 1 1]
[0 1 2 2]
[0 1 2 3]
sage: asm = A([[0, 1, 0],[1, -1, 1],[0, 1, 0]])
sage: asm.corner_sum_matrix()
[0 0 0 0]
[0 0 1 1]
[0 1 1 2]
[0 1 2 3]
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.corner_sum_matrix()
[0 0 0 0]
[0 0 0 1]
[0 1 1 2]
[0 1 2 3]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]]).corner_sum_matrix()
[0 0 0 0]
[0 1 1 1]
```

(continues on next page)

(continued from previous page)

```
[0 1 2 2]
[0 1 2 3]
>>> asm = A([[Integer(0), Integer(1), Integer(0)],[Integer(1), -Integer(1),␣
↪Integer(1)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.corner_sum_matrix()
[0 0 0 0]
[0 0 1 1]
[0 1 1 2]
[0 1 2 3]
>>> asm = A([[Integer(0), Integer(0), Integer(1)],[Integer(1), Integer(0),␣
↪Integer(0)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.corner_sum_matrix()
[0 0 0 0]
[0 0 0 1]
[0 1 1 2]
[0 1 2 3]
```

gyration()

Return the alternating sign matrix obtained by applying gyration to the height function in bijection with `self`.

Gyration acts on height functions as follows. Go through the entries of the matrix, first those for which the sum of the row and column indices is even, then for those for which it is odd, and increment or decrement the squares by 2 wherever possible such that the resulting matrix is still a height function. Gyration was first defined in [Wie2000] as an action on fully-packed loops.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).gyration()
[0 0 1]
[0 1 0]
[1 0 0]
sage: asm = A([[0, 1, 0],[1, -1, 1],[0, 1, 0]])
sage: asm.gyration()
[1 0 0]
[0 1 0]
[0 0 1]
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.gyration()
[0 1 0]
[0 0 1]
[1 0 0]
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).gyration().gyration()
[ 0  1  0]
[ 1 -1  1]
[ 0  1  0]
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).gyration().gyration().gyration()
[1 0 0]
[0 1 0]
[0 0 1]

sage: A = AlternatingSignMatrices(4)
```

(continues on next page)

(continued from previous page)

```
sage: M = A([[0,0,1,0],[1,0,0,0],[0,1,-1,1],[0,0,1,0]])
sage: for i in range(5):
....:     M = M.gyration()
sage: M
[1 0 0 0]
[0 0 0 1]
[0 1 0 0]
[0 0 1 0]

sage: a0 = a = AlternatingSignMatrices(5).random_element()
sage: for i in range(20):
....:     a = a.gyration()
sage: a == a0
True
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]]).gyration()
[0 0 1]
[0 1 0]
[1 0 0]
>>> asm = A([[Integer(0), Integer(1), Integer(0)],[Integer(1), -Integer(1),␣
↪Integer(1)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.gyration()

>>> asm.gyration()
[0 1 0]
[0 0 1]
[1 0 0]
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]]).gyration().gyration()
[ 0  1  0]
[ 1 -1  1]
[ 0  1  0]
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]]).gyration().gyration().
↪gyration()
[1 0 0]
[0 1 0]
[0 0 1]

>>> A = AlternatingSignMatrices(Integer(4))
>>> M = A([[Integer(0),Integer(0),Integer(1),Integer(0)],[Integer(1),
↪Integer(0),Integer(0),Integer(0)],[Integer(0),Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(0),Integer(1),Integer(0)]])
>>> for i in range(Integer(5)):
```

(continues on next page)

(continued from previous page)

```
...       M = M.gyration()
>>> M
[1 0 0 0]
[0 0 0 1]
[0 1 0 0]
[0 0 1 0]

>>> a0 = a = AlternatingSignMatrices(Integer(5)).random_element()
>>> for i in range(Integer(20)):
...       a = a.gyration()
>>> a == a0
True
```

gyration_orbit()

Return the gyration orbit of `self` (including `self`).

EXAMPLES:

```
sage: AlternatingSignMatrix([[0,1,0],[1,-1,1],[0,1,0]]).gyration_orbit()
[
[ 0  1  0]  [1 0 0]  [0 0 1]
[ 1 -1  1]  [0 1 0]  [0 1 0]
[ 0  1  0], [0 0 1], [1 0 0]
]

sage: AlternatingSignMatrix([[0,1,0,0],[1,-1,1,0],[0,1,-1,1],[0,0,1,0]]).
↪gyration_orbit()
[
[ 0  1  0  0]  [1 0 0 0]  [ 0  0  1  0]  [0 0 0 1]
[ 1 -1  1  0]  [0 1 0 0]  [ 0  1 -1  1]  [0 0 1 0]
[ 0  1 -1  1]  [0 0 1 0]  [ 1 -1  1  0]  [0 1 0 0]
[ 0  0  1  0], [0 0 0 1], [ 0  1  0  0], [1 0 0 0]
]

sage: len(AlternatingSignMatrix([[0,1,0,0,0,0],[0,0,1,0,0,0],[1,-1,0,0,0,1],
....: [0,1,0,0,0,0],[0,0,0,1,0,0],[0,0,0,0,1,0]]).gyration_orbit())
12
```

```
>>> from sage.all import *
>>> AlternatingSignMatrix([[Integer(0),Integer(1),Integer(0)],[Integer(1),-
↪Integer(1),Integer(1)],[Integer(0),Integer(1),Integer(0)]]).gyration_orbit()
[
[ 0  1  0]  [1 0 0]  [0 0 1]
[ 1 -1  1]  [0 1 0]  [0 1 0]
[ 0  1  0], [0 0 1], [1 0 0]
]

>>> AlternatingSignMatrix([[Integer(0),Integer(1),Integer(0),Integer(0)],
↪[Integer(1),-Integer(1),Integer(1),Integer(0)],[Integer(0),Integer(1),-
↪Integer(1),Integer(1)],[Integer(0),Integer(0),Integer(1),Integer(0)]]).
↪gyration_orbit()
[
```

(continues on next page)

(continued from previous page)

```
[ 0  1  0  0]  [1 0 0 0]  [ 0  0  1  0]  [0 0 0 1]
[ 1 -1  1  0]  [0 1 0 0]  [ 0  1 -1  1]  [0 0 1 0]
[ 0  1 -1  1]  [0 0 1 0]  [ 1 -1  1  0]  [0 1 0 0]
[ 0  0  1  0], [0 0 0 1], [ 0  1  0  0], [1 0 0 0]
]

>>> len(AlternatingSignMatrix([[Integer(0),Integer(1),Integer(0),Integer(0),
↪Integer(0),Integer(0)],[Integer(0),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(0)],[Integer(1),-Integer(1),Integer(0),Integer(0),
↪Integer(0),Integer(1)],
... [Integer(0),Integer(1),Integer(0),Integer(0),Integer(0),Integer(0)],
↪[Integer(0),Integer(0),Integer(0),Integer(1),Integer(0),Integer(0)],
↪[Integer(0),Integer(0),Integer(0),Integer(0),Integer(1),Integer(0)]]).
↪gyration_orbit())
12
```

height_function()

Return the height function from `self`.

A height function corresponding to an $n \times n$ ASM is an $(n+1) \times (n+1)$ matrix such that the first row is $0, 1, \ldots, n$, the last row is $n, n-1, \ldots, 1, 0$, and the difference between adjacent entries is 1.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).height_function()
[0 1 2 3]
[1 0 1 2]
[2 1 0 1]
[3 2 1 0]
sage: asm = A([[0, 1, 0],[1, -1, 1],[0, 1, 0]])
sage: asm.height_function()
[0 1 2 3]
[1 2 1 2]
[2 1 2 1]
[3 2 1 0]
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.height_function()
[0 1 2 3]
[1 2 1 2]
[2 3 2 1]
[3 2 1 0]

sage: A = AlternatingSignMatrices(4)
sage: all(A.from_height_function(a.height_function()) == a for a in A)
True
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]]).height_function()
[0 1 2 3]
[1 0 1 2]
```

(continues on next page)

(continued from previous page)

```
[2 1 0 1]
[3 2 1 0]
>>> asm = A([[Integer(0), Integer(1), Integer(0)],[Integer(1), -Integer(1),␣
↪Integer(1)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.height_function()
[0 1 2 3]
[1 2 1 2]
[2 1 2 1]
[3 2 1 0]
>>> asm = A([[Integer(0), Integer(0), Integer(1)],[Integer(1), Integer(0),␣
↪Integer(0)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.height_function()
[0 1 2 3]
[1 2 1 2]
[2 3 2 1]
[3 2 1 0]

>>> A = AlternatingSignMatrices(Integer(4))
>>> all(A.from_height_function(a.height_function()) == a for a in A)
True
```

inversion_number()

alias of *number_of_inversions()*.

is_permutation()

Return `True` if `self` is a permutation matrix and `False` otherwise.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: asm = A([[0,1,0],[1,0,0],[0,0,1]])
sage: asm.is_permutation()
True
sage: asm = A([[0,1,0],[1,-1,1],[0,1,0]])
sage: asm.is_permutation()
False
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> asm = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),Integer(0),
↪Integer(0)],[Integer(0),Integer(0),Integer(1)]])
>>> asm.is_permutation()
True
>>> asm = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(1),Integer(0)]])
>>> asm.is_permutation()
False
```

left_key()

Return the left key of the alternating sign matrix `self`.

The left key of an alternating sign matrix was defined by Lascoux in [Lasc] and is obtained by successively removing all the -1's until what remains is a permutation matrix. This notion corresponds to the notion of left key for semistandard tableaux. So our algorithm proceeds as follows: we map `self` to its corresponding

monotone triangle, view that monotone triangle as a semistandard tableau, take its left key, and then map back through monotone triangles to the permutation matrix which is the left key.

See also [Ava2007].

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[0,0,1],[1,0,0],[0,1,0]]).left_key()
[0 0 1]
[1 0 0]
[0 1 0]
sage: t = A([[0,1,0],[1,-1,1],[0,1,0]]).left_key(); t
[1 0 0]
[0 0 1]
[0 1 0]
sage: parent(t)
Alternating sign matrices of size 3
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(0),Integer(0),Integer(1)],[Integer(1),Integer(0),Integer(0)],
↪[Integer(0),Integer(1),Integer(0)]]).left_key()
[0 0 1]
[1 0 0]
[0 1 0]
>>> t = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(1),Integer(0)]]).left_key(); t
[1 0 0]
[0 0 1]
[0 1 0]
>>> parent(t)
Alternating sign matrices of size 3
```

left_key_as_permutation()

Return the permutation of the left key of `self`.

See also

- *left_key()*

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[0,0,1],[1,0,0],[0,1,0]]).left_key_as_permutation()
[3, 1, 2]
sage: t = A([[0,1,0],[1,-1,1],[0,1,0]]).left_key_as_permutation(); t
[1, 3, 2]
sage: parent(t)
Standard permutations
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
```

(continues on next page)

(continued from previous page)

```
>>> A([[Integer(0),Integer(0),Integer(1)],[Integer(1),Integer(0),Integer(0)],
↪[Integer(0),Integer(1),Integer(0)]]).left_key_as_permutation()
[3, 1, 2]
>>> t = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(1),Integer(0)]]).left_key_as_permutation();␣
↪t
[1, 3, 2]
>>> parent(t)
Standard permutations
```

link_pattern()

Return the link pattern corresponding to the fully packed loop corresponding to `self`.

EXAMPLES:

We can extract the underlying link pattern (a non-crossing partition) from a fully packed loop:

```
sage: A = AlternatingSignMatrix([[0, 1, 0], [1, -1, 1], [0, 1, 0]])
sage: A.link_pattern()
[(1, 2), (3, 6), (4, 5)]

sage: B = AlternatingSignMatrix([[1, 0, 0], [0, 1, 0], [0, 0, 1]])
sage: B.link_pattern()
[(1, 6), (2, 5), (3, 4)]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrix([[Integer(0), Integer(1), Integer(0)],␣
↪[Integer(1), -Integer(1), Integer(1)], [Integer(0), Integer(1),␣
↪Integer(0)]])
>>> A.link_pattern()
[(1, 2), (3, 6), (4, 5)]

>>> B = AlternatingSignMatrix([[Integer(1), Integer(0), Integer(0)],␣
↪[Integer(0), Integer(1), Integer(0)], [Integer(0), Integer(0), Integer(1)]])
>>> B.link_pattern()
[(1, 6), (2, 5), (3, 4)]
```

number_negative_ones()

alias of *number_of_negative_ones()*.

number_of_inversions()

Return the inversion number of `self`.

If we denote the entries of the alternating sign matrix as $a_{i,j}$, the inversion number is defined as $\sum_{i>k} \sum_{j<l} a_{i,j} a_{k,l}$. When restricted to permutation matrices, this gives the usual inversion number of the permutation.

This definition is equivalent to the one given in [MRR1983].

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).number_of_inversions()
0
```

(continues on next page)

(continued from previous page)

```
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.number_of_inversions()
2
sage: asm = A([[0, 1, 0],[1, -1, 1],[0, 1, 0]])
sage: asm.number_of_inversions()
2
sage: P = Permutations(5)
sage: A = AlternatingSignMatrix
sage: all(p.number_of_inversions() == A(p.to_matrix()).number_of_inversions()␣
↪for p in P)
True
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]]).number_of_inversions()
0
>>> asm = A([[Integer(0), Integer(0), Integer(1)],[Integer(1), Integer(0),␣
↪Integer(0)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.number_of_inversions()
2
>>> asm = A([[Integer(0), Integer(1), Integer(0)],[Integer(1), -Integer(1),␣
↪Integer(1)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.number_of_inversions()
2
>>> P = Permutations(Integer(5))
>>> A = AlternatingSignMatrix
>>> all(p.number_of_inversions() == A(p.to_matrix()).number_of_inversions()␣
↪for p in P)
True
```

number_of_negative_ones()

Return the number of entries in `self` equal to -1.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: asm = A([[0,1,0],[1,0,0],[0,0,1]])
sage: asm.number_of_negative_ones()
0
sage: asm = A([[0,1,0],[1,-1,1],[0,1,0]])
sage: asm.number_of_negative_ones()
1
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> asm = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),Integer(0),
↪Integer(0)],[Integer(0),Integer(0),Integer(1)]])
>>> asm.number_of_negative_ones()
0
>>> asm = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(1),Integer(0)]])
```

(continues on next page)

(continued from previous page)

```
>>> asm.number_of_negative_ones()
1
```

rotate_ccw()

Return the counterclockwise quarter turn rotation of `self`.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).rotate_ccw()
[0 0 1]
[0 1 0]
[1 0 0]
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.rotate_ccw()
[1 0 0]
[0 0 1]
[0 1 0]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]]).rotate_ccw()
[0 0 1]
[0 1 0]
[1 0 0]
>>> asm = A([[Integer(0), Integer(0), Integer(1)],[Integer(1), Integer(0),␣
↪Integer(0)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.rotate_ccw()
[1 0 0]
[0 0 1]
[0 1 0]
```

rotate_cw()

Return the clockwise quarter turn rotation of `self`.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).rotate_cw()
[0 0 1]
[0 1 0]
[1 0 0]
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.rotate_cw()
[0 1 0]
[1 0 0]
[0 0 1]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]]).rotate_cw()
[0 0 1]
[0 1 0]
[1 0 0]
>>> asm = A([[Integer(0), Integer(0), Integer(1)],[Integer(1), Integer(0),␣
↪Integer(0)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.rotate_cw()
[0 1 0]
[1 0 0]
[0 0 1]
```

to_dyck_word(*algorithm*)

Return a Dyck word determined by the specified algorithm.

The algorithm 'last_diagonal' uses the last diagonal of the monotone triangle corresponding to `self`. The algorithm 'link_pattern' returns the Dyck word in bijection with the link pattern of the fully packed loop.

Note that these two algorithms in general yield different Dyck words for a given alternating sign matrix.

INPUT:

- `algorithm` – either `'last_diagonal'` or `'link_pattern'`

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[0,1,0],[1,0,0],[0,0,1]]).to_dyck_word(algorithm = 'last_diagonal')
[1, 1, 0, 0, 1, 0]
sage: d = A([[0,1,0],[1,-1,1],[0,1,0]]).to_dyck_word(algorithm = 'last_
↪diagonal'); d
[1, 1, 0, 1, 0, 0]
sage: parent(d)
Complete Dyck words
sage: A = AlternatingSignMatrices(3)
sage: asm = A([[0,1,0],[1,0,0],[0,0,1]])
sage: asm.to_dyck_word(algorithm = 'link_pattern')
[1, 0, 1, 0, 1, 0]
sage: asm = A([[0,1,0],[1,-1,1],[0,1,0]])
sage: asm.to_dyck_word(algorithm = 'link_pattern')
[1, 0, 1, 1, 0, 0]
sage: A = AlternatingSignMatrices(4)
sage: asm = A([[0,0,1,0],[1,0,0,0],[0,1,-1,1],[0,0,1,0]])
sage: asm.to_dyck_word(algorithm = 'link_pattern')
[1, 1, 1, 0, 1, 0, 0, 0]
sage: asm.to_dyck_word()
Traceback (most recent call last):
...
TypeError: ...to_dyck_word() ...argument...
sage: asm.to_dyck_word(algorithm = 'notamethod')
Traceback (most recent call last):
...
ValueError: unknown algorithm 'notamethod'
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(0),Integer(1),Integer(0)],[Integer(1),Integer(0),Integer(0)],
↪[Integer(0),Integer(0),Integer(1)]]).to_dyck_word(algorithm = 'last_diagonal
↪')
[1, 1, 0, 0, 1, 0]
>>> d = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(1),Integer(0)]]).to_dyck_word(algorithm =
↪'last_diagonal'); d
[1, 1, 0, 1, 0, 0]
>>> parent(d)
Complete Dyck words
>>> A = AlternatingSignMatrices(Integer(3))
>>> asm = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),Integer(0),
↪Integer(0)],[Integer(0),Integer(0),Integer(1)]])
>>> asm.to_dyck_word(algorithm = 'link_pattern')
[1, 0, 1, 0, 1, 0]
>>> asm = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(1),Integer(0)]])
>>> asm.to_dyck_word(algorithm = 'link_pattern')
[1, 0, 1, 1, 0, 0]
>>> A = AlternatingSignMatrices(Integer(4))
>>> asm = A([[Integer(0),Integer(0),Integer(1),Integer(0)],[Integer(1),
↪Integer(0),Integer(0),Integer(0)],[Integer(0),Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(0),Integer(1),Integer(0)]])
>>> asm.to_dyck_word(algorithm = 'link_pattern')
[1, 1, 1, 0, 1, 0, 0, 0]
>>> asm.to_dyck_word()
Traceback (most recent call last):
...
TypeError: ...to_dyck_word() ...argument...
>>> asm.to_dyck_word(algorithm = 'notamethod')
Traceback (most recent call last):
...
ValueError: unknown algorithm 'notamethod'
```

to_fully_packed_loop()

Return the fully packed loop configuration from `self`.

See also

FullyPackedLoop

EXAMPLES:

```
sage: asm = AlternatingSignMatrix([[1,0,0],[0,1,0],[0,0,1]])
sage: fpl = asm.to_fully_packed_loop()
sage: fpl
    |         |
    |         |
    +    + -- +
    |    |
```

(continues on next page)

(continued from previous page)

```
    |     |
 ── +     +     + ──
          |     |
          |     |
    + ── +     +
    |           |
    |           |
```

```

          |     |
          |     |
    + ── +     +
    |           |
    |           |
```

to_matrix()

Return `self` as a regular matrix.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: asm = A([[1, 0, 0],[0, 1, 0],[0, 0, 1]])
sage: m = asm.to_matrix(); m
[1 0 0]
[0 1 0]
[0 0 1]
sage: m.parent()
Full MatrixSpace of 3 by 3 dense matrices over Integer Ring
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> asm = A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]])
>>> m = asm.to_matrix(); m
[1 0 0]
[0 1 0]
[0 0 1]
>>> m.parent()
Full MatrixSpace of 3 by 3 dense matrices over Integer Ring
```

to_monotone_triangle()

Return a monotone triangle from `self`.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).to_monotone_triangle()
[[3, 2, 1], [2, 1], [1]]
sage: asm = A([[0, 1, 0],[1, -1, 1],[0, 1, 0]])
sage: asm.to_monotone_triangle()
[[3, 2, 1], [3, 1], [2]]
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.to_monotone_triangle()
[[3, 2, 1], [3, 1], [3]]
sage: A.from_monotone_triangle(asm.to_monotone_triangle()) == asm
True
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]]).to_monotone_triangle()
[[3, 2, 1], [2, 1], [1]]
>>> asm = A([[Integer(0), Integer(1), Integer(0)],[Integer(1), -Integer(1),␣
↪Integer(1)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.to_monotone_triangle()
[[3, 2, 1], [3, 1], [2]]
>>> asm = A([[Integer(0), Integer(0), Integer(1)],[Integer(1), Integer(0),␣
↪Integer(0)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.to_monotone_triangle()
[[3, 2, 1], [3, 1], [3]]
>>> A.from_monotone_triangle(asm.to_monotone_triangle()) == asm
True
```

to_permutation()

Return the corresponding permutation if `self` is a permutation matrix.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: asm = A([[0,1,0],[1,0,0],[0,0,1]])
sage: p = asm.to_permutation(); p
[2, 1, 3]
sage: parent(p)
Standard permutations
sage: asm = A([[0,1,0],[1,-1,1],[0,1,0]])
sage: asm.to_permutation()
Traceback (most recent call last):
...
ValueError: not a permutation matrix
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> asm = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),Integer(0),
↪Integer(0)],[Integer(0),Integer(0),Integer(1)]])
>>> p = asm.to_permutation(); p
[2, 1, 3]
```

(continues on next page)

(continued from previous page)

```
>>> parent(p)
Standard permutations
>>> asm = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(1),Integer(0)]])
>>> asm.to_permutation()
Traceback (most recent call last):
...
ValueError: not a permutation matrix
```

to_semistandard_tableau()

Return the semistandard tableau corresponding the monotone triangle corresponding to `self`.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[0,0,1],[1,0,0],[0,1,0]]).to_semistandard_tableau()
[[1, 1, 3], [2, 3], [3]]
sage: t = A([[0,1,0],[1,-1,1],[0,1,0]]).to_semistandard_tableau(); t
[[1, 1, 2], [2, 3], [3]]
sage: parent(t)
Semistandard tableaux
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(0),Integer(0),Integer(1)],[Integer(1),Integer(0),Integer(0)],
↪[Integer(0),Integer(1),Integer(0)]]).to_semistandard_tableau()
[[1, 1, 3], [2, 3], [3]]
>>> t = A([[Integer(0),Integer(1),Integer(0)],[Integer(1),-Integer(1),
↪Integer(1)],[Integer(0),Integer(1),Integer(0)]]).to_semistandard_tableau();␣
↪t
[[1, 1, 2], [2, 3], [3]]
>>> parent(t)
Semistandard tableaux
```

to_six_vertex_model()

Return the six vertex model configuration from `self`.

This method calls *sage.combinat.six_vertex_model.SquareIceModel.from_alternating_sign_matrix()*.

EXAMPLES:

```
sage: asm = AlternatingSignMatrix([[0,1,0],[1,-1,1],[0,1,0]])
sage: asm.to_six_vertex_model()
    ^    ^    ^
    |    |    |
--> # -> # <- # <--
    ^    |    ^
    |    V    |
--> # <- # -> # <--
    |    ^    |
    V    |    V
--> # -> # <- # <--
```

(continues on next page)

(continued from previous page)

```
    |    |    |
    V    V    V
```

```
>>> from sage.all import *
>>> asm = AlternatingSignMatrix([[Integer(0),Integer(1),Integer(0)],
↪[Integer(1),-Integer(1),Integer(1)],[Integer(0),Integer(1),Integer(0)]])
>>> asm.to_six_vertex_model()
    ^    ^    ^
    |    |    |
--> # -> # <- # <--
    ^    |    ^
    |    V    |
--> # <- # -> # <--
    |    ^    |
    V    |    V
--> # -> # <- # <--
    |    |    |
    V    V    V
```

transpose()

Return `self` transposed.

EXAMPLES:

```
sage: A = AlternatingSignMatrices(3)
sage: A([[1, 0, 0],[0, 1, 0],[0, 0, 1]]).transpose()
[1 0 0]
[0 1 0]
[0 0 1]
sage: asm = A([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: asm.transpose()
[0 1 0]
[0 0 1]
[1 0 0]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrices(Integer(3))
>>> A([[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1),␣
↪Integer(0)],[Integer(0), Integer(0), Integer(1)]]).transpose()
[1 0 0]
[0 1 0]
[0 0 1]
>>> asm = A([[Integer(0), Integer(0), Integer(1)],[Integer(1), Integer(0),␣
↪Integer(0)],[Integer(0), Integer(1), Integer(0)]])
>>> asm.transpose()
[0 1 0]
[0 0 1]
[1 0 0]
```

class sage.combinat.alternating_sign_matrix.**ContreTableaux**

Bases: `Parent`

Factory class for the combinatorial class of contre tableaux of size n.

EXAMPLES:

```
sage: ct4 = ContreTableaux(4); ct4
Contre tableaux of size 4
sage: ct4.cardinality()
42
```

```
>>> from sage.all import *
>>> ct4 = ContreTableaux(Integer(4)); ct4
Contre tableaux of size 4
>>> ct4.cardinality()
42
```

class sage.combinat.alternating_sign_matrix.**ContreTableaux_n**(*n*)

Bases: *ContreTableaux*

cardinality()

EXAMPLES:

```
sage: [ContreTableaux(n).cardinality() for n in range(11)]
[1, 1, 2, 7, 42, 429, 7436, 218348, 10850216, 911835460, 129534272700]
```

```
>>> from sage.all import *
>>> [ContreTableaux(n).cardinality() for n in range(Integer(11))]
[1, 1, 2, 7, 42, 429, 7436, 218348, 10850216, 911835460, 129534272700]
```

class sage.combinat.alternating_sign_matrix.**MonotoneTriangles**(*n*)

Bases: *GelfandTsetlinPatternsTopRow*

Monotone triangles with n rows.

A monotone triangle is a number triangle $(a_{i,j})_{1 \leq i \leq n, 1 \leq j \leq i}$ on $\{1, \ldots, n\}$ such that:

- $a_{i,j} < a_{i,j+1}$
- $a_{i+1,j} < a_{i,j} \leq a_{i+1,j+1}$

This notably requires that the bottom column is `[1,...,n]`.

Alternatively a monotone triangle is a strict Gelfand-Tsetlin pattern with top row $(n, \ldots, 2, 1)$.

INPUT:

- `n` – the number of rows in the monotone triangles

EXAMPLES:

This represents the monotone triangles with base `[3,2,1]`:

```
sage: M = MonotoneTriangles(3)
sage: M
Monotone triangles with 3 rows
sage: M.cardinality()
7
```

```
>>> from sage.all import *
>>> M = MonotoneTriangles(Integer(3))
>>> M
```

(continues on next page)

(continued from previous page)

```
Monotone triangles with 3 rows
>>> M.cardinality()
7
```

The monotone triangles are a lattice:

```
sage: M.lattice()
Finite lattice containing 7 elements
```

```
>>> from sage.all import *
>>> M.lattice()
Finite lattice containing 7 elements
```

Monotone triangles can be converted to alternating sign matrices and back:

```
sage: M = MonotoneTriangles(5)
sage: A = AlternatingSignMatrices(5)
sage: all(A.from_monotone_triangle(m).to_monotone_triangle() == m for m in M)
True
```

```
>>> from sage.all import *
>>> M = MonotoneTriangles(Integer(5))
>>> A = AlternatingSignMatrices(Integer(5))
>>> all(A.from_monotone_triangle(m).to_monotone_triangle() == m for m in M)
True
```

cardinality()

Cardinality of `self`.

The number of monotone triangles with n rows is equal to

$$\prod_{k=0}^{n-1} \frac{(3k+1)!}{(n+k)!} = \frac{1!4!7!10!\cdots(3n-2)!}{n!(n+1)!(n+2)!(n+3)!\cdots(2n-1)!}$$

EXAMPLES:

```
sage: M = MonotoneTriangles(4)
sage: M.cardinality()
42
```

```
>>> from sage.all import *
>>> M = MonotoneTriangles(Integer(4))
>>> M.cardinality()
42
```

cover_relations()

Iterate on the cover relations in the set of monotone triangles with n rows.

EXAMPLES:

```
sage: M = MonotoneTriangles(3)
sage: for a, b in M.cover_relations():
```

(continues on next page)

(continued from previous page)

```
....:   eval('a, b')
([[3, 2, 1], [2, 1], [1]], [[3, 2, 1], [2, 1], [2]])
([[3, 2, 1], [2, 1], [1]], [[3, 2, 1], [3, 1], [1]])
([[3, 2, 1], [2, 1], [2]], [[3, 2, 1], [3, 1], [2]])
([[3, 2, 1], [3, 1], [1]], [[3, 2, 1], [3, 1], [2]])
([[3, 2, 1], [3, 1], [2]], [[3, 2, 1], [3, 1], [3]])
([[3, 2, 1], [3, 1], [2]], [[3, 2, 1], [3, 2], [2]])
([[3, 2, 1], [3, 1], [3]], [[3, 2, 1], [3, 2], [3]])
([[3, 2, 1], [3, 2], [2]], [[3, 2, 1], [3, 2], [3]])
```

```
>>> from sage.all import *
>>> M = MonotoneTriangles(Integer(3))
>>> for a, b in M.cover_relations():
...   eval('a, b')
([[3, 2, 1], [2, 1], [1]], [[3, 2, 1], [2, 1], [2]])
([[3, 2, 1], [2, 1], [1]], [[3, 2, 1], [3, 1], [1]])
([[3, 2, 1], [2, 1], [2]], [[3, 2, 1], [3, 1], [2]])
([[3, 2, 1], [3, 1], [1]], [[3, 2, 1], [3, 1], [2]])
([[3, 2, 1], [3, 1], [2]], [[3, 2, 1], [3, 1], [3]])
([[3, 2, 1], [3, 1], [2]], [[3, 2, 1], [3, 2], [2]])
([[3, 2, 1], [3, 1], [3]], [[3, 2, 1], [3, 2], [3]])
([[3, 2, 1], [3, 2], [2]], [[3, 2, 1], [3, 2], [3]])
```

lattice()

Return the lattice of the monotone triangles with n rows.

EXAMPLES:

```
sage: M = MonotoneTriangles(3)
sage: P = M.lattice()
sage: P
Finite lattice containing 7 elements
```

```
>>> from sage.all import *
>>> M = MonotoneTriangles(Integer(3))
>>> P = M.lattice()
>>> P
Finite lattice containing 7 elements
```

class sage.combinat.alternating_sign_matrix.**TruncatedStaircases**

Bases: Parent

Factory class for the combinatorial class of truncated staircases of size `n` with last column `last_column`.

EXAMPLES:

```
sage: t4 = TruncatedStaircases(4, [2,3]); t4
Truncated staircases of size 4 with last column [2, 3]
sage: t4.cardinality()
4
```

```
>>> from sage.all import *
>>> t4 = TruncatedStaircases(Integer(4), [Integer(2),Integer(3)]); t4
```

(continues on next page)

(continued from previous page)

```
Truncated staircases of size 4 with last column [2, 3]
>>> t4.cardinality()
4
```

class sage.combinat.alternating_sign_matrix.**TruncatedStaircases_nlastcolumn**(*n*, *last_column*)

Bases: *TruncatedStaircases*

cardinality()

EXAMPLES:

```
sage: T = TruncatedStaircases(4, [2,3])
sage: T.cardinality()
4
```

```
>>> from sage.all import *
>>> T = TruncatedStaircases(Integer(4), [Integer(2),Integer(3)])
>>> T.cardinality()
4
```

Backtracking

This library contains a generic tool for constructing large sets whose elements can be enumerated by exploring a search space with a (lazy) tree or graph structure.

- *GenericBacktracker*: Depth first search through a tree described by a `children` function, with branch pruning, etc.

This module has mostly been superseded by `RecursivelyEnumeratedSet`.

class sage.combinat.backtrack.**GenericBacktracker**(*initial_data*, *initial_state*)

Bases: `object`

A generic backtrack tool for exploring a search space organized as a tree, with branch pruning, etc.

See also `RecursivelyEnumeratedSet_forest` for handling simple special cases.

class sage.combinat.backtrack.**PositiveIntegerSemigroup**

Bases: `UniqueRepresentation`, `RecursivelyEnumeratedSet_forest`

The commutative additive semigroup of positive integers.

This class provides an example of algebraic structure which inherits from `RecursivelyEnumeratedSet_forest`. It builds the positive integers a la Peano, and endows it with its natural commutative additive semigroup structure.

EXAMPLES:

```
sage: from sage.combinat.backtrack import PositiveIntegerSemigroup
sage: PP = PositiveIntegerSemigroup()
sage: PP.category()
Join of Category of monoids and Category of commutative additive semigroups and␣
↪Category of infinite enumerated sets and Category of facade sets
sage: PP.cardinality()
+Infinity
sage: PP.one()
```

(continues on next page)

(continued from previous page)

```
1
sage: PP.an_element()
1
sage: some_elements = list(PP.some_elements()); some_elements
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22,␣
↪23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42,␣
↪43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62,␣
↪63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82,␣
↪83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100]
```

```
>>> from sage.all import *
>>> from sage.combinat.backtrack import PositiveIntegerSemigroup
>>> PP = PositiveIntegerSemigroup()
>>> PP.category()
Join of Category of monoids and Category of commutative additive semigroups and␣
↪Category of infinite enumerated sets and Category of facade sets
>>> PP.cardinality()
+Infinity
>>> PP.one()
1
>>> PP.an_element()
1
>>> some_elements = list(PP.some_elements()); some_elements
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22,␣
↪23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42,␣
↪43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62,␣
↪63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82,␣
↪83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100]
```

children(*x*)

Return the single child `x+1` of the integer `x`.

EXAMPLES:

```
sage: from sage.combinat.backtrack import PositiveIntegerSemigroup
sage: PP = PositiveIntegerSemigroup()
sage: list(PP.children(1))
[2]
sage: list(PP.children(42))
[43]
```

```
>>> from sage.all import *
>>> from sage.combinat.backtrack import PositiveIntegerSemigroup
>>> PP = PositiveIntegerSemigroup()
>>> list(PP.children(Integer(1)))
[2]
>>> list(PP.children(Integer(42)))
[43]
```

one()

Return the unit of `self`.

EXAMPLES:

```
sage: from sage.combinat.backtrack import PositiveIntegerSemigroup
sage: PP = PositiveIntegerSemigroup()
sage: PP.one()
1
```

```
>>> from sage.all import *
>>> from sage.combinat.backtrack import PositiveIntegerSemigroup
>>> PP = PositiveIntegerSemigroup()
>>> PP.one()
1
```

roots()

Return the single root of `self`.

EXAMPLES:

```
sage: from sage.combinat.backtrack import PositiveIntegerSemigroup
sage: PP = PositiveIntegerSemigroup()
sage: list(PP.roots())
[1]
```

```
>>> from sage.all import *
>>> from sage.combinat.backtrack import PositiveIntegerSemigroup
>>> PP = PositiveIntegerSemigroup()
>>> list(PP.roots())
[1]
```

Baxter permutations

class sage.combinat.baxter_permutations.**BaxterPermutations**

Bases: `UniqueRepresentation`, `Parent`

The combinatorial class of Baxter permutations.

A Baxter permutation is a permutation avoiding the generalized permutation patterns $2-41-3$ and $3-14-2$. In other words, a permutation σ is a Baxter permutation if for any subword $u := u_1u_2u_3u_4$ of σ such that the letters u_2 and u_3 are adjacent in σ, the standardized version of u is neither 2413 nor 3142.

See [Gir2012] for a study of Baxter permutations.

INPUT:

- `n` – nonnegative integer (default: `None`); the size of the permutations

OUTPUT:

Return the combinatorial class of the Baxter permutations of size `n` if `n` is not `None`. Otherwise, return the combinatorial class of all Baxter permutations.

EXAMPLES:

```
sage: BaxterPermutations(5)
Baxter permutations of size 5
sage: BaxterPermutations()
Baxter permutations
```

```
>>> from sage.all import *
>>> BaxterPermutations(Integer(5))
Baxter permutations of size 5
>>> BaxterPermutations()
Baxter permutations
```

class sage.combinat.baxter_permutations.**BaxterPermutations_all**(*n=None*)

Bases: DisjointUnionEnumeratedSets, *BaxterPermutations*

The enumerated set of all Baxter permutations.

See *BaxterPermutations* for the definition of Baxter permutations.

EXAMPLES:

```
sage: from sage.combinat.baxter_permutations import BaxterPermutations_all
sage: BaxterPermutations_all()
Baxter permutations
```

```
>>> from sage.all import *
>>> from sage.combinat.baxter_permutations import BaxterPermutations_all
>>> BaxterPermutations_all()
Baxter permutations
```

to_pair_of_twin_binary_trees(*p*)

Apply a bijection between Baxter permutations of size `self._n` and the set of pairs of twin binary trees with `self._n` nodes.

INPUT:

- `p` – a Baxter permutation

OUTPUT:

The pair of twin binary trees (T_L, T_R) where T_L (resp. T_R) is obtained by inserting the letters of `p` from left to right (resp. right to left) following the binary search tree insertion algorithm. This is called the *Baxter P-symbol* in [Gir2012] Definition 4.1.

Note

This method only works when `p` is a permutation. For words with repeated letters, it would return two "right binary search trees" (in the terminology of [Gir2012]), which conflicts with the definition in [Gir2012].

EXAMPLES:

```
sage: # needs sage.graphs
sage: BP = BaxterPermutations()
sage: BP.to_pair_of_twin_binary_trees(Permutation([]))
(., .)
sage: BP.to_pair_of_twin_binary_trees(Permutation([1, 2, 3]))
(1[., 2[., 3[., .]]], 3[2[1[., .], .], .])
sage: BP.to_pair_of_twin_binary_trees(Permutation([3, 4, 1, 2]))
(3[1[., 2[., .]], 4[., .]], 2[1[., .], 4[3[., .], .]])
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> BP = BaxterPermutations()
>>> BP.to_pair_of_twin_binary_trees(Permutation([]))
(., .)
>>> BP.to_pair_of_twin_binary_trees(Permutation([Integer(1), Integer(2),␣
↪Integer(3)]))
(1[., 2[., 3[., .]]], 3[2[1[., .], .], .])
>>> BP.to_pair_of_twin_binary_trees(Permutation([Integer(3), Integer(4),␣
↪Integer(1), Integer(2)]))
(3[1[., 2[., .]], 4[., .]], 2[1[., .], 4[3[., .], .]])
```

class sage.combinat.baxter_permutations.**BaxterPermutations_size**(*n*)

Bases: *BaxterPermutations*

The enumerated set of Baxter permutations of a given size.

See *BaxterPermutations* for the definition of Baxter permutations.

EXAMPLES:

```
sage: from sage.combinat.baxter_permutations import BaxterPermutations_size
sage: BaxterPermutations_size(5)
Baxter permutations of size 5
```

```
>>> from sage.all import *
>>> from sage.combinat.baxter_permutations import BaxterPermutations_size
>>> BaxterPermutations_size(Integer(5))
Baxter permutations of size 5
```

cardinality()

Return the number of Baxter permutations of size `self._n`.

For any positive integer n, the number of Baxter permutations of size n equals

$$\sum_{k=1}^{n} \frac{\binom{n+1}{k-1}\binom{n+1}{k}\binom{n+1}{k+1}}{\binom{n+1}{1}\binom{n+1}{2}}.$$

This is OEIS sequence A001181.

EXAMPLES:

```
sage: [BaxterPermutations(n).cardinality() for n in range(13)]
[1, 1, 2, 6, 22, 92, 422, 2074, 10754, 58202, 326240, 1882960, 11140560]

sage: BaxterPermutations(3r).cardinality()
6
sage: parent(_)
Integer Ring
```

```
>>> from sage.all import *
>>> [BaxterPermutations(n).cardinality() for n in range(Integer(13))]
[1, 1, 2, 6, 22, 92, 422, 2074, 10754, 58202, 326240, 1882960, 11140560]

>>> BaxterPermutations(3).cardinality()
```

(continues on next page)

(continued from previous page)

```
6
>>> parent(_)
Integer Ring
```

lattice()

Return the lattice of Baxter permutations.

This is defined by restriction of the weak order.

EXAMPLES:

```
sage: L = BaxterPermutations(4).lattice(); L
Finite lattice containing 22 elements
```

```
>>> from sage.all import *
>>> L = BaxterPermutations(Integer(4)).lattice(); L
Finite lattice containing 22 elements
```

sage.combinat.expnums.**expnums**(*n*, *aa*)

Compute the first n exponential numbers around aa, starting with the zero-th.

INPUT:

- `n` – C machine int
- `aa` – C machine int

OUTPUT: list of length n

ALGORITHM: We use the same integer addition algorithm as GAP. This is an extension of Bell's triangle to the general case of exponential numbers. The recursion performs $O(n^2)$ additions, but the running time is dominated by the cost of the last integer addition, because the growth of the integer results of partial computations is exponential in n. The algorithm stores $O(n)$ integers, but each is exponential in n.

EXAMPLES:

```
sage: expnums(10, 1)
[1, 1, 2, 5, 15, 52, 203, 877, 4140, 21147]
```

```
>>> from sage.all import *
>>> expnums(Integer(10), Integer(1))
[1, 1, 2, 5, 15, 52, 203, 877, 4140, 21147]
```

```
sage: expnums(10, -1)
[1, -1, 0, 1, 1, -2, -9, -9, 50, 267]
```

```
>>> from sage.all import *
>>> expnums(Integer(10), -Integer(1))
[1, -1, 0, 1, 1, -2, -9, -9, 50, 267]
```

```
sage: expnums(1, 1)
[1]
sage: expnums(0, 1)
[]
sage: expnums(-1, 0)
[]
```

```
>>> from sage.all import *
>>> expnums(Integer(1), Integer(1))
[1]
>>> expnums(Integer(0), Integer(1))
[]
>>> expnums(-Integer(1), Integer(0))
[]
```

sage.combinat.expnums.**expnums2**(*n*, *aa*)

A vanilla python (but compiled via Cython) implementation of expnums.

We Compute the first n exponential numbers around aa, starting with the zero-th.

EXAMPLES:

```
sage: from sage.combinat.expnums import expnums2
sage: expnums2(10, 1)
[1, 1, 2, 5, 15, 52, 203, 877, 4140, 21147]
```

```
>>> from sage.all import *
>>> from sage.combinat.expnums import expnums2
>>> expnums2(Integer(10), Integer(1))
[1, 1, 2, 5, 15, 52, 203, 877, 4140, 21147]
```

Binary recurrence sequences

This class implements several methods relating to general linear binary recurrence sequences, including a sieve to find perfect powers in integral linear binary recurrence sequences.

EXAMPLES:

```
sage: R = BinaryRecurrenceSequence(1,1)        #the Fibonacci sequence
sage: R(137)        #the 137th term of the Fibonacci sequence
19134702400093278081449423917
sage: R(137) == fibonacci(137)
True
sage: [R(i) % 4 for i in range(12)]
[0, 1, 1, 2, 3, 1, 0, 1, 1, 2, 3, 1]
sage: R.period(4)        #the period of the fibonacci sequence modulo 4
```

(continues on next page)

(continued from previous page)

```

AUTHORS:

- Isabel Vogt (2013): initial version

See [SV2013], [BMS2006], and [SS1983].

class sage.combinat.binary_recurrence_sequences.**BinaryRecurrenceSequence**(*b*, *c*, *u0=0*, *u1=1*)

Bases: SageObject

Create a linear binary recurrence sequence defined by initial conditions u_0 and u_1 and recurrence relation $u_{n+2} = b * u_{n+1} + c * u_n$.

INPUT:

- b – integer; (partially determining the recurrence relation)
- c – integer; (partially determining the recurrence relation)
- u0 – integer; (the 0-th term of the binary recurrence sequence)
- u1 – integer; (the 1-st term of the binary recurrence sequence)

OUTPUT: an integral linear binary recurrence sequence defined by u_0, u_1, and $u_{n+2} = bu_{n+1} + cu_n$

See also

fibonacci(), *lucas_number1()*, *lucas_number2()*

EXAMPLES:

```
sage: R = BinaryRecurrenceSequence(3,3,2,1)
sage: R
Binary recurrence sequence defined by: u_n = 3 * u_{n-1} + 3 * u_{n-2};
With initial conditions: u_0 = 2, and u_1 = 1
```

```
>>> from sage.all import *
>>> R = BinaryRecurrenceSequence(Integer(3),Integer(3),Integer(2),Integer(1))
>>> R
Binary recurrence sequence defined by: u_n = 3 * u_{n-1} + 3 * u_{n-2};
With initial conditions: u_0 = 2, and u_1 = 1
```

is_arithmetic()

Decide whether the sequence is degenerate and an arithmetic sequence.

The sequence is arithmetic if and only if $u_1 - u_0 = u_2 - u_1 = u_3 - u_2$.

This corresponds to the matrix $F = [[0, 1], [c, b]]$ being nondiagonalizable and $\alpha/\beta = 1$.

EXAMPLES:

```
sage: S = BinaryRecurrenceSequence(2,-1)
sage: [S(i) for i in range(10)]
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9]
sage: S.is_arithmetic()
True
```

```
>>> from sage.all import *
>>> S = BinaryRecurrenceSequence(Integer(2),-Integer(1))
>>> [S(i) for i in range(Integer(10))]
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9]
>>> S.is_arithmetic()
True
```

is_degenerate()

Decide whether the binary recurrence sequence is degenerate.

Let α and β denote the roots of the characteristic polynomial $p(x) = x^2 - bx - c$. Let $a = u_1 - u_0\beta/(\beta - \alpha)$ and $b = u_1 - u_0\alpha/(\beta - \alpha)$. The sequence is, thus, given by $u_n = a\alpha^n - b\beta^n$. Then we say that the sequence is nondegenerate if and only if $a * b * \alpha * \beta \neq 0$ and α/β is not a root of unity.

More concretely, there are 4 classes of degeneracy, that can all be formulated in terms of the matrix $F = [[0, 1], [c, b]]$.

- F is singular – this corresponds to `c` = 0, and thus $\alpha * \beta = 0$. This sequence is geometric after term `u0` and so we call it `quasigeometric`
- $v = [[u_0], [u_1]]$ is an eigenvector of F – this corresponds to a `geometric` sequence with $a * b = 0$
- F is nondiagonalizable – this corresponds to $\alpha = \beta$. This sequence will be the point-wise product of an arithmetic and geometric sequence.
- F^k is scalar, for some $k > 1$ – this corresponds to α/β a k th root of unity. This sequence is a union of several geometric sequences, and so we again call it `quasigeometric`.

EXAMPLES:

```
sage: S = BinaryRecurrenceSequence(0,1)
sage: S.is_degenerate()
True
sage: S.is_geometric()
False
sage: S.is_quasigeometric()
True

sage: R = BinaryRecurrenceSequence(3,-2)
sage: R.is_degenerate()
False

sage: T = BinaryRecurrenceSequence(2,-1)
sage: T.is_degenerate()
True
```

(continues on next page)

(continued from previous page)

```
sage: T.is_arithmetic()
True
```

```
>>> from sage.all import *
>>> S = BinaryRecurrenceSequence(Integer(0),Integer(1))
>>> S.is_degenerate()
True
>>> S.is_geometric()
False
>>> S.is_quasigeometric()
True

>>> R = BinaryRecurrenceSequence(Integer(3),-Integer(2))
>>> R.is_degenerate()
False

>>> T = BinaryRecurrenceSequence(Integer(2),-Integer(1))
>>> T.is_degenerate()
True
>>> T.is_arithmetic()
True
```

is_geometric()

Decide whether the binary recurrence sequence is geometric - ie a geometric sequence.

This is a subcase of a degenerate binary recurrence sequence, for which $ab = 0$, i.e. $u_n/u_{n-1} = r$ for some value of r.

See *is_degenerate()* for a description of degeneracy and definitions of a and b.

EXAMPLES:

```
sage: S = BinaryRecurrenceSequence(2,0,1,2)
sage: [S(i) for i in range(10)]
[1, 2, 4, 8, 16, 32, 64, 128, 256, 512]
sage: S.is_geometric()
True
```

```
>>> from sage.all import *
>>> S = BinaryRecurrenceSequence(Integer(2),Integer(0),Integer(1),Integer(2))
>>> [S(i) for i in range(Integer(10))]
[1, 2, 4, 8, 16, 32, 64, 128, 256, 512]
>>> S.is_geometric()
True
```

is_quasigeometric()

Decide whether the binary recurrence sequence is degenerate and similar to a geometric sequence, i.e. the union of multiple geometric sequences, or geometric after term `u0`.

If α/β is a k th root of unity, where $k > 1$, then necessarily $k = 2, 3, 4, 6$. Then $F = [[0, 1], [c, b]$ is diagonalizable, and $F^k = [[\alpha^k, 0], [0, \beta^k]]$ is a diagonal matrix. Thus for all values of j mod k, the j mod k terms of u_n form a geometric series.

If α or β is zero, this implies that $c = 0$. This is the case when F is singular. In this case, $u_1, u_2, u_3, ...$ is geometric.

EXAMPLES:

```
sage: S = BinaryRecurrenceSequence(0,1)
sage: [S(i) for i in range(10)]
[0, 1, 0, 1, 0, 1, 0, 1, 0, 1]
sage: S.is_quasigeometric()
True

sage: R = BinaryRecurrenceSequence(3,0)
sage: [R(i) for i in range(10)]
[0, 1, 3, 9, 27, 81, 243, 729, 2187, 6561]
sage: R.is_quasigeometric()
True
```

```
>>> from sage.all import *
>>> S = BinaryRecurrenceSequence(Integer(0),Integer(1))
>>> [S(i) for i in range(Integer(10))]
[0, 1, 0, 1, 0, 1, 0, 1, 0, 1]
>>> S.is_quasigeometric()
True

>>> R = BinaryRecurrenceSequence(Integer(3),Integer(0))
>>> [R(i) for i in range(Integer(10))]
[0, 1, 3, 9, 27, 81, 243, 729, 2187, 6561]
>>> R.is_quasigeometric()
True
```

period(*m*, *eventual*)

Return the period of the binary recurrence sequence modulo an integer `m`.

If n_1 is congruent to n_2 modulo `period(m)`, then u_{n_1} is is congruent to u_{n_2} modulo `m`.

INPUT:

- `m` – integer; modulo which the period of the recurrence relation is calculated
- `eventual` – boolean (default: `False`); if `True`, allow the sequence to be eventually periodic, rather than requiring it to be purely periodic. So n_1 might not be congruent to n_2 modulo `period(m)` unless n_1 and n_2 are large.

OUTPUT: integer (the period of the sequence modulo m)

EXAMPLES:

If $p = \pm 1 \mod 5$, then the period of the Fibonacci sequence mod p is $p-1$ (c.f. Lemma 3.3 of [BMS2006]).

```
sage: R = BinaryRecurrenceSequence(1,1)
sage: R.period(31)
30

sage: [R(i) % 4 for i in range(12)]
[0, 1, 1, 2, 3, 1, 0, 1, 1, 2, 3, 1]
sage: R.period(4)
6
```

```
>>> from sage.all import *
>>> R = BinaryRecurrenceSequence(Integer(1),Integer(1))
>>> R.period(Integer(31))
30

>>> [R(i) % Integer(4) for i in range(Integer(12))]
[0, 1, 1, 2, 3, 1, 0, 1, 1, 2, 3, 1]
>>> R.period(Integer(4))
6
```

This function works for degenerate sequences as well.

```
sage: S = BinaryRecurrenceSequence(2,0,1,2)
sage: S.is_degenerate()
True
sage: S.is_geometric()
True
sage: [S(i) % 17 for i in range(16)]
[1, 2, 4, 8, 16, 15, 13, 9, 1, 2, 4, 8, 16, 15, 13, 9]
sage: S.period(17)
8
```

```
>>> from sage.all import *
>>> S = BinaryRecurrenceSequence(Integer(2),Integer(0),Integer(1),Integer(2))
>>> S.is_degenerate()
True
>>> S.is_geometric()
True
>>> [S(i) % Integer(17) for i in range(Integer(16))]
[1, 2, 4, 8, 16, 15, 13, 9, 1, 2, 4, 8, 16, 15, 13, 9]
>>> S.period(Integer(17))
8
```

Letting `eventual` be `True` allows us to find the period of a sequence that is not purely periodic.

```
sage: T = BinaryRecurrenceSequence(5,12,u0=0,u1=1)
sage: [T(n) % 10 for n in range(20)]
[0, 1, 5, 7, 5, 9, 5, 3, 5, 1, 5, 7, 5, 9, 5, 3, 5, 1, 5, 7]
sage: T.period(10)
Traceback (most recent call last):
...
ValueError: Binary recurrence sequence modulo 10 is not a purely
periodic sequence.
sage: T.period(10,eventual=True)
8
```

```
>>> from sage.all import *
>>> T = BinaryRecurrenceSequence(Integer(5),Integer(12),u0=Integer(0),
↪u1=Integer(1))
>>> [T(n) % Integer(10) for n in range(Integer(20))]
[0, 1, 5, 7, 5, 9, 5, 3, 5, 1, 5, 7, 5, 9, 5, 3, 5, 1, 5, 7]
>>> T.period(Integer(10))
Traceback (most recent call last):
```

(continues on next page)

(continued from previous page)

```
...
ValueError: Binary recurrence sequence modulo 10 is not a purely
periodic sequence.
>>> T.period(Integer(10),eventual=True)
8
```

Note

The answer is cached.

pthpowers(*p*, *Bound*)

Find the indices of proveably all p-th powers in the recurrence sequence bounded by Bound.

Let u_n be a binary recurrence sequence. A p th power in u_n is a solution to $u_n = y^p$ for some integer y. There are only finitely many p th powers in any recurrence sequence [SS1983].

INPUT:

- p – a rational prime integer (the fixed p in $u_n = y^p$)
- Bound – a natural number (the maximum index n in $u_n = y^p$ that is checked)

OUTPUT:

A list of the indices of all p th powers less bounded by Bound. If the sequence is degenerate and there are many p th powers, raises ValueError.

EXAMPLES:

```
sage: R = BinaryRecurrenceSequence(1,1)        #the Fibonacci sequence
sage: R.pthpowers(2, 10**10)        # long time (7 seconds) -- in fact these␣
↪are all squares, c.f. [BMS2006]_
[0, 1, 2, 12]

sage: S = BinaryRecurrenceSequence(8,1) #a Lucas sequence
sage: S.pthpowers(3,10**10)    # long time (3 seconds) -- provably finds the␣
↪indices of all 3rd powers less than 10^10
[0, 1, 2]

sage: Q = BinaryRecurrenceSequence(3,3,2,1)
sage: Q.pthpowers(11,10**10)          # long time (7.5 seconds)
[1]
```

```
>>> from sage.all import *
>>> R = BinaryRecurrenceSequence(Integer(1),Integer(1))        #the Fibonacci␣
↪sequence
>>> R.pthpowers(Integer(2), Integer(10)**Integer(10))        # long time (7␣
↪seconds) -- in fact these are all squares, c.f. [BMS2006]_
[0, 1, 2, 12]

>>> S = BinaryRecurrenceSequence(Integer(8),Integer(1)) #a Lucas sequence
>>> S.pthpowers(Integer(3),Integer(10)**Integer(10))    # long time (3␣
↪seconds) -- provably finds the indices of all 3rd powers less than 10^10
[0, 1, 2]
```

(continues on next page)

(continued from previous page)

```
>>> Q = BinaryRecurrenceSequence(Integer(3),Integer(3),Integer(2),Integer(1))
>>> Q.pthpowers(Integer(11),Integer(10)**Integer(10))          # long time (7.
↪5 seconds)
[1]
```

If the sequence is degenerate, and there are no `p` th powers, returns []. Otherwise, if there are many `p` th powers, raises `ValueError`.

```
sage: T = BinaryRecurrenceSequence(2,0,1,2)
sage: T.is_degenerate()
True
sage: T.is_geometric()
True
sage: T.pthpowers(7, 10**30)                                                #␣
↪needs sage.symbolic
Traceback (most recent call last):

> This function is primarily optimized in the range where `Bound` is much larger than `p`.

Binary trees

This module deals with binary trees as mathematical (in particular immutable) objects.

> **Note**
>
> If you need the data-structure for example to represent sets or hash tables with AVL trees, you should have a look at `sage.misc.binary_tree`.

AUTHORS:

- Florent Hivert (2010-2011): initial implementation.
- Adrien Boussicault (2015): Hook statistics.

class `sage.combinat.binary_tree.`**BinaryTree**(*parent*, *children=None*, *check=True*)

Bases: *AbstractClonableTree*, `ClonableArray`

Binary trees.

Binary trees here mean ordered (a.k.a. plane) finite binary trees, where "ordered" means that the children of each node are ordered.

Binary trees contain nodes and leaves, where each node has two children while each leaf has no children. The number of leaves of a binary tree always equals the number of nodes plus 1.

INPUT:

- `children` – `None` (default) or a list, tuple or iterable of length 2 of binary trees or convertible objects. This corresponds to the standard recursive definition of a binary tree as either a leaf or a pair of binary trees. Syntactic sugar allows leaving out all but the outermost calls of the `BinaryTree()` constructor, so that, e. g., `BinaryTree([BinaryTree(None),BinaryTree(None)])` can be shortened to `BinaryTree([None, None])`. It is also allowed to abbreviate `[None, None]` by `[]`.
- `check` – boolean (default: `True`); whether check for binary should be performed or not

EXAMPLES:

```
sage: BinaryTree()
.
sage: BinaryTree(None)
.
sage: BinaryTree([])
[., .]
sage: BinaryTree([None, None])
[., .]
sage: BinaryTree([None, []])
[., [., .]]
sage: BinaryTree([[], None])
[[., .], .]
sage: BinaryTree("[[], .]")
[[., .], .]
```

(continues on next page)

(continued from previous page)

```
sage: BinaryTree([None, BinaryTree([None, None])])
[., [., .]]

sage: BinaryTree([[], None, []])
Traceback (most recent call last):
...
ValueError: this is not a binary tree
```

```
>>> from sage.all import *
>>> BinaryTree()
.
>>> BinaryTree(None)
.
>>> BinaryTree([])
[., .]
>>> BinaryTree([None, None])
[., .]
>>> BinaryTree([None, []])
[., [., .]]
>>> BinaryTree([[], None])
[[., .], .]
>>> BinaryTree("[[], .]")
[[., .], .]
>>> BinaryTree([None, BinaryTree([None, None])])
[., [., .]]

>>> BinaryTree([[], None, []])
Traceback (most recent call last):
...
ValueError: this is not a binary tree
```

as_ordered_tree(*with_leaves=True*)

Return the same tree seen as an ordered tree. By default, leaves are transformed into actual nodes, but this can be avoided by setting the optional variable `with_leaves` to `False`.

EXAMPLES:

```
sage: bt = BinaryTree([]); bt
[., .]
sage: bt.as_ordered_tree()
[[], []]
sage: bt.as_ordered_tree(with_leaves = False)
[]
sage: bt = bt.canonical_labelling(); bt
1[., .]
sage: bt.as_ordered_tree()
1[None[], None[]]
sage: bt.as_ordered_tree(with_leaves=False)
1[]
```

```
>>> from sage.all import *
>>> bt = BinaryTree([]); bt
```

(continues on next page)

(continued from previous page)

```
[., .]
>>> bt.as_ordered_tree()
[[], []]
>>> bt.as_ordered_tree(with_leaves = False)
[]
>>> bt = bt.canonical_labelling(); bt
1[., .]
>>> bt.as_ordered_tree()
1[None[], None[]]
>>> bt.as_ordered_tree(with_leaves=False)
1[]
```

canonical_labelling(*shift=1*)

Return a labelled version of `self`.

The actual canonical labelling is currently unspecified. However, currently we use the labelling of the internal nodes (not the leaves) of the tree given by the in-order, i.e., the order defined recursively using the rule that, for each node u, its descendants in the left (resp. right) subtree comes before (resp. after) u.

Under any future changes, we guarantee that the labels by default is from 1 to n, with n the number of nodes of the tree. The smallest labeling is adjustable using the parameter `shift`. Moreover, we guarantee that two (unlabelled) trees compare as equal if and only if their canonical labelled trees compare as equal.

The runtime of this method is linear in the number of nodes.

INPUT:

- `shift` – integer (optional); the smallest label in the tree labelling

EXAMPLES:

```
sage: BinaryTree().canonical_labelling()
.
sage: BinaryTree([]).canonical_labelling()
1[., .]
sage: BinaryTree([[[], [], None]], [[], []]]).canonical_labelling()
5[2[1[., .], 4[3[., .], .]], 7[6[., .], 8[., .]]]
```

```
>>> from sage.all import *
>>> BinaryTree().canonical_labelling()
.
>>> BinaryTree([]).canonical_labelling()
1[., .]
>>> BinaryTree([[[], [], None]], [[], []]]).canonical_labelling()
5[2[1[., .], 4[3[., .], .]], 7[6[., .], 8[., .]]]
```

canopee()

Return the canopee of `self`.

The *canopee* of a non-empty binary tree T with n internal nodes is the list l of 0 and 1 of length $n-1$ obtained by going along the leaves of T from left to right except the two extremal ones, writing 0 if the leaf is a right leaf and 1 if the leaf is a left leaf.

EXAMPLES:

```
sage: BinaryTree([]).canopee()
[]
sage: BinaryTree([None, []]).canopee()
[1]
sage: BinaryTree([[], None]).canopee()
[0]
sage: BinaryTree([[], []]).canopee()
[0, 1]
sage: BinaryTree([[[], [[], None]], [[], []]]).canopee()
[0, 1, 0, 0, 1, 0, 1]
```

```
>>> from sage.all import *
>>> BinaryTree([]).canopee()
[]
>>> BinaryTree([None, []]).canopee()
[1]
>>> BinaryTree([[], None]).canopee()
[0]
>>> BinaryTree([[], []]).canopee()
[0, 1]
>>> BinaryTree([[[], [[], None]], [[], []]]).canopee()
[0, 1, 0, 0, 1, 0, 1]
```

The number of pairs (t_1, t_2) of binary trees of size n such that the canopee of t_1 is the complementary of the canopee of t_2 is also the number of Baxter permutations (see [DG1994], see also OEIS sequence A001181). We check this in small cases:

```
sage: [len([(u,v) for u in BinaryTrees(n) for v in BinaryTrees(n)
....:       if [1 - x for x in u.canopee()] == v.canopee()])
....:    for n in range(1, 5)]
[1, 2, 6, 22]
```

```
>>> from sage.all import *
>>> [len([(u,v) for u in BinaryTrees(n) for v in BinaryTrees(n)
...       if [Integer(1) - x for x in u.canopee()] == v.canopee()])
...    for n in range(Integer(1), Integer(5))]
[1, 2, 6, 22]
```

Here is a less trivial implementation of this:

```
sage: from sage.sets.finite_set_map_cy import fibers
sage: def baxter(n):
....:     f = fibers(lambda t: tuple(t.canopee()),
....:                BinaryTrees(n))
....:     return sum(len(f[i])*len(f[tuple(1-x for x in i)])
....:                for i in f)
sage: [baxter(n) for n in range(1, 7)]
[1, 2, 6, 22, 92, 422]
```

```
>>> from sage.all import *
>>> from sage.sets.finite_set_map_cy import fibers
>>> def baxter(n):
```

(continues on next page)

(continued from previous page)

```
...     f = fibers(lambda t: tuple(t.canopee()),
...                BinaryTrees(n))
...     return sum(len(f[i])*len(f[tuple(Integer(1)-x for x in i)])
...                for i in f)
>>> [baxter(n) for n in range(Integer(1), Integer(7))]
[1, 2, 6, 22, 92, 422]
```

check()

Check that `self` is a binary tree.

EXAMPLES:

```
sage: BinaryTree([[], []])     # indirect doctest
[[., .], [., .]]
sage: BinaryTree([[], [], []]) # indirect doctest
Traceback (most recent call last):
...
ValueError: this is not a binary tree
sage: BinaryTree([[]])         # indirect doctest
Traceback (most recent call last):
...
ValueError: this is not a binary tree
```

```
>>> from sage.all import *
>>> BinaryTree([[], []])     # indirect doctest
[[., .], [., .]]
>>> BinaryTree([[], [], []]) # indirect doctest
Traceback (most recent call last):
...
ValueError: this is not a binary tree
>>> BinaryTree([[]])         # indirect doctest
Traceback (most recent call last):
...
ValueError: this is not a binary tree
```

comb(*side='left'*)

Return the comb of a tree.

There are two combs in a binary tree: a left comb and a right comb.

Consider all the vertices of the leftmost (resp. rightmost) branch of the root. The left (resp. right) comb is the list of right (resp. left) subtrees of each of these vertices.

INPUT:

- `side` – (default: `'left'`) set to `'left'` to obtain a left comb, and to `'right'` to obtain a right comb

OUTPUT: list of binary trees

See also

over_decomposition(), *under_decomposition()*

EXAMPLES:

```
sage: BT = BinaryTree( '.' )
sage: [BT.comb('left'), BT.comb('right')]
[[], []]
sage: BT = BinaryTree( '[.,.]' )
sage: [BT.comb('left'), BT.comb('right')]

[           o   ]
[          / \  ]
[         o   o ]
```

dendriform_shuffle(*other*)

Return the list of terms in the dendriform product.

This is the list of all binary trees that can be obtained by identifying the rightmost path in `self` and the leftmost path in `other`. Every term corresponds to a shuffle of the vertices on the rightmost path in `self` and the vertices on the leftmost path in `other`.

EXAMPLES:

```
sage: u = BinaryTree()
sage: g = BinaryTree([])
sage: l = BinaryTree([g, u])
sage: r = BinaryTree([u, g])

sage: list(g.dendriform_shuffle(g))                                          #␣
↪needs sage.combinat
[[[., .], .], [., [., .]]]

```

graph(*with_leaves=True*)

Convert `self` to a digraph.

By default, this graph contains both nodes and leaves, hence is never empty. To obtain a graph which contains only the nodes, the `with_leaves` optional keyword variable has to be set to `False`.

The resulting digraph is endowed with a combinatorial embedding, in order to be displayed correctly.

INPUT:

- `with_leaves` – boolean (default: `True`); whether the resulting graph will be formed from the leaves and the nodes of `self` (if `True`), or only from the nodes of `self` (if `False`)

EXAMPLES:

```
sage: t1 = BinaryTree([[], None])
sage: t1.graph()
Digraph on 5 vertices
```

(continues on next page)

(continued from previous page)

```
sage: t1.graph(with_leaves=False)
Digraph on 2 vertices

sage: t1 = BinaryTree([[], [[], None]])
sage: t1.graph()
Digraph on 9 vertices
sage: t1.graph().edges(sort=True)
[(0, 1, None), (0, 4, None), (1, 2, None), (1, 3, None), (4, 5, None), (4, 8,␣
↪None), (5, 6, None), (5, 7, None)]
sage: t1.graph(with_leaves=False)
Digraph on 4 vertices
sage: t1.graph(with_leaves=False).edges(sort=True)
[(0, 1, None), (0, 2, None), (2, 3, None)]

sage: t1 = BinaryTree()
sage: t1.graph()
Digraph on 1 vertex
sage: t1.graph(with_leaves=False)
Digraph on 0 vertices

sage: BinaryTree([]).graph()
Digraph on 3 vertices
sage: BinaryTree([]).graph(with_leaves=False)
Digraph on 1 vertex

sage: t1 = BinaryTree([[], [[], []]])
sage: t1.graph(with_leaves=False)
Digraph on 5 vertices
sage: t1.graph(with_leaves=False).edges(sort=True)
[(0, 1, None), (0, 2, None), (2, 3, None), (2, 4, None)]
```

```
>>> from sage.all import *
>>> t1 = BinaryTree([[], None])
>>> t1.graph()
Digraph on 5 vertices
>>> t1.graph(with_leaves=False)
Digraph on 2 vertices

>>> t1 = BinaryTree([[], [[], None]])
>>> t1.graph()
Digraph on 9 vertices
>>> t1.graph().edges(sort=True)
[(0, 1, None), (0, 4, None), (1, 2, None), (1, 3, None), (4, 5, None), (4, 8,␣
↪None), (5, 6, None), (5, 7, None)]
>>> t1.graph(with_leaves=False)
Digraph on 4 vertices
>>> t1.graph(with_leaves=False).edges(sort=True)
[(0, 1, None), (0, 2, None), (2, 3, None)]

>>> t1 = BinaryTree()
>>> t1.graph()
Digraph on 1 vertex
```

(continues on next page)

(continued from previous page)

```
>>> t1.graph(with_leaves=False)
Digraph on 0 vertices

>>> BinaryTree([]).graph()
Digraph on 3 vertices
>>> BinaryTree([]).graph(with_leaves=False)
Digraph on 1 vertex

>>> t1 = BinaryTree([[], [[], []]])
>>> t1.graph(with_leaves=False)
Digraph on 5 vertices
>>> t1.graph(with_leaves=False).edges(sort=True)
[(0, 1, None), (0, 2, None), (2, 3, None), (2, 4, None)]
```

hook_number()

Return the number of hooks.

Recalling that a branch is a path from a vertex of the tree to a leaf, the leftmost (resp. rightmost) branch of a vertex v is the branch from v made only of left (resp. right) edges.

The hook of a vertex v is a set of vertices formed by the union of v, and the vertices of its leftmost and rightmost branches.

There is a unique way to partition the set of vertices in hooks. The number of hooks in such a partition is the hook number of the tree.

We can obtain this partition recursively by extracting the root's hook and iterating the processus on each tree of the remaining forest.

EXAMPLES:

```
sage: BT = BinaryTree( '.' )
sage: BT.hook_number()
0
sage: BT = BinaryTree( '[.,.]' )
sage: BT.hook_number()
1
sage: BT = BinaryTree( '[[[.,.], .], [.,.]]' ); ascii_art(BT)
    o
   / \
  o   o
 /
o
sage: BT.hook_number()
1
sage: BT = BinaryTree( '[[[[., [., .]], .], [[., .], [[[., .], [., .]], [., .
↪]]]], [., [[[., .], [[[., .], [., .]], .]], .]]]' )
sage: ascii_art(BT)
        _________o_________
       /                   \
    __o__                   o
   /     \                   \
  o      __o___               o

>>> BT.hook_number()
6
```

in_order_traversal(*node_action=None*, *leaf_action=None*)

Explore the binary tree `self` using the depth-first infix-order traversal algorithm, executing the `node_action` function whenever traversing a node and executing the `leaf_action` function whenever traversing a leaf.

In more detail, what this method does to a tree T is the following:

```
if the root of `T` is a node:
```

(continues on next page)

(continued from previous page)

```
    apply in_order_traversal to the left subtree of `T`
        (with the same node_action and leaf_action);
    apply node_action to the root of `T`;
    apply in_order_traversal to the right subtree of `T`
        (with the same node_action and leaf_action);
else:
    apply leaf_action to the root of `T`.
```

For example on the following binary tree T, where we denote leaves by $a, b, c, \ldots$ and nodes by $1, 2, 3, \ldots$:

```
|     ____3____          |
|    /          \        |
|   1           __7__    |
|  / \         /     \   |
| a   2       _5_     8  |
|    / \     /   \   / \ |
|   b   c   4     6 h   i |
|          / \   / \      |
|         d   e f   g     |
```

this method first applies `leaf_action` to a, then applies `node_action` to 1, then `leaf_action` to b, then `node_action` to 2, etc., with the vertices being traversed in the order $a, 1, b, 2, c, 3, d, 4, e, 5, f, 6, g, 7, h, 8, i$.

See *in_order_traversal_iter()* for a version of this algorithm which only iterates through the vertices rather than applying any function to them.

INPUT:

- `node_action` – (optional) a function which takes a node in input and does something during the exploration
- `leaf_action` – (optional) a function which takes a leaf in input and does something during the exploration

in_order_traversal_iter()

The depth-first infix-order traversal iterator for the binary tree `self`.

This method iters each vertex (node and leaf alike) of the given binary tree following the depth-first infix order traversal algorithm.

The *depth-first infix order traversal algorithm* iterates through a binary tree as follows:

```
iterate through the left subtree (by the depth-first infix
    order traversal algorithm);
yield the root;
iterate through the right subtree (by the depth-first infix
    order traversal algorithm).
```

For example on the following binary tree T, where we denote leaves by $a, b, c, \ldots$ and nodes by $1, 2, 3, \ldots$:

```
|     ____3____          |
|    /          \        |
|   1           __7__    |
|  / \         /     \   |
| a   2       _5_     8  |
```

(continues on next page)

(continued from previous page)

```
|    / \    /   \   / \  |
|   b   c  4     6 h   i |
|         / \   / \      |
|        d   e f   g     |
```

the depth-first infix-order traversal algorithm iterates through the vertices of T in the following order: $a, 1, b, 2, c, 3, d, 4, e, 5, f, 6, g, 7, h, 8, i$.

See *in_order_traversal()* for a version of this algorithm which not only iterates through, but actually does something at the vertices of tree.

is_complete()

Return `True` if `self` is complete, else return `False`.

In a nutshell, a complete binary tree is a perfect binary tree except possibly in the last level, with all nodes in the last level "flush to the left".

In more detail: A complete binary tree (also called binary heap) is a binary tree in which every level, except possibly the last one (the deepest), is completely filled. At depth n, all nodes must be as far left as possible.

For example:

```
|          ___o___    |
|         /       \   |
|      __o__        o |
|     /     \         |
|    o       o        |
|   / \     / \       |
|  o   o   o   o      |
```

is not complete but the following ones are:

```
|      __o__          _o_            ___o___      |
|     /     \        /   \          /       \     |
|    o       o      o     o      __o__       o    |
|   / \     / \    / \          /     \     / \   |
|  o   o   o   o, o   o    ,   o       o   o   o  |
|                            / \     /            |
|                           o   o   o             |
```

EXAMPLES:

```
sage: def lst(i):
....:     return [bt for bt in BinaryTrees(i) if bt.is_complete()]
sage: for i in range(8): ascii_art(lst(i)) # long time
[  ]
[ o ]
[   o ]
[  /  ]
[ o   ]
[   o   ]
[  / \  ]
[ o   o ]
[     o   ]
[    / \  ]
```

(continues on next page)

(continued from previous page)

```
[   o   o ]
[  /      ]
[ o       ]
[     _o_   ]
[    /   \  ]
[   o     o ]
[  / \      ]
[ o   o     ]
[     __o__   ]
[    /     \  ]
[   o       o ]
[  / \     /  ]
[ o   o   o   ]
[     __o__     ]
[    /     \    ]
[   o       o   ]
[  / \     / \  ]
[ o   o   o   o ]
```

```
>>> from sage.all import *
>>> def lst(i):
...     return [bt for bt in BinaryTrees(i) if bt.is_complete()]
>>> for i in range(Integer(8)): ascii_art(lst(i)) # long time
[  ]
[ o ]
[   o ]
[  /  ]
[ o   ]
[   o   ]
[  / \  ]
[ o   o ]
[     o   ]
[    / \  ]
[   o   o ]
[  /      ]
[ o       ]
[     _o_   ]
[    /   \  ]
[   o     o ]
[  / \      ]
[ o   o     ]
[     __o__   ]
[    /     \  ]
[   o       o ]
[  / \     /  ]
[ o   o   o   ]
[     __o__     ]
[    /     \    ]
[   o       o   ]
[  / \     / \  ]
[ o   o   o   o ]
```

is_empty()

Return whether `self` is empty.

The notion of emptiness employed here is the one which defines a binary tree to be empty if its root is a leaf. There is precisely one empty binary tree.

EXAMPLES:

```
sage: BinaryTree().is_empty()
True
sage: BinaryTree([]).is_empty()
False
sage: BinaryTree([[], None]).is_empty()
False
```

```
>>> from sage.all import *
>>> BinaryTree().is_empty()
True
>>> BinaryTree([]).is_empty()
False
>>> BinaryTree([[], None]).is_empty()
False
```

is_full()

Return `True` if `self` is full, else return `False`.

A full binary tree is a tree in which every node either has two child nodes or has two child leaves.

This is also known as *proper binary tree* or *2-tree* or *strictly binary tree*.

For example:

```
|        __o__    |
|       /     \   |
|      o       o  |
|     / \         |
|    o   o        |
|   /     \       |
|  o       o      |
```

is not full but the next one is:

```
|          ___o___    |
|         /       \   |
|      __o__       o  |
|     /     \         |
|    o       o        |
|   / \     / \       |
|  o   o   o   o      |
```

EXAMPLES:

```
sage: BinaryTree([[[[],None],[None,[]]], []]).is_full()
False
sage: BinaryTree([[[[],[]],[[],[]]], []]).is_full()
True
```

(continues on next page)

(continued from previous page)

```
sage: ascii_art([bt for bt in BinaryTrees(5) if bt.is_full()])
[   _o_    ,     _o_   ]
[  /   \        /   \  ]
[ o     o      o     o ]
[      / \    / \      ]
[     o   o  o   o     ]
```

```
>>> from sage.all import *
>>> BinaryTree([[[[],None],[None,[]]], []]).is_full()
False
>>> BinaryTree([[[[],[]],[[],[]]], []]).is_full()
True
>>> ascii_art([bt for bt in BinaryTrees(Integer(5)) if bt.is_full()])
[   _o_    ,     _o_   ]
[  /   \        /   \  ]
[ o     o      o     o ]
[      / \    / \      ]
[     o   o  o   o     ]
```

is_perfect()

Return `True` if `self` is perfect, else return `False`.

A perfect binary tree is a full tree in which all leaves are at the same depth.

For example:

```
|          ___o___    |
|         /       \   |
|      __o__        o |
|     /     \         |
|    o       o        |
|   / \     / \       |
|  o   o   o   o      |
```

is not perfect but the next one is:

```
|      __o__      |
|     /     \     |
|    o       o    |
|   / \     / \   |
|  o   o   o   o  |
```

EXAMPLES:

```
sage: def lst(i):
....:     return [bt for bt in BinaryTrees(i) if bt.is_perfect()]
sage: for i in range(8): ascii_art(lst(i)) # long time
[  ]
[ o ]
[  ]
[   o   ]
[  / \  ]
[ o   o ]
```

(continues on next page)

(continued from previous page)

```
[  ]
[  ]
[  ]
[     __o__     ]
[    /     \    ]
[   o       o   ]
[  / \     / \  ]
[ o   o   o   o ]
```

```
>>> from sage.all import *
>>> def lst(i):
...     return [bt for bt in BinaryTrees(i) if bt.is_perfect()]
>>> for i in range(Integer(8)): ascii_art(lst(i)) # long time
[  ]
[ o ]
[  ]
[   o   ]
[  / \  ]
[ o   o ]
[  ]
[  ]
[  ]
[     __o__     ]
[    /     \    ]
[   o       o   ]
[  / \     / \  ]
[ o   o   o   o ]
```

left_border_symmetry()

Return the tree where a symmetry has been applied recursively on all left borders. If a tree is made of three trees $[T_1, T_2, T_3]$ on its left border, it becomes $[T_3', T_2', T_1']$ where same symmetry has been applied to T_1, T_2, T_3.

EXAMPLES:

```
sage: BinaryTree().left_border_symmetry()
.
sage: BinaryTree([]).left_border_symmetry()
[., .]
sage: BinaryTree([[None,[]],None]).left_border_symmetry()
[[., .], [., .]]
sage: BinaryTree([[None,[None,[]]],None]).left_border_symmetry()
[[., .], [., [., .]]]
sage: bt = BinaryTree([[None,[None,[]]],None]).canonical_labelling()
sage: bt
4[1[., 2[., 3[., .]]], .]
sage: bt.left_border_symmetry()
1[4[., .], 2[., 3[., .]]]
```

```
>>> from sage.all import *
>>> BinaryTree().left_border_symmetry()
.
```

(continues on next page)

(continued from previous page)

```
>>> BinaryTree([]).left_border_symmetry()
[., .]
>>> BinaryTree([[None,[]],None]).left_border_symmetry()
[[., .], [., .]]
>>> BinaryTree([[None,[None,[]]],None]).left_border_symmetry()
[[., .], [., [., .]]]
>>> bt = BinaryTree([[None,[None,[]]],None]).canonical_labelling()
>>> bt
4[1[., 2[., 3[., .]]], .]
>>> bt.left_border_symmetry()
1[4[., .], 2[., 3[., .]]]
```

left_children_node_number(*direction='left'*)

alias of *number_of_left_nodes()*.

left_right_symmetry()

Return the left-right symmetrized tree of `self`.

EXAMPLES:

```
sage: BinaryTree().left_right_symmetry()
.
sage: BinaryTree([]).left_right_symmetry()
[., .]
sage: BinaryTree([[],None]).left_right_symmetry()
[., [., .]]
sage: BinaryTree([[None, []],None]).left_right_symmetry()
[., [[., .], .]]
```

```
>>> from sage.all import *
>>> BinaryTree().left_right_symmetry()
.
>>> BinaryTree([]).left_right_symmetry()
[., .]
>>> BinaryTree([[],None]).left_right_symmetry()
[., [., .]]
>>> BinaryTree([[None, []],None]).left_right_symmetry()
[., [[., .], .]]
```

left_rotate()

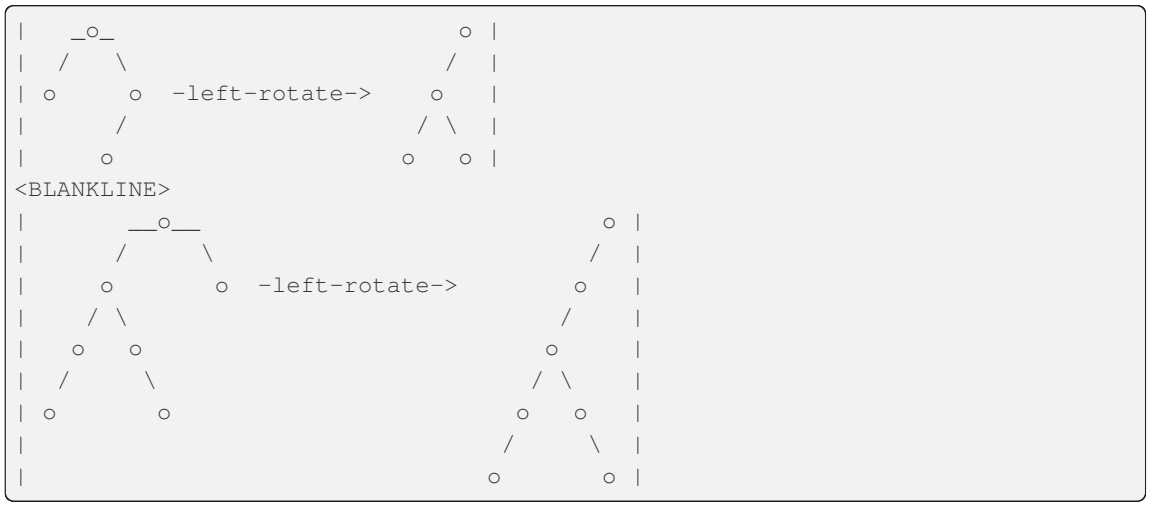
Return the result of left rotation applied to the binary tree `self`.

Left rotation on binary trees is defined as follows: Let T be a binary tree such that the right child of the root of T is a node. Let A be the left child of the root of T, and let B and C be the left and right children of the right child of the root of T. (Keep in mind that nodes of trees are identified with the subtrees consisting of their descendants.) Then, the left rotation of T is the binary tree in which the right child of the root is C, whereas the left child of the root is a node whose left and right children are A and B. In pictures:

```
|   *                        *   |
|  / \                      / \  |
| A   *  -left-rotate->     *   C |
|    / \                   / \   |
|   B   C                 A   B  |
```

where asterisks signify a single node each (but A, B and C might be empty).

For example,



Left rotation is the inverse operation to right rotation (*right_rotate()*).

See also

right_rotate()

EXAMPLES:

```
sage: b = BinaryTree([[],[[],None]]); ascii_art([b])
[   _o_   ]
[  /   \  ]
[ o     o ]
[      /  ]
[     o   ]
sage: ascii_art([b.left_rotate()])
[     o ]
[    /  ]
[   o   ]
[  / \  ]
[ o   o ]
sage: b.left_rotate().right_rotate() == b
True
```

```
>>> from sage.all import *
>>> b = BinaryTree([[],[[],None]]); ascii_art([b])
[   _o_   ]
[  /   \  ]
[ o     o ]
[      /  ]
[     o   ]
>>> ascii_art([b.left_rotate()])
[     o ]
[    /  ]
```

(continues on next page)

(continued from previous page)

```
[   o   ]
[  / \  ]
[ o   o ]
>>> b.left_rotate().right_rotate() == b
True
```

make_leaf()

Modify `self` so that it becomes a leaf (i. e., an empty tree).

Note

`self` must be in a mutable state.

See also

make_node

EXAMPLES:

```
sage: t = BinaryTree([None, None])
sage: t.make_leaf()
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
sage: with t.clone() as t1:
....:     t1.make_leaf()
sage: t, t1
([., .], .)
```

```
>>> from sage.all import *
>>> t = BinaryTree([None, None])
>>> t.make_leaf()
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
>>> with t.clone() as t1:
...     t1.make_leaf()
>>> t, t1
([., .], .)
```

make_node(*child_list=[None, None]*)

Modify `self` so that it becomes a node with children `child_list`.

INPUT:

- `child_list` – a pair of binary trees (or objects convertible to)

Note

`self` must be in a mutable state.

See also

make_leaf

EXAMPLES:

```
sage: t = BinaryTree()
sage: t.make_node([None, None])
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
sage: with t.clone() as t1:
....:     t1.make_node([None, None])
sage: t, t1
(., [., .])
sage: with t.clone() as t:
....:     t.make_node([BinaryTree(), BinaryTree(), BinaryTree([])])
Traceback (most recent call last):
...
ValueError: the list must have length 2
sage: with t1.clone() as t2:
....:     t2.make_node([t1, t1])
sage: with t2.clone() as t3:
....:     t3.make_node([t1, t2])
sage: t1, t2, t3
([., .], [[., .], [., .]], [[., .], [[., .], [., .]]])
```

```
>>> from sage.all import *
>>> t = BinaryTree()
>>> t.make_node([None, None])
Traceback (most recent call last):
...
ValueError: object is immutable; please change a copy instead.
>>> with t.clone() as t1:
...     t1.make_node([None, None])
>>> t, t1
(., [., .])
>>> with t.clone() as t:
...     t.make_node([BinaryTree(), BinaryTree(), BinaryTree([])])
Traceback (most recent call last):
...
ValueError: the list must have length 2
>>> with t1.clone() as t2:
...     t2.make_node([t1, t1])
>>> with t2.clone() as t3:
...     t3.make_node([t1, t2])
>>> t1, t2, t3
([., .], [[., .], [., .]], [[., .], [[., .], [., .]]])
```

number_of_left_nodes(*direction='left'*)

Return the number of nodes which are left children in `self`.

Every node (except the root) is either the left child or the right child of its parent node. The total number of

nodes is 1 plus the number of left-children nodes plus the number of right-children nodes.

INPUT:

- `direction` – either `'left'` (default) or `'right'` ; if set to `'right'`, instead count nodes that are right children

EXAMPLES:

```
sage: bt = BinaryTree([[None,[[],[]]],[None,[[],None]]])
sage: ascii_art(bt)
  __o__
 /     \
o       o
 \       \
  o       o
 / \     /
o   o   o
sage: bt.number_of_left_nodes('left')
3
sage: bt.number_of_left_nodes('right')
4

sage: all(5 == 1 + bt.number_of_left_nodes()
....:             + bt.number_of_left_nodes('right')
....:     for bt in BinaryTrees(5))
True
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[None,[[],[]]],[None,[[],None]]])
>>> ascii_art(bt)
  __o__
 /     \
o       o
 \       \
  o       o
 / \     /
o   o   o
>>> bt.number_of_left_nodes('left')
3
>>> bt.number_of_left_nodes('right')
4

>>> all(Integer(5) == Integer(1) + bt.number_of_left_nodes()
...             + bt.number_of_left_nodes('right')
...     for bt in BinaryTrees(Integer(5)))
True
```

over(*bt*)

Return `self` over `bt`, where "over" is the `over` (/) operation.

If T and T' are two binary trees, then T over T' (written T/T') is defined as the tree obtained by grafting T' on the rightmost leaf of T. More precisely, T/T' is defined by identifying the root of the T' with the rightmost leaf of T. See section 4.5 of [HNT2005].

If T is empty, then $T/T' = T'$.

The definition of this "over" operation goes back to Loday-Ronco [LR0102066] (Definition 2.2), but it is denoted by \ and called the "under" operation there. In fact, trees in sage have their root at the top, contrary to the trees in [LR0102066] which are growing upwards. For this reason, the names of the over and under operations are swapped, in order to keep a graphical meaning. (Our notation follows that of section 4.5 of [HNT2005].)

See also

under()

EXAMPLES:

Showing only the nodes of a binary tree, here is an example for the over operation:

```
|   o        __o__        _o_          |
|  / \  /  /     \  =  /   \           |
| o   o  o        o   o     o          |
|          \     /           \         |
|           o   o           __o__      |
|                          /     \     |
|                         o       o    |
|                          \     /     |
|                           o   o      |
```

A Sage example:

```
sage: b1 = BinaryTree([[],[[],[]]])
sage: b2 = BinaryTree([[None, []],[]])
sage: ascii_art((b1, b2, b1/b2))
(   _o_     ,   _o_  ,   _o_            )
(  /   \       /   \    /   \           )
( o     o     o     o  o     o_         )
(      / \     \             /  \        )
(     o   o     o           o    o       )
(                                \      )
(                               _o_     )
(                              /   \    )
(                             o     o   )
(                              \       )
(                               o      )
```

```
>>> from sage.all import *
>>> b1 = BinaryTree([[],[[],[]]])
>>> b2 = BinaryTree([[None, []],[]])
>>> ascii_art((b1, b2, b1/b2))
(   _o_     ,   _o_  ,   _o_            )
(  /   \       /   \    /   \           )
( o     o     o     o  o     o_         )
(      / \     \             /  \        )
(     o   o     o           o    o       )
(                                \      )
(                               _o_     )
(                              /   \    )
```

(continues on next page)

(continued from previous page)

```
(                                o      o )
(                                 \       )
(                                  o      )
```

over_decomposition()

Return the unique maximal decomposition as an over product.

This means that the tree is cut along all edges of its rightmost path.

Beware that the factors are ordered starting from the root.

See also

comb(), *under_decomposition()*

EXAMPLES:

```
sage: g = BinaryTree([])
sage: r = g.over(g); r
[., [., .]]
sage: l = g.under(g); l
[[., .], .]
sage: r.over_decomposition()
[[., .], [., .]]
sage: l.over_decomposition() == [l]
True

sage: x = g.over(l).over(l).over(g).over(g)
sage: ascii_art(x)
 o
                _o_
 /               o     o
     /                 o   o
                               o
sage: x.over_decomposition() == [g,l,l,g,g]
True
```

```
>>> from sage.all import *
>>> g = BinaryTree([])
>>> r = g.over(g); r
[., [., .]]
>>> l = g.under(g); l
[[., .], .]
>>> r.over_decomposition()
[[., .], [., .]]
>>> l.over_decomposition() == [l]
True

>>> x = g.over(l).over(l).over(g).over(g)
>>> ascii_art(x)
 o
                _o_
```

(continues on next page)

(continued from previous page)

```
 /               o     o
     /                 o   o
                               o
>>> x.over_decomposition() == [g,l,l,g,g]
True
```

prune()

Return the binary tree obtained by deleting each leaf of `self`.

The operation of pruning is the left inverse of attaching as many leaves as possible to each node of a binary tree. That is to say, for all binary trees `bt`, we have:

```
bt == bt.to_full().prune()
```

However, it is only a right inverse if and only if `bt` is a full binary tree:

```
bt == bt.prune().to_full()
```

OUTPUT: a binary tree

See also

to_full()

EXAMPLES:

```
sage: bt = BinaryTree([[[None, []], [[], []]], None])
sage: ascii_art(bt)
      o
     /
  __o__
 /     \
o       o
 \     / \
  o   o   o
sage: ascii_art(bt.prune())
    o
   /
  o
 / \
o   o
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[[None, []], [[], []]], None])
>>> ascii_art(bt)
      o
     /
  __o__
 /     \
o       o
 \     / \
  o   o   o
```

(continues on next page)

(continued from previous page)

```
>>> ascii_art(bt.prune())
    o
   /
  o
 / \
o   o
```

We check the relationship with *to_full()*:

```
sage: bt = BinaryTree([[[], [[None, []], []]], [[],[]]])
sage: bt == bt.to_full().prune()
True
sage: bt == bt.prune().to_full()
False

sage: bt = BinaryTree([[[], []], [[], [[], []], []], [[]]])
sage: bt.is_full()
True
sage: bt == bt.prune().to_full()
True
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[[], [[None, []], []]], [[],[]]])
>>> bt == bt.to_full().prune()
True
>>> bt == bt.prune().to_full()
False

>>> bt = BinaryTree([[[], []], [[], [[], []], []], [[]]])
>>> bt.is_full()
True
>>> bt == bt.prune().to_full()
True
```

Pruning the empty tree is again the empty tree:

```
sage: bt = BinaryTree(None)
sage: bt.prune()
.
```

```
>>> from sage.all import *
>>> bt = BinaryTree(None)
>>> bt.prune()
.
```

q_hook_length_fraction(*q=None*, *q_factor=False*)

Compute the `q`-hook length fraction of the binary tree `self`, with an additional "q-factor" if desired.

If T is a (plane) binary tree and q is a polynomial indeterminate over some ring, then the q-hook length fraction $h_q(T)$ of T is defined by

$$h_q(T) = \frac{[|T|]_q!}{\prod_{t \in T} [|T_t|]_q},$$

where the product ranges over all nodes t of T, where T_t denotes the subtree of T consisting of t and its all descendants, and where for every tree S, we denote by $|S|$ the number of nodes of S. While this definition only shows that $h_q(T)$ is a rational function in T, it is in fact easy to show that $h_q(T)$ is actually a polynomial in T, and thus makes sense when any element of a commutative ring is substituted for q. This can also be explicitly seen from the following recursive formula for $h_q(T)$:

$$h_q(T) = \binom{|T|-1}{|T_1|}_q h_q(T_1) h_q(T_2),$$

where T is any nonempty binary tree, and T_1 and T_2 are the two child trees of the root of T, and where $\binom{a}{b}_q$ denotes a q-binomial coefficient.

A variation of the q-hook length fraction is the following "q-hook length fraction with q-factor":

$$f_q(T) = h_q(T) \cdot \prod_{t \in T} q^{|T_{\mathrm{right}(t)}|},$$

where for every node t, we denote by $\mathrm{right}(t)$ the right child of t. This $f_q(T)$ differs from $h_q(T)$ only in a multiplicative factor, which is a power of q.

When $q = 1$, both $f_q(T)$ and $h_q(T)$ equal the number of permutations whose binary search tree (see [HNT2005] for the definition) is T (after dropping the labels). For example, there are 20 permutations which give a binary tree of the following shape:

by the binary search insertion algorithm, in accordance with the fact that this tree satisfies $f_1(T) = 20$.

When q is considered as a polynomial indeterminate, $f_q(T)$ is the generating function for all permutations whose binary search tree is T (after dropping the labels) with respect to the number of inversions (i. e., the Coxeter length) of the permutations.

Objects similar to $h_q(T)$ also make sense for general ordered forests (rather than just binary trees), see e. g. [BW1988], Theorem 9.1.

INPUT:

- `q` – a ring element which is to be substituted as q into the q-hook length fraction (by default, this is set to be the indeterminate q in the polynomial ring $\mathbf{Z}[q]$)
- `q_factor` – a Boolean (default: `False`); which determines whether to compute $h_q(T)$ or to compute $f_q(T)$ (namely, $h_q(T)$ is obtained when `q_factor == False`, and $f_q(T)$ is obtained when `q_factor == True`)

EXAMPLES:

Let us start with a simple example. Actually, let us start with the easiest possible example – the binary tree with only one vertex (which is a leaf):

```
sage: b = BinaryTree()
sage: b.q_hook_length_fraction()                                    #␣
↪needs sage.combinat
1
sage: b.q_hook_length_fraction(q_factor=True)                       #␣
↪needs sage.combinat
1
```

```
>>> from sage.all import *
>>> b = BinaryTree()
>>> b.q_hook_length_fraction()                                                #␣
↪needs sage.combinat
1
>>> b.q_hook_length_fraction(q_factor=True)                                   #␣
↪needs sage.combinat
1
```

Nothing different for a tree with one node and two leaves:

```
sage: b = BinaryTree([]); b
[., .]
sage: b.q_hook_length_fraction()                                             #␣
↪needs sage.combinat
1
sage: b.q_hook_length_fraction(q_factor=True)                                #␣
↪needs sage.combinat
1
```

```
>>> from sage.all import *
>>> b = BinaryTree([]); b
[., .]
>>> b.q_hook_length_fraction()                                               #␣
↪needs sage.combinat
1
>>> b.q_hook_length_fraction(q_factor=True)                                  #␣
↪needs sage.combinat
1
```

Let us get to a more interesting tree:

```
sage: # needs sage.combinat
sage: b = BinaryTree([[[],[]],[[],None]]); b
[[[., .], [., .]], [[., .], .]]
sage: b.q_hook_length_fraction()(q=1)
20
sage: b.q_hook_length_fraction()
q^7 + 2*q^6 + 3*q^5 + 4*q^4 + 4*q^3 + 3*q^2 + 2*q + 1
sage: b.q_hook_length_fraction(q_factor=True)
q^10 + 2*q^9 + 3*q^8 + 4*q^7 + 4*q^6 + 3*q^5 + 2*q^4 + q^3
sage: b.q_hook_length_fraction(q=2)
465
sage: b.q_hook_length_fraction(q=2, q_factor=True)
3720
sage: q = PolynomialRing(ZZ, 'q').gen()
sage: b.q_hook_length_fraction(q=q**2)
q^14 + 2*q^12 + 3*q^10 + 4*q^8 + 4*q^6 + 3*q^4 + 2*q^2 + 1
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> b = BinaryTree([[[],[]],[[],None]]); b
[[[., .], [., .]], [[., .], .]]
```

(continues on next page)

(continued from previous page)

```
>>> b.q_hook_length_fraction()(q=Integer(1))
20
>>> b.q_hook_length_fraction()
q^7 + 2*q^6 + 3*q^5 + 4*q^4 + 4*q^3 + 3*q^2 + 2*q + 1
>>> b.q_hook_length_fraction(q_factor=True)
q^10 + 2*q^9 + 3*q^8 + 4*q^7 + 4*q^6 + 3*q^5 + 2*q^4 + q^3
>>> b.q_hook_length_fraction(q=Integer(2))
465
>>> b.q_hook_length_fraction(q=Integer(2), q_factor=True)
3720
>>> q = PolynomialRing(ZZ, 'q').gen()
>>> b.q_hook_length_fraction(q=q**Integer(2))
q^14 + 2*q^12 + 3*q^10 + 4*q^8 + 4*q^6 + 3*q^4 + 2*q^2 + 1
```

Let us check the fact that $f_q(T)$ is the generating function for all permutations whose binary search tree is T (after dropping the labels) with respect to the number of inversions of the permutations:

```
sage: def q_hook_length_fraction_2(T):
....:     P = PolynomialRing(ZZ, 'q')
....:     q = P.gen()
....:     res = P.zero()
....:     for w in T.sylvester_class():
....:         res += q ** Permutation(w).length()
....:     return res
sage: def test_genfun(i):
....:     return all( q_hook_length_fraction_2(T)
....:                 == T.q_hook_length_fraction(q_factor=True)
....:                 for T in BinaryTrees(i) )
sage: test_genfun(4)                                                    #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> def q_hook_length_fraction_2(T):
...     P = PolynomialRing(ZZ, 'q')
...     q = P.gen()
...     res = P.zero()
...     for w in T.sylvester_class():
...         res += q ** Permutation(w).length()
...     return res
>>> def test_genfun(i):
...     return all( q_hook_length_fraction_2(T)
...                 == T.q_hook_length_fraction(q_factor=True)
...                 for T in BinaryTrees(i) )
>>> test_genfun(Integer(4))                                             ␣
↪     # needs sage.combinat
True
```

right_rotate()

Return the result of right rotation applied to the binary tree `self`.

Right rotation on binary trees is defined as follows: Let T be a binary tree such that the left child of the root of T is a node. Let C be the right child of the root of T, and let A and B be the left and right children of

the left child of the root of T. (Keep in mind that nodes of trees are identified with the subtrees consisting of their descendants.) Then, the right rotation of T is the binary tree in which the left child of the root is A, whereas the right child of the root is a node whose left and right children are B and C. In pictures:

```
|      *                        *      |
|     / \                      / \     |
|    *   C -right-rotate->  A   *     |
|   / \                         / \    |
|  A   B                       B   C   |
```

where asterisks signify a single node each (but A, B and C might be empty).

For example,

```
|      o                      _o_    |
|     /                      /   \   |
|    o     -right-rotate->   o     o |
|   / \                         /   |
|  o   o                       o    |
<BLANKLINE>
|        __o__                          _o__       |
|       /     \                        /    \      |
|      o       o  -right-rotate->     o     _o_    |
|     / \                            /     /   \   |
|    o   o                          o     o     o  |
|   /     \                               \        |
|  o       o                               o       |
```

Right rotation is the inverse operation to left rotation (*left_rotate()*).

The right rotation operation introduced here is the one defined in Definition 2.1 of [CP2012].

left_rotate()

EXAMPLES:

```
sage: b = BinaryTree([[[],[]], None]); ascii_art([b])
[     o ]
[    /  ]
[   o   ]
[  / \  ]
[ o   o ]
sage: ascii_art([b.right_rotate()])
[   _o_   ]
[  /   \  ]
[ o     o ]
[      /  ]
[     o   ]
sage: b = BinaryTree([[[[],None],[None,[]]], []]); ascii_art([b])
[       __o__    ]
[      /     \   ]
[     o       o  ]
```

(continues on next page)

(continued from previous page)

```
[     / \         ]
[    o   o        ]
[   /     \       ]
[  o       o      ]
sage: ascii_art([b.right_rotate()])
[      _o__       ]
[     /    \      ]
[    o     _o_    ]
[   /     /   \   ]
[  o     o     o  ]
[         \       ]
[          o      ]
```

```
>>> from sage.all import *
>>> b = BinaryTree([[[],[]], None]); ascii_art([b])
[     o ]
[    /  ]
[   o   ]
[  / \  ]
[ o   o ]
>>> ascii_art([b.right_rotate()])
[   _o_   ]
[  /   \  ]
[ o     o ]
[      /  ]
[     o   ]
>>> b = BinaryTree([[[[],None],[None,[]]], []]); ascii_art([b])
[       __o__   ]
[      /     \  ]
[     o       o ]
[    / \        ]
[   o   o       ]
[  /     \      ]
[ o       o     ]
>>> ascii_art([b.right_rotate()])
[      _o__       ]
[     /    \      ]
[    o     _o_    ]
[   /     /   \   ]
[  o     o     o  ]
[         \       ]
[          o      ]
```

show(*with_leaves=False*)

Show the binary tree `show`, with or without leaves depending on the Boolean keyword variable `with_leaves`.

> **Warning**
>
> For a labelled binary tree, the labels shown in the picture are not (in general) the ones given by the labelling!
>
> Use `_latex_`, `view`, `_ascii_art_()` or `pretty_print` for more faithful representations of the data of the tree.

single_edge_cut_shapes()

Return the list of possible single-edge cut shapes for the binary tree.

This is used in *sage.combinat.interval_posets.TamariIntervalPoset.is_new()*.

OUTPUT:

a list of triples (m, i, n) of integers

This is a list running over all inner edges (i.e., edges joining two non-leaf vertices) of the binary tree. The removal of each inner edge defines two binary trees (connected components), the root-tree and the sub-tree. Thus, to every inner edge, we can assign three positive integers: m is the node number of the root-tree R, and n is the node number of the sub-tree S. The integer i is the index of the leaf of R on which S is grafted to obtain the original tree. The leaves of R are numbered starting from 1 (from left to right), hence $1 \leq i \leq m + 1$.

In fact, each of m and n determines the other, as the total node number of R and S is the node number of `self`.

EXAMPLES:

```
sage: BT = BinaryTrees(3)
sage: [t.single_edge_cut_shapes() for t in BT]
[[(2, 3, 1), (1, 2, 2)],
[(2, 2, 1), (1, 2, 2)],
[(2, 1, 1), (2, 3, 1)],
[(2, 2, 1), (1, 1, 2)],
[(2, 1, 1), (1, 1, 2)]]

sage: BT = BinaryTrees(2)
sage: [t.single_edge_cut_shapes() for t in BT]
[[(1, 2, 1)], [(1, 1, 1)]]

sage: BT = BinaryTrees(1)
sage: [t.single_edge_cut_shapes() for t in BT]
[[]]
```

```
>>> from sage.all import *
>>> BT = BinaryTrees(Integer(3))
>>> [t.single_edge_cut_shapes() for t in BT]
[[(2, 3, 1), (1, 2, 2)],
[(2, 2, 1), (1, 2, 2)],
[(2, 1, 1), (2, 3, 1)],
[(2, 2, 1), (1, 1, 2)],
[(2, 1, 1), (1, 1, 2)]]

>>> BT = BinaryTrees(Integer(2))
>>> [t.single_edge_cut_shapes() for t in BT]
[[(1, 2, 1)], [(1, 1, 1)]]

>>> BT = BinaryTrees(Integer(1))
>>> [t.single_edge_cut_shapes() for t in BT]
[[]]
```

sylvester_class(*left_to_right=False*)

Iterate over the sylvester class corresponding to the binary tree `self`.

The sylvester class of a tree T is the set of permutations σ whose right-to-left binary search tree (a notion defined in [HNT2005], Definition 7) is T after forgetting the labels. This is an equivalence class of the sylvester congruence (the congruence on words which holds two words $uacvbw$ and $ucavbw$ congruent whenever a, b, c are letters satisfying $a \leq b < c$, and extends by transitivity) on the symmetric group.

For example the following tree's sylvester class consists of the permutations $(1, 3, 2)$ and $(3, 1, 2)$:

```
[   o   ]
[  / \  ]
[ o   o ]
```

(only the nodes are drawn here).

The right-to-left binary search tree of a word is constructed by an RSK-like insertion algorithm which proceeds as follows: Start with an empty labelled binary tree, and read the word from right to left. Each time a letter is read from the word, insert this letter in the existing tree using binary search tree insertion (*binary_search_insert()*). This is what the *binary_search_tree()* method computes if it is given the keyword `left_to_right=False`.

Here are two more descriptions of the sylvester class of a binary search tree:

- The sylvester class of a binary search tree T is the set of all linear extensions of the poset corresponding to T (that is, of the poset whose Hasse diagram is T, with the root on top), provided that the nodes of T are labelled with $1, 2, \ldots, n$ in a binary-search-tree way (i.e., every left descendant of a node has a label smaller than that of the node, and every right descendant of a node has a label higher than that of the node).
- The sylvester class of a binary search tree T (with vertex labels $1, 2, \ldots, n$) is the interval $[u, v]$ in the right permutohedron order (*permutohedron_lequal()*), where u is the 312-avoiding permutation corresponding to T (*to_312_avoiding_permutation()*), and where v is the 132-avoiding permutation corresponding to T (*to_132_avoiding_permutation()*).

If the optional keyword variable `left_to_right` is set to `True`, then the *left* sylvester class of `self` is returned instead. This is the set of permutations σ whose left-to-right binary search tree (that is, the result of the *binary_search_tree()* with `left_to_right` set to `True`) is `self`. It is an equivalence class of the left sylvester congruence.

Warning

This method yields the elements of the sylvester class as raw lists, not as permutations!

EXAMPLES:

Verifying the claim that the right-to-left binary search trees of the permutations in the sylvester class of a tree t all equal t:

```
sage: def test_bst_of_sc(n, left_to_right):
....:     for t in BinaryTrees(n):
....:         for p in t.sylvester_class(left_to_right=left_to_right):
....:             p_per = Permutation(p)
....:             tree = p_per.binary_search_tree(left_to_right=left_to_right)
....:             if not BinaryTree(tree) == t:
....:                 return False
....:     return True
sage: test_bst_of_sc(4, False)                                          #␣
↪needs sage.combinat
```

(continues on next page)

(continued from previous page)

```
True
sage: test_bst_of_sc(5, False)      # long time                                #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> def test_bst_of_sc(n, left_to_right):
...     for t in BinaryTrees(n):
...         for p in t.sylvester_class(left_to_right=left_to_right):
...             p_per = Permutation(p)
...             tree = p_per.binary_search_tree(left_to_right=left_to_right)
...             if not BinaryTree(tree) == t:
...                 return False
...     return True
>>> test_bst_of_sc(Integer(4), False)                                          ␣
↪     # needs sage.combinat
True
>>> test_bst_of_sc(Integer(5), False)      # long time                         ␣
↪     # needs sage.combinat
True
```

The same with the left-to-right version of binary search:

```
sage: test_bst_of_sc(4, True)                                                 #␣
↪needs sage.combinat
True
sage: test_bst_of_sc(5, True)       # long time                               #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> test_bst_of_sc(Integer(4), True)                                          ␣
↪     # needs sage.combinat
True
>>> test_bst_of_sc(Integer(5), True)       # long time                        ␣
↪     # needs sage.combinat
True
```

Checking that the sylvester class is the set of linear extensions of the poset of the tree:

```
sage: all(sorted(t.canonical_labelling().sylvester_class())                   #␣
↪needs sage.combinat sage.modules
....:       == sorted(list(v)
....:                 for v in t.canonical_labelling().to_poset().linear_
↪extensions())
....:     for t in BinaryTrees(4))
True
```

```
>>> from sage.all import *
>>> all(sorted(t.canonical_labelling().sylvester_class())                     #␣
↪needs sage.combinat sage.modules
...       == sorted(list(v)
```

(continues on next page)

(continued from previous page)

```
...                 for v in t.canonical_labelling().to_poset().linear_
↪extensions())
...     for t in BinaryTrees(Integer(4)))
True
```

tamari_greater()

The list of all trees greater or equal to `self` in the Tamari order.

This is the order filter of the Tamari order generated by `self`.

See *tamari_lequal()* for the definition of the Tamari poset.

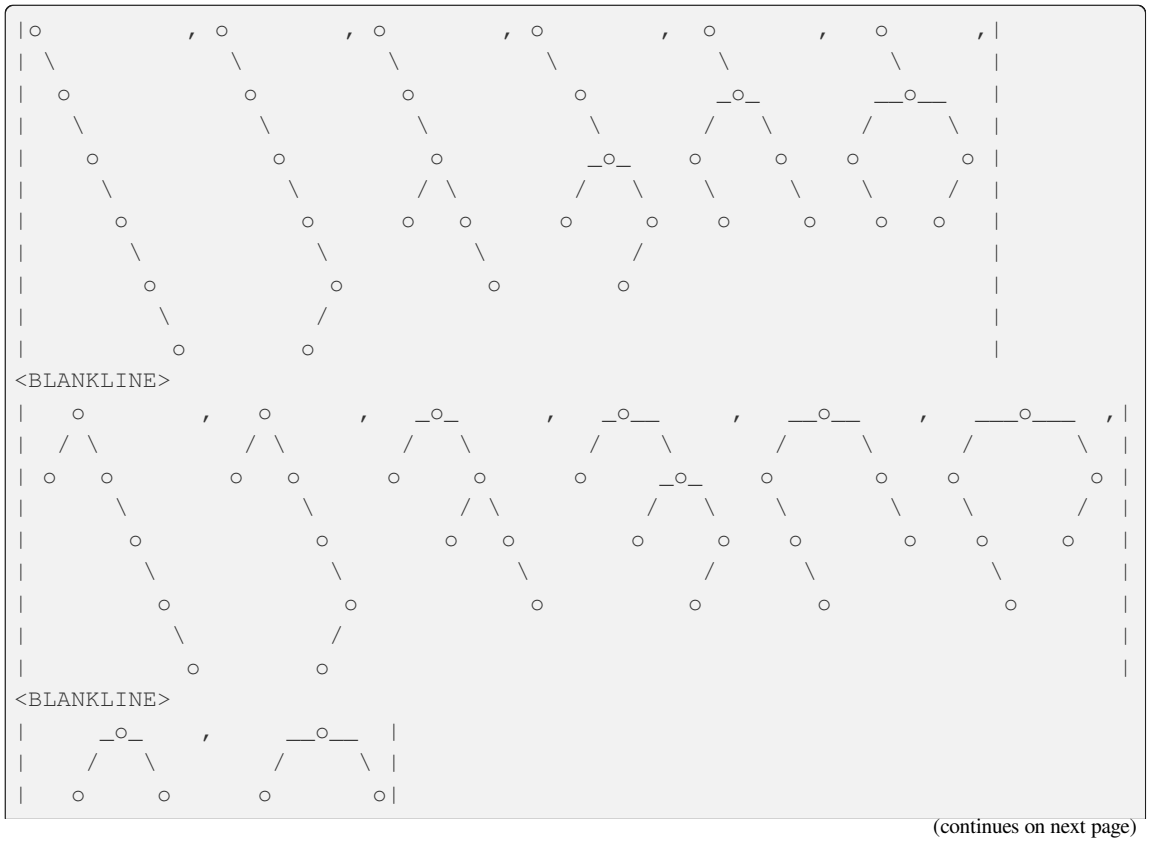
See also

tamari_smaller()

EXAMPLES:

For example, the tree:

has these trees greater or equal to it:



(continues on next page)

(continued from previous page)

```
|  / \     \    / \     / |
| o   o     o  o   o   o  |
```

tamari_interval(*other*)

Return the Tamari interval between `self` and `other` as a *TamariIntervalPoset*.

A "Tamari interval" is an interval in the Tamari poset. See *tamari_lequal()* for the definition of the Tamari poset.

INPUT:

- `other` – a binary tree greater or equal to `self` in the Tamari order

EXAMPLES:

```
sage: bt = BinaryTree([[None, [[], None]], None])
sage: ip = bt.tamari_interval(BinaryTree([None, [[None, []], None]])); ip
The Tamari interval of size 4 induced by relations [(2, 4), (3, 4), (3, 1),␣
↪(2, 1)]
sage: ip.lower_binary_tree()
[[., [[., .], .]], .]
sage: ip.upper_binary_tree()
[., [[., [., .]], .]]
sage: ip.interval_cardinality()
4
sage: ip.number_of_tamari_inversions()
2
sage: list(ip.binary_trees())
[[., [[., [., .]], .]],
 [[., [., [., .]]], .],
 [., [[[., .], .], .]],
 [[., [[., .], .]], .]]
sage: bt.tamari_interval(BinaryTree([[None,[]],[]]))
Traceback (most recent call last):
...
ValueError: the two binary trees are not comparable on the Tamari lattice
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[None, [[], None]], None])
>>> ip = bt.tamari_interval(BinaryTree([None, [[None, []], None]])); ip
The Tamari interval of size 4 induced by relations [(2, 4), (3, 4), (3, 1),␣
↪(2, 1)]
>>> ip.lower_binary_tree()
[[., [[., .], .]], .]
>>> ip.upper_binary_tree()
[., [[., [., .]], .]]
>>> ip.interval_cardinality()
4
>>> ip.number_of_tamari_inversions()
2
>>> list(ip.binary_trees())
[[., [[., [., .]], .]],
 [[., [., [., .]]], .],
 [., [[[., .], .], .]],
```

(continues on next page)

(continued from previous page)

```
 [[., [[., .], .]], .]]
>>> bt.tamari_interval(BinaryTree([[None,[]],[]]))
Traceback (most recent call last):
...
ValueError: the two binary trees are not comparable on the Tamari lattice
```

tamari_join(*other*)

Return the join of the binary trees `self` and `other` (of equal size) in the n-th Tamari poset (where n is the size of these trees).

The n-th Tamari poset (defined in *tamari_lequal()*) is known to be a lattice, and the map from the n-th symmetric group S_n to the n-th Tamari poset defined by sending every permutation $p \in S_n$ to the binary search tree of p (more precisely, to `p.binary_search_tree_shape()`) is a lattice homomorphism. (See Theorem 6.2 in [Rea2004].)

AUTHORS:

Viviane Pons and Darij Grinberg, 18 June 2014; Frédéric Chapoton, 9 January 2018.

EXAMPLES:

```
sage: a = BinaryTree([None, [None, []]])
sage: b = BinaryTree([None, [[], None]])
sage: c = BinaryTree([[None, []], None])
sage: d = BinaryTree([[[], None], None])
sage: e = BinaryTree([[], []])
sage: a.tamari_join(c) == a
True
sage: b.tamari_join(c) == b
True
sage: c.tamari_join(e) == a
True
sage: d.tamari_join(e) == e
True
sage: e.tamari_join(b) == a
True
sage: e.tamari_join(a) == a
True
```

```
>>> from sage.all import *
>>> a = BinaryTree([None, [None, []]])
>>> b = BinaryTree([None, [[], None]])
>>> c = BinaryTree([[None, []], None])
>>> d = BinaryTree([[[], None], None])
>>> e = BinaryTree([[], []])
>>> a.tamari_join(c) == a
True
>>> b.tamari_join(c) == b
```

(continues on next page)

(continued from previous page)

```
True
>>> c.tamari_join(e) == a
True
>>> d.tamari_join(e) == e
True
>>> e.tamari_join(b) == a
True
>>> e.tamari_join(a) == a
True
```

```
sage: b1 = BinaryTree([None, [[], None], None])
sage: b2 = BinaryTree([[], None], []])
sage: b1.tamari_join(b2)
[., [[., .], [., .]]]
sage: b3 = BinaryTree([[], [[], None]])
sage: b1.tamari_join(b3)
[., [., [[., .], .]]]
sage: b2.tamari_join(b3)
[[., .], [., [., .]]]
```

```
>>> from sage.all import *
>>> b1 = BinaryTree([None, [[], None], None])
>>> b2 = BinaryTree([[], None], []])
>>> b1.tamari_join(b2)

↪needs sage.combinat
True
```

Border cases:

```
sage: b = BinaryTree(None)
sage: b.tamari_join(b)
.
sage: b = BinaryTree([])
sage: b.tamari_join(b)
[., .]
```

```
>>> from sage.all import *
>>> b = BinaryTree(None)
>>> b.tamari_join(b)
.
>>> b = BinaryTree([])
>>> b.tamari_join(b)
[., .]
```

tamari_lequal(*t2*)

Return `True` if `self` is less or equal to another binary tree `t2` (of the same size as `self`) in the Tamari order.

The Tamari order on binary trees of size n is the partial order on the set of all binary trees of size n generated by the following requirement: If a binary tree T' is obtained by right rotation (see *right_rotate()*) from a binary tree T, then $T < T'$. This not only is a well-defined partial order, but actually is a lattice structure on the set of binary trees of size n, and is a quotient of the weak order on the n-th symmetric group (also known as the right permutohedron order, see *permutohedron_lequal()*). See [CP2012]. The set of binary trees of size n equipped with the Tamari order is called the n-th Tamari poset.

The Tamari order can equivalently be defined as follows:

If T and S are two binary trees of size n, then the following four statements are equivalent:

- We have $T \leq S$ in the Tamari order.
- There exist elements t and s of the Sylvester classes (*sylvester_class()*) of T and S, respectively, such that $t \leq s$ in the weak order on the symmetric group.
- The 132-avoiding permutation corresponding to T (see *to_132_avoiding_permutation()*) is $\leq$ to the 132-avoiding permutation corresponding to S in the weak order on the symmetric group.
- The 312-avoiding permutation corresponding to T (see *to_312_avoiding_permutation()*) is $\leq$ to the 312-avoiding permutation corresponding to S in the weak order on the symmetric group.

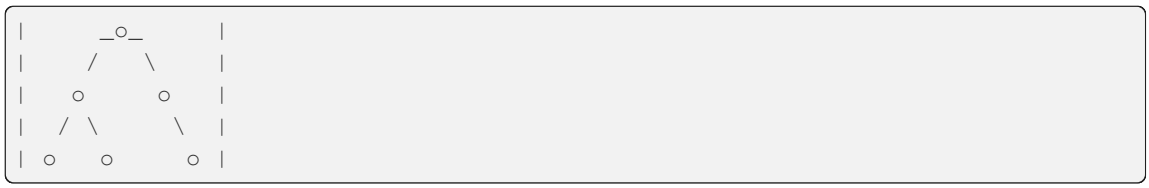
See also

tamari_smaller(), *tamari_greater()*, *tamari_pred()*, *tamari_succ()*, *tamari_interval()*

EXAMPLES:

This tree:

is Tamari-$\leq$ to the following tree:



Checking this:

```
sage: b = BinaryTree([[[[], []], None], [[]])
sage: c = BinaryTree([[[],[]],[None,[[]]])
sage: b.tamari_lequal(c)
True
```

```
>>> from sage.all import *
>>> b = BinaryTree([[[[], []], None], [[]])
>>> c = BinaryTree([[[],[]],[None,[[]]])
>>> b.tamari_lequal(c)
True
```

tamari_meet(*other*, *side='right'*)

Return the meet of the binary trees `self` and `other` (of equal size) in the n-th Tamari poset (where n is the size of these trees).

The n-th Tamari poset (defined in *tamari_lequal()*) is known to be a lattice, and the map from the n-th symmetric group S_n to the n-th Tamari poset defined by sending every permutation $p \in S_n$ to the binary

search tree of p (more precisely, to `p.binary_search_tree_shape()`) is a lattice homomorphism. (See Theorem 6.2 in [Rea2004].)

>>> a = BinaryTree([None, [None, []]])
>>> b = BinaryTree([None, [[], None]])
>>> c = BinaryTree([[None, []], None])
>>> d = BinaryTree([[[], None], None])
>>> e = BinaryTree([[], []])
>>> a.tamari_meet(c) == c
True
>>> b.tamari_meet(c) == c
True
>>> c.tamari_meet(e) == d
True
>>> d.tamari_meet(e) == d
True
>>> e.tamari_meet(b) == d
True
>>> e.tamari_meet(a) == e
True
```

```
sage: b1 = BinaryTree([None, [[], None], None])
sage: b2 = BinaryTree([[], None], []])
sage: b1.tamari_meet(b2)
```

(continues on next page)

(continued from previous page)

```
[[[[., .], .], .], .]
sage: b3 = BinaryTree([[], [[], None]])
sage: b1.tamari_meet(b3)
[[[[., .], .], .], .]
sage: b2.tamari_meet(b3)
[[[[., .], .], .], .]
```

```
>>> from sage.all import *
>>> b1 = BinaryTree([None, [[[], None], None]])
>>> b2 = BinaryTree([[[], None], []])
>>> b1.tamari_meet(b2)
[[[[., .], .], .], .]
>>> b3 = BinaryTree([[], [[], None]])
>>> b1.tamari_meet(b3)
[[[[., .], .], .], .]
>>> b2.tamari_meet(b3)
[[[[., .], .], .], .]
```

The universal property of the meet operation is satisfied:

```
sage: def test_uni_meet(p, q):
....:     m = p.tamari_meet(q)
....:     if not m.tamari_lequal(p):
....:         return False
....:     if not m.tamari_lequal(q):
....:         return False
....:     for r in p.tamari_smaller():
....:         if r.tamari_lequal(q) and not r.tamari_lequal(m):
....:             return False
....:     return True
sage: all( test_uni_meet(p, q) for p in BinaryTrees(3) for q in␣
↪BinaryTrees(3) )

↪needs sage.combinat
True
```

Border cases:

```
sage: b = BinaryTree(None)
sage: b.tamari_meet(b)
.
sage: b = BinaryTree([])
sage: b.tamari_meet(b)
[., .]
```

```
>>> from sage.all import *
>>> b = BinaryTree(None)
>>> b.tamari_meet(b)
.
>>> b = BinaryTree([])
>>> b.tamari_meet(b)
[., .]
```

tamari_pred()

Compute the list of predecessors of `self` in the Tamari poset.

This list is computed by performing all left rotates possible on its nodes.

See *tamari_lequal()* for the definition of the Tamari poset.

EXAMPLES:

For this tree:

```
|      __o__    |
|     /     \   |
|    o       o  |
|   / \     /   |
|  o   o   o    |
```

the list is:

```
|         o ,        _o_    |
|        /          /   \   |
|      _o_         o     o  |
|     /   \       /     /   |
|    o     o     o     o    |
|   / \         /            |
|  o   o       o             |
```

tamari_smaller()

The list of all trees smaller or equal to `self` in the Tamari order.

This is the order ideal of the Tamari order generated by `self`.

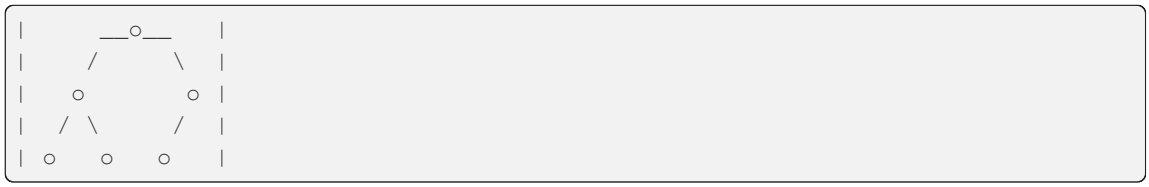
See *tamari_lequal()* for the definition of the Tamari poset.

See also

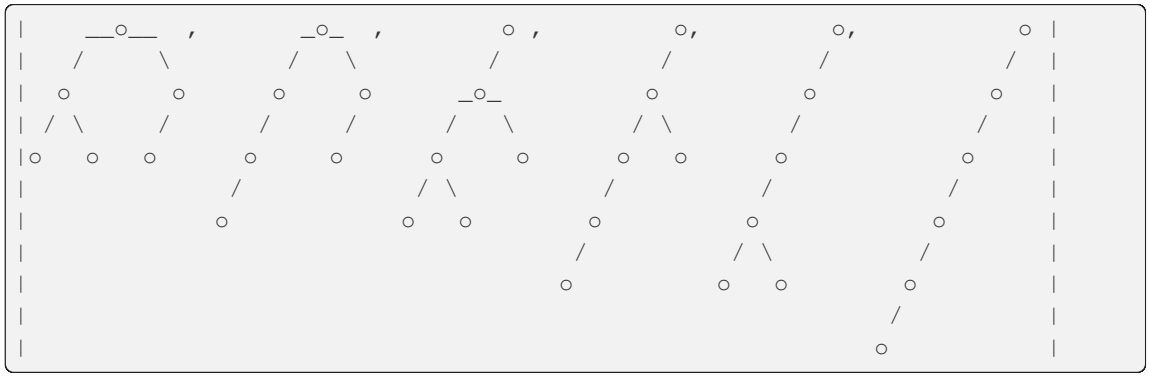
tamari_greater()

EXAMPLES:

The tree:



has these trees smaller or equal to it:



tamari_sorting_tuple(*reverse=False*)

Return the Tamari sorting tuple of `self` and the size of `self`.

This is a pair (w, n), where n is the number of nodes of `self`, and w is an n-tuple whose i-th entry is the number of all nodes among the descendants of the right child of the i-th node of `self`. Here, the nodes of `self` are numbered from left to right.

INPUT:

- `reverse` – boolean (default: `False`); if `True`, return instead the result for the left-right symmetric of the binary tree

OUTPUT:

a pair (w, n), where w is a tuple of integers, and n the size

Two binary trees of the same size are comparable in the Tamari order if and only if the associated tuples w are componentwise comparable. (This is essentially the Theorem in [HT1972].) This is used in *tamari_lequal()*.

EXAMPLES:

```
sage: [t.tamari_sorting_tuple() for t in BinaryTrees(3)]
[((2, 1, 0), 3),
 ((2, 0, 0), 3),
 ((0, 1, 0), 3),
 ((1, 0, 0), 3),
 ((0, 0, 0), 3)]

sage: t = BinaryTrees(10).random_element()                                  #␣
↪needs sage.combinat
sage: u = t.left_right_symmetry()                                           #␣
↪needs sage.combinat
sage: t.tamari_sorting_tuple(True) == u.tamari_sorting_tuple()              #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> [t.tamari_sorting_tuple() for t in BinaryTrees(Integer(3))]
[((2, 1, 0), 3),
 ((2, 0, 0), 3),
 ((0, 1, 0), 3),
 ((1, 0, 0), 3),
 ((0, 0, 0), 3)]

>>> t = BinaryTrees(Integer(10)).random_element()                           ␣
↪     # needs sage.combinat
>>> u = t.left_right_symmetry()                                           #␣
↪needs sage.combinat
>>> t.tamari_sorting_tuple(True) == u.tamari_sorting_tuple()              #␣
↪needs sage.combinat
True
```

REFERENCES:

- [HT1972]

tamari_succ()

Compute the list of successors of `self` in the Tamari poset.

This is the list of all trees obtained by a right rotate of one of its nodes.

See *tamari_lequal()* for the definition of the Tamari poset.

EXAMPLES:

The list of successors of:

```
|      __o__    |
|     /     \   |
|    o       o  |
|   / \     /   |
|  o   o   o    |
```

is:

```
|   _o__      ,    ___o___   ,      _o_      |
|  /    \         /       \       /   \     |
```

(continues on next page)

(continued from previous page)

```
| o     _o_    o          o    o     o   |
|      /   \    \        /    / \     \  |
|     o     o    o      o    o   o     o |
|          /      \                      |
|         o        o                     |
```

to_132_avoiding_permutation()

Return a 132-avoiding permutation corresponding to the binary tree.

The linear extensions of a binary tree form an interval of the weak order called the sylvester class of the tree. This permutation is the maximal element of this sylvester class.

EXAMPLES:

```
sage: bt = BinaryTree([[],[]])
sage: bt.to_132_avoiding_permutation()
[3, 1, 2]
sage: bt = BinaryTree([[[], [[], None]], [[], []]])
sage: bt.to_132_avoiding_permutation()
[8, 6, 7, 3, 4, 1, 2, 5]
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[],[]])
>>> bt.to_132_avoiding_permutation()
[3, 1, 2]
>>> bt = BinaryTree([[[], [[], None]], [[], []]])
>>> bt.to_132_avoiding_permutation()
[8, 6, 7, 3, 4, 1, 2, 5]
```

to_312_avoiding_permutation()

Return a 312-avoiding permutation corresponding to the binary tree.

The linear extensions of a binary tree form an interval of the weak order called the sylvester class of the tree. This permutation is the minimal element of this sylvester class.

EXAMPLES:

```
sage: bt = BinaryTree([[],[]])
sage: bt.to_312_avoiding_permutation()
[1, 3, 2]
sage: bt = BinaryTree([[[], [[], None]], [[], []]])
sage: bt.to_312_avoiding_permutation()
[1, 3, 4, 2, 6, 8, 7, 5]
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[],[]])
>>> bt.to_312_avoiding_permutation()
[1, 3, 2]
>>> bt = BinaryTree([[[], [[], None]], [[], []]])
>>> bt.to_312_avoiding_permutation()
[1, 3, 4, 2, 6, 8, 7, 5]
```

to_dyck_word(*usemap='1L0R'*)

Return the Dyck word associated with `self` using the given map.

INPUT:

- `usemap` – string; either `'1L0R'`, `'1R0L'`, `'L1R0'`, `'R1L0'`

The bijection is defined recursively as follows:

- a leaf is associated to the empty Dyck Word
- a tree with children l, r is associated with the Dyck word described by `usemap` where L and R are respectively the Dyck words associated with the trees l and r.

EXAMPLES:

```
sage: # needs sage.combinat
sage: BinaryTree().to_dyck_word()
[]
sage: BinaryTree([]).to_dyck_word()
[1, 0]
sage: BinaryTree([[[], [[], None]], [[], []]]).to_dyck_word()
[1, 1, 1, 0, 0, 1, 1, 0, 0, 0, 1, 1, 0, 0, 1, 0]
sage: BinaryTree([[None,[]],None]).to_dyck_word()
[1, 1, 0, 1, 0, 0]
sage: BinaryTree([[None,[]],None]).to_dyck_word("1R0L")
[1, 0, 1, 1, 0, 0]
sage: BinaryTree([[None,[]],None]).to_dyck_word("L1R0")
[1, 1, 0, 0, 1, 0]
sage: BinaryTree([[None,[]],None]).to_dyck_word("R1L0")
[1, 1, 0, 1, 0, 0]
sage: BinaryTree([[None,[]],None]).to_dyck_word("R10L")
Traceback (most recent call last):
...
ValueError: R10L is not a correct map
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> BinaryTree().to_dyck_word()
[]
>>> BinaryTree([]).to_dyck_word()
[1, 0]
>>> BinaryTree([[[], [[], None]], [[], []]]).to_dyck_word()
[1, 1, 1, 0, 0, 1, 1, 0, 0, 0, 1, 1, 0, 0, 1, 0]
>>> BinaryTree([[None,[]],None]).to_dyck_word()
[1, 1, 0, 1, 0, 0]
>>> BinaryTree([[None,[]],None]).to_dyck_word("1R0L")
[1, 0, 1, 1, 0, 0]
>>> BinaryTree([[None,[]],None]).to_dyck_word("L1R0")
[1, 1, 0, 0, 1, 0]
>>> BinaryTree([[None,[]],None]).to_dyck_word("R1L0")
[1, 1, 0, 1, 0, 0]
>>> BinaryTree([[None,[]],None]).to_dyck_word("R10L")
Traceback (most recent call last):
...
ValueError: R10L is not a correct map
```

to_dyck_word_tamari()

Return the Dyck word associated with `self` in consistency with the Tamari order on Dyck words and binary

trees.

The bijection is defined recursively as follows:

- a leaf is associated with an empty Dyck word;
- a tree with children l, r is associated with the Dyck word $T(l)1T(r)0$.

EXAMPLES:

```
sage: # needs sage.combinat
sage: BinaryTree().to_dyck_word_tamari()
[]
sage: BinaryTree([]).to_dyck_word_tamari()
[1, 0]
sage: BinaryTree([[None,[]],None]).to_dyck_word_tamari()
[1, 1, 0, 0, 1, 0]
sage: BinaryTree([[[], [[], None]], [[], []]]).to_dyck_word_tamari()
[1, 0, 1, 1, 0, 1, 0, 0, 1, 1, 0, 1, 1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> BinaryTree().to_dyck_word_tamari()
[]
>>> BinaryTree([]).to_dyck_word_tamari()
[1, 0]
>>> BinaryTree([[None,[]],None]).to_dyck_word_tamari()
[1, 1, 0, 0, 1, 0]
>>> BinaryTree([[[], [[], None]], [[], []]]).to_dyck_word_tamari()
[1, 0, 1, 1, 0, 1, 0, 0, 1, 1, 0, 1, 1, 0, 0, 0]
```

to_full()

Return the full binary tree constructed from `self`.

Let T be a binary tree with n nodes. We construct a full binary tree F from T by attaching a leaf to each node of T which does not have 2 children. The resulting tree will have $2n + 1$ nodes.

OUTPUT: a full binary tree. See *is_full()* for the definition of full

See also

prune()

EXAMPLES:

```
sage: bt = BinaryTree([[None,[]],None])
sage: bt.to_full().is_full()
True
sage: ascii_art(bt)
  o
 /
o
 \
  o
sage: ascii_art(bt.to_full())
```

 /   \
o     o
     / \
    o   o

>>> bt = BinaryTree([[],[]])
>>> ascii_art(bt)
  o
 / \
o   o
>>> ascii_art(bt.to_full())
    __o__
   /     \
  o       o
 / \     / \
```

(continues on next page)

(continued from previous page)

```
o   o   o   o

>>> BinaryTree(None).to_full()
[., .]
```

to_ordered_tree_left_branch()

Return an ordered tree of size $n + 1$ by the following recursive rule:

- if x is the left child of y, x becomes the left brother of y
- if x is the right child of y, x becomes the last child of y

EXAMPLES:

```
sage: bt = BinaryTree([[],[]])
sage: bt.to_ordered_tree_left_branch()
[[], [[]]]
sage: bt = BinaryTree([[[], [[], None]], [[], [[]]])
sage: bt.to_ordered_tree_left_branch()
[[], [[], [[]], [[], [[]]]]
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[],[]])
>>> bt.to_ordered_tree_left_branch()
[[], [[]]]
>>> bt = BinaryTree([[[], [[], None]], [[], [[]]])
>>> bt.to_ordered_tree_left_branch()
[[], [[], [[]], [[], [[]]]]
```

to_ordered_tree_right_branch()

Return an ordered tree of size $n + 1$ by the following recursive rule:

- if x is the right child of y, x becomes the right brother of y
- if x is the left child of y, x becomes the first child of y

EXAMPLES:

```
sage: bt = BinaryTree([[],[]])
sage: bt.to_ordered_tree_right_branch()
[[[]], []]
sage: bt = BinaryTree([[[], [[], None]], [[], [[]]])
sage: bt.to_ordered_tree_right_branch()
[[[[]], [[]]], [[]], []]
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[],[]])
>>> bt.to_ordered_tree_right_branch()
[[[]], []]
>>> bt = BinaryTree([[[], [[], None]], [[], [[]]])
>>> bt.to_ordered_tree_right_branch()
[[[[]], [[]]], [[]], []]
```

to_poset(*with_leaves=False*, *root_to_leaf=False*)

Return the poset obtained by interpreting the tree as a Hasse diagram.

The default orientation is from leaves to root but you can pass `root_to_leaf=True` to obtain the inverse orientation.

Leaves are ignored by default, but one can set `with_leaves` to `True` to obtain the poset of the complete tree.

INPUT:

- `with_leaves` – boolean (default: `False`); whether the resulting poset will be formed from the leaves and the nodes of `self` (if `True`), or only from the nodes of `self` (if `False`)
- `root_to_leaf` – boolean (default: `False`); whether the poset orientation should be from root to leaves (if `True`) or from leaves to root (if `False`)

EXAMPLES:

```
sage: bt = BinaryTree([])
sage: bt.to_poset()
Finite poset containing 1 elements
sage: bt.to_poset(with_leaves=True)
Finite poset containing 3 elements
sage: P1 = bt.to_poset(with_leaves=True)
sage: len(P1.maximal_elements())
1
sage: len(P1.minimal_elements())
2
sage: bt = BinaryTree([])
sage: P2 = bt.to_poset(with_leaves=True,root_to_leaf=True)
sage: len(P2.maximal_elements())
2
sage: len(P2.minimal_elements())
1
```

```
>>> from sage.all import *
>>> bt = BinaryTree([])
>>> bt.to_poset()
Finite poset containing 1 elements
>>> bt.to_poset(with_leaves=True)
Finite poset containing 3 elements
>>> P1 = bt.to_poset(with_leaves=True)
>>> len(P1.maximal_elements())
1
>>> len(P1.minimal_elements())
2
>>> bt = BinaryTree([])
>>> P2 = bt.to_poset(with_leaves=True,root_to_leaf=True)
>>> len(P2.maximal_elements())
2
>>> len(P2.minimal_elements())
1
```

If the tree is labelled, we use its labelling to label the poset. Otherwise, we use the poset canonical labelling:

```
sage: bt = BinaryTree([[],[None,[]]]).canonical_labelling()
sage: bt
2[1[., .], 3[., 4[., .]]]
```

(continues on next page)

(continued from previous page)

```
sage: bt.to_poset().cover_relations()
[[4, 3], [3, 2], [1, 2]]
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[],[None,[]]]).canonical_labelling()
>>> bt
2[1[., .], 3[., 4[., .]]]
>>> bt.to_poset().cover_relations()
[[4, 3], [3, 2], [1, 2]]
```

Let us check that the empty binary tree is correctly handled:

```
sage: bt = BinaryTree()
sage: bt.to_poset()
Finite poset containing 0 elements
sage: bt.to_poset(with_leaves=True)
Finite poset containing 1 elements
```

```
>>> from sage.all import *
>>> bt = BinaryTree()
>>> bt.to_poset()
Finite poset containing 0 elements
>>> bt.to_poset(with_leaves=True)
Finite poset containing 1 elements
```

to_tilting()

Transform a binary tree into a tilting object.

Let t be a binary tree with n nodes. There exists a unique depiction of t (above the diagonal) such that all leaves are regularly distributed on the diagonal line from $(0, 0)$ to (n, n) and all edges are either horizontal or vertical. This method provides the coordinates of this depiction, with the root as the top-left vertex.

OUTPUT: list of pairs of integers

Every vertex of the binary tree is mapped to a pair of integers. The conventions are the following. The root has coordinates $(0, n)$ where n is the node number. If a vertex is the left (right) son of another vertex, they share the first (second) coordinate.

EXAMPLES:

```
sage: t = BinaryTrees(1)[0]
sage: t.to_tilting()
[(0, 1)]

sage: for t in BinaryTrees(2):
....:     print(t.to_tilting())
[(1, 2), (0, 2)]
[(0, 1), (0, 2)]

sage: from sage.combinat.abstract_tree import from_hexacode
sage: t = from_hexacode('2020222002000', BinaryTrees())
sage: print(t.to_tilting())
[(0, 1), (2, 3), (4, 5), (6, 7), (4, 7), (8, 9), (10, 11),
 (8, 11), (4, 11), (12, 13), (4, 13), (2, 13), (0, 13)]
```

(continues on next page)

(continued from previous page)

```
sage: w = DyckWord([1,1,1,1,0,1,1,0,0,0,1,1,0,1,0,1,1,0,1,1,0,0,0,0,0,0])    #␣
↪needs sage.combinat
sage: t2 = w.to_binary_tree()                                                 #␣
↪needs sage.combinat
sage: len(t2.to_tilting()) == t2.number_of_nodes()                            #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> t = BinaryTrees(Integer(1))[Integer(0)]
>>> t.to_tilting()
[(0, 1)]

>>> for t in BinaryTrees(Integer(2)):
...     print(t.to_tilting())
[(1, 2), (0, 2)]
[(0, 1), (0, 2)]

>>> from sage.combinat.abstract_tree import from_hexacode
>>> t = from_hexacode('2020222002000', BinaryTrees())
>>> print(t.to_tilting())
[(0, 1), (2, 3), (4, 5), (6, 7), (4, 7), (8, 9), (10, 11),
 (8, 11), (4, 11), (12, 13), (4, 13), (2, 13), (0, 13)]

>>> w = DyckWord([Integer(1),Integer(1),Integer(1),Integer(1),Integer(0),
↪Integer(1),Integer(1),Integer(0),Integer(0),Integer(0),Integer(1),
↪Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),Integer(1),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(0),Integer(0),
↪Integer(0),Integer(0),Integer(0)])    # needs sage.combinat
>>> t2 = w.to_binary_tree()                                                   #␣
↪needs sage.combinat
>>> len(t2.to_tilting()) == t2.number_of_nodes()                              #␣
↪needs sage.combinat
True
```

to_undirected_graph(*with_leaves=False*)

Return the undirected graph obtained from the tree nodes and edges.

Leaves are ignored by default, but one can set `with_leaves` to `True` to obtain the graph of the complete tree.

INPUT:

- `with_leaves` – boolean (default: `False`); whether the resulting graph will be formed from the leaves and the nodes of `self` (if `True`), or only from the nodes of `self` (if `False`)

EXAMPLES:

```
sage: bt = BinaryTree([])
sage: bt.to_undirected_graph()
Graph on 1 vertex
sage: bt.to_undirected_graph(with_leaves=True)
Graph on 3 vertices
```

(continues on next page)

(continued from previous page)

```
sage: bt = BinaryTree()
sage: bt.to_undirected_graph()
Graph on 0 vertices
sage: bt.to_undirected_graph(with_leaves=True)
Graph on 1 vertex
```

```
>>> from sage.all import *
>>> bt = BinaryTree([])
>>> bt.to_undirected_graph()
Graph on 1 vertex
>>> bt.to_undirected_graph(with_leaves=True)
Graph on 3 vertices

>>> bt = BinaryTree()
>>> bt.to_undirected_graph()
Graph on 0 vertices
>>> bt.to_undirected_graph(with_leaves=True)
Graph on 1 vertex
```

If the tree is labelled, we use its labelling to label the graph. Otherwise, we use the graph canonical labelling which means that two different trees can have the same graph.

EXAMPLES:

```
sage: bt = BinaryTree([[],[None,[]]])
sage: bt.canonical_labelling().to_undirected_graph() == bt.to_undirected_
↪graph()
False
sage: BinaryTree([[],[]]).to_undirected_graph() == BinaryTree([[[],None],
↪None]).to_undirected_graph()
True
```

```
>>> from sage.all import *
>>> bt = BinaryTree([[],[None,[]]])
>>> bt.canonical_labelling().to_undirected_graph() == bt.to_undirected_graph()
False
>>> BinaryTree([[],[]]).to_undirected_graph() == BinaryTree([[[],None],None]).
↪to_undirected_graph()
True
```

twisting_number()

Return a pair (number of maximal left branches, number of maximal right branches).

Recalling that a branch of a vertex v is a path from a vertex of the tree to a leaf, a left (resp. right) branch is a branch made only of left (resp. right) edges. The length of a branch is the number of edges composing it. A left (resp. right) branch is maximal if it is not included in a strictly longer left (resp. right) branch.

OUTPUT: list of two integers

EXAMPLES:

```
sage: BT = BinaryTree( '.' )
sage: BT.twisting_number()
```

(continues on next page)

(continued from previous page)

```
[0, 0]

o
>>> BT.twisting_number()
[1, 1]
```

under(*bt*)

Return `self` under `bt`, where "under" is the `under` (\) operation.

If T and T' are two binary trees, then T under T' (written $T \backslash T'$) is defined as the tree obtained by grafting T on the leftmost leaf of T'. More precisely, $T \backslash T'$ is defined by identifying the root of T with the leftmost leaf of T'.

If T' is empty, then $T \backslash T' = T$.

The definition of this "under" operation goes back to Loday-Ronco [LR0102066] (Definition 2.2), but it is denoted by $/$ and called the "over" operation there. In fact, trees in sage have their root at the top, contrary to the trees in [LR0102066] which are growing upwards. For this reason, the names of the over and under operations are swapped, in order to keep a graphical meaning. (Our notation follows that of section 4.5 of [HNT2005].)

See also

over()

EXAMPLES:

Showing only the nodes of a binary tree, here is an example for the under operation:

```
sage: b1 = BinaryTree([[],[]])
sage: b2 = BinaryTree([None,[]])
sage: ascii_art((b1, b2, b1.under(b2)))
(   o  , o  ,     _o_   )
(  / \    \       /   \  )
( o   o    o     o     o )
(              / \       )
(             o   o      )
```

```
>>> from sage.all import *
>>> b1 = BinaryTree([[],[]])
>>> b2 = BinaryTree([None,[]])
>>> ascii_art((b1, b2, b1.under(b2)))
(   o  , o  ,     _o_   )
(  / \    \       /   \  )
( o   o    o     o     o )
(              / \       )
(             o   o      )
```

under_decomposition()

Return the unique maximal decomposition as an under product.

This means that the tree is cut along all edges of its leftmost path.

Beware that the factors are ordered starting from the root.

See also

comb(), *over_decomposition()*

EXAMPLES:

```
sage: g = BinaryTree([])
sage: r = g.over(g); r
[., [., .]]
sage: l = g.under(g); l

>>> x.under_decomposition() == [g,r,g,r]
True
```

class sage.combinat.binary_tree.**BinaryTrees**

Bases: UniqueRepresentation, Parent

Factory for binary trees.

A binary tree is a tree with at most 2 children. The binary trees considered here are also ordered (a.k.a. planar), that is to say, their children are ordered.

A full binary tree is a binary tree with no nodes with 1 child.

INPUT:

- size – integer (optional)
- full – boolean (optional)

OUTPUT:

The set of all (full if full=True) binary trees (of the given size if specified).

See also

BinaryTree, *BinaryTree.is_full()*

EXAMPLES:

```
sage: BinaryTrees()
Binary trees

sage: BinaryTrees(2)
Binary trees of size 2

sage: BinaryTrees(full=True)
Full binary trees

sage: BinaryTrees(3, full=True)
Full binary trees of size 3

sage: BinaryTrees(4, full=True)
Traceback (most recent call last):
...
ValueError: n must be 0 or odd
```

```
>>> from sage.all import *
>>> BinaryTrees()
Binary trees

>>> BinaryTrees(Integer(2))
Binary trees of size 2

>>> BinaryTrees(full=True)
Full binary trees

>>> BinaryTrees(Integer(3), full=True)
Full binary trees of size 3

>>> BinaryTrees(Integer(4), full=True)
Traceback (most recent call last):
...
ValueError: n must be 0 or odd
```

Note

This is a factory class whose constructor returns instances of subclasses.

Note

The fact that BinaryTrees is a class instead of a simple callable is an implementation detail. It could be changed in the future and one should not rely on it.

leaf()

Return a leaf tree with `self` as parent.

EXAMPLES:

```
sage: BinaryTrees().leaf()
.
```

```
>>> from sage.all import *
>>> BinaryTrees().leaf()
.
```

class sage.combinat.binary_tree.**BinaryTrees_all**

Bases: DisjointUnionEnumeratedSets, *BinaryTrees*

Element

alias of *BinaryTree*

labelled_trees()

Return the set of labelled trees associated to `self`.

EXAMPLES:

```
sage: BinaryTrees().labelled_trees()
Labelled binary trees
```

```
>>> from sage.all import *
>>> BinaryTrees().labelled_trees()
Labelled binary trees
```

unlabelled_trees()

Return the set of unlabelled trees associated to `self`.

EXAMPLES:

```
sage: BinaryTrees().unlabelled_trees()
Binary trees
```

```
>>> from sage.all import *
>>> BinaryTrees().unlabelled_trees()
Binary trees
```

class sage.combinat.binary_tree.**BinaryTrees_size**(*size*)

Bases: *BinaryTrees*

The enumerated sets of binary trees of given size.

cardinality()

The cardinality of `self`.

This is a Catalan number.

random_element()

Return a random `BinaryTree` with uniform probability.

This method generates a random `DyckWord` and then uses a bijection between Dyck words and binary trees.

EXAMPLES:

```
sage: BinaryTrees(5).random_element()  # random                              #␣
↪needs sage.combinat
[., [., [., [., [., .]]]]]
sage: BinaryTrees(0).random_element()                                        #␣
↪needs sage.combinat
.
sage: BinaryTrees(1).random_element()                                        #␣
↪needs sage.combinat
[., .]
```

```
>>> from sage.all import *
>>> BinaryTrees(Integer(5)).random_element()  # random                       ␣
↪     # needs sage.combinat
[., [., [., [., [., .]]]]]
>>> BinaryTrees(Integer(0)).random_element()                                 ␣
↪     # needs sage.combinat
.
>>> BinaryTrees(Integer(1)).random_element()                                 ␣
↪     # needs sage.combinat
[., .]
```

class sage.combinat.binary_tree.**FullBinaryTrees_all**

Bases: DisjointUnionEnumeratedSets, *BinaryTrees*

All full binary trees.

class sage.combinat.binary_tree.**FullBinaryTrees_size**(*size*)

Bases: *BinaryTrees*

Full binary trees of a fixed size (number of nodes).

cardinality()

The cardinality of `self`.

This is a Catalan number.

random_element()

Return a random `FullBinaryTree` with uniform probability.

This method generates a random `DyckWord` of size $(s-1)/2$, where s is the size of `self`, which uses a bijection between Dyck words and binary trees to get a binary tree, and convert it to a full binary tree.

EXAMPLES:

```
sage: BinaryTrees(5, full=True).random_element()  # random                  #␣
↪needs sage.combinat
[[], [[], []]]
sage: BinaryTrees(0, full=True).random_element()                             #␣
↪needs sage.combinat
.
sage: BinaryTrees(1, full=True).random_element()                             #␣
↪needs sage.combinat
[., .]
```

```
>>> from sage.all import *
>>> BinaryTrees(Integer(5), full=True).random_element()  # random
↪     # needs sage.combinat
[[], [[], []]]
>>> BinaryTrees(Integer(0), full=True).random_element()
↪     # needs sage.combinat
.
>>> BinaryTrees(Integer(1), full=True).random_element()
↪     # needs sage.combinat
[., .]
```

class sage.combinat.binary_tree.**LabelledBinaryTree**(*parent*, *children*, *label=None*, *check=True*)

Bases: *AbstractLabelledClonableTree*, *BinaryTree*

Labelled binary trees.

A labelled binary tree is a binary tree (see *BinaryTree* for the meaning of this) with a label assigned to each node. The labels need not be integers, nor are they required to be distinct. `None` can be used as a label.

Warning

While it is possible to assign values to leaves (not just nodes) using this class, these labels are disregarded by various methods such as *labels()*, *map_labels()*, and (ironically) *leaf_labels()*.

INPUT:

- `children` – `None` (default) or a list, tuple or iterable of length 2 of labelled binary trees or convertible objects. This corresponds to the standard recursive definition of a labelled binary tree as being either a leaf, or a pair of:
  - a pair of labelled binary trees,
  - and a label.

  (The label is specified in the keyword variable `label`; see below.)

  Syntactic sugar allows leaving out all but the outermost calls of the `LabelledBinaryTree()` constructor, so that, e. g., `LabelledBinaryTree([LabelledBinaryTree(None), LabelledBinaryTree(None)])` can be shortened to `LabelledBinaryTree([None,None])`. However, using this shorthand, it is impossible to label any vertex of the tree other than the root (because there is no way to pass a `label` variable without calling `LabelledBinaryTree` explicitly).

  It is also allowed to abbreviate `[None, None]` by `[]` if one does not want to label the leaves (which one should not do anyway!).
- `label` – (default: `None`) the label to be put on the root of this tree
- `check` – boolean (default: `True`); whether checks should be performed or not

Todo

It is currently not possible to use `LabelledBinaryTree()` as a shorthand for `LabelledBinaryTree(None)` (in analogy to similar syntax in the `BinaryTree` class).

EXAMPLES:

```
sage: LabelledBinaryTree(None)
.
sage: LabelledBinaryTree(None, label='ae')    # not well supported
'ae'
sage: LabelledBinaryTree([])
None[., .]
sage: LabelledBinaryTree([], label=3)    # not well supported
3[., .]
sage: LabelledBinaryTree([None, None])
None[., .]
sage: LabelledBinaryTree([None, None], label=5)
5[., .]
sage: LabelledBinaryTree([None, []])
None[., None[., .]]
sage: LabelledBinaryTree([None, []], label=4)
4[., None[., .]]
sage: LabelledBinaryTree([[], None])
None[None[., .], .]
sage: LabelledBinaryTree("[[], .]", label=False)
False[None[., .], .]
sage: LabelledBinaryTree([None, LabelledBinaryTree([None, None], label=4)],␣
↪label=3)
3[., 4[., .]]
sage: LabelledBinaryTree([None, BinaryTree([None, None])], label=3)
3[., None[., .]]

sage: LabelledBinaryTree([[], None, []])
Traceback (most recent call last):
...
ValueError: this is not a binary tree

sage: LBT = LabelledBinaryTree
sage: t1 = LBT([[LBT([], label=2), None], None], label=4); t1
4[None[2[., .], .], .]
```

```
>>> from sage.all import *
>>> LabelledBinaryTree(None)
.
>>> LabelledBinaryTree(None, label='ae')    # not well supported
'ae'
>>> LabelledBinaryTree([])
None[., .]
>>> LabelledBinaryTree([], label=Integer(3))    # not well supported
3[., .]
>>> LabelledBinaryTree([None, None])
None[., .]
>>> LabelledBinaryTree([None, None], label=Integer(5))
5[., .]
>>> LabelledBinaryTree([None, []])
None[., None[., .]]
>>> LabelledBinaryTree([None, []], label=Integer(4))
4[., None[., .]]
```

(continues on next page)

(continued from previous page)

```
>>> LabelledBinaryTree([[], None])
None[None[., .], .]
>>> LabelledBinaryTree("[[], .]", label=False)
False[None[., .], .]
>>> LabelledBinaryTree([None, LabelledBinaryTree([None, None], label=Integer(4))],
↪ label=Integer(3))
3[., 4[., .]]
>>> LabelledBinaryTree([None, BinaryTree([None, None])], label=Integer(3))
3[., None[., .]]

>>> LabelledBinaryTree([[], None, []])
Traceback (most recent call last):

ValueError: this is not a binary tree

>>> LBT = LabelledBinaryTree
>>> t1 = LBT([[LBT([], label=Integer(2)), None], None], label=Integer(4)); t1
4[None[2[., .], .], .]
```

binary_search_insert(*letter*)

Return the result of inserting a letter `letter` into the right strict binary search tree `self`.

INPUT:

- `letter` – any object comparable with the labels of `self`

OUTPUT:

The right strict binary search tree `self` with `letter` inserted into it according to the binary search insertion algorithm.

Note

`self` is supposed to be a binary search tree. This is not being checked!

A right strict binary search tree is defined to be a labelled binary tree such that for each node n with label x, every descendant of the left child of n has a label $\leq x$, and every descendant of the right child of n has a label $> x$. (Here, only nodes count as descendants, and every node counts as its own descendant too.) Leaves are assumed to have no labels.

Given a right strict binary search tree t and a letter i, the result of inserting i into t (denoted $Ins(i, t)$ in the following) is defined recursively as follows:

- If t is empty, then $Ins(i, t)$ is the tree with one node only, and this node is labelled with i.
- Otherwise, let j be the label of the root of t. If $i > j$, then $Ins(i, t)$ is obtained by replacing the right child of t by $Ins(i, r)$ in t, where r denotes the right child of t. If $i \leq j$, then $Ins(i, t)$ is obtained by replacing the left child of t by $Ins(i, l)$ in t, where l denotes the left child of t.

See, for example, [HNT2005] for properties of this algorithm.

Warning

If t is nonempty, then inserting i into t does not change the root label of t. Hence, as opposed to algorithms like Robinson-Schensted-Knuth, binary search tree insertion involves no bumping.

EXAMPLES:

The example from Fig. 2 of [HNT2005]:

```
sage: LBT = LabelledBinaryTree
sage: x = LBT(None)
sage: x
.
sage: x = x.binary_search_insert("b"); x
b[., .]
sage: x = x.binary_search_insert("d"); x
b[., d[., .]]
sage: x = x.binary_search_insert("e"); x
b[., d[., e[., .]]]
sage: x = x.binary_search_insert("a"); x
b[a[., .], d[., e[., .]]]
sage: x = x.binary_search_insert("b"); x
b[a[., b[., .]], d[., e[., .]]]
sage: x = x.binary_search_insert("d"); x
b[a[., b[., .]], d[d[., .], e[., .]]]
sage: x = x.binary_search_insert("a"); x
b[a[a[., .], b[., .]], d[d[., .], e[., .]]]
sage: x = x.binary_search_insert("c"); x
b[a[a[., .], b[., .]], d[d[c[., .], .], e[., .]]]
```

```
>>> from sage.all import *
>>> LBT = LabelledBinaryTree
>>> x = LBT(None)
>>> x
.
>>> x = x.binary_search_insert("b"); x
b[., .]
>>> x = x.binary_search_insert("d"); x
b[., d[., .]]
>>> x = x.binary_search_insert("e"); x
b[., d[., e[., .]]]
>>> x = x.binary_search_insert("a"); x
b[a[., .], d[., e[., .]]]
>>> x = x.binary_search_insert("b"); x
b[a[., b[., .]], d[., e[., .]]]
>>> x = x.binary_search_insert("d"); x
b[a[., b[., .]], d[d[., .], e[., .]]]
>>> x = x.binary_search_insert("a"); x
b[a[a[., .], b[., .]], d[d[., .], e[., .]]]
>>> x = x.binary_search_insert("c"); x
b[a[a[., .], b[., .]], d[d[c[., .], .], e[., .]]]
```

Other examples:

```
sage: LBT = LabelledBinaryTree
sage: LBT(None).binary_search_insert(3)
3[., .]
sage: LBT([], label = 1).binary_search_insert(3)
1[., 3[., .]]
sage: LBT([], label = 3).binary_search_insert(1)
3[1[., .], .]
sage: res = LBT(None)
sage: for i in [3,1,5,2,4,6]:
....:     res = res.binary_search_insert(i)
sage: res
3[1[., 2[., .]], 5[4[., .], 6[., .]]]
```

```
>>> from sage.all import *
>>> LBT = LabelledBinaryTree
>>> LBT(None).binary_search_insert(Integer(3))
3[., .]
>>> LBT([], label = Integer(1)).binary_search_insert(Integer(3))
1[., 3[., .]]
>>> LBT([], label = Integer(3)).binary_search_insert(Integer(1))
3[1[., .], .]
>>> res = LBT(None)
>>> for i in [Integer(3),Integer(1),Integer(5),Integer(2),Integer(4),
↪Integer(6)]:
...     res = res.binary_search_insert(i)
>>> res
3[1[., 2[., .]], 5[4[., .], 6[., .]]]
```

heap_insert(*l*)

Return the result of inserting a letter `l` into the binary heap (tree) `self`.

A binary heap is a labelled complete binary tree such that for each node, the label at the node is greater or equal to the label of each of its child nodes. (More precisely, this is called a max-heap.)

For example:

```
|     _7_   |
|    /   \  |
|   5     6 |
|  / \      |
| 3   4     |
```

is a binary heap.

See Wikipedia article Binary_heap#Insert for a description of how to insert a letter into a binary heap. The result is another binary heap.

INPUT:

- `letter` – any object comparable with the labels of `self`

Note

`self` is assumed to be a binary heap (tree). No check is performed.

left_rotate()

Return the result of left rotation applied to the labelled binary tree `self`.

Left rotation on labelled binary trees is defined as follows: Let T be a labelled binary tree such that the right child of the root of T is a node. Let A be the left child of the root of T, and let B and C be the left and right children of the right child of the root of T. (Keep in mind that nodes of trees are identified with the subtrees consisting of their descendants.) Furthermore, let x be the label at the root of T, and y be the label at the right child of the root of T. Then, the left rotation of T is the labelled binary tree in which the root is labelled y, the right child of the root is C, whereas the left child of the root is a node labelled x whose left and right children are A and B. In pictures:

```
|     y                    x      |
|    / \                  / \     |
|   x   C <-left-rotate- A   y    |
|  / \                      / \   |
| A   B                    B   C  |
```

Left rotation is the inverse operation to right rotation (*right_rotate()*).

right_rotate()

Return the result of right rotation applied to the labelled binary tree `self`.

Right rotation on labelled binary trees is defined as follows: Let T be a labelled binary tree such that the left child of the root of T is a node. Let C be the right child of the root of T, and let A and B be the left and right children of the left child of the root of T. (Keep in mind that nodes of trees are identified with the subtrees consisting of their descendants.) Furthermore, let y be the label at the root of T, and x be the label at the left child of the root of T. Then, the right rotation of T is the labelled binary tree in which the root is labelled x, the left child of the root is A, whereas the right child of the root is a node labelled y whose left and right children are B and C. In pictures:

```
|     y                      x      |
|    / \                    / \     |
|   x   C -right-rotate->  A   y    |
|  / \                        / \   |
| A   B                      B   C  |
```

Right rotation is the inverse operation to left rotation (*left_rotate()*).

semistandard_insert(*letter*)

Return the result of inserting a letter `letter` into the semistandard tree `self` using the bumping algorithm.

INPUT:

- `letter` – any object comparable with the labels of `self`

OUTPUT:

The semistandard tree `self` with `letter` inserted into it according to the bumping algorithm.

Note

`self` is supposed to be a semistandard tree. This is not being checked!

A semistandard tree is defined to be a labelled binary tree such that for each node n with label x, every descendant of the left child of n has a label $> x$, and every descendant of the right child of n has a label $\geq x$. (Here, only nodes count as descendants, and every node counts as its own descendant too.) Leaves are assumed to have no labels.

Given a semistandard tree t and a letter i, the result of inserting i into t (denoted $Ins(i, t)$ in the following) is defined recursively as follows:

- If t is empty, then $Ins(i, t)$ is the tree with one node only, and this node is labelled with i.
- Otherwise, let j be the label of the root of t. If $i \geq j$, then $Ins(i, t)$ is obtained by replacing the right child of t by $Ins(i, r)$ in t, where r denotes the right child of t. If $i < j$, then $Ins(i, t)$ is obtained by replacing the label at the root of t by i, and replacing the left child of t by $Ins(j, l)$ in t, where l denotes the left child of t.

This algorithm is similar to the Robinson-Schensted-Knuth insertion algorithm for semistandard Young tableaux.

AUTHORS:

- Darij Grinberg (10 Nov 2013).

EXAMPLES:

```
sage: LBT = LabelledBinaryTree
sage: x = LBT(None)
sage: x
.
sage: x = x.semistandard_insert("b"); x
b[., .]
sage: x = x.semistandard_insert("d"); x
b[., d[., .]]
sage: x = x.semistandard_insert("e"); x
b[., d[., e[., .]]]
sage: x = x.semistandard_insert("a"); x
a[b[., .], d[., e[., .]]]
sage: x = x.semistandard_insert("b"); x
a[b[., .], b[d[., .], e[., .]]]
sage: x = x.semistandard_insert("d"); x
a[b[., .], b[d[., .], d[e[., .], .]]]
sage: x = x.semistandard_insert("a"); x
a[b[., .], a[b[d[., .], .], d[e[., .], .]]]
sage: x = x.semistandard_insert("c"); x
a[b[., .], a[b[d[., .], .], c[d[e[., .], .], .]]]
```

```
>>> from sage.all import *
>>> LBT = LabelledBinaryTree
>>> x = LBT(None)
>>> x
.
>>> x = x.semistandard_insert("b"); x
b[., .]
>>> x = x.semistandard_insert("d"); x
b[., d[., .]]
>>> x = x.semistandard_insert("e"); x
b[., d[., e[., .]]]
>>> x = x.semistandard_insert("a"); x
a[b[., .], d[., e[., .]]]
>>> x = x.semistandard_insert("b"); x
a[b[., .], b[d[., .], e[., .]]]
>>> x = x.semistandard_insert("d"); x
```

(continues on next page)

(continued from previous page)

```
a[b[., .], b[d[., .], d[e[., .], .]]]
>>> x = x.semistandard_insert("a"); x
a[b[., .], a[b[d[., .], .], d[e[., .], .]]]
>>> x = x.semistandard_insert("c"); x
a[b[., .], a[b[d[., .], .], c[d[e[., .], .], .]]]
```

Other examples:

```
sage: LBT = LabelledBinaryTree
sage: LBT(None).semistandard_insert(3)
3[., .]
sage: LBT([], label = 1).semistandard_insert(3)
1[., 3[., .]]
sage: LBT([], label = 3).semistandard_insert(1)
1[3[., .], .]
sage: res = LBT(None)
sage: for i in [3,1,5,2,4,6]:
....:     res = res.semistandard_insert(i)
sage: res
1[3[., .], 2[5[., .], 4[., 6[., .]]]]
```

```
>>> from sage.all import *
>>> LBT = LabelledBinaryTree
>>> LBT(None).semistandard_insert(Integer(3))
3[., .]
>>> LBT([], label = Integer(1)).semistandard_insert(Integer(3))
1[., 3[., .]]
>>> LBT([], label = Integer(3)).semistandard_insert(Integer(1))
1[3[., .], .]
>>> res = LBT(None)
>>> for i in [Integer(3),Integer(1),Integer(5),Integer(2),Integer(4),
↪Integer(6)]:
...     res = res.semistandard_insert(i)
>>> res
1[3[., .], 2[5[., .], 4[., 6[., .]]]]
```

class sage.combinat.binary_tree.**LabelledBinaryTrees**(*category=None*)

Bases: *LabelledOrderedTrees*

This is a parent stub to serve as a factory class for trees with various labels constraints.

Element

alias of *LabelledBinaryTree*

labelled_trees()

Return the set of labelled trees associated to `self`.

EXAMPLES:

```
sage: LabelledBinaryTrees().labelled_trees()
Labelled binary trees
```

```
>>> from sage.all import *
>>> LabelledBinaryTrees().labelled_trees()
Labelled binary trees
```

unlabelled_trees()

Return the set of unlabelled trees associated to `self`.

EXAMPLES:

```
sage: LabelledBinaryTrees().unlabelled_trees()
Binary trees
```

```
>>> from sage.all import *
>>> LabelledBinaryTrees().unlabelled_trees()
Binary trees
```

This is used to compute the shape:

```
sage: t = LabelledBinaryTrees().an_element().shape(); t
[[[., .], [., .]], [[., .], [., .]]]
sage: t.parent()
Binary trees
```

```
>>> from sage.all import *
>>> t = LabelledBinaryTrees().an_element().shape(); t
[[[., .], [., .]], [[., .], [., .]]]
>>> t.parent()
Binary trees
```

sage.combinat.binary_tree.**binary_search_tree_shape**(*w*, *left_to_right=True*)

Direct computation of the binary search tree shape of a list of integers.

INPUT:

- `w` – list of integers
- `left_to_right` – boolean (default: `True`)

OUTPUT: a non labelled binary tree

This is used under the same name as a method for permutations.

EXAMPLES:

```
sage: from sage.combinat.binary_tree import binary_search_tree_shape
sage: binary_search_tree_shape([1,4,3,2])
[., [[[., .], .], .]]
sage: binary_search_tree_shape([5,1,3,2])
[[., [[., .], .]], .]
```

```
>>> from sage.all import *
>>> from sage.combinat.binary_tree import binary_search_tree_shape
>>> binary_search_tree_shape([Integer(1),Integer(4),Integer(3),Integer(2)])
[., [[[., .], .], .]]
>>> binary_search_tree_shape([Integer(5),Integer(1),Integer(3),Integer(2)])
[[., [[., .], .]], .]
```

By passing the option `left_to_right=False` one can have the insertion going from right to left:

```
sage: binary_search_tree_shape([1,6,4,2], False)
[[., .], [., [., .]]]
```

```
>>> from sage.all import *
>>> binary_search_tree_shape([Integer(1),Integer(6),Integer(4),Integer(2)], False)
[[., .], [., [., .]]]
```

sage.combinat.binary_tree.**from_tamari_sorting_tuple**(*key*)

Return a binary tree from its Tamari-sorting tuple.

See *tamari_sorting_tuple()*

INPUT:

- `key` – tuple of integers

EXAMPLES:

```
sage: from sage.combinat.binary_tree import from_tamari_sorting_tuple
sage: t = BinaryTrees(60).random_element()                                  #␣
↪needs sage.combinat
sage: from_tamari_sorting_tuple(t.tamari_sorting_tuple()[0]) == t           #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> from sage.combinat.binary_tree import from_tamari_sorting_tuple
>>> t = BinaryTrees(Integer(60)).random_element()                            ␣
↪     # needs sage.combinat
>>> from_tamari_sorting_tuple(t.tamari_sorting_tuple()[Integer(0)]) == t     ␣
↪     # needs sage.combinat
True
```

Blob algebras

AUTHORS:

- Travis Scrimshaw (2020-05-16): Initial version

class sage.combinat.blob_algebra.**BlobAlgebra**(*k*, *q1*, *q2*, *q3*, *base_ring*, *prefix*)

Bases: *CombinatorialFreeModule*

The blob algebra.

The *blob algebra* (also known as the Temperley-Lieb algebra of type B in [ILZ2018], but is a quotient of the Temperley-Lieb algebra of type B defined in [Graham1985]) is a diagram-type algebra introduced in [MS1994] whose basis consists of *Temperley-Lieb diagrams*, noncrossing perfect matchings, that may contain blobs on strands that can be deformed so that the blob touches the left side (which we can think of as a frozen pole).

The form we give here has 3 parameters, the natural one from the *Temperley-Lieb algebra*, one for the idempotent relation, and one for a loop with a blob.

INPUT:

- `k` – the order
- `q1` – the loop parameter

- `q2` – the idempotent parameter
- `q3` – the blob loop parameter

EXAMPLES:

```
sage: R.<q,r,s> = ZZ[]
sage: B4 = algebras.Blob(4, q, r, s)
sage: B = sorted(B4.basis())
sage: B[14]
B({{-4, -3}}, {{-2, -1}, {1, 2}, {3, 4}})
sage: B[40]
B({{3, 4}}, {{-4, -3}, {-2, -1}, {1, 2}})
sage: B[14] * B[40]
q*r*s*B({}, {{-4, -3}, {-2, -1}, {1, 2}, {3, 4}})
```

```
>>> from sage.all import *
>>> R = ZZ['q, r, s']; (q, r, s,) = R._first_ngens(3)
>>> B4 = algebras.Blob(Integer(4), q, r, s)
>>> B = sorted(B4.basis())
>>> B[Integer(14)]
B({{-4, -3}}, {{-2, -1}, {1, 2}, {3, 4}})
>>> B[Integer(40)]
B({{3, 4}}, {{-4, -3}, {-2, -1}, {1, 2}})
>>> B[Integer(14)] * B[Integer(40)]
q*r*s*B({}, {{-4, -3}, {-2, -1}, {1, 2}, {3, 4}})
```

REFERENCES:

- [MS1994]
- [ILZ2018]

one_basis()

Return the index of the basis element 1.

EXAMPLES:

```
sage: R.<q,r,s> = ZZ[]
sage: B4 = algebras.Blob(4, q, r, s)
sage: B4.one_basis()
({}, {{-4, 4}, {-3, 3}, {-2, 2}, {-1, 1}})
```

```
>>> from sage.all import *
>>> R = ZZ['q, r, s']; (q, r, s,) = R._first_ngens(3)
>>> B4 = algebras.Blob(Integer(4), q, r, s)
>>> B4.one_basis()
({}, {{-4, 4}, {-3, 3}, {-2, 2}, {-1, 1}})
```

order()

Return the order of `self`.

The order of a partition algebra is defined as half of the number of nodes in the diagrams.

EXAMPLES:

```
sage: R.<q,r,s> = ZZ[]
sage: B4 = algebras.Blob(4, q, r, s)
sage: B4.order()
4
```

```
>>> from sage.all import *
>>> R = ZZ['q, r, s']; (q, r, s,) = R._first_ngens(3)
>>> B4 = algebras.Blob(Integer(4), q, r, s)
>>> B4.order()
4
```

product_on_basis(*top*, *bot*)

Return the product of the basis elements indexed by `top` and `bot`.

EXAMPLES:

```
sage: R.<q,r,s> = ZZ[]
sage: B4 = algebras.Blob(4, q, r, s)
sage: B = B4.basis()
sage: BD = sorted(B.keys())
sage: BD[14]
({{-4, -3}}, {{-2, -1}, {1, 2}, {3, 4}})
sage: BD[40]
({{3, 4}}, {{-4, -3}, {-2, -1}, {1, 2}})
sage: B4.product_on_basis(BD[14], BD[40])
q*r*s*B({}, {{-4, -3}, {-2, -1}, {1, 2}, {3, 4}})
sage: all(len((x*y).support()) == 1 for x in B for y in B)
True
```

```
>>> from sage.all import *
>>> R = ZZ['q, r, s']; (q, r, s,) = R._first_ngens(3)
>>> B4 = algebras.Blob(Integer(4), q, r, s)
>>> B = B4.basis()
>>> BD = sorted(B.keys())
>>> BD[Integer(14)]
({{-4, -3}}, {{-2, -1}, {1, 2}, {3, 4}})
>>> BD[Integer(40)]
({{3, 4}}, {{-4, -3}, {-2, -1}, {1, 2}})
>>> B4.product_on_basis(BD[Integer(14)], BD[Integer(40)])
q*r*s*B({}, {{-4, -3}, {-2, -1}, {1, 2}, {3, 4}})
>>> all(len((x*y).support()) == Integer(1) for x in B for y in B)
True
```

class sage.combinat.blob_algebra.**BlobDiagram**(*parent*, *marked*, *unmarked*)

Bases: `Element`

A blob diagram.

A blob diagram consists of a perfect matching of the set $\{1, \ldots, n\} \sqcup \{-1, \ldots, -n\}$ such that the result is a noncrossing matching (a *Temperley-Lieb diagram*), divided into two sets of pairs: one for the pairs with blobs and one for those without. The blobed pairs must either be either the leftmost propagating strand or to the left of it and not nested.

temperley_lieb_diagram()

Return the Temperley-Lieb diagram corresponding to `self`.

EXAMPLES:

```
sage: from sage.combinat.blob_algebra import BlobDiagrams
sage: BD4 = BlobDiagrams(4)
sage: B = BD4([[1,-3]], [[2,-4], [3,4], [-1,-2]])
sage: B.temperley_lieb_diagram()
{{-4, 2}, {-3, 1}, {-2, -1}, {3, 4}}
```

```
>>> from sage.all import *
>>> from sage.combinat.blob_algebra import BlobDiagrams
>>> BD4 = BlobDiagrams(Integer(4))
>>> B = BD4([[Integer(1),-Integer(3)]], [[Integer(2),-Integer(4)],␣
↪[Integer(3),Integer(4)], [-Integer(1),-Integer(2)]])
>>> B.temperley_lieb_diagram()
{{-4, 2}, {-3, 1}, {-2, -1}, {3, 4}}
```

class sage.combinat.blob_algebra.**BlobDiagrams**(*n*)

Bases: Parent, UniqueRepresentation

The set of all blob diagrams.

Element

alias of *BlobDiagram*

base_set()

Return the base set of `self`.

EXAMPLES:

```
sage: from sage.combinat.blob_algebra import BlobDiagrams
sage: BD4 = BlobDiagrams(4)
sage: sorted(BD4.base_set())
[-4, -3, -2, -1, 1, 2, 3, 4]
```

```
>>> from sage.all import *
>>> from sage.combinat.blob_algebra import BlobDiagrams
>>> BD4 = BlobDiagrams(Integer(4))
>>> sorted(BD4.base_set())
[-4, -3, -2, -1, 1, 2, 3, 4]
```

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: from sage.combinat.blob_algebra import BlobDiagrams
sage: BD4 = BlobDiagrams(4)
sage: BD4.cardinality()
70
```

```
>>> from sage.all import *
>>> from sage.combinat.blob_algebra import BlobDiagrams
>>> BD4 = BlobDiagrams(Integer(4))
>>> BD4.cardinality()
70
```

order()

Return the order of `self`.

EXAMPLES:

```
sage: from sage.combinat.blob_algebra import BlobDiagrams
sage: BD4 = BlobDiagrams(4)
sage: BD4.order()
4
```

```
>>> from sage.all import *
>>> from sage.combinat.blob_algebra import BlobDiagrams
>>> BD4 = BlobDiagrams(Integer(4))
>>> BD4.order()
4
```

Boundedness of k-Regular Sequences

This module contains a collection of algorithms to check for boundedness. This is done - based on eigenvalues and - by the criterion presented in [MS1977a].

Various

sage.combinat.regular_sequence_bounded.**construct_phi**(*matrices*)

Return the set $\phi(S)$ as defined in [MS1977a].

INPUT:

- `matrices` – a list of non-negative square matrices in the same dimension

OUTPUT:

A list of matrices.

EXAMPLES:

```
sage: from sage.combinat.regular_sequence_bounded import construct_phi
sage: L = [Matrix([[2, 2], [1, 3]]), Matrix([[0, 2], [1, 1]])]
sage: construct_phi(L)
[
[2 2]  [2 2]  [0 2]
[2 2], [1 2], [1 1]
]
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence_bounded import construct_phi
>>> L = [Matrix([[Integer(2), Integer(2)], [Integer(1), Integer(3)]]),␣
↪Matrix([[Integer(0), Integer(2)], [Integer(1), Integer(1)]])]
>>> construct_phi(L)
[
[2 2]  [2 2]  [0 2]
[2 2], [1 2], [1 1]
]
```

```
sage: L = [Matrix([[42, 1, 0], [5, 0, 1], [0, 0, 1]]), Matrix([[0, 1, 1],
....: [4, 1, 1], [1, 2, 2]]), Matrix([[5, 1, 1], [1, 7, 1], [0, 1, 32]])]
sage: construct_phi(L)
[
[2 2 1]  [1 2 2]  [2 2 2]  [2 2 2]  [2 2 2]  [2 2 2]  [2 0 2]  [2 2 2]
[2 2 1]  [2 2 2]  [2 2 2]  [2 2 2]  [2 2 2]  [2 2 2]  [2 2 2]  [2 1 2]
[0 0 1], [2 2 2], [2 2 2], [0 1 2], [2 0 2], [0 0 1], [2 1 2], [2 1 2],

[2 1 2]  [2 2 2]  [2 2 2]  [2 2 2]  [2 1 1]  [2 2 2]  [0 1 1]  [2 1 0]
[2 2 2]  [1 2 2]  [2 2 2]  [2 2 2]  [1 2 1]  [2 1 2]  [2 1 1]  [2 0 1]
[2 2 2], [1 2 2], [1 2 2], [2 1 2], [0 1 2], [2 0 2], [1 2 2], [0 0 1]
]
```

```
>>> from sage.all import *
>>> L = [Matrix([[Integer(42), Integer(1), Integer(0)], [Integer(5), Integer(0),␣
↪Integer(1)], [Integer(0), Integer(0), Integer(1)]]), Matrix([[Integer(0),␣
↪Integer(1), Integer(1)],
... [Integer(4), Integer(1), Integer(1)], [Integer(1), Integer(2), Integer(2)]]),␣
↪Matrix([[Integer(5), Integer(1), Integer(1)], [Integer(1), Integer(7),␣
↪Integer(1)], [Integer(0), Integer(1), Integer(32)]])]
>>> construct_phi(L)
[
[2 2 1]  [1 2 2]  [2 2 2]  [2 2 2]  [2 2 2]  [2 2 2]  [2 0 2]  [2 2 2]
[2 2 1]  [2 2 2]  [2 2 2]  [2 2 2]  [2 2 2]  [2 2 2]  [2 2 2]  [2 1 2]
[0 0 1], [2 2 2], [2 2 2], [0 1 2], [2 0 2], [0 0 1], [2 1 2], [2 1 2],
<BLANKLINE>
[2 1 2]  [2 2 2]  [2 2 2]  [2 2 2]  [2 1 1]  [2 2 2]  [0 1 1]  [2 1 0]
[2 2 2]  [1 2 2]  [2 2 2]  [2 2 2]  [1 2 1]  [2 1 2]  [2 1 1]  [2 0 1]
[2 2 2], [1 2 2], [1 2 2], [2 1 2], [0 1 2], [2 0 2], [1 2 2], [0 0 1]
]
```

sage.combinat.regular_sequence_bounded.**has_bounded_matrix_powers**(*matrices*)

Return whether M^n is bounded for $n \to \infty$ for all M in `matrices`.

INPUT:

- `matrices` – a list of square matrices

ALGORITHM:

Eigenvalues are used for the check.

EXAMPLES:

Maximum of the absolute value of the eigenvalues $= 1$, algebraic multiplicity equals geometric multiplicity for all eigenvalues with absolute value $= 1$:

```
sage: from sage.combinat.regular_sequence_bounded import has_bounded_matrix_powers
sage: matrices = [Matrix([[-1, 1, 1], [-1, 1, 1], [1, -1, 1]]),
....:             Matrix([[-1, 1, 1], [-1, 0, 0], [1, 1, 1]])]
sage: has_bounded_matrix_powers(matrices)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence_bounded import has_bounded_matrix_powers
>>> matrices = [Matrix([[-Integer(1), Integer(1), Integer(1)], [-Integer(1),␣
↪Integer(1), Integer(1)], [Integer(1), -Integer(1), Integer(1)]]),
...              Matrix([[-Integer(1), Integer(1), Integer(1)], [-Integer(1),␣
↪Integer(0), Integer(0)], [Integer(1), Integer(1), Integer(1)]])]
>>> has_bounded_matrix_powers(matrices)
True
```

Maximum of the absolute value of the eigenvalues > 1:

```
sage: matrices = [Matrix([[1, 1], [1/2, -1]])]
sage: has_bounded_matrix_powers(matrices)
False
```

```
>>> from sage.all import *
>>> matrices = [Matrix([[Integer(1), Integer(1)], [Integer(1)/Integer(2), -
↪Integer(1)]])]
>>> has_bounded_matrix_powers(matrices)
False
```

Maximum of the absolute value of the eigenvalues $= 1$, algebraic and geometric multiplicities different for eigenvalue 1:

```
sage: matrices = [Matrix([[1,1],[0,1]])]
sage: has_bounded_matrix_powers(matrices)
False
```

```
>>> from sage.all import *
>>> matrices = [Matrix([[Integer(1),Integer(1)],[Integer(0),Integer(1)]])]
>>> has_bounded_matrix_powers(matrices)
False
```

Maximum of the absolute value of the eigenvalues < 1:

```
sage: matrices = [Matrix([[1, -1], [1/2, -1]])]
sage: has_bounded_matrix_powers(matrices)
True
```

```
>>> from sage.all import *
>>> matrices = [Matrix([[Integer(1), -Integer(1)], [Integer(1)/Integer(2), -
↪Integer(1)]])]
>>> has_bounded_matrix_powers(matrices)
True
```

sage.combinat.regular_sequence_bounded.**is_bounded_via_mandel_simon_algorithm**(*matrices*)

Return whether the semigroup generated whether the semigroup of all possible products of `matrices` is finite/bounded.

INPUT:

- `matrices` – a list of non-negative square matrices in the same dimension

OUTPUT:

A boolean.

ALGORITHM:

A criterion based on [MS1977a] is used here.

EXAMPLES:

```
sage: from sage.combinat.regular_sequence_bounded import is_bounded_via_mandel_
↪simon_algorithm
sage: J = [Matrix([[1, 0, 1], [0, 1, 1], [0, 0, 0]])]
sage: is_bounded_via_mandel_simon_algorithm(J)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence_bounded import is_bounded_via_mandel_
↪simon_algorithm
>>> J = [Matrix([[Integer(1), Integer(0), Integer(1)], [Integer(0), Integer(1),␣
↪Integer(1)], [Integer(0), Integer(0), Integer(0)]])]
>>> is_bounded_via_mandel_simon_algorithm(J)
True
```

```
sage: from sage.combinat.regular_sequence_bounded import is_bounded_via_mandel_
↪simon_algorithm
sage: K = [Matrix([[1, 1], [1, 1]])]
sage: is_bounded_via_mandel_simon_algorithm(K)
False
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence_bounded import is_bounded_via_mandel_
↪simon_algorithm
>>> K = [Matrix([[Integer(1), Integer(1)], [Integer(1), Integer(1)]])]
>>> is_bounded_via_mandel_simon_algorithm(K)
False
```

```
sage: L = [Matrix([[1, 0], [0, 1]]), Matrix([[1, 0], [0, 0]])]
sage: is_bounded_via_mandel_simon_algorithm(L)
True
```

```
>>> from sage.all import *
>>> L = [Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(0)]])]
>>> is_bounded_via_mandel_simon_algorithm(L)
True
```

```
sage: M = [Matrix([[1, 0], [0, 2]]), Matrix([[1, 0], [0, 0]])]
sage: is_bounded_via_mandel_simon_algorithm(M)
False
```

```
>>> from sage.all import *
>>> M = [Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(2)]]),␣
↪Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(0)]])]
>>> is_bounded_via_mandel_simon_algorithm(M)
False
```

Non-integer-valued input:

```
sage: N = [Matrix([[0.5, 0], [1, 0]])]
sage: is_bounded_via_mandel_simon_algorithm(N)
Traceback (most recent call last):
...
ValueError: not all matrices are integer-valued
```

```
>>> from sage.all import *
>>> N = [Matrix([[RealNumber('0.5'), Integer(0)], [Integer(1), Integer(0)]])]
>>> is_bounded_via_mandel_simon_algorithm(N)
Traceback (most recent call last):
...
ValueError: not all matrices are integer-valued
```

sage.combinat.regular_sequence_bounded.**is_integer_valued**(*matrices*)

Return whether every matrix in `matrices` is integer-valued.

INPUT:

- `matrices` – a list of square matrices in the same dimension

OUTPUT:

A boolean.

EXAMPLES:

```
sage: from sage.combinat.regular_sequence_bounded import is_integer_valued
sage: matrices = [Matrix([[1, 2], [-1, 0]]), Matrix([[42, -42], [0, 0]])]
sage: is_integer_valued(matrices)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence_bounded import is_integer_valued
>>> matrices = [Matrix([[Integer(1), Integer(2)], [-Integer(1), Integer(0)]]),␣
↪Matrix([[Integer(42), -Integer(42)], [Integer(0), Integer(0)]])]
>>> is_integer_valued(matrices)
True
```

```
sage: matrices = [Matrix([[1, pi], [-1, 0]])]
sage: is_integer_valued(matrices)
False
```

```
>>> from sage.all import *
>>> matrices = [Matrix([[Integer(1), pi], [-Integer(1), Integer(0)]])]
>>> is_integer_valued(matrices)
False
```

```
sage: matrices = [Matrix([[1, 1/2], [2/4, 0]])]
sage: is_integer_valued(matrices)
False
```

```
>>> from sage.all import *
>>> matrices = [Matrix([[Integer(1), Integer(1)/Integer(2)], [Integer(2)/
↪Integer(4), Integer(0)]])]
>>> is_integer_valued(matrices)
False
```

```
sage: matrices = [Matrix([[1, 4/2], [-1, 0]])]
sage: is_integer_valued(matrices)
True
```

```
>>> from sage.all import *
>>> matrices = [Matrix([[Integer(1), Integer(4)/Integer(2)], [-Integer(1),␣
↪Integer(0)]])]
>>> is_integer_valued(matrices)
True
```

sage.combinat.regular_sequence_bounded.**is_non_negative**(*matrices*)

Return whether every matrix in `matrices` is non-negative.

INPUT:

- `matrices` – a list of square matrices in the same dimension

OUTPUT:

A boolean.

EXAMPLES:

```
sage: from sage.combinat.regular_sequence_bounded import is_non_negative
sage: matrices = [Matrix([[1, 2], [1, 0]]), Matrix([[42, -42], [0, 0]])]
sage: is_non_negative(matrices)
False
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence_bounded import is_non_negative
>>> matrices = [Matrix([[Integer(1), Integer(2)], [Integer(1), Integer(0)]]),␣
↪Matrix([[Integer(42), -Integer(42)], [Integer(0), Integer(0)]])]
>>> is_non_negative(matrices)
False
```

```
sage: matrices = [Matrix([[0]])]
sage: is_non_negative(matrices)
True
```

```
>>> from sage.all import *
>>> matrices = [Matrix([[Integer(0)]])]
>>> is_non_negative(matrices)
True
```

```
sage: matrices = [Matrix([[1, 1/2], [2/4, 0]])]
sage: is_non_negative(matrices)
True
```

```
>>> from sage.all import *
>>> matrices = [Matrix([[Integer(1), Integer(1)/Integer(2)], [Integer(2)/
↪Integer(4), Integer(0)]])]
>>> is_non_negative(matrices)
True
```

sage.combinat.regular_sequence_bounded.**make_positive**(*matrices*)

Return a list of non-negative matrices

INPUT:

- `matrices` – a list of matrices where every matrix is either non-negative or non-positive.

OUTPUT:

A list of matrices containing every non-negative matrix of `matrices`, and $-M$ if M is a non-positive matrix of `matrices`.

EXAMPLES:

```
sage: from sage.combinat.regular_sequence_bounded import make_positive
sage: matrices = [Matrix([[1, 2], [1, 0]]), Matrix([[42, 42], [0, 0]])]
sage: make_positive(matrices)
[
[1 2]  [42 42]
[1 0], [ 0  0]
]
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence_bounded import make_positive
>>> matrices = [Matrix([[Integer(1), Integer(2)], [Integer(1), Integer(0)]]),␣
↪Matrix([[Integer(42), Integer(42)], [Integer(0), Integer(0)]])]
>>> make_positive(matrices)
[
[1 2]  [42 42]
[1 0], [ 0  0]
]
```

```
sage: matrices = [Matrix([[1, 2], [1, 0]]), Matrix([[-42, -42], [0, 0]])]
sage: make_positive(matrices)
[
[1 2]  [42 42]
[1 0], [ 0  0]
]
```

```
>>> from sage.all import *
>>> matrices = [Matrix([[Integer(1), Integer(2)], [Integer(1), Integer(0)]]),␣
↪Matrix([[-Integer(42), -Integer(42)], [Integer(0), Integer(0)]])]
>>> make_positive(matrices)
[
[1 2]  [42 42]
[1 0], [ 0  0]
]
```

```
sage: matrices = [Matrix([[1, 2], [1, 0]]), Matrix([[42, -42], [0, 0]])]
sage: make_positive(matrices)
Traceback (most recent call last):
...
ValueError: There is a matrix which is neither non-negative nor non-positive.
```

```
>>> from sage.all import *
>>> matrices = [Matrix([[Integer(1), Integer(2)], [Integer(1), Integer(0)]]),␣
↪Matrix([[Integer(42), -Integer(42)], [Integer(0), Integer(0)]])]
>>> make_positive(matrices)
Traceback (most recent call last):
...
ValueError: There is a matrix which is neither non-negative nor non-positive.
```

sage.combinat.regular_sequence_bounded.**multiply_reduce**(*A*, *B*)

Return the matrix $A \cdot B$ with entries $\min(A \cdot B)_{ij}, 2$.

INPUT:

- `A` – an $m \times n$ matrix
- `B` – an $n \times p$ matrix

OUTPUT:

An $m \times p$ matrix with entries $\min(A \cdot B)_{ij}, 2$.

EXAMPLES:

```
sage: from sage.combinat.regular_sequence_bounded import multiply_reduce
sage: A = Matrix([[2, 0], [0, 2]])
sage: B = Matrix([[-2, 0], [0, 2]])
sage: A*B
[-4  0]
[ 0  4]
sage: multiply_reduce(A, B)
[-4  0]
[ 0  2]
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence_bounded import multiply_reduce
>>> A = Matrix([[Integer(2), Integer(0)], [Integer(0), Integer(2)]])
>>> B = Matrix([[-Integer(2), Integer(0)], [Integer(0), Integer(2)]])
>>> A*B
[-4  0]
[ 0  4]
```

(continues on next page)

(continued from previous page)

```
>>> multiply_reduce(A, B)
[-4  0]
[ 0  2]
```

```
sage: A = Matrix([[1, 2, 3], [-1, -2, -3], [1, 2, 3]])
sage: B = Matrix([[1, 2, 3], [2, 3, 4], [1, 2, 3]])
sage: A*B
[  8  14  20]
[ -8 -14 -20]
[  8  14  20]
sage: multiply_reduce(A, B)
[  2   2   2]
[ -8 -14 -20]
[  2   2   2]
```

```
>>> from sage.all import *
>>> A = Matrix([[Integer(1), Integer(2), Integer(3)], [-Integer(1), -Integer(2), -
↪Integer(3)], [Integer(1), Integer(2), Integer(3)]])
>>> B = Matrix([[Integer(1), Integer(2), Integer(3)], [Integer(2), Integer(3),␣
↪Integer(4)], [Integer(1), Integer(2), Integer(3)]])
>>> A*B
[  8  14  20]
[ -8 -14 -20]
[  8  14  20]
>>> multiply_reduce(A, B)
[  2   2   2]
[ -8 -14 -20]
[  2   2   2]
```

sage.combinat.regular_sequence_bounded.**regular_sequence_is_bounded**(S)

Return whether this k-regular sequence is bounded.

INPUT:

- S – a k-regular sequence

OUTPUT:

A boolean.

EXAMPLES:

Thue–Morse Sequence:

```
sage: from sage.combinat.regular_sequence_bounded import regular_sequence_is_
↪bounded
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: TM = Seq2([Matrix([[1, 0], [0, 1]]), Matrix([[0, 1], [1, 0]])],
....:           left=vector([1, 0]), right=vector([0, 1]))
sage: regular_sequence_is_bounded(TM)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence_bounded import regular_sequence_is_bounded
```

(continues on next page)

(continued from previous page)

```
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> TM = Seq2([Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [Integer(1), Integer(0)]])],
...            left=vector([Integer(1), Integer(0)]), right=vector([Integer(0),␣
↪Integer(1)]))
>>> regular_sequence_is_bounded(TM)
True
```

Binary Sum of Digits:

```
sage: SD = Seq2([Matrix([[1, 0], [0, 1]]), Matrix([[0, -1], [1, 2]])],
....:           left=vector([0, 1]), right=vector([1, 0]))
sage: regular_sequence_is_bounded(SD)
False
```

```
>>> from sage.all import *
>>> SD = Seq2([Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), -Integer(1)], [Integer(1), Integer(2)]])],
...           left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),␣
↪Integer(0)]))
>>> regular_sequence_is_bounded(SD)
False
```

Sequence of All Natural Numbers:

```
sage: N = Seq2([Matrix([[2, 0], [2, 1]]), Matrix([[0, 1], [-2, 3]])],
....:          left=vector([1, 0]), right=vector([0, 1]))
sage: regular_sequence_is_bounded(N)
False
```

```
>>> from sage.all import *
>>> N = Seq2([Matrix([[Integer(2), Integer(0)], [Integer(2), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [-Integer(2), Integer(3)]])],
...          left=vector([Integer(1), Integer(0)]), right=vector([Integer(0),␣
↪Integer(1)]))
>>> regular_sequence_is_bounded(N)
False
```

Indicator Function of Even Integers:

```
sage: E = Seq2([Matrix([[0, 1], [0, 1]]), Matrix([[0, 0], [0, 1]])],
....:          left=vector([1, 0]), right=vector([1, 1]))
sage: regular_sequence_is_bounded(E)
True
```

```
>>> from sage.all import *
>>> E = Seq2([Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(1)]])],
...          left=vector([Integer(1), Integer(0)]), right=vector([Integer(1),␣
↪Integer(1)]))
>>> regular_sequence_is_bounded(E)
True
```

Indicator Function of Odd Integers:

```
sage: O = Seq2([Matrix([[0, 0], [0, 1]]), Matrix([[0, 1], [0, 1]])],
....:          left=vector([1, 0]), right=vector([0, 1]))
sage: regular_sequence_is_bounded(O)
True
```

```
>>> from sage.all import *
>>> O = Seq2([Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]])],
...          left=vector([Integer(1), Integer(0)]), right=vector([Integer(0),␣
↪Integer(1)]))
>>> regular_sequence_is_bounded(O)
True
```

Number of Odd Entries in Pascal's Triangle:

```
sage: U = Seq2([Matrix([[3, 0], [6, 1]]), Matrix([[0, 1], [-6, 5]])],
....:          left=vector([1, 0]), right=vector([0, 1]))
sage: regular_sequence_is_bounded(U)
False
```

```
>>> from sage.all import *
>>> U = Seq2([Matrix([[Integer(3), Integer(0)], [Integer(6), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [-Integer(6), Integer(5)]])],
...          left=vector([Integer(1), Integer(0)]), right=vector([Integer(0),␣
↪Integer(1)]))
>>> regular_sequence_is_bounded(U)
False
```

Counting '10' in the Binary Representation:

```
sage: C = Seq2([Matrix([[0, 1, 0, 0], [0, 0, 0, 1],
....:                   [-1, 0, 1, 1], [0, 0, 0, 1]]),
....:           Matrix([[0, 0, 1, 0], [0, 1, 0, 0],
....:                   [0, 0, 1, 0], [-1, 0, 1, 1]])],
....:                  left=vector([1, 0, 0, 0]),
....:                  right=vector([0, 0, 1, 0]))
sage: regular_sequence_is_bounded(C)
False
```

```
>>> from sage.all import *
>>> C = Seq2([Matrix([[Integer(0), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(0), Integer(0), Integer(0), Integer(1)],
...                   [-Integer(1), Integer(0), Integer(1), Integer(1)],␣
↪[Integer(0), Integer(0), Integer(0), Integer(1)]]),
...            Matrix([[Integer(0), Integer(0), Integer(1), Integer(0)],␣
↪[Integer(0), Integer(1), Integer(0), Integer(0)],
...                    [Integer(0), Integer(0), Integer(1), Integer(0)], [-
↪Integer(1), Integer(0), Integer(1), Integer(1)]])],
...                  left=vector([Integer(1), Integer(0), Integer(0),␣
↪Integer(0)]),
...                  right=vector([Integer(0), Integer(0), Integer(1),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(0)]))
>>> regular_sequence_is_bounded(C)
False
```

Numbers Starting with '10':

```
sage: D = Seq2([Matrix([[0, 1, 0, 0], [0, 0, 1, 0],
....:                   [0, -2, 3, 0], [0, -2, 2, 1]]),
....:           Matrix([[2, 0, 0, 0], [0, 0, 0, 1],
....:                   [0, 2, 0, 1], [0, -2, 0, 3]])],
....:                  left=vector([1, 0, 0, 0]),
....:                  right=vector([2, 2, 2, 5]))
sage: regular_sequence_is_bounded(D)
False
```

```
>>> from sage.all import *
>>> D = Seq2([Matrix([[Integer(0), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(0), Integer(0), Integer(1), Integer(0)],
...                   [Integer(0), -Integer(2), Integer(3), Integer(0)],␣
↪[Integer(0), -Integer(2), Integer(2), Integer(1)]]),
...            Matrix([[Integer(2), Integer(0), Integer(0), Integer(0)],␣
↪[Integer(0), Integer(0), Integer(0), Integer(1)],
...                   [Integer(0), Integer(2), Integer(0), Integer(1)],␣
↪[Integer(0), -Integer(2), Integer(0), Integer(3)]])],
...                  left=vector([Integer(1), Integer(0), Integer(0),␣
↪Integer(0)]),
...                  right=vector([Integer(2), Integer(2), Integer(2),␣
↪Integer(5)]))
>>> regular_sequence_is_bounded(D)
False
```

Signum Function:

```
sage: S = Seq2([Matrix([[1, 0], [0, 1]]), Matrix([[0, 1], [0, 1]])],
....:          left=vector([1, 0]), right=vector([0, 1]))
sage: regular_sequence_is_bounded(S)
True
```

```
>>> from sage.all import *
>>> S = Seq2([Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]])],
...          left=vector([Integer(1), Integer(0)]), right=vector([Integer(0),␣
↪Integer(1)]))
>>> regular_sequence_is_bounded(S)
True
```

Number of Digits from the Right to the First '1':

```
sage: S = Seq2([Matrix([[0, 1, 0], [-1, 2, 0], [0, 0, 1]]),
....:           Matrix([[0, 0, 1], [0, 0, 2], [0, 0, 1]])],
....:          left=vector([1, 0, 0]), right=vector([0, 0, 1]))
sage: regular_sequence_is_bounded(S)
```

(continues on next page)

(continued from previous page)

```
False
```

```
>>> from sage.all import *
>>> S = Seq2([Matrix([[Integer(0), Integer(1), Integer(0)], [-Integer(1),␣
↪Integer(2), Integer(0)], [Integer(0), Integer(0), Integer(1)]]),
...           Matrix([[Integer(0), Integer(0), Integer(1)], [Integer(0),␣
↪Integer(0), Integer(2)], [Integer(0), Integer(0), Integer(1)]])],
...          left=vector([Integer(1), Integer(0), Integer(0)]),␣
↪right=vector([Integer(0), Integer(0), Integer(1)]))
>>> regular_sequence_is_bounded(S)
False
```

Brent Yorgey's fast algorithm for integer vector (multiset) partitions

ALGORITHM:

Brent Yorgey, Generating Multiset Partitions, The Monad Reader, Issue 8, September 2007, p. 5.

https://wiki.haskell.org/The_Monad.Reader/Previous_issues

AUTHORS:

- D. K. Sunko (2020-02-19): initial version
- F. Chapoton (2020-02-22): conversion to iterators and shorter doctests and doc tweaks
- T. Scrimshaw (2020-03-06): Cython optimizations and doc tweaks

`sage.combinat.fast_vector_partitions.`**`fast_vector_partitions`**`(`*v*, *min_vals=None*`)`

Brent Yorgey's fast algorithm for integer vector (multiset) partitions.

INPUT:

- `v` – list of nonnegative integers, understood as the vector to be partitioned
- `min_vals` – (optional) list of nonnegative integers, of same length as `v`

OUTPUT: list of lists, each representing a vector partition of `v`

If `min_vals` is given, only partitions with parts `p >= min_vals` in the lexicographic ordering will appear.

If `min_vals` is given and `len(min_vals) != len(v)`, an error is raised.

EXAMPLES:

The older the computer, the more impressive the comparison:

```
sage: from sage.combinat.fast_vector_partitions import fast_vector_partitions
sage: fastvparts = list(fast_vector_partitions([3, 3, 3]))
sage: vparts = list(VectorPartitions([3, 3, 3]))
sage: vparts == fastvparts[::-1]
True
sage: len(fastvparts)
686
sage: list(fast_vector_partitions([1, 2, 3], min_vals=[0, 1, 1]))
[[[1, 2, 3]],
 [[0, 2, 3], [1, 0, 0]],
 [[0, 2, 2], [1, 0, 1]],
 [[0, 2, 1], [1, 0, 2]],
```

(continues on next page)

(continued from previous page)

```
 [[0, 2, 0], [1, 0, 3]],
 [[0, 1, 3], [1, 1, 0]],
 [[0, 1, 2], [1, 1, 1]],
 [[0, 1, 1], [1, 1, 2]],
 [[0, 1, 1], [0, 1, 2], [1, 0, 0]],
 [[0, 1, 1], [0, 1, 1], [1, 0, 1]]]
sage: L1 = list(fast_vector_partitions([5, 7, 6], min_vals=[1, 3, 2]))
sage: L1 == list(VectorPartitions([5, 7, 6], min=[1, 3, 2]))[::-1]
True
```

```
>>> from sage.all import *
>>> from sage.combinat.fast_vector_partitions import fast_vector_partitions
>>> fastvparts = list(fast_vector_partitions([Integer(3), Integer(3),␣
↪Integer(3)]))
>>> vparts = list(VectorPartitions([Integer(3), Integer(3), Integer(3)]))
>>> vparts == fastvparts[::-Integer(1)]
True
>>> len(fastvparts)
686
>>> list(fast_vector_partitions([Integer(1), Integer(2), Integer(3)], min_
↪vals=[Integer(0), Integer(1), Integer(1)]))
[[[1, 2, 3]],
 [[0, 2, 3], [1, 0, 0]],
 [[0, 2, 2], [1, 0, 1]],
 [[0, 2, 1], [1, 0, 2]],
 [[0, 2, 0], [1, 0, 3]],
 [[0, 1, 3], [1, 1, 0]],
 [[0, 1, 2], [1, 1, 1]],
 [[0, 1, 1], [1, 1, 2]],
 [[0, 1, 1], [0, 1, 2], [1, 0, 0]],
 [[0, 1, 1], [0, 1, 1], [1, 0, 1]]]
>>> L1 = list(fast_vector_partitions([Integer(5), Integer(7), Integer(6)], min_
↪vals=[Integer(1), Integer(3), Integer(2)]))
>>> L1 == list(VectorPartitions([Integer(5), Integer(7), Integer(6)],␣
↪min=[Integer(1), Integer(3), Integer(2)]))[::-Integer(1)]
True
```

Note

The partitions are returned as an iterator.

In this documentation, `a <|= b` means `a[i] <= b[i]` for all `i` (notation following B. Yorgey's paper). It is the monomial partial ordering in Dickson's lemma: `a <|= b` iff `x^a` divides `x^b` as monomials.

Warning

The ordering of the partitions is reversed with respect to the output of Sage class *VectorPartitions*.

`sage.combinat.fast_vector_partitions.`**`recursive_vector_partitions`**`(v, vL)`

Iterate over a lexicographically ordered list of lists, each list representing a vector partition of `v`, such that no part

of any partition is lexicographically smaller than `vL`.

Internal part of *fast_vector_partitions()*.

INPUT:

- `v` – list of nonnegative integers, understood as a vector
- `vL` – list of nonnegative integers, understood as a vector

EXAMPLES:

```
sage: from sage.combinat.fast_vector_partitions import recursive_vector_partitions
sage: list(recursive_vector_partitions([2, 2, 2],[1, 1, 1]))
[[[2, 2, 2]], [[1, 1, 1], [1, 1, 1]]]
sage: list(recursive_vector_partitions([2, 2, 2],[1, 1, 0]))
[[[2, 2, 2]], [[1, 1, 1], [1, 1, 1]], [[1, 1, 0], [1, 1, 2]]]
sage: list(recursive_vector_partitions([2, 2, 2],[1, 0, 1]))
[[[2, 2, 2]],
 [[1, 1, 1], [1, 1, 1]],
 [[1, 1, 0], [1, 1, 2]],
 [[1, 0, 2], [1, 2, 0]],
 [[1, 0, 1], [1, 2, 1]]]
```

```
>>> from sage.all import *
>>> from sage.combinat.fast_vector_partitions import recursive_vector_partitions
>>> list(recursive_vector_partitions([Integer(2), Integer(2), Integer(2)],
↪[Integer(1), Integer(1), Integer(1)]))
[[[2, 2, 2]], [[1, 1, 1], [1, 1, 1]]]
>>> list(recursive_vector_partitions([Integer(2), Integer(2), Integer(2)],
↪[Integer(1), Integer(1), Integer(0)]))
[[[2, 2, 2]], [[1, 1, 1], [1, 1, 1]], [[1, 1, 0], [1, 1, 2]]]
>>> list(recursive_vector_partitions([Integer(2), Integer(2), Integer(2)],
↪[Integer(1), Integer(0), Integer(1)]))
[[[2, 2, 2]],
 [[1, 1, 1], [1, 1, 1]],
 [[1, 1, 0], [1, 1, 2]],
 [[1, 0, 2], [1, 2, 0]],
 [[1, 0, 1], [1, 2, 1]]]
```

sage.combinat.fast_vector_partitions.**recursive_within_from_to**(*m*, *s*, *e*, *useS*, *useE*)

Iterate over a lexicographically ordered list of lists `v` satisfying `e <= v <= s` and `v <|= m` as vectors.

Internal part of *fast_vector_partitions()*.

INPUT:

- `m` – list of nonnegative integers, understood as a vector
- `s` – list of nonnegative integers, understood as a vector
- `e` – list of nonnegative integers, understood as a vector
- `useS` – boolean
- `useE` – boolean

EXAMPLES:

```
sage: from sage.combinat.fast_vector_partitions import recursive_within_from_to
sage: list(recursive_within_from_to([1, 2, 3],[1, 2, 2],[1, 1, 1],True,True))
[[1, 2, 2], [1, 2, 1], [1, 2, 0], [1, 1, 3], [1, 1, 2], [1, 1, 1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.fast_vector_partitions import recursive_within_from_to
>>> list(recursive_within_from_to([Integer(1), Integer(2), Integer(3)],
↪[Integer(1), Integer(2), Integer(2)],[Integer(1), Integer(1), Integer(1)],True,
↪True))
[[1, 2, 2], [1, 2, 1], [1, 2, 0], [1, 1, 3], [1, 1, 2], [1, 1, 1]]
```

Note

The flags `useS` and `useE` are used to implement the condition efficiently. Because testing it loops over the vector, re-testing at each step as the vector is parsed is inefficient: all but the last comparison have been done cumulatively already. This code tests only for the last one, using the flags to accumulate information from previous calls.

Warning

Expects to be called with `s <|= m`.

Expects to be called first with `useS == useE == True`.

`sage.combinat.fast_vector_partitions.`**`within_from_to`**(*m*, *s*, *e*)

Iterate over a lexicographically ordered list of lists `v` satisfying `e <= v <= s` and `v <|= m` as vectors.

Internal part of *`fast_vector_partitions()`*.

INPUT:

- `m` – list of nonnegative integers, understood as a vector
- `s` – list of nonnegative integers, understood as a vector
- `e` – list of nonnegative integers, understood as a vector

EXAMPLES:

```
sage: from sage.combinat.fast_vector_partitions import within_from_to
sage: list(within_from_to([1, 2, 3], [1, 2, 2], [1, 1, 1]))
[[1, 2, 2], [1, 2, 1], [1, 2, 0], [1, 1, 3], [1, 1, 2], [1, 1, 1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.fast_vector_partitions import within_from_to
>>> list(within_from_to([Integer(1), Integer(2), Integer(3)], [Integer(1),␣
↪Integer(2), Integer(2)], [Integer(1), Integer(1), Integer(1)]))
[[1, 2, 2], [1, 2, 1], [1, 2, 0], [1, 1, 3], [1, 1, 2], [1, 1, 1]]
```

Note

The input `s` will be "clipped" internally if it does not satisfy the condition `s <|= m`.

To understand the input check, some line art is helpful. Assume that `(a,b)` are the two least significant coordinates of some vector. Say:

`e = (2,3), s = (7,6), m = (9,8).`

In the figure, these values are denoted by `E`, `S`, and `M`, while the letter `X` stands for all other allowed values of `v = (a,b)`:

```
b ^
  |
8 --------X---X---X---X---X-----------M
  |                                    |
7 -        X   X   X   X   X           |
  |                                    |
6 -        X   X   X   X   X   S       |
  |                                    |
5 -        X   X   X   X   X   X       |
  |                                    |
4 -        X   X   X   X   X   X       |
  |                                    |
3 -        E   X   X   X   X   X       |
  |                                    |
2 -            X   X   X   X   X       |
  |                                    |
1 -            X   X   X   X   X       |
  |                                    |
0 ----|---|---X---X---X---X---X---|---|--->
  0   1   2   3   4   5   6   7   8   9   a
```

If `S` moves horizontally, the full-height columns fill the box in until `S` reaches `M`, at which point it remains the limit in the b-direction as it moves out of the box, while M takes over as the limit in the a-direction, so the `M`-column remains filled only up to `S`, no matter how much `S` moves further to the right.

If `S` moves vertically, its column will be filled to the top of the box, but it remains the relevant limit in the a-direction, while `M` takes over in the b-direction as `S` goes out of the box upwards.

Both behaviors are captured by using the smaller coordinate of `S` and `M`, whenever `S` is outside the box defined by M. The input will be "clipped" accordingly in that case.

Warning

The "clipping" behavior is transparent to the user, but may be puzzling when comparing outputs with the function *recursive_within_from_to()* which has no input protection.

Cartesian products

class sage.combinat.cartesian_product.**CartesianProduct_iters**(**iters*)

Bases: EnumeratedSetFromIterator

Cartesian product of finite sets.

This class will soon be deprecated (see Issue #18411 and Issue #19195). One should instead use the functorial construction `cartesian_product`. The main differences in behavior are:

- construction: `CartesianProduct` takes as many argument as there are factors whereas `cartesian_product` takes a single list (or iterable) of factors;

- representation of elements: elements are represented by plain Python list for `CartesianProduct` versus a custom element class for `cartesian_product`;
- membership testing: because of the above, plain Python lists are not considered as elements of a `cartesian_product`.

All of these is illustrated in the examples below.

EXAMPLES:

```
sage: F1 = ['a', 'b']
sage: F2 = [1, 2, 3, 4]
sage: F3 = Permutations(3)
sage: from sage.combinat.cartesian_product import CartesianProduct_iters
sage: C = CartesianProduct_iters(F1, F2, F3)
sage: c = cartesian_product([F1, F2, F3])

sage: type(C.an_element())
<class 'list'>
sage: type(c.an_element())
<class 'sage.sets.cartesian_product.CartesianProduct_with_category.element_class'>

sage: l = ['a', 1, Permutation([3,2,1])]
sage: l in C
True
sage: l in c
False
sage: elt = c(l)
sage: elt
('a', 1, [3, 2, 1])
sage: elt in c
True
sage: elt.parent() is c
True
```

```
>>> from sage.all import *
>>> F1 = ['a', 'b']
>>> F2 = [Integer(1), Integer(2), Integer(3), Integer(4)]
>>> F3 = Permutations(Integer(3))
>>> from sage.combinat.cartesian_product import CartesianProduct_iters
>>> C = CartesianProduct_iters(F1, F2, F3)
>>> c = cartesian_product([F1, F2, F3])

>>> type(C.an_element())
<class 'list'>
>>> type(c.an_element())
<class 'sage.sets.cartesian_product.CartesianProduct_with_category.element_class'>

>>> l = ['a', Integer(1), Permutation([Integer(3),Integer(2),Integer(1)])]
>>> l in C
True
>>> l in c
False
>>> elt = c(l)
>>> elt
```

(continues on next page)

(continued from previous page)

```
('a', 1, [3, 2, 1])
>>> elt in c
True
>>> elt.parent() is c
True
```

cardinality()

Return the number of elements in the Cartesian product of everything in *iters.

EXAMPLES:

```
sage: from sage.combinat.cartesian_product import CartesianProduct_iters
sage: CartesianProduct_iters(range(2), range(3)).cardinality()
6
sage: CartesianProduct_iters(range(2), range(3)).cardinality()
6
sage: CartesianProduct_iters(range(2), range(3), range(4)).cardinality()
24
```

```
>>> from sage.all import *
>>> from sage.combinat.cartesian_product import CartesianProduct_iters
>>> CartesianProduct_iters(range(Integer(2)), range(Integer(3))).cardinality()
6
>>> CartesianProduct_iters(range(Integer(2)), range(Integer(3))).cardinality()
6
>>> CartesianProduct_iters(range(Integer(2)), range(Integer(3)),␣
↪range(Integer(4))).cardinality()
24
```

This works correctly for infinite objects:

```
sage: CartesianProduct_iters(ZZ, QQ).cardinality()
+Infinity
sage: CartesianProduct_iters(ZZ, []).cardinality()
0
```

```
>>> from sage.all import *
>>> CartesianProduct_iters(ZZ, QQ).cardinality()
+Infinity
>>> CartesianProduct_iters(ZZ, []).cardinality()
0
```

is_finite()

The Cartesian product is finite if all of its inputs are finite, or if any input is empty.

EXAMPLES:

```
sage: from sage.combinat.cartesian_product import CartesianProduct_iters
sage: CartesianProduct_iters(ZZ, []).is_finite()
True
sage: CartesianProduct_iters(4,4).is_finite()
Traceback (most recent call last):
```

(continues on next page)

(continued from previous page)

```
...
ValueError: unable to determine whether this product is finite
```

```
>>> from sage.all import *
>>> from sage.combinat.cartesian_product import CartesianProduct_iters
>>> CartesianProduct_iters(ZZ, []).is_finite()
True
>>> CartesianProduct_iters(Integer(4),Integer(4)).is_finite()
Traceback (most recent call last):
...
ValueError: unable to determine whether this product is finite
```

list()

Return.

EXAMPLES:

```
sage: from sage.combinat.cartesian_product import CartesianProduct_iters
sage: CartesianProduct_iters(range(3), range(3)).list()
[[0, 0], [0, 1], [0, 2], [1, 0], [1, 1], [1, 2], [2, 0], [2, 1], [2, 2]]
sage: CartesianProduct_iters('dog', 'cat').list()
[['d', 'c'],
 ['d', 'a'],
 ['d', 't'],
 ['o', 'c'],
 ['o', 'a'],
 ['o', 't'],
 ['g', 'c'],
 ['g', 'a'],
 ['g', 't']]
```

```
>>> from sage.all import *
>>> from sage.combinat.cartesian_product import CartesianProduct_iters
>>> CartesianProduct_iters(range(Integer(3)), range(Integer(3))).list()
[[0, 0], [0, 1], [0, 2], [1, 0], [1, 1], [1, 2], [2, 0], [2, 1], [2, 2]]
>>> CartesianProduct_iters('dog', 'cat').list()
[['d', 'c'],
 ['d', 'a'],
 ['d', 't'],
 ['o', 'c'],
 ['o', 'a'],
 ['o', 't'],
 ['g', 'c'],
 ['g', 'a'],
 ['g', 't']]
```

random_element()

Return a random element from the Cartesian product of *iters.

EXAMPLES:

```
sage: from sage.combinat.cartesian_product import CartesianProduct_iters
sage: c = CartesianProduct_iters('dog', 'cat').random_element()
```

(continues on next page)

(continued from previous page)

```
sage: c in CartesianProduct_iters('dog', 'cat')
True
```

```
>>> from sage.all import *
>>> from sage.combinat.cartesian_product import CartesianProduct_iters
>>> c = CartesianProduct_iters('dog', 'cat').random_element()
>>> c in CartesianProduct_iters('dog', 'cat')
True
```

unrank(*x*)

For finite Cartesian products, we can reduce unrank to the constituent iterators.

EXAMPLES:

```
sage: from sage.combinat.cartesian_product import CartesianProduct_iters
sage: C = CartesianProduct_iters(range(1000), range(1000), range(1000))
sage: C[238792368]
[238, 792, 368]
```

```
>>> from sage.all import *
>>> from sage.combinat.cartesian_product import CartesianProduct_iters
>>> C = CartesianProduct_iters(range(Integer(1000)), range(Integer(1000)),␣
↪range(Integer(1000)))
>>> C[Integer(238792368)]
[238, 792, 368]
```

Check for Issue #15919:

```
sage: FF = IntegerModRing(29)
sage: C = CartesianProduct_iters(FF, FF, FF)
sage: C.unrank(0)
[0, 0, 0]
```

```
>>> from sage.all import *
>>> FF = IntegerModRing(Integer(29))
>>> C = CartesianProduct_iters(FF, FF, FF)
>>> C.unrank(Integer(0))
[0, 0, 0]
```

Cluster complex (or generalized dual associahedron)

EXAMPLES:

A first example of a cluster complex:

```
sage: C = ClusterComplex(['A', 2]); C
Cluster complex of type ['A', 2] with 5 vertices and 5 facets
```

```
>>> from sage.all import *
>>> C = ClusterComplex(['A', Integer(2)]); C
Cluster complex of type ['A', 2] with 5 vertices and 5 facets
```

Its vertices, facets, and minimal non-faces:

```
sage: C.vertices()
(0, 1, 2, 3, 4)

sage: C.facets()
[(0, 1), (0, 4), (1, 2), (2, 3), (3, 4)]

sage: for F in C.facets(): F.cluster()
[(-1, 0), (0, -1)]
[(-1, 0), (0, 1)]
[(0, -1), (1, 0)]
[(1, 0), (1, 1)]
[(1, 1), (0, 1)]

sage: C.minimal_nonfaces()
[[0, 2], [0, 3], [1, 3], [1, 4], [2, 4]]
```

```
>>> from sage.all import *
>>> C.vertices()
(0, 1, 2, 3, 4)

>>> C.facets()
[(0, 1), (0, 4), (1, 2), (2, 3), (3, 4)]

>>> for F in C.facets(): F.cluster()
[(-1, 0), (0, -1)]
[(-1, 0), (0, 1)]
[(0, -1), (1, 0)]
[(1, 0), (1, 1)]
[(1, 1), (0, 1)]

>>> C.minimal_nonfaces()
[[0, 2], [0, 3], [1, 3], [1, 4], [2, 4]]
```

We can do everything we can do on simplicial complexes, e.g. computing its homology:

```
sage: C.homology()
{0: 0, 1: Z}
```

```
>>> from sage.all import *
>>> C.homology()
{0: 0, 1: Z}
```

AUTHORS:

- Christian Stump (2011) Initial version

class sage.combinat.cluster_complex.**ClusterComplex**(*W*, *k*, *coxeter_element*, *algorithm*)

Bases: *SubwordComplex*

A cluster complex (or generalized dual associahedron).

The cluster complex (or generalized dual associahedron) is a simplicial complex constructed from a cluster algebra. Its vertices are the cluster variables and its facets are the clusters, i.e., maximal subsets of compatible cluster variables.

The cluster complex of type A_n is the simplicial complex with vertices being (proper) diagonals in a convex $(n+3)$-gon and with facets being triangulations.

The implementation of the cluster complex depends on its connection to subword complexes, see [CLS2014]. Let c be a Coxeter element with reduced word $\mathbf{c}$ in a finite Coxeter group W, and let $\mathbf{w}_\circ$ be the c-sorting word for the longest element $w_\circ \in W$.

The `multi-cluster complex` $\Delta(W, k)$ has vertices in one-to-one correspondence with letters in the word $Q = \mathbf{c}^k\mathbf{w}_\circ$ and with facets being complements in Q of reduced expressions for $w_\circ$.

For $k = 1$, the multi-cluster complex is isomorphic to the cluster complex as defined above.

EXAMPLES:

A first example of a cluster complex:

```
sage: C = ClusterComplex(['A', 2]); C
Cluster complex of type ['A', 2] with 5 vertices and 5 facets
```

```
>>> from sage.all import *
>>> C = ClusterComplex(['A', Integer(2)]); C
Cluster complex of type ['A', 2] with 5 vertices and 5 facets
```

Its vertices, facets, and minimal non-faces:

```
sage: C.vertices()
(0, 1, 2, 3, 4)

sage: C.facets()
[(0, 1), (0, 4), (1, 2), (2, 3), (3, 4)]

sage: C.minimal_nonfaces()
[[0, 2], [0, 3], [1, 3], [1, 4], [2, 4]]
```

```
>>> from sage.all import *
>>> C.vertices()
(0, 1, 2, 3, 4)

>>> C.facets()
[(0, 1), (0, 4), (1, 2), (2, 3), (3, 4)]

>>> C.minimal_nonfaces()
[[0, 2], [0, 3], [1, 3], [1, 4], [2, 4]]
```

We can do everything we can do on simplicial complexes, e.g. computing its homology:

```
sage: C.homology()
{0: 0, 1: Z}
```

```
>>> from sage.all import *
>>> C.homology()
{0: 0, 1: Z}
```

We can also create a multi-cluster complex:

```
sage: ClusterComplex(['A', 2], k=2)
Multi-cluster complex of type ['A', 2] with 7 vertices and 14 facets
```

```
>>> from sage.all import *
>>> ClusterComplex(['A', Integer(2)], k=Integer(2))
Multi-cluster complex of type ['A', 2] with 7 vertices and 14 facets
```

REFERENCES:

- [CLS2014]

Element

alias of *ClusterComplexFacet*

cyclic_rotation()

Return the operation on the facets of `self` obtained by the cyclic rotation as defined in [CLS2014].

EXAMPLES:

```
sage: ClusterComplex(['A', 2]).cyclic_rotation()
<function ...act at ...>
```

```
>>> from sage.all import *
>>> ClusterComplex(['A', Integer(2)]).cyclic_rotation()
<function ...act at ...>
```

k()

Return the index k of `self`.

EXAMPLES:

```
sage: ClusterComplex(['A', 2]).k()
1
```

```
>>> from sage.all import *
>>> ClusterComplex(['A', Integer(2)]).k()
1
```

minimal_nonfaces()

Return the minimal non-faces of `self`.

EXAMPLES:

```
sage: ClusterComplex(['A', 2]).minimal_nonfaces()
[[0, 2], [0, 3], [1, 3], [1, 4], [2, 4]]
```

```
>>> from sage.all import *
>>> ClusterComplex(['A', Integer(2)]).minimal_nonfaces()
[[0, 2], [0, 3], [1, 3], [1, 4], [2, 4]]
```

class sage.combinat.cluster_complex.**ClusterComplexFacet**(*parent*, *positions*, *facet_test=True*)

Bases: *SubwordComplexFacet*

A cluster (i.e., a facet) of a cluster complex.

cluster()

Return this cluster as a set of almost positive roots.

EXAMPLES:

```
sage: C = ClusterComplex(['A', 2])
sage: F = C((0, 1))
sage: F.cluster()
[(-1, 0), (0, -1)]
```

```
>>> from sage.all import *
>>> C = ClusterComplex(['A', Integer(2)])
>>> F = C((Integer(0), Integer(1)))
>>> F.cluster()
[(-1, 0), (0, -1)]
```

product_of_upper_cluster()

Return the product of the upper cluster in reversed order.

EXAMPLES:

```
sage: C = ClusterComplex(['A', 2])
sage: for F in C: F.product_of_upper_cluster().reduced_word()
[]
[2]
[1]
[1, 2]
[1, 2]
```

```
>>> from sage.all import *
>>> C = ClusterComplex(['A', Integer(2)])
>>> for F in C: F.product_of_upper_cluster().reduced_word()
[]
[2]
[1]
[1, 2]
[1, 2]
```

upper_cluster()

Return the part of the cluster that contains positive roots.

EXAMPLES:

```
sage: C = ClusterComplex(['A', 2])
sage: F = C((0, 1))
sage: F.upper_cluster()
[]
```

```
>>> from sage.all import *
>>> C = ClusterComplex(['A', Integer(2)])
>>> F = C((Integer(0), Integer(1)))
>>> F.upper_cluster()
[]
```

Colored permutations

Todo

Much of the colored permutations (and element) class can be generalized to $G \wr S_n$

class sage.combinat.colored_permutations.**ColoredPermutation**(*parent*, *colors*, *perm*)

Bases: MultiplicativeGroupElement

A colored permutation.

colors()

Return the colors of self.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: s1,s2,t = C.gens()
sage: x = s1*s2*t
sage: x.colors()
[1, 0, 0]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> s1,s2,t = C.gens()
>>> x = s1*s2*t
>>> x.colors()
[1, 0, 0]
```

has_left_descent(*i*)

Return True if i is a left descent of self.

Let $p = ((s_1, \ldots s_n), \sigma)$ be a colored permutation. We say p has a left n-descent if $s_n > 0$. If $i < n$, then we say p has a left i-descent if either

- $s_i \neq 0, s_{i+1} = 0$ and $\sigma_i < \sigma_{i+1}$ or
- $s_i = s_{i+1}$ and $\sigma_i > \sigma_{i+1}$.

This notion of a left i-descent is done in order to recursively construct $w(p) = \sigma_i w(\sigma_i^{-1} p)$, where $w(p)$ denotes a reduced word of p.

EXAMPLES:

```
sage: C = ColoredPermutations(2, 4)
sage: s1,s2,s3,s4 = C.gens()
sage: x = s4*s1*s2*s3*s4
sage: [x.has_left_descent(i) for i in C.index_set()]
[True, False, False, True]

sage: C = ColoredPermutations(1, 5)
sage: s1,s2,s3,s4 = C.gens()
sage: x = s4*s1*s2*s3*s4
sage: [x.has_left_descent(i) for i in C.index_set()]
[True, False, False, True]
```

(continues on next page)

(continued from previous page)

```
sage: C = ColoredPermutations(3, 3)
sage: x = C([[2,1,0],[3,1,2]])
sage: [x.has_left_descent(i) for i in C.index_set()]
[False, True, False]

sage: C = ColoredPermutations(4, 4)
sage: x = C([[2,1,0,1],[3,2,4,1]])
sage: [x.has_left_descent(i) for i in C.index_set()]
[False, True, False, True]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(2), Integer(4))
>>> s1,s2,s3,s4 = C.gens()
>>> x = s4*s1*s2*s3*s4
>>> [x.has_left_descent(i) for i in C.index_set()]
[True, False, False, True]

>>> C = ColoredPermutations(Integer(1), Integer(5))
>>> s1,s2,s3,s4 = C.gens()
>>> x = s4*s1*s2*s3*s4
>>> [x.has_left_descent(i) for i in C.index_set()]
[True, False, False, True]

>>> C = ColoredPermutations(Integer(3), Integer(3))
>>> x = C([[Integer(2),Integer(1),Integer(0)],[Integer(3),Integer(1),
↪Integer(2)]])
>>> [x.has_left_descent(i) for i in C.index_set()]
[False, True, False]

>>> C = ColoredPermutations(Integer(4), Integer(4))
>>> x = C([[Integer(2),Integer(1),Integer(0),Integer(1)],[Integer(3),
↪Integer(2),Integer(4),Integer(1)]])
>>> [x.has_left_descent(i) for i in C.index_set()]
[False, True, False, True]
```

length()

Return the length of `self` in generating reflections.

This is the minimal numbers of generating reflections needed to obtain `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(3, 3)
sage: x = C([[2,1,0],[3,1,2]])
sage: x.length()
7

sage: C = ColoredPermutations(4, 4)
sage: x = C([[2,1,0,1],[3,2,4,1]])
sage: x.length()
12
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(3), Integer(3))
>>> x = C([[Integer(2),Integer(1),Integer(0)],[Integer(3),Integer(1),
↪Integer(2)]])
>>> x.length()
7

>>> C = ColoredPermutations(Integer(4), Integer(4))
>>> x = C([[Integer(2),Integer(1),Integer(0),Integer(1)],[Integer(3),
↪Integer(2),Integer(4),Integer(1)]])
>>> x.length()
12
```

one_line_form()

Return the one line form of `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: s1,s2,t = C.gens()
sage: x = s1*s2*t
sage: x
[[1, 0, 0], [3, 1, 2]]
sage: x.one_line_form()
[(1, 3), (0, 1), (0, 2)]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> s1,s2,t = C.gens()
>>> x = s1*s2*t
>>> x
[[1, 0, 0], [3, 1, 2]]
>>> x.one_line_form()
[(1, 3), (0, 1), (0, 2)]
```

permutation()

Return the permutation of `self`.

This is obtained by forgetting the colors.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: s1,s2,t = C.gens()
sage: x = s1*s2*t
sage: x.permutation()
[3, 1, 2]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> s1,s2,t = C.gens()
>>> x = s1*s2*t
>>> x.permutation()
[3, 1, 2]
```

reduced_word()

Return a word in the simple reflections to obtain `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(3, 3)
sage: x = C([[2,1,0],[3,1,2]])
sage: x.reduced_word()
[2, 1, 3, 2, 1, 3, 3]

sage: C = ColoredPermutations(4, 4)
sage: x = C([[2,1,0,1],[3,2,4,1]])
sage: x.reduced_word()
[2, 1, 4, 3, 2, 1, 4, 3, 2, 4, 4, 3]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(3), Integer(3))
>>> x = C([[Integer(2),Integer(1),Integer(0)],[Integer(3),Integer(1),
↪Integer(2)]])
>>> x.reduced_word()
[2, 1, 3, 2, 1, 3, 3]

>>> C = ColoredPermutations(Integer(4), Integer(4))
>>> x = C([[Integer(2),Integer(1),Integer(0),Integer(1)],[Integer(3),
↪Integer(2),Integer(4),Integer(1)]])
>>> x.reduced_word()
[2, 1, 4, 3, 2, 1, 4, 3, 2, 4, 4, 3]
```

to_matrix()

Return a matrix of `self`.

The colors are mapped to roots of unity.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: s1,s2,t = C.gens()
sage: x = s1*s2*t*s2; x.one_line_form()
[(1, 2), (0, 1), (0, 3)]
sage: M = x.to_matrix(); M                                                  #␣
↪needs sage.rings.number_field
[    0     1     0]
[zeta4     0     0]
[    0     0     1]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> s1,s2,t = C.gens()
>>> x = s1*s2*t*s2; x.one_line_form()
[(1, 2), (0, 1), (0, 3)]
>>> M = x.to_matrix(); M                                                    #␣
↪needs sage.rings.number_field
[    0     1     0]
[zeta4     0     0]
[    0     0     1]
```

The matrix multiplication is in the *opposite* order:

```
sage: M == s2.to_matrix()*t.to_matrix()*s2.to_matrix()*s1.to_matrix()        #␣
↪needs sage.rings.number_field
True
```

```
>>> from sage.all import *
>>> M == s2.to_matrix()*t.to_matrix()*s2.to_matrix()*s1.to_matrix()        #␣
↪needs sage.rings.number_field
True
```

class sage.combinat.colored_permutations.**ColoredPermutations**(m, n)

Bases: *ShephardToddFamilyGroup*

The group of m-colored permutations on $\{1, 2, \ldots, n\}$.

Let S_n be the symmetric group on n letters and C_m be the cyclic group of order m. The m-colored permutation group on n letters is given by $P_n^m = C_m \wr S_n$. This is also the complex reflection group $G(m, 1, n)$.

We define our multiplication by

$$((s_1, \ldots s_n), \sigma) \cdot ((t_1, \ldots, t_n), \tau) = ((s_1 t_{\sigma(1)}, \ldots, s_n t_{\sigma(n)}), \tau\sigma).$$

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3); C
4-colored permutations of size 3
sage: s1,s2,t = C.gens()
sage: (s1, s2, t)
([[0, 0, 0], [2, 1, 3]], [[0, 0, 0], [1, 3, 2]], [[0, 0, 1], [1, 2, 3]])
sage: s1*s2
[[0, 0, 0], [3, 1, 2]]
sage: s1*s2*s1 == s2*s1*s2
True
sage: t^4 == C.one()
True
sage: s2*t*s2
[[0, 1, 0], [1, 2, 3]]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3)); C
4-colored permutations of size 3
>>> s1,s2,t = C.gens()
>>> (s1, s2, t)
([[0, 0, 0], [2, 1, 3]], [[0, 0, 0], [1, 3, 2]], [[0, 0, 1], [1, 2, 3]])
>>> s1*s2
[[0, 0, 0], [3, 1, 2]]
>>> s1*s2*s1 == s2*s1*s2
True
>>> t**Integer(4) == C.one()
True
>>> s2*t*s2
[[0, 1, 0], [1, 2, 3]]
```

We can also create a colored permutation by passing an iterable consisting of tuples consisting of `(color, element)`:

```
sage: x = C([(2,1), (3,3), (3,2)]); x
[[2, 3, 3], [1, 3, 2]]
```

```
>>> from sage.all import *
>>> x = C([(Integer(2),Integer(1)), (Integer(3),Integer(3)), (Integer(3),
↪Integer(2))]); x
[[2, 3, 3], [1, 3, 2]]
```

or a list of colors and a permutation:

```
sage: C([[3,3,1], [1,3,2]])
[[3, 3, 1], [1, 3, 2]]
sage: C(([3,3,1], [1,3,2]))
[[3, 3, 1], [1, 3, 2]]
```

```
>>> from sage.all import *
>>> C([[Integer(3),Integer(3),Integer(1)], [Integer(1),Integer(3),Integer(2)]])
[[3, 3, 1], [1, 3, 2]]
>>> C(([Integer(3),Integer(3),Integer(1)], [Integer(1),Integer(3),Integer(2)]))
[[3, 3, 1], [1, 3, 2]]
```

There is also the natural lift from permutations:

```
sage: P = Permutations(3)
sage: C(P.an_element())
[[0, 0, 0], [3, 1, 2]]
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(3))
>>> C(P.an_element())
[[0, 0, 0], [3, 1, 2]]
```

A colored permutation:

```
sage: C(C.an_element()) == C.an_element()
True
```

```
>>> from sage.all import *
>>> C(C.an_element()) == C.an_element()
True
```

class sage.combinat.colored_permutations.**MaximalSpechtSubmodule**(*specht_module*)

Bases: Representation_abstract, SubmoduleWithBasis

The maximal submodule $U^{\lambda,\mu}$ of the type B_n Specht module $S^{\lambda,\mu}$.

ALGORITHM:

We construct $U^{(\lambda,\mu)}$ as the intersection $S \cap S^{\perp}$, where $S^{\perp}$ is the orthogonal complement of the Specht module S inside of the tabloid module T (with respect to the natural bilinear form on T).

EXAMPLES:

```
sage: B4 = SignedPermutations(4)
sage: SM = B4.specht_module([[1], [2,1]], GF(3))
sage: U = SM.maximal_submodule()
sage: u = U.an_element(); u
2*U[0] + 2*U[1]
sage: [p * u for p in list(B4)[:4]]
[2*U[0] + 2*U[1], 2*U[0] + 2*U[1], 2*U[0] + 2*U[1], 2*U[0] + 2*U[1]]
sage: sum(U.semigroup_algebra().basis()) * u  # long time
0
```

```
>>> from sage.all import *
>>> B4 = SignedPermutations(Integer(4))
>>> SM = B4.specht_module([[Integer(1)], [Integer(2),Integer(1)]], GF(Integer(3)))
>>> U = SM.maximal_submodule()
>>> u = U.an_element(); u
2*U[0] + 2*U[1]
>>> [p * u for p in list(B4)[:Integer(4)]]
[2*U[0] + 2*U[1], 2*U[0] + 2*U[1], 2*U[0] + 2*U[1], 2*U[0] + 2*U[1]]
>>> sum(U.semigroup_algebra().basis()) * u  # long time
0
```

Element

alias of *Element*

class sage.combinat.colored_permutations.**ShephardToddFamilyGroup**(*m*, *p*, *n*)

Bases: UniqueRepresentation, Parent

The Shephard-Todd family complex reflection group $G(m, p, n)$ realized as a subgroup of *colored permutations*.

A general complex reflection group is a subgroup of $GL(V)$, where V is a $\mathbf{C}$ vector space, that is generated by *reflections*, diagonalizable matrices with at most one eigenvalue not equal to 1. The group of colored permutations $G(m, 1, n)$ are the generalized permutation matrices whose entries are m-th roots of unity. For $p|m$, the group $G(m, p, n)$ is the index p subgroup such that the product of the entries is a m/p-th root of unity.

By the (Chevalley-)Shephard-Todd classification of irreducible finite complex reflection groups, the groups $G(m, p, n)$ (with $G(2, 2, 2)$ being exceptionally reducible since it is the Klein four group) form the only infinite family with an additional 34 exceptional groups G_k, where $4 \leq k \leq 37$. To avoid ambiguities, we refer to $G(m, p, n)$ as the *Shephard-Todd family complex reflection group*.

INPUT:

- m – positive integer
- p – positive integer dividing m
- n – positive integer

>>> groups.misc.ShephardToddFamily(Integer(6), Integer(6), Integer(4))
Complex reflection group G(6, 6, 4)
```

Element

alias of *ColoredPermutation*

as_permutation_group()

Return the permutation group corresponding to `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.as_permutation_group()                                                  #␣
↪needs sage.groups
Complex reflection group G(4, 1, 3) as a permutation group
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.as_permutation_group()                                                    #␣
↪needs sage.groups
Complex reflection group G(4, 1, 3) as a permutation group
```

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.cardinality()
384
sage: C.cardinality() == 4**3 * factorial(3)
True
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.cardinality()
384
>>> C.cardinality() == Integer(4)**Integer(3) * factorial(Integer(3))
True
```

codegrees()

Return the codegrees of `self`.

Let G be a complex reflection group. The codegrees $d_1^* \leq d_2^* \leq \cdots \leq d_\ell^*$ of G can be defined by:

$$\prod_{i=1}^{\ell}(q - d_i^* - 1) = \sum_{g \in G} \det(g) q^{\dim(V^g)},$$

where V is the natural complex vector space that G acts on and ℓ is the *rank()*.

If $m = 1$, then we are in the special case of the symmetric group and the codegrees are $(n-2, n-3, \ldots 1, 0)$. Otherwise the degrees are $((n-1)m, (n-2)m, \ldots, m, 0)$.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.codegrees()
(8, 4, 0)
sage: S = ColoredPermutations(1, 3)
sage: S.codegrees()
(1, 0)
sage: G = groups.misc.ShephardToddFamily(6, 2, 3)
sage: G.codegrees()
(12, 6, 0)
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.codegrees()
(8, 4, 0)
>>> S = ColoredPermutations(Integer(1), Integer(3))
>>> S.codegrees()
(1, 0)
>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(2), Integer(3))
>>> G.codegrees()
(12, 6, 0)
```

coxeter_matrix()

Return the Coxeter matrix of `self`.

When the group is imprimitive and not a Coxeter group, this returns `None`.

EXAMPLES:

```
sage: C = ColoredPermutations(3, 4)
sage: C.coxeter_matrix()                                                    #␣
↪needs sage.modules

>>> G.coxeter_matrix()
[]

>>> G = groups.misc.ShephardToddFamily(Integer(4), Integer(4), Integer(2))
>>> G.coxeter_matrix()
[1 4]
[4 1]

>>> G = groups.misc.ShephardToddFamily(Integer(7), Integer(7), Integer(2))
>>> G.coxeter_matrix()
[1 7]
[7 1]

>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(3), Integer(1))
>>> G.coxeter_matrix() is None
True
>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(3), Integer(4))
>>> G.coxeter_matrix() is None
True
```

degrees()

Return the degrees of `self`.

The degrees of a complex reflection group are the degrees of the fundamental invariants of the ring of polynomial invariants.

If $m = 1$, then we are in the special case of the symmetric group and the degrees are $(2, 3, \ldots, n, n+1)$. Otherwise the degrees are $(m, 2m, \ldots, nm)$.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.degrees()
(4, 8, 12)
```

(continues on next page)

(continued from previous page)

```
sage: S = ColoredPermutations(1, 3)
sage: S.degrees()
(2, 3)
sage: G = groups.misc.ShephardToddFamily(6, 2, 3)
sage: G.degrees()
(6, 9, 12)
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.degrees()
(4, 8, 12)
>>> S = ColoredPermutations(Integer(1), Integer(3))
>>> S.degrees()
(2, 3)
>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(2), Integer(3))
>>> G.degrees()
(6, 9, 12)
```

We now check that the product of the degrees is equal to the cardinality of `self`:

```
sage: prod(C.degrees()) == C.cardinality()
True
sage: prod(S.degrees()) == S.cardinality()
True
sage: prod(G.degrees()) == G.cardinality()
True
```

```
>>> from sage.all import *
>>> prod(C.degrees()) == C.cardinality()
True
>>> prod(S.degrees()) == S.cardinality()
True
>>> prod(G.degrees()) == G.cardinality()
True
```

fixed_point_polynomial(*q=None*)

The fixed point polynomial of `self`.

The fixed point polynomial f_G of a complex reflection group G is counting the dimensions of fixed points subspaces:

$$f_G(q) = \sum_{w \in W} q^{\dim V^w}.$$

Furthermore, let $d_1, d_2, \ldots, d_\ell$ be the degrees of G, where ℓ is the *rank()*. Then the fixed point polynomial is given by

$$f_G(q) = \prod_{i=1}^{\ell} (q + d_i - 1).$$

INPUT:

- `q` – (default: the generator of `ZZ['q']`) the parameter q

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.fixed_point_polynomial()
q^3 + 21*q^2 + 131*q + 231

sage: S = ColoredPermutations(1, 3)
sage: S.fixed_point_polynomial()
q^2 + 3*q + 2
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.fixed_point_polynomial()
q^3 + 21*q^2 + 131*q + 231

>>> S = ColoredPermutations(Integer(1), Integer(3))
>>> S.fixed_point_polynomial()
q^2 + 3*q + 2
```

gens()

Return the generators of `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.gens()
([[0, 0, 0], [2, 1, 3]],
 [[0, 0, 0], [1, 3, 2]],
 [[0, 0, 1], [1, 2, 3]])

sage: S = SignedPermutations(4)
sage: S.gens()
([2, 1, 3, 4], [1, 3, 2, 4], [1, 2, 4, 3], [1, 2, 3, -4])
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.gens()
([[0, 0, 0], [2, 1, 3]],
 [[0, 0, 0], [1, 3, 2]],
 [[0, 0, 1], [1, 2, 3]])

>>> S = SignedPermutations(Integer(4))
>>> S.gens()
([2, 1, 3, 4], [1, 3, 2, 4], [1, 2, 4, 3], [1, 2, 3, -4])
```

index_set()

Return the index set of `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(3, 4)
sage: C.index_set()
(1, 2, 3, 4)

sage: C = ColoredPermutations(1, 4)
```

(continues on next page)

(continued from previous page)

```
sage: C.index_set()
(1, 2, 3)

sage: G = groups.misc.ShephardToddFamily(6, 6, 4)
sage: G.index_set()
(1, 2, 3, 4)

sage: G = groups.misc.ShephardToddFamily(6, 2, 4)
sage: G.index_set()
(1, 2, 3, 4, 5)

sage: G = groups.misc.ShephardToddFamily(6, 6, 1)
sage: G.index_set()
()

sage: G = groups.misc.ShephardToddFamily(6, 2, 1)
sage: G.index_set()
(1,)
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(3), Integer(4))
>>> C.index_set()
(1, 2, 3, 4)

>>> C = ColoredPermutations(Integer(1), Integer(4))
>>> C.index_set()
(1, 2, 3)

>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(6), Integer(4))
>>> G.index_set()
(1, 2, 3, 4)

>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(2), Integer(4))
>>> G.index_set()
(1, 2, 3, 4, 5)

>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(6), Integer(1))
>>> G.index_set()
()

>>> G = groups.misc.ShephardToddFamily(Integer(6), Integer(2), Integer(1))
>>> G.index_set()
(1,)
```

is_well_generated()

Return if `self` is a well-generated complex reflection group.

A complex reflection group G is well-generated if it is generated by ℓ reflections. Equivalently, G is well-generated if $d_i + d_i^* = d_\ell$ for all $1 \leq i \leq \ell$.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.is_well_generated()
True
sage: C = ColoredPermutations(2, 8)
sage: C.is_well_generated()
True
sage: C = ColoredPermutations(1, 4)
sage: C.is_well_generated()
True
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.is_well_generated()
True
>>> C = ColoredPermutations(Integer(2), Integer(8))
>>> C.is_well_generated()
True
>>> C = ColoredPermutations(Integer(1), Integer(4))
>>> C.is_well_generated()
True
```

matrix_group()

Return the matrix group corresponding to `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.matrix_group()                                                      #␣
↪needs sage.modules
Matrix group over Cyclotomic Field of order 4 and degree 2 with 3 generators (
[0 1 0]  [1 0 0]  [    1     0     0]
[1 0 0]  [0 0 1]  [    0     1     0]
[0 0 1], [0 1 0], [    0     0 zeta4]
)
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.matrix_group()                                                        #␣
↪needs sage.modules
Matrix group over Cyclotomic Field of order 4 and degree 2 with 3 generators (
[0 1 0]  [1 0 0]  [    1     0     0]
[1 0 0]  [0 0 1]  [    0     1     0]
[0 0 1], [0 1 0], [    0     0 zeta4]
)
```

number_of_reflection_hyperplanes()

Return the number of reflection hyperplanes of `self`.

The number of reflection hyperplanes of a complex reflection group is equal to the sum of the codegrees plus the rank.

EXAMPLES:

```
sage: C = ColoredPermutations(1, 2)
sage: C.number_of_reflection_hyperplanes()
1
sage: C = ColoredPermutations(1, 3)
sage: C.number_of_reflection_hyperplanes()
3
sage: C = ColoredPermutations(4, 12)
sage: C.number_of_reflection_hyperplanes()
276
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(1), Integer(2))
>>> C.number_of_reflection_hyperplanes()
1
>>> C = ColoredPermutations(Integer(1), Integer(3))
>>> C.number_of_reflection_hyperplanes()
3
>>> C = ColoredPermutations(Integer(4), Integer(12))
>>> C.number_of_reflection_hyperplanes()
276
```

one()

Return the identity element of `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.one()
[[0, 0, 0], [1, 2, 3]]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.one()
[[0, 0, 0], [1, 2, 3]]
```

order()

alias of *cardinality()*.

random_element()

Return an element of `self` at random.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: s = C.random_element(); s  # random
[[0, 2, 1], [2, 1, 3]]
sage: s in C
True
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> s = C.random_element(); s  # random
[[0, 2, 1], [2, 1, 3]]
```

(continues on next page)

(continued from previous page)

```
>>> s in C
True
```

rank()

Return the rank of `self`.

The rank of a complex reflection group is equal to the dimension of the complex vector space the group acts on.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 12)
sage: C.rank()
12
sage: C = ColoredPermutations(7, 4)
sage: C.rank()
4
sage: C = ColoredPermutations(1, 4)
sage: C.rank()
3
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(12))
>>> C.rank()
12
>>> C = ColoredPermutations(Integer(7), Integer(4))
>>> C.rank()
4
>>> C = ColoredPermutations(Integer(1), Integer(4))
>>> C.rank()
3
```

simple_reflection(*i*)

Return the `i`-th simple reflection of `self`.

EXAMPLES:

```
sage: C = ColoredPermutations(4, 3)
sage: C.gens()
([[0, 0, 0], [2, 1, 3]], [[0, 0, 0], [1, 3, 2]], [[0, 0, 1], [1, 2, 3]])
sage: C.simple_reflection(2)
[[0, 0, 0], [1, 3, 2]]
sage: C.simple_reflection(3)
[[0, 0, 1], [1, 2, 3]]

sage: S = SignedPermutations(4)
sage: S.simple_reflection(1)
[2, 1, 3, 4]
sage: S.simple_reflection(4)
[1, 2, 3, -4]

sage: G = groups.misc.ShephardToddFamily(4, 2, 3)
sage: list(G.simple_reflections())
```

(continues on next page)

(continued from previous page)

```
[[[0, 0, 0], [2, 1, 3]],
 [[0, 0, 0], [1, 3, 2]],
 [[0, 1, 3], [1, 3, 2]],
 [[0, 0, 2], [1, 2, 3]]]

sage: G = groups.misc.ShephardToddFamily(8, 4, 1)
sage: G.simple_reflections()
Finite family {1: [[4], [1]]}

sage: G = groups.misc.ShephardToddFamily(8, 8, 1)
sage: G.simple_reflections()
Finite family {}
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(4), Integer(3))
>>> C.gens()
([[0, 0, 0], [2, 1, 3]], [[0, 0, 0], [1, 3, 2]], [[0, 0, 1], [1, 2, 3]])
>>> C.simple_reflection(Integer(2))
[[0, 0, 0], [1, 3, 2]]
>>> C.simple_reflection(Integer(3))
[[0, 0, 1], [1, 2, 3]]

>>> S = SignedPermutations(Integer(4))
>>> S.simple_reflection(Integer(1))
[2, 1, 3, 4]
>>> S.simple_reflection(Integer(4))
[1, 2, 3, -4]

>>> G = groups.misc.ShephardToddFamily(Integer(4), Integer(2), Integer(3))
>>> list(G.simple_reflections())
[[[0, 0, 0], [2, 1, 3]],
 [[0, 0, 0], [1, 3, 2]],
 [[0, 1, 3], [1, 3, 2]],
 [[0, 0, 2], [1, 2, 3]]]

>>> G = groups.misc.ShephardToddFamily(Integer(8), Integer(4), Integer(1))
>>> G.simple_reflections()
Finite family {1: [[4], [1]]}

>>> G = groups.misc.ShephardToddFamily(Integer(8), Integer(8), Integer(1))
>>> G.simple_reflections()
Finite family {}
```

class sage.combinat.colored_permutations.**SignedPermutation**(*parent*, *colors*, *perm*)

Bases: *ColoredPermutation*

A signed permutation.

cycle_type()

Return a pair of partitions of `len(self)` corresponding to the signed cycle type of `self`.

A *cycle* is a tuple $C = (c_0, \ldots, c_{k-1})$ with $\pi(c_i) = c_{i+1}$ for $0 \leq i < k$ and $\pi(c_{k-1}) = c_0$. If C is a cycle, $\overline{C} = (-c_0, \ldots, -c_{k-1})$ is also a cycle. A cycle is *negative*, if $C = \overline{C}$ up to cyclic reordering. In this case, k is necessarily even and the length of C is $k/2$. A *positive cycle* is a pair $C\overline{C}$, its length is k.

Let α be the partition whose parts are the lengths of the positive cycles and let β be the partition whose parts are the lengths of the negative cycles. Then (α, β) is the cycle type of π.

EXAMPLES:

```
sage: G = SignedPermutations(7)
sage: pi = G([2, -1, 4, -6, -5, -3, 7])
sage: pi.cycle_type()
([3, 1], [2, 1])

sage: G = SignedPermutations(5)
sage: all(pi.cycle_type().size() == 5 for pi in G)
True
sage: set(pi.cycle_type() for pi in G) == set(PartitionTuples(2, 5))
True
```

```
>>> from sage.all import *
>>> G = SignedPermutations(Integer(7))
>>> pi = G([Integer(2), -Integer(1), Integer(4), -Integer(6), -Integer(5), -
↪Integer(3), Integer(7)])
>>> pi.cycle_type()
([3, 1], [2, 1])

>>> G = SignedPermutations(Integer(5))
>>> all(pi.cycle_type().size() == Integer(5) for pi in G)
True
>>> set(pi.cycle_type() for pi in G) == set(PartitionTuples(Integer(2),␣
↪Integer(5)))
True
```

has_left_descent(*i*)

Return `True` if `i` is a left descent of `self`.

EXAMPLES:

```
sage: S = SignedPermutations(4)
sage: s1,s2,s3,s4 = S.gens()
sage: x = s4*s1*s2*s3*s4
sage: [x.has_left_descent(i) for i in S.index_set()]
[True, False, False, True]
```

```
>>> from sage.all import *
>>> S = SignedPermutations(Integer(4))
>>> s1,s2,s3,s4 = S.gens()
>>> x = s4*s1*s2*s3*s4
>>> [x.has_left_descent(i) for i in S.index_set()]
[True, False, False, True]
```

order()

Return the multiplicative order of the signed permutation.

EXAMPLES:

```
sage: pi = SignedPermutations(7)([2,-1,4,-6,-5,-3,7])
sage: pi.to_cycles(singletons=False)
[(1, 2, -1, -2), (3, 4, -6), (-3, -4, 6), (5, -5)]
sage: pi.order()
12
```

```
>>> from sage.all import *
>>> pi = SignedPermutations(Integer(7))([Integer(2),-Integer(1),Integer(4),-
↪Integer(6),-Integer(5),-Integer(3),Integer(7)])
>>> pi.to_cycles(singletons=False)
[(1, 2, -1, -2), (3, 4, -6), (-3, -4, 6), (5, -5)]
>>> pi.order()
12
```

to_cycles(*singletons=True*, *use_min=True*, *negative_cycles=True*)

Return the signed permutation `self` as a list of disjoint cycles.

The cycles are returned in the order of increasing smallest elements, and each cycle is returned as a tuple which starts with its smallest positive element.

INPUT:

- `singletons` – boolean (default: `True`); whether to include singleton cycles or not
- `use_min` – boolean (default: `True`); if `False`, the cycles are returned in the order of increasing *largest* (not smallest) elements, and each cycle starts with its largest element
- `negative_cycles` – boolean (default: `True`); if `False`, for any two cycles $C^{\pm} = \{\pm c_1, \ldots, \pm c_k\}$ such that $C^+ \neq C^-$, this does not include the cycle C^-

Warning

The argument `negative_cycles` does not refer to the usual definition of a negative cycle; see *cycle_type()*.

EXAMPLES:

```
sage: pi = SignedPermutations(7)([2,-1,4,-6,-5,-3,7])
sage: pi.to_cycles()
[(1, 2, -1, -2), (3, 4, -6), (-3, -4, 6), (5, -5), (7,), (-7,)]
sage: pi.to_cycles(singletons=False)
[(1, 2, -1, -2), (3, 4, -6), (-3, -4, 6), (5, -5)]
sage: pi.to_cycles(negative_cycles=False)
[(1, 2, -1, -2), (3, 4, -6), (5, -5), (7,)]
sage: pi.to_cycles(singletons=False, negative_cycles=False)
[(1, 2, -1, -2), (3, 4, -6), (5, -5)]
sage: pi.to_cycles(use_min=False)
[(7,), (-7,), (6, -3, -4), (-6, 3, 4), (5, -5), (2, -1, -2, 1)]
sage: pi.to_cycles(singletons=False, use_min=False)
[(6, -3, -4), (-6, 3, 4), (5, -5), (2, -1, -2, 1)]
```

```
>>> from sage.all import *
>>> pi = SignedPermutations(Integer(7))([Integer(2),-Integer(1),Integer(4),-
```

(continues on next page)

(continued from previous page)

```
↪Integer(6),-Integer(5),-Integer(3),Integer(7)])
>>> pi.to_cycles()
[(1, 2, -1, -2), (3, 4, -6), (-3, -4, 6), (5, -5), (7,), (-7,)]
>>> pi.to_cycles(singletons=False)
[(1, 2, -1, -2), (3, 4, -6), (-3, -4, 6), (5, -5)]
>>> pi.to_cycles(negative_cycles=False)
[(1, 2, -1, -2), (3, 4, -6), (5, -5), (7,)]
>>> pi.to_cycles(singletons=False, negative_cycles=False)
[(1, 2, -1, -2), (3, 4, -6), (5, -5)]
>>> pi.to_cycles(use_min=False)
[(7,), (-7,), (6, -3, -4), (-6, 3, 4), (5, -5), (2, -1, -2, 1)]
>>> pi.to_cycles(singletons=False, use_min=False)
[(6, -3, -4), (-6, 3, 4), (5, -5), (2, -1, -2, 1)]
```

to_matrix()

Return a matrix of `self`.

EXAMPLES:

```
sage: S = SignedPermutations(4)
sage: s1,s2,s3,s4 = S.gens()
sage: x = s4*s1*s2*s3*s4
sage: M = x.to_matrix(); M                                                  #␣
↪needs sage.modules
[ 0  1  0  0]
[ 0  0  1  0]
[ 0  0  0 -1]
[-1  0  0  0]
```

```
>>> from sage.all import *
>>> S = SignedPermutations(Integer(4))
>>> s1,s2,s3,s4 = S.gens()
>>> x = s4*s1*s2*s3*s4
>>> M = x.to_matrix(); M                                                    #␣
↪needs sage.modules
[ 0  1  0  0]
[ 0  0  1  0]
[ 0  0  0 -1]
[-1  0  0  0]
```

The matrix multiplication is in the *opposite* order:

```
sage: m1,m2,m3,m4 = [g.to_matrix() for g in S.gens()]                       #␣
↪needs sage.modules
sage: M == m4 * m3 * m2 * m1 * m4                                           #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> m1,m2,m3,m4 = [g.to_matrix() for g in S.gens()]                         #␣
↪needs sage.modules
>>> M == m4 * m3 * m2 * m1 * m4                                             #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.modules
True
```

class sage.combinat.colored_permutations.**SignedPermutationGroupConjugacyClass**(*group*, *shape*)

Bases: ConjugacyClass

A conjugacy class of the signed permutations of n.

INPUT:

- `group` – the signed permutations of n
- `shape` – a pair of partitions or an element of `group`

shape()

Return the shape of `self`.

EXAMPLES:

```
sage: G = SignedPermutations(4)
sage: C = G.conjugacy_class(G([-3,2,-4,1]))
sage: C.shape()
([3, 1], [])
```

```
>>> from sage.all import *
>>> G = SignedPermutations(Integer(4))
>>> C = G.conjugacy_class(G([-Integer(3),Integer(2),-Integer(4),Integer(1)]))
>>> C.shape()
([3, 1], [])
```

class sage.combinat.colored_permutations.**SignedPermutations**(n)

Bases: *ColoredPermutations*

Group of signed permutations.

The group of signed permutations is also known as the hyperoctahedral group, the Coxeter group of type B_n, and the 2-colored permutation group. Thus it can be constructed as the wreath product $S_2 \wr S_n$.

EXAMPLES:

```
sage: S = SignedPermutations(4)
sage: s1,s2,s3,s4 = S.group_generators()
sage: x = s4*s1*s2*s3*s4; x
[-4, 1, 2, -3]
sage: x^4 == S.one()
True
```

```
>>> from sage.all import *
>>> S = SignedPermutations(Integer(4))
>>> s1,s2,s3,s4 = S.group_generators()
>>> x = s4*s1*s2*s3*s4; x
[-4, 1, 2, -3]
>>> x**Integer(4) == S.one()
True
```

This is a finite Coxeter group of type B_n:

```
sage: S.canonical_representation()                                          #␣
↪needs sage.modules
Finite Coxeter group over Number Field in a with defining polynomial x^2 - 2
 with a = 1.414213562373095? with Coxeter matrix:
[1 3 2 2]
[3 1 3 2]
[2 3 1 4]
[2 2 4 1]
sage: S.long_element()
[-1, -2, -3, -4]
sage: S.long_element().reduced_word()
[1, 2, 1, 3, 2, 1, 4, 3, 2, 1, 4, 3, 2, 4, 3, 4]
```

```
>>> from sage.all import *
>>> S.canonical_representation()                                            #␣
↪needs sage.modules
Finite Coxeter group over Number Field in a with defining polynomial x^2 - 2
 with a = 1.414213562373095? with Coxeter matrix:
[1 3 2 2]
[3 1 3 2]
[2 3 1 4]
[2 2 4 1]
>>> S.long_element()
[-1, -2, -3, -4]
>>> S.long_element().reduced_word()
[1, 2, 1, 3, 2, 1, 4, 3, 2, 1, 4, 3, 2, 4, 3, 4]
```

We can also go between the 2-colored permutation group:

```
sage: C = ColoredPermutations(2, 3)
sage: S = SignedPermutations(3)
sage: S.an_element()
[-3, 1, 2]
sage: C(S.an_element())
[[1, 0, 0], [3, 1, 2]]
sage: S(C(S.an_element())) == S.an_element()
True
sage: S(C.an_element())
[-3, 1, 2]
```

```
>>> from sage.all import *
>>> C = ColoredPermutations(Integer(2), Integer(3))
>>> S = SignedPermutations(Integer(3))
>>> S.an_element()
[-3, 1, 2]
>>> C(S.an_element())
[[1, 0, 0], [3, 1, 2]]
>>> S(C(S.an_element())) == S.an_element()
True
>>> S(C.an_element())
[-3, 1, 2]
```

There is also the natural lift from permutations:

```
sage: P = Permutations(3)
sage: x = S(P.an_element()); x
[3, 1, 2]
sage: x.parent()
Signed permutations of 3
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(3))
>>> x = S(P.an_element()); x
[3, 1, 2]
>>> x.parent()
Signed permutations of 3
```

REFERENCES:

- Wikipedia article Hyperoctahedral_group

Element

alias of *SignedPermutation*

conjugacy_class(*g*)

Return the conjugacy class of `g` in `self`.

INPUT:

- `g` – a pair of partitions or an element of `self`

EXAMPLES:

```
sage: G = SignedPermutations(5)
sage: g = G([1,-3,2,5,-4])
sage: G.conjugacy_class(g)
Conjugacy class of cycle type ([1], [2, 2]) in Signed permutations of 5
sage: G.conjugacy_class([[2,1], [1,1]])
Conjugacy class of cycle type ([2, 1], [1, 1]) in Signed permutations of 5
```

```
>>> from sage.all import *
>>> G = SignedPermutations(Integer(5))
>>> g = G([Integer(1),-Integer(3),Integer(2),Integer(5),-Integer(4)])
>>> G.conjugacy_class(g)
Conjugacy class of cycle type ([1], [2, 2]) in Signed permutations of 5
>>> G.conjugacy_class([[Integer(2),Integer(1)], [Integer(1),Integer(1)]])
Conjugacy class of cycle type ([2, 1], [1, 1]) in Signed permutations of 5
```

conjugacy_class_representative(*nu*)

Return a permutation with (signed) cycle type `nu`.

EXAMPLES:

```
sage: G = SignedPermutations(4)
sage: for nu in PartitionTuples(2, 4):
....:     print(nu, G.conjugacy_class_representative(nu))
....:     assert nu == G.conjugacy_class_representative(nu).cycle_type(), nu
([4], []) [2, 3, 4, 1]
```

(continues on next page)

(continued from previous page)

```
([3, 1], []) [2, 3, 1, 4]
([2, 2], []) [2, 1, 4, 3]

```

conjugacy_classes()

Return the list of conjugacy classes of `self`.

EXAMPLES:

```
sage: G = SignedPermutations(3)
```

(continues on next page)

(continued from previous page)

```
sage: G.conjugacy_classes()
[Conjugacy class of cycle type ([3], []) in Signed permutations of 3,
 Conjugacy class of cycle type ([2, 1], []) in Signed permutations of 3,
 Conjugacy class of cycle type ([1, 1, 1], []) in Signed permutations of 3,
 Conjugacy class of cycle type ([2], [1]) in Signed permutations of 3,
 Conjugacy class of cycle type ([1, 1], [1]) in Signed permutations of 3,
 Conjugacy class of cycle type ([1], [2]) in Signed permutations of 3,
 Conjugacy class of cycle type ([1], [1, 1]) in Signed permutations of 3,
 Conjugacy class of cycle type ([], [3]) in Signed permutations of 3,
 Conjugacy class of cycle type ([], [2, 1]) in Signed permutations of 3,
 Conjugacy class of cycle type ([], [1, 1, 1]) in Signed permutations of 3]
```

```
>>> from sage.all import *
>>> G = SignedPermutations(Integer(3))
>>> G.conjugacy_classes()
[Conjugacy class of cycle type ([3], []) in Signed permutations of 3,
 Conjugacy class of cycle type ([2, 1], []) in Signed permutations of 3,
 Conjugacy class of cycle type ([1, 1, 1], []) in Signed permutations of 3,
 Conjugacy class of cycle type ([2], [1]) in Signed permutations of 3,
 Conjugacy class of cycle type ([1, 1], [1]) in Signed permutations of 3,
 Conjugacy class of cycle type ([1], [2]) in Signed permutations of 3,
 Conjugacy class of cycle type ([1], [1, 1]) in Signed permutations of 3,
 Conjugacy class of cycle type ([], [3]) in Signed permutations of 3,
 Conjugacy class of cycle type ([], [2, 1]) in Signed permutations of 3,
 Conjugacy class of cycle type ([], [1, 1, 1]) in Signed permutations of 3]
```

long_element(*index_set=None*)

Return the longest element of `self`, or of the parabolic subgroup corresponding to the given `index_set`.

INPUT:

- `index_set` – (optional) a subset (as a list or iterable) of the nodes of the indexing set

EXAMPLES:

```
sage: S = SignedPermutations(4)
sage: S.long_element()
[-1, -2, -3, -4]
```

```
>>> from sage.all import *
>>> S = SignedPermutations(Integer(4))
>>> S.long_element()
[-1, -2, -3, -4]
```

one()

Return the identity element of `self`.

EXAMPLES:

```
sage: S = SignedPermutations(4)
sage: S.one()
[1, 2, 3, 4]
```

```
>>> from sage.all import *
>>> S = SignedPermutations(Integer(4))
>>> S.one()
[1, 2, 3, 4]
```

random_element()

Return an element drawn uniformly at random.

EXAMPLES:

```
sage: C = SignedPermutations(7)
sage: s = C.random_element(); s # random
[7, 6, -4, -5, 2, 3, -1]
sage: s in C
True
```

```
>>> from sage.all import *
>>> C = SignedPermutations(Integer(7))
>>> s = C.random_element(); s # random
[7, 6, -4, -5, 2, 3, -1]
>>> s in C
True
```

simple_module(*shape*, *base_ring*)

Return the simple module of `self` with shape `shape` over `base_ring`.

EXAMPLES:

```
sage: B4 = SignedPermutations(4)
sage: L = B4.simple_module([[], [3,1]], GF(2))
sage: L.dimension()
2
```

```
>>> from sage.all import *
>>> B4 = SignedPermutations(Integer(4))
>>> L = B4.simple_module([[], [Integer(3),Integer(1)]], GF(Integer(2)))
>>> L.dimension()
2
```

simple_reflection(*i*)

Return the `i`-th simple reflection of `self`.

EXAMPLES:

```
sage: S = SignedPermutations(4)
sage: S.simple_reflection(1)
[2, 1, 3, 4]
sage: S.simple_reflection(4)
[1, 2, 3, -4]
```

```
>>> from sage.all import *
>>> S = SignedPermutations(Integer(4))
>>> S.simple_reflection(Integer(1))
```

(continues on next page)

(continued from previous page)

```
[2, 1, 3, 4]
>>> S.simple_reflection(Integer(4))
[1, 2, 3, -4]
```

specht_module(*shape*, *base_ring*)

Return the Specht module of `self` with shape `shape` over `base_ring`.

EXAMPLES:

```
sage: B4 = SignedPermutations(4)
sage: SM = B4.specht_module([[2,1], [1]], GF(2))
sage: SM.dimension()
8
sage: SM = B4.specht_module([[], [3,1]], GF(2))
sage: SM.dimension()
3
```

```
>>> from sage.all import *
>>> B4 = SignedPermutations(Integer(4))
>>> SM = B4.specht_module([[Integer(2),Integer(1)], [Integer(1)]],␣
↪GF(Integer(2)))
>>> SM.dimension()
8
>>> SM = B4.specht_module([[], [Integer(3),Integer(1)]], GF(Integer(2)))
>>> SM.dimension()
3
```

tabloid_module(*shape*, *base_ring*)

Return the tabloid module of `self` with shape `shape` over `base_ring`.

EXAMPLES:

```
sage: B4 = SignedPermutations(4)
sage: TM = B4.tabloid_module([[2,1], [1]], GF(2))
sage: TM.dimension()
96
sage: TM = B4.tabloid_module([[], [3,1]], GF(2))
sage: TM.dimension()
4
```

```
>>> from sage.all import *
>>> B4 = SignedPermutations(Integer(4))
>>> TM = B4.tabloid_module([[Integer(2),Integer(1)], [Integer(1)]],␣
↪GF(Integer(2)))
>>> TM.dimension()
96
>>> TM = B4.tabloid_module([[], [Integer(3),Integer(1)]], GF(Integer(2)))
>>> TM.dimension()
4
```

class sage.combinat.colored_permutations.**SimpleModule**(*specht_module*)

Bases: Representation_abstract, QuotientModuleWithBasis

The simple B_n-module associated with a partition pair (λ, μ).

The simple module $D^{\lambda,\mu}$ is the quotient of the Specht module $S^{\lambda,\mu}$ by its *maximal submodule* $U^{\lambda,\mu}$.

For $p \neq 2$, a partition pair (λ, μ) is *p-regular* if λ and μ are p-regular partitions. It is 2-regular if $\lambda = \emptyset$ and μ is 2-regular.

EXAMPLES:

```
sage: B5 = SignedPermutations(5)
sage: SM = B5.specht_module([[1,1], [2,1]], GF(3))
sage: D = SM.simple_module()
sage: v = D.an_element(); v
2*D([[1], [2]], [[3, 5], [4]]) + 2*D([[1], [3]], [[2, 5], [4]])
sage: B5.an_element() * v
2*D([[1], [5]], [[2, 4], [3]]) + 2*D([[2], [5]], [[1, 4], [3]])
```

```
>>> from sage.all import *
>>> B5 = SignedPermutations(Integer(5))
>>> SM = B5.specht_module([[Integer(1),Integer(1)], [Integer(2),Integer(1)]],␣
↪GF(Integer(3)))
>>> D = SM.simple_module()
>>> v = D.an_element(); v
2*D([[1], [2]], [[3, 5], [4]]) + 2*D([[1], [3]], [[2, 5], [4]])
>>> B5.an_element() * v
2*D([[1], [5]], [[2, 4], [3]]) + 2*D([[2], [5]], [[1, 4], [3]])
```

An example of a simple module for $n = 4$ coming from the tabloid module:

```
sage: B4 = SignedPermutations(4)
sage: TM = B4.tabloid_module([[1], [2,1]], GF(3))
sage: SM = TM.specht_module()
sage: SM.dimension()
8
sage: SM.maximal_submodule().dimension()
4
sage: D = SM.simple_module()
sage: D
Simple module of ([1], [2, 1]) over Finite Field of size 3
sage: D.dimension()
4
```

```
>>> from sage.all import *
>>> B4 = SignedPermutations(Integer(4))
>>> TM = B4.tabloid_module([[Integer(1)], [Integer(2),Integer(1)]],␣
↪GF(Integer(3)))
>>> SM = TM.specht_module()
>>> SM.dimension()
8
>>> SM.maximal_submodule().dimension()
4
>>> D = SM.simple_module()
>>> D
Simple module of ([1], [2, 1]) over Finite Field of size 3
>>> D.dimension()
4
```

We give an example on how to construct the decomposition matrix (the Specht modules are a complete set of irreducible projective modules) and the Cartan matrix of a symmetric group algebra:

```
sage: B3 = SignedPermutations(3)
sage: BM = matrix(B3.simple_module(la, GF(3)).brauer_character()
....:             for la in PartitionTuples(2, 3, regular=3))
sage: SBT = matrix(B3.specht_module(la, GF(3)).brauer_character()
....:              for la in PartitionTuples(2, 3))
sage: D = SBT * ~BM; D
[1 0 0 0 0 0 0 0]
[1 1 0 0 0 0 0 0]
[0 1 0 0 0 0 0 0]
[0 0 1 0 0 0 0 0]
[0 0 0 1 0 0 0 0]
[0 0 0 0 1 0 0 0]
[0 0 0 0 0 1 0 0]
[0 0 0 0 0 0 1 0]
[0 0 0 0 0 0 1 1]
[0 0 0 0 0 0 0 1]
sage: D.transpose() * D
[2 1 0 0 0 0 0 0]
[1 2 0 0 0 0 0 0]
[0 0 1 0 0 0 0 0]
[0 0 0 1 0 0 0 0]
[0 0 0 0 1 0 0 0]
[0 0 0 0 0 1 0 0]
[0 0 0 0 0 0 2 1]
[0 0 0 0 0 0 1 2]
```

```
>>> from sage.all import *
>>> B3 = SignedPermutations(Integer(3))
>>> BM = matrix(B3.simple_module(la, GF(Integer(3))).brauer_character()
...              for la in PartitionTuples(Integer(2), Integer(3),␣
↪regular=Integer(3)))
>>> SBT = matrix(B3.specht_module(la, GF(Integer(3))).brauer_character()
...               for la in PartitionTuples(Integer(2), Integer(3)))
>>> D = SBT * ~BM; D
[1 0 0 0 0 0 0 0]
[1 1 0 0 0 0 0 0]
[0 1 0 0 0 0 0 0]
[0 0 1 0 0 0 0 0]
[0 0 0 1 0 0 0 0]
[0 0 0 0 1 0 0 0]
[0 0 0 0 0 1 0 0]
[0 0 0 0 0 0 1 0]
[0 0 0 0 0 0 1 1]
[0 0 0 0 0 0 0 1]
>>> D.transpose() * D
[2 1 0 0 0 0 0 0]
[1 2 0 0 0 0 0 0]
[0 0 1 0 0 0 0 0]
[0 0 0 1 0 0 0 0]
[0 0 0 0 1 0 0 0]
```

(continues on next page)

(continued from previous page)

```
[0 0 0 0 0 1 0 0]
[0 0 0 0 0 0 2 1]
[0 0 0 0 0 0 1 2]
```

We verify this against the direct computation (up to reindexing the rows and columns):

```
sage: B3A = B3.algebra(GF(3))
sage: B3A.cartan_invariants_matrix()  # not tested (~2 min)
[2 1 0 0 0 0 0 0]
[1 2 0 0 0 0 0 0]
[0 0 2 1 0 0 0 0]
[0 0 1 2 0 0 0 0]
[0 0 0 0 1 0 0 0]
[0 0 0 0 0 1 0 0]
[0 0 0 0 0 0 1 0]
[0 0 0 0 0 0 0 1]
```

```
>>> from sage.all import *
>>> B3A = B3.algebra(GF(Integer(3)))
>>> B3A.cartan_invariants_matrix()  # not tested (~2 min)
[2 1 0 0 0 0 0 0]
[1 2 0 0 0 0 0 0]
[0 0 2 1 0 0 0 0]
[0 0 1 2 0 0 0 0]
[0 0 0 0 1 0 0 0]
[0 0 0 0 0 1 0 0]
[0 0 0 0 0 0 1 0]
[0 0 0 0 0 0 0 1]
```

Element

alias of *Element*

class sage.combinat.colored_permutations.**SpechtModule**(*ambient*)

Bases: Representation_abstract, SubmoduleWithBasis

A Specht module of a type B_n Coxeter group in the classical standard tableau pair basis.

This is constructed as a B_n-submodule of the *TabloidModule* (also referred to as the standard module) using the polytabloid elements associated to the standard tableaux of shape (λ, μ).

We verify the set of 2-regular partitions for $n = 4$:

```
sage: B4 = SignedPermutations(4)
sage: for la in PartitionTuples(2, 4):  # long time
....:     SM = B4.specht_module(la, GF(3))
....:     if SM.gram_matrix():
....:         print(la)
([4], [])
([3, 1], [])
([2, 2], [])
([2, 1, 1], [])
([3], [1])
([2, 1], [1])
([2], [2])
```

(continues on next page)

(continued from previous page)

```
([2], [1, 1])
([1, 1], [2])
([1, 1], [1, 1])
([1], [3])
([1], [2, 1])
([], [4])
([], [3, 1])
([], [2, 2])
([], [2, 1, 1])
sage: for la in PartitionTuples(2, 4):  # long time
....:     SM = B4.specht_module(la, GF(2))
....:     if SM.gram_matrix():
....:         print(la)
([], [4])
([], [3, 1])
```

```
>>> from sage.all import *
>>> B4 = SignedPermutations(Integer(4))
>>> for la in PartitionTuples(Integer(2), Integer(4)):  # long time
...     SM = B4.specht_module(la, GF(Integer(3)))
...     if SM.gram_matrix():
...         print(la)
([4], [])
([3, 1], [])

class Element

Bases: IndexedFreeModuleElement

bilinear_form(*u*, *v*)

Return the natural bilinear form of `self` applied to `u` and `v`.

The natural bilinear form is given by the pullback of the natural bilinear form on the tabloid module (where the tabloid basis is an orthonormal basis).

EXAMPLES:

```
sage: B5 = SignedPermutations(5)
sage: SM = B5.specht_module([[1], [2,2]], QQ)
sage: u = SM.an_element(); u
2*S([[1]], [[2, 3], [4, 5]]) + 2*S([[2]], [[1, 3], [4, 5]])
 + 3*S([[3]], [[1, 2], [4, 5]])
sage: v = sum(SM.basis())
sage: SM.bilinear_form(u, v)
84
```

```
>>> from sage.all import *
>>> B5 = SignedPermutations(Integer(5))
>>> SM = B5.specht_module([[Integer(1)], [Integer(2),Integer(2)]], QQ)
>>> u = SM.an_element(); u
2*S([[1]], [[2, 3], [4, 5]]) + 2*S([[2]], [[1, 3], [4, 5]])
 + 3*S([[3]], [[1, 2], [4, 5]])
>>> v = sum(SM.basis())
>>> SM.bilinear_form(u, v)
84
```

gram_matrix()

Return the Gram matrix of the natural bilinear form of `self`.

EXAMPLES:

```
sage: B4 = SignedPermutations(4)
sage: SM = B4.specht_module([[2,1], [1]], QQ)
sage: M = SM.gram_matrix(); M
[16  8  0  0  0  0  0  0]
[ 8 16  0  0  0  0  0  0]
[ 0  0 16  0  0  8  0  0]
[ 0  0  0 16  0  0  8  0]
[ 0  0  0  0 16  0  0  8]
[ 0  0  8  0  0 16  0  0]
[ 0  0  0  8  0  0 16  0]
[ 0  0  0  0  8  0  0 16]
sage: M.det() != 0
True
```

```
>>> from sage.all import *
>>> B4 = SignedPermutations(Integer(4))
>>> SM = B4.specht_module([[Integer(2),Integer(1)], [Integer(1)]], QQ)
>>> M = SM.gram_matrix(); M
[16  8  0  0  0  0  0  0]
[ 8 16  0  0  0  0  0  0]
[ 0  0 16  0  0  8  0  0]
[ 0  0  0 16  0  0  8  0]
[ 0  0  0  0 16  0  0  8]
[ 0  0  8  0  0 16  0  0]
[ 0  0  0  8  0  0 16  0]
```

(continues on next page)

(continued from previous page)

```
[ 0  0  0  0  8  0  0 16]
>>> M.det() != Integer(0)
True
```

lift()

The lift (embedding) map from `self` to the ambient space.

EXAMPLES:

```
sage: B4 = SignedPermutations(4)
sage: SM = B4.specht_module([[1], [2,1]], QQ)
sage: SM.lift
Generic morphism:
  From: Specht module of shape ([1], [2, 1]) over Rational Field
  To:   Tabloid module of ([1], [2, 1]) over Rational Field
```

```
>>> from sage.all import *
>>> B4 = SignedPermutations(Integer(4))
>>> SM = B4.specht_module([[Integer(1)], [Integer(2),Integer(1)]], QQ)
>>> SM.lift
Generic morphism:
  From: Specht module of shape ([1], [2, 1]) over Rational Field
  To:   Tabloid module of ([1], [2, 1]) over Rational Field
```

maximal_submodule()

Return the maximal submodule of `self`.

EXAMPLES:

```
sage: B4 = SignedPermutations(4)
sage: SM = B4.specht_module([[1], [2,1]], GF(3))
sage: SM.dimension()
8
sage: U = SM.maximal_submodule()
sage: U.dimension()
4
```

```
>>> from sage.all import *
>>> B4 = SignedPermutations(Integer(4))
>>> SM = B4.specht_module([[Integer(1)], [Integer(2),Integer(1)]],␣
↪GF(Integer(3)))
>>> SM.dimension()
8
>>> U = SM.maximal_submodule()
>>> U.dimension()
4
```

retract()

The retract map from the ambient space.

EXAMPLES:

```
sage: B5 = SignedPermutations(5)
sage: X = B5.tabloid_module([[2,1], [2]], QQ)
sage: Y = X.specht_module()
sage: Y.retract
Generic morphism:
  From: Tabloid module of ([2, 1], [2]) over Rational Field
  To:   Specht module of shape ([2, 1], [2]) over Rational Field
sage: all(Y.retract(u.lift()) == u for u in Y.basis())
True

sage: Y.retract(X.zero())
0
sage: Y.retract(sum(X.basis()))
Traceback (most recent call last):
...
ValueError: ... is not in the image
```

```
>>> from sage.all import *
>>> B5 = SignedPermutations(Integer(5))
>>> X = B5.tabloid_module([[Integer(2),Integer(1)], [Integer(2)]], QQ)
>>> Y = X.specht_module()
>>> Y.retract
Generic morphism:
  From: Tabloid module of ([2, 1], [2]) over Rational Field
  To:   Specht module of shape ([2, 1], [2]) over Rational Field
>>> all(Y.retract(u.lift()) == u for u in Y.basis())
True

>>> Y.retract(X.zero())
0
>>> Y.retract(sum(X.basis()))
Traceback (most recent call last):
...
ValueError: ... is not in the image
```

simple_module()

Return the simple (or irreducible) S_n-submodule of `self`.

See also

SimpleModule

EXAMPLES:

```
sage: B4 = SignedPermutations(4)
sage: SM = B4.specht_module([[2,1], [1]], GF(3))
sage: L = SM.simple_module()
sage: L.dimension()
4

sage: SM = B4.specht_module([[2,1], [1]], QQ)
```

(continues on next page)

(continued from previous page)

```
sage: SM.simple_module() is SM
True
```

```
>>> from sage.all import *
>>> B4 = SignedPermutations(Integer(4))
>>> SM = B4.specht_module([[Integer(2),Integer(1)], [Integer(1)]],␣
↪GF(Integer(3)))
>>> L = SM.simple_module()
>>> L.dimension()
4

>>> SM.simple_module() is SM
True
```

class sage.combinat.colored_permutations.**TabloidModule**(*G*, *base_ring*, *diagram*)

Bases: Representation_abstract, *CombinatorialFreeModule*

The vector space of all tabloids of a fixed shape with the natural signed permutation group action.

A *tabloid* of size n is a pair of sequences sets (S, T) such that:

- For all $X, Y \in S \cup T$, we have $X \cap Y = \emptyset$ (all sets are pairwise disjoint).
- $\sum_{X \in S \cup T} |X| = n$.
- $\bigsqcup_{X \subseteq S \cup T} X \sqcup \overline{X} = \{1, \ldots, n, \overline{1} \ldots, \overline{n}\}$.

The signed permutation group acts naturally on the entries of each set. Hence, this is a representation of the signed permutation group defined over any field.

EXAMPLES:

```
sage: B4 = SignedPermutations(4)
sage: la = [1]
sage: mu = [2, 1]

sage: TM = B4.tabloid_module([la, mu], QQ)
sage: TM.dimension()
24
sage: chi = TM.character(); chi
(0, 0, 0, 4, 24, 0, 2, 18, 0, 0, 4, 12, 0, 2, 6, 0, 0, 0, 0, 0)
```

```
>>> from sage.all import *
>>> B4 = SignedPermutations(Integer(4))
>>> la = [Integer(1)]
>>> mu = [Integer(2), Integer(1)]

>>> TM = B4.tabloid_module([la, mu], QQ)
>>> TM.dimension()
24
>>> chi = TM.character(); chi
(0, 0, 0, 4, 24, 0, 2, 18, 0, 0, 4, 12, 0, 2, 6, 0, 0, 0, 0, 0)
```

We show how to compute the decomposition into irreducibles (it takes some time to generate the character table this way though):

```
sage: chartab = matrix([B4.specht_module(la, QQ).character()  # not tested
....:                   for la in PartitionTuples(2,4)])
sage: chi * ~chartab  # not tested
(0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1, 1, 0, 1, 2, 1, 1, 0)
```

```
>>> from sage.all import *
>>> chartab = matrix([B4.specht_module(la, QQ).character()  # not tested
...                   for la in PartitionTuples(Integer(2),Integer(4))])
>>> chi * ~chartab  # not tested
(0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1, 1, 0, 1, 2, 1, 1, 0)
```

We now do some computations for the modular representation theory:

```
sage: TM = B4.tabloid_module([la, mu], GF(3))
sage: TM.brauer_character()
(0, 0, 4, 24, 2, 18, 0, 0, 4, 12, 2, 6, 0, 0, 0, 0)
sage: IM = TM.invariant_module()
sage: IM.dimension()  # long time
1
sage: IM.basis()[0].lift() == sum(TM.basis())
True
```

```
>>> from sage.all import *
>>> TM = B4.tabloid_module([la, mu], GF(Integer(3)))
>>> TM.brauer_character()
(0, 0, 4, 24, 2, 18, 0, 0, 4, 12, 2, 6, 0, 0, 0, 0)
>>> IM = TM.invariant_module()
>>> IM.dimension()  # long time
1
>>> IM.basis()[Integer(0)].lift() == sum(TM.basis())
True
```

We verify the dimension is $2^{|\lambda|} \frac{n!}{\lambda_1! \cdots \lambda_\ell! \mu_1! \cdots \mu_m!}$:

```
sage: TM.dimension() == (2^sum(la) * factorial(4)
....:                    / prod(factorial(lai) for lai in la)
....:                    / prod(factorial(mui) for mui in mu))
True
```

```
>>> from sage.all import *
>>> TM.dimension() == (Integer(2)**sum(la) * factorial(Integer(4))
...                    / prod(factorial(lai) for lai in la)
...                    / prod(factorial(mui) for mui in mu))
True
```

We can see that the tabloid module is not symmetric with swapping $\lambda \leftrightarrow \mu$:

```
sage: TMp = B4.tabloid_module([mu, la], GF(3))
sage: TMp.dimension()
96
sage: TMp.dimension() == (2^sum(mu) * factorial(4)
....:                     / prod(factorial(mui) for mui in mu)
```

(continues on next page)

(continued from previous page)

```
....:                     / prod(factorial(lai) for lai in la))
True
```

```
>>> from sage.all import *
>>> TMp = B4.tabloid_module([mu, la], GF(Integer(3)))
>>> TMp.dimension()
96
>>> TMp.dimension() == (Integer(2)**sum(mu) * factorial(Integer(4))
...                     / prod(factorial(mui) for mui in mu)
...                     / prod(factorial(lai) for lai in la))
True
```

REFERENCES:

- [Morris1981]

bilinear_form(*u*, *v*)

Return the natural bilinear form of `self` applied to `u` and `v`.

The natural bilinear form is given by defining the tabloid basis to be orthonormal.

EXAMPLES:

```
sage: B4 = SignedPermutations(4)
sage: TM = B4.tabloid_module([[2], [1,1]], QQ)
sage: u = TM.an_element(); u
2*T([{1, 2}], [{3}, {4}]) + 2*T([{1, 2}], [{4}, {3}])
 + 3*T([{-2, 1}], [{3}, {4}])
sage: v = sum(TM.basis())
sage: TM.bilinear_form(u, v)
7
sage: TM.bilinear_form(u, TM.zero())
0
```

```
>>> from sage.all import *
>>> B4 = SignedPermutations(Integer(4))
>>> TM = B4.tabloid_module([[Integer(2)], [Integer(1),Integer(1)]], QQ)
>>> u = TM.an_element(); u
2*T([{1, 2}], [{3}, {4}]) + 2*T([{1, 2}], [{4}, {3}])
 + 3*T([{-2, 1}], [{3}, {4}])
>>> v = sum(TM.basis())
>>> TM.bilinear_form(u, v)
7
>>> TM.bilinear_form(u, TM.zero())
0
```

specht_module()

Return the Specht submodule of `self`.

EXAMPLES:

```
sage: B5 = SignedPermutations(5)
sage: TM = B5.tabloid_module([[2], [2,1]], QQ)
```

(continues on next page)

(continued from previous page)

```
sage: TM.specht_module() is B5.specht_module([[2], [2,1]], QQ)
True
```

```
>>> from sage.all import *
>>> B5 = SignedPermutations(Integer(5))
>>> TM = B5.tabloid_module([[Integer(2)], [Integer(2),Integer(1)]], QQ)
>>> TM.specht_module() is B5.specht_module([[Integer(2)], [Integer(2),
↪Integer(1)]], QQ)
True
```

Combinations

sage.combinat.combination.**Combinations**(*mset*, *k*, *as_tuples=None*)

Return the combinatorial class of combinations of the multiset `mset`. If `k` is specified, then it returns the combinatorial class of combinations of `mset` of size `k`.

A *combination* of a multiset M is an unordered selection of k objects of M, where every object can appear at most as many times as it appears in M.

The boolean keyword `as_tuples` (default: `False`) determines whether each combination is represented as a tuple or as a list.

The combinatorial classes correctly handle the cases where `mset` has duplicate elements.

EXAMPLES:

```
sage: C = Combinations(range(4)); C
Combinations of [0, 1, 2, 3]
sage: C.list()
[[],
 [0],
 [1],
 [2],
 [3],
 [0, 1],
 [0, 2],
 [0, 3],
 [1, 2],
 [1, 3],

 ['d', 'a', 'v'],
 ['d', 'a', 'i'],
 ['d', 'v', 'i'],
 ['a', 'v', 'i']]
```

```
>>> from sage.all import *
>>> mset = ["d","a","v","i","d"]
>>> Combinations(mset,Integer(3)).list()
[['d', 'd', 'a'],
 ['d', 'd', 'v'],
 ['d', 'd', 'i'],
 ['d', 'a', 'v'],
 ['d', 'a', 'i'],
 ['d', 'v', 'i'],
 ['a', 'v', 'i']]
```

```
sage: X = Combinations([1,2,3,4,5],3)
sage: [x for x in X]
[[1, 2, 3],
 [1, 2, 4],
 [1, 2, 5],
 [1, 3, 4],
 [1, 3, 5],
 [1, 4, 5],
 [2, 3, 4],
 [2, 3, 5],
```

(continues on next page)

(continued from previous page)

```
 [2, 4, 5],
 [3, 4, 5]]
```

```
>>> from sage.all import *
>>> X = Combinations([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)],
↪Integer(3))
>>> [x for x in X]
[[1, 2, 3],
 [1, 2, 4],
 [1, 2, 5],
 [1, 3, 4],
 [1, 3, 5],
 [1, 4, 5],
 [2, 3, 4],
 [2, 3, 5],
 [2, 4, 5],
 [3, 4, 5]]
```

It is possible to take combinations of Sage objects:

```
sage: Combinations([vector([1,1]), vector([2,2]), vector([3,3])], 2).list()      #␣
↪needs sage.modules
[[(1, 1), (2, 2)], [(1, 1), (3, 3)], [(2, 2), (3, 3)]]
```

```
>>> from sage.all import *
>>> Combinations([vector([Integer(1),Integer(1)]), vector([Integer(2),
↪Integer(2)]), vector([Integer(3),Integer(3)])], Integer(2)).list()      # needs␣
↪sage.modules
[[(1, 1), (2, 2)], [(1, 1), (3, 3)], [(2, 2), (3, 3)]]
```

class sage.combinat.combination.**Combinations_mset**(*mset*, *as_tuples=False*)

Bases: Parent

cardinality()

class sage.combinat.combination.**Combinations_msetk**(*mset*, *k*, *as_tuples=False*)

Bases: Parent

cardinality()

Return the size of combinations(mset, k).

IMPLEMENTATION: Wraps GAP's NrCombinations.

EXAMPLES:

```
sage: mset = [1,1,2,3,4,4,5]
sage: Combinations(mset,2).cardinality()                                        #␣
↪needs sage.libs.gap
12
```

```
>>> from sage.all import *
>>> mset = [Integer(1),Integer(1),Integer(2),Integer(3),Integer(4),Integer(4),
↪Integer(5)]
```

(continues on next page)

(continued from previous page)

```
>>> Combinations(mset,Integer(2)).cardinality()
↪     # needs sage.libs.gap
12
```

class sage.combinat.combination.**Combinations_set**(*mset*, *as_tuples=False*)

Bases: *Combinations_mset*

cardinality()

Return the size of Combinations(set).

EXAMPLES:

```
sage: Combinations(range(16000)).cardinality() == 2^16000
True
```

```
>>> from sage.all import *
>>> Combinations(range(Integer(16000))).cardinality() ==
↪Integer(2)**Integer(16000)
True
```

rank(*x*)

EXAMPLES:

```
sage: c = Combinations([1,2,3])
sage: list(range(c.cardinality())) == list(map(c.rank, c))
True
```

```
>>> from sage.all import *
>>> c = Combinations([Integer(1),Integer(2),Integer(3)])
>>> list(range(c.cardinality())) == list(map(c.rank, c))
True
```

unrank(*r*)

EXAMPLES:

```
sage: c = Combinations([1,2,3])
sage: c.list() == list(map(c.unrank, range(c.cardinality())))
True
```

```
>>> from sage.all import *
>>> c = Combinations([Integer(1),Integer(2),Integer(3)])
>>> c.list() == list(map(c.unrank, range(c.cardinality())))
True
```

class sage.combinat.combination.**Combinations_setk**(*mset*, *k*, *as_tuples=False*)

Bases: *Combinations_msetk*

cardinality()

Return the size of combinations(set, k).

EXAMPLES:

```
sage: Combinations(range(16000), 5).cardinality()
8732673194560003200
```

```
>>> from sage.all import *
>>> Combinations(range(Integer(16000)), Integer(5)).cardinality()
8732673194560003200
```

list()

EXAMPLES:

```
sage: Combinations([1,2,3,4,5],3).list()
[[1, 2, 3],
 [1, 2, 4],
 [1, 2, 5],
 [1, 3, 4],
 [1, 3, 5],
 [1, 4, 5],
 [2, 3, 4],
 [2, 3, 5],
 [2, 4, 5],
 [3, 4, 5]]
```

```
>>> from sage.all import *
>>> Combinations([Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)],
↪Integer(3)).list()
[[1, 2, 3],
 [1, 2, 4],
 [1, 2, 5],
 [1, 3, 4],
 [1, 3, 5],
 [1, 4, 5],
 [2, 3, 4],
 [2, 3, 5],
 [2, 4, 5],
 [3, 4, 5]]
```

rank(x)

EXAMPLES:

```
sage: c = Combinations([1,2,3], 2)
sage: list(range(c.cardinality())) == list(map(c.rank, c.list()))
True
```

```
>>> from sage.all import *
>>> c = Combinations([Integer(1),Integer(2),Integer(3)], Integer(2))
>>> list(range(c.cardinality())) == list(map(c.rank, c.list()))
True
```

unrank(r)

EXAMPLES:

```
sage: c = Combinations([1,2,3], 2)
sage: c.list() == list(map(c.unrank, range(c.cardinality())))
True
```

```
>>> from sage.all import *
>>> c = Combinations([Integer(1),Integer(2),Integer(3)], Integer(2))
>>> c.list() == list(map(c.unrank, range(c.cardinality())))
True
```

sage.combinat.combination.**from_rank**(*r*, *n*, *k*)

Return the combination of rank `r` in the subsets of `range(n)` of size `k` when listed in lexicographic order.

The algorithm used is based on factoradics and presented in [DGH2020]. It is there compared to the other from the literature.

EXAMPLES:

```
sage: import sage.combinat.combination as combination
sage: combination.from_rank(0,3,0)
()
sage: combination.from_rank(0,3,1)
(0,)
sage: combination.from_rank(1,3,1)
(1,)
sage: combination.from_rank(2,3,1)
(2,)
sage: combination.from_rank(0,3,2)
(0, 1)
sage: combination.from_rank(1,3,2)
(0, 2)
sage: combination.from_rank(2,3,2)
(1, 2)
sage: combination.from_rank(0,3,3)
(0, 1, 2)
```

```
>>> from sage.all import *
>>> import sage.combinat.combination as combination
>>> combination.from_rank(Integer(0),Integer(3),Integer(0))
()
>>> combination.from_rank(Integer(0),Integer(3),Integer(1))
(0,)
>>> combination.from_rank(Integer(1),Integer(3),Integer(1))
(1,)
>>> combination.from_rank(Integer(2),Integer(3),Integer(1))
(2,)
>>> combination.from_rank(Integer(0),Integer(3),Integer(2))
(0, 1)
>>> combination.from_rank(Integer(1),Integer(3),Integer(2))
(0, 2)
>>> combination.from_rank(Integer(2),Integer(3),Integer(2))
(1, 2)
>>> combination.from_rank(Integer(0),Integer(3),Integer(3))
(0, 1, 2)
```

sage.combinat.combination.**rank**(*comb*, *n*, *check=True*)

Return the rank of `comb` in the subsets of `range(n)` of size `k` where `k` is the length of `comb`.

The algorithm used is based on combinadics and James McCaffrey's MSDN article. See: Wikipedia article Combinadic.

EXAMPLES:

```
sage: import sage.combinat.combination as combination
sage: combination.rank((), 3)
0
sage: combination.rank((0,), 3)
0
sage: combination.rank((1,), 3)
1
sage: combination.rank((2,), 3)
2
sage: combination.rank((0,1), 3)
0
sage: combination.rank((0,2), 3)
1
sage: combination.rank((1,2), 3)
2
sage: combination.rank((0,1,2), 3)
0

sage: combination.rank((0,1,2,3), 3)
Traceback (most recent call last):
...
ValueError: len(comb) must be <= n
sage: combination.rank((0,0), 2)
Traceback (most recent call last):
...
ValueError: comb must be a subword of (0,1,...,n)

sage: combination.rank([1,2], 3)
2
sage: combination.rank([0,1,2], 3)
0
```

```
>>> from sage.all import *
>>> import sage.combinat.combination as combination
>>> combination.rank((), Integer(3))
0
>>> combination.rank((Integer(0),), Integer(3))
0
>>> combination.rank((Integer(1),), Integer(3))
1
>>> combination.rank((Integer(2),), Integer(3))
2
>>> combination.rank((Integer(0),Integer(1)), Integer(3))
0
>>> combination.rank((Integer(0),Integer(2)), Integer(3))
1
```

(continues on next page)

(continued from previous page)

```
>>> combination.rank((Integer(1),Integer(2)), Integer(3))
2
>>> combination.rank((Integer(0),Integer(1),Integer(2)), Integer(3))
0

>>> combination.rank((Integer(0),Integer(1),Integer(2),Integer(3)), Integer(3))
Traceback (most recent call last):
...
ValueError: len(comb) must be <= n
>>> combination.rank((Integer(0),Integer(0)), Integer(2))
Traceback (most recent call last):
...
ValueError: comb must be a subword of (0,1,...,n)

>>> combination.rank([Integer(1),Integer(2)], Integer(3))
2
>>> combination.rank([Integer(0),Integer(1),Integer(2)], Integer(3))
0
```

Combinatorial diagrams

A combinatorial diagram is a collection of cells (i, j) indexed by pairs of natural numbers.

For arbitrary diagrams, see *Diagram*. There are also two other specific types of diagrams implemented here. They are northwest diagrams (*NorthwestDiagram*) and Rothe diagrams (*RotheDiagram()*, a special kind of northwest diagram).

AUTHORS:

- Trevor K. Karn (2022-08-01): initial version

class sage.combinat.diagram.**Diagram**(*parent*, *cells*, *n_rows=None*, *n_cols=None*, *check=True*)

Bases: ClonableArray

Combinatorial diagrams with positions indexed by rows and columns.

The positions are indexed by rows and columns as in a matrix. For example, a Ferrers diagram is a diagram obtained from a partition $\lambda = (\lambda_0, \lambda_1, \ldots, \lambda_\ell)$, where the cells are in rows i for $0 \leq i \leq \ell$ and the cells in row i consist of (i, j) for $0 \leq j < \lambda_i$. In English notation, the indices are read from top left to bottom right as in a matrix.

Indexing conventions are the same as *Partition*. Printing the diagram of a partition, however, will always be in English notation.

EXAMPLES:

To create an arbitrary diagram, pass a list of all cells:

```
sage: from sage.combinat.diagram import Diagram
sage: cells = [(0,0), (0,1), (1,0), (1,1), (4,4), (4,5), (4,6), (5,4), (7, 6)]
sage: D = Diagram(cells); D
[(0, 0), (0, 1), (1, 0), (1, 1), (4, 4), (4, 5), (4, 6), (5, 4), (7, 6)]
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import Diagram
>>> cells = [(Integer(0),Integer(0)), (Integer(0),Integer(1)), (Integer(1),
↪Integer(0)), (Integer(1),Integer(1)), (Integer(4),Integer(4)), (Integer(4),
```

(continues on next page)

(continued from previous page)

```
↪Integer(5)), (Integer(4),Integer(6)), (Integer(5),Integer(4)), (Integer(7),␣
↪Integer(6))]
>>> D = Diagram(cells); D
[(0, 0), (0, 1), (1, 0), (1, 1), (4, 4), (4, 5), (4, 6), (5, 4), (7, 6)]
```

We can visualize the diagram by printing `O`'s and `.`'s. `O`'s are present in the cells which are present in the diagram and a `.` represents the absence of a cell in the diagram:

```
sage: D.pp()
O O . . . . .
O O . . . . .
. . . . . . .
. . . . . . .
. . . . O O O
. . . . O . .
. . . . . . .
. . . . . . O
```

```
>>> from sage.all import *
>>> D.pp()
O O . . . . .
O O . . . . .
. . . . . . .
. . . . . . .
. . . . O O O
. . . . O . .
. . . . . . .
. . . . . . O
```

We can also check if certain cells are contained in a given diagram:

```
sage: (1, 0) in D
True
sage: (2, 2) in D
False
```

```
>>> from sage.all import *
>>> (Integer(1), Integer(0)) in D
True
>>> (Integer(2), Integer(2)) in D
False
```

If you know that there are entire empty rows or columns at the end of the diagram, you can manually pass them with keyword arguments `n_rows=` or `n_cols=`:

```
sage: Diagram([(0,0), (0,3), (2,2), (2,4)]).pp()
O . . O .
. . . . .
. . O . O
sage: Diagram([(0,0), (0,3), (2,2), (2,4)], n_rows=6, n_cols=6).pp()
O . . O . .
. . . . . .
```

(continues on next page)

(continued from previous page)

```
. . O . O .
. . . . . .
. . . . . .
. . . . . .
```

```
>>> from sage.all import *
>>> Diagram([(Integer(0),Integer(0)), (Integer(0),Integer(3)), (Integer(2),
↪Integer(2)), (Integer(2),Integer(4))]).pp()
O . . O .
. . . . .
. . O . O
>>> Diagram([(Integer(0),Integer(0)), (Integer(0),Integer(3)), (Integer(2),
↪Integer(2)), (Integer(2),Integer(4))], n_rows=Integer(6), n_cols=Integer(6)).
↪pp()
O . . O . .
. . . . . .
. . O . O .
. . . . . .
. . . . . .
. . . . . .
```

cells()

Return a `list` of the cells contained in the diagram `self`.

EXAMPLES:

```
sage: from sage.combinat.diagram import Diagram
sage: D1 = Diagram([(0,2),(0,3),(1,1),(3,2)])
sage: D1.cells()
[(0, 2), (0, 3), (1, 1), (3, 2)]
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import Diagram
>>> D1 = Diagram([(Integer(0),Integer(2)),(Integer(0),Integer(3)),(Integer(1),
↪Integer(1)),(Integer(3),Integer(2))])
>>> D1.cells()
[(0, 2), (0, 3), (1, 1), (3, 2)]
```

check()

Check that this is a valid diagram.

EXAMPLES:

```
sage: from sage.combinat.diagram import Diagram
sage: D = Diagram([(0,0), (0,3), (2,2), (2,4)])
sage: D.check()
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import Diagram
>>> D = Diagram([(Integer(0),Integer(0)), (Integer(0),Integer(3)),␣
↪(Integer(2),Integer(2)), (Integer(2),Integer(4))])
>>> D.check()
```

In the next two examples, a bad diagram is passed. The first example fails because one cell is indexed by negative integers:

```
sage: D = Diagram([(0,0), (0,-3), (2,2), (2,4)])
Traceback (most recent call last):
...
ValueError: diagrams must be indexed by nonnegative integers
```

```
>>> from sage.all import *
>>> D = Diagram([(Integer(0),Integer(0)), (Integer(0),-Integer(3)),␣
↪(Integer(2),Integer(2)), (Integer(2),Integer(4))])
Traceback (most recent call last):
...
ValueError: diagrams must be indexed by nonnegative integers
```

The next example fails because one cell is indexed by rational numbers:

```
sage: D = Diagram([(0,0), (0,3), (2/3,2), (2,4)])
Traceback (most recent call last):
...
ValueError: diagrams must be indexed by nonnegative integers
```

```
>>> from sage.all import *
>>> D = Diagram([(Integer(0),Integer(0)), (Integer(0),Integer(3)),␣
↪(Integer(2)/Integer(3),Integer(2)), (Integer(2),Integer(4))])
Traceback (most recent call last):
...
ValueError: diagrams must be indexed by nonnegative integers
```

essential_set()

Return the essential set of `self` as defined by Fulton.

Let D be a diagram. Then the *essential set* of D are the cells $(i, j) \in D$ such that $(i + 1, j) \notin D$ and $(i, j + 1) \notin D$; that is, the maximally southwest elements in each connected component of D.

EXAMPLES:

```
sage: w = Permutation([2, 1, 5, 4, 3])
sage: D = w.rothe_diagram()
sage: D.essential_set()
((0, 0), (2, 3), (3, 2))
```

```
>>> from sage.all import *
>>> w = Permutation([Integer(2), Integer(1), Integer(5), Integer(4),␣
↪Integer(3)])
>>> D = w.rothe_diagram()
>>> D.essential_set()
((0, 0), (2, 3), (3, 2))
```

n_cells()

alias of *number_of_cells()*.

ncols()

alias of *number_of_cols()*.

nrows()

alias of *number_of_rows()*.

number_of_cells()

Return the total number of cells contained in the diagram `self`.

EXAMPLES:

```
sage: from sage.combinat.diagram import Diagram
sage: D1 = Diagram([(0,2),(0,3),(1,1),(3,2)])
sage: D1.number_of_cells()
4
sage: D1.n_cells()
4
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import Diagram
>>> D1 = Diagram([(Integer(0),Integer(2)),(Integer(0),Integer(3)),(Integer(1),
↪Integer(1)),(Integer(3),Integer(2))])
>>> D1.number_of_cells()
4
>>> D1.n_cells()
4
```

number_of_cols()

Return the total number of rows of `self`.

EXAMPLES:

The following example has three columns which are filled, but they are contained in rows 0 to 3 (for a total of four):

```
sage: from sage.combinat.diagram import Diagram
sage: D = Diagram([(0,2),(0,3),(1,1),(3,2)])
sage: D.number_of_cols()
4
sage: D.ncols()
4
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import Diagram
>>> D = Diagram([(Integer(0),Integer(2)),(Integer(0),Integer(3)),(Integer(1),
↪Integer(1)),(Integer(3),Integer(2))])
>>> D.number_of_cols()
4
>>> D.ncols()
4
```

We can also include empty columns at the end:

```
sage: from sage.combinat.diagram import Diagram
sage: D = Diagram([(0,2),(0,3),(1,1),(3,2)], n_cols=6)
sage: D.number_of_cols()
6
sage: D.pp()
```

(continues on next page)

(continued from previous page)

```
. . O O . .
. O . . . .
. . . . . .
. . O . . .
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import Diagram
>>> D = Diagram([(Integer(0),Integer(2)),(Integer(0),Integer(3)),(Integer(1),
↪Integer(1)),(Integer(3),Integer(2))], n_cols=Integer(6))
>>> D.number_of_cols()
6
>>> D.pp()
. . O O . .
. O . . . .
. . . . . .
. . O . . .
```

number_of_rows()

Return the total number of rows of `self`.

EXAMPLES:

The following example has three rows which are filled, but they are contained in rows 0 to 3 (for a total of four):

```
sage: from sage.combinat.diagram import Diagram
sage: D1 = Diagram([(0,2),(0,3),(1,1),(3,2)])
sage: D1.number_of_rows()
4
sage: D1.nrows()
4
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import Diagram
>>> D1 = Diagram([(Integer(0),Integer(2)),(Integer(0),Integer(3)),(Integer(1),
↪Integer(1)),(Integer(3),Integer(2))])
>>> D1.number_of_rows()
4
>>> D1.nrows()
4
```

The total number of rows includes including those which are empty. We can also include empty rows at the end:

```
sage: from sage.combinat.diagram import Diagram
sage: D = Diagram([(0,2),(0,3),(1,1),(3,2)], n_rows=6)
sage: D.number_of_rows()
6
sage: D.pp()
. . O O
. O . .
. . . .
. . O .
```

(continues on next page)

(continued from previous page)

```
. . . .
. . . .
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import Diagram
>>> D = Diagram([(Integer(0),Integer(2)),(Integer(0),Integer(3)),(Integer(1),
↪Integer(1)),(Integer(3),Integer(2))], n_rows=Integer(6))
>>> D.number_of_rows()
6
>>> D.pp()
. . O O
. O . .
. . . .
. . O .
. . . .
. . . .
```

pp()

Return a visualization of the diagram.

Cells which are present in the diagram are filled with a o. Cells which are not present in the diagram are filled with a ..

EXAMPLES:

```
sage: from sage.combinat.diagram import Diagram
sage: Diagram([(0,0), (0,3), (2,2), (2,4)]).pp()
O . . O .
. . . . .
. . O . O
sage: Diagram([(0,0), (0,3), (2,2), (2,4)], n_rows=6, n_cols=6).pp()
O . . O . .
. . . . . .
. . O . O .
. . . . . .
. . . . . .
. . . . . .
sage: Diagram([]).pp()
-
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import Diagram
>>> Diagram([(Integer(0),Integer(0)), (Integer(0),Integer(3)), (Integer(2),
↪Integer(2)), (Integer(2),Integer(4))]).pp()
O . . O .
. . . . .
. . O . O
>>> Diagram([(Integer(0),Integer(0)), (Integer(0),Integer(3)), (Integer(2),
↪Integer(2)), (Integer(2),Integer(4))], n_rows=Integer(6), n_
↪cols=Integer(6)).pp()
O . . O . .
. . . . . .
```

(continues on next page)

(continued from previous page)

```
. . O . O .
. . . . . .
. . . . . .
. . . . . .
>>> Diagram([]).pp()
-
```

size()

alias of *number_of_cells()*.

specht_module(*base_ring=None*)

Return the Specht module corresponding to `self`.

EXAMPLES:

```
sage: from sage.combinat.diagram import Diagram
sage: D = Diagram([(0,0), (1,1), (2,2), (2,3)])
sage: SM = D.specht_module(QQ)                                          #␣
↪needs sage.modules
sage: s = SymmetricFunctions(QQ).s()                                    #␣
↪needs sage.modules
sage: s(SM.frobenius_image())                                           #␣
↪needs sage.modules
s[2, 1, 1] + s[2, 2] + 2*s[3, 1] + s[4]
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import Diagram
>>> D = Diagram([(Integer(0),Integer(0)), (Integer(1),Integer(1)),␣
↪(Integer(2),Integer(2)), (Integer(2),Integer(3))])
>>> SM = D.specht_module(QQ)                                            #␣
↪needs sage.modules
>>> s = SymmetricFunctions(QQ).s()                                      #␣
↪needs sage.modules
>>> s(SM.frobenius_image())                                             #␣
↪needs sage.modules
s[2, 1, 1] + s[2, 2] + 2*s[3, 1] + s[4]
```

specht_module_dimension(*base_ring=None*)

Return the dimension of the Specht module corresponding to `self`.

INPUT:

- `base_ring` – (default: $\mathbf{Q}$) the base ring

EXAMPLES:

```
sage: from sage.combinat.diagram import Diagram
sage: D = Diagram([(0,0), (1,1), (2,2), (2,3)])
sage: D.specht_module_dimension()                                       #␣
↪needs sage.modules
12
sage: D.specht_module(QQ).dimension()                                   #␣
↪needs sage.modules
12
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import Diagram
>>> D = Diagram([(Integer(0),Integer(0)), (Integer(1),Integer(1)),␣
↪(Integer(2),Integer(2)), (Integer(2),Integer(3))])
>>> D.specht_module_dimension()                                    #␣
↪needs sage.modules
12
>>> D.specht_module(QQ).dimension()                                #␣
↪needs sage.modules
12
```

class sage.combinat.diagram.**Diagrams**(*category=None*)

Bases: UniqueRepresentation, Parent

The class of combinatorial diagrams.

A *combinatorial diagram* is a set of cells indexed by pairs of natural numbers. Calling an instance of *Diagrams* is one way to construct diagrams.

EXAMPLES:

```
sage: from sage.combinat.diagram import Diagrams
sage: Dgms = Diagrams()
sage: D = Dgms([(0,0), (0,3), (2,2), (2,4)])
sage: D.parent()
Combinatorial diagrams
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import Diagrams
>>> Dgms = Diagrams()
>>> D = Dgms([(Integer(0),Integer(0)), (Integer(0),Integer(3)), (Integer(2),
↪Integer(2)), (Integer(2),Integer(4))])
>>> D.parent()
Combinatorial diagrams
```

Element

alias of *Diagram*

from_composition(*alpha*)

Create the diagram corresponding to a weak composition $\alpha \vDash n$.

EXAMPLES:

```
sage: alpha = IntegerVectors()([3,0,2,1,4,4])
sage: from sage.combinat.diagram import Diagrams
sage: Diagrams()(alpha).pp()
O O O .
. . . .
O O . .
O . . .
O O O O
O O O O
sage: Diagrams().from_composition(alpha).pp()
O O O .
. . . .
```

(continues on next page)

(continued from previous page)

```
O O . .
O . . .
O O O O
O O O O
```

```
>>> from sage.all import *
>>> alpha = IntegerVectors()([Integer(3),Integer(0),Integer(2),Integer(1),
↪Integer(4),Integer(4)])
>>> from sage.combinat.diagram import Diagrams
>>> Diagrams()(alpha).pp()
O O O .
. . . .
O O . .
O . . .
O O O O
O O O O
>>> Diagrams().from_composition(alpha).pp()
O O O .
. . . .
O O . .
O . . .
O O O O
O O O O
```

from_polyomino(*p*)

Create the diagram corresponding to a 2d *Polyomino*

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino                    #␣
↪needs sage.modules
sage: p = Polyomino([(0,0),(1,0),(1,1),(1,2)])                      #␣
↪needs sage.modules
sage: from sage.combinat.diagram import Diagrams
sage: Diagrams()(p).pp()                                            #␣
↪needs sage.modules
O . .
O O O
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino                      #␣
↪needs sage.modules
>>> p = Polyomino([(Integer(0),Integer(0)),(Integer(1),Integer(0)),
↪(Integer(1),Integer(1)),(Integer(1),Integer(2))])                  ␣
↪    # needs sage.modules
>>> from sage.combinat.diagram import Diagrams
>>> Diagrams()(p).pp()                                              #␣
↪needs sage.modules
O . .
O O O
```

We can also call this method directly:

```
sage: Diagrams().from_polyomino(p).pp()                                    #␣
↪needs sage.modules
O . .
O O O
```

```
>>> from sage.all import *
>>> Diagrams().from_polyomino(p).pp()                                      #␣
↪needs sage.modules
O . .
O O O
```

This only works for a 2d *Polyomino*:

```
sage: p = Polyomino([(0,0,0), (0,1,0), (1,1,0), (1,1,1)], color='blue')    #␣
↪needs sage.modules
sage: Diagrams().from_polyomino(p)                                         #␣
↪needs sage.modules
Traceback (most recent call last):
...
ValueError: the polyomino must be 2 dimensional
```

```
>>> from sage.all import *
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(1),
↪Integer(0)), (Integer(1),Integer(1),Integer(0)), (Integer(1),Integer(1),
↪Integer(1))], color='blue')     # needs sage.modules
>>> Diagrams().from_polyomino(p)                                           #␣
↪needs sage.modules
Traceback (most recent call last):
...
ValueError: the polyomino must be 2 dimensional
```

from_zero_one_matrix(*M*, *check=True*)

Get a diagram from a matrix with entries in $\{0, 1\}$, where positions of cells are indicated by the 1's.

EXAMPLES:

```
sage: M = matrix([[1,0,1,1],[0,1,1,0]])                                   #␣
↪needs sage.modules
sage: from sage.combinat.diagram import Diagrams
sage: Diagrams()(M).pp()                                                   #␣
↪needs sage.modules
O . O O
. O O .
sage: Diagrams().from_zero_one_matrix(M).pp()                              #␣
↪needs sage.modules
O . O O
. O O .

sage: M = matrix([[1, 0, 0], [1, 0, 0], [0, 0, 0]])                       #␣
↪needs sage.modules
sage: Diagrams()(M).pp()                                                   #␣
↪needs sage.modules
O . .
```

(continues on next page)

(continued from previous page)

```
O . .
. . .
```

```
>>> from sage.all import *
>>> M = matrix([[Integer(1),Integer(0),Integer(1),Integer(1)],[Integer(0),
↪Integer(1),Integer(1),Integer(0)]])                                    #␣
↪needs sage.modules
>>> from sage.combinat.diagram import Diagrams
>>> Diagrams()(M).pp()                                                  #␣
↪needs sage.modules
O . O O
. O O .
>>> Diagrams().from_zero_one_matrix(M).pp()                             #␣
↪needs sage.modules
O . O O
. O O .

>>> M = matrix([[Integer(1), Integer(0), Integer(0)], [Integer(1), Integer(0),
↪ Integer(0)], [Integer(0), Integer(0), Integer(0)]])                    ␣
↪ # needs sage.modules
>>> Diagrams()(M).pp()                                                  #␣
↪needs sage.modules
O . .
O . .
. . .
```

class sage.combinat.diagram.**NorthwestDiagram**(*parent*, *cells*, *n_rows=None*, *n_cols=None*, *check=True*)

Bases: *Diagram*

Diagrams with the northwest property.

A diagram is a set of cells indexed by natural numbers. Such a diagram has the *northwest property* if the presence of cells $(i1, j1)$ and $(i2, j2)$ implies the presence of the cell $(\min(i1, i2), \min(j1, j2))$. Diagrams with the northwest property are called *northwest diagrams*.

For general diagrams see *Diagram*.

EXAMPLES:

```
sage: from sage.combinat.diagram import NorthwestDiagram
sage: N = NorthwestDiagram([(0,0), (0, 2), (2,0)])
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import NorthwestDiagram
>>> N = NorthwestDiagram([(Integer(0),Integer(0)), (Integer(0), Integer(2)),␣
↪(Integer(2),Integer(0))])
```

To visualize them, use the `.pp()` method:

```
sage: N.pp()
O . O
. . .
O . .
```

```
>>> from sage.all import *
>>> N.pp()
O . O
. . .
O . .
```

check()

A diagram has the northwest property if the presence of cells $(i1, j1)$ and $(i2, j2)$ implies the presence of the cell $(min(i1, i2), min(j1, j2))$. This method checks if the northwest property is satisfied for `self`

EXAMPLES:

```
sage: from sage.combinat.diagram import NorthwestDiagram
sage: N = NorthwestDiagram([(0,0), (0,3), (3,0)])
sage: N.check()
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import NorthwestDiagram
>>> N = NorthwestDiagram([(Integer(0),Integer(0)), (Integer(0),Integer(3)),␣
↪(Integer(3),Integer(0))])
>>> N.check()
```

Here is a non-example:

```
sage: notN = NorthwestDiagram([(0,1), (1,0)])  #.check() is implicit
Traceback (most recent call last):
...
ValueError: diagram is not northwest
```

```
>>> from sage.all import *
>>> notN = NorthwestDiagram([(Integer(0),Integer(1)), (Integer(1),
↪Integer(0))])  #.check() is implicit
Traceback (most recent call last):
...
ValueError: diagram is not northwest
```

peelable_tableaux()

Return the set of peelable tableaux whose diagram is `self`.

For a fixed northwest diagram D, we say that a Young tableau T is D-peelable if:

1. the row indices of the cells in the first column of D are the entries in an initial segment in the first column of T and
2. the tableau Q obtained by removing those cells from T and playing jeu de taquin is $(D - C)$-peelable, where $D - C$ is the diagram formed by forgetting the first column of D.

Reiner and Shimozono [RS1995] showed that the number $\mathrm{red}(w)$ of reduced words of a permutation w may be computed using the peelable tableaux of the Rothe diagram $D(w)$. Explicitly,

$$\mathrm{red}(w) = \sum_T f_{\mathrm{shape}\, T},$$

where the sum runs over the $D(w)$-peelable tableaux T and f_λ is the number of standard Young tableaux of shape λ (which may be computed using the hook-length formula).

EXAMPLES:

We can compute the D-peelable diagrams for a northwest diagram D:

```
sage: from sage.combinat.diagram import NorthwestDiagram
sage: cells = [(0,0), (0,1), (0,2), (1,0), (2,0), (2,2), (2,4),
....:          (4,0), (4,2)]
sage: D = NorthwestDiagram(cells); D.pp()
O O O . .
O . . . .
O . O . O
. . . . .
O . O . .
sage: D.peelable_tableaux()
{[[1, 1, 1], [2, 3, 3], [3, 5], [5]],
[[1, 1, 1, 3], [2, 3], [3, 5], [5]]}
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import NorthwestDiagram
>>> cells = [(Integer(0),Integer(0)), (Integer(0),Integer(1)), (Integer(0),
↪Integer(2)), (Integer(1),Integer(0)), (Integer(2),Integer(0)), (Integer(2),
↪Integer(2)), (Integer(2),Integer(4)),
...           (Integer(4),Integer(0)), (Integer(4),Integer(2))]
>>> D = NorthwestDiagram(cells); D.pp()
O O O . .
O . . . .
O . O . O
. . . . .
O . O . .
>>> D.peelable_tableaux()
{[[1, 1, 1], [2, 3, 3], [3, 5], [5]],
[[1, 1, 1, 3], [2, 3], [3, 5], [5]]}
```

EXAMPLES:

If the diagram is only one column, there is only one peelable tableau:

```
sage: from sage.combinat.diagram import NorthwestDiagram
sage: NWD = NorthwestDiagram([(0,0), (2,0)])
sage: NWD.peelable_tableaux()
{[[1], [3]]}
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import NorthwestDiagram
>>> NWD = NorthwestDiagram([(Integer(0),Integer(0)), (Integer(2),Integer(0))])
>>> NWD.peelable_tableaux()
{[[1], [3]]}
```

From [RS1995], we know that there is only one peelable tableau for the Rothe diagram of the permutation (in one line notation) 251643:

```
sage: D = NorthwestDiagram([(1, 2), (1, 3), (3, 2), (3, 3), (4, 2)])
sage: D.pp()
. . . .
```

(continues on next page)

(continued from previous page)

```
. . O O
. . . .
. . O O
. . O .

sage: D.peelable_tableaux()
{[[2, 2], [4, 4], [5]]}
```

```
>>> from sage.all import *
>>> D = NorthwestDiagram([(Integer(1), Integer(2)), (Integer(1), Integer(3)),␣
↪(Integer(3), Integer(2)), (Integer(3), Integer(3)), (Integer(4),␣
↪Integer(2))])
>>> D.pp()
. . . .
. . O O
. . . .
. . O O
. . O .

>>> D.peelable_tableaux()
{[[2, 2], [4, 4], [5]]}
```

Here are all the intermediate steps to compute the peelables for the Rothe diagram of (in one-line notation) 64817235. They are listed from deepest in the recursion to the final step. The recursion has depth five in this case so we will label the intermediate tableaux by D_i where i is the step in the recursion at which they appear.

Start with the one that has a single column:

```
sage: D5 = NorthwestDiagram([(2,0)]); D5.pp()
.
.
O
sage: D5.peelable_tableaux()
{[[3]]}
```

```
>>> from sage.all import *
>>> D5 = NorthwestDiagram([(Integer(2),Integer(0))]); D5.pp()
.
.
O
>>> D5.peelable_tableaux()
{[[3]]}
```

Now we know all of the D_5 peelables, so we can compute the D_4 peelables:

```
sage: D4 = NorthwestDiagram([(0, 0), (2,0), (4, 0), (2, 2)])
sage: D4.pp()
O . .
. . .
O . O
. . .
O . .
```

(continues on next page)

(continued from previous page)

```
sage: D4.peelable_tableaux()
{[[1, 3], [3], [5]]}
```

```
>>> from sage.all import *
>>> D4 = NorthwestDiagram([(Integer(0), Integer(0)), (Integer(2),Integer(0)),␣
↪(Integer(4), Integer(0)), (Integer(2), Integer(2))])
>>> D4.pp()
O . .
. . .
O . O
. . .
O . .

>>> D4.peelable_tableaux()
{[[1, 3], [3], [5]]}
```

There is only one D_4 peelable, so we can compute the D_3 peelables:

```
sage: D3 = NorthwestDiagram([(0,0), (0,1), (2, 1), (2, 3), (4,1)])
sage: D3.pp()
O O . .
. . . .
. O . O
. . . .
. O . .

sage: D3.peelable_tableaux()
{[[1, 1], [3, 3], [5]], [[1, 1, 3], [3], [5]]}
```

```
>>> from sage.all import *
>>> D3 = NorthwestDiagram([(Integer(0),Integer(0)), (Integer(0),Integer(1)),␣
↪(Integer(2), Integer(1)), (Integer(2), Integer(3)), (Integer(4),
↪Integer(1))])
>>> D3.pp()
O O . .
. . . .
. O . O
. . . .
. O . .

>>> D3.peelable_tableaux()
{[[1, 1], [3, 3], [5]], [[1, 1, 3], [3], [5]]}
```

Now compute the D_2 peelables:

```
sage: cells = [(0,0), (0,1), (0,2), (1,0), (2,0), (2,2), (2,4),
....:          (4,0), (4,2)]
sage: D2 = NorthwestDiagram(cells); D2.pp()
O O O . .
O . . . .
O . O . O
```

(continues on next page)

(continued from previous page)

```
. . . . .
O . O . .

sage: D2.peelable_tableaux()
{[[1, 1, 1], [2, 3, 3], [3, 5], [5]],
[[1, 1, 1, 3], [2, 3], [3, 5], [5]]}
```

```
>>> from sage.all import *
>>> cells = [(Integer(0),Integer(0)), (Integer(0),Integer(1)), (Integer(0),
↪Integer(2)), (Integer(1),Integer(0)), (Integer(2),Integer(0)), (Integer(2),
↪Integer(2)), (Integer(2),Integer(4)),
...           (Integer(4),Integer(0)), (Integer(4),Integer(2))]
>>> D2 = NorthwestDiagram(cells); D2.pp()
O O O . .
O . . . .
O . O . O
. . . . .
O . O . .

>>> D2.peelable_tableaux()
{[[1, 1, 1], [2, 3, 3], [3, 5], [5]],
[[1, 1, 1, 3], [2, 3], [3, 5], [5]]}
```

And the D_1 peelables:

```
sage: cells = [(0,0), (0,1), (0,2), (0,3), (1,0), (1,1), (2,0),
....:          (2,1), (2,3), (2,5), (4,0), (4,1), (4,3)]
sage: D1 = NorthwestDiagram(cells); D1.pp()
O O O O . .
O O . . . .
O O . O . O
. . . . . .
O O . O . .

sage: D1.peelable_tableaux()
{[[1, 1, 1, 1], [2, 2, 3, 3], [3, 3, 5], [5, 5]],
[[1, 1, 1, 1, 3], [2, 2, 3], [3, 3, 5], [5, 5]]}
```

```
>>> from sage.all import *
>>> cells = [(Integer(0),Integer(0)), (Integer(0),Integer(1)), (Integer(0),
↪Integer(2)), (Integer(0),Integer(3)), (Integer(1),Integer(0)), (Integer(1),
↪Integer(1)), (Integer(2),Integer(0)),
...           (Integer(2),Integer(1)), (Integer(2),Integer(3)), (Integer(2),
↪Integer(5)), (Integer(4),Integer(0)), (Integer(4),Integer(1)), (Integer(4),
↪Integer(3))]
>>> D1 = NorthwestDiagram(cells); D1.pp()
O O O O . .
O O . . . .
O O . O . O
. . . . . .
O O . O . .
```

(continues on next page)

(continued from previous page)

```
>>> D1.peelable_tableaux()
{[[1, 1, 1, 1], [2, 2, 3, 3], [3, 3, 5], [5, 5]],
[[1, 1, 1, 1, 3], [2, 2, 3], [3, 3, 5], [5, 5]]}
```

Which we can use to get the D peelables:

```
sage: cells = [(0,0), (0,1), (0,2), (0,3), (0,4),
....:          (1,0), (1,1), (1,2),
....:          (2,0), (2,1), (2,2), (2,4), (2,6),
....:                 (4,1), (4,2), (4,4)]
sage: D = NorthwestDiagram(cells); D.pp()
O O O O O . .
O O O . . . .
O O O . O . O
. . . . . . .
. O O . O . .
sage: D.peelable_tableaux()
{[[1, 1, 1, 1, 1], [2, 2, 2, 3, 3], [3, 3, 3], [5, 5, 5]],
 [[1, 1, 1, 1, 1], [2, 2, 2, 3, 3], [3, 3, 3, 5], [5, 5]],
 [[1, 1, 1, 1, 1, 3], [2, 2, 2, 3], [3, 3, 3], [5, 5, 5]],
 [[1, 1, 1, 1, 1, 3], [2, 2, 2, 3], [3, 3, 3, 5], [5, 5]]}
```

```
>>> from sage.all import *
>>> cells = [(Integer(0),Integer(0)), (Integer(0),Integer(1)), (Integer(0),
↪Integer(2)), (Integer(0),Integer(3)), (Integer(0),Integer(4)),
...           (Integer(1),Integer(0)), (Integer(1),Integer(1)), (Integer(1),
↪Integer(2)),
...           (Integer(2),Integer(0)), (Integer(2),Integer(1)), (Integer(2),
↪Integer(2)), (Integer(2),Integer(4)), (Integer(2),Integer(6)),
...                  (Integer(4),Integer(1)), (Integer(4),Integer(2)),␣
↪(Integer(4),Integer(4))]
>>> D = NorthwestDiagram(cells); D.pp()
O O O O O . .
O O O . . . .
O O O . O . O
. . . . . . .
. O O . O . .
>>> D.peelable_tableaux()
{[[1, 1, 1, 1, 1], [2, 2, 2, 3, 3], [3, 3, 3], [5, 5, 5]],
 [[1, 1, 1, 1, 1], [2, 2, 2, 3, 3], [3, 3, 3, 5], [5, 5]],
 [[1, 1, 1, 1, 1, 3], [2, 2, 2, 3], [3, 3, 3], [5, 5, 5]],
 [[1, 1, 1, 1, 1, 3], [2, 2, 2, 3], [3, 3, 3, 5], [5, 5]]}
```

ALGORITHM:

This implementation uses the algorithm suggested in Remark 25 of [RS1995].

class sage.combinat.diagram.**NorthwestDiagrams**(*category=None*)

Bases: *Diagrams*

Diagrams satisfying the northwest property.

A diagram D is a *northwest diagram* if for every two cells (i_1, j_1) and (i_2, j_2) in D then there exists the cell $(\min(i_1, i_2), \min(j_1, j_2)) \in D$.

EXAMPLES:

```
sage: from sage.combinat.diagram import NorthwestDiagram
sage: N = NorthwestDiagram([(0,0), (0, 10), (5,0)]); N.pp()
O . . . . . . . . . O
. . . . . . . . . . .
. . . . . . . . . . .
. . . . . . . . . . .
. . . . . . . . . . .
O . . . . . . . . . .
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import NorthwestDiagram
>>> N = NorthwestDiagram([(Integer(0),Integer(0)), (Integer(0), Integer(10)),␣
↪(Integer(5),Integer(0))]); N.pp()
O . . . . . . . . . O
. . . . . . . . . . .
. . . . . . . . . . .
. . . . . . . . . . .
. . . . . . . . . . .
O . . . . . . . . . .
```

Note that checking whether or not the northwest property is satisfied is automatically checked. The diagram found by adding the cell $(1, 1)$ to the diagram above is *not* a northwest diagram. The cell $(1, 0)$ should be present due to the presence of $(5, 0)$ and $(1, 1)$:

```
sage: from sage.combinat.diagram import Diagram
sage: Diagram([(0, 0), (0, 10), (5, 0), (1, 1)]).pp()
O . . . . . . . . . O
. O . . . . . . . . .
. . . . . . . . . . .
. . . . . . . . . . .
. . . . . . . . . . .
O . . . . . . . . . .
sage: NorthwestDiagram([(0, 0), (0, 10), (5, 0), (1, 1)])
Traceback (most recent call last):
...
ValueError: diagram is not northwest
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import Diagram
>>> Diagram([(Integer(0), Integer(0)), (Integer(0), Integer(10)), (Integer(5),␣
↪Integer(0)), (Integer(1), Integer(1))]).pp()
O . . . . . . . . . O
. O . . . . . . . . .
. . . . . . . . . . .
. . . . . . . . . . .
. . . . . . . . . . .
O . . . . . . . . . .
>>> NorthwestDiagram([(Integer(0), Integer(0)), (Integer(0), Integer(10)),␣
↪(Integer(5), Integer(0)), (Integer(1), Integer(1))])
Traceback (most recent call last):
...
```

(continues on next page)

(continued from previous page)

```
ValueError: diagram is not northwest
```

However, this behavior can be turned off if you are confident that you are providing a northwest diagram:

```
sage: N = NorthwestDiagram([(0, 0), (0, 10), (5, 0),
....:                       (1, 1), (0, 1), (1, 0)],
....:                       check=False)
sage: N.pp()
O O . . . . . . . . O
O O . . . . . . . . .
. . . . . . . . . . .
. . . . . . . . . . .
. . . . . . . . . . .
O . . . . . . . . . .
```

```
>>> from sage.all import *
>>> N = NorthwestDiagram([(Integer(0), Integer(0)), (Integer(0), Integer(10)),␣
↪(Integer(5), Integer(0)),
...                       (Integer(1), Integer(1)), (Integer(0), Integer(1)),␣
↪(Integer(1), Integer(0))],
...                       check=False)
>>> N.pp()
O O . . . . . . . . O
O O . . . . . . . . .
. . . . . . . . . . .
. . . . . . . . . . .
. . . . . . . . . . .
O . . . . . . . . . .
```

Note that arbitrary diagrams which happen to be northwest diagrams only live in the parent of *Diagrams*:

```
sage: D = Diagram([(0, 0), (0, 10), (5, 0), (1, 1), (0, 1), (1, 0)])
sage: D.pp()
O O . . . . . . . . O
O O . . . . . . . . .
. . . . . . . . . . .
. . . . . . . . . . .
. . . . . . . . . . .
O . . . . . . . . . .
sage: from sage.combinat.diagram import NorthwestDiagrams
sage: D in NorthwestDiagrams()
False
```

```
>>> from sage.all import *
>>> D = Diagram([(Integer(0), Integer(0)), (Integer(0), Integer(10)), (Integer(5),
↪ Integer(0)), (Integer(1), Integer(1)), (Integer(0), Integer(1)), (Integer(1),␣
↪Integer(0))])
>>> D.pp()
O O . . . . . . . . O
O O . . . . . . . . .
. . . . . . . . . . .
. . . . . . . . . . .
```

(continues on next page)

(continued from previous page)

```
. . . . . . . . . . .
O . . . . . . . . . .
>>> from sage.combinat.diagram import NorthwestDiagrams
>>> D in NorthwestDiagrams()
False
```

Here are some more examples:

```
sage: from sage.combinat.diagram import NorthwestDiagram, NorthwestDiagrams
sage: D = NorthwestDiagram([(0,1), (0,2), (1,1)]); D.pp()
. O O
. O .
sage: NWDgms = NorthwestDiagrams()
sage: D = NWDgms([(1,1), (1,2), (2,1)]); D.pp()
. . .
. O O
. O .
sage: D.parent()
Combinatorial northwest diagrams
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram import NorthwestDiagram, NorthwestDiagrams
>>> D = NorthwestDiagram([(Integer(0),Integer(1)), (Integer(0),Integer(2)),␣
↪(Integer(1),Integer(1))]); D.pp()
. O O
. O .
>>> NWDgms = NorthwestDiagrams()
>>> D = NWDgms([(Integer(1),Integer(1)), (Integer(1),Integer(2)), (Integer(2),
↪Integer(1))]); D.pp()
. . .
. O O
. O .
>>> D.parent()
Combinatorial northwest diagrams
```

Additionally, there are natural constructions of a northwest diagram given the data of a permutation (Rothe diagrams are the prototypical example of northwest diagrams), or the data of a partition of an integer, or a skew partition.

The Rothe diagram $D(\omega)$ of a permutation ω is specified by the cells

$$D(\omega) = \{(\omega_j, i) : i < j, \omega_i > \omega_j\}.$$

We can construct one by calling *rothe_diagram()* method on the set of all *NorthwestDiagrams*:

```
sage: w = Permutations(4)([4,3,2,1])
sage: NorthwestDiagrams().rothe_diagram(w).pp()
O O O .
O O . .
O . . .
. . . .
```

```
>>> from sage.all import *
>>> w = Permutations(Integer(4))([Integer(4),Integer(3),Integer(2),Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> NorthwestDiagrams().rothe_diagram(w).pp()
O O O .
O O . .
O . . .
. . . .
```

To turn a Ferrers diagram into a northwest diagram, we may call *from_partition()*. This will return a Ferrer's diagram in the set of all northwest diagrams. For many use-cases it is probably better to get Ferrer's diagrams by the corresponding method on partitions, namely *sage.combinat.partition.Partition.ferrers_diagram()*:

```
sage: mu = Partition([7,3,1,1])
sage: mu.pp()
*******
***
*
*
sage: NorthwestDiagrams().from_partition(mu).pp()
O O O O O O O
O O O . . . .
O . . . . . .
O . . . . . .
```

```
>>> from sage.all import *
>>> mu = Partition([Integer(7),Integer(3),Integer(1),Integer(1)])
>>> mu.pp()
*******
***
*
*
>>> NorthwestDiagrams().from_partition(mu).pp()
O O O O O O O
O O O . . . .
O . . . . . .
O . . . . . .
```

It is also possible to turn a Ferrers diagram of a skew partition into a northwest diagram, although it is more subtle than just using the skew diagram itself. One must first reflect the partition about a vertical axis so that the skew partition looks "backwards":

```
sage: mu, nu = Partition([5,4,3,2,1]), Partition([3,2,1])
sage: s = mu/nu; s.pp()
   **
  **
 **
**
*
sage: NorthwestDiagrams().from_skew_partition(s).pp()
O O . . .
. O O . .
. . O O .
. . . O O
```

(continues on next page)

(continued from previous page)

```
. . . . O
```

```
>>> from sage.all import *
>>> mu, nu = Partition([Integer(5),Integer(4),Integer(3),Integer(2),Integer(1)]),␣
↪Partition([Integer(3),Integer(2),Integer(1)])
>>> s = mu/nu; s.pp()
   **
  **
 **
**
*
>>> NorthwestDiagrams().from_skew_partition(s).pp()
O O . . .
. O O . .
. . O O .
. . . O O
. . . . O
```

Element

alias of *NorthwestDiagram*

from_parallelogram_polyomino(*p*)

Create the diagram corresponding to a *ParallelogramPolyomino*.

EXAMPLES:

```
sage: p = ParallelogramPolyomino([[0, 0, 1, 0, 0, 0, 1, 1],                    #␣
↪needs sage.modules
....:                                [1, 1, 0, 1, 0, 0, 0, 0]])
sage: from sage.combinat.diagram import NorthwestDiagrams
sage: NorthwestDiagrams().from_parallelogram_polyomino(p).pp()                 #␣
↪needs sage.modules
O O .
O O O
. O O
. O O
. O O
```

```
>>> from sage.all import *
>>> p = ParallelogramPolyomino([[Integer(0), Integer(0), Integer(1),␣
↪Integer(0), Integer(0), Integer(0), Integer(1), Integer(1)],                  ␣
↪ # needs sage.modules
...                                [Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(0)]])
>>> from sage.combinat.diagram import NorthwestDiagrams
>>> NorthwestDiagrams().from_parallelogram_polyomino(p).pp()                   #␣
↪needs sage.modules
O O .
O O O
. O O
. O O
. O O
```

from_partition(*mu*)

Return the Ferrer's diagram of `mu` as a northwest diagram.

EXAMPLES:

```
sage: mu = Partition([5,2,1]); mu.pp()
*****
**
*
sage: mu.parent()
Partitions
sage: from sage.combinat.diagram import NorthwestDiagrams
sage: D = NorthwestDiagrams().from_partition(mu)
sage: D.pp()
O O O O O
O O . . .
O . . . .
sage: D.parent()
Combinatorial northwest diagrams
```

```
>>> from sage.all import *
>>> mu = Partition([Integer(5),Integer(2),Integer(1)]); mu.pp()
*****
**
*
>>> mu.parent()
Partitions
>>> from sage.combinat.diagram import NorthwestDiagrams
>>> D = NorthwestDiagrams().from_partition(mu)
>>> D.pp()
O O O O O
O O . . .
O . . . .
>>> D.parent()
Combinatorial northwest diagrams
```

This will print in English notation even if the notation is set to French for the partition:

```
sage: Partitions.options.convention="french"
sage: mu.pp()
*
**
*****
sage: D.pp()
O O O O O
O O . . .
O . . . .
```

```
>>> from sage.all import *
>>> Partitions.options.convention="french"
>>> mu.pp()
*
**
```

(continues on next page)

(continued from previous page)

```
*****
>>> D.pp()
O O O O O
O O . . .
O . . . .
```

from_permutation(*w*)

alias of *rothe_diagram()*.

from_skew_partition(*s*)

Get the northwest diagram found by reflecting a skew shape across a vertical plane.

EXAMPLES:

```
sage: mu, nu = Partition([3,2,1]), Partition([2,1])
sage: s = mu/nu; s.pp()
  *
 *
*
sage: from sage.combinat.diagram import NorthwestDiagrams
sage: D = NorthwestDiagrams().from_skew_partition(s)
sage: D.pp()
O . .
. O .
. . O

sage: mu, nu = Partition([3,3,2]), Partition([2,2,2])
sage: s = mu/nu; s.pp()
  *
  *
sage: NorthwestDiagrams().from_skew_partition(s).pp()
O . .
O . .
. . .
```

```
>>> from sage.all import *
>>> mu, nu = Partition([Integer(3),Integer(2),Integer(1)]),␣
↪Partition([Integer(2),Integer(1)])
>>> s = mu/nu; s.pp()
  *
 *
*
>>> from sage.combinat.diagram import NorthwestDiagrams
>>> D = NorthwestDiagrams().from_skew_partition(s)
>>> D.pp()
O . .
. O .
. . O

>>> mu, nu = Partition([Integer(3),Integer(3),Integer(2)]),␣
↪Partition([Integer(2),Integer(2),Integer(2)])
>>> s = mu/nu; s.pp()
```

(continues on next page)

(continued from previous page)

```
  *
  *
>>> NorthwestDiagrams().from_skew_partition(s).pp()
O . .
O . .
. . .
```

rothe_diagram(*w*)

Return the Rothe diagram of `w`.

We construct a northwest diagram from a permutation by constructing its Rothe diagram. Formally, if ω is a *Permutation* then the Rothe diagram $D(\omega)$ is the diagram whose cells are

$$D(\omega) = \{(\omega_j, i) : i < j,\ \omega_i > \omega_j\}.$$

Informally, one can construct the Rothe diagram by starting with all n^2 possible cells, and then deleting the cells $(i, \omega(i))$ as well as all cells to the right and below. (These are sometimes called "death rays".)

. . . . . . . .
. . . . . . . .
. . . . . . . .
```

sage.combinat.diagram.**RotheDiagram**(*w*)

The Rothe diagram of a permutation `w`.

EXAMPLES:

```
sage: w = Permutations(9)([1, 7, 4, 5, 9, 3, 2, 8, 6])
sage: from sage.combinat.diagram import RotheDiagram
sage: D = RotheDiagram(w); D.pp()
. . . . . . . . .
. O O O O O . . .
. O O . . . . . .
. O O . . . . . .
. O O . . O . O .
. O . . . . . . .
. . . . . . . . .
. . . . . O . . .
. . . . . . . . .
```

```
>>> from sage.all import *
>>> w = Permutations(Integer(9))([Integer(1), Integer(7), Integer(4), Integer(5),␣
↪Integer(9), Integer(3), Integer(2), Integer(8), Integer(6)])
>>> from sage.combinat.diagram import RotheDiagram
>>> D = RotheDiagram(w); D.pp()
. . . . . . . . .
. O O O O O . . .
. O O . . . . . .
. O O . . . . . .
. O O . . O . O .
. O . . . . . . .
. . . . . . . . .
. . . . . O . . .
. . . . . . . . .
```

The Rothe diagram is a northwest diagram:

```
sage: D.parent()
Combinatorial northwest diagrams
```

```
>>> from sage.all import *
>>> D.parent()
Combinatorial northwest diagrams
```

Some other examples:

```
sage: RotheDiagram([2, 1, 4, 3]).pp()
O . . .
. . . .
. . O .
. . . .

sage: RotheDiagram([4, 1, 3, 2]).pp()
O O O .
. . . .
. O . .
. . . .
```

```
>>> from sage.all import *
>>> RotheDiagram([Integer(2), Integer(1), Integer(4), Integer(3)]).pp()
O . . .
. . . .
. . O .
. . . .

>>> RotheDiagram([Integer(4), Integer(1), Integer(3), Integer(2)]).pp()
O O O .
. . . .
. O . .
. . . .
```

Currently, only elements of the set of *sage.combinat.permutation.Permutations* are supported. In particular, elements of permutation groups are not supported:

```
sage: w = SymmetricGroup(9).an_element()                                    #␣
↪needs sage.groups
sage: RotheDiagram(w)                                                       #␣
↪needs sage.groups
Traceback (most recent call last):
...
ValueError: w must be a permutation
```

```
>>> from sage.all import *
>>> w = SymmetricGroup(Integer(9)).an_element()                              ␣
↪     # needs sage.groups
>>> RotheDiagram(w)                                                        #␣
↪needs sage.groups
Traceback (most recent call last):
...
ValueError: w must be a permutation
```

Combinatorial functions

This module implements some combinatorial functions, as listed below. For a more detailed description, see the relevant docstrings.

Numbers:

- Bell numbers *bell_number()*
- Catalan numbers *catalan_number()*
- Narayana numbers *narayana_number()*
- Euler numbers *euler_number()*
- Eulerian numbers *eulerian_number()*
- Fibonacci numbers *fibonacci()*
- Lucas numbers *lucas_number1()*, *lucas_number2()*
- Stirling numbers *stirling_number1()*, *stirling_number2()*
- Polygonal numbers *polygonal_number()*

Polynomials

- Eulerian polynomial *eulerian_polynomial()*
- Bernoulli polynomials *bernoulli_polynomial()*

Sets:

- Tuples of a multiset *tuples()*, *number_of_tuples()*
- Unordered tuples of a set *unordered_tuples()*, *number_of_unordered_tuples()*

Combinatorial functions from other modules:

- Binomial coefficient `sage.arith.misc.binomial()`
- Factorial `sage.arith.misc.factorial()`
- Falling power `sage.arith.misc.falling_factorial()`
- Rising power `sage.arith.misc.rising_factorial()`
- Number of partitions *sage.combinat.partition.number_of_partitions()*
- Gaussian binomial coefficient *sage.combinat.q_analogues.gaussian_binomial()*

Todo

Add GUAVA commands:

- VandermondeMat
- GrayMat returns a list of all different vectors of length n over the field F, using Gray ordering.

Add commands not in GAP:

- Rencontres numbers (Wikipedia article Rencontres_number)

- Kei Beauduin (2024-04-06): when univariate, the Bell polynomial is in variable `x0`; extended to complete exponential, partial ordinary and complete ordinary Bell polynomials.
- Kwankyu Lee (2025-01): added Lah numbers

class sage.combinat.combinat.**CombinatorialElement**(*parent*, **args*, ***kwds*)

Bases: *CombinatorialObject*, Element

`CombinatorialElement` is both a *CombinatorialObject* and an `Element`. So it represents a list which is an element of some parent.

A `CombinatorialElement` subclass also automatically supports the `__classcall__` mechanism.

Warning

This class is slowly being deprecated. Use `ClonableList` instead.

INPUT:

- `parent` – the `Parent` class for this element
- `lst` – list or any object that can be converted to a list by calling `list()`

EXAMPLES:

```
sage: # needs sage.combinat
sage: from sage.combinat.combinat import CombinatorialElement
sage: e = CombinatorialElement(Partitions(6), [3,2,1])
sage: e == loads(dumps(e))
True
sage: parent(e)
Partitions of the integer 6
```

(continues on next page)

(continued from previous page)

```
sage: list(e)
[3, 2, 1]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> from sage.combinat.combinat import CombinatorialElement
>>> e = CombinatorialElement(Partitions(Integer(6)), [Integer(3),Integer(2),
↪Integer(1)])
>>> e == loads(dumps(e))
True
>>> parent(e)
Partitions of the integer 6
>>> list(e)
[3, 2, 1]
```

Check classcalls:

```
sage: class Foo(CombinatorialElement):                                    #␣
↪needs sage.combinat
....:     @staticmethod
....:     def __classcall__(cls, x):
....:         return x
sage: Foo(17)                                                             #␣
↪needs sage.combinat
17
```

```
>>> from sage.all import *
>>> class Foo(CombinatorialElement):                                      #␣
↪needs sage.combinat
...     @staticmethod
...     def __classcall__(cls, x):
...         return x
>>> Foo(Integer(17))                                                      ␣
↪     # needs sage.combinat
17
```

class sage.combinat.combinat.**CombinatorialObject**(*l*, *copy=True*)

Bases: SageObject

CombinatorialObject provides a thin wrapper around a list. The main differences are that __setitem__ is disabled so that CombinatorialObjects are shallowly immutable, and the intention is that they are semantically immutable.

Because of this, CombinatorialObjects provide a __hash__ function which computes the hash of the string representation of a list and the hash of its parent's class. Thus, each CombinatorialObject should have a unique string representation.

See also

CombinatorialElement if you want a combinatorial object which is an element of a parent.

Warning

This class is slowly being deprecated. Use `ClonableList` instead.

INPUT:

- `l` – list or any object that can be converted to a list by calling `list()`
- `copy` – boolean (default: `True`); if `False`, then `l` must be a `list`, which is assigned to `self._list` without copying

EXAMPLES:

```
sage: c = CombinatorialObject([1,2,3])
sage: c == loads(dumps(c))
True
sage: c._list
[1, 2, 3]
sage: c._hash is None
True
```

```
>>> from sage.all import *
>>> c = CombinatorialObject([Integer(1),Integer(2),Integer(3)])
>>> c == loads(dumps(c))
True
>>> c._list
[1, 2, 3]
>>> c._hash is None
True
```

For efficiency, you can specify `copy=False` if you know what you are doing:

```
sage: from sage.combinat.combinat import CombinatorialObject
sage: x = [3, 2, 1]
sage: C = CombinatorialObject(x, copy=False)
sage: C
[3, 2, 1]
sage: x[0] = 5
sage: C
[5, 2, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat import CombinatorialObject
>>> x = [Integer(3), Integer(2), Integer(1)]
>>> C = CombinatorialObject(x, copy=False)
>>> C
[3, 2, 1]
>>> x[Integer(0)] = Integer(5)
>>> C
[5, 2, 1]
```

index(*key*)

EXAMPLES:

```
sage: c = CombinatorialObject([1,2,3])
sage: c.index(1)
0
sage: c.index(3)
2
```

```
>>> from sage.all import *
>>> c = CombinatorialObject([Integer(1),Integer(2),Integer(3)])
>>> c.index(Integer(1))
0
>>> c.index(Integer(3))
2
```

sage.combinat.combinat.**bell_number**(*n*, *algorithm='flint'*, ***options*)

Return the n-th Bell number.

This is the number of ways to partition a set of n elements into pairwise disjoint nonempty subsets.

INPUT:

- `n` – positive integer
- `algorithm` – (default: `'flint'`) any one of the following:
  - `'dobinski'` – use Dobinski's formula
  - `'flint'` – wrap FLINT's `arith_bell_number`
  - `'gap'` – wrap GAP's `Bell`
  - `'mpmath'` – wrap mpmath's `bell`

Warning

When using the mpmath algorithm to compute Bell numbers and you specify `prec`, it can return incorrect results due to low precision. See the examples section.

EXAMPLES:

```
sage: # needs sage.libs.flint
sage: bell_number(10)
115975
sage: bell_number(2)
2
sage: bell_number(-10)
Traceback (most recent call last):
...
ArithmeticError: Bell numbers not defined for negative indices
sage: bell_number(1)
1
sage: bell_number(1/3)
Traceback (most recent call last):
...
TypeError: no conversion of this rational to integer
```

```
>>> from sage.all import *
>>> # needs sage.libs.flint
>>> bell_number(Integer(10))
115975
>>> bell_number(Integer(2))
2
>>> bell_number(-Integer(10))
Traceback (most recent call last):
...
ArithmeticError: Bell numbers not defined for negative indices
>>> bell_number(Integer(1))
1
>>> bell_number(Integer(1)/Integer(3))
Traceback (most recent call last):
...
TypeError: no conversion of this rational to integer
```

When using the mpmath algorithm, we are required have mpmath's precision set to at least $\log_2(B_n)$ bits. If upon computing the Bell number the first time, we deem the precision too low, we use our guess to (temporarily) raise mpmath's precision and the Bell number is recomputed.

```
sage: k = bell_number(30, 'mpmath'); k                                          #␣
↪needs mpmath
846749014511809332450147
sage: k == bell_number(30)                                                      #␣
↪needs mpmath sage.libs.flint
True
```

```
>>> from sage.all import *
>>> k = bell_number(Integer(30), 'mpmath'); k                                    ␣
↪     # needs mpmath
846749014511809332450147
>>> k == bell_number(Integer(30))                                               ␣
↪     # needs mpmath sage.libs.flint
True
```

If you knows what precision is necessary before computing the Bell number, you can use the `prec` option:

```
sage: k2 = bell_number(30, 'mpmath', prec=30); k2                               #␣
↪needs mpmath
846749014511809332450147
sage: k == k2                                                                   #␣
↪needs mpmath
True
```

```
>>> from sage.all import *
>>> k2 = bell_number(Integer(30), 'mpmath', prec=Integer(30)); k2               ␣
↪              # needs mpmath
846749014511809332450147
>>> k == k2                                                                     #␣
↪needs mpmath
True
```

Warning

Running mpmath with the precision set too low can result in incorrect results:

```
sage: k = bell_number(30, 'mpmath', prec=15); k                                 #␣
↪needs mpmath
846749014511809388871680
sage: k == bell_number(30)                                                      #␣
↪needs mpmath sage.libs.flint
False
```

```
>>> from sage.all import *
>>> k = bell_number(Integer(30), 'mpmath', prec=Integer(15)); k                 ␣
↪          # needs mpmath
846749014511809388871680
>>> k == bell_number(Integer(30))
↪# needs mpmath sage.libs.flint
False
```

Note

Let B_n denote the n-th Bell number. Dobinski's formula is:

$$B_n = e^{-1} \sum_{k=0}^{\infty} \frac{k^n}{k!}.$$

To show our implementation of Dobinski's method works, suppose that $n \geq 5$ and let k_0 be the smallest positive integer such that $\frac{k_0^n}{k_0!} < 1$. Note that $k_0 > n$ and $k_0 \leq 2n$ because we can prove that $\frac{(2n)^n}{(2n)!} < 1$ by Stirling.

If $k > k_0$, then we have $\frac{k^n}{k!} < \frac{1}{2^{k-k_0}}$. We show this by induction: let $c_k = \frac{k^n}{k!}$, if $k > n$ then

$$\frac{c_{k+1}}{c_k} = \frac{(1+k^{-1})^n}{k+1} < \frac{(1+n^{-1})^n}{n} < \frac{1}{2}.$$

The last inequality can easily be checked numerically for $n \geq 5$.

Using this, we can see that $\frac{c_k}{c_{k_0}} < \frac{1}{2^{k-k_0}}$ for $k > k_0 > n$. So summing this it gives that $\sum_{k=k_0+1}^{\infty} \frac{k^n}{k!} < 1$, and hence

$$B_n = e^{-1} \left(\sum_{k=0}^{k_0} \frac{k^n}{k!} + E_1 \right) = e^{-1} \sum_{k=0}^{k_0} \frac{k^n}{k!} + E_2,$$

where $0 < E_1 < 1$ and $0 < E_2 < e^{-1}$. Next we have for any $q > 0$

$$\sum_{k=0}^{k_0} \frac{k^n}{k!} = \frac{1}{q} \sum_{k=0}^{k_0} \left\lfloor \frac{qk^n}{k!} \right\rfloor + \frac{E_3}{q}$$

where $0 \leq E_3 \leq k_0 + 1 \leq 2n + 1$. Let $E_4 = \frac{E_3}{q}$ and let $q = 2n + 1$. We find $0 \leq E_4 \leq 1$. These two bounds give:

$$\begin{aligned} B_n &= \frac{e^{-1}}{q} \sum_{k=0}^{k_0} \left\lfloor \frac{qk^n}{k!} \right\rfloor + e^{-1} E_4 + E_2 \\ &= \frac{e^{-1}}{q} \sum_{k=0}^{k_0} \left\lfloor \frac{qk^n}{k!} \right\rfloor + E_5 \end{aligned}$$

where

$$0 < E_5 = e^{-1}E_4 + E_2 \leq e^{-1} + e^{-1} < \frac{3}{4}.$$

It follows that

$$B_n = \left\lceil \frac{e^{-1}}{q} \sum_{k=0}^{k_0} \left\lfloor \frac{qk^n}{k!} \right\rfloor \right\rceil.$$

Now define

$$b = \sum_{k=0}^{k_0} \left\lfloor \frac{qk^n}{k!} \right\rfloor.$$

This b can be computed exactly using integer arithmetic. To avoid the costly integer division by $k!$, we collect more terms and do only one division, for example with 3 terms:

$$\frac{k^n}{k!} + \frac{(k+1)^n}{(k+1)!} + \frac{(k+2)^n}{(k+2)!} = \frac{k^n(k+1)(k+2) + (k+1)^n(k+2) + (k+2)^n}{(k+2)!}$$

In the implementation, we collect $\sqrt{n}/2$ terms.

To actually compute B_n from b, we let $p = \lfloor \log_2(b) \rfloor + 1$ such that $b < 2^p$ and we compute with p bits of precision. This implies that b (and $q < b$) can be represented exactly.

We compute $\frac{e^{-1}}{q}b$, rounding down, and we must have an absolute error of at most $1/4$ (given that $E_5 < 3/4$). This means that we need a relative error of at most

$$\frac{eq}{4b} > \frac{(eq)/4}{2^p} > \frac{7}{2^p}$$

(assuming $n \geq 5$). With a precision of p bits and rounding down, every rounding has a relative error of at most $2^{1-p} = 2/2^p$. Since we do 3 roundings (b and q do not require rounding), we get a relative error of at most $6/2^p$. All this implies that the precision of p bits is sufficient.

- http://mathworld.wolfram.com/DobinskisFormula.html

sage.combinat.combinat.**bell_polynomial**(*n*, *k=None*, *ordinary=False*)

Return the partial (or complete) exponential (or ordinary) Bell polynomial.

The partial exponential *Bell polynomial* is defined by the formula

$$B_{n,k}(x_0, x_1, \ldots, x_{n-k}) = \sum_{\substack{j_0+\ldots+j_{n-k}=k \\ 1j_0+\ldots+(n-k+1)j_{n-k}=n}} \frac{n!}{j_0!j_1!\cdots j_{n-k}!} \left(\frac{x_0}{(0+1)!}\right)^{j_0} \left(\frac{x_1}{(1+1)!}\right)^{j_1} \cdots \left(\frac{x_{n-k}}{(n-k+1)!}\right)^{j_{n-k}}.$$

The complete exponential Bell Polynomial is defined as

$$B_n(x_0, x_1, \ldots, x_{n-k}) = \sum_{k=0}^{n} B_{n,k}(x_0, x_1, \ldots, x_{n-k}).$$

The ordinary variant of the partial Bell polynomial is defined by

$$\hat{B}_{n,k}(x_0, x_1, \ldots, x_{n-k}) = \sum_{\substack{j_0+\ldots+j_{n-k}=k \\ 1j_0+\ldots+(n-k+1)j_{n-k}=n}} \binom{k}{j_0, j_1, \ldots, j_{n-k}} x_0^{j_0} x_1^{j_1} \cdots x_{n-k}^{j_{n-k}},$$

where we have used the multinomial coefficient. The complete version has the same definition as its exponential counterpart.

If we define $f(z) = \sum_{n=1}^{\infty} x_{n-1} z^n / n!$ then these are alternative definitions for exponential Bell polynomials

$$\exp(f(z)) = \sum_{n=0}^{\infty} B_n(x_0, \ldots, x_{n-1}) \frac{z^n}{n!},$$
$$\frac{f(z)^k}{k!} = \sum_{n=k}^{\infty} B_{n,k}(x_0, \ldots, x_{n-k}) \frac{z^n}{n!}.$$

Defining $g(z) = \sum_{n=1}^{\infty} x_{n-1} z^n$, we have the analogous alternative definitions

$$\frac{1}{1-f(z)} = \sum_{n=0}^{\infty} \hat{B}_n(x_0, \ldots, x_{n-1}) z^n,$$
$$f(z)^k = \sum_{n=k}^{\infty} \hat{B}_{n,k}(x_0, \ldots, x_{n-k}) z^n.$$

INPUT:

- `k` – (optional) if specified, returns the partial Bell polynomial, otherwise returns the complete Bell polynomial
- `ordinary` – boolean (default: `False`); if `True`, returns the (partial) ordinary Bell polynomial, otherwise returns the (partial) exponential Bell polynomial

EXAMPLES:

The complete and partial Bell polynomials:

```
sage: # needs sage.combinat
sage: bell_polynomial(3)
x0^3 + 3*x0*x1 + x2
sage: bell_polynomial(4)
x0^4 + 6*x0^2*x1 + 3*x1^2 + 4*x0*x2 + x3
sage: bell_polynomial(6, 3)
15*x1^3 + 60*x0*x1*x2 + 15*x0^2*x3
sage: bell_polynomial(6, 6)
x0^6
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> bell_polynomial(Integer(3))
x0^3 + 3*x0*x1 + x2
>>> bell_polynomial(Integer(4))
x0^4 + 6*x0^2*x1 + 3*x1^2 + 4*x0*x2 + x3
>>> bell_polynomial(Integer(6), Integer(3))
15*x1^3 + 60*x0*x1*x2 + 15*x0^2*x3
>>> bell_polynomial(Integer(6), Integer(6))
x0^6
```

The ordinary variants are:

```
sage: # needs sage.combinat sage.arith
sage: bell_polynomial(3, ordinary=True)
x0^3 + 2*x0*x1 + x2
sage: bell_polynomial(4, ordinary=True)
x0^4 + 3*x0^2*x1 + x1^2 + 2*x0*x2 + x3
sage: bell_polynomial(6, 3, True)
x1^3 + 6*x0*x1*x2 + 3*x0^2*x3
sage: bell_polynomial(6, 6, True)
x0^6
```

```
>>> from sage.all import *
>>> # needs sage.combinat sage.arith
>>> bell_polynomial(Integer(3), ordinary=True)
x0^3 + 2*x0*x1 + x2
>>> bell_polynomial(Integer(4), ordinary=True)
x0^4 + 3*x0^2*x1 + x1^2 + 2*x0*x2 + x3
>>> bell_polynomial(Integer(6), Integer(3), True)
x1^3 + 6*x0*x1*x2 + 3*x0^2*x3
>>> bell_polynomial(Integer(6), Integer(6), True)
x0^6
```

We verify the alternative definition of the different Bell polynomials using the functions f and g given above:

```
sage: # needs sage.combinat sage.arith
sage: n = 6 # positive integer
sage: k = 4 # positive integer
sage: R.<x> = InfinitePolynomialRing(QQ)
sage: PR = PolynomialRing(QQ, 'x', n)
sage: d = {x[i]: PR.gen(i) for i in range(n)}  # substitution dictionary
sage: L.<z> = LazyPowerSeriesRing(R)
sage: f = L(lambda i: x[i-1]/factorial(i), valuation=1)
sage: all(exp(f)[i].subs(d) * factorial(i) == bell_polynomial(i) for i in␣
↪range(n+1))
True
sage: all((f^k/factorial(k))[i].subs(d) * factorial(i) == bell_polynomial(i, k)␣
↪for i in range(k, n+k))
True
sage: g = L(lambda i: x[i-1], valuation=1)
sage: all((1/(1-g))[i].subs(d) == bell_polynomial(i, ordinary=True) for i in␣
↪range(n+1))
True
sage: all((g^k)[i].subs(d) == bell_polynomial(i, k, True) for i in range(k, n+k))
True
```

```
>>> from sage.all import *
>>> # needs sage.combinat sage.arith
>>> n = Integer(6) # positive integer
>>> k = Integer(4) # positive integer
>>> R = InfinitePolynomialRing(QQ, names=('x',)); (x,) = R._first_ngens(1)
>>> PR = PolynomialRing(QQ, 'x', n)
>>> d = {x[i]: PR.gen(i) for i in range(n)}  # substitution dictionary
>>> L = LazyPowerSeriesRing(R, names=('z',)); (z,) = L._first_ngens(1)
```

(continues on next page)

(continued from previous page)

```
>>> f = L(lambda i: x[i-Integer(1)]/factorial(i), valuation=Integer(1))
>>> all(exp(f)[i].subs(d) * factorial(i) == bell_polynomial(i) for i in␣
↪range(n+Integer(1)))
True
>>> all((f**k/factorial(k))[i].subs(d) * factorial(i) == bell_polynomial(i, k)␣
↪for i in range(k, n+k))
True
>>> g = L(lambda i: x[i-Integer(1)], valuation=Integer(1))
>>> all((Integer(1)/(Integer(1)-g))[i].subs(d) == bell_polynomial(i,␣
↪ordinary=True) for i in range(n+Integer(1)))
True
>>> all((g**k)[i].subs(d) == bell_polynomial(i, k, True) for i in range(k, n+k))
True
```

sage.combinat.combinat.**bernoulli_polynomial**(*x*, *n*)

Return the `n`-th Bernoulli polynomial evaluated at `x`.

The generating function for the Bernoulli polynomials is

$$\frac{te^{xt}}{e^t - 1} = \sum_{n=0}^{\infty} B_n(x)\frac{t^n}{n!},$$

and they are given directly by

$$B_n(x) = \sum_{i=0}^{n} \binom{n}{i} B_{n-i}x^i.$$

One has $B_n(x) = -n\zeta(1-n, x)$, where $\zeta(s, x)$ is the Hurwitz zeta function. Thus, in a certain sense, the Hurwitz zeta function generalizes the Bernoulli polynomials to non-integer values of n.

EXAMPLES:

```
sage: # needs sage.libs.flint
sage: y = QQ['y'].0
sage: bernoulli_polynomial(y, 5)
y^5 - 5/2*y^4 + 5/3*y^3 - 1/6*y
sage: bernoulli_polynomial(y, 5)(12)
199870
sage: bernoulli_polynomial(12, 5)
199870
sage: bernoulli_polynomial(y^2 + 1, 5)
y^10 + 5/2*y^8 + 5/3*y^6 - 1/6*y^2
sage: P.<t> = ZZ[]
sage: p = bernoulli_polynomial(t, 6)
sage: p.parent()
Univariate Polynomial Ring in t over Rational Field
```

```
>>> from sage.all import *
>>> # needs sage.libs.flint
>>> y = QQ['y'].gen(0)
>>> bernoulli_polynomial(y, Integer(5))
y^5 - 5/2*y^4 + 5/3*y^3 - 1/6*y
>>> bernoulli_polynomial(y, Integer(5))(Integer(12))
199870
>>> bernoulli_polynomial(Integer(12), Integer(5))
199870
>>> bernoulli_polynomial(y**Integer(2) + Integer(1), Integer(5))
y^10 + 5/2*y^8 + 5/3*y^6 - 1/6*y^2
>>> P = ZZ['t']; (t,) = P._first_ngens(1)
>>> p = bernoulli_polynomial(t, Integer(6))
>>> p.parent()
Univariate Polynomial Ring in t over Rational Field
```

We verify an instance of the formula which is the origin of the Bernoulli polynomials (and numbers):

```
sage: power_sum = sum(k^4 for k in range(10))
sage: 5*power_sum == bernoulli_polynomial(10, 5) - bernoulli(5)                #␣
↪needs sage.libs.flint
True
```

```
>>> from sage.all import *
>>> power_sum = sum(k**Integer(4) for k in range(Integer(10)))
>>> Integer(5)*power_sum == bernoulli_polynomial(Integer(10), Integer(5)) -␣
↪bernoulli(Integer(5))                  # needs sage.libs.flint
True
```

sage.combinat.combinat.**catalan_number**(*n*)

Return the n-th Catalan number.

The n-th Catalan number is given directly in terms of binomial coefficients by

$$C_n = \frac{1}{n+1}\binom{2n}{n} = \frac{(2n)!}{(n+1)!\,n!} \qquad \text{for} \quad n \geq 0.$$

Consider the set $S = \{1, ..., n\}$. A noncrossing partition of S is a partition in which no two blocks "cross" each other, i.e., if a and b belong to one block and x and y to another, they are not arranged in the order $axby$. C_n is the number of noncrossing partitions of the set S. There are many other interpretations (see REFERENCES).

When $n = -1$, this function returns the limit value $-1/2$. For other $n < 0$ it returns 0.

INPUT:

- `n` – integer

OUTPUT: integer

EXAMPLES:

```
sage: [catalan_number(i) for i in range(7)]
[1, 1, 2, 5, 14, 42, 132]
```

(continues on next page)

(continued from previous page)

```
sage: x = (QQ[['x']].0).O(8)
sage: (-1/2)*sqrt(1 - 4*x)
-1/2 + x + x^2 + 2*x^3 + 5*x^4 + 14*x^5 + 42*x^6 + 132*x^7 + O(x^8)
sage: [catalan_number(i) for i in range(-7,7)]
[0, 0, 0, 0, 0, 0, -1/2, 1, 1, 2, 5, 14, 42, 132]
sage: [catalan_number(n).mod(2) for n in range(16)]
[1, 1, 0, 1, 0, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 1]
```

```
>>> from sage.all import *
>>> [catalan_number(i) for i in range(Integer(7))]
[1, 1, 2, 5, 14, 42, 132]
>>> x = (QQ[['x']].gen(0)).O(Integer(8))
>>> (-Integer(1)/Integer(2))*sqrt(Integer(1) - Integer(4)*x)
-1/2 + x + x^2 + 2*x^3 + 5*x^4 + 14*x^5 + 42*x^6 + 132*x^7 + O(x^8)
>>> [catalan_number(i) for i in range(-Integer(7),Integer(7))]
[0, 0, 0, 0, 0, 0, -1/2, 1, 1, 2, 5, 14, 42, 132]
>>> [catalan_number(n).mod(Integer(2)) for n in range(Integer(16))]
[1, 1, 0, 1, 0, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 1]
```

`sage.combinat.combinat.`**`euler_number`**(*n*, *algorithm='flint'*)

Return the n-th Euler number.

INPUT:

- `n` – positive integer
- `algorithm` – (default: `'flint'`) any one of the following:
  - `'maxima'` – wraps Maxima's `euler`
  - `'flint'` – wrap FLINT's `arith_euler_number`

EXAMPLES:

```
sage: [euler_number(i) for i in range(10)]                                  #␣
↪needs sage.libs.flint
[1, 0, -1, 0, 5, 0, -61, 0, 1385, 0]
sage: x = PowerSeriesRing(QQ, 'x').gen().O(10)
sage: 2/(exp(x)+exp(-x))
1 - 1/2*x^2 + 5/24*x^4 - 61/720*x^6 + 277/8064*x^8 + O(x^10)
sage: [euler_number(i)/factorial(i) for i in range(11)]                     #␣
↪needs sage.libs.flint
[1, 0, -1/2, 0, 5/24, 0, -61/720, 0, 277/8064, 0, -50521/3628800]
sage: euler_number(-1)
Traceback (most recent call last):
...
ValueError: n (=-1) must be a nonnegative integer
```

```
>>> from sage.all import *
>>> [euler_number(i) for i in range(Integer(10))]                           ␣
```

(continues on next page)

(continued from previous page)

```
↪     # needs sage.libs.flint
[1, 0, -1, 0, 5, 0, -61, 0, 1385, 0]
>>> x = PowerSeriesRing(QQ, 'x').gen().O(Integer(10))
>>> Integer(2)/(exp(x)+exp(-x))
1 - 1/2*x^2 + 5/24*x^4 - 61/720*x^6 + 277/8064*x^8 + O(x^10)
>>> [euler_number(i)/factorial(i) for i in range(Integer(11))]                ␣
↪     # needs sage.libs.flint
[1, 0, -1/2, 0, 5/24, 0, -61/720, 0, 277/8064, 0, -50521/3628800]
>>> euler_number(-Integer(1))
Traceback (most recent call last):
...
ValueError: n (=-1) must be a nonnegative integer
```

REFERENCES:

- Wikipedia article Euler_number

sage.combinat.combinat.**eulerian_number**(*k*, *algorithm='recursive'*)

Return the Eulerian number of index `(n, k)`.

This is the coefficient of t^k in the Eulerian polynomial $A_n(t)$.

INPUT:

- `n` – integer
- `k` – integer between `0` and `n - 1`
- `algorithm` – `'recursive'` (default) or `'formula'`

OUTPUT: integer

See also

eulerian_polynomial()

EXAMPLES:

```
sage: from sage.combinat.combinat import eulerian_number
sage: [eulerian_number(5,i) for i in range(5)]
[1, 26, 66, 26, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat import eulerian_number
>>> [eulerian_number(Integer(5),i) for i in range(Integer(5))]
[1, 26, 66, 26, 1]
```

sage.combinat.combinat.**eulerian_polynomial**(*algorithm='derivative'*)

Return the Eulerian polynomial of index `n`.

This is the generating polynomial counting permutations in the symmetric group S_n according to their number of descents.

INPUT:

- `n` – integer

- `algorithm` – `'derivative'` (default) or `'coeffs'`

OUTPUT: polynomial in one variable `t`

See also

eulerian_number()

EXAMPLES:

```
sage: from sage.combinat.combinat import eulerian_polynomial
sage: eulerian_polynomial(5)
t^4 + 26*t^3 + 66*t^2 + 26*t + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat import eulerian_polynomial
>>> eulerian_polynomial(Integer(5))
t^4 + 26*t^3 + 66*t^2 + 26*t + 1
```

REFERENCES:

- Wikipedia article Eulerian_number

`sage.combinat.combinat.`**`fibonacci`**(*n*, *algorithm='pari'*)

Return the n-th Fibonacci number.

The Fibonacci sequence F_n is defined by the initial conditions $F_1 = F_2 = 1$ and the recurrence relation $F_{n+2} = F_{n+1} + F_n$. For negative n we define $F_n = (-1)^{n+1} F_{-n}$, which is consistent with the recurrence relation.

INPUT:

- `algorithm` – string; one of
  - `'pari'` – (default) use the PARI C library's pari:fibo function
  - `'gap'` – use GAP's Fibonacci function

Note

PARI is tens to hundreds of times faster than GAP here. Moreover, PARI works for every large input whereas GAP does not.

EXAMPLES:

```
sage: fibonacci(10)                                                             #␣
↪needs sage.libs.pari
55
sage: fibonacci(10, algorithm='gap')                                            #␣
↪needs sage.libs.gap
55
```

```
>>> from sage.all import *
>>> fibonacci(Integer(10))                                                      ␣
↪     # needs sage.libs.pari
55
```

(continues on next page)

(continued from previous page)

```
>>> fibonacci(Integer(10), algorithm='gap')
↪     # needs sage.libs.gap
55
```

```
sage: fibonacci(-100)
↪needs sage.libs.pari
-354224848179261915075
sage: fibonacci(100)

-354224848179261915075
>>> fibonacci(Integer(100))
↪     # needs sage.libs.pari
354224848179261915075
```

```
sage: fibonacci(0)
↪needs sage.libs.pari
0
sage: fibonacci(1/2)
Traceback (most recent call last):
...
TypeError: no conversion of this rational to integer
```

```
>>> from sage.all import *
>>> fibonacci(Integer(0))
↪     # needs sage.libs.pari
0
>>> fibonacci(Integer(1)/Integer(2))
Traceback (most recent call last):
...
TypeError: no conversion of this rational to integer
```

sage.combinat.combinat.**fibonacci_sequence**(*start*, *stop=None*, *algorithm=None*)

Return an iterator over the Fibonacci sequence, for all fibonacci numbers f_n from `n = start` up to (but not including) `n = stop`

INPUT:

- `start` – starting value
- `stop` – stopping value
- `algorithm` – (default: `None`) passed on to fibonacci function (or not passed on if `None`, i.e., use the default)

EXAMPLES:

```
sage: fibs = [i for i in fibonacci_sequence(10, 20)]; fibs
↪needs sage.libs.pari
[55, 89, 144, 233, 377, 610, 987, 1597, 2584, 4181]
```

```
>>> from sage.all import *
>>> fibs = [i for i in fibonacci_sequence(Integer(10), Integer(20))]; fibs
↪              # needs sage.libs.pari
[55, 89, 144, 233, 377, 610, 987, 1597, 2584, 4181]
```

```
sage: sum([i for i in fibonacci_sequence(100, 110)])
↪needs sage.libs.pari
699193769230753087300013
```

```
>>> from sage.all import *
>>> sum([i for i in fibonacci_sequence(Integer(100), Integer(110))])
↪              # needs sage.libs.pari
699193769230753087300013
```

See also

fibonacci_xrange()

sage.combinat.combinat.**fibonacci_xrange**(*start*, *stop=None*, *algorithm='pari'*)

Return an iterator over all of the Fibonacci numbers in the given range, including `f_n = start` up to, but not including, `f_n = stop`.

EXAMPLES:

```
sage: fibs_in_some_range = [i for i in fibonacci_xrange(10^7, 10^8)]
↪needs sage.libs.pari
sage: len(fibs_in_some_range)
↪needs sage.libs.pari
4
sage: fibs_in_some_range
↪needs sage.libs.pari
[14930352, 24157817, 39088169, 63245986]
```

```
>>> from sage.all import *
>>> fibs_in_some_range = [i for i in fibonacci_xrange(Integer(10)**Integer(7),
↪Integer(10)**Integer(8))]            # needs sage.libs.pari
>>> len(fibs_in_some_range)
↪needs sage.libs.pari
4
>>> fibs_in_some_range
↪needs sage.libs.pari
[14930352, 24157817, 39088169, 63245986]
```

```
sage: fibs = [i for i in fibonacci_xrange(10, 100)]; fibs
↪needs sage.libs.pari
[13, 21, 34, 55, 89]
```

```
>>> from sage.all import *
>>> fibs = [i for i in fibonacci_xrange(Integer(10), Integer(100))]; fibs
↪              # needs sage.libs.pari
[13, 21, 34, 55, 89]
```

```
sage: list(fibonacci_xrange(13, 34))                                    #␣
↪needs sage.libs.pari
[13, 21]
```

```
>>> from sage.all import *
>>> list(fibonacci_xrange(Integer(13), Integer(34)))                    ␣
↪              # needs sage.libs.pari
[13, 21]
```

A solution to the second Project Euler problem:

```
sage: sum([i for i in fibonacci_xrange(10^6) if is_even(i)])            #␣
↪needs sage.libs.pari
1089154
```

```
>>> from sage.all import *
>>> sum([i for i in fibonacci_xrange(Integer(10)**Integer(6)) if is_even(i)])    ␣
↪               # needs sage.libs.pari
1089154
```

See also

fibonacci_sequence()

sage.combinat.combinat.**lah_number**(n, k)

Return the Lah number $L(n, k)$

This is the number of ways to partition a set of n elements into k pairwise disjoint nonempty linearly-ordered subsets.

This is also called the Stirling number of the third kind.

See Wikipedia article Lah_number.

INPUT:

- `n` – nonnegative integer
- `k` – nonnegative integer

EXAMPLES:

```
sage: from sage.combinat.combinat import lah_number
sage: lah_number(50, 30)
3242322638238907670866645288893161825894400000
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat import lah_number
>>> lah_number(Integer(50), Integer(30))
3242322638238907670866645288893161825894400000
```

We verify a well-known identity:

```
sage: S1 = stirling_number1; S2 = stirling_number2
sage: all(lah_number(n, k) == sum(S1(n, j) * S2(j, k) for j in [k..n])
....:     for n in range(10) for k in range(10))
True
```

```
>>> from sage.all import *
>>> S1 = stirling_number1; S2 = stirling_number2
>>> all(lah_number(n, k) == sum(S1(n, j) * S2(j, k) for j in (ellipsis_range(k,
↪Ellipsis,n)))
...     for n in range(Integer(10)) for k in range(Integer(10)))
True
```

sage.combinat.combinat.**lucas_number1**(n, P, Q)

Return the n-th Lucas number "of the first kind" (this is not standard terminology). The Lucas sequence $L_n^{(1)}$ is defined by the initial conditions $L_1^{(1)} = 0$, $L_2^{(1)} = 1$ and the recurrence relation $L_{n+2}^{(1)} = P \cdot L_{n+1}^{(1)} - Q \cdot L_n^{(1)}$.

Wraps GAP's `Lucas(...)[1]`.

$P = 1$, $Q = -1$ gives the Fibonacci sequence.

INPUT:

- `n` – integer
- `P`, `Q` – integer or rational numbers

OUTPUT: integer or rational number

EXAMPLES:

```
sage: # needs sage.libs.gap
sage: lucas_number1(5,1,-1)
5
sage: lucas_number1(6,1,-1)
8
sage: lucas_number1(7,1,-1)
13
sage: lucas_number1(7,1,-2)
43
sage: lucas_number1(5,2,3/5)
229/25
sage: lucas_number1(5,2,1.5)
1/4
```

```
>>> from sage.all import *
>>> # needs sage.libs.gap
>>> lucas_number1(Integer(5),Integer(1),-Integer(1))
5
>>> lucas_number1(Integer(6),Integer(1),-Integer(1))
8
>>> lucas_number1(Integer(7),Integer(1),-Integer(1))
13
>>> lucas_number1(Integer(7),Integer(1),-Integer(2))
43
>>> lucas_number1(Integer(5),Integer(2),Integer(3)/Integer(5))
```

(continues on next page)

(continued from previous page)

```
229/25
>>> lucas_number1(Integer(5),Integer(2),RealNumber('1.5'))
1/4
```

There was a conjecture that the sequence L_n defined by $L_{n+2} = L_{n+1} + L_n$, $L_1 = 1$, $L_2 = 3$, has the property that n prime implies that L_n is prime.

```
sage: def lucas(n):
....:     return Integer((5/2)*lucas_number1(n,1,-1) + (1/2)*lucas_number2(n,1,-
↪1))
sage: [[lucas(n), is_prime(lucas(n)), n+1, is_prime(n+1)] for n in range(15)]   #␣
↪needs sage.libs.gap
[[1, False, 1, False],
 [3, True, 2, True],
 [4, False, 3, True],
 [7, True, 4, False],
 [11, True, 5, True],
 [18, False, 6, False],
 [29, True, 7, True],
 [47, True, 8, False],
 [76, False, 9, False],
 [123, False, 10, False],
 [199, True, 11, True],
 [322, False, 12, False],
 [521, True, 13, True],
 [843, False, 14, False],
 [1364, False, 15, False]]
```

```
>>> from sage.all import *
>>> def lucas(n):
...     return Integer((Integer(5)/Integer(2))*lucas_number1(n,Integer(1),-
↪Integer(1)) + (Integer(1)/Integer(2))*lucas_number2(n,Integer(1),-Integer(1)))
>>> [[lucas(n), is_prime(lucas(n)), n+Integer(1), is_prime(n+Integer(1))] for n␣
↪in range(Integer(15))]   # needs sage.libs.gap
[[1, False, 1, False],

 [1364, False, 15, False]]
```

Can you use Sage to find a counterexample to the conjecture?

`sage.combinat.combinat.`**`lucas_number2`**(n, P, Q)

Return the n-th Lucas number "of the second kind" (this is not standard terminology). The Lucas sequence $L_n^{(2)}$ is defined by the initial conditions $L_1^{(2)} = 2$, $L_2^{(2)} = P$ and the recurrence relation $L_{n+2}^{(2)} = P \cdot L_{n+1}^{(2)} - Q \cdot L_n^{(2)}$.

INPUT:

- `n` – integer
- `P`, `Q` – integer or rational numbers

OUTPUT: integer or rational number

EXAMPLES:

```
sage: [lucas_number2(i,1,-1) for i in range(10)]                                #␣
↪needs sage.libs.gap
[2, 1, 3, 4, 7, 11, 18, 29, 47, 76]
sage: [fibonacci(i-1)+fibonacci(i+1) for i in range(10)]                        #␣
↪needs sage.libs.pari
[2, 1, 3, 4, 7, 11, 18, 29, 47, 76]
```

```
>>> from sage.all import *
>>> [lucas_number2(i,Integer(1),-Integer(1)) for i in range(Integer(10))]       ␣
↪                        # needs sage.libs.gap
[2, 1, 3, 4, 7, 11, 18, 29, 47, 76]
>>> [fibonacci(i-Integer(1))+fibonacci(i+Integer(1)) for i in range(Integer(10))]␣
↪                        # needs sage.libs.pari
[2, 1, 3, 4, 7, 11, 18, 29, 47, 76]
```

```
sage: # needs sage.libs.gap
sage: n = lucas_number2(5,2,3); n
2
sage: type(n)
<class 'sage.rings.integer.Integer'>
sage: n = lucas_number2(5,2,-3/9); n
418/9
sage: type(n)
<class 'sage.rings.rational.Rational'>
```

```
>>> from sage.all import *
>>> # needs sage.libs.gap
>>> n = lucas_number2(Integer(5),Integer(2),Integer(3)); n
2
>>> type(n)
<class 'sage.rings.integer.Integer'>
>>> n = lucas_number2(Integer(5),Integer(2),-Integer(3)/Integer(9)); n
418/9
>>> type(n)
<class 'sage.rings.rational.Rational'>
```

The case $P = 1$, $Q = -1$ is the Lucas sequence in Brualdi's Introductory Combinatorics, 4th ed., Prentice-Hall, 2004:

```
sage: [lucas_number2(n,1,-1) for n in range(10)]                                #␣
↪needs sage.libs.gap
[2, 1, 3, 4, 7, 11, 18, 29, 47, 76]
```

```
>>> from sage.all import *
>>> [lucas_number2(n,Integer(1),-Integer(1)) for n in range(Integer(10))]
↪                        # needs sage.libs.gap
[2, 1, 3, 4, 7, 11, 18, 29, 47, 76]
```

sage.combinat.combinat.**narayana_number**(*n*, *k*)

Return the Narayana number of index `(n, k)`.

For every integer $n \geq 1$, the sum of Narayana numbers $\sum_k N_{n,k}$ is the Catalan number C_n.

INPUT:

- `n` – integer
- `k` – integer between 0 and $n - 1$

OUTPUT: integer

EXAMPLES:

```
sage: from sage.combinat.combinat import narayana_number
sage: [narayana_number(3, i) for i in range(3)]
[1, 3, 1]
sage: sum(narayana_number(7,i) for i in range(7)) == catalan_number(7)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat import narayana_number
>>> [narayana_number(Integer(3), i) for i in range(Integer(3))]
[1, 3, 1]
>>> sum(narayana_number(Integer(7),i) for i in range(Integer(7))) == catalan_
↪number(Integer(7))
True
```

sage.combinat.combinat.**number_of_tuples**(*S*, *k*, *algorithm='naive'*)

Return the size of `tuples(S, k)` for a set S.

S is first converted to a set. Hence, unlike *`tuples()`*, this method removes redundant entries from S.

INPUT:

- `S` – the base set
- `k` – the length of the tuples
- `algorithm` – can be one of the following:
  - `'naive'` – (default) use the naive counting $|S|^k$
  - `'gap'` – wraps GAP's `NrTuples`

Warning

When using `algorithm='gap'`, `S` must be a list of objects that have string representations that can be interpreted by the GAP interpreter. If `S` consists of at all complicated Sage objects, this function might *not* do what you expect.

EXAMPLES:

```
sage: S = [1,2,3,4,5]
sage: number_of_tuples(S,2)
25
sage: number_of_tuples(S,2, algorithm='gap')                                #␣
↪needs sage.libs.gap
25
sage: S = [1,1,2,3,4,5]
sage: number_of_tuples(S,2)
25
sage: number_of_tuples(S,2, algorithm='gap')                                #␣
↪needs sage.libs.gap
25
sage: number_of_tuples(S,0)
1
sage: number_of_tuples(S,0, algorithm='gap')                                #␣
↪needs sage.libs.gap
1
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]
>>> number_of_tuples(S,Integer(2))
25
>>> number_of_tuples(S,Integer(2), algorithm='gap')                          ␣
↪     # needs sage.libs.gap
25
>>> S = [Integer(1),Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]
>>> number_of_tuples(S,Integer(2))
25
>>> number_of_tuples(S,Integer(2), algorithm='gap')                          ␣
↪     # needs sage.libs.gap
25
>>> number_of_tuples(S,Integer(0))
1
>>> number_of_tuples(S,Integer(0), algorithm='gap')                          ␣
↪     # needs sage.libs.gap
1
```

`sage.combinat.combinat.`**`number_of_unordered_tuples`**(*S*, *k*, *algorithm='naive'*)

Return the size of `unordered_tuples(S, k)` when S is a set.

INPUT:

- `S` – the base set
- `k` – the length of the tuples
- `algorithm` – can be one of the following:
  - `'naive'` – (default) use the naive counting $\binom{|S|+k-1}{k}$

– `'gap'` – wraps GAP's `NrUnorderedTuples`

Warning

When using `algorithm='gap'`, `S` must be a list of objects that have string representations that can be interpreted by the GAP interpreter. If `S` consists of at all complicated Sage objects, this function might *not* do what you expect.

EXAMPLES:

```
sage: S = [1,2,3,4,5]
sage: number_of_unordered_tuples(S,2)
15
sage: number_of_unordered_tuples(S,2, algorithm='gap')                          #␣
↪needs sage.libs.gap
15
sage: S = [1,1,2,3,4,5]
sage: number_of_unordered_tuples(S,2)
15
sage: number_of_unordered_tuples(S,2, algorithm='gap')                          #␣
↪needs sage.libs.gap
15
sage: number_of_unordered_tuples(S,0)
1
sage: number_of_unordered_tuples(S,0, algorithm='gap')                          #␣
↪needs sage.libs.gap
1
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]
>>> number_of_unordered_tuples(S,Integer(2))
15
>>> number_of_unordered_tuples(S,Integer(2), algorithm='gap')                    ␣
↪     # needs sage.libs.gap
15
>>> S = [Integer(1),Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]
>>> number_of_unordered_tuples(S,Integer(2))
15
>>> number_of_unordered_tuples(S,Integer(2), algorithm='gap')                    ␣
↪     # needs sage.libs.gap
15
>>> number_of_unordered_tuples(S,Integer(0))
1
>>> number_of_unordered_tuples(S,Integer(0), algorithm='gap')                    ␣
↪     # needs sage.libs.gap
1
```

`sage.combinat.combinat.`**`polygonal_number`**`(s, n)`

Return the n-th s-gonal number.

Polygonal sequences are represented by dots forming a regular polygon. Two famous sequences are the triangular numbers (3rd column of Pascal's Triangle) and the square numbers. The n-th term in a polygonal sequence is

defined by

$$P(s,n) = \frac{n^2(s-2) - n(s-4)}{2},$$

where s is the number of sides of the polygon.

INPUT:

- `s` – integer greater than 1; the number of sides of the polygon
- `n` – integer; the index of the returned s-gonal number

OUTPUT: integer

EXAMPLES:

The triangular numbers:

```
sage: [polygonal_number(3, n) for n in range(10)]
[0, 1, 3, 6, 10, 15, 21, 28, 36, 45]

sage: [polygonal_number(3, n) for n in range(-10, 0)]
[45, 36, 28, 21, 15, 10, 6, 3, 1, 0]
```

```
>>> from sage.all import *
>>> [polygonal_number(Integer(3), n) for n in range(Integer(10))]
[0, 1, 3, 6, 10, 15, 21, 28, 36, 45]

>>> [polygonal_number(Integer(3), n) for n in range(-Integer(10), Integer(0))]
[45, 36, 28, 21, 15, 10, 6, 3, 1, 0]
```

The square numbers:

```
sage: [polygonal_number(4, n) for n in range(10)]
[0, 1, 4, 9, 16, 25, 36, 49, 64, 81]
```

```
>>> from sage.all import *
>>> [polygonal_number(Integer(4), n) for n in range(Integer(10))]
[0, 1, 4, 9, 16, 25, 36, 49, 64, 81]
```

The pentagonal numbers:

```
sage: [polygonal_number(5, n) for n in range(10)]
[0, 1, 5, 12, 22, 35, 51, 70, 92, 117]
```

```
>>> from sage.all import *
>>> [polygonal_number(Integer(5), n) for n in range(Integer(10))]
[0, 1, 5, 12, 22, 35, 51, 70, 92, 117]
```

The hexagonal numbers:

```
sage: [polygonal_number(6, n) for n in range(10)]
[0, 1, 6, 15, 28, 45, 66, 91, 120, 153]
```

```
>>> from sage.all import *
>>> [polygonal_number(Integer(6), n) for n in range(Integer(10))]
[0, 1, 6, 15, 28, 45, 66, 91, 120, 153]
```

The input is converted into an integer:

```
sage: polygonal_number(3.0, 2.0)
3
```

```
>>> from sage.all import *
>>> polygonal_number(RealNumber('3.0'), RealNumber('2.0'))
3
```

A non-integer input returns an error:

```
sage: polygonal_number(3.5, 1)                                                  #␣
↪needs sage.rings.real_mpfr
Traceback (most recent call last):
...
TypeError: Attempt to coerce non-integral RealNumber to Integer
```

```
>>> from sage.all import *
>>> polygonal_number(RealNumber('3.5'), Integer(1))                             ␣
↪                    # needs sage.rings.real_mpfr
Traceback (most recent call last):
...
TypeError: Attempt to coerce non-integral RealNumber to Integer
```

s must be greater than 1:

```
sage: polygonal_number(1, 4)
Traceback (most recent call last):
...
ValueError: s (=1) must be greater than 1
```

```
>>> from sage.all import *
>>> polygonal_number(Integer(1), Integer(4))
Traceback (most recent call last):
...
ValueError: s (=1) must be greater than 1
```

REFERENCES:

- Wikipedia article Polygonal_number

sage.combinat.combinat.**stirling_number1**(*n*, *k*, *algorithm='gap'*)

Return the n-th Stirling number $S_1(n,k)$ of the first kind.

This is the number of permutations of n points with k cycles.

See Wikipedia article Stirling_numbers_of_the_first_kind.

INPUT:

- `n` – nonnegative machine-size integer
- `k` – nonnegative machine-size integer
- `algorithm`:
  - `'gap'` – default; use GAP's `Stirling1` function

- `'flint'` – use flint's `arith_stirling_number_1u` function

EXAMPLES:

```
sage: # needs sage.libs.gap
sage: stirling_number1(3,2)
3
sage: stirling_number1(5,2)
50
sage: 9*stirling_number1(9,5) + stirling_number1(9,4)
269325
sage: stirling_number1(10,5)
269325
```

```
>>> from sage.all import *
>>> # needs sage.libs.gap
>>> stirling_number1(Integer(3),Integer(2))
3
>>> stirling_number1(Integer(5),Integer(2))
50
>>> Integer(9)*stirling_number1(Integer(9),Integer(5)) + stirling_
↪number1(Integer(9),Integer(4))
269325
>>> stirling_number1(Integer(10),Integer(5))
269325
```

Indeed, $S_1(n,k) = S_1(n-1,k-1) + (n-1)S_1(n-1,k)$.

`sage.combinat.combinat.`**`stirling_number2`**(*n*, *k*, *algorithm=None*)

Return the n-th Stirling number $S_2(n,k)$ of the second kind.

This is the number of ways to partition a set of n elements into k pairwise disjoint nonempty subsets. The n-th Bell number is the sum of the $S_2(n,k)$'s, $k = 0, ..., n$.

See Wikipedia article Stirling_numbers_of_the_second_kind.

INPUT:

- `n` – nonnegative machine-size integer
- `k` – nonnegative machine-size integer
- `algorithm`:
  - `None` – default; use native implementation
  - `'flint'` – use flint's `arith_stirling_number_2` function
  - `'gap'` – use GAP's `Stirling2` function
  - `'maxima'` – use Maxima's `stirling2` function

EXAMPLES:

Print a table of the first several Stirling numbers of the second kind:

```
sage: for n in range(10):
....:     for k in range(10):
....:         print(str(stirling_number2(n,k)).rjust(k and 6))
1      0      0      0      0      0      0      0      0      0
```

(continues on next page)

(continued from previous page)

```
0      1      0      0      0      0      0      0      0      0
0      1      1      0      0      0      0      0      0      0
0      1      3      1      0      0      0      0      0      0
0      1      7      6      1      0      0      0      0      0
0      1     15     25     10      1      0      0      0      0
0      1     31     90     65     15      1      0      0      0
0      1     63    301    350    140     21      1      0      0
0      1    127    966   1701   1050    266     28      1      0
0      1    255   3025   7770   6951   2646    462     36      1
```

```
>>> from sage.all import *
>>> for n in range(Integer(10)):
...     for k in range(Integer(10)):
...         print(str(stirling_number2(n,k)).rjust(k and Integer(6)))
1      0      0      0      0      0      0      0      0      0
0      1      0      0      0      0      0      0      0      0
0      1      1      0      0      0      0      0      0      0
0      1      3      1      0      0      0      0      0      0
0      1      7      6      1      0      0      0      0      0
0      1     15     25     10      1      0      0      0      0
0      1     31     90     65     15      1      0      0      0
0      1     63    301    350    140     21      1      0      0
0      1    127    966   1701   1050    266     28      1      0
0      1    255   3025   7770   6951   2646    462     36      1
```

Stirling numbers satisfy $S_2(n,k) = S_2(n-1,k-1) + kS_2(n-1,k)$:

```
sage: 5*stirling_number2(9,5) + stirling_number2(9,4)
42525
sage: stirling_number2(10,5)
42525
```

```
>>> from sage.all import *
>>> Integer(5)*stirling_number2(Integer(9),Integer(5)) + stirling_
↪number2(Integer(9),Integer(4))
42525
>>> stirling_number2(Integer(10),Integer(5))
42525
```

sage.combinat.combinat.**tuples**(*S*, *k*, *algorithm='itertools'*)

Return a list of all k-tuples of elements of a given set `S`.

This function accepts the set `S` in the form of any iterable (list, tuple or iterator), and returns a list of k-tuples. If `S` contains duplicate entries, then you should expect the method to return tuples multiple times!

Recall that k-tuples are ordered (in the sense that two k-tuples differing in the order of their entries count as different) and can have repeated entries (even if `S` is a list with no repetition).

INPUT:

- `S` – the base set
- `k` – the length of the tuples
- `algorithm` – can be one of the following:

- `'itertools'` – (default) use python's itertools
- `'native'` – use a native Sage implementation

Note

The ordering of the list of tuples depends on the algorithm.

EXAMPLES:

```
sage: S = [1,2]
sage: tuples(S,3)
[(1, 1, 1), (1, 1, 2), (1, 2, 1), (1, 2, 2),
 (2, 1, 1), (2, 1, 2), (2, 2, 1), (2, 2, 2)]
sage: mset = ["s","t","e","i","n"]
sage: tuples(mset, 2)
[('s', 's'), ('s', 't'), ('s', 'e'), ('s', 'i'), ('s', 'n'),
 ('t', 's'), ('t', 't'), ('t', 'e'), ('t', 'i'), ('t', 'n'),
 ('e', 's'), ('e', 't'), ('e', 'e'), ('e', 'i'), ('e', 'n'),
 ('i', 's'), ('i', 't'), ('i', 'e'), ('i', 'i'), ('i', 'n'),
 ('n', 's'), ('n', 't'), ('n', 'e'), ('n', 'i'), ('n', 'n')]
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(2)]
>>> tuples(S,Integer(3))
[(1, 1, 1), (1, 1, 2), (1, 2, 1), (1, 2, 2),
 (2, 1, 1), (2, 1, 2), (2, 2, 1), (2, 2, 2)]
>>> mset = ["s","t","e","i","n"]
>>> tuples(mset, Integer(2))
[('s', 's'), ('s', 't'), ('s', 'e'), ('s', 'i'), ('s', 'n'),
 ('t', 's'), ('t', 't'), ('t', 'e'), ('t', 'i'), ('t', 'n'),
 ('e', 's'), ('e', 't'), ('e', 'e'), ('e', 'i'), ('e', 'n'),
 ('i', 's'), ('i', 't'), ('i', 'e'), ('i', 'i'), ('i', 'n'),
 ('n', 's'), ('n', 't'), ('n', 'e'), ('n', 'i'), ('n', 'n')]
```

```
sage: K.<a> = GF(4, 'a')                                                    #␣
↪needs sage.rings.finite_rings
sage: mset = [x for x in K if x != 0]                                       #␣
↪needs sage.rings.finite_rings
sage: tuples(mset, 2)                                                       #␣
↪needs sage.rings.finite_rings
[(a, a), (a, a + 1), (a, 1), (a + 1, a), (a + 1, a + 1),
 (a + 1, 1), (1, a), (1, a + 1), (1, 1)]
```

```
>>> from sage.all import *
>>> K = GF(Integer(4), 'a', names=('a',)); (a,) = K._first_ngens(1)# needs sage.
↪rings.finite_rings
>>> mset = [x for x in K if x != Integer(0)]                                 ␣
↪     # needs sage.rings.finite_rings
>>> tuples(mset, Integer(2))                                                 ␣
↪     # needs sage.rings.finite_rings
[(a, a), (a, a + 1), (a, 1), (a + 1, a), (a + 1, a + 1),
```

(continues on next page)

(continued from previous page)

```
 (a + 1, 1), (1, a), (1, a + 1), (1, 1)]
```

We check that the implementations agree (up to ordering):

```
sage: tuples(S, 3, 'native')
[(1, 1, 1), (2, 1, 1), (1, 2, 1), (2, 2, 1),
 (1, 1, 2), (2, 1, 2), (1, 2, 2), (2, 2, 2)]
```

```
>>> from sage.all import *
>>> tuples(S, Integer(3), 'native')
[(1, 1, 1), (2, 1, 1), (1, 2, 1), (2, 2, 1),
 (1, 1, 2), (2, 1, 2), (1, 2, 2), (2, 2, 2)]
```

Lastly we check on a multiset:

```
sage: S = [1,1,2]
sage: sorted(tuples(S, 3)) == sorted(tuples(S, 3, 'native'))
True
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(1),Integer(2)]
>>> sorted(tuples(S, Integer(3))) == sorted(tuples(S, Integer(3), 'native'))
True
```

sage.combinat.combinat.**unordered_tuples**(*S*, *k*, *algorithm='itertools'*)

Return a list of all unordered tuples of length `k` of the set `S`.

An unordered tuple of length k of set S is a unordered selection with repetitions of S and is represented by a sorted list of length k containing elements from S.

Unlike *tuples()*, the result of this method does not depend on how often an element appears in S; only the *set* S is being used. For example, `unordered_tuples([1, 1, 1], 2)` will return `[(1, 1)]`. If you want it to return `[(1, 1), (1, 1), (1, 1)]`, use Python's `itertools.combinations_with_replacement` instead.

INPUT:

- `S` – the base set
- `k` – the length of the tuples
- `algorithm` – can be one of the following:
  - `'itertools'` – (default) use python's itertools
  - `'gap'` – wraps GAP's `UnorderedTuples`

Warning

When using `algorithm='gap'`, `S` must be a list of objects that have string representations that can be interpreted by the GAP interpreter. If `S` consists of at all complicated Sage objects, this function might *not* do what you expect.

EXAMPLES:

```
sage: S = [1,2]
sage: unordered_tuples(S, 3)
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(2)]
>>> unordered_tuples(S, Integer(3))
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
```

We check that this agrees with GAP:

```
sage: unordered_tuples(S, 3, algorithm='gap')                                  #␣
↪needs sage.libs.gap
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
```

```
>>> from sage.all import *
>>> unordered_tuples(S, Integer(3), algorithm='gap')                            ␣
↪     # needs sage.libs.gap
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
```

We check the result on strings:

```
sage: S = ["a","b","c"]
sage: unordered_tuples(S, 2)
[('a', 'a'), ('a', 'b'), ('a', 'c'), ('b', 'b'), ('b', 'c'), ('c', 'c')]
sage: unordered_tuples(S, 2, algorithm='gap')                                  #␣
↪needs sage.libs.gap
[('a', 'a'), ('a', 'b'), ('a', 'c'), ('b', 'b'), ('b', 'c'), ('c', 'c')]
```

```
>>> from sage.all import *
>>> S = ["a","b","c"]
>>> unordered_tuples(S, Integer(2))
[('a', 'a'), ('a', 'b'), ('a', 'c'), ('b', 'b'), ('b', 'c'), ('c', 'c')]
>>> unordered_tuples(S, Integer(2), algorithm='gap')                            ␣
↪     # needs sage.libs.gap
[('a', 'a'), ('a', 'b'), ('a', 'c'), ('b', 'b'), ('b', 'c'), ('c', 'c')]
```

Lastly we check on a multiset:

```
sage: S = [1,1,2]
sage: unordered_tuples(S, 3) == unordered_tuples(S, 3, 'gap')                  #␣
↪needs sage.libs.gap
True
sage: unordered_tuples(S, 3)
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(1),Integer(2)]
>>> unordered_tuples(S, Integer(3)) == unordered_tuples(S, Integer(3), 'gap')   ␣
↪              # needs sage.libs.gap
True
>>> unordered_tuples(S, Integer(3))
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
```

sage.combinat.combinat.**unshuffle_iterator**(*a*, *one=1*)

Iterate over the unshuffles of a list (or tuple) a, also yielding the signs of the respective permutations.

If n and k are integers satisfying $0 \leq k \leq n$, then a $(k, n-k)$-*unshuffle* means a permutation $\pi \in S_n$ such that $\pi(1) < \pi(2) < \cdots < \pi(k)$ and $\pi(k+1) < \pi(k+2) < \cdots < \pi(n)$. This method provides, for a list $a = (a_1, a_2, \ldots, a_n)$ of length n, an iterator yielding all pairs:

$$\left(\left((a_{\pi(1)}, a_{\pi(2)}, \ldots, a_{\pi(k)}), (a_{\pi(k+1)}, a_{\pi(k+2)}, \ldots, a_{\pi(n)})\right), (-1)^{\pi}\right)$$

for all $k \in \{0, 1, \ldots, n\}$ and all $(k, n-k)$-unshuffles π. The optional variable one can be set to a different value which results in the $(-1)^{\pi}$ component being multiplied by said value.

The iterator does not yield these in order of increasing k.

EXAMPLES:

```
sage: from sage.combinat.combinat import unshuffle_iterator
sage: list(unshuffle_iterator([1, 3, 4]))
[((), (1, 3, 4)), 1), (((1,), (3, 4)), 1), (((3,), (1, 4)), -1),
 (((1, 3), (4,)), 1), (((4,), (1, 3)), 1), (((1, 4), (3,)), -1),
 (((3, 4), (1,)), 1), (((1, 3, 4), ()), 1)]
sage: list(unshuffle_iterator([3, 1]))
[((), (3, 1)), 1), (((3,), (1,)), 1), (((1,), (3,)), -1),
 (((3, 1), ()), 1)]
sage: list(unshuffle_iterator([8]))
[((), (8,)), 1), (((8,), ()), 1)]
sage: list(unshuffle_iterator([]))
[((), ()), 1)]
sage: list(unshuffle_iterator([3, 1], 3/2))
[((), (3, 1)), 3/2), (((3,), (1,)), 3/2), (((1,), (3,)), -3/2),
 (((3, 1), ()), 3/2)]
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat import unshuffle_iterator
>>> list(unshuffle_iterator([Integer(1), Integer(3), Integer(4)]))
[((), (1, 3, 4)), 1), (((1,), (3, 4)), 1), (((3,), (1, 4)), -1),
 (((1, 3), (4,)), 1), (((4,), (1, 3)), 1), (((1, 4), (3,)), -1),
 (((3, 4), (1,)), 1), (((1, 3, 4), ()), 1)]
>>> list(unshuffle_iterator([Integer(3), Integer(1)]))
[((), (3, 1)), 1), (((3,), (1,)), 1), (((1,), (3,)), -1),
 (((3, 1), ()), 1)]
>>> list(unshuffle_iterator([Integer(8)]))
[((), (8,)), 1), (((8,), ()), 1)]
>>> list(unshuffle_iterator([]))
[((), ()), 1)]
>>> list(unshuffle_iterator([Integer(3), Integer(1)], Integer(3)/Integer(2)))
[((), (3, 1)), 3/2), (((3,), (1,)), 3/2), (((1,), (3,)), -3/2),
 (((3, 1), ()), 3/2)]
```

Combinatorial maps

This module provides a decorator that can be used to add semantic to a Python method by marking it as implementing a *combinatorial map*, that is a map between two enumerated sets:

```
sage: from sage.combinat.combinatorial_map import combinatorial_map
sage: class MyPermutation():
....:     @combinatorial_map()
....:     def reverse(self):
....:         '''
....:         Reverse the permutation
....:         '''
....:         # ... code ...
```

```
>>> from sage.all import *
>>> from sage.combinat.combinatorial_map import combinatorial_map
>>> class MyPermutation():
...     @combinatorial_map()
...     def reverse(self):
...         '''
...         Reverse the permutation
...         '''
...         # ... code ...
```

By default, this decorator is a no-op: it returns the decorated method as is:

```
sage: MyPermutation.reverse
<function MyPermutation.reverse at ...>
```

```
>>> from sage.all import *
>>> MyPermutation.reverse
<function MyPermutation.reverse at ...>
```

See *combinatorial_map_wrapper()* for the various options this decorator can take.

Projects built on top of Sage are welcome to customize locally this hook to instrument the Sage code and exploit this semantic information. Typically, the decorator could be used to populate a database of maps. For a real-life application, see the project $FindStat < http : //findstat.org/ >$. As a basic example, a variant of the decorator is provided as *combinatorial_map_wrapper()*; it wraps the decorated method, so that one can later use *combinatorial_maps_in_class()* to query an object, or class thereof, for all the combinatorial maps that apply to it.

Note

Since decorators are evaluated upon loading Python modules, customizing *combinatorial_map()* needs to be done before the modules using it are loaded. In the examples below, where we illustrate the customized `combinatorial_map` decorator on the *sage.combinat.permutation* module, we resort to force a reload of this module after dynamically changing `sage.combinat.combinatorial_map.combinatorial_map`. This is good enough for those doctests, but remains fragile.

For real use cases, it is probably best to just edit this source file statically (see below).

class sage.combinat.combinatorial_map.**CombinatorialMap**(*f*, *order=None*, *name=None*)

Bases: `object`

This is a wrapper class for methods that are *combinatorial maps*.

For further details and doctests, see *Combinatorial maps* and *combinatorial_map_wrapper()*.

name()

Return the name of a combinatorial map. This is used for the string representation of `self`.

EXAMPLES:

```
sage: from sage.combinat.combinatorial_map import combinatorial_map
sage: class CombinatorialClass:
....:     @combinatorial_map(name='map1')
....:     def to_self_1(): pass
....:     @combinatorial_map()
....:     def to_self_2(): pass
sage: CombinatorialClass.to_self_1.name()
'map1'
sage: CombinatorialClass.to_self_2.name()
'to_self_2'
```

```
>>> from sage.all import *
>>> from sage.combinat.combinatorial_map import combinatorial_map
>>> class CombinatorialClass:
...     @combinatorial_map(name='map1')
...     def to_self_1(): pass
...     @combinatorial_map()
...     def to_self_2(): pass
>>> CombinatorialClass.to_self_1.name()
'map1'
>>> CombinatorialClass.to_self_2.name()
'to_self_2'
```

order()

Return the order of `self`, or `None` if the order is not known.

EXAMPLES:

```
sage: from sage.combinat.combinatorial_map import combinatorial_map
sage: class CombinatorialClass:
....:     @combinatorial_map(order=2)
....:     def to_self_1(): pass
....:     @combinatorial_map()
....:     def to_self_2(): pass
sage: CombinatorialClass.to_self_1.order()
2
sage: CombinatorialClass.to_self_2.order() is None
True
```

```
>>> from sage.all import *
>>> from sage.combinat.combinatorial_map import combinatorial_map
>>> class CombinatorialClass:
...     @combinatorial_map(order=Integer(2))
...     def to_self_1(): pass
...     @combinatorial_map()
...     def to_self_2(): pass
>>> CombinatorialClass.to_self_1.order()
2
```

(continues on next page)

(continued from previous page)

```
>>> CombinatorialClass.to_self_2.order() is None
True
```

unbounded_map()

Return the unbounded version of `self`.

You can use this method to return a function which takes as input an element in the domain of the combinatorial map. See the example below.

EXAMPLES:

```
sage: sage.combinat.combinatorial_map.combinatorial_map = sage.combinat.
↪combinatorial_map.combinatorial_map_wrapper
sage: from importlib import reload
sage: _ = reload(sage.combinat.permutation)
sage: from sage.combinat.permutation import Permutation
sage: pi = Permutation([1,3,2])
sage: f = pi.reverse
sage: F = f.unbounded_map()
sage: F(pi)
[2, 3, 1]
```

```
>>> from sage.all import *
>>> sage.combinat.combinatorial_map.combinatorial_map = sage.combinat.
↪combinatorial_map.combinatorial_map_wrapper
>>> from importlib import reload
>>> _ = reload(sage.combinat.permutation)
>>> from sage.combinat.permutation import Permutation
>>> pi = Permutation([Integer(1),Integer(3),Integer(2)])
>>> f = pi.reverse
>>> F = f.unbounded_map()
>>> F(pi)
[2, 3, 1]
```

sage.combinat.combinatorial_map.**combinatorial_map**(*f=None*, *order=None*, *name=None*)

alias of *combinatorial_map_trivial()*.

sage.combinat.combinatorial_map.**combinatorial_map_trivial**(*f=None*, *order=None*, *name=None*)

Combinatorial map decorator.

See *Combinatorial maps* for a description of this decorator and its purpose. This default implementation does nothing.

INPUT:

- `f` – (default: `None`, if combinatorial_map is used as a decorator) a function
- `name` – (default: `None`) the name for nicer outputs on combinatorial maps
- `order` – (default: `None`) the order of the combinatorial map, if it is known. Is not used, but might be helpful later

OUTPUT: `f` unchanged

EXAMPLES:

```
sage: from sage.combinat.combinatorial_map import combinatorial_map_trivial as␣
↪combinatorial_map
sage: class MyPermutation():
....:     @combinatorial_map
....:     def reverse(self):
....:         '''
....:         Reverse the permutation
....:         '''
....:         # ... code ...
....:     @combinatorial_map(name='descent set of permutation')
....:     def descent_set(self):
....:         '''
....:         The descent set of the permutation
....:         '''
....:         # ... code ...

sage: MyPermutation.reverse
<function MyPermutation.reverse at ...>

sage: MyPermutation.descent_set
<function MyPermutation.descent_set at ...>
```

```
>>> from sage.all import *
>>> from sage.combinat.combinatorial_map import combinatorial_map_trivial as␣
↪combinatorial_map
>>> class MyPermutation():
...     @combinatorial_map
...     def reverse(self):
...         '''
...         Reverse the permutation
...         '''
...         # ... code ...
...     @combinatorial_map(name='descent set of permutation')
...     def descent_set(self):
...         '''
...         The descent set of the permutation
...         '''
...         # ... code ...

>>> MyPermutation.reverse
<function MyPermutation.reverse at ...>

>>> MyPermutation.descent_set
<function MyPermutation.descent_set at ...>
```

sage.combinat.combinatorial_map.**combinatorial_map_wrapper**(*f=None*, *order=None*, *name=None*)

Combinatorial map decorator (basic example).

See *Combinatorial maps* for a description of the `combinatorial_map` decorator and its purpose. This implementation, together with *`combinatorial_maps_in_class()`* illustrates how to use this decorator as a hook to instrument the Sage code.

INPUT:

- `f` – (default: `None`, if combinatorial_map is used as a decorator) a function
- `name` – (default: `None`) the name for nicer outputs on combinatorial maps
- `order` – (default: `None`) the order of the combinatorial map, if it is known. Is not used, but might be helpful later

OUTPUT: a combinatorial map; this is an instance of the *CombinatorialMap*

EXAMPLES:

We define a class illustrating the use of this implementation of the *combinatorial_map* decorator with its various arguments:

```
sage: from sage.combinat.combinatorial_map import combinatorial_map_wrapper as␣
↪combinatorial_map
sage: class MyPermutation():
....:     @combinatorial_map()
....:     def reverse(self):
....:         '''
....:         Reverse the permutation
....:         '''
....:         pass
....:     @combinatorial_map(order=2)
....:     def inverse(self):
....:         '''
....:         The inverse of the permutation
....:         '''
....:         pass
....:     @combinatorial_map(name='descent set of permutation')
....:     def descent_set(self):
....:         '''
....:         The descent set of the permutation
....:         '''
....:         pass
....:     def major_index(self):
....:         '''
....:         The major index of the permutation
....:         '''
....:         pass
sage: MyPermutation.reverse
Combinatorial map: reverse
sage: MyPermutation.descent_set
Combinatorial map: descent set of permutation
sage: MyPermutation.inverse
Combinatorial map: inverse
```

```
>>> from sage.all import *
>>> from sage.combinat.combinatorial_map import combinatorial_map_wrapper as␣
↪combinatorial_map
>>> class MyPermutation():
...     @combinatorial_map()
...     def reverse(self):
...         '''
...         Reverse the permutation
...         '''
```

(continues on next page)

(continued from previous page)

```
...         pass
...     @combinatorial_map(order=Integer(2))
...     def inverse(self):
...         '''
...         The inverse of the permutation
...         '''
...         pass
...     @combinatorial_map(name='descent set of permutation')
...     def descent_set(self):
...         '''
...         The descent set of the permutation
...         '''
...         pass
...     def major_index(self):
...         '''
...         The major index of the permutation
...         '''
...         pass
>>> MyPermutation.reverse
Combinatorial map: reverse
>>> MyPermutation.descent_set
Combinatorial map: descent set of permutation
>>> MyPermutation.inverse
Combinatorial map: inverse
```

One can now determine all the combinatorial maps associated with a given object as follows:

```
sage: from sage.combinat.combinatorial_map import combinatorial_maps_in_class
sage: X = combinatorial_maps_in_class(MyPermutation); X # random
[Combinatorial map: reverse,
 Combinatorial map: descent set of permutation,
 Combinatorial map: inverse]
```

```
>>> from sage.all import *
>>> from sage.combinat.combinatorial_map import combinatorial_maps_in_class
>>> X = combinatorial_maps_in_class(MyPermutation); X # random
[Combinatorial map: reverse,
 Combinatorial map: descent set of permutation,
 Combinatorial map: inverse]
```

The method `major_index` defined about is not a combinatorial map:

```
sage: MyPermutation.major_index
<function MyPermutation.major_index at ...>
```

```
>>> from sage.all import *
>>> MyPermutation.major_index
<function MyPermutation.major_index at ...>
```

But one can define a function that turns `major_index` into a combinatorial map:

```
sage: def major_index(p):
....:     return p.major_index()
sage: major_index
<function major_index at ...>
sage: combinatorial_map(major_index)
Combinatorial map: major_index
```

```
>>> from sage.all import *
>>> def major_index(p):
...     return p.major_index()
>>> major_index
<function major_index at ...>
>>> combinatorial_map(major_index)
Combinatorial map: major_index
```

sage.combinat.combinatorial_map.**combinatorial_maps_in_class**(*cls*)

Return the combinatorial maps of the class as a list of combinatorial maps.

For further details and doctests, see *Combinatorial maps* and `combinatorial_map_wrapper()`.

EXAMPLES:

```
sage: sage.combinat.combinatorial_map.combinatorial_map = sage.combinat.
↪combinatorial_map.combinatorial_map_wrapper
sage: from importlib import reload
sage: _ = reload(sage.combinat.permutation)
sage: from sage.combinat.combinatorial_map import combinatorial_maps_in_class
sage: p = Permutation([1,3,2,4])
sage: cmaps = combinatorial_maps_in_class(p)
sage: cmaps # random
[Combinatorial map: Robinson-Schensted insertion tableau,
 Combinatorial map: Robinson-Schensted recording tableau,
 Combinatorial map: Robinson-Schensted tableau shape,
 Combinatorial map: complement,
 Combinatorial map: descent composition,
 Combinatorial map: inverse, ...]
sage: p.left_tableau in cmaps
True
sage: p.right_tableau in cmaps
True
sage: p.complement in cmaps
True
```

```
>>> from sage.all import *
>>> sage.combinat.combinatorial_map.combinatorial_map = sage.combinat.
↪combinatorial_map.combinatorial_map_wrapper
>>> from importlib import reload
>>> _ = reload(sage.combinat.permutation)
>>> from sage.combinat.combinatorial_map import combinatorial_maps_in_class
>>> p = Permutation([Integer(1),Integer(3),Integer(2),Integer(4)])
>>> cmaps = combinatorial_maps_in_class(p)
>>> cmaps # random
[Combinatorial map: Robinson-Schensted insertion tableau,
```

(continues on next page)

(continued from previous page)

```
 Combinatorial map: Robinson-Schensted recording tableau,
 Combinatorial map: Robinson-Schensted tableau shape,
 Combinatorial map: complement,
 Combinatorial map: descent composition,
 Combinatorial map: inverse, ...]
>>> p.left_tableau in cmaps
True
>>> p.right_tableau in cmaps
True
>>> p.complement in cmaps
True
```

Combinatorial triangles for posets and fans

This provides several classes and methods to convert between them. Elements of the classes are polynomials in two variables x and y, possibly with other parameters. The conversion methods amount to specific invertible rational change-of-variables involving x and y.

These polynomial are called triangles because their supports, the sets of exponents where their coefficients can be nonzero, have a triangular shape.

The M-triangle class is motivated by the generating series of Möbius numbers for graded posets. A typical example is:

```
sage: W = SymmetricGroup(4)                                                 #␣
↪needs sage.groups
sage: posets.NoncrossingPartitions(W).M_triangle()                          #␣
↪needs sage.graphs sage.groups
M: x^3*y^3 - 6*x^2*y^3 + 6*x^2*y^2 + 10*x*y^3 - 16*x*y^2
- 5*y^3 + 6*x*y + 10*y^2 - 6*y + 1

⎝  1   0   0   0⎠
```

The F-triangle class is motivated by the generating series of pure simplicial complexes endowed with a distinguished facet. One can also think about complete fans endowed with a distinguished maximal cone. A typical example is:

```
sage: # needs sage.graphs sage.modules
sage: C = ClusterComplex(['A',3])
sage: f = C.greedy_facet()
sage: C.F_triangle(f)
F: 5*x^3 + 5*x^2*y + 3*x*y^2 + y^3 + 10*x^2 + 8*x*y + 3*y^2 + 6*x + 3*y + 1
sage: unicode_art(_)
⎛ 1  0  0  0⎞
⎜ 3  3  0  0⎟
⎜ 3  8  5  0⎟
⎝ 1  6 10  5⎠
```

```
>>> from sage.all import *
>>> # needs sage.graphs sage.modules
>>> C = ClusterComplex(['A',Integer(3)])
>>> f = C.greedy_facet()
>>> C.F_triangle(f)
F: 5*x^3 + 5*x^2*y + 3*x*y^2 + y^3 + 10*x^2 + 8*x*y + 3*y^2 + 6*x + 3*y + 1
>>> unicode_art(_)
⎛ 1  0  0  0⎞
⎜ 3  3  0  0⎟
⎜ 3  8  5  0⎟
⎝ 1  6 10  5⎠
```

The H-triangles are related to the F-triangles by a relationship similar to the classical link between the f-vector and the h-vector of a simplicial complex.

The Gamma-triangles are related to the H-triangles by an analog of the relationship between gamma-vectors and h-vectors of flag simplicial complexes.

class sage.combinat.triangles_FHM.**F_triangle**(*poly*, *variables=None*)

Bases: *Triangle*

Class for the F-triangles.

h()

Return the associated H-triangle.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import F_triangle
sage: x,y = polygens(ZZ,'x,y')
sage: ft = F_triangle(1+x+y)
sage: ft.h()
H: x*y + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import F_triangle
>>> x,y = polygens(ZZ,'x,y')
>>> ft = F_triangle(Integer(1)+x+y)
>>> ft.h()
H: x*y + 1
```

m()

Return the associated M-triangle.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygens(ZZ,'x,y')
sage: H_triangle(1+x*y).f()
F: x + y + 1
sage: _.m()
M: x*y - y + 1

sage: H_triangle(x^2*y^2 + 2*x*y + x + 1).f()
F: 2*x^2 + 2*x*y + y^2 + 3*x + 2*y + 1
sage: _.m()
M: x^2*y^2 - 3*x*y^2 + 3*x*y + 2*y^2 - 3*y + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import H_triangle
>>> x, y = polygens(ZZ,'x,y')
>>> H_triangle(Integer(1)+x*y).f()
F: x + y + 1
>>> _.m()
M: x*y - y + 1

>>> H_triangle(x**Integer(2)*y**Integer(2) + Integer(2)*x*y + x + Integer(1)).
↪f()
F: 2*x^2 + 2*x*y + y^2 + 3*x + 2*y + 1
>>> _.m()
M: x^2*y^2 - 3*x*y^2 + 3*x*y + 2*y^2 - 3*y + 1
```

parabolic()

Return a parabolic version of the F-triangle.

This is obtained by replacing the variable y by $y - 1$.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygens(ZZ,'x,y')
sage: H_triangle(1+x*y).f()
F: x + y + 1
sage: _.parabolic()
F: x + y
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import H_triangle
>>> x, y = polygens(ZZ,'x,y')
>>> H_triangle(Integer(1)+x*y).f()
F: x + y + 1
>>> _.parabolic()
F: x + y
```

vector()

Return the f-vector as a polynomial in one variable.

This is obtained by letting $y = x$.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import F_triangle
sage: x, y = polygen(ZZ,'x,y')
sage: ft = 2*x^2 + 2*x*y + y^2 + 3*x + 2*y + 1
sage: F_triangle(ft).vector()
5*x^2 + 5*x + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import F_triangle
>>> x, y = polygen(ZZ,'x,y')
>>> ft = Integer(2)*x**Integer(2) + Integer(2)*x*y + y**Integer(2) +␣
↪Integer(3)*x + Integer(2)*y + Integer(1)
>>> F_triangle(ft).vector()
5*x^2 + 5*x + 1
```

class sage.combinat.triangles_FHM.**Gamma_triangle**(*poly*, *variables=None*)

Bases: *Triangle*

Class for the Gamma-triangles.

h()

Return the associated H-triangle.

The transition between Gamma-triangles and H-triangles is defined by

$$H(x,y) = (1+x)^d \sum_{0\le i;0\le j\le d-2i} \gamma_{i,j} \left(\frac{x}{(1+x)^2}\right)^i \left(\frac{1+xy}{1+x}\right)^j$$

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import Gamma_triangle
sage: x, y = polygen(ZZ,'x,y')
sage: g = y**2 + x
sage: Gamma_triangle(g).h()
H: x^2*y^2 + 2*x*y + x + 1

sage: a, b = polygen(ZZ, 'a, b')
sage: x, y = polygens(a.parent(),'x,y')
sage: g = Gamma_triangle(y**3+a*x*y+b*x,(x,y))
sage: hh = g.h()
sage: hh.gamma() == g
True
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import Gamma_triangle
>>> x, y = polygen(ZZ,'x,y')
>>> g = y**Integer(2) + x
>>> Gamma_triangle(g).h()
H: x^2*y^2 + 2*x*y + x + 1

>>> a, b = polygen(ZZ, 'a, b')
>>> x, y = polygens(a.parent(),'x,y')
>>> g = Gamma_triangle(y**Integer(3)+a*x*y+b*x,(x,y))
>>> hh = g.h()
```

(continues on next page)

(continued from previous page)

```
>>> hh.gamma() == g
True
```

vector()

Return the gamma-vector as a polynomial in one variable.

This is obtained by letting $y = 1$.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import Gamma_triangle
sage: x, y = polygen(ZZ,'x,y')
sage: gt = y**2 + x
sage: Gamma_triangle(gt).vector()
x + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import Gamma_triangle
>>> x, y = polygen(ZZ,'x,y')
>>> gt = y**Integer(2) + x
>>> Gamma_triangle(gt).vector()
x + 1
```

class sage.combinat.triangles_FHM.**H_triangle**(*poly*, *variables=None*)

Bases: *Triangle*

Class for the H-triangles.

f()

Return the associated F-triangle.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygens(ZZ,'x,y')
sage: H_triangle(1+x*y).f()
F: x + y + 1
sage: H_triangle(x^2*y^2 + 2*x*y + x + 1).f()
F: 2*x^2 + 2*x*y + y^2 + 3*x + 2*y + 1
sage: flo = H_triangle(1+4*x+2*x**2+x*y*(4+8*x)+
....:    x**2*y**2*(6+4*x)+4*(x*y)**3+(x*y)**4).f(); flo
F: 7*x^4 + 12*x^3*y + 10*x^2*y^2 + 4*x*y^3 + y^4 + 20*x^3
+ 28*x^2*y + 16*x*y^2 + 4*y^3 + 20*x^2 + 20*x*y
+ 6*y^2 + 8*x + 4*y + 1
sage: flo(-1-x,-1-y) == flo
True
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import H_triangle
>>> x, y = polygens(ZZ,'x,y')
>>> H_triangle(Integer(1)+x*y).f()
F: x + y + 1
>>> H_triangle(x**Integer(2)*y**Integer(2) + Integer(2)*x*y + x + Integer(1)).
↪f()
```

(continues on next page)

(continued from previous page)

```
F: 2*x^2 + 2*x*y + y^2 + 3*x + 2*y + 1
>>> flo = H_triangle(Integer(1)+Integer(4)*x+Integer(2)*x**Integer(2)+x*y*(Int
↪eger(4)+Integer(8)*x)+
...   x**Integer(2)*y**Integer(2)*(Integer(6)+Integer(4)*x)+Inte-
ger(4)*(x*y)**Integer(3)+(x*y)**Integer(4)).f(); flo
F: 7*x^4 + 12*x^3*y + 10*x^2*y^2 + 4*x*y^3 + y^4 + 20*x^3
+ 28*x^2*y + 16*x*y^2 + 4*y^3 + 20*x^2 + 20*x*y
+ 6*y^2 + 8*x + 4*y + 1
>>> flo(-Integer(1)-x,-Integer(1)-y) == flo
True
```

gamma()

Return the associated Gamma-triangle.

In some cases, this is a more condensed way to encode the same amount of information.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygen(ZZ,'x,y')
sage: ht = x**2*y**2 + 2*x*y + x + 1
sage: H_triangle(ht).gamma()
Γ: y^2 + x

sage: W = SymmetricGroup(5)                                                 #␣
↪needs sage.groups
sage: P = posets.NoncrossingPartitions(W)                                   #␣
↪needs sage.graphs sage.groups
sage: P.M_triangle().h().gamma()                                            #␣
↪needs sage.graphs sage.groups
Γ: y^4 + 3*x*y^2 + 2*x^2 + 2*x*y + x
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import H_triangle
>>> x, y = polygen(ZZ,'x,y')
>>> ht = x**Integer(2)*y**Integer(2) + Integer(2)*x*y + x + Integer(1)
>>> H_triangle(ht).gamma()
Γ: y^2 + x

>>> W = SymmetricGroup(Integer(5))                                          ␣
↪     # needs sage.groups
>>> P = posets.NoncrossingPartitions(W)                                   #␣
↪needs sage.graphs sage.groups
>>> P.M_triangle().h().gamma()                                            #␣
↪needs sage.graphs sage.groups
Γ: y^4 + 3*x*y^2 + 2*x^2 + 2*x*y + x
```

m()

Return the associated M-triangle.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import H_triangle
sage: h = polygen(ZZ, 'h')
sage: x, y = polygens(h.parent(),'x,y')
sage: ht = H_triangle(x^2*y^2 + 2*x*y + 2*x*h - 4*x + 1, variables=[x,y])
sage: ht.m()
M: x^2*y^2 + (-2*h + 2)*x*y^2 + (2*h - 2)*x*y
+ (2*h - 3)*y^2 + (-2*h + 2)*y + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import H_triangle
>>> h = polygen(ZZ, 'h')
>>> x, y = polygens(h.parent(),'x,y')
>>> ht = H_triangle(x**Integer(2)*y**Integer(2) + Integer(2)*x*y +␣
↪Integer(2)*x*h - Integer(4)*x + Integer(1), variables=[x,y])
>>> ht.m()
M: x^2*y^2 + (-2*h + 2)*x*y^2 + (2*h - 2)*x*y
+ (2*h - 3)*y^2 + (-2*h + 2)*y + 1
```

transpose()

Return the transposed H-triangle.

OUTPUT: another H-triangle

This operation is an involution. When seen as a matrix, it performs a symmetry with respect to the northwest-southeast diagonal.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygens(ZZ,'x,y')
sage: H_triangle(1+x*y).transpose()
H: x*y + 1
sage: H_triangle(x^2*y^2 + 2*x*y + x + 1).transpose()
H: x^2*y^2 + x^2*y + 2*x*y + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import H_triangle
>>> x, y = polygens(ZZ,'x,y')
>>> H_triangle(Integer(1)+x*y).transpose()
H: x*y + 1
>>> H_triangle(x**Integer(2)*y**Integer(2) + Integer(2)*x*y + x + Integer(1)).
↪transpose()
H: x^2*y^2 + x^2*y + 2*x*y + 1
```

vector()

Return the h-vector as a polynomial in one variable.

This is obtained by letting $y = 1$.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygen(ZZ,'x,y')
sage: ht = x**2*y**2 + 2*x*y + x + 1
```

(continues on next page)

(continued from previous page)

```
sage: H_triangle(ht).vector()
x^2 + 3*x + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import H_triangle
>>> x, y = polygen(ZZ,'x,y')
>>> ht = x**Integer(2)*y**Integer(2) + Integer(2)*x*y + x + Integer(1)
>>> H_triangle(ht).vector()
x^2 + 3*x + 1
```

class sage.combinat.triangles_FHM.**M_triangle**(*poly*, *variables=None*)

Bases: *Triangle*

Class for the M-triangles.

This is motivated by generating series of Möbius numbers of graded posets.

EXAMPLES:

```
sage: x, y = polygens(ZZ, 'x,y')
sage: P = Poset({2: [1]})                                                    #␣
↪needs sage.graphs
sage: P.M_triangle()                                                         #␣
↪needs sage.graphs
M: x*y - y + 1
```

```
>>> from sage.all import *
>>> x, y = polygens(ZZ, 'x,y')
>>> P = Poset({Integer(2): [Integer(1)]})                                     ␣
↪              # needs sage.graphs
>>> P.M_triangle()                                                          #␣
↪needs sage.graphs
M: x*y - y + 1
```

dual()

Return the dual M-triangle.

This is the M-triangle of the dual poset, hence an involution.

When seen as a matrix, this performs a symmetry with respect to the northwest-southeast diagonal.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import  M_triangle
sage: x, y = polygens(ZZ, 'x,y')
sage: mt = M_triangle(x*y - y + 1)
sage: mt.dual() == mt
True
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import  M_triangle
>>> x, y = polygens(ZZ, 'x,y')
>>> mt = M_triangle(x*y - y + Integer(1))
>>> mt.dual() == mt
True
```

f()

Return the associated F-triangle.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import M_triangle
sage: x, y = polygens(ZZ,'x,y')
sage: M_triangle(1-y+x*y).f()
F: x + y + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import M_triangle
>>> x, y = polygens(ZZ,'x,y')
>>> M_triangle(Integer(1)-y+x*y).f()
F: x + y + 1
```

h()

Return the associated H-triangle.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import M_triangle
sage: x, y = polygens(ZZ,'x,y')
sage: M_triangle(1-y+x*y).h()
H: x*y + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import M_triangle
>>> x, y = polygens(ZZ,'x,y')
>>> M_triangle(Integer(1)-y+x*y).h()
H: x*y + 1
```

transmute()

Return the image of `self` by an involution.

OUTPUT: another M-triangle

The involution is defined by converting to an H-triangle, transposing the matrix, and then converting back to an M-triangle.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import  M_triangle
sage: x, y = polygens(ZZ, 'x,y')
sage: nc3 = x^2*y^2 - 3*x*y^2 + 3*x*y + 2*y^2 - 3*y + 1
sage: m = M_triangle(nc3)
sage: m2 = m.transmute(); m2                                                #␣
↪needs sage.libs.flint
M: 2*x^2*y^2 - 3*x*y^2 + 2*x*y + y^2 - 2*y + 1
sage: m2.transmute() == m                                                   #␣
↪needs sage.libs.flint
True
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import  M_triangle
```

(continues on next page)

(continued from previous page)

```
>>> x, y = polygens(ZZ, 'x,y')
>>> nc3 = x**Integer(2)*y**Integer(2) - Integer(3)*x*y**Integer(2) +␣
↪Integer(3)*x*y + Integer(2)*y**Integer(2) - Integer(3)*y + Integer(1)
>>> m = M_triangle(nc3)
>>> m2 = m.transmute(); m2                                                    #␣
↪needs sage.libs.flint
M: 2*x^2*y^2 - 3*x*y^2 + 2*x*y + y^2 - 2*y + 1
>>> m2.transmute() == m                                                       #␣
↪needs sage.libs.flint
True
```

class sage.combinat.triangles_FHM.**Triangle**(*poly*, *variables=None*)

Bases: SageObject

Common class for different kinds of triangles.

This serves as a base class for F-triangles, H-triangles, M-triangles and Gamma-triangles.

The user should use these subclasses directly.

The input is a polynomial in two variables. One can also give a polynomial with more variables and specify two chosen variables.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import Triangle
sage: x, y = polygens(ZZ, 'x,y')
sage: ht = Triangle(1+4*x+2*x*y)
sage: unicode_art(ht)                                                        #␣
↪needs sage.modules
⎛0 2⎞
⎝1 4⎠
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import Triangle
>>> x, y = polygens(ZZ, 'x,y')
>>> ht = Triangle(Integer(1)+Integer(4)*x+Integer(2)*x*y)
>>> unicode_art(ht)                                                          #␣
↪needs sage.modules
⎛0 2⎞
⎝1 4⎠
```

factor()

Return the decomposition of `self` as a product.

This is defined by factoring the underlying polynomial.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import M_triangle
sage: x, y = polygens(ZZ, 'x,y')
sage: p = 3*x^3*y^3 - 7*x^2*y^3 + 5*x^2*y^2
sage: p += 5*x*y^3 - 8*x*y^2 - y^3 + 3*x*y + 3*y^2 - 3*y + 1
sage: m = M_triangle(p)
sage: m.factor()
[M: x*y - y + 1, M: 3*x^2*y^2 - 4*x*y^2 + 2*x*y + y^2 - 2*y + 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import M_triangle
>>> x, y = polygens(ZZ, 'x,y')
>>> p = Integer(3)*x**Integer(3)*y**Integer(3) -␣
↪Integer(7)*x**Integer(2)*y**Integer(3) +␣
↪Integer(5)*x**Integer(2)*y**Integer(2)
>>> p += Integer(5)*x*y**Integer(3) - Integer(8)*x*y**Integer(2) -␣
↪y**Integer(3) + Integer(3)*x*y + Integer(3)*y**Integer(2) - Integer(3)*y +␣
↪Integer(1)
>>> m = M_triangle(p)
>>> m.factor()
[M: x*y - y + 1, M: 3*x^2*y^2 - 4*x*y^2 + 2*x*y + y^2 - 2*y + 1]
```

matrix()

Return the associated matrix for display.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygens(ZZ, 'x,y')
sage: h = H_triangle(1+2*x*y)
sage: h.matrix()                                                              #␣
↪needs sage.modules
[0 2]
[1 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import H_triangle
>>> x, y = polygens(ZZ, 'x,y')
>>> h = H_triangle(Integer(1)+Integer(2)*x*y)
>>> h.matrix()                                                                #␣
↪needs sage.modules
[0 2]
[1 0]
```

polynomial()

Return the triangle as a bare polynomial.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygens(ZZ, 'x,y')
sage: h = H_triangle(1+2*x*y)
sage: h.polynomial()
2*x*y + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import H_triangle
>>> x, y = polygens(ZZ, 'x,y')
>>> h = H_triangle(Integer(1)+Integer(2)*x*y)
>>> h.polynomial()
2*x*y + 1
```

truncate(*d*)

Return the truncated triangle.

INPUT:

- `d` – integer

As a polynomial, this means that all monomials with a power of either x or y greater than or equal to `d` are dismissed.

EXAMPLES:

```
sage: from sage.combinat.triangles_FHM import H_triangle
sage: x, y = polygens(ZZ, 'x,y')
sage: h = H_triangle(1+2*x*y)
sage: h.truncate(2)
H: 2*x*y + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.triangles_FHM import H_triangle
>>> x, y = polygens(ZZ, 'x,y')
>>> h = H_triangle(Integer(1)+Integer(2)*x*y)
>>> h.truncate(Integer(2))
H: 2*x*y + 1
```

Introduction to combinatorics in Sage

This thematic tutorial is a translation by Hugh Thomas of the combinatorics chapter written by Nicolas M. Thiéry in the book "Calcul Mathématique avec Sage" [CMS2012]. It covers mainly the treatment in Sage of the following combinatorial problems: enumeration (how many elements are there in a set S?), listing (generate all the elements of S, or iterate through them), and random selection (choosing an element at random from a set S according to a given distribution, for example the uniform distribution). These questions arise naturally in the calculation of probabilities (what is the probability in poker of obtaining a straight or a four-of-a-kind of aces?), in statistical physics, and also in computer algebra (the number of elements in a finite field), or in the analysis of algorithms. Combinatorics covers a much wider domain (partial orders, representation theory, ...) for which we only give a few pointers towards the possibilities offered by Sage.

A characteristic of computational combinatorics is the profusion of types of objects and sets that one wants to manipulate. It would be impossible to describe them all or, a fortiori, to implement them all. After some *Initial examples*, this chapter illustrates the underlying method: supplying the basic building blocks to describe common combinatorial sets *Common enumerated sets*, tools for combining them to construct new examples *Constructions*, and generic algorithms for solving uniformly a large class of problems *Generic algorithms*.

This is a domain in which Sage has much more extensive capabilities than most computer algebra systems, and it is rapidly expanding; at the same time, it is still quite new, and has many unnecessary limitations and incoherences.

Initial examples

Poker and probability

We begin by solving a classic problem: enumerating certain combinations of cards in the game of poker, in order to deduce their probability.

A card in a poker deck is characterized by a suit (hearts, diamonds, spades, or clubs) and a value (2, 3, ..., 10, jack, queen, king, ace). The game is played with a full deck, which consists of the Cartesian product of the set of suits and the set of values:

$$\text{Cards} = \text{Suits} \times \text{Values} = \{(s, v) \mid s \in \text{Suits et } v \in \text{Values}\}.$$

We construct these examples in Sage:

```
sage: Suits = Set(["Hearts", "Diamonds", "Spades", "Clubs"])
sage: Values = Set([2, 3, 4, 5, 6, 7, 8, 9, 10,
....:               "Jack", "Queen", "King", "Ace"])
sage: Cards = cartesian_product([Values, Suits])
```

```
>>> from sage.all import *
>>> Suits = Set(["Hearts", "Diamonds", "Spades", "Clubs"])
>>> Values = Set([Integer(2), Integer(3), Integer(4), Integer(5), Integer(6),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(7), Integer(8), Integer(9), Integer(10),
...                "Jack", "Queen", "King", "Ace"])
>>> Cards = cartesian_product([Values, Suits])
```

There are 4 suits and 13 possible values, and therefore $4 \times 13 = 52$ cards in the poker deck:

```
sage: Suits.cardinality()
4
sage: Values.cardinality()
13
sage: Cards.cardinality()
52
```

```
>>> from sage.all import *
>>> Suits.cardinality()
4
>>> Values.cardinality()
13
>>> Cards.cardinality()
52
```

Draw a card at random:

```
sage: Cards.random_element()                          # random
(6, 'Clubs')
```

```
>>> from sage.all import *
>>> Cards.random_element()                          # random
(6, 'Clubs')
```

Now we can define a set of cards:

```
sage: Set([Cards.random_element(), Cards.random_element()])  # random
{(2, 'Hearts'), (4, 'Spades')}
```

```
>>> from sage.all import *
>>> Set([Cards.random_element(), Cards.random_element()])  # random
{(2, 'Hearts'), (4, 'Spades')}
```

This problem should eventually disappear: it is planned to change the implementation of Cartesian products so that their elements are immutable by default.

Returning to our main topic, we will be considering a simplified version of poker, in which each player directly draws five cards, which form his *hand*. The cards are all distinct and the order in which they are drawn is irrelevant; a hand is therefore a subset of size 5 of the set of cards. To draw a hand at random, we first construct the set of all possible hands, and then we ask for a randomly chosen element:

```
sage: Hands = Subsets(Cards, 5)
sage: Hands.random_element()                          # random
{(4, 'Hearts', 4), (9, 'Diamonds'), (8, 'Spades'),
 (9, 'Clubs'), (7, 'Hearts')}
```

```
>>> from sage.all import *
>>> Hands = Subsets(Cards, Integer(5))
>>> Hands.random_element()                          # random
{(4, 'Hearts', 4), (9, 'Diamonds'), (8, 'Spades'),
 (9, 'Clubs'), (7, 'Hearts')}
```

The total number of hands is given by the number of subsets of size 5 of a set of size 52, which is given by the binomial coefficient $\binom{52}{5}$:

```
sage: binomial(52,5)
2598960
```

```
>>> from sage.all import *
>>> binomial(Integer(52),Integer(5))
2598960
```

One can also ignore the method of calculation, and simply ask for the size of the set of hands:

```
sage: Hands.cardinality()
2598960
```

```
>>> from sage.all import *
>>> Hands.cardinality()
2598960
```

The strength of a poker hand depends on the particular combination of cards present. One such combination is the *flush*; this is a hand all of whose cards have the same suit. (In principle, straight flushes should be excluded; this will be the goal of an exercise given below.) Such a hand is therefore characterized by the choice of five values from among the thirteen possibilities, and the choice of one of four suits. We will construct the set of all flushes, so as to determine how many there are:

```
sage: Flushes = cartesian_product([Subsets(Values, 5), Suits])
sage: Flushes.cardinality()
5148
```

```
>>> from sage.all import *
>>> Flushes = cartesian_product([Subsets(Values, Integer(5)), Suits])
>>> Flushes.cardinality()
5148
```

The probability of obtaining a flush when drawing a hand at random is therefore:

```
sage: Flushes.cardinality()  / Hands.cardinality()
33/16660
```

```
>>> from sage.all import *
>>> Flushes.cardinality()  / Hands.cardinality()
33/16660
```

or about two in a thousand:

```
sage: 1000.0 * Flushes.cardinality()  / Hands.cardinality()
1.98079231692677
```

```
>>> from sage.all import *
>>> RealNumber('1000.0') * Flushes.cardinality()  / Hands.cardinality()
1.98079231692677
```

We will now attempt a little numerical simulation. The following function tests whether a given hand is a flush or not:

```
sage: def is_flush(hand):
....:     return len(set(suit for val, suit in hand)) == 1
```

```
>>> from sage.all import *
>>> def is_flush(hand):
...     return len(set(suit for val, suit in hand)) == Integer(1)
```

We now draw 10000 hands at random, and count the number of flushes obtained (this takes about 10 seconds):

```
sage: n = 10000
sage: nflush = 0
sage: for i in range(n):                                # long time
....:     hand = Hands.random_element()
....:     if is_flush(hand):
....:         nflush += 1
sage: n, nflush                                  # random
(10000, 18)
```

```
>>> from sage.all import *
>>> n = Integer(10000)
>>> nflush = Integer(0)
>>> for i in range(n):                                # long time
...     hand = Hands.random_element()
...     if is_flush(hand):
...         nflush += Integer(1)
>>> n, nflush                                  # random
(10000, 18)
```

Exercises

A hand containing four cards of the same value is called a *four of a kind*. Construct the set of four of a kind hands (Hint: use `Arrangements` to choose a pair of distinct values at random, then choose a suit for the first value). Calculate the number of four of a kind hand, list them, and then determine the probability of obtaining a four of a kind when drawing a hand at random.

A hand all of whose cards have the same suit, and whose values are consecutive, is called a *straight flush* rather than a *flush*. Count the number of straight flushes, and then deduce the correct probability of obtaining a flush when drawing a hand at random.

Calculate the probability of each of the poker hands (see Wikipedia article Poker_hands), and compare them with the results of simulations.

Enumeration of trees using generating functions

In this section, we discuss the example of complete binary trees, and illustrate in this context many techniques of enumeration in which formal power series play a natural role. These techniques are quite general, and can be applied whenever the combinatorial objects in question admit a recursive definition (grammar) (see *Species, decomposable combinatorial classes* for an automated treatment). The goal is not a formal presentation of these methods; the calculations are rigorous, but most of the justifications will be skipped.

A *complete binary tree* is either a leaf L, or a node to which two complete binary trees are attached (see *Figure: The five complete binary trees with four leaves*).

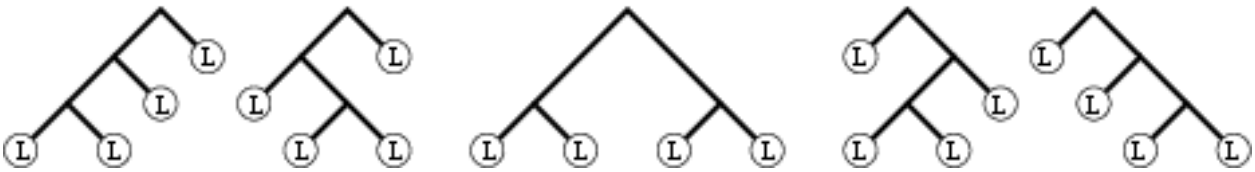

Fig. 1: Figure: The five complete binary trees with four leaves

Exercise: enumeration of binary trees

Find by hand all the complete binary trees with $n = 1, 2, 3, 4, 5$ leaves (see *Exercise: complete binary tree iterator* to find them using `Sage`).

Our goal is to determine the number c_n of complete binary trees with n leaves (in this section, except when explicitly stated otherwise, "trees" always means complete binary trees). This is a typical situation in which one is not only interested in a single set, but in a family of sets, typically parameterized by $n \in \mathbf{N}$.

According to the solution of *Exercise: enumeration of binary trees*, the first terms are given by $c_1, \ldots, c_5 = 1, 1, 2, 5, 14$. The simple fact of knowing these few numbers is already very valuable. In fact, this permits research in a gold mine of information: the Online Encyclopedia of Integer Sequences, commonly called "Sloane", the name of its principal author, which contains more than 190000 sequences of integers:

```
sage: oeis([1,1,2,5,14])                                  # optional -- internet
0: A000108: Catalan numbers: ...
1: ...
2: ...
```

```
>>> from sage.all import *
>>> oeis([Integer(1),Integer(1),Integer(2),Integer(5),Integer(14)])
↪          # optional -- internet
0: A000108: Catalan numbers: ...
1: ...
2: ...
```

The result suggests that the trees are counted by one of the most famous sequences, the Catalan numbers. Looking through the references supplied by the Encyclopedia, we see that this is really the case: the few numbers above form a digital fingerprint of our objects, which enable us to find, in a few seconds, a precise result from within an abundant literature.

Our next goal is to recover this result using `Sage`. Let C_n be the set of trees with n leaves, so that $c_n = |C_n|$; by convention, we will define $C_0 = \emptyset$ and $c_0 = 0$. The set of all trees is then the disjoint union of the sets C_n:

$$C = \biguplus_{n \in \mathbb{N}} C_n \,.$$

Having named the set C of all trees, we can translate the recursive definition of trees into a set-theoretic equation:

$$C \quad \approx \quad \{\mathrm{L}\} \quad \uplus \quad C \times C\,.$$

In words: a tree t (which is by definition in C) is either a leaf (so in $\{\mathrm{L}\}$) or a node to which two trees t_1 and t_2 have been attached, and which we can therefore identify with the pair (t_1, t_2) (in the Cartesian product $C \times C$).

The founding idea of algebraic combinatorics, introduced by Euler in a letter to Goldbach of 1751 to treat a similar problem , is to manipulate all the numbers c_n simultaneously, by encoding them as coefficients in a formal power series, called the *generating function* of the c_n's:

$$C(z) = \sum_{n\in\mathbb{N}} c_n z^n\,,$$

where z is a formal variable (which means that we do not have to worry about questions of convergence). The beauty of this idea is that set-theoretic operations $(A \uplus B,\ A \times B)$ translate naturally into algebraic operations on the corresponding series $(A(z) + B(z),\ A(z) \cdot B(z))$, in such a way that the set-theoretic equation satisfied by C can be translated directly into an algebraic equation satisfied by $C(z)$:

$$C(z) = z + C(z) \cdot C(z)\,.$$

Now we can solve this equation with `Sage`. In order to do so, we introduce two variables, C and z, and we define the equation:

```
sage: C, z = var('C,z')                                                 #␣
↪needs sage.symbolic
sage: sys = [ C == z + C*C ]                                            #␣
↪needs sage.symbolic
```

```
>>> from sage.all import *
>>> C, z = var('C,z')                                                   #␣
↪needs sage.symbolic
>>> sys = [ C == z + C*C ]                                              #␣
↪needs sage.symbolic
```

There are two solutions, which happen to have closed forms:

```
sage: sol = solve(sys, C, solution_dict=True); sol                      #␣
↪needs sage.symbolic
[{C: -1/2*sqrt(-4*z + 1) + 1/2}, {C: 1/2*sqrt(-4*z + 1) + 1/2}]
sage: s0 = sol[0][C]; s1 = sol[1][C]                                    #␣
↪needs sage.symbolic
```

```
>>> from sage.all import *
>>> sol = solve(sys, C, solution_dict=True); sol                        #␣
↪needs sage.symbolic
[{C: -1/2*sqrt(-4*z + 1) + 1/2}, {C: 1/2*sqrt(-4*z + 1) + 1/2}]
>>> s0 = sol[Integer(0)][C]; s1 = sol[Integer(1)][C]                    ␣
↪              # needs sage.symbolic
```

and whose Taylor series begin as follows:

```
sage: s0.series(z, 6)                                                   #␣
↪needs sage.symbolic
1*z + 1*z^2 + 2*z^3 + 5*z^4 + 14*z^5 + Order(z^6)
```

(continues on next page)

(continued from previous page)

```
sage: s1.series(z, 6)                                                          #␣
↪needs sage.symbolic
1 + (-1)*z + (-1)*z^2 + (-2)*z^3 + (-5)*z^4 + (-14)*z^5
+ Order(z^6)
```

```
>>> from sage.all import *
>>> s0.series(z, Integer(6))                                                   ␣
↪      # needs sage.symbolic
1*z + 1*z^2 + 2*z^3 + 5*z^4 + 14*z^5 + Order(z^6)
>>> s1.series(z, Integer(6))                                                   ␣
↪      # needs sage.symbolic
1 + (-1)*z + (-1)*z^2 + (-2)*z^3 + (-5)*z^4 + (-14)*z^5
+ Order(z^6)
```

The second solution is clearly aberrant, while the first one gives the expected coefficients. Therefore, we set:

```
sage: C = s0                                                                   #␣
↪needs sage.symbolic
```

```
>>> from sage.all import *
>>> C = s0                                                                     #␣
↪needs sage.symbolic
```

We can now calculate the next terms:

```
sage: C.series(z, 11)                                                          #␣
↪needs sage.symbolic
1*z + 1*z^2 + 2*z^3 + 5*z^4 + 14*z^5 + 42*z^6 +
132*z^7 + 429*z^8 + 1430*z^9 + 4862*z^10 + Order(z^11)
```

```
>>> from sage.all import *
>>> C.series(z, Integer(11))                                                   ␣
↪      # needs sage.symbolic
1*z + 1*z^2 + 2*z^3 + 5*z^4 + 14*z^5 + 42*z^6 +
132*z^7 + 429*z^8 + 1430*z^9 + 4862*z^10 + Order(z^11)
```

or calculate, more or less instantaneously, the 100-th coefficient:

```
sage: C.series(z, 101).coefficient(z,100)                                      #␣
↪needs sage.symbolic
227508830794229349661819540395688853956041682601541047340
```

```
>>> from sage.all import *
>>> C.series(z, Integer(101)).coefficient(z,Integer(100))                      ␣
↪              # needs sage.symbolic
227508830794229349661819540395688853956041682601541047340
```

It is unfortunate to have to recalculate everything if at some point we wanted the 101-st coefficient. Lazy power series (see `sage.rings.lazy_series_ring`) come into their own here, in that one can define them from a system of equations without solving it, and, in particular, without needing a closed form for the answer. We begin by defining the ring of lazy power series:

```
sage: L.<z> = LazyPowerSeriesRing(QQ)
```

```
>>> from sage.all import *
>>> L = LazyPowerSeriesRing(QQ, names=('z',)); (z,) = L._first_ngens(1)
```

Then we create a "free" power series, which we name, and which we then define by a recursive equation:

```
sage: C = L.undefined(valuation=1)
sage: C.define(z + C * C)
```

```
>>> from sage.all import *
>>> C = L.undefined(valuation=Integer(1))
>>> C.define(z + C * C)
```

```
sage: [C.coefficient(i) for i in range(11)]
[0, 1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862]
```

```
>>> from sage.all import *
>>> [C.coefficient(i) for i in range(Integer(11))]
[0, 1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862]
```

At any point, one can ask for any coefficient without having to redefine C:

```
sage: C.coefficient(100)
227508830794229349661819540395688853956041682601541047340
sage: C.coefficient(200)
129013158064429114001222907669676675134349530552728882499810851598901419013348319045534
↪5808508477355282757501221889 40
```

```
>>> from sage.all import *
>>> C.coefficient(Integer(100))
227508830794229349661819540395688853956041682601541047340
>>> C.coefficient(Integer(200))
129013158064429114001222907669676675134349530552728882499810851598901419013348319045534
↪5808508477355282757501221889 40
```

We now return to the closed form of $C(z)$:

```
sage: z = var('z')                                                          #␣
↪needs sage.symbolic
sage: C = s0; C                                                             #␣
↪needs sage.symbolic
-1/2*sqrt(-4*z + 1) + 1/2
```

```
>>> from sage.all import *
>>> z = var('z')                                                          #␣
↪needs sage.symbolic
>>> C = s0; C                                                             #␣
↪needs sage.symbolic
-1/2*sqrt(-4*z + 1) + 1/2
```

The n-th coefficient in the Taylor series for $C(z)$ being given by $\frac{1}{n!}C(z)^{(n)}(0)$, we look at the successive derivatives $C(z)^{(n)}(z)$:

```
sage: derivative(C, z, 1)                                                   #␣
↪needs sage.symbolic
1/sqrt(-4*z + 1)
sage: derivative(C, z, 2)                                                   #␣
↪needs sage.symbolic
2/(-4*z + 1)^(3/2)
sage: derivative(C, z, 3)                                                   #␣
↪needs sage.symbolic
12/(-4*z + 1)^(5/2)
```

```
>>> from sage.all import *
>>> derivative(C, z, Integer(1))                                            ␣
↪     # needs sage.symbolic
1/sqrt(-4*z + 1)
>>> derivative(C, z, Integer(2))                                            ␣
↪     # needs sage.symbolic
2/(-4*z + 1)^(3/2)
>>> derivative(C, z, Integer(3))                                            ␣
↪     # needs sage.symbolic
12/(-4*z + 1)^(5/2)
```

This suggests the existence of a simple explicit formula, which we will now seek. The following small function returns $d_n = n!\,c_n$:

```
sage: def d(n): return derivative(s0, n).subs(z=0)
```

```
>>> from sage.all import *
>>> def d(n): return derivative(s0, n).subs(z=Integer(0))
```

Taking successive quotients:

```
sage: [ (d(n+1) / d(n)) for n in range(1,17) ]                              #␣
↪needs sage.symbolic
[2, 6, 10, 14, 18, 22, 26, 30, 34, 38, 42, 46, 50, 54, 58, 62]
```

```
>>> from sage.all import *
>>> [ (d(n+Integer(1)) / d(n)) for n in range(Integer(1),Integer(17)) ]      ␣
↪                       # needs sage.symbolic
[2, 6, 10, 14, 18, 22, 26, 30, 34, 38, 42, 46, 50, 54, 58, 62]
```

we observe that d_n satisfies the recurrence relation $d_{n+1} = (4n-2)d_n$, from which we deduce that c_n satisfies the recurrence relation $c_{n+1} = \frac{(4n-2)}{n+1}c_n$. Simplifying, we find that c_n is the $(n-1)$-th Catalan number:

$$c_n = \text{Catalan}(n-1) = \frac{1}{n}\binom{2(n-1)}{n-1}.$$

We check this:

```
sage: n = var('n')                                                          #␣
↪needs sage.symbolic
sage: c = 1/n*binomial(2*(n-1),n-1)                                         #␣
↪needs sage.symbolic
sage: [c.subs(n=k) for k in range(1, 11)]                                   #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.symbolic
[1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862]
sage: [catalan_number(k-1) for k in range(1, 11)]
[1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862]
```

```
>>> from sage.all import *
>>> n = var('n')                                                    #␣
↪needs sage.symbolic
>>> c = Integer(1)/n*binomial(Integer(2)*(n-Integer(1)),n-Integer(1))          ␣
↪                                  # needs sage.symbolic
>>> [c.subs(n=k) for k in range(Integer(1), Integer(11))]                      ␣
↪              # needs sage.symbolic
[1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862]
>>> [catalan_number(k-Integer(1)) for k in range(Integer(1), Integer(11))]
[1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862]
```

We can now calculate coefficients much further; here we calculate c_{100000} which has more than 60000 digits:

```
sage: cc = c(n=100000)                                                  #␣
↪needs sage.symbolic
```

```
>>> from sage.all import *
>>> cc = c(n=Integer(100000))                                                ␣
↪     # needs sage.symbolic
```

This takes a couple of seconds:

```
sage: %time cc = c(100000)                  # not tested                    #␣
↪needs sage.symbolic
CPU times: user 2.34 s, sys: 0.00 s, total: 2.34 s
Wall time: 2.34 s
sage: ZZ(cc).ndigits()                                                  #␣
↪needs sage.symbolic
60198
```

```
>>> from sage.all import *
>>> %time cc = c(Integer(100000))                  # not tested              ␣
↪     # needs sage.symbolic
CPU times: user 2.34 s, sys: 0.00 s, total: 2.34 s
Wall time: 2.34 s
>>> ZZ(cc).ndigits()                                                    #␣
↪needs sage.symbolic
60198
```

The methods which we have used generalize to all recursively defined objects: the system of set-theoretic equations can be translated into a system of equations on the generating function, which enables the recursive calculation of its coefficients. If the set-theoretic equations are simple enough (for example, if they only involve Cartesian products and disjoint unions), the equation for $C(z)$ is algebraic. This equation has, in general, no closed-form solution. However, using *confinement*, one can deduce a *linear* differential equation which $C(z)$ satisfies. This differential equation, in turn, can be translated into a recurrence relation of fixed length on its coefficients c_n. In this case, the series is called *D-finite*. After the initial calculation of this recurrence relation, the calculation of coefficients is very fast. All these steps are purely algorithmic, and it is planned to port into `Sage` the implementations which exist in `Maple` (the `gfun` and `combstruct` packages) or

`MuPAD-Combinat` (the `decomposableObjects` library).

For the moment, we illustrate this general procedure in the case of complete binary trees. The generating function $C(z)$ is a solution to an algebraic equation $P(z, C(z)) = 0$, where $P = P(x, y)$ is a polynomial with coefficients in $\mathbf{Q}$. In the present case, $P = y^2 - y + x$. We formally differentiate this equation with respect to z:

```
sage: # needs sage.symbolic
sage: x, y, z = var('x, y, z')
sage: P = function('P')(x, y)
sage: C = function('C')(z)
sage: equation =  P(x=z, y=C) == 0
sage: diff(equation, z)
diff(C(z), z)*D[1](P)(z, C(z)) + D[0](P)(z, C(z)) == 0
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> x, y, z = var('x, y, z')
>>> P = function('P')(x, y)
>>> C = function('C')(z)
>>> equation =  P(x=z, y=C) == Integer(0)
>>> diff(equation, z)
diff(C(z), z)*D[1](P)(z, C(z)) + D[0](P)(z, C(z)) == 0
```

or, in a more readable format,

$$\frac{dC(z)}{dz}\frac{\partial P}{\partial y}(z, C(z)) + \frac{\partial P}{\partial x}(z, C(z)) = 0$$

From this we deduce:

$$\frac{dC(z)}{dz} = -\frac{\frac{\partial P}{\partial x}}{\frac{\partial P}{\partial y}}(z, C(z))\,.$$

In the case of complete binary trees, this gives:

```
sage: P = y^2 - y + x                                                       #␣
↪needs sage.symbolic
sage: Px = diff(P, x); Py = diff(P, y)                                      #␣
↪needs sage.symbolic
sage: - Px / Py                                                             #␣
↪needs sage.symbolic
-1/(2*y - 1)
```

```
>>> from sage.all import *
>>> P = y**Integer(2) - y + x                                                  ␣
↪       # needs sage.symbolic
>>> Px = diff(P, x); Py = diff(P, y)                                        #␣
↪needs sage.symbolic
>>> - Px / Py                                                               #␣
↪needs sage.symbolic
-1/(2*y - 1)
```

Recall that $P(z, C(z)) = 0$. Thus, we can calculate this fraction mod P and, in this way, express the derivative of $C(z)$ as a *polynomial in* $C(z)$ *with coefficients in* $\mathbf{Q}(z)$. In order to achieve this, we construct the quotient ring $R = \mathbf{Q}(x)[y]/(P)$:

```
sage: Qx = QQ['x'].fraction_field()
sage: Qxy = Qx['y']
sage: R = Qxy.quo(P); R                                                    #␣
↪needs sage.symbolic
Univariate Quotient Polynomial Ring in ybar
over Fraction Field of Univariate Polynomial Ring in x
over Rational Field with modulus y^2 - y + x
```

```
>>> from sage.all import *
>>> Qx = QQ['x'].fraction_field()
>>> Qxy = Qx['y']
>>> R = Qxy.quo(P); R                                                      #␣
↪needs sage.symbolic
Univariate Quotient Polynomial Ring in ybar
over Fraction Field of Univariate Polynomial Ring in x
over Rational Field with modulus y^2 - y + x
```

Note: `ybar` is the name of the variable y in the quotient ring.

Todo

add link to some tutorial on quotient rings

We continue the calculation of this fraction in R:

```
sage: fraction = - R(Px) / R(Py); fraction                                 #␣
↪needs sage.symbolic
(1/2/(x - 1/4))*ybar - 1/4/(x - 1/4)
```

```
>>> from sage.all import *
>>> fraction = - R(Px) / R(Py); fraction                                   #␣
↪needs sage.symbolic
(1/2/(x - 1/4))*ybar - 1/4/(x - 1/4)
```

Note

The following variant does not work yet:

```
sage: fraction = R( - Px / Py ); fraction   # todo: not implemented
Traceback (most recent call last):
...
TypeError: denominator must be a unit
```

```
>>> from sage.all import *
>>> fraction = R( - Px / Py ); fraction   # todo: not implemented
Traceback (most recent call last):
...
TypeError: denominator must be a unit
```

We lift the result to $\mathbf{Q}(x)[y]$ and then substitute z and $C(z)$ to obtain an expression for $\frac{d}{dz}C(z)$:

```
sage: fraction = fraction.lift(); fraction                                    #␣
↪needs sage.symbolic
(1/2/(x - 1/4))*y - 1/4/(x - 1/4)
sage: fraction(x=z, y=C)                                                      #␣
↪needs sage.symbolic
2*C(z)/(4*z - 1) - 1/(4*z - 1)
```

```
>>> from sage.all import *
>>> fraction = fraction.lift(); fraction                                      #␣
↪needs sage.symbolic
(1/2/(x - 1/4))*y - 1/4/(x - 1/4)
>>> fraction(x=z, y=C)                                                        #␣
↪needs sage.symbolic
2*C(z)/(4*z - 1) - 1/(4*z - 1)
```

or, more legibly,

$$\frac{\partial C(z)}{\partial z} = \frac{1}{1-4z} - \frac{2}{1-4z} C(z)\,.$$

In this simple case, we can directly deduce from this expression a linear differential equation with coefficients in $\mathbf{Q}[z]$:

```
sage: # needs sage.symbolic
sage: equadiff = diff(C,z) == fraction(x=z, y=C)
sage: equadiff
diff(C(z), z) == 2*C(z)/(4*z - 1) - 1/(4*z - 1)
sage: equadiff = equadiff.simplify_rational()
sage: equadiff = equadiff * equadiff.rhs().denominator()
sage: equadiff = equadiff - equadiff.rhs()
sage: equadiff
(4*z - 1)*diff(C(z), z) - 2*C(z) + 1 == 0
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> equadiff = diff(C,z) == fraction(x=z, y=C)
>>> equadiff
diff(C(z), z) == 2*C(z)/(4*z - 1) - 1/(4*z - 1)
>>> equadiff = equadiff.simplify_rational()
>>> equadiff = equadiff * equadiff.rhs().denominator()
>>> equadiff = equadiff - equadiff.rhs()
>>> equadiff
(4*z - 1)*diff(C(z), z) - 2*C(z) + 1 == 0
```

or, more legibly,

$$(1-4z)\frac{\partial C(z)}{\partial z} + 2C(z) - 1 = 0\,.$$

It is trivial to verify this equation on the closed form:

```
sage: Cf = sage.symbolic.function_factory.function('C')                       #␣
↪needs sage.symbolic
sage: equadiff.substitute_function(Cf, s0.function(z))                        #␣
↪needs sage.symbolic
```

(continues on next page)

(continued from previous page)

```
(4*z - 1)/sqrt(-4*z + 1) + sqrt(-4*z + 1) == 0
sage: bool(equadiff.substitute_function(Cf, s0.function(z)))                    #␣
↪needs sage.symbolic
True
```

```
>>> from sage.all import *
>>> Cf = sage.symbolic.function_factory.function('C')                           #␣
↪needs sage.symbolic
>>> equadiff.substitute_function(Cf, s0.function(z))                            #␣
↪needs sage.symbolic
(4*z - 1)/sqrt(-4*z + 1) + sqrt(-4*z + 1) == 0
>>> bool(equadiff.substitute_function(Cf, s0.function(z)))                      #␣
↪needs sage.symbolic
True
```

In the general case, one continues to calculate successive derivatives of $C(z)$. These derivatives are *confined* in the quotient ring $\mathbf{Q}(z)[C]/(P)$ which is of finite dimension $\deg P$ over $\mathbf{Q}(z)$. Therefore, one will eventually find a linear relation among the first $\deg P$ derivatives of $C(z)$. Putting it over a single denominator, we obtain a linear differential equation of degree $\leq \deg P$ with coefficients in $\mathbf{Q}[z]$. By extracting the coefficient of z^n in the differential equation, we obtain the desired recurrence relation on the coefficients; in this case we recover the relation we had already found, based on the closed form:

$$c_{n+1} = \frac{(4n-2)}{n+1} c_n$$

After fixing the correct initial conditions, it becomes possible to calculate the coefficients of $C(z)$ recursively:

```
sage: def C(n): return 1 if n <= 1 else (4*n-6)/n * C(n-1)
sage: [ C(i) for i in range(10) ]
[1, 1, 1, 2, 5, 14, 42, 132, 429, 1430]
```

```
>>> from sage.all import *
>>> def C(n): return Integer(1) if n <= Integer(1) else (Integer(4)*n-Integer(6))/n *␣
↪C(n-Integer(1))
>>> [ C(i) for i in range(Integer(10)) ]
[1, 1, 1, 2, 5, 14, 42, 132, 429, 1430]
```

If n is too large for the explicit calculation of c_n, a sequence asymptotically equivalent to the sequence of coefficients c_n may be sought. Here again, there are generic techniques. The central tool is complex analysis, specifically, the study of the generating function around its singularities. In the present instance, the singularity is at $z_0 = 1/4$ and one would obtain $c_n \sim \frac{4^n}{n^{3/2}\sqrt{\pi}}$.

Summary

We see here a general phenomenon of computer algebra: the best *data structure* to describe a complicated mathematical object (a real number, a sequence, a formal power series, a function, a set) is often an equation defining the object (or a system of equations, typically with some initial conditions). Attempting to find a closed-form solution to this equation is not necessarily of interest: on the one hand, such a closed form rarely exists (e.g., the problem of solving a polynomial by radicals), and on the other hand, the equation, in itself, contains all the necessary information to calculate algorithmically the properties of the object under consideration (e.g., a numerical approximation, the initial terms or elements, an asymptotic equivalent), or to calculate with the object itself (e.g., performing arithmetic on power series). Therefore, instead of solving the equation, we look for the equation describing the object which is best suited to the problem we want to solve.

As we saw in our example, confinement (for example, in a finite dimensional vector space) is a fundamental tool for studying such equations. This notion of confinement is widely applicable in elimination techniques (linear algebra, Gröbner bases, and their algebro-differential generalizations). The same tool is central in algorithms for automatic summation and automatic verification of identities (Gosper's algorithm, Zeilberger's algorithm, and their generalizations; see also *Exercise: alternating sign matrices*).

Todo

add link to some tutorial on summation

All these techniques and their many generalizations are at the heart of very active topics of research: automatic combinatorics and analytic combinatorics, with major applications in the analysis of algorithms. It is likely, and desirable, that they will be progressively implemented in `Sage`.

Common enumerated sets

First example: the subsets of a set

Fix a set E of size n and consider the subsets of E of size k. We know that these subsets are counted by the binomial coefficients $\binom{n}{k}$. We can therefore calculate the number of subsets of size $k = 2$ of $E = \{1, 2, 3, 4\}$ with the function `binomial`:

```
sage: binomial(4, 2)
6
```

```
>>> from sage.all import *
>>> binomial(Integer(4), Integer(2))
6
```

Alternatively, we can *construct* the set $\mathcal{P}_2(E)$ of all the subsets of size 2 of E, then ask its cardinality:

```
sage: S = Subsets([1,2,3,4], 2)
sage: S.cardinality()
6
```

```
>>> from sage.all import *
>>> S = Subsets([Integer(1),Integer(2),Integer(3),Integer(4)], Integer(2))
>>> S.cardinality()
6
```

Once `S` has been constructed, we can also obtain the list of its elements:

```
sage: S.list()
[{1, 2}, {1, 3}, {1, 4}, {2, 3}, {2, 4}, {3, 4}]
```

```
>>> from sage.all import *
>>> S.list()
[{1, 2}, {1, 3}, {1, 4}, {2, 3}, {2, 4}, {3, 4}]
```

or select an element at random:

```
sage: S.random_element()                    # random
{1, 4}
```

```
>>> from sage.all import *
>>> S.random_element()                  # random
{1, 4}
```

More precisely, the object `S` models the set $\mathcal{P}_2(E)$ equipped with a fixed order (here, lexicographic order). It is therefore possible to ask for its 5-th element, keeping in mind that, as with `Python` lists, the first element is numbered zero:

```
sage: S.unrank(4)
{2, 4}
```

```
>>> from sage.all import *
>>> S.unrank(Integer(4))
{2, 4}
```

As a shortcut, in this setting, one can also use the notation:

```
sage: S[4]
{2, 4}
```

```
>>> from sage.all import *
>>> S[Integer(4)]
{2, 4}
```

but this should be used with care because some sets have a natural indexing other than by $(0, 1, \dots)$.

Conversely, one can calculate the position of an object in this order:

```
sage: s = S([2,4]); s
{2, 4}
sage: S.rank(s)
4
```

```
>>> from sage.all import *
>>> s = S([Integer(2),Integer(4)]); s
{2, 4}
>>> S.rank(s)
4
```

Note that `S` is *not* the list of its elements. One can, for example, model the set $\mathcal{P}(\mathcal{P}(\mathcal{P}(E)))$ and calculate its cardinality ($2^{2^{2^4}}$):

```
sage: E = Set([1,2,3,4])
sage: S = Subsets(Subsets(Subsets(E))); S
Subsets of Subsets of Subsets of {1, 2, 3, 4}
sage: n = S.cardinality(); n
2003529930406846464979072351560255750447825475569751419265016973...
```

```
>>> from sage.all import *
>>> E = Set([Integer(1),Integer(2),Integer(3),Integer(4)])
>>> S = Subsets(Subsets(Subsets(E))); S
Subsets of Subsets of Subsets of {1, 2, 3, 4}
>>> n = S.cardinality(); n
2003529930406846464979072351560255750447825475569751419265016973...
```

which is roughly $2 \cdot 10^{19728}$:

```
sage: n.ndigits()
19729
```

```
>>> from sage.all import *
>>> n.ndigits()
19729
```

or ask for its 237102124-th element:

```
sage: S.unrank(237102123) # random print output
{{{2, 4}, {1, 4}, {}, {1, 3, 4}, {1, 2, 4}, {4}, {2, 3}, {1, 3}, {2}},
  {{1, 3}, {2, 4}, {1, 2, 4}, {}, {3, 4}}}
```

```
>>> from sage.all import *
>>> S.unrank(Integer(237102123)) # random print output
{{{2, 4}, {1, 4}, {}, {1, 3, 4}, {1, 2, 4}, {4}, {2, 3}, {1, 3}, {2}},
  {{1, 3}, {2, 4}, {1, 2, 4}, {}, {3, 4}}}
```

It would be physically impossible to construct explicitly all the elements of S, as there are many more of them than there are particles in the universe (estimated at 10^{82}).

Remark: it would be natural in `Python` to use `len(S)` to ask for the cardinality of `S`. This is not possible because `Python` requires that the result of `len` be an integer of type `int`; this could cause overflows, and would not permit the return of {Infinity} for infinite sets:

```
sage: len(S)
Traceback (most recent call last):
...
OverflowError: cannot fit 'int' into an index-sized integer
```

```
>>> from sage.all import *
>>> len(S)
Traceback (most recent call last):
...
OverflowError: cannot fit 'int' into an index-sized integer
```

Partitions of integers

We now consider another classic problem: given a positive integer n, in how many ways can it be written in the form of a sum $n = i_1 + i_2 + \cdots + i_\ell$, where $i_1, \ldots, i_\ell$ are positive integers? There are two cases to distinguish:

- the order of the elements in the sum is not important, in which case we call $(i_1, \ldots, i_\ell)$ a *partition* of n;
- the order of the elements in the sum is important, in which case we call $(i_1, \ldots, i_\ell)$ a *composition* of n.

We will begin with the partitions of $n = 5$; as before, we begin by constructing the set of these partitions:

```
sage: P5 = Partitions(5); P5
Partitions of the integer 5
```

```
>>> from sage.all import *
>>> P5 = Partitions(Integer(5)); P5
Partitions of the integer 5
```

then we ask for its cardinality:

```
sage: P5.cardinality()
7
```

```
>>> from sage.all import *
>>> P5.cardinality()
7
```

We look at these 7 partitions; the order being irrelevant, the entries are ordered, by convention, in decreasing order.

```
sage: P5.list()
[[5], [4, 1], [3, 2], [3, 1, 1], [2, 2, 1], [2, 1, 1, 1],
 [1, 1, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> P5.list()
[[5], [4, 1], [3, 2], [3, 1, 1], [2, 2, 1], [2, 1, 1, 1],
 [1, 1, 1, 1, 1]]
```

The calculation of the number of partitions uses the Rademacher formula (Wikipedia article Partition_(number_theory)), implemented in C and highly optimized, which makes it very fast:

```
sage: Partitions(100000).cardinality()
2749351056977569651267751632098635268817342931598005475820312598430214732811496417305

↪421098519
```

Partitions of integers are combinatorial objects naturally equipped with many operations. They are therefore returned as objects that are richer than simple lists:

```
sage: P7 = Partitions(7)
sage: p = P7.unrank(5); p
[4, 2, 1]
sage: type(p)
<class 'sage.combinat.partition.Partitions_n_with_category.element_class'>
```

```
>>> from sage.all import *
>>> P7 = Partitions(Integer(7))
>>> p = P7.unrank(Integer(5)); p
[4, 2, 1]
>>> type(p)
<class 'sage.combinat.partition.Partitions_n_with_category.element_class'>
```

For example, they can be represented graphically by a Ferrers diagram:

```
sage: print(p.ferrers_diagram())
****
**
*
```

```
>>> from sage.all import *
>>> print(p.ferrers_diagram())
****
**
*
```

We leave it to the user to explore by introspection the available operations.

Note that we can also construct a partition directly by:

```
sage: Partition([4,2,1])
[4, 2, 1]
```

```
>>> from sage.all import *
>>> Partition([Integer(4),Integer(2),Integer(1)])
[4, 2, 1]
```

or:

```
sage: P7([4,2,1])
[4, 2, 1]
```

```
>>> from sage.all import *
>>> P7([Integer(4),Integer(2),Integer(1)])
[4, 2, 1]
```

If one wants to restrict the possible values of the parts $i_1, \ldots, i_\ell$ of the partition as, for example, when giving change, one can use `WeightedIntegerVectors`. For example, the following calculation:

```
sage: WeightedIntegerVectors(8, [2,3,5]).list()
[[0, 1, 1], [1, 2, 0], [4, 0, 0]]
```

```
>>> from sage.all import *
>>> WeightedIntegerVectors(Integer(8), [Integer(2),Integer(3),Integer(5)]).list()
[[0, 1, 1], [1, 2, 0], [4, 0, 0]]
```

shows that to make 8 dollars using 2, 3, and 5 dollar bills, one can use a 3 and a 5 dollar bill, or a 2 and two 3 dollar bills, or four 2 dollar bills.

Compositions of integers are manipulated the same way:

```
sage: C5 = Compositions(5); C5
Compositions of 5
sage: C5.cardinality()
16
sage: C5.list()
[[1, 1, 1, 1, 1], [1, 1, 1, 2], [1, 1, 2, 1], [1, 1, 3],
```

(continues on next page)

(continued from previous page)

```
 [1, 2, 1, 1], [1, 2, 2], [1, 3, 1], [1, 4], [2, 1, 1, 1],
 [2, 1, 2], [2, 2, 1], [2, 3], [3, 1, 1], [3, 2], [4, 1], [5]]
```

```
>>> from sage.all import *
>>> C5 = Compositions(Integer(5)); C5
Compositions of 5
>>> C5.cardinality()
16
>>> C5.list()
[[1, 1, 1, 1, 1], [1, 1, 1, 2], [1, 1, 2, 1], [1, 1, 3],
 [1, 2, 1, 1], [1, 2, 2], [1, 3, 1], [1, 4], [2, 1, 1, 1],
 [2, 1, 2], [2, 2, 1], [2, 3], [3, 1, 1], [3, 2], [4, 1], [5]]
```

The number 16 above seems significant and suggests the existence of a formula. We look at the number of compositions of n ranging from 0 to 9:

```
sage: [Compositions(n).cardinality() for n in range(10)]
[1, 1, 2, 4, 8, 16, 32, 64, 128, 256]
```

```
>>> from sage.all import *
>>> [Compositions(n).cardinality() for n in range(Integer(10))]
[1, 1, 2, 4, 8, 16, 32, 64, 128, 256]
```

Similarly, if we consider the number of compositions of 5 by length, we find a line of Pascal's triangle:

```
sage: x = var('x')                                                          #␣
↪needs sage.symbolic
sage: sum(x^len(c) for c in C5)                                             #␣
↪needs sage.symbolic
x^5 + 4*x^4 + 6*x^3 + 4*x^2 + x
```

```
>>> from sage.all import *
>>> x = var('x')                                                          #␣
↪needs sage.symbolic
>>> sum(x**len(c) for c in C5)                                            #␣
↪needs sage.symbolic
x^5 + 4*x^4 + 6*x^3 + 4*x^2 + x
```

The above example uses a functionality which we have not seen yet: `C5` being iterable, it can be used like a list in a `for` loop or a comprehension (*Set comprehension and iterators*).

> Prove the formulas suggested by the above examples for the number of compositions of n and the number of compositions of n of length k; investigate by introspection whether `Sage` uses these formulas for calculating cardinalities.

Some other finite enumerated sets

Essentially, the principle is the same for all the finite sets with which one wants to do combinatorics in `Sage`; begin by constructing an object which models this set, and then supply appropriate methods, following a uniform interface[1]. We now give a few more typical examples.

Intervals of integers:

[1] Or at least that should be the case; there are still many corners to clean up.

```
sage: C = IntegerRange(3, 21, 2); C
{3, 5, ..., 19}
sage: C.cardinality()
9
sage: C.list()
[3, 5, 7, 9, 11, 13, 15, 17, 19]
```

```
>>> from sage.all import *
>>> C = IntegerRange(Integer(3), Integer(21), Integer(2)); C
{3, 5, ..., 19}
>>> C.cardinality()
9
>>> C.list()
[3, 5, 7, 9, 11, 13, 15, 17, 19]
```

Permutations:

```
sage: C = Permutations(4); C
Standard permutations of 4
sage: C.cardinality()
24
sage: C.list()
[[1, 2, 3, 4], [1, 2, 4, 3], [1, 3, 2, 4], [1, 3, 4, 2],
 [1, 4, 2, 3], [1, 4, 3, 2], [2, 1, 3, 4], [2, 1, 4, 3],
 [2, 3, 1, 4], [2, 3, 4, 1], [2, 4, 1, 3], [2, 4, 3, 1],
 [3, 1, 2, 4], [3, 1, 4, 2], [3, 2, 1, 4], [3, 2, 4, 1],
 [3, 4, 1, 2], [3, 4, 2, 1], [4, 1, 2, 3], [4, 1, 3, 2],
 [4, 2, 1, 3], [4, 2, 3, 1], [4, 3, 1, 2], [4, 3, 2, 1]]
```

```
>>> from sage.all import *
>>> C = Permutations(Integer(4)); C
Standard permutations of 4
>>> C.cardinality()
24
>>> C.list()
[[1, 2, 3, 4], [1, 2, 4, 3], [1, 3, 2, 4], [1, 3, 4, 2],
 [1, 4, 2, 3], [1, 4, 3, 2], [2, 1, 3, 4], [2, 1, 4, 3],
 [2, 3, 1, 4], [2, 3, 4, 1], [2, 4, 1, 3], [2, 4, 3, 1],
 [3, 1, 2, 4], [3, 1, 4, 2], [3, 2, 1, 4], [3, 2, 4, 1],
 [3, 4, 1, 2], [3, 4, 2, 1], [4, 1, 2, 3], [4, 1, 3, 2],
 [4, 2, 1, 3], [4, 2, 3, 1], [4, 3, 1, 2], [4, 3, 2, 1]]
```

Set partitions:

```
sage: C = SetPartitions(["a", "b", "c"])
sage: C # random print output
Set partitions of {'a', 'c', 'b'}
sage: C.cardinality()
5
sage: C.list()
[{{'a', 'b', 'c'}},
 {{'a', 'b'}, {'c'}},
 {{'a', 'c'}, {'b'}},
```

(continues on next page)

(continued from previous page)

```
 {{'a'}, {'b', 'c'}},
 {{'a'}, {'b'}, {'c'}}]
```

```
>>> from sage.all import *
>>> C = SetPartitions(["a", "b", "c"])
>>> C # random print output
Set partitions of {'a', 'c', 'b'}
>>> C.cardinality()
5
>>> C.list()
[{{'a', 'b', 'c'}},
 {{'a', 'b'}, {'c'}},
 {{'a', 'c'}, {'b'}},
 {{'a'}, {'b', 'c'}},
 {{'a'}, {'b'}, {'c'}}]
```

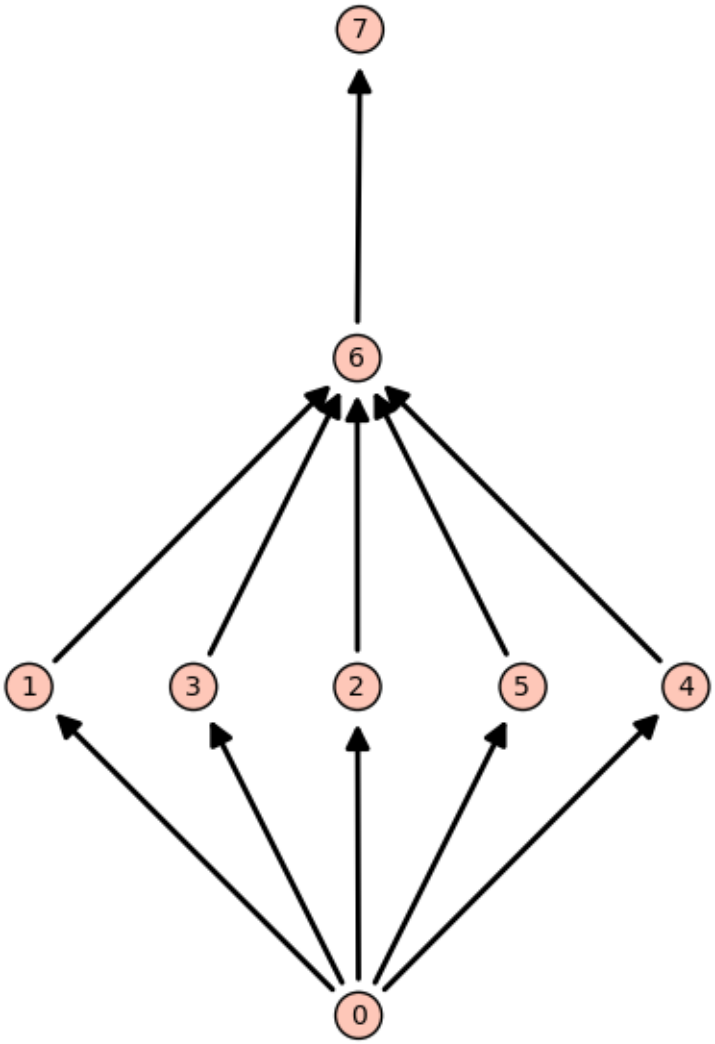
Partial orders on a set of 8 elements, up to isomorphism:

```
sage: C = Posets(7); C
Posets containing 7 elements
sage: C.cardinality()
2045
```

```
>>> from sage.all import *
>>> C = Posets(Integer(7)); C
Posets containing 7 elements
>>> C.cardinality()
2045
```

```
sage: C.unrank(20).plot()
Graphics object consisting of ... graphics primitives
```

```
>>> from sage.all import *
>>> C.unrank(Integer(20)).plot()
Graphics object consisting of ... graphics primitives
```



One can iterate through all graphs up to isomorphism. For example, there are 34 simple graphs with 5 vertices:

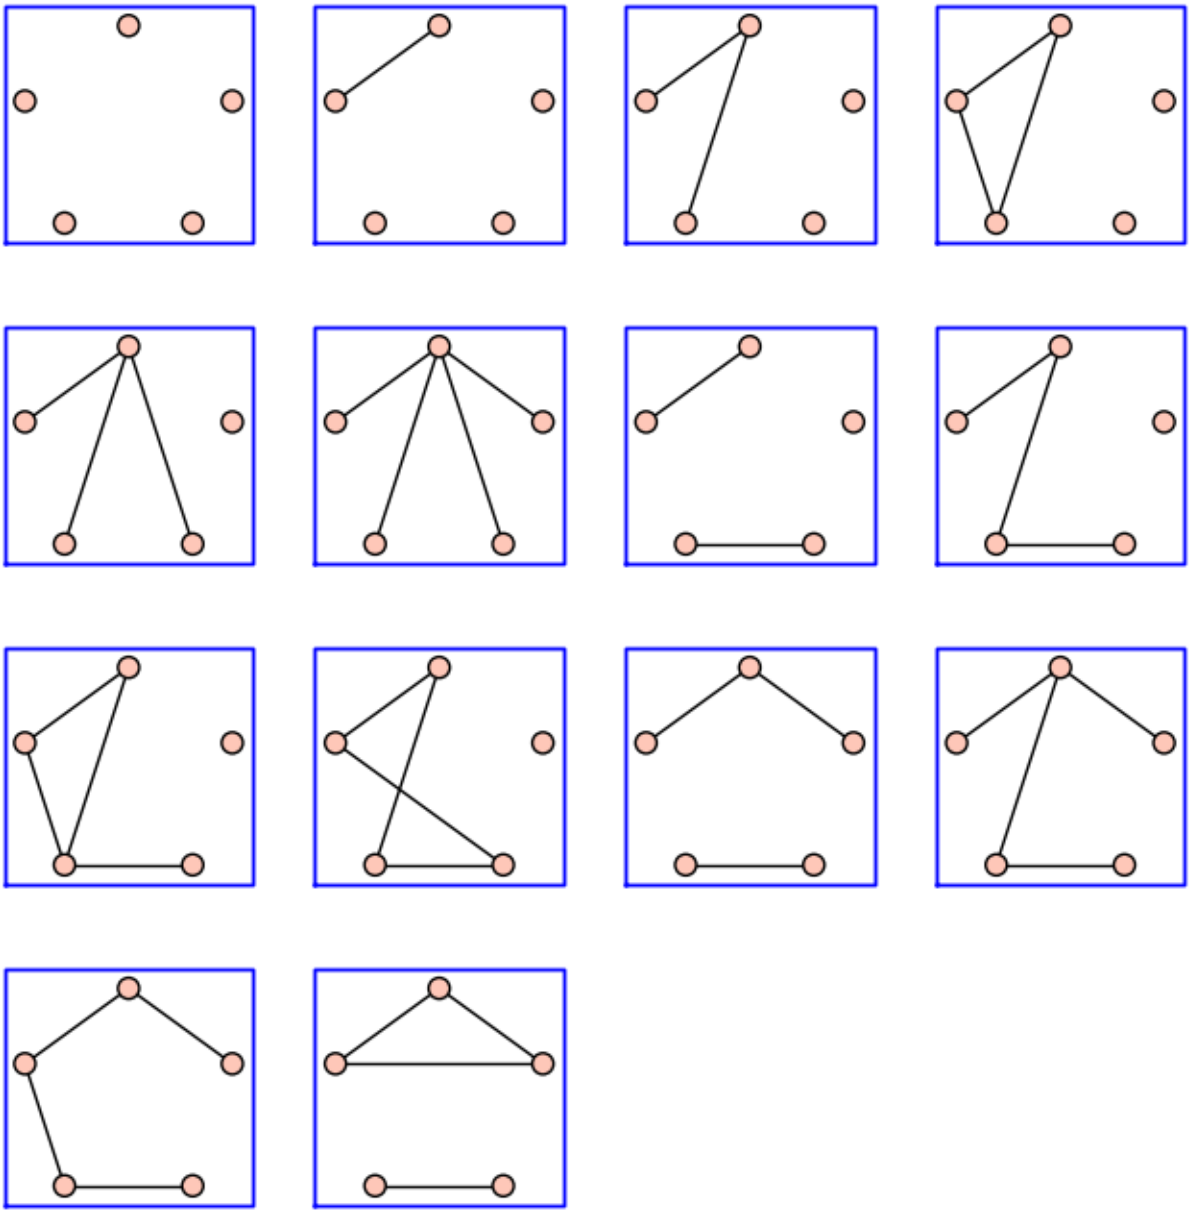
```
sage: len(list(graphs(5)))
34
```

```
>>> from sage.all import *
>>> len(list(graphs(Integer(5))))
34
```

Here are those with at most 4 edges:

```
sage: up_to_four_edges = list(graphs(5, lambda G: G.size() <= 4))
sage: pretty_print(*up_to_four_edges)
```

```
>>> from sage.all import *
>>> up_to_four_edges = list(graphs(Integer(5), lambda G: G.size() <= Integer(4)))
>>> pretty_print(*up_to_four_edges)
```



However, the *set* `C` of these graphs is not yet available in `Sage`; as a result, the following commands are not yet implemented:

```
sage: # not implemented
sage: C = Graphs(5)
sage: C.cardinality()
34
sage: Graphs(19).cardinality()
246378092531250045243830074914327 68
sage: Graphs(19).random_element()
Graph on 19 vertices
```

```
>>> from sage.all import *
```

(continues on next page)

(continued from previous page)

```
>>> # not implemented
>>> C = Graphs(Integer(5))
>>> C.cardinality()
34
>>> Graphs(Integer(19)).cardinality()
246378092531250045243830074914327 68
>>> Graphs(Integer(19)).random_element()
Graph on 19 vertices
```

What we have seen so far also applies, in principle, to finite algebraic structures like the dihedral groups:

```
sage: G = DihedralGroup(4); G
Dihedral group of order 8 as a permutation group
sage: G.cardinality()
8
sage: G.list()
[(), (1,3)(2,4), (1,4,3,2), (1,2,3,4), (2,4), (1,3), (1,4)(2,3), (1,2)(3,4)]
```

```
>>> from sage.all import *
>>> G = DihedralGroup(Integer(4)); G
Dihedral group of order 8 as a permutation group
>>> G.cardinality()
8
>>> G.list()
[(), (1,3)(2,4), (1,4,3,2), (1,2,3,4), (2,4), (1,3), (1,4)(2,3), (1,2)(3,4)]
```

or the algebra of 2×2 matrices over the finite field $\mathbf{Z}/2\mathbf{Z}$:

```
sage: C = MatrixSpace(GF(2), 2)                                                 #␣
↪needs sage.modules sage.rings.finite_rings
sage: C.list()                                                                  #␣

```

Exercise

List all the monomials of degree 5 in three variables (see `IntegerVectors`). Manipulate the ordered set partitions `OrderedSetPartitions` and standard tableaux (`StandardTableaux`).

Exercise

List the alternating sign matrices of size 3, 4, and 5 (`AlternatingSignMatrices`), and try to guess the definition. The discovery and proof of the formula for the enumeration of these matrices (see the method `cardinality`), motivated by calculations of determinants in physics, is quite a story. In particular, the first proof, given by Zeilberger in 1992 was automatically produced by a computer program. It was 84 pages long, and required nearly a hundred people to verify it.

Exercise

Calculate by hand the number of vectors in $(\mathbf{Z}/2\mathbf{Z})^5$, and the number of matrices in $GL_3(\mathbf{Z}/2\mathbf{Z})$ (that is to say, the number of invertible 3×3 matrices with coefficients in $\mathbf{Z}/2\mathbf{Z}$). Verify your answer with `Sage`. Generalize to $GL_n(\mathbf{Z}/q\mathbf{Z})$.

Set comprehension and iterators

We will now show some of the possibilities offered by `Python` for constructing (and iterating through) sets, with a notation that is flexible and close to usual mathematical usage, and in particular the benefits this yields in combinatorics.

We begin by constructing the finite set $\{i^2 \mid i \in \{1, 3, 7\}\}$:

```
sage: [ i^2 for i in [1, 3, 7] ]
[1, 9, 49]
```

```
>>> from sage.all import *
>>> [ i**Integer(2) for i in [Integer(1), Integer(3), Integer(7)] ]
[1, 9, 49]
```

and then the same set, but with i running from 1 to 9:

```
sage: [ i^2 for i in range(1,10) ]
[1, 4, 9, 16, 25, 36, 49, 64, 81]
```

```
>>> from sage.all import *
>>> [ i**Integer(2) for i in range(Integer(1),Integer(10)) ]
[1, 4, 9, 16, 25, 36, 49, 64, 81]
```

A construction of this form in Python is called *set comprehension*. A clause can be added to keep only those elements with i prime:

```
sage: [ i^2 for i in range(1,10) if is_prime(i) ]
[4, 9, 25, 49]
```

```
>>> from sage.all import *
>>> [ i**Integer(2) for i in range(Integer(1),Integer(10)) if is_prime(i) ]
[4, 9, 25, 49]
```

Combining more than one set comprehension, it is possible to construct the set $\{(i, j) \mid 1 \leq j < i < 5\}$:

```
sage: [ (i,j) for i in range(1,6) for j in range(1,i) ]
[(2, 1), (3, 1), (3, 2), (4, 1), (4, 2), (4, 3),
 (5, 1), (5, 2), (5, 3), (5, 4)]
```

```
>>> from sage.all import *
>>> [ (i,j) for i in range(Integer(1),Integer(6)) for j in range(Integer(1),i) ]
[(2, 1), (3, 1), (3, 2), (4, 1), (4, 2), (4, 3),
 (5, 1), (5, 2), (5, 3), (5, 4)]
```

or to produce Pascal's triangle:

```
sage: [[binomial(n,i) for i in range(n+1)] for n in range(10)]
[[1],
 [1, 1],
 [1, 2, 1],
 [1, 3, 3, 1],
 [1, 4, 6, 4, 1],
 [1, 5, 10, 10, 5, 1],
 [1, 6, 15, 20, 15, 6, 1],
 [1, 7, 21, 35, 35, 21, 7, 1],
 [1, 8, 28, 56, 70, 56, 28, 8, 1],
 [1, 9, 36, 84, 126, 126, 84, 36, 9, 1]]
```

```
>>> from sage.all import *
>>> [[binomial(n,i) for i in range(n+Integer(1))] for n in range(Integer(10))]
[[1],
 [1, 1],
 [1, 2, 1],
 [1, 3, 3, 1],
 [1, 4, 6, 4, 1],
 [1, 5, 10, 10, 5, 1],
 [1, 6, 15, 20, 15, 6, 1],
 [1, 7, 21, 35, 35, 21, 7, 1],
 [1, 8, 28, 56, 70, 56, 28, 8, 1],
 [1, 9, 36, 84, 126, 126, 84, 36, 9, 1]]
```

The execution of a set comprehension is accomplished in two steps; first an *iterator* is constructed, and then a list is filled with the elements successively produced by the iterator. Technically, an *iterator* is an object with a method next which returns a new value each time it is called, until it is exhausted. For example, the following iterator it:

```
sage: it = (binomial(3, i) for i in range(4))
```

```
>>> from sage.all import *
>>> it = (binomial(Integer(3), i) for i in range(Integer(4)))
```

returns successively the binomial coefficients $\binom{3}{i}$ with $i = 0, 1, 2, 3$:

```
sage: next(it)
1
sage: next(it)
3
sage: next(it)
3
sage: next(it)
1
```

```
>>> from sage.all import *
>>> next(it)
1
>>> next(it)
3
>>> next(it)
3
>>> next(it)
1
```

When the iterator is finally exhausted, an exception is raised:

```
sage: next(it)
Traceback (most recent call last):
  ...
StopIteration
```

```
>>> from sage.all import *
>>> next(it)
Traceback (most recent call last):
  ...
StopIteration
```

More generally, an *iterable* is a `Python` object `L` (a list, a set, ...) over whose elements it is possible to iterate. Technically, the iterator is constructed by `iter(L)`. In practice, the commands `iter` and `next` are used very rarely, since `for` loops and list comprehensions provide a much pleasanter syntax:

```
sage: for s in Subsets(3):
....:     print(s)
{}
{1}
{2}
{3}
{1, 2}
{1, 3}
{2, 3}
{1, 2, 3}
```

```
>>> from sage.all import *
>>> for s in Subsets(Integer(3)):
...     print(s)
{}
{1}
{2}
{3}
{1, 2}
{1, 3}
{2, 3}
{1, 2, 3}
```

```
sage: [ s.cardinality() for s in Subsets(3) ]
[0, 1, 1, 1, 2, 2, 2, 3]
```

```
>>> from sage.all import *
>>> [ s.cardinality() for s in Subsets(Integer(3)) ]
[0, 1, 1, 1, 2, 2, 2, 3]
```

What is the point of an iterator? Consider the following example:

```
sage: sum( [ binomial(8, i) for i in range(9) ] )
256
```

```
>>> from sage.all import *
>>> sum( [ binomial(Integer(8), i) for i in range(Integer(9)) ] )
256
```

When it is executed, a list of 9 elements is constructed, and then it is passed as an argument to `sum` to add them up. If, on the other hand, the iterator is passed directly to `sum` (note the absence of square brackets):

```
sage: sum( binomial(8, i) for i in range(9) )
256
```

```
>>> from sage.all import *
>>> sum( binomial(Integer(8), i) for i in range(Integer(9)) )
256
```

the function `sum` receives the iterator directly, and can short-circuit the construction of the intermediate list. If there are a large number of elements, this avoids allocating a large quantity of memory to fill a list which will be immediately destroyed.

Most functions that take a list of elements as input will also accept an iterator (or an iterable) instead. To begin with, one can obtain the list (or the tuple) of elements of an iterator as follows:

```
sage: list(binomial(8, i) for i in range(9))
[1, 8, 28, 56, 70, 56, 28, 8, 1]
sage: tuple(binomial(8, i) for i in range(9))
(1, 8, 28, 56, 70, 56, 28, 8, 1)
```

```
>>> from sage.all import *
>>> list(binomial(Integer(8), i) for i in range(Integer(9)))
```

(continues on next page)

(continued from previous page)

```
[1, 8, 28, 56, 70, 56, 28, 8, 1]
>>> tuple(binomial(Integer(8), i) for i in range(Integer(9)))
(1, 8, 28, 56, 70, 56, 28, 8, 1)
```

We now consider the functions `all` and `any` which denote respectively the n-ary *and* and *or*:

```
sage: all([True, True, True, True])
True
sage: all([True, False, True, True])
False
sage: any([False, False, False, False])
False
sage: any([False, False, True, False])
True
```

```
>>> from sage.all import *
>>> all([True, True, True, True])
True
>>> all([True, False, True, True])
False
>>> any([False, False, False, False])
False
>>> any([False, False, True, False])
True
```

The following example verifies that all primes from 3 to 99 are odd:

```
sage: all( is_odd(p) for p in range(3,100) if is_prime(p) )
True
```

```
>>> from sage.all import *
>>> all( is_odd(p) for p in range(Integer(3),Integer(100)) if is_prime(p) )
True
```

A *Mersenne prime* is a prime of the form $2^p - 1$. We verify that, for $p < 1000$, if $2^p - 1$ is prime, then p is also prime:

```
sage: def mersenne(p): return 2^p -1
sage: [ is_prime(p)
....:   for p in range(1000) if is_prime(mersenne(p)) ]
[True, True, True, True, True, True, True, True, True, True,
 True, True, True, True]
```

```
>>> from sage.all import *
>>> def mersenne(p): return Integer(2)**p -Integer(1)
>>> [ is_prime(p)
...   for p in range(Integer(1000)) if is_prime(mersenne(p)) ]
[True, True, True, True, True, True, True, True, True, True,
 True, True, True, True]
```

Is the converse true?

Exercise

Try the two following commands and explain the considerable difference in the length of the calculations:

```
sage: all(   is_prime(mersenne(p))
....:        for p in range(1000) if is_prime(p)  )
False
sage: all( [ is_prime(mersenne(p))
....:        for p in range(1000) if is_prime(p)] )
False
```

```
>>> from sage.all import *
>>> all(   is_prime(mersenne(p))
...         for p in range(Integer(1000)) if is_prime(p)  )
False
>>> all( [ is_prime(mersenne(p))
...         for p in range(Integer(1000)) if is_prime(p)] )
False
```

We now try to find the smallest counter-example. In order to do this, we use the `Sage` function `exists`:

```
sage: exists( (p for p in range(1000) if is_prime(p)),
....:         lambda p: not is_prime(mersenne(p)) )
(True, 11)
```

```
>>> from sage.all import *
>>> exists( (p for p in range(Integer(1000)) if is_prime(p)),
...          lambda p: not is_prime(mersenne(p)) )
(True, 11)
```

Alternatively, we could construct an iterator on the counter-examples:

```
sage: counter_examples = (p for p in range(1000)
....:       if is_prime(p) and not is_prime(mersenne(p)))
sage: next(counter_examples)
11
sage: next(counter_examples)
23
```

```
>>> from sage.all import *
>>> counter_examples = (p for p in range(Integer(1000))
...       if is_prime(p) and not is_prime(mersenne(p)))
>>> next(counter_examples)
11
>>> next(counter_examples)
23
```

Exercise

What do the following commands do?

```
sage: cubes = [t**3 for t in range(-999,1000)]
sage: exists([(x,y) for x in cubes for y in cubes],  # long time (3s, 2012)
```

```
....:         lambda x_y: x_y[0] + x_y[1] == 218)
(True, (-125, 343))
sage: exists(((x,y) for x in cubes for y in cubes),  # long time (2s, 2012)
....:         lambda x_y: x_y[0] + x_y[1] == 218)
(True, (-125, 343))
>>> from sage.all import *
>>> cubes = [t**Integer(3) for t in range(-Integer(999),Integer(1000))]
>>> exists([(x,y) for x in cubes for y in cubes],  # long time (3s, 2012)
...         lambda x_y: x_y[Integer(0)] + x_y[Integer(1)] == Integer(218))
(True, (-125, 343))
>>> exists(((x,y) for x in cubes for y in cubes),  # long time (2s, 2012)
...         lambda x_y: x_y[Integer(0)] + x_y[Integer(1)] == Integer(218))
(True, (-125, 343))
```

Which of the last two is more economical in terms of time? In terms of memory? By how much?

Exercise

Try each of the following commands, and explain its result. If possible, hide the result first and try to guess it before launching the command.

Todo

hide the results by default

Warning

it will be necessary to interrupt the execution of some of the commands

```
sage: x = var('x')                                                          #␣
↪needs sage.symbolic
sage: sum(x^len(s) for s in Subsets(8))                                     #␣
↪needs sage.symbolic
x^8 + 8*x^7 + 28*x^6 + 56*x^5 + 70*x^4 + 56*x^3 + 28*x^2 + 8*x + 1
```

```
>>> from sage.all import *
>>> x = var('x')                                                          #␣
↪needs sage.symbolic
>>> sum(x**len(s) for s in Subsets(Integer(8)))                                ␣
↪    # needs sage.symbolic
x^8 + 8*x^7 + 28*x^6 + 56*x^5 + 70*x^4 + 56*x^3 + 28*x^2 + 8*x + 1
```

```

Operations on iterators

Python provides numerous tools for manipulating iterators; most of them are in the itertools library, which can be imported by:

```
sage: import itertools
```

```
>>> from sage.all import *
>>> import itertools
```

We will demonstrate some applications, taking as a starting point the permutations of 3:

```
sage: list(Permutations(3))
[[1, 2, 3], [1, 3, 2], [2, 1, 3],
 [2, 3, 1], [3, 1, 2], [3, 2, 1]]
```

```
>>> from sage.all import *
>>> list(Permutations(Integer(3)))
[[1, 2, 3], [1, 3, 2], [2, 1, 3],
 [2, 3, 1], [3, 1, 2], [3, 2, 1]]
```

We can list the elements of a set by numbering them:

```
sage: list(enumerate(Permutations(3)))
[(0, [1, 2, 3]), (1, [1, 3, 2]), (2, [2, 1, 3]),
 (3, [2, 3, 1]), (4, [3, 1, 2]), (5, [3, 2, 1])]
```

```
>>> from sage.all import *
>>> list(enumerate(Permutations(Integer(3))))
[(0, [1, 2, 3]), (1, [1, 3, 2]), (2, [2, 1, 3]),
 (3, [2, 3, 1]), (4, [3, 1, 2]), (5, [3, 2, 1])]
```

or select only the elements in positions 2, 3, and 4 (analogue of `l[1:4]`):

```
sage: import itertools
sage: list(itertools.islice(Permutations(3), int(1), int(4)))
[[1, 3, 2], [2, 1, 3], [2, 3, 1]]
```

```
>>> from sage.all import *
>>> import itertools
>>> list(itertools.islice(Permutations(Integer(3)), int(Integer(1)), int(Integer(4))))
[[1, 3, 2], [2, 1, 3], [2, 3, 1]]
```

To apply a function to all the elements, one can do:

```
sage: [z.cycle_type() for z in Permutations(3)]
[[1, 1, 1], [2, 1], [2, 1], [3], [3], [2, 1]]
```

```
>>> from sage.all import *
>>> [z.cycle_type() for z in Permutations(Integer(3))]
[[1, 1, 1], [2, 1], [2, 1], [3], [3], [2, 1]]
```

and similarly to select the elements satisfying a certain condition:

```
sage: [z for z in Permutations(3) if z.has_pattern([1,2])]
[[1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2]]
```

```
>>> from sage.all import *
>>> [z for z in Permutations(Integer(3)) if z.has_pattern([Integer(1),Integer(2)])]
[[1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1], [3, 1, 2]]
```

Implementation of new iterators

It is easy to construct new iterators, using the keyword `yield` instead of `return` in a function:

```
sage: def f(n):
....:     for i in range(n):
....:         yield i
```

```
>>> from sage.all import *
>>> def f(n):
...     for i in range(n):
...         yield i
```

After the `yield`, execution is not halted, but only suspended, ready to be continued from the same point. The result of the function is therefore an iterator over the successive values returned by `yield`:

```
sage: g = f(4)
sage: next(g)
```

(continues on next page)

(continued from previous page)

```
0
sage: next(g)
1
sage: next(g)
2
sage: next(g)
3
```

```
>>> from sage.all import *
>>> g = f(Integer(4))
>>> next(g)
0
>>> next(g)
1
>>> next(g)
2
>>> next(g)
3
```

```
sage: next(g)
Traceback (most recent call last):
  ...
StopIteration
```

```
>>> from sage.all import *
>>> next(g)
Traceback (most recent call last):
  ...
StopIteration
```

The function could be used as follows:

```
sage: [ x for x in f(5) ]
[0, 1, 2, 3, 4]
```

```
>>> from sage.all import *
>>> [ x for x in f(Integer(5)) ]
[0, 1, 2, 3, 4]
```

This model of computation, called *continuation*, is very useful in combinatorics, especially when combined with recursion. Here is how to generate all words of a given length on a given alphabet:

```
sage: def words(alphabet, l):
....:     if l == 0:
....:         yield []
....:     else:
....:         for word in words(alphabet, l-1):
....:             for l in alphabet:
....:                 yield word + [l]
sage: [ w for w in words(['a','b'], 3) ]
[['a', 'a', 'a'], ['a', 'a', 'b'], ['a', 'b', 'a'],
```

(continues on next page)

(continued from previous page)

```
 ['a', 'b', 'b'], ['b', 'a', 'a'], ['b', 'a', 'b'],
 ['b', 'b', 'a'], ['b', 'b', 'b']]
```

```
>>> from sage.all import *
>>> def words(alphabet, l):
...     if l == Integer(0):
...         yield []
...     else:
...         for word in words(alphabet, l-Integer(1)):
...             for l in alphabet:
...                 yield word + [l]
>>> [ w for w in words(['a','b'], Integer(3)) ]
[['a', 'a', 'a'], ['a', 'a', 'b'], ['a', 'b', 'a'],
 ['a', 'b', 'b'], ['b', 'a', 'a'], ['b', 'a', 'b'],
 ['b', 'b', 'a'], ['b', 'b', 'b']]
```

These words can then be counted by:

```
sage: sum(1 for w in words(['a','b','c','d'], 10))
1048576
```

```
>>> from sage.all import *
>>> sum(Integer(1) for w in words(['a','b','c','d'], Integer(10)))
1048576
```

Counting the words one by one is clearly not an efficient method in this case, since the formula n^ℓ is also available; note, though, that this is not the stupidest possible approach - it does, at least, avoid constructing the entire list in memory.

We now consider Dyck words, which are well-parenthesized words in the letters "(" and ")". The function below generates all the Dyck words of a given length (where the length is the number of pairs of parentheses), using the recursive definition which says that a Dyck word is either empty or of the form $(w_1)w_2$ where w_1 and w_2 are Dyck words:

```
sage: def dyck_words(l):
....:     if l==0:
....:         yield ''
....:     else:
....:         for k in range(l):
....:             for w1 in dyck_words(k):
....:                 for w2 in dyck_words(l-k-1):
....:                     yield '('+w1+')'+w2
```

```
>>> from sage.all import *
>>> def dyck_words(l):
...     if l==Integer(0):
...         yield ''
...     else:
...         for k in range(l):
...             for w1 in dyck_words(k):
...                 for w2 in dyck_words(l-k-Integer(1)):
...                     yield '('+w1+')'+w2
```

Here are all the Dyck words of length 4:

```
sage: list(dyck_words(4))
['()()()()', '()()(())', '()(())()', '()(()())', '()((()))',
 '(())()()', '(())(())', '(()())()', '((()))()', '(()()())',
 '(()((()))', '((())())', '((()()))', '(((())))']
```

```
>>> from sage.all import *
>>> list(dyck_words(Integer(4)))
['()()()()', '()()(())', '()(())()', '()(()())', '()((()))',
 '(())()()', '(())(())', '(()())()', '((()))()', '(()()())',
 '(()((()))', '((())())', '((()()))', '(((())))']
```

Counting them, we recover a well-known sequence:

```
sage: [ sum(1 for w in dyck_words(l)) for l in range(10) ]
[1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862]
```

```
>>> from sage.all import *
>>> [ sum(Integer(1) for w in dyck_words(l)) for l in range(Integer(10)) ]
[1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862]
```

Exercise: complete binary tree iterator

Construct an iterator on the set C_n of complete binary trees with n leaves (see *Enumeration of trees using generating functions*).

Hint: `Sage` 4.8.2 does not yet have a native data structure to represent complete binary trees. One simple way to represent them is to define a formal variable `Leaf` for the leaves and a formal 2-ary function `Node`:

```
sage: var('Leaf')                                                              #␣
↪needs sage.symbolic
Leaf
sage: function('Node', nargs=2)                                                #␣
↪needs sage.symbolic
Node
```

```
>>> from sage.all import *
>>> var('Leaf')                                                              #␣
↪needs sage.symbolic
Leaf
>>> function('Node', nargs=Integer(2))                                          ␣
↪    # needs sage.symbolic
Node
```

The second tree in *Figure: The five complete binary trees with four leaves* can be represented by the expression:

```
sage: tr = Node(Node(Leaf, Node(Leaf, Leaf)), Leaf)                            #␣
↪needs sage.symbolic
```

```
>>> from sage.all import *
>>> tr = Node(Node(Leaf, Node(Leaf, Leaf)), Leaf)                            #␣
↪needs sage.symbolic
```

Constructions

We will now see how to construct new sets starting from these building blocks. In fact, we have already begun to do this with the construction of $\mathcal{P}(\mathcal{P}(\mathcal{P}(\{1,2,3,4\})))$ in the previous section, and to construct the example of sets of cards in *Initial examples*.

Consider a large Cartesian product:

```
sage: C = cartesian_product([Compositions(8), Permutations(20)]); C
The Cartesian product of (Compositions of 8, Standard permutations of 20)
sage: C.cardinality()
311411457046609920000
```

```
>>> from sage.all import *
>>> C = cartesian_product([Compositions(Integer(8)), Permutations(Integer(20))]); C
The Cartesian product of (Compositions of 8, Standard permutations of 20)
>>> C.cardinality()
311411457046609920000
```

Clearly, it is impractical to construct the list of all the elements of this Cartesian product! And, in the following example, H is equipped with the usual combinatorial operations and also its structure as a product group:

```
sage: G = DihedralGroup(4)
sage: H = cartesian_product([G,G])
sage: H in Groups()
True
sage: H.an_element()
((1,3), (1,3))
sage: t = H([G.gen(0), G.gen(0)])
sage: t
((1,2,3,4), (1,2,3,4))
sage: t*t
((1,3)(2,4), (1,3)(2,4))
```

```
>>> from sage.all import *
>>> G = DihedralGroup(Integer(4))
>>> H = cartesian_product([G,G])
>>> H in Groups()
True
>>> H.an_element()
((1,3), (1,3))
>>> t = H([G.gen(Integer(0)), G.gen(Integer(0))])
>>> t
((1,2,3,4), (1,2,3,4))
>>> t*t
((1,3)(2,4), (1,3)(2,4))
```

We now construct the union of two existing disjoint sets:

```
sage: C = DisjointUnionEnumeratedSets(
....:       [ Compositions(4), Permutations(3)] )
sage: C
Disjoint union of Family (Compositions of 4,
Standard permutations of 3)
```

(continues on next page)

(continued from previous page)

```
sage: C.cardinality()
14
sage: C.list()
[[1, 1, 1, 1], [1, 1, 2], [1, 2, 1], [1, 3], [2, 1, 1], [2, 2],
[3, 1], [4], [1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1],
[3, 1, 2], [3, 2, 1]]
```

```
>>> from sage.all import *
>>> C = DisjointUnionEnumeratedSets(
...       [ Compositions(Integer(4)), Permutations(Integer(3))] )
>>> C
Disjoint union of Family (Compositions of 4,
Standard permutations of 3)
>>> C.cardinality()
14
>>> C.list()
[[1, 1, 1, 1], [1, 1, 2], [1, 2, 1], [1, 3], [2, 1, 1], [2, 2],
[3, 1], [4], [1, 2, 3], [1, 3, 2], [2, 1, 3], [2, 3, 1],
[3, 1, 2], [3, 2, 1]]
```

It is also possible to take the union of more than two disjoint sets, or even an infinite number of them. We will now construct the set of all permutations, viewed as the union of the sets P_n of permutations of size n. We begin by constructing the infinite family $F = (P_n)_{n \in N}$:

```
sage: F = Family(NonNegativeIntegers(), Permutations); F
Lazy family (<class 'sage.combinat.permutation.Permutations'>(i))_{i in Non negative␣
↪integers}
sage: F.keys()
Non negative integers
sage: F[1000]
Standard permutations of 1000
```

```
>>> from sage.all import *
>>> F = Family(NonNegativeIntegers(), Permutations); F
Lazy family (<class 'sage.combinat.permutation.Permutations'>(i))_{i in Non negative␣
↪integers}
>>> F.keys()
Non negative integers
>>> F[Integer(1000)]
Standard permutations of 1000
```

Now we can construct the disjoint union $\bigcup_{n \in \mathbf{N}} P_n$:

```
sage: U = DisjointUnionEnumeratedSets(F); U
Disjoint union of
Lazy family (<class 'sage.combinat.permutation.Permutations'>(i))_{i in Non negative␣
↪integers}
```

```
>>> from sage.all import *
>>> U = DisjointUnionEnumeratedSets(F); U
Disjoint union of
```

(continues on next page)

(continued from previous page)

```
Lazy family (<class 'sage.combinat.permutation.Permutations'>(i))_{i in Non negative␣
↪integers}
```

It is an infinite set:

```
sage: U.cardinality()
+Infinity
```

```
>>> from sage.all import *
>>> U.cardinality()
+Infinity
```

which doesn't prohibit iteration through its elements, though it will be necessary to interrupt it at some point:

```
sage: for p in U:                 # not tested
....:     print(p)
[]
[1]
[1, 2]
[2, 1]
[1, 2, 3]
[1, 3, 2]
[2, 1, 3]
[2, 3, 1]
[3, 1, 2]
...
```

```
>>> from sage.all import *
>>> for p in U:                 # not tested
...     print(p)
[]
[1]
[1, 2]
[2, 1]
[1, 2, 3]
[1, 3, 2]
[2, 1, 3]
[2, 3, 1]
[3, 1, 2]
...
```

Note: the above set could also have been constructed directly with:

```
sage: U = Permutations(); U
Standard permutations
```

```
>>> from sage.all import *
>>> U = Permutations(); U
Standard permutations
```

Summary

Sage provides a library of common enumerated sets, which can be combined by standard constructions, giving a toolbox that is flexible (but which could still be expanded). It is also possible to add new building blocks to Sage with a few lines (see the code in FiniteEnumeratedSets().example()). This is made possible by the uniformity of the interfaces and the fact that Sage is based on an object-oriented language. Also, very large or even infinite sets can be manipulated thanks to lazy evaluation strategies (iterators, etc.).

There is no magic to any of this: under the hood, Sage applies the usual rules (for example, that the cardinality of $E \times E$ is $|E|^2$); the added value comes from the capacity to manipulate complicated constructions. The situation is comparable to Sage's implementation of differential calculus: Sage applies the usual rules for differentiation of functions and their compositions, where the added value comes from the possibility of manipulating complicated formulas. In this sense, Sage implements a *calculus* of finite enumerated sets.

Generic algorithms

Lexicographic generation of lists of integers

Among the classic enumerated sets, especially in algebraic combinatorics, a certain number are composed of lists of integers of fixed sum, such as partitions, compositions, or integer vectors. These examples can also have supplementary constraints added to them. Here are some examples. We start with the integer vectors with sum 10 and length 3, with parts bounded below by 2, 4 and 2 respectively:

```
sage: IntegerVectors(10, 3, min_part=2, max_part=5,
....:                inner=[2, 4, 2]).list()
[[4, 4, 2], [3, 5, 2], [3, 4, 3], [2, 5, 3], [2, 4, 4]]
```

```
>>> from sage.all import *
>>> IntegerVectors(Integer(10), Integer(3), min_part=Integer(2), max_part=Integer(5),
...                inner=[Integer(2), Integer(4), Integer(2)]).list()
[[4, 4, 2], [3, 5, 2], [3, 4, 3], [2, 5, 3], [2, 4, 4]]
```

The compositions of 5 with each part at most 3, and with length 2 or 3:

```
sage: Compositions(5, max_part=3,
....:              min_length=2, max_length=3).list()
[[3, 2], [3, 1, 1], [2, 3], [2, 2, 1], [2, 1, 2], [1, 3, 1],
 [1, 2, 2], [1, 1, 3]]
```

```
>>> from sage.all import *
>>> Compositions(Integer(5), max_part=Integer(3),
...              min_length=Integer(2), max_length=Integer(3)).list()
[[3, 2], [3, 1, 1], [2, 3], [2, 2, 1], [2, 1, 2], [1, 3, 1],
 [1, 2, 2], [1, 1, 3]]
```

The strictly decreasing partitions of 5:

```
sage: Partitions(5, max_slope=-1).list()
[[5], [4, 1], [3, 2]]
```

```
>>> from sage.all import *
>>> Partitions(Integer(5), max_slope=-Integer(1)).list()
[[5], [4, 1], [3, 2]]
```

These sets share the same underlying algorithmic structure, implemented in the more general (and slightly more cumbersome) class `IntegerListsLex`. This class models sets of vectors $(\ell_0, \ldots, \ell_k)$ of nonnegative integers, with constraints on the sum and the length, and bounds on the parts and on the consecutive differences between the parts. Here are some more examples:

```
sage: IntegerListsLex(10, length=3,
....:                 min_part=2, max_part=5,
....:                 floor=[2, 4, 2]).list()
[[4, 4, 2], [3, 5, 2], [3, 4, 3], [2, 5, 3], [2, 4, 4]]

sage: IntegerListsLex(5, min_part=1, max_part=3,
....:                 min_length=2, max_length=3).list()
[[3, 2], [3, 1, 1], [2, 3], [2, 2, 1], [2, 1, 2],
 [1, 3, 1], [1, 2, 2], [1, 1, 3]]

sage: IntegerListsLex(5, min_part=1, max_slope=-1).list()
[[5], [4, 1], [3, 2]]

sage: list(Compositions(5, max_length=2))
[[5], [4, 1], [3, 2], [2, 3], [1, 4]]

sage: list(IntegerListsLex(5, max_length=2, min_part=1))
[[5], [4, 1], [3, 2], [2, 3], [1, 4]]
```

```
>>> from sage.all import *
>>> IntegerListsLex(Integer(10), length=Integer(3),
...                 min_part=Integer(2), max_part=Integer(5),
...                 floor=[Integer(2), Integer(4), Integer(2)]).list()
[[4, 4, 2], [3, 5, 2], [3, 4, 3], [2, 5, 3], [2, 4, 4]]

>>> IntegerListsLex(Integer(5), min_part=Integer(1), max_part=Integer(3),
...                 min_length=Integer(2), max_length=Integer(3)).list()
[[3, 2], [3, 1, 1], [2, 3], [2, 2, 1], [2, 1, 2],
 [1, 3, 1], [1, 2, 2], [1, 1, 3]]

>>> IntegerListsLex(Integer(5), min_part=Integer(1), max_slope=-Integer(1)).list()
[[5], [4, 1], [3, 2]]

>>> list(Compositions(Integer(5), max_length=Integer(2)))
[[5], [4, 1], [3, 2], [2, 3], [1, 4]]

>>> list(IntegerListsLex(Integer(5), max_length=Integer(2), min_part=Integer(1)))
[[5], [4, 1], [3, 2], [2, 3], [1, 4]]
```

The point of the model of `IntegerListsLex` is in the compromise between generality and efficiency. The main algorithm permits iteration through the elements of such a set S in reverse lexicographic order with a good complexity in most practical use cases. Roughly speaking, the time needed to iterate through all the elements of S is proportional to the number of elements, where the proportion factor is controlled by the length l of the longest element of S. In addition, the memory usage is also controlled by l, which is to say negligible in practice.

This algorithm is based on a very general principle for traversing a decision tree, called *branch and bound*: at the top level, we run through all the possible choices for ℓ_0; for each of these choices, we run through all the possible choices for ℓ_1, and so on. Mathematically speaking, we have put the structure of a prefix tree on the elements of S: a node of the tree at depth k corresponds to a prefix $\ell_0, \ldots, \ell_k$ of one (or more) elements of S (see *Figure: The prefix tree of the partitions*

of 5.).

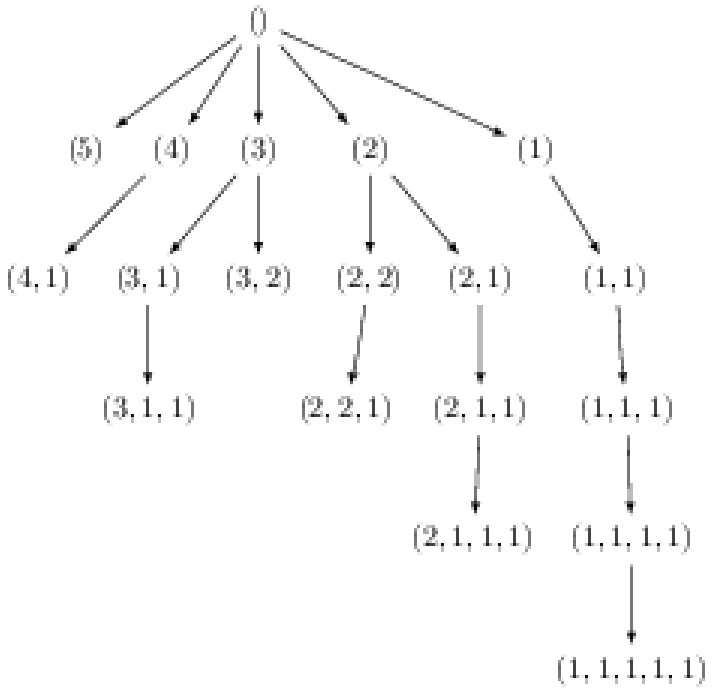

Fig. 2: Figure: The prefix tree of the partitions of 5.

The usual problem with this type of approach is to avoid bad decisions which lead to leaving the prefix tree and exploring dead branches; this is particularly problematic because the growth of the number of elements is usually exponential in the depth. It turns out that the constraints listed above are simple enough to be able to reasonably predict when a sequence $\ell_0, \ldots, \ell_k$ is a prefix of some element S. Hence, most dead branches can be pruned.

Integer points in polytopes

Although the algorithm for iteration in `IntegerListsLex` is efficient, its counting algorithm is naive: it just iterates over all the elements.

There is an alternative approach to treating this problem: modelling the desired lists of integers as the set of integer points of a polytope, that is to say, the set of solutions with integer coordinates of a system of linear inequalities. This is a very general context in which there exist advanced counting algorithms (e.g. Barvinok), which are implemented in libraries like `LattE`. Iteration does not pose a hard problem in principle. However, there are two limitations that justify the existence of `IntegerListsLex`. The first is theoretical: lattice points in a polytope only allow modelling of problems of a fixed dimension (length). The second is practical: at the moment only the library `PALP` has a `Sage` interface, and though it offers multiple capabilities for the study of polytopes, in the present application it only produces a list of lattice points, without providing either an iterator or non-naive counting:

```
sage: A = random_matrix(ZZ, 6, 3, x=7)
sage: L = LatticePolytope(A.rows())
sage: L.points()                                    # random
M(4, 1, 0),
M(0, 3, 5),
M(2, 2, 3),
M(6, 1, 3),
M(1, 3, 6),
```

(continues on next page)

(continued from previous page)

```
M(6, 2, 3),
M(3, 2, 4),
M(3, 2, 3),
M(4, 2, 4),
M(4, 2, 3),
M(5, 2, 3)
in 3-d lattice M
sage: L.n_points()                                    # random
11
```

```
>>> from sage.all import *
>>> A = random_matrix(ZZ, Integer(6), Integer(3), x=Integer(7))
>>> L = LatticePolytope(A.rows())
>>> L.points()                                        # random
M(4, 1, 0),
M(0, 3, 5),
M(2, 2, 3),
M(6, 1, 3),
M(1, 3, 6),
M(6, 2, 3),
M(3, 2, 4),
M(3, 2, 3),
M(4, 2, 4),
M(4, 2, 3),
M(5, 2, 3)
in 3-d lattice M
>>> L.n_points()                                      # random
11
```

This polytope can be visualized in 3D with `L.plot3d()` (see *Figure: The polytope L and its integer points, in cross-eyed stereographic perspective.*).

Species, decomposable combinatorial classes

In *Enumeration of trees using generating functions*, we showed how to use the recursive definition of binary trees to count them efficiently using generating functions. The techniques we used there are very general, and apply whenever the sets involved can be defined recursively (depending on who you ask, such a set is called a *decomposable combinatorial class* or, roughly speaking, a *combinatorial species*). This includes all the types of trees, but also permutations, compositions, functional graphs, etc.

Here, we illustrate just a few examples using the `Sage` library on combinatorial species:

```
sage: from sage.combinat.species.library import *
sage: o = var('o')                                                    #␣
↪needs sage.symbolic
```

```
>>> from sage.all import *
>>> from sage.combinat.species.library import *
>>> o = var('o')                                                      #␣
↪needs sage.symbolic
```

We begin by redefining the complete binary trees; to do so, we stipulate the recurrence relation directly on the sets:

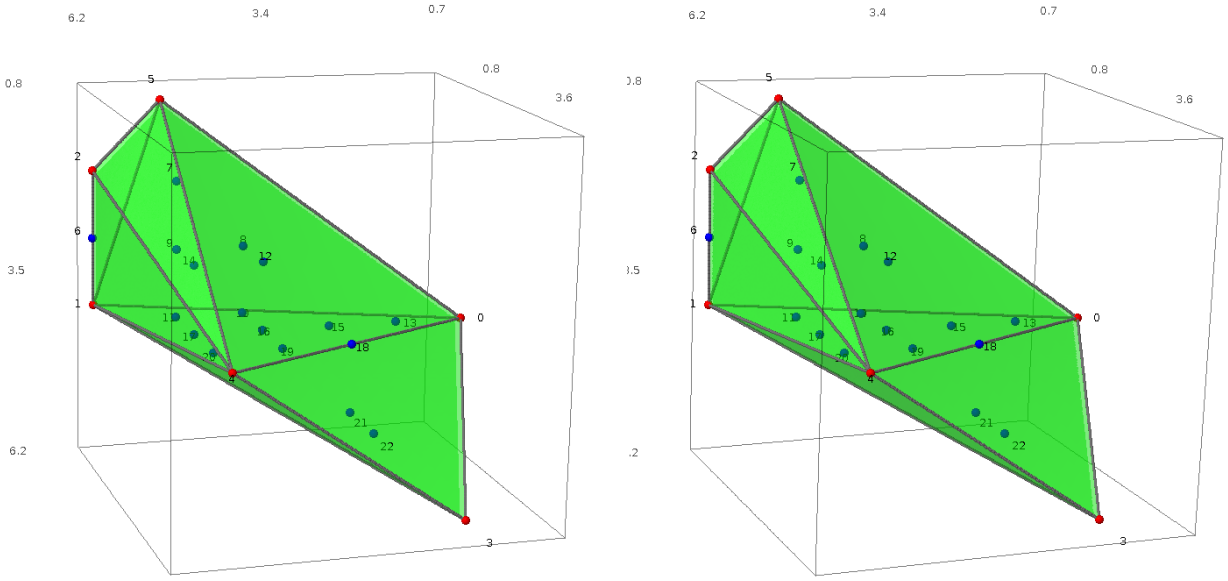

Fig. 3: Figure: The polytope L and its integer points, in cross-eyed stereographic perspective.

```
sage: BT = CombinatorialSpecies(min=1)
sage: Leaf =  SingletonSpecies()
sage: BT.define( Leaf + (BT*BT) )
```

```
>>> from sage.all import *
>>> BT = CombinatorialSpecies(min=Integer(1))
>>> Leaf =  SingletonSpecies()
>>> BT.define( Leaf + (BT*BT) )
```

Now we can construct the set of trees with five nodes, list them, count them…:

```
sage: BT5 = BT.isotypes([o]*5)                                                  #␣
↪needs sage.symbolic
sage: BT5.cardinality()                                                         #␣
↪needs sage.symbolic
14
sage: BT5.list()                                                                #␣
↪needs sage.symbolic
[o*(o*(o*(o*o))), o*(o*((o*o)*o)), o*((o*o)*(o*o)),
 o*((o*(o*o))*o), o*(((o*o)*o)*o), (o*o)*(o*(o*o)),
 (o*o)*((o*o)*o), (o*(o*o))*(o*o), ((o*o)*o)*(o*o),
 (o*(o*(o*o)))*o, (o*((o*o)*o))*o, ((o*o)*(o*o))*o,
 ((o*(o*o))*o)*o, (((o*o)*o)*o)*o]
```

```
>>> from sage.all import *
>>> BT5 = BT.isotypes([o]*Integer(5))                                           ␣
↪      # needs sage.symbolic
>>> BT5.cardinality()                                                          #␣
↪needs sage.symbolic
```

(continues on next page)

(continued from previous page)

```
14
>>> BT5.list()                                                                #␣
↪needs sage.symbolic
[o*(o*(o*(o*o))), o*(o*((o*o)*o)), o*((o*o)*(o*o)),
 o*((o*(o*o))*o), o*(((o*o)*o)*o), (o*o)*(o*(o*o)),
 (o*o)*((o*o)*o), (o*(o*o))*(o*o), ((o*o)*o)*(o*o),
 (o*(o*(o*o)))*o, (o*((o*o)*o))*o, ((o*o)*(o*o))*o,
 ((o*(o*o))*o)*o, (((o*o)*o)*o)*o]
```

The trees are constructed using a generic recursive structure; the display is therefore not wonderful. To do better, it would be necessary to provide `Sage` with a more specialized data structure with the desired display capabilities.

We recover the generating function for the Catalan numbers:

```
sage: g = BT.isotype_generating_series(); g
z + z^2 + 2*z^3 + 5*z^4 + 14*z^5 + 42*z^6 + 132*z^7 + O(z^8)
```

```
>>> from sage.all import *
>>> g = BT.isotype_generating_series(); g
z + z^2 + 2*z^3 + 5*z^4 + 14*z^5 + 42*z^6 + 132*z^7 + O(z^8)
```

which is returned in the form of a lazy power series:

```
sage: g[100]
227508830794229349661819540395688853956041682601541047340
```

```
>>> from sage.all import *
>>> g[Integer(100)]
227508830794229349661819540395688853956041682601541047340
```

We finish with the Fibonacci words, which are binary words without two consecutive "1"s. They admit a natural recursive definition:

```
sage: Eps =  EmptySetSpecies()
sage: Z0  =  SingletonSpecies()
sage: Z1  =  Eps*SingletonSpecies()
sage: FW  = CombinatorialSpecies()
sage: FW.define(Eps + Z0*FW  +  Z1*Eps + Z1*Z0*FW)
```

```
>>> from sage.all import *
>>> Eps =  EmptySetSpecies()
>>> Z0  =  SingletonSpecies()
>>> Z1  =  Eps*SingletonSpecies()
>>> FW  = CombinatorialSpecies()
>>> FW.define(Eps + Z0*FW  +  Z1*Eps + Z1*Z0*FW)
```

The Fibonacci sequence is easily recognized here, hence the name:

```
sage: L = FW.isotype_generating_series()[:15]; L
[1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, 377, 610, 987]
```

```
>>> from sage.all import *
>>> L = FW.isotype_generating_series()[:Integer(15)]; L
[1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, 377, 610, 987]
```

```
sage: oeis(L)                                             # optional -- internet
0: A000045: Fibonacci numbers: F(n) = F(n-1) + F(n-2) with F(0) = 0 and F(1) = 1.
1: ...
2: ...
```

```
>>> from sage.all import *
>>> oeis(L)                                               # optional -- internet
0: A000045: Fibonacci numbers: F(n) = F(n-1) + F(n-2) with F(0) = 0 and F(1) = 1.
1: ...
2: ...
```

This is an immediate consequence of the recurrence relation. One can also generate immediately all the Fibonacci words of a given length, with the same limitations resulting from the generic display.

```
sage: FW3 = FW.isotypes([o]*3)                                                  #␣
↪needs sage.symbolic
sage: FW3.list()                                                                #␣
↪needs sage.symbolic
[o*(o*(o*{})), o*(o*(({}*o)*{})), o*((({}*o)*o)*{}),
 (({}*o)*o)*(o*{}), (({}*o)*o)*(({}*o)*{})]
```

```
>>> from sage.all import *
>>> FW3 = FW.isotypes([o]*Integer(3))                                            ␣
↪     # needs sage.symbolic
>>> FW3.list()                                                                 #␣
↪needs sage.symbolic
[o*(o*(o*{})), o*(o*(({}*o)*{})), o*((({}*o)*o)*{}),
 (({}*o)*o)*(o*{}), (({}*o)*o)*(({}*o)*{})]
```

Graphs up to isomorphism

We saw in *Some other finite enumerated sets* that `Sage` could generate graphs and partial orders up to isomorphism. We will now describe the underlying algorithm, which is the same in both cases, and covers a substantially wider class of problems.

We begin by recalling some notions. A graph $G = (V, E)$ is a set V of vertices and a set E of edges connecting these vertices; an edge is described by a pair $\{u, v\}$ of distinct vertices of V. Such a graph is called labelled; its vertices are typically numbered by considering $V = \{1, 2, 3, 4, 5\}$.

In many problems, the labels on the vertices play no role. Typically a chemist wants to study all the possible molecules with a given composition, for example the alkanes with $n = 8$ atoms of carbon and $2n + 2 = 18$ atoms of hydrogen. He therefore wants to find all the graphs consisting of 8 vertices with 4 neighbours, and 18 vertices with a single neighbour. The different carbon atoms, however, are all considered to be identical, and the same for the hydrogen atoms. The problem of our chemist is not imaginary; this type of application is actually at the origin of an important part of the research in graph theory on isomorphism problems.

Working by hand on a small graph it is possible, as in the example of *Some other finite enumerated sets*, to make a drawing, erase the labels, and "forget" the geometrical information about the location of the vertices in the plane. However, to represent a graph in a computer program, it is necessary to introduce labels on the vertices so as to be able to describe how the edges connect them together. To compensate for the extra information which we have introduced, we then say

that two labelled graphs g_1 and g_2 are *isomorphic* if there is a bijection from the vertices of g_1 to those of g_2, which maps bijectively the edges of g_1 to those of g_2; an *unlabelled graph* is then an equivalence class of labelled graphs.

In general, testing if two labelled graphs are isomorphic is expensive. However, the number of graphs, even unlabelled, grows very rapidly. Nonetheless, it is possible to list unlabelled graphs very efficiently considering their number. For example, the program `Nauty` can list the 12005168 simple graphs with 10 vertices in 20 seconds.

As in *Lexicographic generation of lists of integers*, the general principle of the algorithm is to organize the objects to be enumerated into a tree that one traverses.

For this, in each equivalence class of labelled graphs (that is to say, for each unlabelled graph) one fixes a convenient canonical representative. The following are the fundamental operations:

- Testing whether a labelled graph is canonical
- Calculating the canonical representative of a labelled graph

These unavoidable operations remain expensive; one therefore tries to minimize the number of calls to them.

The canonical representatives are chosen in such a way that, for each canonical labelled graph G, there is a canonical choice of an edge whose removal produces a canonical graph again, which is called the father of G. This property implies that it is possible to organize the set of canonical representatives as a tree: at the root, the graph with no edges; below it, its unique child, the graph with one edge; then the graphs with two edges, and so on. The set of children of a graph G can be constructed by *augmentation*, adding an edge in all the possible ways to G, and then selecting, from among those graphs, the ones that are still canonical[2]. Recursively, one obtains all the canonical graphs.

In what sense is this algorithm generic? Consider for example planar graphs (graphs which can be drawn in the plane without edges crossing): by removing an edge from a planar graph, one obtains another planar graph; so planar graphs form a subtree of the previous tree. To generate them, exactly the same algorithm can be used, selecting only the children which are planar:

```
sage: [len(list(graphs(n, property=lambda G: G.is_planar())))
....:  for n in range(7)]
[1, 1, 2, 4, 11, 33, 142]
```

```
>>> from sage.all import *
>>> [len(list(graphs(n, property=lambda G: G.is_planar())))
...  for n in range(Integer(7))]
[1, 1, 2, 4, 11, 33, 142]
```

In a similar fashion, one can generate any family of graphs closed under deletion of an edge, and in particular any family characterized by a forbidden subgraph. This includes for example forests (graphs without cycles), bipartite graphs (graphs without odd cycles), etc. This can be applied to generate:

- partial orders, via the bijection with Hasse diagrams which are oriented graphs without cycles and without edges implied by the transitivity of the order relation;
- lattices (not implemented in `Sage`), via the bijection with the meet semi-lattice obtained by deleting the maximal vertex; in this case an augmentation by vertices rather than by edges is used.

```

Common automata and transducers (finite state machines generators)

Automata and transducers in Sage can be built through the *automata* and *transducers* objects, respectively. It contains generators for common finite state machines. For example,

```
sage: I = transducers.Identity([0, 1, 2])
```

```
>>> from sage.all import *
>>> I = transducers.Identity([Integer(0), Integer(1), Integer(2)])
```

generates an identity transducer on the alphabet $\{0, 1, 2\}$.

To construct automata and transducers manually, you can use the classes *Automaton* and *Transducer*, respectively. See *Finite state machines, automata, transducers* for more details and a lot of *examples*.

Automata

AnyLetter()	Return an automaton recognizing any letter.
AnyWord()	Return an automaton recognizing any word.
EmptyWord()	Return an automaton recognizing the empty word.
Word()	Return an automaton recognizing the given word.
ContainsWord()	Return an automaton recognizing words containing the given word.

Transducers

Identity()	Return a transducer realizing the identity map.
abs()	Return a transducer realizing absolute value.
map()	Return a transducer realizing a function.
operator()	Return a transducer realizing a binary operation.
all()	Return a transducer realizing logical `and`.
any()	Return a transducer realizing logical `or`.
add()	Return a transducer realizing addition.
sub()	Return a transducer realizing subtraction.
CountSubblockOccurrences()	Return a transducer counting the occurrences of a subblock.
Wait()	Return a transducer writing `False` until first (or k-th) true input is read.
weight()	Return a transducer realizing the Hamming weight.
GrayCode()	Return a transducer realizing binary Gray code.
Recursion()	Return a transducer defined by recursions.

Functions and methods

class sage.combinat.finite_state_machine_generators.**AutomatonGenerators**

Bases: `object`

A collection of constructors for several common automata.

A list of all automata in this database is available via tab completion. Type "`automata.`" and then hit tab to see which automata are available.

The automata currently in this class include:

- *AnyLetter()*
- *AnyWord()*
- *EmptyWord()*
- *Word()*
- *ContainsWord()*

AnyLetter(*input_alphabet*)

Return an automaton recognizing any letter of the given input alphabet.

INPUT:

- `input_alphabet` – list; the input alphabet

OUTPUT: an *Automaton*

EXAMPLES:

```
sage: A = automata.AnyLetter([0, 1])
sage: A([])
False
sage: A([0])
True
sage: A([1])
True
sage: A([0, 0])
False
```

```
>>> from sage.all import *
>>> A = automata.AnyLetter([Integer(0), Integer(1)])
>>> A([])
False
>>> A([Integer(0)])
True
>>> A([Integer(1)])
True
>>> A([Integer(0), Integer(0)])
False
```

See also

AnyWord()

AnyWord(*input_alphabet*)

Return an automaton recognizing any word of the given input alphabet.

INPUT:

- `input_alphabet` – list; the input alphabet

OUTPUT: an *Automaton*

EXAMPLES:

```
sage: A = automata.AnyWord([0, 1])
sage: A([0])
True
sage: A([1])
True
sage: A([0, 1])
True
sage: A([0, 2])
False
```

```
>>> from sage.all import *
>>> A = automata.AnyWord([Integer(0), Integer(1)])
>>> A([Integer(0)])
True
>>> A([Integer(1)])
True
>>> A([Integer(0), Integer(1)])
True
>>> A([Integer(0), Integer(2)])
False
```

This is equivalent to taking the *kleene_star()* of *AnyLetter()* and minimizing the result. This method immediately gives a minimized version:

```
sage: B = automata.AnyLetter([0, 1]).kleene_star().minimization().relabeled()
sage: B == A
True
```

```
>>> from sage.all import *
>>> B = automata.AnyLetter([Integer(0), Integer(1)]).kleene_star().
↪minimization().relabeled()
>>> B == A
True
```

See also

AnyLetter(), *Word()*.

ContainsWord(*word*, *input_alphabet*)

Return an automaton recognizing the words containing the given word as a factor.

INPUT:

- `word` – list (or other iterable) of letters; the word we are looking for
- `input_alphabet` – list or other iterable; the input alphabet

OUTPUT: an *Automaton*

EXAMPLES:

```
sage: A = automata.ContainsWord([0, 1, 0, 1, 1],
....:                           input_alphabet=[0, 1])
sage: A([1, 0, 1, 0, 1, 0, 1, 1, 0, 0])
True
sage: A([1, 0, 1, 0, 1, 0, 1, 0])
False
```

```
>>> from sage.all import *
>>> A = automata.ContainsWord([Integer(0), Integer(1), Integer(0), Integer(1),
↪ Integer(1)],
...                           input_alphabet=[Integer(0), Integer(1)])
>>> A([Integer(1), Integer(0), Integer(1), Integer(0), Integer(1), Integer(0),
```

(continues on next page)

(continued from previous page)

```
↪ Integer(1), Integer(1), Integer(0), Integer(0)])
True
>>> A([Integer(1), Integer(0), Integer(1), Integer(0), Integer(1), Integer(0),
↪ Integer(1), Integer(0)])
False
```

This is equivalent to taking the concatenation of *AnyWord()*, *Word()* and *AnyWord()* and minimizing the result. This method immediately gives a minimized version:

```
sage: B = (automata.AnyWord([0, 1]) *
....:      automata.Word([0, 1, 0, 1, 1], [0, 1]) *
....:      automata.AnyWord([0, 1])).minimization()
sage: B.is_equivalent(A)
True
```

```
>>> from sage.all import *
>>> B = (automata.AnyWord([Integer(0), Integer(1)]) *
...      automata.Word([Integer(0), Integer(1), Integer(0), Integer(1),␣
↪Integer(1)], [Integer(0), Integer(1)]) *
...      automata.AnyWord([Integer(0), Integer(1)])).minimization()
>>> B.is_equivalent(A)
True
```

See also

CountSubblockOccurrences(), *AnyWord()*, *Word()*.

EmptyWord(*input_alphabet=None*)

Return an automaton recognizing the empty word.

INPUT:

- `input_alphabet` – iterable or `None` (default: `None`)

OUTPUT: an *Automaton*

EXAMPLES:

```
sage: A = automata.EmptyWord()
sage: A([])
True
sage: A([0])
False
```

```
>>> from sage.all import *
>>> A = automata.EmptyWord()
>>> A([])
True
>>> A([Integer(0)])
False
```

See also

AnyLetter(), *AnyWord()*.

Word(*word*, *input_alphabet=None*)

Return an automaton recognizing the given word.

INPUT:

- `word` – an iterable
- `input_alphabet` – list or `None`; if `None`, then the letters occurring in the word are used

OUTPUT: an *Automaton*

EXAMPLES:

```
sage: A = automata.Word([0])
sage: A.transitions()
[Transition from 0 to 1: 0|-]
sage: [A(w) for w in ([], [0], [1])]
[False, True, False]
sage: A = automata.Word([0, 1, 0])
sage: A.transitions()
[Transition from 0 to 1: 0|-,
Transition from 1 to 2: 1|-,
Transition from 2 to 3: 0|-]
sage: [A(w) for w in ([], [0], [0, 1], [0, 1, 1], [0, 1, 0])]
[False, False, False, False, True]
```

```
>>> from sage.all import *
>>> A = automata.Word([Integer(0)])
>>> A.transitions()
[Transition from 0 to 1: 0|-]
>>> [A(w) for w in ([], [Integer(0)], [Integer(1)])]
[False, True, False]
>>> A = automata.Word([Integer(0), Integer(1), Integer(0)])
>>> A.transitions()
[Transition from 0 to 1: 0|-,
Transition from 1 to 2: 1|-,
Transition from 2 to 3: 0|-]
>>> [A(w) for w in ([], [Integer(0)], [Integer(0), Integer(1)], [Integer(0),␣
↪Integer(1), Integer(1)], [Integer(0), Integer(1), Integer(0)])]
[False, False, False, False, True]
```

If the input alphabet is not given, it is derived from the given word.

```
sage: A.input_alphabet
[0, 1]
sage: A = automata.Word([0, 1, 0], input_alphabet=[0, 1, 2])
sage: A.input_alphabet
[0, 1, 2]
```

```
>>> from sage.all import *
>>> A.input_alphabet
```

(continues on next page)

(continued from previous page)

```
[0, 1]
>>> A = automata.Word([Integer(0), Integer(1), Integer(0)], input_
↪alphabet=[Integer(0), Integer(1), Integer(2)])
>>> A.input_alphabet
[0, 1, 2]
```

See also

AnyWord(), *ContainsWord()*.

class sage.combinat.finite_state_machine_generators.**TransducerGenerators**

Bases: object

A collection of constructors for several common transducers.

A list of all transducers in this database is available via tab completion. Type "`transducers.`" and then hit tab to see which transducers are available.

The transducers currently in this class include:

- *Identity()*
- *abs()*
- *operator()*
- *all()*
- *any()*
- *add()*
- *sub()*
- *CountSubblockOccurrences()*
- *Wait()*
- *GrayCode()*
- *Recursion()*

CountSubblockOccurrences(*block*, *input_alphabet*)

Return a transducer counting the number of (possibly overlapping) occurrences of a block in the input.

INPUT:

- `block` – list (or other iterable) of letters
- `input_alphabet` – list or other iterable

OUTPUT:

A transducer counting (in unary) the number of occurrences of the given block in the input. Overlapping occurrences are counted several times.

Denoting the block by $b_0 \dots b_{k-1}$, the input word by $i_0 \dots i_L$ and the output word by $o_0 \dots o_L$, we have $o_j = 1$ if and only if $i_{j-k+1} \dots i_j = b_0 \dots b_{k-1}$. Otherwise, $o_j = 0$.

EXAMPLES:

1. Counting the number of `10` blocks over the alphabet `[0, 1]`:

```
sage: T = transducers.CountSubblockOccurrences(
....:     [1, 0],
....:     [0, 1])
sage: sorted(T.transitions())
[Transition from () to (): 0|0,
 Transition from () to (1,): 1|0,
 Transition from (1,) to (): 0|1,
 Transition from (1,) to (1,): 1|0]
sage: T.input_alphabet
[0, 1]
sage: T.output_alphabet
[0, 1]
sage: T.initial_states()
[()]
sage: T.final_states()
[(), (1,)]
```

```
>>> from sage.all import *
>>> T = transducers.CountSubblockOccurrences(
...     [Integer(1), Integer(0)],
...     [Integer(0), Integer(1)])
>>> sorted(T.transitions())
[Transition from () to (): 0|0,
 Transition from () to (1,): 1|0,
 Transition from (1,) to (): 0|1,
 Transition from (1,) to (1,): 1|0]
>>> T.input_alphabet
[0, 1]
>>> T.output_alphabet
[0, 1]
>>> T.initial_states()
[()]
>>> T.final_states()
[(), (1,)]
```

Check some sequence:

```
sage: T([0, 1, 0, 1, 1, 0])
[0, 0, 1, 0, 0, 1]
```

```
>>> from sage.all import *
>>> T([Integer(0), Integer(1), Integer(0), Integer(1), Integer(1),␣
↪Integer(0)])
[0, 0, 1, 0, 0, 1]
```

2. Counting the number of `11` blocks over the alphabet `[0, 1]`:

```
sage: T = transducers.CountSubblockOccurrences(
....:     [1, 1],
....:     [0, 1])
sage: sorted(T.transitions())
[Transition from () to (): 0|0,
 Transition from () to (1,): 1|0,
```

(continues on next page)

(continued from previous page)

```
 Transition from (1,) to (): 0|0,
 Transition from (1,) to (1,): 1|1]
```

```
>>> from sage.all import *
>>> T = transducers.CountSubblockOccurrences(
...     [Integer(1), Integer(1)],
...     [Integer(0), Integer(1)])
>>> sorted(T.transitions())
[Transition from () to (): 0|0,
 Transition from () to (1,): 1|0,
 Transition from (1,) to (): 0|0,
 Transition from (1,) to (1,): 1|1]
```

Check some sequence:

```
sage: T([0, 1, 0, 1, 1, 0])
[0, 0, 0, 0, 1, 0]
```

```
>>> from sage.all import *
>>> T([Integer(0), Integer(1), Integer(0), Integer(1), Integer(1),␣
↪Integer(0)])
[0, 0, 0, 0, 1, 0]
```

3. Counting the number of `1010` blocks over the alphabet `[0, 1, 2]`:

```
sage: T = transducers.CountSubblockOccurrences(
....:     [1, 0, 1, 0],
....:     [0, 1, 2])
sage: sorted(T.transitions())
[Transition from () to (): 0|0,
 Transition from () to (1,): 1|0,
 Transition from () to (): 2|0,

ContainsWord()

GrayCode()

Return a transducer converting the standard binary expansion to Gray code.

OUTPUT: a transducer

Cf. the Wikipedia article Gray_code for a description of the Gray code.

EXAMPLES:

```
sage: G = transducers.GrayCode()
sage: G
Transducer with 3 states
sage: for v in srange(10):
....:     print("{} {}".format(v, G(v.digits(base=2))))
0 []
1 [1]
2 [1, 1]
3 [0, 1]
4 [0, 1, 1]
5 [1, 1, 1]
6 [1, 0, 1]
7 [0, 0, 1]
8 [0, 0, 1, 1]
9 [1, 0, 1, 1]
```

```
>>> from sage.all import *
>>> G = transducers.GrayCode()
>>> G
```

(continues on next page)

(continued from previous page)

```
Transducer with 3 states
>>> for v in srange(Integer(10)):
...     print("{} {}".format(v, G(v.digits(base=Integer(2)))))
0 []
1 [1]
2 [1, 1]
3 [0, 1]
4 [0, 1, 1]
5 [1, 1, 1]
6 [1, 0, 1]
7 [0, 0, 1]
8 [0, 0, 1, 1]
9 [1, 0, 1, 1]
```

In the example *Gray Code* in the documentation of the *Finite state machines, automata, transducers* module, the Gray code transducer is derived from the algorithm converting the binary expansion to the Gray code. The result is the same as the one given here.

Identity(*input_alphabet*)

Return the identity transducer realizing the identity map.

INPUT:

- `input_alphabet` – list or other iterable

OUTPUT: a transducer mapping each word over `input_alphabet` to itself

EXAMPLES:

```
sage: T = transducers.Identity([0, 1])
sage: sorted(T.transitions())
[Transition from 0 to 0: 0|0,
 Transition from 0 to 0: 1|1]
sage: T.initial_states()
[0]
sage: T.final_states()
[0]
sage: T.input_alphabet
[0, 1]
sage: T.output_alphabet
[0, 1]
sage: T([0, 1, 0, 1, 1])
[0, 1, 0, 1, 1]
```

```
>>> from sage.all import *
>>> T = transducers.Identity([Integer(0), Integer(1)])
>>> sorted(T.transitions())
[Transition from 0 to 0: 0|0,
 Transition from 0 to 0: 1|1]
>>> T.initial_states()
[0]
>>> T.final_states()
[0]
>>> T.input_alphabet
```

(continues on next page)

(continued from previous page)

```
[0, 1]
>>> T.output_alphabet
[0, 1]
>>> T([Integer(0), Integer(1), Integer(0), Integer(1), Integer(1)])
[0, 1, 0, 1, 1]
```

Recursion(*recursions, base, function=None, var=None, input_alphabet=None, word_function=None, is_zero=None, output_rings=[Integer Ring, Rational Field]*)

Return a transducer realizing the given recursion when reading the digit expansion with base `base`.

INPUT:

- `recursions` – list or iterable of equations. Each equation has either the form
  - `f(base^K * n + r) == f(base^k * n + s) + t` for some integers `0 <= k < K`, `r` and some `t`—valid for all `n` such that the arguments on both sides are nonnegative—

  or the form
  - `f(r) == t` for some integer `r` and some `t`.

  Alternatively, an equation may be replaced by a `transducers.RecursionRule` with the attributes `K`, `r`, `k`, `s`, `t` as above or a tuple `(r, t)`. Note that `t` *must* be a list in this case.
- `base` – base of the digit expansion
- `function` – symbolic function `f` occurring in the recursions
- `var` – symbolic variable
- `input_alphabet` – (default: `None`) a list of digits to be used as the input alphabet. If `None` and the base is an integer, `input_alphabet` is chosen to be `srange(base.abs())`.
- `word_function` – (default: `None`) a symbolic function. If not `None`, `word_function(arg1, ..., argn)` in a symbolic recurrence relation is interpreted as a transition with output `[arg1, ..., argn]`. This could not be entered in a symbolic recurrence relation because lists do not coerce into the `SymbolicRing`.
- `is_zero` – (default: `None`) a callable. The recursion relations are only well-posed if there is no cycle with nonzero output and input consisting of zeros. This parameter is used to determine whether the output of such a cycle is nonzero. By default, the output must evaluate to `False` as a boolean.
- `output_rings` – (default: `[ZZ, QQ]`) a list of rings. The output labels are converted into the first ring of the list in which they are contained. If they are not contained in any ring, they remain in whatever ring they are after parsing the recursions, typically the symbolic ring.

OUTPUT: a transducer `T`

The transducer is constructed such that `T(expansion) == f(n)` if `expansion` is the digit expansion of `n` to the base `base` with the given input alphabet as set of digits. Here, the `+` on the right hand side of the recurrence relation is interpreted as the concatenation of words.

The formal equations and initial conditions in the recursion have to be selected such that `f` is uniquely defined.

EXAMPLES:

- The following example computes the Hamming weight of the ternary expansion of integers.

```
sage: # needs sage.symbolic
sage: function('f')
f
```

(continues on next page)

(continued from previous page)

```
sage: var('n')
n
sage: T = transducers.Recursion([
....:     f(3*n + 1) == f(n) + 1,
....:     f(3*n + 2) == f(n) + 1,
....:     f(3*n) == f(n),
....:     f(0) == 0],
....:     3, f, n)
sage: T.transitions()
[Transition from (0, 0) to (0, 0): 0|-,
 Transition from (0, 0) to (0, 0): 1|1,
 Transition from (0, 0) to (0, 0): 2|1]
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> function('f')
f
>>> var('n')
n
>>> T = transducers.Recursion([
...     f(Integer(3)*n + Integer(1)) == f(n) + Integer(1),
...     f(Integer(3)*n + Integer(2)) == f(n) + Integer(1),
...     f(Integer(3)*n) == f(n),
...     f(Integer(0)) == Integer(0)],
...     Integer(3), f, n)
>>> T.transitions()
[Transition from (0, 0) to (0, 0): 0|-,
 Transition from (0, 0) to (0, 0): 1|1,
 Transition from (0, 0) to (0, 0): 2|1]
```

To illustrate what this transducer does, we consider the example of $n = 601$:

```
sage: # needs sage.symbolic
sage: ternary_expansion = 601.digits(base=3)
sage: ternary_expansion
[1, 2, 0, 1, 1, 2]
sage: weight_sequence = T(ternary_expansion)
sage: weight_sequence
[1, 1, 1, 1, 1]
sage: sum(weight_sequence)
5
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> ternary_expansion = Integer(601).digits(base=Integer(3))
>>> ternary_expansion
[1, 2, 0, 1, 1, 2]
>>> weight_sequence = T(ternary_expansion)
>>> weight_sequence
[1, 1, 1, 1, 1]
>>> sum(weight_sequence)
5
```

Note that the digit zero does not show up in the output because the equation `f(3*n) == f(n)` means that no output is added to `f(n)`.

- The following example computes the Hamming weight of the non-adjacent form, cf. the Wikipedia article Non-adjacent_form.

```
sage: # needs sage.symbolic
sage: function('f')
f
sage: var('n')
n
sage: T = transducers.Recursion([
....:     f(4*n + 1) == f(n) + 1,
....:     f(4*n - 1) == f(n) + 1,
....:     f(2*n) == f(n),
....:     f(0) == 0],
....:     2, f, n)
sage: T.transitions()
[Transition from (0, 0) to (0, 0): 0|-,
 Transition from (0, 0) to (1, 1): 1|-,
 Transition from (1, 1) to (0, 0): 0|1,
 Transition from (1, 1) to (1, 0): 1|1,
 Transition from (1, 0) to (1, 1): 0|-,
 Transition from (1, 0) to (1, 0): 1|-]
sage: [(s.label(), s.final_word_out)
....:  for s in T.iter_final_states()]
[((0, 0), []),
 ((1, 1), [1]),
 ((1, 0), [1])]
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> function('f')
f
>>> var('n')
n
>>> T = transducers.Recursion([
...     f(Integer(4)*n + Integer(1)) == f(n) + Integer(1),
...     f(Integer(4)*n - Integer(1)) == f(n) + Integer(1),
...     f(Integer(2)*n) == f(n),
...     f(Integer(0)) == Integer(0)],
...     Integer(2), f, n)
>>> T.transitions()
[Transition from (0, 0) to (0, 0): 0|-,
 Transition from (0, 0) to (1, 1): 1|-,
 Transition from (1, 1) to (0, 0): 0|1,
 Transition from (1, 1) to (1, 0): 1|1,
 Transition from (1, 0) to (1, 1): 0|-,
 Transition from (1, 0) to (1, 0): 1|-]
>>> [(s.label(), s.final_word_out)
...  for s in T.iter_final_states()]
[((0, 0), []),
 ((1, 1), [1]),
 ((1, 0), [1])]
```

As we are interested in the weight only, we also output 1 for numbers congruent to 3 mod 4. The actual expansion is computed in the next example.

Consider the example of $29 = (100\bar{1}01)_2$ (as usual, the digit -1 is denoted by $\bar{1}$ and digits are written from the most significant digit at the left to the least significant digit at the right; for the transducer, we have to give the digits in the reverse order):

```
sage: NAF = [1, 0, -1, 0, 0, 1]
sage: ZZ(NAF, base=2)
29
sage: binary_expansion = 29.digits(base=2)
sage: binary_expansion
[1, 0, 1, 1, 1]
sage: T(binary_expansion)                                                   #␣
↪needs sage.symbolic
[1, 1, 1]
sage: sum(T(binary_expansion))                                              #␣
↪needs sage.symbolic
3
```

```
>>> from sage.all import *
>>> NAF = [Integer(1), Integer(0), -Integer(1), Integer(0), Integer(0),␣
↪Integer(1)]
>>> ZZ(NAF, base=Integer(2))
29
>>> binary_expansion = Integer(29).digits(base=Integer(2))
>>> binary_expansion
[1, 0, 1, 1, 1]
>>> T(binary_expansion)                                                     #␣
↪needs sage.symbolic
[1, 1, 1]
>>> sum(T(binary_expansion))                                                #␣
↪needs sage.symbolic
3
```

Indeed, the given non-adjacent form has three nonzero digits.

- The following example computes the non-adjacent form from the binary expansion, cf. the Wikipedia article Non-adjacent_form. In contrast to the previous example, we actually compute the expansion, not only the weight.

  We have to write the output 0 when converting an even number. This cannot be encoded directly by an equation in the symbolic ring, because `f(2*n) == f(n) + 0` would be equivalent to `f(2*n) == f(n)` and an empty output would be written. Therefore, we wrap the output in the symbolic function `w` and use the parameter `word_function` to announce this.

  Similarly, we use `w(-1, 0)` to write an output word of length 2 in one iteration. Finally, we write `f(0) == w()` to write an empty word upon completion.

  Moreover, there is a cycle with output `[0]` which—from the point of view of this method—is a contradicting recursion. We override this by the parameter `is_zero`.

```
sage: # needs sage.symbolic
sage: var('n')
n
sage: function('f w')
```

(continues on next page)

(continued from previous page)

```
(f, w)
sage: T = transducers.Recursion([
....:       f(2*n) == f(n) + w(0),
....:       f(4*n + 1) == f(n) + w(1, 0),
....:       f(4*n - 1) == f(n) + w(-1, 0),
....:       f(0) == w()],
....:       2, f, n,
....:       word_function=w,
....:       is_zero=lambda x: sum(x).is_zero())
sage: T.transitions()
[Transition from (0, 0) to (0, 0): 0|0,
 Transition from (0, 0) to (1, 1): 1|-,
 Transition from (1, 1) to (0, 0): 0|1,0,
 Transition from (1, 1) to (1, 0): 1|-1,0,
 Transition from (1, 0) to (1, 1): 0|-,
 Transition from (1, 0) to (1, 0): 1|0]
sage: for s in T.iter_states():
....:     print("{} {}".format(s, s.final_word_out))
(0, 0) []
(1, 1) [1, 0]
(1, 0) [1, 0]
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> var('n')
n
>>> function('f w')
(f, w)
>>> T = transducers.Recursion([
...       f(Integer(2)*n) == f(n) + w(Integer(0)),
...       f(Integer(4)*n + Integer(1)) == f(n) + w(Integer(1), Integer(0)),
...       f(Integer(4)*n - Integer(1)) == f(n) + w(-Integer(1),␣
↪Integer(0)),
...       f(Integer(0)) == w()],
...       Integer(2), f, n,
...       word_function=w,
...       is_zero=lambda x: sum(x).is_zero())
>>> T.transitions()
[Transition from (0, 0) to (0, 0): 0|0,
 Transition from (0, 0) to (1, 1): 1|-,
 Transition from (1, 1) to (0, 0): 0|1,0,
 Transition from (1, 1) to (1, 0): 1|-1,0,
 Transition from (1, 0) to (1, 1): 0|-,
 Transition from (1, 0) to (1, 0): 1|0]
>>> for s in T.iter_states():
...     print("{} {}".format(s, s.final_word_out))
(0, 0) []
(1, 1) [1, 0]
(1, 0) [1, 0]
```

We again consider the example of $n = 29$:

```
sage: T(29.digits(base=2))                                                  #␣
↪needs sage.symbolic
[1, 0, -1, 0, 0, 1, 0]
```

```
>>> from sage.all import *
>>> T(Integer(29).digits(base=Integer(2)))                                  ␣
↪              # needs sage.symbolic
[1, 0, -1, 0, 0, 1, 0]
```

The same transducer can also be entered bypassing the symbolic equations:

```
sage: R = transducers.RecursionRule
sage: TR = transducers.Recursion([
....:       R(K=1, r=0, k=0, s=0, t=[0]),
....:       R(K=2, r=1, k=0, s=0, t=[1, 0]),
....:       R(K=2, r=-1, k=0, s=0, t=[-1, 0]),
....:       (0, [])],
....:       2,
....:       is_zero=lambda x: sum(x).is_zero())
sage: TR == T                                                               #␣
↪needs sage.symbolic
True
```

```
>>> from sage.all import *
>>> R = transducers.RecursionRule
>>> TR = transducers.Recursion([
...       R(K=Integer(1), r=Integer(0), k=Integer(0), s=Integer(0),␣
↪t=[Integer(0)]),
...       R(K=Integer(2), r=Integer(1), k=Integer(0), s=Integer(0),␣
↪t=[Integer(1), Integer(0)]),
...       R(K=Integer(2), r=-Integer(1), k=Integer(0), s=Integer(0), t=[-
↪Integer(1), Integer(0)]),
...       (Integer(0), [])],
...       Integer(2),
...       is_zero=lambda x: sum(x).is_zero())
>>> TR == T                                                                 #␣
↪needs sage.symbolic
True
```

- Here is an artificial example where some of the s are negative:

```
sage: # needs sage.symbolic
sage: function('f')
f
sage: var('n')
n
sage: T = transducers.Recursion([
....:     f(2*n + 1) == f(n-1) + 1,
....:     f(2*n) == f(n),
....:     f(1) == 1,
....:     f(0) == 0], 2, f, n)
sage: T.transitions()
[Transition from (0, 0) to (0, 0): 0|-,
```

(continues on next page)

(continued from previous page)

```
 Transition from (0, 0) to (1, 1): 1|-,
 Transition from (1, 1) to (-1, 1): 0|1,
 Transition from (1, 1) to (0, 0): 1|1,
 Transition from (-1, 1) to (-1, 2): 0|-,
 Transition from (-1, 1) to (1, 2): 1|-,
 Transition from (-1, 2) to (-1, 1): 0|1,
 Transition from (-1, 2) to (0, 0): 1|1,
 Transition from (1, 2) to (-1, 2): 0|1,
 Transition from (1, 2) to (1, 2): 1|1]
sage: [(s.label(), s.final_word_out)
....:  for s in T.iter_final_states()]
[((0, 0), []),
 ((1, 1), [1]),
 ((-1, 1), [0]),
 ((-1, 2), [0]),
 ((1, 2), [1])]
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> function('f')
f
>>> var('n')
n
>>> T = transducers.Recursion([
...     f(Integer(2)*n + Integer(1)) == f(n-Integer(1)) + Integer(1),
...     f(Integer(2)*n) == f(n),
...     f(Integer(1)) == Integer(1),
...     f(Integer(0)) == Integer(0)], Integer(2), f, n)
>>> T.transitions()

>>> for s in T.iter_states():
...       print("{} {}".format(s, s.final_word_out))
(0, 0) []
(0, 1) []
(1, 1) [2]
(1, 2) [2]
(3, 2) [2, 2]
(1, 3) [2]
(5, 3) [2, 2]
(3, 3) [2, 2]
(7, 3) [2, 2]
(2, 1) [1, 2]
>>> list(sum(T(n.bits())) for n in srange(Integer(1), Integer(21)))
[2, 3, 4, 3, 4, 5, 4, 3, 4, 5, 6, 5, 4, 5, 4, 3, 4, 5, 6, 5]
```

- We now demonstrate the use of the `output_rings` parameter. If no `output_rings` are specified, the output labels are converted into `ZZ`:

```
sage: # needs sage.symbolic
sage: function('f')
f
sage: var('n')
```

(continues on next page)

(continued from previous page)

```
n
sage: T = transducers.Recursion([
....:     f(2*n + 1) == f(n) + 1,
....:     f(2*n) == f(n),
....:     f(0) == 2],
....:     2, f, n)
sage: for t in T.transitions():
....:     print([x.parent() for x in t.word_out])
[]
[Integer Ring]
sage: [x.parent() for x in T.states()[0].final_word_out]
[Integer Ring]
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> function('f')
f
>>> var('n')
n
>>> T = transducers.Recursion([
...     f(Integer(2)*n + Integer(1)) == f(n) + Integer(1),
...     f(Integer(2)*n) == f(n),
...     f(Integer(0)) == Integer(2)],
...     Integer(2), f, n)
>>> for t in T.transitions():
...     print([x.parent() for x in t.word_out])
[]
[Integer Ring]
>>> [x.parent() for x in T.states()[Integer(0)].final_word_out]
[Integer Ring]
```

In contrast, if `output_rings` is set to the empty list, the results are not converted:

```
sage: T = transducers.Recursion([                                    #␣
↪needs sage.symbolic
....:     f(2*n + 1) == f(n) + 1,
....:     f(2*n) == f(n),
....:     f(0) == 2],
....:     2, f, n, output_rings=[])
sage: for t in T.transitions():                                      #␣
↪needs sage.symbolic
....:     print([x.parent() for x in t.word_out])
[]
[Symbolic Ring]
sage: [x.parent() for x in T.states()[0].final_word_out]             #␣
↪needs sage.symbolic
[Symbolic Ring]
```

```
>>> from sage.all import *
>>> T = transducers.Recursion([                                      #␣
↪needs sage.symbolic
...     f(Integer(2)*n + Integer(1)) == f(n) + Integer(1),
```

(continues on next page)

(continued from previous page)

```
...       f(Integer(2)*n) == f(n),
...       f(Integer(0)) == Integer(2)],
...       Integer(2), f, n, output_rings=[])
>>> for t in T.transitions():                                    #␣
↪needs sage.symbolic
...       print([x.parent() for x in t.word_out])
[]
[Symbolic Ring]
>>> [x.parent() for x in T.states()[Integer(0)].final_word_out]          ␣
↪      # needs sage.symbolic
[Symbolic Ring]
```

Finally, we use a somewhat questionable conversion:

```
sage: T = transducers.Recursion([                                    #␣
↪needs sage.rings.finite_rings sage.symbolic
....:     f(2*n + 1) == f(n) + 1,
....:     f(2*n) == f(n),
....:     f(0) == 0],
....:     2, f, n, output_rings=[GF(5)])
sage: for t in T.transitions():                                      #␣
↪needs sage.rings.finite_rings sage.symbolic
....:     print([x.parent() for x in t.word_out])
[]
[Finite Field of size 5]
```

```
>>> from sage.all import *
>>> T = transducers.Recursion([                                     #␣
↪needs sage.rings.finite_rings sage.symbolic
...       f(Integer(2)*n + Integer(1)) == f(n) + Integer(1),
...       f(Integer(2)*n) == f(n),
...       f(Integer(0)) == Integer(0)],
...       Integer(2), f, n, output_rings=[GF(Integer(5))])
>>> for t in T.transitions():                                       #␣
↪needs sage.rings.finite_rings sage.symbolic
...       print([x.parent() for x in t.word_out])
[]
[Finite Field of size 5]
```

Todo

Extend the method to

- non-integral bases,
- higher dimensions.

ALGORITHM:

See [HKP2015], Section 6. However, there are also recursion transitions for states of level $< \kappa$ if the recursion rules allow such a transition. Furthermore, the intermediate step of a non-deterministic transducer is left out by implicitly using recursion transitions. The well-posedness is checked in a truncated version of the recursion digraph.

class RecursionRule(*K*, *r*, *k*, *s*, *t*)

Bases: `tuple`

K

Alias for field number 0

k

Alias for field number 2

r

Alias for field number 1

s

Alias for field number 3

t

Alias for field number 4

Wait(*input_alphabet*, *threshold=1*)

Writes `False` until reading the `threshold`-th occurrence of a true input letter; then writes `True`.

INPUT:

- `input_alphabet` – list or other iterable
- `threshold` – positive integer specifying how many occurrences of `True` inputs are waited for

OUTPUT:

A transducer writing `False` until the `threshold`-th true (Python's standard conversion to boolean is used to convert the actual input to boolean) input is read. Subsequently, the transducer writes `True`.

EXAMPLES:

```
sage: T = transducers.Wait([0, 1])
sage: T([0, 0, 1, 0, 1, 0])
[False, False, True, True, True, True]
sage: T2 = transducers.Wait([0, 1], threshold=2)
sage: T2([0, 0, 1, 0, 1, 0])
[False, False, False, False, True, True]
```

```
>>> from sage.all import *
>>> T = transducers.Wait([Integer(0), Integer(1)])
>>> T([Integer(0), Integer(0), Integer(1), Integer(0), Integer(1),␣
↪Integer(0)])
[False, False, True, True, True, True]
>>> T2 = transducers.Wait([Integer(0), Integer(1)], threshold=Integer(2))
>>> T2([Integer(0), Integer(0), Integer(1), Integer(0), Integer(1),␣
↪Integer(0)])
[False, False, False, False, True, True]
```

abs(*input_alphabet*)

Return a transducer which realizes the letter-wise absolute value of an input word over the given input alphabet.

INPUT:

- `input_alphabet` – list or other iterable

OUTPUT:

A transducer mapping $i_0 \dots i_k$ to $|i_0| \dots |i_k|$.

EXAMPLES:

The following transducer realizes letter-wise absolute value:

```
sage: T = transducers.abs([-1, 0, 1])
sage: T.transitions()
[Transition from 0 to 0: -1|1,
 Transition from 0 to 0: 0|0,
 Transition from 0 to 0: 1|1]
sage: T.initial_states()
[0]
sage: T.final_states()
[0]
sage: T([-1, -1, 0, 1])
[1, 1, 0, 1]
```

```
>>> from sage.all import *
>>> T = transducers.abs([-Integer(1), Integer(0), Integer(1)])
>>> T.transitions()
[Transition from 0 to 0: -1|1,
 Transition from 0 to 0: 0|0,
 Transition from 0 to 0: 1|1]
>>> T.initial_states()
[0]
>>> T.final_states()
[0]
>>> T([-Integer(1), -Integer(1), Integer(0), Integer(1)])
[1, 1, 0, 1]
```

add(*input_alphabet*, *number_of_operands=2*)

Return a transducer which realizes addition on pairs over the given input alphabet.

INPUT:

- `input_alphabet` – list or other iterable
- `number_of_operands` – (default: 2) it specifies the number of input arguments the operator takes

OUTPUT:

A transducer mapping an input word $(i_{01}, \dots, i_{0d}) \dots (i_{k1}, \dots, i_{kd})$ to the word $(i_{01} + \dots + i_{0d}) \dots (i_{k1} + \dots + i_{kd})$.

The input alphabet of the generated transducer is the Cartesian product of `number_of_operands` copies of `input_alphabet`.

EXAMPLES:

The following transducer realizes letter-wise addition:

```
sage: T = transducers.add([0, 1])
sage: T.transitions()
[Transition from 0 to 0: (0, 0)|0,
 Transition from 0 to 0: (0, 1)|1,
 Transition from 0 to 0: (1, 0)|1,
```

(continues on next page)

(continued from previous page)

```
 Transition from 0 to 0: (1, 1)|2]
sage: T.input_alphabet
[(0, 0), (0, 1), (1, 0), (1, 1)]
sage: T.initial_states()
[0]
sage: T.final_states()
[0]
sage: T([(0, 0), (0, 1), (1, 0), (1, 1)])
[0, 1, 1, 2]
```

```
>>> from sage.all import *
>>> T = transducers.add([Integer(0), Integer(1)])
>>> T.transitions()
[Transition from 0 to 0: (0, 0)|0,
 Transition from 0 to 0: (0, 1)|1,
 Transition from 0 to 0: (1, 0)|1,
 Transition from 0 to 0: (1, 1)|2]
>>> T.input_alphabet
[(0, 0), (0, 1), (1, 0), (1, 1)]
>>> T.initial_states()
[0]
>>> T.final_states()
[0]
>>> T([(Integer(0), Integer(0)), (Integer(0), Integer(1)), (Integer(1),␣
↪Integer(0)), (Integer(1), Integer(1))])
[0, 1, 1, 2]
```

More than two operands can also be handled:

```
sage: T3 = transducers.add([0, 1], number_of_operands=3)
sage: T3.input_alphabet
[(0, 0, 0), (0, 0, 1), (0, 1, 0), (0, 1, 1),
 (1, 0, 0), (1, 0, 1), (1, 1, 0), (1, 1, 1)]
sage: T3([(0, 0, 0), (0, 1, 0), (0, 1, 1), (1, 1, 1)])
[0, 1, 2, 3]
```

```
>>> from sage.all import *
>>> T3 = transducers.add([Integer(0), Integer(1)], number_of_
↪operands=Integer(3))
>>> T3.input_alphabet
[(0, 0, 0), (0, 0, 1), (0, 1, 0), (0, 1, 1),
 (1, 0, 0), (1, 0, 1), (1, 1, 0), (1, 1, 1)]
>>> T3([(Integer(0), Integer(0), Integer(0)), (Integer(0), Integer(1),␣
↪Integer(0)), (Integer(0), Integer(1), Integer(1)), (Integer(1), Integer(1),␣
↪Integer(1))])
[0, 1, 2, 3]
```

all(*input_alphabet*, *number_of_operands=2*)

Return a transducer which realizes logical `and` over the given input alphabet.

INPUT:

- `input_alphabet` – list or other iterable

- number_of_operands – (default: 2) specifies the number of input arguments for the and operation

OUTPUT:

A transducer mapping an input word $(i_{01}, \ldots, i_{0d}) \ldots (i_{k1}, \ldots, i_{kd})$ to the word $(i_{01} \wedge \cdots \wedge i_{0d}) \ldots (i_{k1} \wedge \cdots \wedge i_{kd})$.

The input alphabet of the generated transducer is the Cartesian product of number_of_operands copies of input_alphabet.

EXAMPLES:

The following transducer realizes letter-wise logical and:

```
sage: T = transducers.all([False, True])
sage: T.transitions()
[Transition from 0 to 0: (False, False)|False,
 Transition from 0 to 0: (False, True)|False,
 Transition from 0 to 0: (True, False)|False,
 Transition from 0 to 0: (True, True)|True]
sage: T.input_alphabet
[(False, False), (False, True), (True, False), (True, True)]
sage: T.initial_states()
[0]
sage: T.final_states()
[0]
sage: T([(False, False), (False, True), (True, False), (True, True)])
[False, False, False, True]
```

```
>>> from sage.all import *
>>> T = transducers.all([False, True])
>>> T.transitions()
[Transition from 0 to 0: (False, False)|False,
 Transition from 0 to 0: (False, True)|False,
 Transition from 0 to 0: (True, False)|False,
 Transition from 0 to 0: (True, True)|True]
>>> T.input_alphabet
[(False, False), (False, True), (True, False), (True, True)]
>>> T.initial_states()
[0]
>>> T.final_states()
[0]
>>> T([(False, False), (False, True), (True, False), (True, True)])
[False, False, False, True]
```

More than two operands and other input alphabets (with conversion to boolean) are also possible:

```
sage: T3 = transducers.all([0, 1], number_of_operands=3)
sage: T3([(0, 0, 0), (1, 0, 0), (1, 1, 1)])
[False, False, True]
```

```
>>> from sage.all import *
>>> T3 = transducers.all([Integer(0), Integer(1)], number_of_
↪operands=Integer(3))
>>> T3([(Integer(0), Integer(0), Integer(0)), (Integer(1), Integer(0),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(0)), (Integer(1), Integer(1), Integer(1))])
[False, False, True]
```

any(*input_alphabet*, *number_of_operands=2*)

Return a transducer which realizes logical `or` over the given input alphabet.

INPUT:

- `input_alphabet` – list or other iterable
- `number_of_operands` – (default: 2) specifies the number of input arguments for the `or` operation

OUTPUT:

A transducer mapping an input word $(i_{01}, \ldots, i_{0d}) \ldots (i_{k1}, \ldots, i_{kd})$ to the word $(i_{01} \vee \cdots \vee i_{0d}) \ldots (i_{k1} \vee \cdots \vee i_{kd})$.

The input alphabet of the generated transducer is the Cartesian product of `number_of_operands` copies of `input_alphabet`.

EXAMPLES:

The following transducer realizes letter-wise logical `or`:

```
sage: T = transducers.any([False, True])
sage: T.transitions()
[Transition from 0 to 0: (False, False)|False,
 Transition from 0 to 0: (False, True)|True,
 Transition from 0 to 0: (True, False)|True,
 Transition from 0 to 0: (True, True)|True]
sage: T.input_alphabet
[(False, False), (False, True), (True, False), (True, True)]
sage: T.initial_states()
[0]
sage: T.final_states()
[0]
sage: T([(False, False), (False, True), (True, False), (True, True)])
[False, True, True, True]
```

```
>>> from sage.all import *
>>> T = transducers.any([False, True])
>>> T.transitions()
[Transition from 0 to 0: (False, False)|False,
 Transition from 0 to 0: (False, True)|True,
 Transition from 0 to 0: (True, False)|True,
 Transition from 0 to 0: (True, True)|True]
>>> T.input_alphabet
[(False, False), (False, True), (True, False), (True, True)]
>>> T.initial_states()
[0]
>>> T.final_states()
[0]
>>> T([(False, False), (False, True), (True, False), (True, True)])
[False, True, True, True]
```

More than two operands and other input alphabets (with conversion to boolean) are also possible:

```
sage: T3 = transducers.any([0, 1], number_of_operands=3)
sage: T3([(0, 0, 0), (1, 0, 0), (1, 1, 1)])
[False, True, True]
```

```
>>> from sage.all import *
>>> T3 = transducers.any([Integer(0), Integer(1)], number_of_
↪operands=Integer(3))
>>> T3([(Integer(0), Integer(0), Integer(0)), (Integer(1), Integer(0),␣
↪Integer(0)), (Integer(1), Integer(1), Integer(1))])
[False, True, True]
```

map(*f*, *input_alphabet*)

Return a transducer which realizes a function on the alphabet.

INPUT:

- `f` – function to realize
- `input_alphabet` – list or other iterable

OUTPUT:

A transducer mapping an input letter x to $f(x)$.

EXAMPLES:

The following binary transducer realizes component-wise absolute value (this transducer is also available as *abs()*):

```
sage: T = transducers.map(abs, [-1, 0, 1])
sage: T.transitions()
[Transition from 0 to 0: -1|1,
 Transition from 0 to 0: 0|0,
 Transition from 0 to 0: 1|1]
sage: T.input_alphabet
[-1, 0, 1]
sage: T.initial_states()
[0]
sage: T.final_states()
[0]
sage: T([-1, 1, 0, 1])
[1, 1, 0, 1]
```

```
>>> from sage.all import *
>>> T = transducers.map(abs, [-Integer(1), Integer(0), Integer(1)])
>>> T.transitions()
[Transition from 0 to 0: -1|1,
 Transition from 0 to 0: 0|0,
 Transition from 0 to 0: 1|1]
>>> T.input_alphabet
[-1, 0, 1]
>>> T.initial_states()
[0]
>>> T.final_states()
[0]
```

(continues on next page)

(continued from previous page)

```
>>> T([-Integer(1), Integer(1), Integer(0), Integer(1)])
[1, 1, 0, 1]
```

Automaton.with_output().

operator(*operator*, *input_alphabet*, *number_of_operands=2*)

Return a transducer which realizes an operation on tuples over the given input alphabet.

INPUT:

- `operator` – operator to realize; it is a function which takes `number_of_operands` input arguments (each out of `input_alphabet`)
- `input_alphabet` – list or other iterable
- `number_of_operands` – (default: 2) it specifies the number of input arguments the operator takes

OUTPUT:

A transducer mapping an input letter $(i_1, \ldots, i_n)$ to operator$(i_1, \ldots, i_n)$. Here, n equals `number_of_operands`.

The input alphabet of the generated transducer is the Cartesian product of `number_of_operands` copies of `input_alphabet`.

EXAMPLES:

The following binary transducer realizes component-wise addition (this transducer is also available as *add()*):

```
sage: import operator
sage: T = transducers.operator(operator.add, [0, 1])
sage: T.transitions()
[Transition from 0 to 0: (0, 0)|0,
 Transition from 0 to 0: (0, 1)|1,
 Transition from 0 to 0: (1, 0)|1,
 Transition from 0 to 0: (1, 1)|2]
sage: T.input_alphabet
[(0, 0), (0, 1), (1, 0), (1, 1)]
sage: T.initial_states()
[0]
sage: T.final_states()
[0]
sage: T([(0, 0), (0, 1), (1, 0), (1, 1)])
[0, 1, 1, 2]
```

```
>>> from sage.all import *
>>> import operator
>>> T = transducers.operator(operator.add, [Integer(0), Integer(1)])
>>> T.transitions()
[Transition from 0 to 0: (0, 0)|0,
 Transition from 0 to 0: (0, 1)|1,
 Transition from 0 to 0: (1, 0)|1,
 Transition from 0 to 0: (1, 1)|2]
```

(continues on next page)

(continued from previous page)

```
>>> T.input_alphabet
[(0, 0), (0, 1), (1, 0), (1, 1)]
>>> T.initial_states()
[0]
>>> T.final_states()
[0]
>>> T([(Integer(0), Integer(0)), (Integer(0), Integer(1)), (Integer(1),␣
↪Integer(0)), (Integer(1), Integer(1))])
[0, 1, 1, 2]
```

Note that for a unary operator the input letters of the new transducer are tuples of length 1:

```
sage: T = transducers.operator(abs,
....:                          [-1, 0, 1],
....:                          number_of_operands=1)
sage: T([-1, 1, 0])
Traceback (most recent call last):
...
ValueError: Invalid input sequence.
sage: T([(-1,), (1,), (0,)])
[1, 1, 0]
```

```
>>> from sage.all import *
>>> T = transducers.operator(abs,
...                          [-Integer(1), Integer(0), Integer(1)],
...                          number_of_operands=Integer(1))
>>> T([-Integer(1), Integer(1), Integer(0)])
Traceback (most recent call last):
...
ValueError: Invalid input sequence.
>>> T([(-Integer(1),), (Integer(1),), (Integer(0),)])
[1, 1, 0]
```

Compare this with the transducer generated by *map()*:

```
sage: T = transducers.map(abs,
....:                     [-1, 0, 1])
sage: T([-1, 1, 0])
[1, 1, 0]
```

```
>>> from sage.all import *
>>> T = transducers.map(abs,
...                     [-Integer(1), Integer(0), Integer(1)])
>>> T([-Integer(1), Integer(1), Integer(0)])
[1, 1, 0]
```

In fact, this transducer is also available as *abs()*:

```
sage: T = transducers.abs([-1, 0, 1])
sage: T([-1, 1, 0])
[1, 1, 0]
```

```
>>> from sage.all import *
>>> T = transducers.abs([-Integer(1), Integer(0), Integer(1)])
>>> T([-Integer(1), Integer(1), Integer(0)])
[1, 1, 0]
```

sub(*input_alphabet*)

Return a transducer which realizes subtraction on pairs over the given input alphabet.

INPUT:

- `input_alphabet` – list or other iterable

OUTPUT:

A transducer mapping an input word $(i_0, i'_0) \dots (i_k, i'_k)$ to the word $(i_0 - i'_0) \dots (i_k - i'_k)$.

The input alphabet of the generated transducer is the Cartesian product of two copies of `input_alphabet`.

EXAMPLES:

The following transducer realizes letter-wise subtraction:

```
sage: T = transducers.sub([0, 1])
sage: T.transitions()
[Transition from 0 to 0: (0, 0)|0,
 Transition from 0 to 0: (0, 1)|-1,
 Transition from 0 to 0: (1, 0)|1,
 Transition from 0 to 0: (1, 1)|0]
sage: T.input_alphabet
[(0, 0), (0, 1), (1, 0), (1, 1)]
sage: T.initial_states()
[0]
sage: T.final_states()
[0]
sage: T([(0, 0), (0, 1), (1, 0), (1, 1)])
[0, -1, 1, 0]
```

```
>>> from sage.all import *
>>> T = transducers.sub([Integer(0), Integer(1)])
>>> T.transitions()
[Transition from 0 to 0: (0, 0)|0,
 Transition from 0 to 0: (0, 1)|-1,
 Transition from 0 to 0: (1, 0)|1,
 Transition from 0 to 0: (1, 1)|0]
>>> T.input_alphabet
[(0, 0), (0, 1), (1, 0), (1, 1)]
>>> T.initial_states()
[0]
>>> T.final_states()
[0]
>>> T([(Integer(0), Integer(0)), (Integer(0), Integer(1)), (Integer(1),␣
↪Integer(0)), (Integer(1), Integer(1))])
[0, -1, 1, 0]
```

weight(*input_alphabet*, *zero=0*)

Return a transducer which realizes the Hamming weight of the input over the given input alphabet.

INPUT:

- `input_alphabet` – list or other iterable
- `zero` – the zero symbol in the alphabet used

OUTPUT:

A transducer mapping $i_0 \dots i_k$ to $(i_0 \neq 0) \dots (i_k \neq 0)$.

The Hamming weight is defined as the number of nonzero digits in the input sequence over the alphabet `input_alphabet` (see Wikipedia article Hamming_weight). The output sequence of the transducer is a unary encoding of the Hamming weight. Thus the sum of the output sequence is the Hamming weight of the input.

EXAMPLES:

```
sage: W = transducers.weight([-1, 0, 2])
sage: W.transitions()
[Transition from 0 to 0: -1|1,
 Transition from 0 to 0: 0|0,
 Transition from 0 to 0: 2|1]
sage: unary_weight = W([-1, 0, 0, 2, -1])
sage: unary_weight
[1, 0, 0, 1, 1]
sage: weight = add(unary_weight)
sage: weight
3
```

```
>>> from sage.all import *
>>> W = transducers.weight([-Integer(1), Integer(0), Integer(2)])
>>> W.transitions()
[Transition from 0 to 0: -1|1,
 Transition from 0 to 0: 0|0,
 Transition from 0 to 0: 2|1]
>>> unary_weight = W([-Integer(1), Integer(0), Integer(0), Integer(2), -
↪Integer(1)])
>>> unary_weight
[1, 0, 0, 1, 1]
>>> weight = add(unary_weight)
>>> weight
3
```

Also the joint Hamming weight can be computed:

```
sage: v1 = vector([-1, 0])
sage: v0 = vector([0, 0])
sage: W = transducers.weight([v1, v0])
sage: unary_weight = W([v1, v0, v1, v0])
sage: add(unary_weight)
2
```

```
>>> from sage.all import *
>>> v1 = vector([-Integer(1), Integer(0)])
>>> v0 = vector([Integer(0), Integer(0)])
>>> W = transducers.weight([v1, v0])
```

(continues on next page)

(continued from previous page)

```
>>> unary_weight = W([v1, v0, v1, v0])
>>> add(unary_weight)
2
```

For the input alphabet `[-1, 0, 1]` the weight transducer is the same as the absolute value transducer *abs()*:

```
sage: W = transducers.weight([-1, 0, 1])
sage: A = transducers.abs([-1, 0, 1])
sage: W == A
True
```

```
>>> from sage.all import *
>>> W = transducers.weight([-Integer(1), Integer(0), Integer(1)])
>>> A = transducers.abs([-Integer(1), Integer(0), Integer(1)])
>>> W == A
True
```

For other input alphabets, we can specify the zero symbol:

```
sage: W = transducers.weight(['a', 'b'], zero='a')
sage: add(W(['a', 'b', 'b']))
2
```

```
>>> from sage.all import *
>>> W = transducers.weight(['a', 'b'], zero='a')
>>> add(W(['a', 'b', 'b']))
2
```

Composition tableaux

AUTHORS:

- Chris Berg, Jeff Ferreira (2012-9): initial version

class sage.combinat.composition_tableau.**CompositionTableau**(*parent*, *t*)

Bases: *CombinatorialElement*

A composition tableau.

A *composition tableau* t of shape $I = (I_1, \ldots, I_\ell)$ is an array of boxes in rows, I_i boxes in row i, filled with positive integers such that:

1) the entries in the rows of t weakly decrease from left to right,

2) the left-most column of t strictly increase from top to bottom.

3) Add zero entries to the rows of t until the resulting array is rectangular of shape $\ell \times m$. For $1 \leq i < j \leq \ell, 2 \leq k \leq m$ and $(t(j,k) \neq 0$, and also if $t(j,k) \geq t(i,k))$ implies $t(j,k) > t(i,k-1)$.

INPUT:

- `t` – list of lists

EXAMPLES:

```
sage: CompositionTableau([[1],[2,2]])
[[1], [2, 2]]
sage: CompositionTableau([[1],[3,2],[4,4]])
[[1], [3, 2], [4, 4]]
sage: CompositionTableau([])
[]
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1)],[Integer(2),Integer(2)]])
[[1], [2, 2]]
>>> CompositionTableau([[Integer(1)],[Integer(3),Integer(2)],[Integer(4),
↪Integer(4)]])
[[1], [3, 2], [4, 4]]
>>> CompositionTableau([])
[]
```

descent_composition()

Return the composition corresponding to the set of all i that do not have $i+1$ appearing strictly to the left of i in `self`.

EXAMPLES:

```
sage: CompositionTableau([[1],[3,2],[4,4]]).descent_composition()
[1, 2, 2]
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1)],[Integer(3),Integer(2)],[Integer(4),
↪Integer(4)]]).descent_composition()
[1, 2, 2]
```

descent_set()

Return the set of all i that do *not* have $i+1$ appearing strictly to the left of i in `self`.

EXAMPLES:

```
sage: CompositionTableau([[1],[3,2],[4,4]]).descent_set()
[1, 3]
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1)],[Integer(3),Integer(2)],[Integer(4),
↪Integer(4)]]).descent_set()
[1, 3]
```

is_standard()

Return `True` if `self` is a standard composition tableau and `False` otherwise.

EXAMPLES:

```
sage: CompositionTableau([[1,1],[3,2],[4,4,3]]).is_standard()
False
sage: CompositionTableau([[2,1],[3],[4]]).is_standard()
True
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1),Integer(1)],[Integer(3),Integer(2)],
↪[Integer(4),Integer(4),Integer(3)]]).is_standard()
False
>>> CompositionTableau([[Integer(2),Integer(1)],[Integer(3)],[Integer(4)]]).
↪is_standard()
True
```

pp()

Return a pretty print string of `self`.

EXAMPLES:

```
sage: CompositionTableau([[1],[3,2],[4,4]]).pp()
1
3  2
4  4
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1)],[Integer(3),Integer(2)],[Integer(4),
↪Integer(4)]]).pp()
1
3  2
4  4
```

shape_composition()

Return a Composition object which is the shape of `self`.

EXAMPLES:

```
sage: CompositionTableau([[1,1],[3,2],[4,4,3]]).shape_composition()
[2, 2, 3]
sage: CompositionTableau([[2,1],[3],[4]]).shape_composition()
[2, 1, 1]
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1),Integer(1)],[Integer(3),Integer(2)],
↪[Integer(4),Integer(4),Integer(3)]]).shape_composition()
[2, 2, 3]
>>> CompositionTableau([[Integer(2),Integer(1)],[Integer(3)],[Integer(4)]]).
↪shape_composition()
[2, 1, 1]
```

shape_partition()

Return a partition which is the shape of `self` sorted into weakly decreasing order.

EXAMPLES:

```
sage: CompositionTableau([[1,1],[3,2],[4,4,3]]).shape_partition()
[3, 2, 2]
sage: CompositionTableau([[2,1],[3],[4]]).shape_partition()
[2, 1, 1]
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1),Integer(1)],[Integer(3),Integer(2)],
↪[Integer(4),Integer(4),Integer(3)]]).shape_partition()
[3, 2, 2]
>>> CompositionTableau([[Integer(2),Integer(1)],[Integer(3)],[Integer(4)]]).
↪shape_partition()
[2, 1, 1]
```

size()

Return the number of boxes in `self`.

EXAMPLES:

```
sage: CompositionTableau([[1],[3,2],[4,4]]).size()
5
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1)],[Integer(3),Integer(2)],[Integer(4),
↪Integer(4)]]).size()
5
```

weight()

Return a (weak) composition where entry i is the number of times that i appears in `self`.

EXAMPLES:

```
sage: CompositionTableau([[1],[3,2],[4,4]]).weight()
[1, 1, 1, 2, 0]
```

```
>>> from sage.all import *
>>> CompositionTableau([[Integer(1)],[Integer(3),Integer(2)],[Integer(4),
↪Integer(4)]]).weight()
[1, 1, 1, 2, 0]
```

class sage.combinat.composition_tableau.**CompositionTableaux**(***kwds*)

Bases: `UniqueRepresentation`, `Parent`

Composition tableaux.

INPUT:

- `size` – the size of the composition tableaux
- `shape` – the shape of the composition tableaux
- `max_entry` – the maximum entry for the composition tableaux

The first argument is interpreted as `size` or `shape` depending on whether it is an integer or a composition.

EXAMPLES:

```
sage: CT = CompositionTableaux(3); CT
Composition Tableaux of size 3 and maximum entry 3
sage: list(CT)
[[[1], [2], [3]],
 [[1], [2, 2]],
```

(continues on next page)

(continued from previous page)

```
 [[1], [3, 2]],
 [[1], [3, 3]],
 [[2], [3, 3]],

Composition Tableaux of size 0 and maximum entry 0
```

(continues on next page)

(continued from previous page)

```
>>> list(CT)
[[]]
```

Element

alias of *CompositionTableau*

class sage.combinat.composition_tableau.**CompositionTableauxBacktracker**(*shape*, *max_entry=None*)

Bases: *GenericBacktracker*

A backtracker class for generating sets of composition tableaux.

get_next_pos(*ii*, *jj*)

EXAMPLES:

```
sage: from sage.combinat.composition_tableau import␣
↪CompositionTableauxBacktracker
sage: T = CompositionTableau([[2,1],[5,4,3,2],[6],[7,7,6]])
sage: n = CompositionTableauxBacktracker(T.shape_composition())
sage: n.get_next_pos(1,1)
(1, 2)
```

```
>>> from sage.all import *
>>> from sage.combinat.composition_tableau import␣
↪CompositionTableauxBacktracker
>>> T = CompositionTableau([[Integer(2),Integer(1)],[Integer(5),Integer(4),
↪Integer(3),Integer(2)],[Integer(6)],[Integer(7),Integer(7),Integer(6)]])
>>> n = CompositionTableauxBacktracker(T.shape_composition())
>>> n.get_next_pos(Integer(1),Integer(1))
(1, 2)
```

class sage.combinat.composition_tableau.**CompositionTableaux_all**(*max_entry=None*)

Bases: *CompositionTableaux*, DisjointUnionEnumeratedSets

All composition tableaux.

an_element()

Return a particular element of self.

EXAMPLES:

```
sage: CT = CompositionTableaux()
sage: CT.an_element()
[[1, 1], [2]]
```

```
>>> from sage.all import *
>>> CT = CompositionTableaux()
>>> CT.an_element()
[[1, 1], [2]]
```

class sage.combinat.composition_tableau.**CompositionTableaux_shape**(*comp*, *max_entry=None*)

Bases: *CompositionTableaux*

Composition tableaux of a fixed shape comp with a given max entry.

INPUT:

- comp – a composition
- max_entry – nonnegative integer (default: size of comp)

class sage.combinat.composition_tableau.**CompositionTableaux_size**(*n*, *max_entry=None*)

Bases: *CompositionTableaux*

Composition tableaux of a fixed size n.

INPUT:

- n – nonnegative integer
- max_entry – nonnegative integer (default: n)

OUTPUT: the class of composition tableaux of size n

Constellations

A constellation is a tuple $(g_0, g_1, \ldots, g_k)$ of permutations such that the product $g_0 g_1 \ldots g_k$ is the identity. One often assumes that the group generated by $g_0, g_1, \ldots, g_k$ acts transitively ([LZ2004] definition 1). Geometrically, it corresponds to a covering of the 2-sphere ramified over k points (the transitivity condition corresponds to the connectivity of the covering).

EXAMPLES:

```
sage: c = Constellation(['(1,2)', '(1,3)', None])
sage: c
Constellation of length 3 and degree 3
g0 (1,2)(3)
g1 (1,3)(2)
g2 (1,3,2)
sage: C = Constellations(3, 4); C
Connected constellations of length 3 and degree 4 on {1, 2, 3, 4}
sage: C.cardinality()
426

sage: C = Constellations(3, 4, domain=('a', 'b', 'c', 'd'))
sage: C
Connected constellations of length 3 and degree 4 on {'a', 'b', 'c', 'd'}
sage: c = C(('a','c'),(('b','c'),('a','d')), None)
sage: c
Constellation of length 3 and degree 4
g0 ('a','c')('b')('d')
g1 ('a','d')('b','c')
g2 ('a','d','c','b')
sage: c.is_connected()
True
sage: c.euler_characteristic()
2
```

```
>>> from sage.all import *
>>> c = Constellation(['(1,2)', '(1,3)', None])
>>> c
Constellation of length 3 and degree 3
g0 (1,2)(3)
```

(continues on next page)

(continued from previous page)

```
g1 (1,3)(2)
g2 (1,3,2)
>>> C = Constellations(Integer(3), Integer(4)); C
Connected constellations of length 3 and degree 4 on {1, 2, 3, 4}
>>> C.cardinality()
426

>>> C = Constellations(Integer(3), Integer(4), domain=('a', 'b', 'c', 'd'))
>>> C
Connected constellations of length 3 and degree 4 on {'a', 'b', 'c', 'd'}
>>> c = C(('a','c'),('b','c'),('a','d')), None)
>>> c
Constellation of length 3 and degree 4
g0 ('a','c')('b')('d')
g1 ('a','d')('b','c')
g2 ('a','d','c','b')
>>> c.is_connected()
True
>>> c.euler_characteristic()
2
```

sage.combinat.constellation.**Constellation**(*g=None*, *mutable=False*, *connected=True*, *check=True*)

Constellation.

INPUT:

- `g` – list of permutations
- `mutable` – boolean (default: `False`); whether the result is mutable or not
- `connected` – boolean (default: `True`); whether the result should be connected
- `check` – boolean (default: `True`); whether or not to check. If it is `True`, then the list `g` must contain no `None`.

EXAMPLES:

Simple initialization:

```
sage: Constellation(['(0,1)', '(0,3)(1,2)', '(0,3,1,2)'])
Constellation of length 3 and degree 4
g0 (0,1)(2)(3)
g1 (0,3)(1,2)
g2 (0,3,1,2)
```

```
>>> from sage.all import *
>>> Constellation(['(0,1)', '(0,3)(1,2)', '(0,3,1,2)'])
Constellation of length 3 and degree 4
g0 (0,1)(2)(3)
g1 (0,3)(1,2)
g2 (0,3,1,2)
```

One of the permutation can be omitted:

```
sage: Constellation(['(0,1)', None, '(0,4)(1,2,3)'])
Constellation of length 3 and degree 5
g0 (0,1)(2)(3)(4)
g1 (0,3,2,1,4)
g2 (0,4)(1,2,3)
```

```
>>> from sage.all import *
>>> Constellation(['(0,1)', None, '(0,4)(1,2,3)'])
Constellation of length 3 and degree 5
g0 (0,1)(2)(3)(4)
g1 (0,3,2,1,4)
g2 (0,4)(1,2,3)
```

One can define mutable constellations:

```
sage: Constellation(([0,2,1], [2,1,0], [1,2,0]), mutable=True)
Constellation of length 3 and degree 3
g0 (0)(1,2)
g1 (0,2)(1)
g2 (0,1,2)
```

```
>>> from sage.all import *
>>> Constellation(([Integer(0),Integer(2),Integer(1)], [Integer(2),Integer(1),
↪Integer(0)], [Integer(1),Integer(2),Integer(0)]), mutable=True)
Constellation of length 3 and degree 3
g0 (0)(1,2)
g1 (0,2)(1)
g2 (0,1,2)
```

class sage.combinat.constellation.**Constellation_class**(*parent*, *g*, *connected*, *mutable*, *check*)

Bases: Element

Constellation.

A constellation or a tuple of permutations $(g_0, g_1, ..., g_k)$ such that the product $g_0 g_1 ... g_k$ is the identity.

braid_group_action(*i*)

Act on self as the braid group generator that exchanges position i and $i+1$.

INPUT:

- i – integer in $[0, n-1]$ where n is the length of self

EXAMPLES:

```
sage: sigma = lambda c, i: c.braid_group_action(i)

sage: c = Constellation(['(0,1)(2,3,4)','(1,4)',None]); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2)(3)
g2 (0,1,3,2,4)
sage: sigma(c, 1)
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
```

(continues on next page)

(continued from previous page)

```
g1  (0,1,3,2,4)
g2  (0,3)(1)(2)(4)
```

```
>>> from sage.all import *
>>> sigma = lambda c, i: c.braid_group_action(i)

>>> c = Constellation(['(0,1)(2,3,4)','(1,4)',None]); c
Constellation of length 3 and degree 5
g0  (0,1)(2,3,4)
g1  (0)(1,4)(2)(3)
g2  (0,1,3,2,4)
>>> sigma(c, Integer(1))
Constellation of length 3 and degree 5
g0  (0,1)(2,3,4)
g1  (0,1,3,2,4)
g2  (0,3)(1)(2)(4)
```

Check the commutation relation:

```
sage: c = Constellation(['(0,1)(2,3,4)','(1,4)','(2,5)(0,4)',None])
sage: d = Constellation(['(0,1,3,5)','(2,3,4)','(0,3,5)',None])
sage: c13 = sigma(sigma(c, 0), 2)
sage: c31 = sigma(sigma(c, 2), 0)
sage: c13 == c31
True
sage: d13 = sigma(sigma(d, 0), 2)
sage: d31 = sigma(sigma(d, 2), 0)
sage: d13 == d31
True
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)(2,3,4)','(1,4)','(2,5)(0,4)',None])
>>> d = Constellation(['(0,1,3,5)','(2,3,4)','(0,3,5)',None])
>>> c13 = sigma(sigma(c, Integer(0)), Integer(2))
>>> c31 = sigma(sigma(c, Integer(2)), Integer(0))
>>> c13 == c31
True
>>> d13 = sigma(sigma(d, Integer(0)), Integer(2))
>>> d31 = sigma(sigma(d, Integer(2)), Integer(0))
>>> d13 == d31
True
```

Check the braid relation:

```
sage: c121 = sigma(sigma(sigma(c, 1), 2), 1)
sage: c212 = sigma(sigma(sigma(c, 2), 1), 2)
sage: c121 == c212
True
sage: d121 = sigma(sigma(sigma(d, 1), 2), 1)
sage: d212 = sigma(sigma(sigma(d, 2), 1), 2)
sage: d121 == d212
True
```

```
>>> from sage.all import *
>>> c121 = sigma(sigma(sigma(c, Integer(1)), Integer(2)), Integer(1))
>>> c212 = sigma(sigma(sigma(c, Integer(2)), Integer(1)), Integer(2))
>>> c121 == c212
True
>>> d121 = sigma(sigma(sigma(d, Integer(1)), Integer(2)), Integer(1))
>>> d212 = sigma(sigma(sigma(d, Integer(2)), Integer(1)), Integer(2))
>>> d121 == d212
True
```

braid_group_orbit()

Return the graph of the action of the braid group.

The action is considered up to isomorphism of constellation.

EXAMPLES:

```
sage: c = Constellation(['(0,1)(2,3,4)','(1,4)',None]); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2)(3)
g2 (0,1,3,2,4)
sage: G = c.braid_group_orbit()
sage: G.n_vertices()
4
sage: G.n_edges()
12
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)(2,3,4)','(1,4)',None]); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2)(3)
g2 (0,1,3,2,4)
>>> G = c.braid_group_orbit()
>>> G.n_vertices()
4
>>> G.n_edges()
12
```

connected_components()

Return the connected components.

OUTPUT: list of connected constellations

EXAMPLES:

```
sage: c = Constellation(['(0,1)(2)', None, '(0,1)(2)'], connected=False)
sage: cc = c.connected_components(); cc
[Constellation of length 3 and degree 2
g0 (0,1)
g1 (0)(1)
g2 (0,1),
Constellation of length 3 and degree 1
```

(continues on next page)

(continued from previous page)

```
g0 (0)
g1 (0)
g2 (0)]
sage: all(c2.is_connected() for c2 in cc)
True

sage: c = Constellation(['(0,1,2)', None], connected=False)
sage: c.connected_components()
[Constellation of length 2 and degree 3
g0 (0,1,2)
g1 (0,2,1)]
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)(2)', None, '(0,1)(2)'], connected=False)
>>> cc = c.connected_components(); cc
[Constellation of length 3 and degree 2
g0 (0,1)
g1 (0)(1)
g2 (0,1),
Constellation of length 3 and degree 1
g0 (0)
g1 (0)
g2 (0)]
>>> all(c2.is_connected() for c2 in cc)
True

>>> c = Constellation(['(0,1,2)', None], connected=False)
>>> c.connected_components()
[Constellation of length 2 and degree 3
g0 (0,1,2)
g1 (0,2,1)]
```

copy()

Return a copy of `self`.

degree()

Return the degree of the constellation.

The degree of a constellation is the number n that corresponds to the symmetric group $S(n)$ in which the permutations of the constellation are defined.

EXAMPLES:

```
sage: c = Constellation([None], connected=False)
sage: c.degree()
0
sage: c = Constellation(['(0,1)', None])
sage: c.degree()
2
sage: c = Constellation(['(0,1)', '(0,3,2)(1,5)', None, '(4,3,2,1)'])
sage: c.degree()
6
```

```
>>> from sage.all import *
>>> c = Constellation([None], connected=False)
>>> c.degree()
0
>>> c = Constellation(['(0,1)', None])
>>> c.degree()
2
>>> c = Constellation(['(0,1)', '(0,3,2)(1,5)', None, '(4,3,2,1)'])
>>> c.degree()
6
```

euler_characteristic()

Return the Euler characteristic of the surface.

ALGORITHM:

Hurwitz formula

EXAMPLES:

```
sage: c = Constellation(['(0,1)', '(0,2)', None])
sage: c.euler_characteristic()
2

sage: c = Constellation(['(0,1,2,3)','(1,3,0,2)', '(0,3,1,2)', None])
sage: c.euler_characteristic()
-4
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)', '(0,2)', None])
>>> c.euler_characteristic()
2

>>> c = Constellation(['(0,1,2,3)','(1,3,0,2)', '(0,3,1,2)', None])
>>> c.euler_characteristic()
-4
```

g(*i=None*)

Return the permutation g_i of the constellation.

INPUT:

- `i` – integer or `None` (default)

If `None` , return instead the list of all g_i.

EXAMPLES:

```
sage: c = Constellation(['(0,1,2)(3,4)','(0,3)',None])
sage: c.g(0)
(0,1,2)(3,4)
sage: c.g(1)
(0,3)
sage: c.g(2)
(0,4,3,2,1)
```

(continues on next page)

(continued from previous page)

```
sage: c.g()
[(0,1,2)(3,4), (0,3), (0,4,3,2,1)]
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1,2)(3,4)','(0,3)',None])
>>> c.g(Integer(0))
(0,1,2)(3,4)
>>> c.g(Integer(1))
(0,3)
>>> c.g(Integer(2))
(0,4,3,2,1)
>>> c.g()
[(0,1,2)(3,4), (0,3), (0,4,3,2,1)]
```

genus()

Return the genus of the surface.

EXAMPLES:

```
sage: c = Constellation(['(0,1)', '(0,2)', None])
sage: c.genus()
0

sage: c = Constellation(['(0,1)(2,3,4)','(1,3,4)(2,0)', None])
sage: c.genus()
1
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)', '(0,2)', None])
>>> c.genus()
0

>>> c = Constellation(['(0,1)(2,3,4)','(1,3,4)(2,0)', None])
>>> c.genus()
1
```

is_connected()

Test of connectedness.

EXAMPLES:

```
sage: c = Constellation(['(0,1)(2)', None, '(0,1)(2)'], connected=False)
sage: c.is_connected()
False
sage: c = Constellation(['(0,1,2)', None], connected=False)
sage: c.is_connected()
True
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)(2)', None, '(0,1)(2)'], connected=False)
>>> c.is_connected()
False
```

(continues on next page)

(continued from previous page)

```
>>> c = Constellation(['(0,1,2)', None], connected=False)
>>> c.is_connected()
True
```

is_isomorphic(*other*, *return_map=False*)

Test of isomorphism.

Return `True` if the constellations are isomorphic (*i.e.* related by a common conjugacy) and return the permutation that conjugate the two permutations if `return_map` is `True` in such a way that `self.relabel(m) == other`.

ALGORITHM:

uses canonical labels obtained from the method *relabel()*.

EXAMPLES:

```
sage: c = Constellation([[1,0,2],[2,1,0],[0,2,1],None])
sage: d = Constellation([[2,1,0],[0,2,1],[1,0,2],None])
sage: answer, mapping = c.is_isomorphic(d,return_map=True)
sage: answer
True
sage: c.relabel(mapping) == d
True
```

```
>>> from sage.all import *
>>> c = Constellation([[Integer(1),Integer(0),Integer(2)],[Integer(2),
↪Integer(1),Integer(0)],[Integer(0),Integer(2),Integer(1)],None])
>>> d = Constellation([[Integer(2),Integer(1),Integer(0)],[Integer(0),
↪Integer(2),Integer(1)],[Integer(1),Integer(0),Integer(2)],None])
>>> answer, mapping = c.is_isomorphic(d,return_map=True)
>>> answer
True
>>> c.relabel(mapping) == d
True
```

is_mutable()

Return `False` as `self` is immutable.

EXAMPLES:

```
sage: c = Constellation(([0,2,1],[2,1,0],[1,2,0]), mutable=False)
sage: c.is_mutable()
False
```

```
>>> from sage.all import *
>>> c = Constellation(([Integer(0),Integer(2),Integer(1)],[Integer(2),
↪Integer(1),Integer(0)],[Integer(1),Integer(2),Integer(0)]), mutable=False)
>>> c.is_mutable()
False
```

length()

Return the number of permutations.

EXAMPLES:

```
sage: c = Constellation(['(0,1)','(0,2)','(0,3)',None])
sage: c.length()
4
sage: c = Constellation(['(0,1,3)',None,'(1,2)'])
sage: c.length()
3
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)','(0,2)','(0,3)',None])
>>> c.length()
4
>>> c = Constellation(['(0,1,3)',None,'(1,2)'])
>>> c.length()
3
```

mutable_copy()

Return a mutable copy of `self`.

EXAMPLES:

```
sage: c = Constellation(([0,2,1],[2,1,0],[1,2,0]), mutable=False)
sage: d = c.mutable_copy()
sage: d.is_mutable()
True
```

```
>>> from sage.all import *
>>> c = Constellation(([Integer(0),Integer(2),Integer(1)],[Integer(2),
↪Integer(1),Integer(0)],[Integer(1),Integer(2),Integer(0)]), mutable=False)
>>> d = c.mutable_copy()
>>> d.is_mutable()
True
```

passport(*i=None*)

alias of *profile()*.

profile(*i=None*)

Return the profile of `self`.

The profile of a constellation is the tuple of partitions associated to the conjugacy classes of the permutations of the constellation.

This is also called the passport.

EXAMPLES:

```
sage: c = Constellation(['(0,1,2)(3,4)','(0,3)',None])
sage: c.profile()
([3, 2], [2, 1, 1, 1], [5])
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1,2)(3,4)','(0,3)',None])
>>> c.profile()
([3, 2], [2, 1, 1, 1], [5])
```

relabel(*perm=None*, *return_map=False*)

Relabel `self`.

If `perm` is provided then relabel with respect to `perm`. Otherwise use canonical labels. In that case, if `return_map` is provided, the return also the map used for canonical labels.

Algorithm:

the cycle for g(0) are adjacent and the cycle are joined with respect to the other permutations. The minimum is taken for all possible renumerotations.

EXAMPLES:

```
sage: S = SymmetricGroup(3)
sage: c = Constellation([S((1,3,2)), S((1,2,3)), None])
sage: c.relabel(S((2,3)))
Constellation of length 3 and degree 3
g0 (1,2,3)
g1 (1,3,2)
g2 (1)(2)(3)

sage: c = Constellation(['(0,1)(2,3,4)','(1,4)',None]); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2)(3)
g2 (0,1,3,2,4)
sage: c2 = c.relabel(); c2
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,2)(3)(4)
g2 (0,1,4,3,2)
```

```
>>> from sage.all import *
>>> S = SymmetricGroup(Integer(3))
>>> c = Constellation([S((Integer(1),Integer(3),Integer(2))), S((Integer(1),
↪Integer(2),Integer(3))), None])
>>> c.relabel(S((Integer(2),Integer(3))))
Constellation of length 3 and degree 3
g0 (1,2,3)
g1 (1,3,2)
g2 (1)(2)(3)

>>> c = Constellation(['(0,1)(2,3,4)','(1,4)',None]); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2)(3)
g2 (0,1,3,2,4)
>>> c2 = c.relabel(); c2
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,2)(3)(4)
g2 (0,1,4,3,2)
```

The map returned when the option `return_map` is set to `True` can be used to set the relabelling:

```
sage: c3, perm = c.relabel(return_map=True)
sage: c3 == c2 and c3 == c.relabel(perm=perm)
True

sage: S5 = SymmetricGroup(range(5))
sage: d = c.relabel(S5([4,3,1,0,2])); d
Constellation of length 3 and degree 5
g0 (0,2,1)(3,4)
g1 (0)(1)(2,3)(4)
g2 (0,1,2,4,3)
sage: d.is_isomorphic(c)
True
```

```
>>> from sage.all import *
>>> c3, perm = c.relabel(return_map=True)
>>> c3 == c2 and c3 == c.relabel(perm=perm)
True

>>> S5 = SymmetricGroup(range(Integer(5)))
>>> d = c.relabel(S5([Integer(4),Integer(3),Integer(1),Integer(0),
↪Integer(2)])); d
Constellation of length 3 and degree 5
g0 (0,2,1)(3,4)
g1 (0)(1)(2,3)(4)
g2 (0,1,2,4,3)
>>> d.is_isomorphic(c)
True
```

We check that after a random relabelling the new constellation is isomorphic to the initial one:

```
sage: c = Constellation(['(0,1)(2,3,4)','(1,4)',None])
sage: p = S5.random_element()
sage: cc = c.relabel(perm=p)
sage: cc.is_isomorphic(c)
True
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)(2,3,4)','(1,4)',None])
>>> p = S5.random_element()
>>> cc = c.relabel(perm=p)
>>> cc.is_isomorphic(c)
True
```

Check that it works for “non standard” labels:

```
sage: c = Constellation([(('a','b'),('c','d','e')),('b','d'), None])
sage: c.relabel()
Constellation of length 3 and degree 5
g0 ('a','b')('c','d','e')
g1 ('a')('b','c')('d')('e')
g2 ('a','b','e','d','c')
```

```
>>> from sage.all import *
>>> c = Constellation([(('a','b'),('c','d','e')),('b','d'), None])
>>> c.relabel()
Constellation of length 3 and degree 5
g0 ('a','b')('c','d','e')
g1 ('a')('b','c')('d')('e')
g2 ('a','b','e','d','c')
```

set_immutable()

Do nothing, as `self` is already immutable.

EXAMPLES:

```
sage: c = Constellation(([0,2,1],[2,1,0],[1,2,0]), mutable=False)
sage: c.set_immutable()
sage: c.is_mutable()
False
```

```
>>> from sage.all import *
>>> c = Constellation(([Integer(0),Integer(2),Integer(1)],[Integer(2),
↪Integer(1),Integer(0)],[Integer(1),Integer(2),Integer(0)]), mutable=False)
>>> c.set_immutable()
>>> c.is_mutable()
False
```

switch(*i*, *j0*, *j1*)

Perform the multiplication by the transposition $(j0, j1)$ between the permutations g_i and g_{i+1}.

The modification is local in the sense that it modifies g_i and g_{i+1} but does not modify the product $g_i g_{i+1}$. The new constellation is

$$(g_0, \ldots, g_{i-1}, g_i(j0j1), (j0j1)g_{i+1}, g_{i+2}, \ldots, g_k)$$

EXAMPLES:

```
sage: c = Constellation(['(0,1)(2,3,4)','(1,4)',None], mutable=True); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2)(3)
g2 (0,1,3,2,4)
sage: c.is_mutable()
True
sage: c.switch(1,2,3); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2,3)
g2 (0,1,3,4)(2)
sage: c._check()
sage: c.switch(2,1,3); c
Constellation of length 3 and degree 5
g0 (0,1,4,2,3)
g1 (0)(1,4)(2,3)
g2 (0,3,4)(1)(2)
sage: c._check()
```

(continues on next page)

(continued from previous page)

```
sage: c.switch(0,0,1); c
Constellation of length 3 and degree 5
g0 (0)(1,4,2,3)
g1 (0,4,1)(2,3)
g2 (0,3,4)(1)(2)
sage: c._check()
```

```
>>> from sage.all import *
>>> c = Constellation(['(0,1)(2,3,4)','(1,4)',None], mutable=True); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2)(3)
g2 (0,1,3,2,4)
>>> c.is_mutable()
True
>>> c.switch(Integer(1),Integer(2),Integer(3)); c
Constellation of length 3 and degree 5
g0 (0,1)(2,3,4)
g1 (0)(1,4)(2,3)
g2 (0,1,3,4)(2)
>>> c._check()
>>> c.switch(Integer(2),Integer(1),Integer(3)); c
Constellation of length 3 and degree 5
g0 (0,1,4,2,3)
g1 (0)(1,4)(2,3)
g2 (0,3,4)(1)(2)
>>> c._check()
>>> c.switch(Integer(0),Integer(0),Integer(1)); c
Constellation of length 3 and degree 5
g0 (0)(1,4,2,3)
g1 (0,4,1)(2,3)
g2 (0,3,4)(1)(2)
>>> c._check()
```

sage.combinat.constellation.**Constellations**(**data*, ***options*)

Build a set of constellations.

INPUT:

- `profile` – an optional profile
- `length` – an optional length
- `degree` – an optional degree
- `connected` – an optional boolean

EXAMPLES:

```
sage: Constellations(4, 2)
Connected constellations of length 4 and degree 2 on {1, 2}

sage: Constellations([[3,2,1], [3,3], [3,3]])
Connected constellations with profile ([3, 2, 1], [3, 3], [3, 3]) on {1, 2, 3, 4,␣
↪5, 6}
```

```
>>> from sage.all import *
>>> Constellations(Integer(4), Integer(2))
Connected constellations of length 4 and degree 2 on {1, 2}

>>> Constellations([[Integer(3),Integer(2),Integer(1)], [Integer(3),Integer(3)],␣
↪[Integer(3),Integer(3)]])
Connected constellations with profile ([3, 2, 1], [3, 3], [3, 3]) on {1, 2, 3, 4,␣
↪5, 6}
```

class sage.combinat.constellation.**Constellations_ld**(*length*, *degree*, *sym=None*, *connected=True*)

Bases: UniqueRepresentation, Parent

Constellations of given length and degree.

EXAMPLES:

```
sage: C = Constellations(2,3); C
Connected constellations of length 2 and degree 3 on {1, 2, 3}
sage: C([[2,3,1],[3,1,2]])
Constellation of length 2 and degree 3
g0 (1,2,3)
g1 (1,3,2)
sage: C.cardinality()
2
sage: Constellations(2,3,connected=False).cardinality()
6
```

```
>>> from sage.all import *
>>> C = Constellations(Integer(2),Integer(3)); C
Connected constellations of length 2 and degree 3 on {1, 2, 3}
>>> C([[Integer(2),Integer(3),Integer(1)],[Integer(3),Integer(1),Integer(2)]])
Constellation of length 2 and degree 3
g0 (1,2,3)
g1 (1,3,2)
>>> C.cardinality()
2
>>> Constellations(Integer(2),Integer(3),connected=False).cardinality()
6
```

Element

alias of *Constellation_class*

braid_group_action()

Return a list of graphs that corresponds to the braid group action on `self` up to isomorphism.

OUTPUT: list of graphs

EXAMPLES:

```
sage: C = Constellations(3,3)
sage: C.braid_group_action()
[Looped multi-digraph on 3 vertices,
 Looped multi-digraph on 1 vertex,
 Looped multi-digraph on 3 vertices]
```

```
>>> from sage.all import *
>>> C = Constellations(Integer(3),Integer(3))
>>> C.braid_group_action()
[Looped multi-digraph on 3 vertices,
 Looped multi-digraph on 1 vertex,
 Looped multi-digraph on 3 vertices]
```

braid_group_orbits()

Return the orbits under the action of braid group.

EXAMPLES:

```
sage: C = Constellations(3,3)
sage: O = C.braid_group_orbits()
sage: len(O)
3
sage: [x.profile() for x in O[0]]
[([1, 1, 1], [3], [3]), ([3], [1, 1, 1], [3]), ([3], [3], [1, 1, 1])]
sage: [x.profile() for x in O[1]]
[([3], [3], [3])]
sage: [x.profile() for x in O[2]]
[([2, 1], [2, 1], [3]), ([2, 1], [3], [2, 1]), ([3], [2, 1], [2, 1])]
```

```
>>> from sage.all import *
>>> C = Constellations(Integer(3),Integer(3))
>>> O = C.braid_group_orbits()
>>> len(O)
3
>>> [x.profile() for x in O[Integer(0)]]
[([1, 1, 1], [3], [3]), ([3], [1, 1, 1], [3]), ([3], [3], [1, 1, 1])]
>>> [x.profile() for x in O[Integer(1)]]
[([3], [3], [3])]
>>> [x.profile() for x in O[Integer(2)]]
[([2, 1], [2, 1], [3]), ([2, 1], [3], [2, 1]), ([3], [2, 1], [2, 1])]
```

cardinality()

Return the cardinality of `self`.

EXAMPLES:

One can check the first few terms of sequence OEIS sequence A220754:

```
sage: [Constellations(4, d).cardinality() for d in range(1, 6)]
[1, 7, 194, 12858, 1647384]

sage: [Constellations(3, d, connected=False).cardinality() for d in range(1,␣
↪6)]
[1, 4, 36, 576, 14400]
```

```
>>> from sage.all import *
>>> [Constellations(Integer(4), d).cardinality() for d in range(Integer(1),␣
↪Integer(6))]
[1, 7, 194, 12858, 1647384]
```

(continues on next page)

(continued from previous page)

```
>>> [Constellations(Integer(3), d, connected=False).cardinality() for d in␣
↪range(Integer(1), Integer(6))]
[1, 4, 36, 576, 14400]
```

is_empty()

Return whether this set of constellations is empty.

EXAMPLES:

```
sage: Constellations(2, 3).is_empty()
False
sage: Constellations(1, 2).is_empty()
True
sage: Constellations(1, 2, connected=False).is_empty()
False
sage: Constellations(1, 0).is_empty()
True
sage: Constellations(2, 1).is_empty()
False
```

```
>>> from sage.all import *
>>> Constellations(Integer(2), Integer(3)).is_empty()
False
>>> Constellations(Integer(1), Integer(2)).is_empty()
True
>>> Constellations(Integer(1), Integer(2), connected=False).is_empty()
False
>>> Constellations(Integer(1), Integer(0)).is_empty()
True
>>> Constellations(Integer(2), Integer(1)).is_empty()
False
```

random_element(*mutable=False*)

Return a random element.

This is found by trial and rejection, starting from a random list of permutations.

EXAMPLES:

```
sage: const = Constellations(3, 3)
sage: const.random_element()
Constellation of length 3 and degree 3
...
...
...
sage: c = const.random_element()
sage: c.degree() == 3 and c.length() == 3
True
```

```
>>> from sage.all import *
>>> const = Constellations(Integer(3), Integer(3))
>>> const.random_element()
Constellation of length 3 and degree 3
```

(continues on next page)

(continued from previous page)

```
...
...
...
>>> c = const.random_element()
>>> c.degree() == Integer(3) and c.length() == Integer(3)
True
```

class sage.combinat.constellation.**Constellations_p**(*profile*, *domain=None*, *connected=True*)

Bases: UniqueRepresentation, Parent

Constellations with fixed profile.

EXAMPLES:

```
sage: C = Constellations([[3,1],[3,1],[2,2]]); C
Connected constellations with profile ([3, 1], [3, 1], [2, 2]) on {1, 2, 3, 4}
sage: C.cardinality()
24
sage: C.first()
Constellation of length 3 and degree 4
g0 (1)(2,3,4)
g1 (1,2,3)(4)
g2 (1,2)(3,4)
sage: C.last()
Constellation of length 3 and degree 4
g0 (1,4,3)(2)
g1 (1,4,2)(3)
g2 (1,2)(3,4)
```

```
>>> from sage.all import *
>>> C = Constellations([[Integer(3),Integer(1)],[Integer(3),Integer(1)],
↪[Integer(2),Integer(2)]]); C
Connected constellations with profile ([3, 1], [3, 1], [2, 2]) on {1, 2, 3, 4}
>>> C.cardinality()
24
>>> C.first()
Constellation of length 3 and degree 4
g0 (1)(2,3,4)
g1 (1,2,3)(4)
g2 (1,2)(3,4)
>>> C.last()
Constellation of length 3 and degree 4
g0 (1,4,3)(2)
g1 (1,4,2)(3)
g2 (1,2)(3,4)
```

Note that the cardinality can also be computed using characters of the symmetric group (Frobenius formula):

```
sage: P = Partitions(4)
sage: p1 = Partition([3,1])
sage: p2 = Partition([3,1])
sage: p3 = Partition([2,2])
sage: i1 = P.cardinality() - P.rank(p1) - 1
```

(continues on next page)

(continued from previous page)

```
sage: i2 = P.cardinality() - P.rank(p2) - 1
sage: i3 = P.cardinality() - P.rank(p3) - 1
sage: s = 0
sage: for c in SymmetricGroup(4).irreducible_characters():
....:     v = c.values()
....:     s += v[i1] * v[i2] * v[i3] / v[0]
sage: c1 = p1.conjugacy_class_size()
sage: c2 = p2.conjugacy_class_size()
sage: c3 = p3.conjugacy_class_size()
sage: c1 * c2 * c3 / factorial(4)**2 * s
1
```

```
>>> from sage.all import *
>>> P = Partitions(Integer(4))
>>> p1 = Partition([Integer(3),Integer(1)])
>>> p2 = Partition([Integer(3),Integer(1)])
>>> p3 = Partition([Integer(2),Integer(2)])
>>> i1 = P.cardinality() - P.rank(p1) - Integer(1)
>>> i2 = P.cardinality() - P.rank(p2) - Integer(1)
>>> i3 = P.cardinality() - P.rank(p3) - Integer(1)
>>> s = Integer(0)
>>> for c in SymmetricGroup(Integer(4)).irreducible_characters():
...     v = c.values()
...     s += v[i1] * v[i2] * v[i3] / v[Integer(0)]
>>> c1 = p1.conjugacy_class_size()
>>> c2 = p2.conjugacy_class_size()
>>> c3 = p3.conjugacy_class_size()
>>> c1 * c2 * c3 / factorial(Integer(4))**Integer(2) * s
1
```

The number obtained above is up to isomorphism. And we can check:

```
sage: len(C.isomorphism_representatives())
1
```

```
>>> from sage.all import *
>>> len(C.isomorphism_representatives())
1
```

isomorphism_representatives()

Return a set of isomorphism representative of `self`.

EXAMPLES:

```
sage: C = Constellations([[5], [4,1], [3,2]])
sage: C.cardinality()
240
sage: ir = sorted(C.isomorphism_representatives())
sage: len(ir)
2
sage: ir[0]
Constellation of length 3 and degree 5
```

(continues on next page)

(continued from previous page)

```
g0 (1,2,3,4,5)
g1 (1)(2,3,4,5)
g2 (1,5,3)(2,4)
sage: ir[1]
Constellation of length 3 and degree 5
g0 (1,2,3,4,5)
g1 (1)(2,5,3,4)
g2 (1,5)(2,3,4)
```

```
>>> from sage.all import *
>>> C = Constellations([[Integer(5)], [Integer(4),Integer(1)], [Integer(3),
↪Integer(2)]])
>>> C.cardinality()
240
>>> ir = sorted(C.isomorphism_representatives())
>>> len(ir)
2
>>> ir[Integer(0)]
Constellation of length 3 and degree 5
g0 (1,2,3,4,5)
g1 (1)(2,3,4,5)
g2 (1,5,3)(2,4)
>>> ir[Integer(1)]
Constellation of length 3 and degree 5
g0 (1,2,3,4,5)
g1 (1)(2,5,3,4)
g2 (1,5)(2,3,4)
```

sage.combinat.constellation.**perm_conjugate**(p, s)

Return the conjugate of the permutation p by the permutation s.

INPUT:

- p, s – two permutations of {0,..,n-1} given by lists of values

OUTPUT: a permutation of {0,..,n-1} given by a list of values

EXAMPLES:

```
sage: from sage.combinat.constellation import perm_conjugate
sage: perm_conjugate([3,1,2,0], [3,2,0,1])
[0, 3, 2, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.constellation import perm_conjugate
>>> perm_conjugate([Integer(3),Integer(1),Integer(2),Integer(0)], [Integer(3),
↪Integer(2),Integer(0),Integer(1)])
[0, 3, 2, 1]
```

sage.combinat.constellation.**perm_invert**(p)

Return the inverse of the permutation p.

INPUT:

- p – a permutation of {0,..,n-1} given by a list of values

OUTPUT: a permutation of {0,..,n-1} given by a list of values

EXAMPLES:

```
sage: from sage.combinat.constellation import perm_invert
sage: perm_invert([3,2,0,1])
[2, 3, 1, 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.constellation import perm_invert
>>> perm_invert([Integer(3),Integer(2),Integer(0),Integer(1)])
[2, 3, 1, 0]
```

sage.combinat.constellation.**perm_sym_domain**(*g*)

Return the domain of a single permutation (before initialization).

EXAMPLES:

```
sage: from sage.combinat.constellation import perm_sym_domain
sage: perm_sym_domain([1,2,3,4])
{1, 2, 3, 4}
sage: perm_sym_domain(((1,2),(0,4)))
{0, 1, 2, 4}
sage: sorted(perm_sym_domain('(1,2,0,5)'))
[0, 1, 2, 5]
```

```
>>> from sage.all import *
>>> from sage.combinat.constellation import perm_sym_domain
>>> perm_sym_domain([Integer(1),Integer(2),Integer(3),Integer(4)])
{1, 2, 3, 4}
>>> perm_sym_domain(((Integer(1),Integer(2)),(Integer(0),Integer(4))))
{0, 1, 2, 4}
>>> sorted(perm_sym_domain('(1,2,0,5)'))
[0, 1, 2, 5]
```

sage.combinat.constellation.**perms_are_connected**(*g*)

Check that the action of the generated group is transitive.

INPUT:

- `g` – non-empty list of permutations (in a `SymmetricGroup`)

EXAMPLES:

```
sage: from sage.combinat.constellation import perms_are_connected
sage: S = SymmetricGroup(range(3))
sage: perms_are_connected([S([0,1,2]), S([0,2,1])])
False
sage: perms_are_connected([S([0,1,2]), S([1,2,0])])
True
```

```
>>> from sage.all import *
>>> from sage.combinat.constellation import perms_are_connected
>>> S = SymmetricGroup(range(Integer(3)))
>>> perms_are_connected([S([Integer(0),Integer(1),Integer(2)]), S([Integer(0),
```

(continues on next page)

(continued from previous page)

```
↪Integer(2),Integer(1)])])
False
>>> perms_are_connected([S([Integer(0),Integer(1),Integer(2)]), S([Integer(1),
↪Integer(2),Integer(0)])])
True
```

Constellations of degree 0 are not connected:

```
sage: S = SymmetricGroup(0)
sage: perms_are_connected([S([]), S([])])
False
```

```
>>> from sage.all import *
>>> S = SymmetricGroup(Integer(0))
>>> perms_are_connected([S([]), S([])])
False
```

Warning

The list `g` need not necessarily be a constellation.

sage.combinat.constellation.**perms_canonical_labels**(*p*, *e=None*)

Relabel a list with a common conjugation such that two conjugated lists are relabeled the same way.

INPUT:

- `p` – list of at least 2 permutations
- `e` – `None` or a list of integer in the domain of the permutations. If provided, then the renumbering algorithm is only performed from the elements of `e`.

OUTPUT: a pair made of a list of permutations (as a list of lists) and a list that corresponds to the conjugacy used.

EXAMPLES:

```
sage: from sage.combinat.constellation import perms_canonical_labels
sage: l0 = [[2,0,3,1], [3,1,2,0], [0,2,1,3]]
sage: l, m = perms_canonical_labels(l0); l
[[1, 2, 3, 0], [0, 3, 2, 1], [2, 1, 0, 3]]

sage: S = SymmetricGroup(range(4))
sage: [~S(m) * S(u) * S(m) for u in l0] == list(map(S, l))
True

sage: perms_canonical_labels([])
Traceback (most recent call last):
...
ValueError: input must have length >= 2
```

```
>>> from sage.all import *
>>> from sage.combinat.constellation import perms_canonical_labels
>>> l0 = [[Integer(2),Integer(0),Integer(3),Integer(1)], [Integer(3),Integer(1),
```

(continues on next page)

(continued from previous page)

```
↪Integer(2),Integer(0)], [Integer(0),Integer(2),Integer(1),Integer(3)]]
>>> l, m = perms_canonical_labels(l0); l
[[1, 2, 3, 0], [0, 3, 2, 1], [2, 1, 0, 3]]

>>> S = SymmetricGroup(range(Integer(4)))
>>> [~S(m) * S(u) * S(m) for u in l0] == list(map(S, l))
True

>>> perms_canonical_labels([])
Traceback (most recent call last):
...
ValueError: input must have length >= 2
```

sage.combinat.constellation.**perms_canonical_labels_from**(*x*, *y*, *j0*, *verbose=False*)

Return canonical labels for `x`, `y` that starts at `j0`.

Warning

The group generated by `x` and the elements of `y` should be transitive.

INPUT:

- `x` – list; a permutation of $[0, ..., n]$ as a list
- `y` – list of permutations of $[0, ..., n]$ as a list of lists
- `j0` – an index in [0, …, n]

OUTPUT: mapping: a permutation that specify the new labels

EXAMPLES:

```
sage: from sage.combinat.constellation import perms_canonical_labels_from
sage: perms_canonical_labels_from([0,1,2],[[1,2,0]], 0)
[0, 1, 2]
sage: perms_canonical_labels_from([1,0,2], [[2,0,1]], 0)
[0, 1, 2]
sage: perms_canonical_labels_from([1,0,2], [[2,0,1]], 1)
[1, 0, 2]
sage: perms_canonical_labels_from([1,0,2], [[2,0,1]], 2)
[2, 1, 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.constellation import perms_canonical_labels_from
>>> perms_canonical_labels_from([Integer(0),Integer(1),Integer(2)],[[Integer(1),
↪Integer(2),Integer(0)]], Integer(0))
[0, 1, 2]
>>> perms_canonical_labels_from([Integer(1),Integer(0),Integer(2)], [[Integer(2),
↪Integer(0),Integer(1)]], Integer(0))
[0, 1, 2]
>>> perms_canonical_labels_from([Integer(1),Integer(0),Integer(2)], [[Integer(2),
↪Integer(0),Integer(1)]], Integer(1))
[1, 0, 2]
```

(continues on next page)

(continued from previous page)

```
>>> perms_canonical_labels_from([Integer(1),Integer(0),Integer(2)], [[Integer(2),
↪Integer(0),Integer(1)]], Integer(2))
[2, 1, 0]
```

sage.combinat.constellation.**perms_sym_init**(*g*, *sym=None*)

Initialize a list of permutations (in the same symmetric group).

OUTPUT:

- `sym` – a symmetric group
- `gg` – list of permutations

EXAMPLES:

```
sage: from sage.combinat.constellation import perms_sym_init
sage: S, g = perms_sym_init([[0,2,1,3], [1,3,2,0]])
sage: S.domain()
{0, 1, 2, 3}
sage: g
[(1,2), (0,1,3)]

sage: S, g = perms_sym_init(['(2,1)', '(0,3)'])
sage: S.domain()
{0, 1, 2, 3}
sage: g
[(1,2), (0,3)]

sage: S, g = perms_sym_init([(1,0), (2,1)])
sage: S.domain()
{0, 1, 2}
sage: g
[(0,1), (1,2)]

sage: S, g = perms_sym_init([((1,0),(2,3)), '(0,1,4)'])
sage: S.domain()
{0, 1, 2, 3, 4}
sage: g
[(0,1)(2,3), (0,1,4)]
```

```
>>> from sage.all import *
>>> from sage.combinat.constellation import perms_sym_init
>>> S, g = perms_sym_init([[Integer(0),Integer(2),Integer(1),Integer(3)],␣
↪[Integer(1),Integer(3),Integer(2),Integer(0)]])
>>> S.domain()
{0, 1, 2, 3}
>>> g
[(1,2), (0,1,3)]

>>> S, g = perms_sym_init(['(2,1)', '(0,3)'])
>>> S.domain()
{0, 1, 2, 3}
>>> g
[(1,2), (0,3)]
```

(continues on next page)

(continued from previous page)

```
>>> S, g = perms_sym_init([(Integer(1),Integer(0)), (Integer(2),Integer(1))])
>>> S.domain()
{0, 1, 2}
>>> g
[(0,1), (1,2)]

>>> S, g = perms_sym_init([((Integer(1),Integer(0)),(Integer(2),Integer(3))), '(0,
↪1,4)'])
>>> S.domain()
{0, 1, 2, 3, 4}
>>> g
[(0,1)(2,3), (0,1,4)]
```

Cores

A k-core is a partition from which no rim hook of size k can be removed. Alternatively, a k-core is an integer partition such that the Ferrers diagram for the partition contains no cells with a hook of size (a multiple of) k.

Authors:

- Anne Schilling and Mike Zabrocki (2011): initial version
- Travis Scrimshaw (2012): Added latex output for Core class

class sage.combinat.core.**Core**(*parent*, *core*)

Bases: *CombinatorialElement*

A k-core is an integer partition from which no rim hook of size k can be removed.

EXAMPLES:

```
sage: c = Core([2,1],4); c
[2, 1]
sage: c = Core([3,1],4); c
Traceback (most recent call last):
...
ValueError: [3, 1] is not a 4-core
```

```
>>> from sage.all import *
>>> c = Core([Integer(2),Integer(1)],Integer(4)); c
[2, 1]
>>> c = Core([Integer(3),Integer(1)],Integer(4)); c
Traceback (most recent call last):
...
ValueError: [3, 1] is not a 4-core
```

affine_symmetric_group_action(*w*, *transposition=False*)

Return the (left) action of the affine symmetric group on `self`.

INPUT:

- `w` – tuple of integers $[w_1, \ldots, w_m]$ with $0 \leq w_j < k$. If transposition is set to be `True`, then $w = [w_0, w_1]$ is interpreted as a transposition t_{w_0,w_1} (see `_transposition_to_reduced_word`).
- `transposition` – boolean (default: `False`)

The output is the (left) action of the product of the corresponding simple transpositions on `self`, that is $s_{w_1} \cdots s_{w_m}(self)$. See *affine_symmetric_group_simple_action()*.

EXAMPLES:

```
sage: c = Core([4,2],3)
sage: c.affine_symmetric_group_action([0,1,0,2,1])
[8, 6, 4, 2]
sage: c.affine_symmetric_group_action([0,2], transposition=True)
[4, 2, 1, 1]

sage: c = Core([11,8,5,5,3,3,1,1,1],4)
sage: c.affine_symmetric_group_action([2,5],transposition=True)
[11, 8, 7, 6, 5, 4, 3, 2, 1]
```

```
>>> from sage.all import *
>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> c.affine_symmetric_group_action([Integer(0),Integer(1),Integer(0),
...Integer(2),Integer(1)])
[8, 6, 4, 2]
>>> c.affine_symmetric_group_action([Integer(0),Integer(2)],␣
...transposition=True)
[4, 2, 1, 1]

>>> c = Core([Integer(11),Integer(8),Integer(5),Integer(5),Integer(3),
...Integer(3),Integer(1),Integer(1),Integer(1)],Integer(4))
>>> c.affine_symmetric_group_action([Integer(2),Integer(5)],
...transposition=True)
[11, 8, 7, 6, 5, 4, 3, 2, 1]
```

affine_symmetric_group_simple_action(i)

Return the action of the simple transposition s_i of the affine symmetric group on `self`.

This gives the action of the affine symmetric group of type $A_k^{(1)}$ on the k-core `self`. If `self` has outside (resp. inside) corners of content i modulo k, then these corners are added (resp. removed). Otherwise the action is trivial.

EXAMPLES:

```
sage: c = Core([4,2],3)
sage: c.affine_symmetric_group_simple_action(0)                                 #␣
...needs sage.modules
[3, 1]
sage: c.affine_symmetric_group_simple_action(1)                                 #␣
...needs sage.modules
[5, 3, 1]
sage: c.affine_symmetric_group_simple_action(2)                                 #␣
...needs sage.modules
[4, 2]
```

```
>>> from sage.all import *
>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> c.affine_symmetric_group_simple_action(Integer(0))                          ␣
...     # needs sage.modules
```

(continues on next page)

(continued from previous page)

```
[3, 1]
>>> c.affine_symmetric_group_simple_action(Integer(1))
↪     # needs sage.modules
[5, 3, 1]
>>> c.affine_symmetric_group_simple_action(Integer(2))
↪     # needs sage.modules
[4, 2]
```

This action corresponds to the left action by the i-th simple reflection in the affine symmetric group:

```
sage: c = Core([4,2],3)
sage: W = c.to_grassmannian().parent()
↪needs sage.modules
sage: i = 0
sage: (c.affine_symmetric_group_simple_action(i).to_grassmannian()
↪needs sage.modules
....:     == W.simple_reflection(i)*c.to_grassmannian())
True
sage: i = 1
sage: (c.affine_symmetric_group_simple_action(i).to_grassmannian()
↪needs sage.modules
....:     == W.simple_reflection(i)*c.to_grassmannian())
True
```

```
>>> from sage.all import *
>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> W = c.to_grassmannian().parent()
↪needs sage.modules
>>> i = Integer(0)
>>> (c.affine_symmetric_group_simple_action(i).to_grassmannian()
↪needs sage.modules
...     == W.simple_reflection(i)*c.to_grassmannian())
True
>>> i = Integer(1)
>>> (c.affine_symmetric_group_simple_action(i).to_grassmannian()
↪needs sage.modules
...     == W.simple_reflection(i)*c.to_grassmannian())
True
```

contains(*other*)

Check whether `self` contains `other`.

INPUT:

- `other` – another k-core or a list

OUTPUT: boolean

This returns `True` if the Ferrers diagram of `self` contains the Ferrers diagram of `other`.

EXAMPLES:

```
sage: c = Core([4,2],3)
sage: x = Core([4,2,2,1,1],3)
```

(continues on next page)

(continued from previous page)

```
sage: x.contains(c)
True
sage: c.contains(x)
False
```

```
>>> from sage.all import *
>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> x = Core([Integer(4),Integer(2),Integer(2),Integer(1),Integer(1)],
↪Integer(3))
>>> x.contains(c)
True
>>> c.contains(x)
False
```

k()

Return k of the k-core `self`.

EXAMPLES:

```
sage: c = Core([2,1],4)
sage: c.k()
4
```

```
>>> from sage.all import *
>>> c = Core([Integer(2),Integer(1)],Integer(4))
>>> c.k()
4
```

length()

Return the length of `self`.

The length of a k-core is the size of the corresponding $(k-1)$-bounded partition which agrees with the length of the corresponding Grassmannian element, see *to_grassmannian()*.

EXAMPLES:

```
sage: c = Core([4,2],3); c.length()
4
sage: c.to_grassmannian().length()                                          #␣
↪needs sage.modules
4

sage: Core([9,5,3,2,1,1], 5).length()
13
```

```
>>> from sage.all import *
>>> c = Core([Integer(4),Integer(2)],Integer(3)); c.length()
4
>>> c.to_grassmannian().length()                                            #␣
↪needs sage.modules
4

>>> Core([Integer(9),Integer(5),Integer(3),Integer(2),Integer(1),Integer(1)],␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(5)).length()
13
```

size()

Return the size of `self` as a partition.

EXAMPLES:

```
sage: Core([2,1],4).size()
3
sage: Core([4,2],3).size()
6
```

```
>>> from sage.all import *
>>> Core([Integer(2),Integer(1)],Integer(4)).size()
3
>>> Core([Integer(4),Integer(2)],Integer(3)).size()
6
```

strong_covers()

Return a list of all elements that cover `self` in strong order.

EXAMPLES:

```
sage: c = Core([1],3)
sage: c.strong_covers()
[[2], [1, 1]]
sage: c = Core([4,2],3)
sage: c.strong_covers()
[[5, 3, 1], [4, 2, 1, 1]]
```

```
>>> from sage.all import *
>>> c = Core([Integer(1)],Integer(3))
>>> c.strong_covers()
[[2], [1, 1]]
>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> c.strong_covers()
[[5, 3, 1], [4, 2, 1, 1]]
```

strong_down_list()

Return a list of all elements that are covered by `self` in strong order.

EXAMPLES:

```
sage: c = Core([1],3)
sage: c.strong_down_list()
[[]]
sage: c = Core([5,3,1],3)
sage: c.strong_down_list()
[[4, 2], [3, 1, 1]]
```

```
>>> from sage.all import *
>>> c = Core([Integer(1)],Integer(3))
```

(continues on next page)

(continued from previous page)

```
>>> c.strong_down_list()
[[]]
>>> c = Core([Integer(5),Integer(3),Integer(1)],Integer(3))
>>> c.strong_down_list()
[[4, 2], [3, 1, 1]]
```

strong_le(*other*)

Strong order (Bruhat) comparison on cores.

INPUT:

- `other` – another k-core

OUTPUT: boolean

This returns whether `self` <= `other` in Bruhat (or strong) order.

EXAMPLES:

```
sage: c = Core([4,2],3)
sage: x = Core([4,2,2,1,1],3)
sage: c.strong_le(x)
True
sage: c.strong_le([4,2,2,1,1])
True

sage: x = Core([4,1],4)
sage: c.strong_le(x)
Traceback (most recent call last):
...
ValueError: the two cores do not have the same k
```

```
>>> from sage.all import *
>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> x = Core([Integer(4),Integer(2),Integer(2),Integer(1),Integer(1)],
↪Integer(3))
>>> c.strong_le(x)
True
>>> c.strong_le([Integer(4),Integer(2),Integer(2),Integer(1),Integer(1)])
True

>>> x = Core([Integer(4),Integer(1)],Integer(4))
>>> c.strong_le(x)
Traceback (most recent call last):
...
ValueError: the two cores do not have the same k
```

to_bounded_partition()

Bijection between k-cores and $(k-1)$-bounded partitions.

This maps the k-core `self` to the corresponding $(k-1)$-bounded partition. This bijection is achieved by deleting all cells in `self` of hook length greater than k.

EXAMPLES:

```
sage: gamma = Core([9,5,3,2,1,1], 5)
sage: gamma.to_bounded_partition()
[4, 3, 2, 2, 1, 1]
```

```
>>> from sage.all import *
>>> gamma = Core([Integer(9),Integer(5),Integer(3),Integer(2),Integer(1),
↪Integer(1)], Integer(5))
>>> gamma.to_bounded_partition()
[4, 3, 2, 2, 1, 1]
```

to_grassmannian()

Bijection between k-cores and Grassmannian elements in the affine Weyl group of type $A^{(1)}_{k-1}$.

For further details, see the documentation of the method *from_kbounded_to_reduced_word()* and *from_kbounded_to_grassmannian()*.

EXAMPLES:

```
sage: c = Core([3,1,1],3)
sage: w = c.to_grassmannian(); w                                                #␣
↪needs sage.modules
[-1  1  1]
[-2  2  1]
[-2  1  2]
sage: c.parent()
3-Cores of length 4
sage: w.parent()                                                                #␣
↪needs sage.modules
Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root space)

sage: c = Core([],3)
sage: c.to_grassmannian()                                                       #␣
↪needs sage.modules
[1 0 0]
[0 1 0]
[0 0 1]
```

```
>>> from sage.all import *
>>> c = Core([Integer(3),Integer(1),Integer(1)],Integer(3))
>>> w = c.to_grassmannian(); w                                                  #␣
↪needs sage.modules
[-1  1  1]
[-2  2  1]
[-2  1  2]
>>> c.parent()
3-Cores of length 4
>>> w.parent()                                                                  #␣
↪needs sage.modules
Weyl Group of type ['A', 2, 1] (as a matrix group acting on the root space)

>>> c = Core([],Integer(3))
>>> c.to_grassmannian()                                                         #␣
↪needs sage.modules
```

(continues on next page)

(continued from previous page)

```
[1 0 0]
[0 1 0]
[0 0 1]
```

to_partition()

Turn the core `self` into the partition identical to `self`.

EXAMPLES:

```
sage: mu = Core([2,1,1],3)
sage: mu.to_partition()
[2, 1, 1]
```

```
>>> from sage.all import *
>>> mu = Core([Integer(2),Integer(1),Integer(1)],Integer(3))
>>> mu.to_partition()
[2, 1, 1]
```

weak_covers()

Return a list of all elements that cover `self` in weak order.

EXAMPLES:

```
sage: c = Core([1],3)
sage: c.weak_covers()                                                       #␣
↪needs sage.modules
[[1, 1], [2]]

sage: c = Core([4,2],3)
sage: c.weak_covers()                                                       #␣
↪needs sage.modules
[[5, 3, 1]]
```

```
>>> from sage.all import *
>>> c = Core([Integer(1)],Integer(3))
>>> c.weak_covers()                                                         #␣
↪needs sage.modules
[[1, 1], [2]]

>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> c.weak_covers()                                                         #␣
↪needs sage.modules
[[5, 3, 1]]
```

weak_le(*other*)

Weak order comparison on cores.

INPUT:

- `other` – another k-core

OUTPUT: boolean

This returns whether `self` <= `other` in weak order.

EXAMPLES:

```
sage: c = Core([4,2],3)
sage: x = Core([5,3,1],3)
sage: c.weak_le(x)                                                          #␣
↪needs sage.modules
True
sage: c.weak_le([5,3,1])                                                    #␣
↪needs sage.modules
True

sage: x = Core([4,2,2,1,1],3)
sage: c.weak_le(x)                                                          #␣
↪needs sage.modules
False

sage: x = Core([5,3,1],6)
sage: c.weak_le(x)
Traceback (most recent call last):
...
ValueError: the two cores do not have the same k
```

```
>>> from sage.all import *
>>> c = Core([Integer(4),Integer(2)],Integer(3))
>>> x = Core([Integer(5),Integer(3),Integer(1)],Integer(3))
>>> c.weak_le(x)                                                            #␣
↪needs sage.modules
True
>>> c.weak_le([Integer(5),Integer(3),Integer(1)])                             ␣
↪                        # needs sage.modules
True

>>> x = Core([Integer(4),Integer(2),Integer(2),Integer(1),Integer(1)],
↪Integer(3))
>>> c.weak_le(x)                                                            #␣
↪needs sage.modules
False

>>> x = Core([Integer(5),Integer(3),Integer(1)],Integer(6))
>>> c.weak_le(x)
Traceback (most recent call last):
...
ValueError: the two cores do not have the same k
```

sage.combinat.core.**Cores**(*k*, *length=None*, ***kwargs*)

A k-core is a partition from which no rim hook of size k can be removed. Alternatively, a k-core is an integer partition such that the Ferrers diagram for the partition contains no cells with a hook of size (a multiple of) k.

The k-cores generally have two notions of size which are useful for different applications. One is the number of cells in the Ferrers diagram with hook less than k, the other is the total number of cells of the Ferrers diagram. In the implementation in Sage, the first of notion is referred to as the `length` of the k-core and the second is the `size` of the k-core. The class of Cores requires that either the size or the length of the elements in the class is specified.

EXAMPLES:

We create the set of the 4-cores of length 6. Here the length of a k-core is the size of the corresponding $(k-1)$-bounded partition, see also *length()*:

```
sage: C = Cores(4, 6); C
4-Cores of length 6
sage: C.list()
[[6, 3], [5, 2, 1], [4, 1, 1, 1], [4, 2, 2], [3, 3, 1, 1], [3, 2, 1, 1, 1], [2, 2,
↪ 2, 1, 1, 1]]
sage: C.cardinality()
7
sage: C.an_element()
[6, 3]
```

```
>>> from sage.all import *
>>> C = Cores(Integer(4), Integer(6)); C
4-Cores of length 6
>>> C.list()
[[6, 3], [5, 2, 1], [4, 1, 1, 1], [4, 2, 2], [3, 3, 1, 1], [3, 2, 1, 1, 1], [2, 2,
↪ 2, 1, 1, 1]]
>>> C.cardinality()
7
>>> C.an_element()
[6, 3]
```

We may also list the set of 4-cores of size 6, where the size is the number of boxes in the core, see also *size()*:

```
sage: C = Cores(4, size=6); C
4-Cores of size 6
sage: C.list()
[[4, 1, 1], [3, 2, 1], [3, 1, 1, 1]]
sage: C.cardinality()
3
sage: C.an_element()
[4, 1, 1]
```

```
>>> from sage.all import *
>>> C = Cores(Integer(4), size=Integer(6)); C
4-Cores of size 6
>>> C.list()
[[4, 1, 1], [3, 2, 1], [3, 1, 1, 1]]
>>> C.cardinality()
3
>>> C.an_element()
[4, 1, 1]
```

class sage.combinat.core.**Cores_length**(k, n)

Bases: UniqueRepresentation, Parent

The class of k-cores of length n.

Element

alias of *Core*

from_partition(*part*)

Convert the partition `part` into a core (as the identity map).

This is the inverse method to *to_partition()*.

EXAMPLES:

```
sage: C = Cores(3,4)
sage: c = C.from_partition([4,2]); c
[4, 2]

sage: mu = Partition([2,1,1])
sage: C = Cores(3,3)
sage: C.from_partition(mu).to_partition() == mu
True

sage: mu = Partition([])
sage: C = Cores(3,0)
sage: C.from_partition(mu).to_partition() == mu
True
```

```
>>> from sage.all import *
>>> C = Cores(Integer(3),Integer(4))
>>> c = C.from_partition([Integer(4),Integer(2)]); c
[4, 2]

>>> mu = Partition([Integer(2),Integer(1),Integer(1)])
>>> C = Cores(Integer(3),Integer(3))
>>> C.from_partition(mu).to_partition() == mu
True

>>> mu = Partition([])
>>> C = Cores(Integer(3),Integer(0))
>>> C.from_partition(mu).to_partition() == mu
True
```

list()

Return the list of all k-cores of length n.

EXAMPLES:

```
sage: C = Cores(3,4)
sage: C.list()
[[4, 2], [3, 1, 1], [2, 2, 1, 1]]
```

```
>>> from sage.all import *
>>> C = Cores(Integer(3),Integer(4))
>>> C.list()
[[4, 2], [3, 1, 1], [2, 2, 1, 1]]
```

class sage.combinat.core.**Cores_size**(k, n)

Bases: UniqueRepresentation, Parent

The class of k-cores of size n.

Element

alias of *Core*

from_partition(*part*)

Convert the partition `part` into a core (as the identity map).

This is the inverse method to *to_partition()*.

EXAMPLES:

```
sage: C = Cores(3,size=4)
sage: c = C.from_partition([2,1,1]); c
[2, 1, 1]

sage: mu = Partition([2,1,1])
sage: C = Cores(3,size=4)
sage: C.from_partition(mu).to_partition() == mu
True

sage: mu = Partition([])
sage: C = Cores(3,size=0)
sage: C.from_partition(mu).to_partition() == mu
True
```

```
>>> from sage.all import *
>>> C = Cores(Integer(3),size=Integer(4))
>>> c = C.from_partition([Integer(2),Integer(1),Integer(1)]); c
[2, 1, 1]

>>> mu = Partition([Integer(2),Integer(1),Integer(1)])
>>> C = Cores(Integer(3),size=Integer(4))
>>> C.from_partition(mu).to_partition() == mu
True

>>> mu = Partition([])
>>> C = Cores(Integer(3),size=Integer(0))
>>> C.from_partition(mu).to_partition() == mu
True
```

list()

Return the list of all k-cores of size n.

EXAMPLES:

```
sage: C = Cores(3, size = 4)
sage: C.list()
[[3, 1], [2, 1, 1]]
```

```
>>> from sage.all import *
>>> C = Cores(Integer(3), size = Integer(4))
>>> C.list()
[[3, 1], [2, 1, 1]]
```

Counting, generating, and manipulating nonnegative integer matrices

Counting, generating, and manipulating nonnegative integer matrices with prescribed row sums and column sums.

AUTHORS:

- Franco Saliola

class sage.combinat.integer_matrices.**IntegerMatrices**(*row_sums*, *column_sums*)

Bases: UniqueRepresentation, Parent

The class of nonnegative integer matrices with prescribed row sums and column sums.

An *integer matrix* m with column sums $c := (c_1, ..., c_k)$ and row sums $l := (l_1, ..., l_n)$ where $c_1 + ... + c_k$ is equal to $l_1 + ... + l_n$, is a $n \times k$ matrix $m = (m_{i,j})$ such that $m_{1,j} + \cdots + m_{n,j} = c_j$, for all j and $m_{i,1} + \cdots + m_{i,k} = l_i$, for all i.

EXAMPLES:

There are 6 integer matrices with row sums $[3, 2, 2]$ and column sums $[2, 5]$:

```
sage: from sage.combinat.integer_matrices import IntegerMatrices
sage: IM = IntegerMatrices([3,2,2], [2,5]); IM
Non-negative integer matrices with row sums [3, 2, 2] and column sums [2, 5]
sage: IM.list()
[
[2 1]  [1 2]  [1 2]  [0 3]  [0 3]  [0 3]
[0 2]  [1 1]  [0 2]  [2 0]  [1 1]  [0 2]
[0 2], [0 2], [1 1], [0 2], [1 1], [2 0]
]
sage: IM.cardinality()
6
```

```
>>> from sage.all import *
>>> from sage.combinat.integer_matrices import IntegerMatrices
>>> IM = IntegerMatrices([Integer(3),Integer(2),Integer(2)], [Integer(2),
↪Integer(5)]); IM
Non-negative integer matrices with row sums [3, 2, 2] and column sums [2, 5]
>>> IM.list()
[
[2 1]  [1 2]  [1 2]  [0 3]  [0 3]  [0 3]
[0 2]  [1 1]  [0 2]  [2 0]  [1 1]  [0 2]
[0 2], [0 2], [1 1], [0 2], [1 1], [2 0]
]
```

(continues on next page)

(continued from previous page)

```
>>> IM.cardinality()
6
```

cardinality()

The number of integer matrices with the prescribed row sums and columns sums.

EXAMPLES:

```
sage: from sage.combinat.integer_matrices import IntegerMatrices
sage: IntegerMatrices([2,5], [3,2,2]).cardinality()
6
sage: IntegerMatrices([1,1,1,1,1], [1,1,1,1,1]).cardinality()
120
sage: IntegerMatrices([2,2,2,2], [2,2,2,2]).cardinality()
282
sage: IntegerMatrices([4], [3]).cardinality()
0
sage: len(IntegerMatrices([0,0], [0]).list())
1
```

```
>>> from sage.all import *
>>> from sage.combinat.integer_matrices import IntegerMatrices
>>> IntegerMatrices([Integer(2),Integer(5)], [Integer(3),Integer(2),
↪Integer(2)]).cardinality()
6
>>> IntegerMatrices([Integer(1),Integer(1),Integer(1),Integer(1),Integer(1)],␣
↪[Integer(1),Integer(1),Integer(1),Integer(1),Integer(1)]).cardinality()
120
>>> IntegerMatrices([Integer(2),Integer(2),Integer(2),Integer(2)],␣
↪[Integer(2),Integer(2),Integer(2),Integer(2)]).cardinality()
282
>>> IntegerMatrices([Integer(4)], [Integer(3)]).cardinality()
0
>>> len(IntegerMatrices([Integer(0),Integer(0)], [Integer(0)]).list())
1
```

This method computes the cardinality using symmetric functions. Below are the same examples, but computed by generating the actual matrices:

```
sage: from sage.combinat.integer_matrices import IntegerMatrices
sage: len(IntegerMatrices([2,5], [3,2,2]).list())
6
sage: len(IntegerMatrices([1,1,1,1,1], [1,1,1,1,1]).list())
120
sage: len(IntegerMatrices([2,2,2,2], [2,2,2,2]).list())
282
sage: len(IntegerMatrices([4], [3]).list())
0
sage: len(IntegerMatrices([0], [0]).list())
1
```

```
>>> from sage.all import *
>>> from sage.combinat.integer_matrices import IntegerMatrices
>>> len(IntegerMatrices([Integer(2),Integer(5)], [Integer(3),Integer(2),
↪Integer(2)]).list())
6
>>> len(IntegerMatrices([Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1)], [Integer(1),Integer(1),Integer(1),Integer(1),Integer(1)]).
↪list())
120
>>> len(IntegerMatrices([Integer(2),Integer(2),Integer(2),Integer(2)],␣
↪[Integer(2),Integer(2),Integer(2),Integer(2)]).list())
282
>>> len(IntegerMatrices([Integer(4)], [Integer(3)]).list())
0
>>> len(IntegerMatrices([Integer(0)], [Integer(0)]).list())
1
```

column_sums()

The column sums of the integer matrices in `self`.

OUTPUT: Composition

EXAMPLES:

```
sage: from sage.combinat.integer_matrices import IntegerMatrices
sage: IM = IntegerMatrices([3,2,2], [2,5])
sage: IM.column_sums()
[2, 5]
```

```
>>> from sage.all import *
>>> from sage.combinat.integer_matrices import IntegerMatrices
>>> IM = IntegerMatrices([Integer(3),Integer(2),Integer(2)], [Integer(2),
↪Integer(5)])
>>> IM.column_sums()
[2, 5]
```

row_sums()

The row sums of the integer matrices in `self`.

OUTPUT: Composition

EXAMPLES:

```
sage: from sage.combinat.integer_matrices import IntegerMatrices
sage: IM = IntegerMatrices([3,2,2], [2,5])
sage: IM.row_sums()
[3, 2, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.integer_matrices import IntegerMatrices
>>> IM = IntegerMatrices([Integer(3),Integer(2),Integer(2)], [Integer(2),
↪Integer(5)])
>>> IM.row_sums()
[3, 2, 2]
```

to_composition(*x*)

The composition corresponding to the integer matrix.

This is the composition obtained by reading the entries of the matrix from left to right along each row, and reading the rows from top to bottom, ignore zeros.

INPUT:

- `x` – matrix

EXAMPLES:

```
sage: from sage.combinat.integer_matrices import IntegerMatrices
sage: IM = IntegerMatrices([3,2,2], [2,5]); IM
Non-negative integer matrices with row sums [3, 2, 2] and column sums [2, 5]
sage: IM.list()
[
[2 1]  [1 2]  [1 2]  [0 3]  [0 3]  [0 3]
[0 2]  [1 1]  [0 2]  [2 0]  [1 1]  [0 2]
[0 2], [0 2], [1 1], [0 2], [1 1], [2 0]
]
sage: for m in IM: print(IM.to_composition(m))
[2, 1, 2, 2]
[1, 2, 1, 1, 2]
[1, 2, 2, 1, 1]
[3, 2, 2]
[3, 1, 1, 1, 1]
[3, 2, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.integer_matrices import IntegerMatrices
>>> IM = IntegerMatrices([Integer(3),Integer(2),Integer(2)], [Integer(2),
↪Integer(5)]); IM
Non-negative integer matrices with row sums [3, 2, 2] and column sums [2, 5]
>>> IM.list()
[
[2 1]  [1 2]  [1 2]  [0 3]  [0 3]  [0 3]
[0 2]  [1 1]  [0 2]  [2 0]  [1 1]  [0 2]
[0 2], [0 2], [1 1], [0 2], [1 1], [2 0]
]
>>> for m in IM: print(IM.to_composition(m))
[2, 1, 2, 2]
[1, 2, 1, 1, 2]
[1, 2, 2, 1, 1]
[3, 2, 2]
[3, 1, 1, 1, 1]
[3, 2, 2]
```

sage.combinat.integer_matrices.**integer_matrices_generator**(*row_sums*, *column_sums*)

Recursively generate the integer matrices with the prescribed row sums and column sums.

INPUT:

- `row_sums` – list or tuple
- `column_sums` – list or tuple

OUTPUT: an iterator producing a list of lists

EXAMPLES:

```
sage: from sage.combinat.integer_matrices import integer_matrices_generator
sage: iter = integer_matrices_generator([3,2,2], [2,5]); iter
<generator object ...integer_matrices_generator at ...>
sage: for m in iter: print(m)
[[2, 1], [0, 2], [0, 2]]
[[1, 2], [1, 1], [0, 2]]
[[1, 2], [0, 2], [1, 1]]
[[0, 3], [2, 0], [0, 2]]
[[0, 3], [1, 1], [1, 1]]
[[0, 3], [0, 2], [2, 0]]
```

```
>>> from sage.all import *
>>> from sage.combinat.integer_matrices import integer_matrices_generator
>>> iter = integer_matrices_generator([Integer(3),Integer(2),Integer(2)],␣
↪[Integer(2),Integer(5)]); iter
<generator object ...integer_matrices_generator at ...>

Cyclic sieving phenomenon

Implementation of the Cyclic Sieving Phenomenon as described by Reiner, Stanton, and White in [RSW2004].

We define the *CyclicSievingPolynomial()* of a finite set S together with cyclic action `cyc_act` (of order n) to be the unique polynomial `P(q)` of order $< n$ such that the triple (S, `cyc_act`, `P(q)`) exhibits the cyclic sieving phenomenon.

AUTHORS:

- Christian Stump

sage.combinat.cyclic_sieving_phenomenon.**CyclicSievingCheck**(*L*, *cyc_act*, *f*, *order=None*)

Return whether the triple `(L, cyc_act, f)` exhibits the cyclic sieving phenomenon.

If `cyc_act` is None, `L` is expected to contain the orbit lengths.

INPUT:

- `L` – if `cyc_act` is `None`: list of orbit sizes, otherwise list of objects
- `cyc_act` – (default: `None`) bijective function from `L` to `L`
- **`order` – (default: `None`) if set to an integer, this**
  cyclic order of `cyc_act` is used (must be an integer multiple of the order of `cyc_act`) otherwise, the order of `cyc_action` is used

EXAMPLES:

```
sage: from sage.combinat.cyclic_sieving_phenomenon import *
sage: from sage.combinat.q_analogues import q_binomial
```

(continues on next page)

(continued from previous page)

```
sage: S42 = Subsets([1,2,3,4], 2)
sage: def cyc_act(S): return Set(i.mod(4) + 1 for i in S)
sage: cyc_act([1,3])
{2, 4}
sage: cyc_act([1,4])
{1, 2}
sage: p = q_binomial(4,2); p
q^4 + q^3 + 2*q^2 + q + 1
sage: CyclicSievingPolynomial( S42, cyc_act )
q^3 + 2*q^2 + q + 2
sage: CyclicSievingCheck( S42, cyc_act, p )
True
```

```
>>> from sage.all import *
>>> from sage.combinat.cyclic_sieving_phenomenon import *
>>> from sage.combinat.q_analogues import q_binomial
>>> S42 = Subsets([Integer(1),Integer(2),Integer(3),Integer(4)], Integer(2))
>>> def cyc_act(S): return Set(i.mod(Integer(4)) + Integer(1) for i in S)
>>> cyc_act([Integer(1),Integer(3)])
{2, 4}
>>> cyc_act([Integer(1),Integer(4)])
{1, 2}
>>> p = q_binomial(Integer(4),Integer(2)); p
q^4 + q^3 + 2*q^2 + q + 1
>>> CyclicSievingPolynomial( S42, cyc_act )
q^3 + 2*q^2 + q + 2
>>> CyclicSievingCheck( S42, cyc_act, p )
True
```

sage.combinat.cyclic_sieving_phenomenon.**CyclicSievingPolynomial**(*L*, *cyc_act=None*, *order=None*, *get_order=False*)

Return the unique polynomial `p` of degree smaller than `order` such that the triple `(L, cyc_act, p)` exhibits the Cyclic Sieving Phenomenon.

If `cyc_act` is None, `L` is expected to contain the orbit lengths.

INPUT:

- `L` – if `cyc_act` is `None`: list of orbit sizes, otherwise list of objects
- `cyc_act` – (default: `None`) bijective function from `L` to `L`
- **`order` – (default: `None`) if set to an integer, this**
  cyclic order of `cyc_act` is used (must be an integer multiple of the order of `cyc_act`) otherwise, the order of `cyc_action` is used
- `get_order` – (default: `False`) if `True`, a tuple `[p,n]` is returned where `p` is as above, and `n` is the order

EXAMPLES:

```
sage: from sage.combinat.cyclic_sieving_phenomenon import CyclicSievingPolynomial
sage: S42 = Subsets([1,2,3,4], 2)
sage: def cyc_act(S): return Set(i.mod(4) + 1 for i in S)
sage: cyc_act([1,3])
{2, 4}
```

(continues on next page)

(continued from previous page)

```
sage: cyc_act([1,4])
{1, 2}
sage: CyclicSievingPolynomial(S42, cyc_act)
q^3 + 2*q^2 + q + 2
sage: CyclicSievingPolynomial(S42, cyc_act, get_order=True)
[q^3 + 2*q^2 + q + 2, 4]
sage: CyclicSievingPolynomial(S42, cyc_act, order=8)
q^6 + 2*q^4 + q^2 + 2
sage: CyclicSievingPolynomial([4,2])
q^3 + 2*q^2 + q + 2
```

```
>>> from sage.all import *
>>> from sage.combinat.cyclic_sieving_phenomenon import CyclicSievingPolynomial
>>> S42 = Subsets([Integer(1),Integer(2),Integer(3),Integer(4)], Integer(2))
>>> def cyc_act(S): return Set(i.mod(Integer(4)) + Integer(1) for i in S)
>>> cyc_act([Integer(1),Integer(3)])
{2, 4}
>>> cyc_act([Integer(1),Integer(4)])
{1, 2}
>>> CyclicSievingPolynomial(S42, cyc_act)
q^3 + 2*q^2 + q + 2
>>> CyclicSievingPolynomial(S42, cyc_act, get_order=True)
[q^3 + 2*q^2 + q + 2, 4]
>>> CyclicSievingPolynomial(S42, cyc_act, order=Integer(8))
q^6 + 2*q^4 + q^2 + 2
>>> CyclicSievingPolynomial([Integer(4),Integer(2)])
q^3 + 2*q^2 + q + 2
```

sage.combinat.cyclic_sieving_phenomenon.**orbit_decomposition**(*L*, *cyc_act*)

Return the orbit decomposition of `L` by the action of `cyc_act`.

INPUT:

- `L` – list
- `cyc_act` – bijective function from `L` to `L`

OUTPUT: list of lists, the orbits under the cyc_act acting on `L`

EXAMPLES:

```
sage: from sage.combinat.cyclic_sieving_phenomenon import *
sage: S42 = Subsets([1,2,3,4], 2); S42
Subsets of {1, 2, 3, 4} of size 2
sage: def cyc_act(S): return Set(i.mod(4) + 1 for i in S)
sage: cyc_act([1,3])
{2, 4}
sage: cyc_act([1,4])
{1, 2}
sage: orbits = orbit_decomposition(S42, cyc_act)
sage: sorted([sorted(orb, key=sorted) for orb in orbits], key=len)
[[{1, 3}, {2, 4}], [{1, 2}, {1, 4}, {2, 3}, {3, 4}]]
```

```
>>> from sage.all import *
>>> from sage.combinat.cyclic_sieving_phenomenon import *
>>> S42 = Subsets([Integer(1),Integer(2),Integer(3),Integer(4)], Integer(2)); S42
Subsets of {1, 2, 3, 4} of size 2
>>> def cyc_act(S): return Set(i.mod(Integer(4)) + Integer(1) for i in S)
>>> cyc_act([Integer(1),Integer(3)])
{2, 4}
>>> cyc_act([Integer(1),Integer(4)])
{1, 2}
>>> orbits = orbit_decomposition(S42, cyc_act)
>>> sorted([sorted(orb, key=sorted) for orb in orbits], key=len)
[[{1, 3}, {2, 4}], [{1, 2}, {1, 4}, {2, 3}, {3, 4}]]
```

De Bruijn sequences

A De Bruijn sequence is defined as the shortest cyclic sequence that incorporates all substrings of a certain length of an alphabet.

For instance, the $2^3 = 8$ binary strings of length 3 are all included in the following string:

```
sage: DeBruijnSequences(2,3).an_element()
[0, 0, 0, 1, 0, 1, 1, 1]
```

```
>>> from sage.all import *
>>> DeBruijnSequences(Integer(2),Integer(3)).an_element()
[0, 0, 0, 1, 0, 1, 1, 1]
```

They can be obtained as a subsequence of the *cyclic* De Bruijn sequence of parameters $k = 2$ and $n = 3$:

```
sage: seq = DeBruijnSequences(2,3).an_element()
sage: print(Word(seq).string_rep())
00010111
sage: shift = lambda i: [(i+j)%2**3 for j in range(3)]
sage: for i in range(2**3):
....:     w = Word([b if j in shift(i) else '*' for j, b in enumerate(seq)])
....:     print(w.string_rep())
000*****
*001****
**010***
***101**
****011*
*****111
0*****11
00*****1
```

```
>>> from sage.all import *
>>> seq = DeBruijnSequences(Integer(2),Integer(3)).an_element()
>>> print(Word(seq).string_rep())
00010111
>>> shift = lambda i: [(i+j)%Integer(2)**Integer(3) for j in range(Integer(3))]
>>> for i in range(Integer(2)**Integer(3)):
...     w = Word([b if j in shift(i) else '*' for j, b in enumerate(seq)])
...     print(w.string_rep())
```

(continues on next page)

(continued from previous page)

```
000*****
*001****
**010***
***101**
****011*
*****111
0*****11
00******1
```

This sequence is of length k^n, which is best possible as it is the number of k-ary strings of length n. One can equivalently define a De Bruijn sequence of parameters k and n as a cyclic sequence of length k^n in which all substring of length n are different.

See also Wikipedia article De_Bruijn_sequence.

AUTHOR:

- Eviatar Bach (2011): initial version
- Nathann Cohen (2011): Some work on the documentation and defined the `__contain__` method

class sage.combinat.debruijn_sequence.**DeBruijnSequences**(k, n)

Bases: `UniqueRepresentation`, `Parent`

Represent the De Bruijn sequences of given parameters k and n.

A De Bruijn sequence of parameters k and n is defined as the shortest cyclic sequence that incorporates all substrings of length n a k-ary alphabet.

This class can be used to generate the lexicographically smallest De Bruijn sequence, to count the number of existing De Bruijn sequences or to test whether a given sequence is De Bruijn.

INPUT:

- `k` – a natural number to define arity; the letters used are the integers $0, \ldots, k-1$
- `n` – a natural number that defines the length of the substring

EXAMPLES:

Obtaining a De Bruijn sequence:

```
sage: seq = DeBruijnSequences(2, 3).an_element()
sage: seq
[0, 0, 0, 1, 0, 1, 1, 1]
```

```
>>> from sage.all import *
>>> seq = DeBruijnSequences(Integer(2), Integer(3)).an_element()
>>> seq
[0, 0, 0, 1, 0, 1, 1, 1]
```

Testing whether it is indeed one:

```
sage: seq in DeBruijnSequences(2, 3)
True
```

```
>>> from sage.all import *
>>> seq in DeBruijnSequences(Integer(2), Integer(3))
True
```

The total number for these parameters:

```
sage: DeBruijnSequences(2, 3).cardinality()
2
```

```
>>> from sage.all import *
>>> DeBruijnSequences(Integer(2), Integer(3)).cardinality()
2
```

Note

This function only generates one De Bruijn sequence (the smallest lexicographically). Support for generating all possible ones may be added in the future.

cardinality()

Return the number of distinct De Bruijn sequences for the object's parameters.

EXAMPLES:

```
sage: DeBruijnSequences(2, 5).cardinality()
2048
```

```
>>> from sage.all import *
>>> DeBruijnSequences(Integer(2), Integer(5)).cardinality()
2048
```

ALGORITHM:

The formula for cardinality is $k!^{k^{n-1}}/k^n$ [Ros2002].

sage.combinat.debruijn_sequence.**debruijn_sequence**(k, n)

The generating function for De Bruijn sequences. This avoids the object creation, so is significantly faster than accessing from DeBruijnSequence. For more information, see the documentation there. The algorithm used is from Frank Ruskey's "Combinatorial Generation".

INPUT:

- k – arity; must be an integer
- n – substring length; must be an integer

EXAMPLES:

```
sage: from sage.combinat.debruijn_sequence import debruijn_sequence
sage: debruijn_sequence(3, 1)
[0, 1, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.debruijn_sequence import debruijn_sequence
```

(continues on next page)

(continued from previous page)

```
>>> debruijn_sequence(Integer(3), Integer(1))
[0, 1, 2]
```

sage.combinat.debruijn_sequence.**is_debruijn_sequence**(*seq*, *k*, *n*)

Given a sequence of integer elements in $0, \ldots, k-1$, tests whether it corresponds to a De Bruijn sequence of parameters k and n.

INPUT:

- `seq` – sequence of elements in $0, \ldots, k-1$
- `n`, `k` – integers

EXAMPLES:

```
sage: from sage.combinat.debruijn_sequence import is_debruijn_sequence
sage: s = DeBruijnSequences(2, 3).an_element()
sage: is_debruijn_sequence(s, 2, 3)
True
sage: is_debruijn_sequence(s + [0], 2, 3)
False
sage: is_debruijn_sequence([1] + s[1:], 2, 3)
False
```

```
>>> from sage.all import *
>>> from sage.combinat.debruijn_sequence import is_debruijn_sequence
>>> s = DeBruijnSequences(Integer(2), Integer(3)).an_element()
>>> is_debruijn_sequence(s, Integer(2), Integer(3))
True
>>> is_debruijn_sequence(s + [Integer(0)], Integer(2), Integer(3))
False
>>> is_debruijn_sequence([Integer(1)] + s[Integer(1):], Integer(2), Integer(3))
False
```

Decorated permutations

AUTHORS:

- Martin Rubey (2020): Initial version

class sage.combinat.decorated_permutation.**DecoratedPermutation**(*parent*, *pi*, *check=True*)

Bases: `ClonableArray`

A decorated permutation.

A decorated permutation is a signed permutation where all non-fixed points have positive sign.

check()

Check that `self` is a valid decorated permutation.

EXAMPLES:

```
sage: S = DecoratedPermutations(3)
sage: elt = S([2, 1, -3])
sage: elt.check()
sage: elt = S([2, -1, 3])
```

(continues on next page)

(continued from previous page)

```
Traceback (most recent call last):
...
ValueError: invalid decorated permutation
```

```
>>> from sage.all import *
>>> S = DecoratedPermutations(Integer(3))
>>> elt = S([Integer(2), Integer(1), -Integer(3)])
>>> elt.check()
>>> elt = S([Integer(2), -Integer(1), Integer(3)])
Traceback (most recent call last):
...
ValueError: invalid decorated permutation
```

size()

Return the size of the decorated permutation.

EXAMPLES:

```
sage: DecoratedPermutation([2, 1, -3]).size()
3
```

```
>>> from sage.all import *
>>> DecoratedPermutation([Integer(2), Integer(1), -Integer(3)]).size()
3
```

to_signed_permutation()

Return `self` as a signed permutation.

EXAMPLES:

```
sage: DecoratedPermutation([2, 1, -3]).to_signed_permutation()
[2, 1, -3]
```

```
>>> from sage.all import *
>>> DecoratedPermutation([Integer(2), Integer(1), -Integer(3)]).to_signed_
↪permutation()
[2, 1, -3]
```

class sage.combinat.decorated_permutation.**DecoratedPermutations**(n)

Bases: `UniqueRepresentation`, `Parent`

Class of all decorated permutations of n.

A decorated permutation is a signed permutation where all non-fixed points have positive sign.

INPUT:

- `n` – integer; the size of the decorated permutations

EXAMPLES:

This will create an instance to manipulate the decorated permutations of size 3:

```
sage: S = DecoratedPermutations(3); S
Decorated permutations of size 3
```

(continues on next page)

(continued from previous page)

```
sage: S.cardinality()
16
```

```
>>> from sage.all import *
>>> S = DecoratedPermutations(Integer(3)); S
Decorated permutations of size 3
>>> S.cardinality()
16
```

Element

alias of *DecoratedPermutation*

cardinality()

Return the cardinality of `self`.

The number of decorated permutations of size n is equal to

$$\sum_{k=0^n} \frac{n!}{k!}$$

EXAMPLES:

```
sage: [DecoratedPermutations(n).cardinality() for n in range(11)]
[1, 2, 5, 16, 65, 326, 1957, 13700, 109601, 986410, 9864101]
```

```
>>> from sage.all import *
>>> [DecoratedPermutations(n).cardinality() for n in range(Integer(11))]
[1, 2, 5, 16, 65, 326, 1957, 13700, 109601, 986410, 9864101]
```

Degree sequences

The present module implements the `DegreeSequences` class, whose instances represent the integer sequences of length n:

```
sage: DegreeSequences(6)
Degree sequences on 6 elements
```

```
>>> from sage.all import *
>>> DegreeSequences(Integer(6))
Degree sequences on 6 elements
```

With the object `DegreeSequences(n)`, one can:

- Check whether a sequence is indeed a degree sequence:

```
sage: DS = DegreeSequences(5)
sage: (4, 3, 3, 3, 3) in DS
True
sage: (4, 4, 0, 0, 0) in DS
False
```

```
>>> from sage.all import *
>>> DS = DegreeSequences(Integer(5))
>>> (Integer(4), Integer(3), Integer(3), Integer(3), Integer(3)) in DS
True
>>> (Integer(4), Integer(4), Integer(0), Integer(0), Integer(0)) in DS
False
```

- List all the possible degree sequences of length n:

```
sage: for seq in DegreeSequences(4):
....:     print(seq)
(0, 0, 0, 0)
(1, 1, 0, 0)
(2, 1, 1, 0)
(3, 1, 1, 1)
(1, 1, 1, 1)
(2, 2, 1, 1)
(2, 2, 2, 0)
(3, 2, 2, 1)
(2, 2, 2, 2)
(3, 3, 2, 2)
(3, 3, 3, 3)
```

```
>>> from sage.all import *
>>> for seq in DegreeSequences(Integer(4)):
...     print(seq)
(0, 0, 0, 0)
(1, 1, 0, 0)
(2, 1, 1, 0)
(3, 1, 1, 1)
(1, 1, 1, 1)
(2, 2, 1, 1)
(2, 2, 2, 0)
(3, 2, 2, 1)
(2, 2, 2, 2)
(3, 3, 2, 2)
(3, 3, 3, 3)
```

Note

Given a degree sequence, one can obtain a graph realizing it by using `DegreeSequence()`. For instance:

```
sage: ds = (3, 3, 2, 2, 2, 2, 2, 1, 1, 0)
sage: g = graphs.DegreeSequence(ds)                                    #␣
↪needs networkx sage.graphs
sage: g.degree_sequence()                                              #␣
↪needs networkx sage.graphs
[3, 3, 2, 2, 2, 2, 2, 1, 1, 0]
```

```
>>> from sage.all import *
>>> ds = (Integer(3), Integer(3), Integer(2), Integer(2), Integer(2), Integer(2),␣
↪Integer(2), Integer(1), Integer(1), Integer(0))
>>> g = graphs.DegreeSequence(ds)                                              #␣
↪needs networkx sage.graphs
>>> g.degree_sequence()                                                        #␣
↪needs networkx sage.graphs
[3, 3, 2, 2, 2, 2, 2, 1, 1, 0]
```

Definitions

A sequence of integers $d_1, ..., d_n$ is said to be a *degree sequence* (or *graphic* sequence) if there exists a graph in which vertex i is of degree d_i. It is often required to be *non-increasing*, i.e. that $d_1 \geq ... \geq d_n$. Finding a graph with given degree sequence is known as *graph realization problem*.

An integer sequence need not necessarily be a degree sequence. Indeed, in a degree sequence of length n no integer can be larger than $n-1$ – the degree of a vertex is at most $n-1$ – and the sum of them is at most $n(n-1)$.

Degree sequences are completely characterized by a result from Erdős and Gallai:

Erdős and Gallai: *The sequence of integers $d_1 \geq \cdots \geq d_n$ is a degree sequence if and only if* $\sum_i d_i$ is even and $\forall i$

$$\sum_{j \leq i} d_j \leq j(j-1) + \sum_{j>i} \min(d_j, i).$$

Alternatively, a degree sequence can be defined recursively:

Havel and Hakimi: *The sequence of integers $d_1 \geq ... \geq d_n$ is a degree sequence if and only if $d_2 - 1, ..., d_{d_1+1} - 1, d_{d_1+2}, ..., d_n$ is also a degree sequence.*

Or equivalently:

Havel and Hakimi (bis): *If there is a realization of an integer sequence as a graph (i.e. if the sequence is a degree sequence), then it can be realized in such a way that the vertex of maximum degree Δ is adjacent to the Δ vertices of highest degree (except itself, of course).*

Algorithms

Checking whether a given sequence is a degree sequence

This is tested using Erdős and Gallai's criterion. It is also checked that the given sequence is non-increasing and has length n.

Iterating through the sequences of length n

From Havel and Hakimi's recursive definition of a degree sequence, one can build an enumeration algorithm as done in [RCES1994]. It consists in trying to **extend** a current degree sequence on n elements into a degree sequence on $n+1$ elements by adding a vertex of degree larger than those already present in the sequence. This can be seen as **reversing** the reduction operation described in Havel and Hakimi's characterization. This operation can appear in several different ways:

- Extensions of a degree sequence that do **not** change the value of the maximum element
  - If the maximum element of a given degree sequence is 0, then one can remove it to reduce the sequence, following Havel and Hakimi's rule. Conversely, if the maximum element of the (current) sequence is 0, then one can always extend it by adding a new element of degree 0 to the sequence.

$$0,0,0 \xrightarrow{Extension} \mathbf{0},0,0,0 \xrightarrow{Extension} \mathbf{0},0,0,...,0,0,0 \xrightarrow{Reduction} 0,0,0,0 \xrightarrow{Reduction} 0,0,0$$

  - If there are at least $\Delta+1$ elements of (maximum) degree Δ in a given degree sequence, then one can reduce it by removing a vertex of degree Δ and decreasing the values of Δ elements of value Δ to $\Delta-1$. Conversely, if the maximum element of the (current) sequence is $d>0$, then one can add a new element of degree d to the sequence if it can be linked to d elements of (current) degree $d-1$. Those d vertices of degree $d-1$ hence become vertices of degree d, and so d elements of degree $d-1$ are removed from the sequence while $d+1$ elements of degree d are added to it.

$$3,2,2,2,1 \xrightarrow{Extension} \mathbf{3},3,(2+1),(2+1),(2+1),1=\mathbf{3},3,3,3,3,1 \xrightarrow{Reduction} 3,2,2,2,1$$

- Extension of a degree sequence that changes the value of the maximum element:
  - In the general case, i.e. when the number of elements of value $\Delta,\Delta-1$ is small compared to Δ (i.e. the maximum element of a given degree sequence), reducing a sequence strictly decreases the value of the maximum element. According to Havel and Hakimi's characterization there is only **one** way to reduce a sequence, but reversing this operation is more complicated than in the previous cases. Indeed, the following extensions are perfectly valid according to the reduction rule.

$$2,1,1,0,0 \xrightarrow{Extension} \mathbf{3},(2+1),(1+1),(1+1),0,0=3,3,2,2,0,0 \xrightarrow{Reduction} 2,1,1,0,0$$
$$2,1,1,0,0 \xrightarrow{Extension} \mathbf{3},(2+1),(1+1),1,(0+1),0=3,3,2,1,1,0 \xrightarrow{Reduction} 2,1,1,0,0$$
$$2,1,1,0,0 \xrightarrow{Extension} \mathbf{3},(2+1),1,1,(0+1),(0+1)=3,3,1,1,1,1 \xrightarrow{Reduction} 2,1,1,0,0$$
$$\dots$$

    In order to extend a current degree sequence while strictly increasing its maximum degree, it is equivalent to pick a set I of elements of the degree sequence with $|I|>\Delta$ in such a way that the $(d_i+1)_{i\in I}$ are the $|I|$ maximum elements of the sequence $(d_i+\begin{smallmatrix}1 \text{ if } i\in I\\ 0 \text{ if } i\notin I\end{smallmatrix})_{1\leq i\leq n}$, and to add to this new sequence an element of value $|I|$. The non-increasing sequence containing the elements $|I|$ and $(d_i+\begin{smallmatrix}1 \text{ if } i\in I\\ 0 \text{ if } i\notin I\end{smallmatrix})_{1\leq i\leq n}$ can be reduced to $(d_i)_{1\leq i\leq n}$ by Havel and Hakimi's rule.

$$\dots 1,1,2,\mathbf{2},\mathbf{2},2,2,3,3,\underline{3},\mathbf{3},\mathbf{3},\mathbf{4},\mathbf{6},\dots \xrightarrow{Extension} \dots 1,1,2,2,2,3,3,\underline{3},\mathbf{3},\mathbf{3},\mathbf{4},\mathbf{4},\mathbf{5},\mathbf{7},\dots$$

    The number of possible sets I having this property (i.e. the number of possible extensions of a sequence) is smaller than it seems. Indeed, by definition, if $j\notin I$ then for all $i\in I$ the inequality $d_j\leq d_i+1$ holds. Hence, each set I is entirely determined by the largest element d_k of the sequence that it does **not** contain (hence I contains $\{1,\dots,k-1\}$), and by the cardinalities of $\{i\in I: d_i=d_k\}$ and $\{i\in I: d_i=d_k-1\}$.

$$I=\{i\in I: d_i=d_k\}\cup\{i\in I: d_i=d_k-1\}\cup\{i: d_i>d_k\}.$$

    The number of possible extensions is hence at most cubic, and is easily enumerated.

About the implementation

In the actual implementation of the enumeration algorithm, the degree sequence is stored differently for reasons of efficiency.

Indeed, when enumerating all the degree sequences of length n, Sage first allocates an array `seq` of $n+1$ integers where `seq[i]` is the number of elements of value `i` in the current sequence. Obviously, `seq[n]=0` holds in permanence : it is useful to allocate a larger array than necessary to simplify the code. The `seq` array lives inside a short-lived enumerator object created for each traversal so that no global state leaks between calls.

The recursive function `enum(depth, maximum)` is the one building the list of sequences. It builds the list of degree sequences of length n which *extend* the sequence currently stored in `seq[0]...seq[depth-1]`. When it is called, `maximum` must be set to the maximum value of an element in the partial sequence `seq[0]...seq[depth-1]`.

If during its run the function `enum` heavily works on the content of the `seq` array, the value of `seq` is the **same** before and after the run of `enum`.

Extending the current partial sequence

The two cases for which the maximum degree of the partial sequence does not change are easy to detect. It is (slightly) harder to enumerate all the sets I corresponding to possible extensions of the partial sequence. As said previously, to each set I one can associate an integer `current_box` such that I contains all the i satisfying $d_i > current_box$. The variable `taken` represents the number of all such elements i, so that when enumerating all possible sets I in the algorithm we have the equality

$$I = \text{taken } + \text{ number of elements of value } current_box + \text{ number of elements of value } current_box - 1.$$

class sage.combinat.degree_sequences.**DegreeSequences**(*n*)

Bases: object

Degree Sequences.

An instance of this class represents the degree sequences of graphs on a given number n of vertices. It can be used to list and count them, as well as to test whether a sequence is a degree sequence. For more information, please refer to the documentation of the *DegreeSequence* module.

EXAMPLES:

```
sage: DegreeSequences(8)
Degree sequences on 8 elements
sage: DegreeSequences(1)
Degree sequences on 1 element
sage: (3,3,2,2,2,2,2,2) in DegreeSequences(8)
True
```

```
>>> from sage.all import *
>>> DegreeSequences(Integer(8))
Degree sequences on 8 elements
>>> DegreeSequences(Integer(1))
Degree sequences on 1 element
>>> (Integer(3),Integer(3),Integer(2),Integer(2),Integer(2),Integer(2),Integer(2),
↪Integer(2)) in DegreeSequences(Integer(8))
True
```

sage.combinat.degree_sequences.**init**(*n*)

Initialize the memory and starts the enumeration algorithm.

This is a generator that yields degree sequences one at a time.

Derangements

AUTHORS:

- Alasdair McAndrew (2010-05): Initial version
- Travis Scrimshaw (2013-03-30): Put derangements into category framework

class sage.combinat.derangements.**Derangement**(*parent*, **args*, ***kwds*)

Bases: *CombinatorialElement*

A derangement.

A derangement on a set S is a permutation σ such that $\sigma(x) \neq x$ for all $x \in S$, i.e. σ is a permutation of S with no fixed points.

EXAMPLES:

```
sage: D = Derangements(4)
sage: elt = D([4,3,2,1])
sage: TestSuite(elt).run()
```

```
>>> from sage.all import *
>>> D = Derangements(Integer(4))
>>> elt = D([Integer(4),Integer(3),Integer(2),Integer(1)])
>>> TestSuite(elt).run()
```

to_permutation()

Return the permutation corresponding to `self`.

EXAMPLES:

```
sage: D = Derangements(4)
sage: p = D([4,3,2,1]).to_permutation(); p
[4, 3, 2, 1]
sage: type(p)
<class 'sage.combinat.permutation.StandardPermutations_all_with_category.
↪element_class'>
sage: D = Derangements([1, 3, 3, 4])
sage: D[0].to_permutation()
Traceback (most recent call last):
...
ValueError: can only convert to a permutation for derangements of [1, 2, ...,␣
↪n]
```

```
>>> from sage.all import *
>>> D = Derangements(Integer(4))
>>> p = D([Integer(4),Integer(3),Integer(2),Integer(1)]).to_permutation(); p
[4, 3, 2, 1]
>>> type(p)
<class 'sage.combinat.permutation.StandardPermutations_all_with_category.
↪element_class'>
>>> D = Derangements([Integer(1), Integer(3), Integer(3), Integer(4)])
>>> D[Integer(0)].to_permutation()
Traceback (most recent call last):
...
ValueError: can only convert to a permutation for derangements of [1, 2, ...,␣
↪n]
```

class sage.combinat.derangements.**Derangements**(*x*)

Bases: UniqueRepresentation, Parent

The class of all derangements of a set or multiset.

A derangement on a set S is a permutation σ such that $\sigma(x) \neq x$ for all $x \in S$, i.e. σ is a permutation of S with no fixed points.

For an integer, or a list or string with all elements distinct, the derangements are obtained by a standard result described in [BV2004]. For a list or string with repeated elements, the derangements are formed by computing all permutations of the input and discarding all non-derangements.

INPUT:

- `x` – can be an integer which corresponds to derangements of $\{1, 2, 3, \ldots, x\}$, a list, or a string

REFERENCES:

- [BV2004]
- Wikipedia article Derangement

EXAMPLES:

```
sage: D1 = Derangements([2,3,4,5])
sage: D1.list()
[[3, 4, 5, 2],
 [5, 4, 2, 3],
 [3, 5, 2, 4],
 [4, 5, 3, 2],
 [4, 2, 5, 3],
 [5, 2, 3, 4],
 [5, 4, 3, 2],
 [4, 5, 2, 3],
 [3, 2, 5, 4]]
sage: D1.cardinality()
9
sage: D1.random_element() # random
[4, 2, 5, 3]
sage: D2 = Derangements([1,2,3,1,2,3])
sage: D2.cardinality()
10
sage: D2.list()
[[2, 1, 1, 3, 3, 2],
 [2, 1, 2, 3, 3, 1],
 [2, 3, 1, 2, 3, 1],
 [2, 3, 1, 3, 1, 2],
 [2, 3, 2, 3, 1, 1],
 [3, 1, 1, 2, 3, 2],
 [3, 1, 2, 2, 3, 1],
 [3, 1, 2, 3, 1, 2],
 [3, 3, 1, 2, 1, 2],
 [3, 3, 2, 2, 1, 1]]
sage: D2.random_element() # random
[2, 3, 1, 3, 1, 2]
```

```
>>> from sage.all import *
>>> D1 = Derangements([Integer(2),Integer(3),Integer(4),Integer(5)])

 [3, 1, 1, 2, 3, 2],
 [3, 1, 2, 2, 3, 1],
 [3, 1, 2, 3, 1, 2],
 [3, 3, 1, 2, 1, 2],
 [3, 3, 2, 2, 1, 1]]
>>> D2.random_element() # random
[2, 3, 1, 3, 1, 2]
```

Element

alias of *Derangement*

cardinality()

Count the number of derangements of a positive integer, a list, or a string.

The list or string may contain repeated elements. If an integer n is given, the value returned is the number of derangements of $[1, 2, 3, \ldots, n]$.

For an integer, or a list or string with all elements distinct, the value is obtained by the standard result $D_2 = 1, D_3 = 2, D_n = (n-1)(D_{n-1} + D_{n-2})$.

For a list or string with repeated elements, the number of derangements is computed by Macmahon's theorem. If the numbers of repeated elements are $a_1, a_2, \ldots, a_k$ then the number of derangements is given by the coefficient of $x_1 x_2 \cdots x_k$ in the expansion of $\prod_{i=0}^{k}(S - s_i)^{a_i}$ where $S = x_1 + x_2 + \cdots + x_k$.

EXAMPLES:

```
sage: D = Derangements(5)
sage: D.cardinality()
44
sage: D = Derangements([1,44,918,67,254])
sage: D.cardinality()
44
sage: D = Derangements(['A','AT','CAT','CATS','CARTS'])
sage: D.cardinality()
```

(continues on next page)

(continued from previous page)

```
44
sage: D = Derangements('UNCOPYRIGHTABLE')
sage: D.cardinality()
481066515734
sage: D = Derangements([1,1,2,2,3,3])
sage: D.cardinality()
10
sage: D = Derangements('SATTAS')
sage: D.cardinality()
10
sage: D = Derangements([1,1,2,2,2])
sage: D.cardinality()
0
sage: D = Derangements(0)
sage: D.cardinality()
1
```

```
>>> from sage.all import *
>>> D = Derangements(Integer(5))
>>> D.cardinality()
44
>>> D = Derangements([Integer(1),Integer(44),Integer(918),Integer(67),
↪Integer(254)])
>>> D.cardinality()
44
>>> D = Derangements(['A','AT','CAT','CATS','CARTS'])
>>> D.cardinality()
44
>>> D = Derangements('UNCOPYRIGHTABLE')
>>> D.cardinality()
481066515734
>>> D = Derangements([Integer(1),Integer(1),Integer(2),Integer(2),Integer(3),
↪Integer(3)])
>>> D.cardinality()
10
>>> D = Derangements('SATTAS')
>>> D.cardinality()
10
>>> D = Derangements([Integer(1),Integer(1),Integer(2),Integer(2),Integer(2)])
>>> D.cardinality()
0
>>> D = Derangements(Integer(0))
>>> D.cardinality()
1
```

random_element()

Return a random derangement.

If the elements of the underlying multiset are all distinct, an algorithm described in [MPP2008] is used. For a list or string with repeated elements the derangement is formed by choosing an element at random from the list of all possible derangements.

OUTPUT:

A derangement, or an empty list if there are no derangements.

EXAMPLES:

```
sage: D = Derangements(4)
sage: D.random_element() # random
[2, 3, 4, 1]
sage: D = Derangements(['A','AT','CAT','CATS','CARTS','CARETS'])
sage: D.random_element() # random
['AT', 'CARTS', 'A', 'CAT', 'CARETS', 'CATS']
sage: D = Derangements('UNCOPYRIGHTABLE')
sage: D.random_element() # random
['C', 'U', 'I', 'H', 'O', 'G', 'N', 'B', 'E', 'L', 'A', 'R', 'P', 'Y', 'T']
sage: D = Derangements([1,1,1,1,2,2,2,2,3,3,3,3])
sage: D.random_element() # random
[3, 2, 2, 3, 1, 3, 1, 3, 2, 1, 1, 2]
sage: D = Derangements('ESSENCES')
sage: D.random_element() # random
['N', 'E', 'E', 'C', 'S', 'S', 'S', 'E']
sage: D = Derangements([1,1,2,2,2])
sage: D.random_element()
[]
```

```
>>> from sage.all import *
>>> D = Derangements(Integer(4))
>>> D.random_element() # random
[2, 3, 4, 1]
>>> D = Derangements(['A','AT','CAT','CATS','CARTS','CARETS'])
>>> D.random_element() # random
['AT', 'CARTS', 'A', 'CAT', 'CARETS', 'CATS']
>>> D = Derangements('UNCOPYRIGHTABLE')
>>> D.random_element() # random
['C', 'U', 'I', 'H', 'O', 'G', 'N', 'B', 'E', 'L', 'A', 'R', 'P', 'Y', 'T']
>>> D = Derangements([Integer(1),Integer(1),Integer(1),Integer(1),Integer(2),
↪Integer(2),Integer(2),Integer(2),Integer(3),Integer(3),Integer(3),
↪Integer(3)])
>>> D.random_element() # random
[3, 2, 2, 3, 1, 3, 1, 3, 2, 1, 1, 2]
>>> D = Derangements('ESSENCES')
>>> D.random_element() # random
['N', 'E', 'E', 'C', 'S', 'S', 'S', 'E']
>>> D = Derangements([Integer(1),Integer(1),Integer(2),Integer(2),Integer(2)])
>>> D.random_element()
[]
```

Descent algebras

AUTHORS:

- Travis Scrimshaw (2013-07-28): initial version

class sage.combinat.descent_algebra.**DescentAlgebra**(*R*, *n*)

Bases: UniqueRepresentation, Parent

Solomon's descent algebra.

The descent algebra Σ_n over a ring R is a subalgebra of the symmetric group algebra RS_n. (The product in the latter algebra is defined by $(pq)(i) = q(p(i))$ for any two permutations p and q in S_n and every $i \in \{1, 2, \ldots, n\}$. The algebra Σ_n inherits this product.)

There are three bases currently implemented for Σ_n:

- the standard basis D_S of (sums of) descent classes, indexed by subsets S of $\{1, 2, \ldots, n-1\}$,
- the subset basis B_p, indexed by compositions p of n,
- the idempotent basis I_p, indexed by compositions p of n, which is used to construct the mutually orthogonal idempotents of the symmetric group algebra.

The idempotent basis is only defined when R is a $\mathbf{Q}$-algebra.

We follow the notations and conventions in [GR1989], apart from the order of multiplication being different from the one used in that article. Schocker's exposition [Sch2004], in turn, uses the same order of multiplication as we are, but has different notations for the bases.

INPUT:

- `R` – the base ring
- `n` – nonnegative integer

REFERENCES:

- [GR1989]
- [At1992]
- [MR1995]
- [Sch2004]

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: D = DA.D(); D
Descent algebra of 4 over Rational Field in the standard basis
sage: B = DA.B(); B
Descent algebra of 4 over Rational Field in the subset basis
sage: I = DA.I(); I
Descent algebra of 4 over Rational Field in the idempotent basis
sage: basis_B = B.basis()
sage: elt = basis_B[Composition([1,2,1])] + 4*basis_B[Composition([1,3])]; elt
B[1, 2, 1] + 4*B[1, 3]
sage: D(elt)
5*D{} + 5*D{1} + D{1, 3} + D{3}
sage: I(elt)
7/6*I[1, 1, 1, 1] + 2*I[1, 1, 2] + 3*I[1, 2, 1] + 4*I[1, 3]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> D = DA.D(); D
Descent algebra of 4 over Rational Field in the standard basis
>>> B = DA.B(); B
Descent algebra of 4 over Rational Field in the subset basis
>>> I = DA.I(); I
Descent algebra of 4 over Rational Field in the idempotent basis
>>> basis_B = B.basis()
```

(continues on next page)

(continued from previous page)

```
>>> elt = basis_B[Composition([Integer(1),Integer(2),Integer(1)])] +␣
↪Integer(4)*basis_B[Composition([Integer(1),Integer(3)])]; elt
B[1, 2, 1] + 4*B[1, 3]
>>> D(elt)
5*D{} + 5*D{1} + D{1, 3} + D{3}
>>> I(elt)
7/6*I[1, 1, 1, 1] + 2*I[1, 1, 2] + 3*I[1, 2, 1] + 4*I[1, 3]
```

As syntactic sugar, one can use the notation `D[i,...,l]` to construct elements of the basis; note that for the empty set one must use `D[[]]` due to Python's syntax:

```
sage: D[[]] + D[2] + 2*D[1,2]
D{} + 2*D{1, 2} + D{2}
```

```
>>> from sage.all import *
>>> D[[]] + D[Integer(2)] + Integer(2)*D[Integer(1),Integer(2)]
D{} + 2*D{1, 2} + D{2}
```

The same syntax works for the other bases:

```
sage: I[1,2,1] + 3*I[4] + 2*I[3,1]
I[1, 2, 1] + 2*I[3, 1] + 3*I[4]
```

```
>>> from sage.all import *
>>> I[Integer(1),Integer(2),Integer(1)] + Integer(3)*I[Integer(4)] +␣
↪Integer(2)*I[Integer(3),Integer(1)]
I[1, 2, 1] + 2*I[3, 1] + 3*I[4]
```

class B(*alg*, *prefix='B'*)

Bases: *CombinatorialFreeModule*, BindableClass

The subset basis of a descent algebra (indexed by compositions).

The subset basis $(B_S)_{S\subseteq\{1,2,\ldots,n-1\}}$ of Σ_n is formed by

$$B_S = \sum_{T\subseteq S} D_T,$$

where $(D_S)_{S\subseteq\{1,2,\ldots,n-1\}}$ is the *standard basis*. However it is more natural to index the subset basis by compositions of n under the bijection $\{i_1, i_2, \ldots, i_k\} \mapsto (i_1, i_2 - i_1, i_3 - i_2, \ldots, i_k - i_{k-1}, n - i_k)$ (where $i_1 < i_2 < \cdots < i_k$), which is what Sage uses to index the basis.

The basis element B_p is denoted Ξ^p in [Sch2004].

By using compositions of n, the product $B_p B_q$ becomes a sum over the nonnegative-integer matrices M with row sum p and column sum q. The summand corresponding to M is B_c, where c is the composition obtained by reading M row-by-row from left-to-right and top-to-bottom and removing all zeroes. This multiplication rule is commonly called "Solomon's Mackey formula".

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: B = DA.B()
sage: list(B.basis())
[B[1, 1, 1, 1], B[1, 1, 2], B[1, 2, 1], B[1, 3],
 B[2, 1, 1], B[2, 2], B[3, 1], B[4]]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> B = DA.B()
>>> list(B.basis())
[B[1, 1, 1, 1], B[1, 1, 2], B[1, 2, 1], B[1, 3],
 B[2, 1, 1], B[2, 2], B[3, 1], B[4]]
```

one_basis()

Return the identity element which is the composition $[n]$, as per `AlgebrasWithBasis.ParentMethods.one_basis`.

EXAMPLES:

```
sage: DescentAlgebra(QQ, 4).B().one_basis()
[4]
sage: DescentAlgebra(QQ, 0).B().one_basis()
[]

sage: all( U * DescentAlgebra(QQ, 3).B().one() == U
....:      for U in DescentAlgebra(QQ, 3).B().basis() )
True
```

```
>>> from sage.all import *
>>> DescentAlgebra(QQ, Integer(4)).B().one_basis()
[4]
>>> DescentAlgebra(QQ, Integer(0)).B().one_basis()
[]

>>> all( U * DescentAlgebra(QQ, Integer(3)).B().one() == U
...       for U in DescentAlgebra(QQ, Integer(3)).B().basis() )
True
```

product_on_basis(p, q)

Return $B_p B_q$, where p and q are compositions of n.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: B = DA.B()
sage: p = Composition([1,2,1])
sage: q = Composition([3,1])
sage: B.product_on_basis(p, q)
B[1, 1, 1, 1] + 2*B[1, 2, 1]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> B = DA.B()
>>> p = Composition([Integer(1),Integer(2),Integer(1)])
>>> q = Composition([Integer(3),Integer(1)])
>>> B.product_on_basis(p, q)
B[1, 1, 1, 1] + 2*B[1, 2, 1]
```

to_D_basis(p)

Return B_p as a linear combination of D-basis elements.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: B = DA.B()
sage: D = DA.D()
sage: list(map(D, B.basis()))  # indirect doctest
[D{} + D{1} + D{1, 2} + D{1, 2, 3}
  + D{1, 3} + D{2} + D{2, 3} + D{3},
 D{} + D{1} + D{1, 2} + D{2},
 D{} + D{1} + D{1, 3} + D{3},
 D{} + D{1},
 D{} + D{2} + D{2, 3} + D{3},
 D{} + D{2},
 D{} + D{3},
 D{}]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> B = DA.B()
>>> D = DA.D()
>>> list(map(D, B.basis()))  # indirect doctest
[D{} + D{1} + D{1, 2} + D{1, 2, 3}
  + D{1, 3} + D{2} + D{2, 3} + D{3},
 D{} + D{1} + D{1, 2} + D{2},
 D{} + D{1} + D{1, 3} + D{3},
 D{} + D{1},
 D{} + D{2} + D{2, 3} + D{3},
 D{} + D{2},
 D{} + D{3},
 D{}]
```

to_I_basis(p)

Return B_p as a linear combination of I-basis elements.

This is done using the formula

$$B_p = \sum_{q \leq p} \frac{1}{\mathbf{k}!(q,p)} I_q,$$

where $\leq$ is the refinement order and $\mathbf{k}!(q,p)$ is defined as follows: When $q \leq p$, we can write q as a concatenation $q_{(1)}q_{(2)}\cdots q_{(k)}$ with each $q_{(i)}$ being a composition of the i-th entry of p, and then we set $\mathbf{k}!(q,p)$ to be $l(q_{(1)})!l(q_{(2)})!\cdots l(q_{(k)})!$, where $l(r)$ denotes the number of parts of any composition r.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: B = DA.B()
sage: I = DA.I()
sage: list(map(I, B.basis()))  # indirect doctest
[I[1, 1, 1, 1],
 1/2*I[1, 1, 1, 1] + I[1, 1, 2],
 1/2*I[1, 1, 1, 1] + I[1, 2, 1],
 1/6*I[1, 1, 1, 1] + 1/2*I[1, 1, 2] + 1/2*I[1, 2, 1] + I[1, 3],
 1/2*I[1, 1, 1, 1] + I[2, 1, 1],
```

(continues on next page)

(continued from previous page)

```
 1/4*I[1, 1, 1, 1] + 1/2*I[1, 1, 2] + 1/2*I[2, 1, 1] + I[2, 2],
 1/6*I[1, 1, 1, 1] + 1/2*I[1, 2, 1] + 1/2*I[2, 1, 1] + I[3, 1],
 1/24*I[1, 1, 1, 1] + 1/6*I[1, 1, 2] + 1/6*I[1, 2, 1]
  + 1/2*I[1, 3] + 1/6*I[2, 1, 1] + 1/2*I[2, 2] + 1/2*I[3, 1] + I[4]]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> B = DA.B()
>>> I = DA.I()
>>> list(map(I, B.basis()))  # indirect doctest
[I[1, 1, 1, 1],
 1/2*I[1, 1, 1, 1] + I[1, 1, 2],
 1/2*I[1, 1, 1, 1] + I[1, 2, 1],
 1/6*I[1, 1, 1, 1] + 1/2*I[1, 1, 2] + 1/2*I[1, 2, 1] + I[1, 3],
 1/2*I[1, 1, 1, 1] + I[2, 1, 1],
 1/4*I[1, 1, 1, 1] + 1/2*I[1, 1, 2] + 1/2*I[2, 1, 1] + I[2, 2],
 1/6*I[1, 1, 1, 1] + 1/2*I[1, 2, 1] + 1/2*I[2, 1, 1] + I[3, 1],
 1/24*I[1, 1, 1, 1] + 1/6*I[1, 1, 2] + 1/6*I[1, 2, 1]
  + 1/2*I[1, 3] + 1/6*I[2, 1, 1] + 1/2*I[2, 2] + 1/2*I[3, 1] + I[4]]
```

to_nsym(*p*)

Return B_p as an element in $NSym$, the non-commutative symmetric functions.

This maps B_p to S_p where S denotes the Complete basis of $NSym$.

EXAMPLES:

```
sage: B = DescentAlgebra(QQ, 4).B()
sage: S = NonCommutativeSymmetricFunctions(QQ).Complete()
sage: list(map(S, B.basis()))  # indirect doctest
[S[1, 1, 1, 1],
 S[1, 1, 2],
 S[1, 2, 1],
 S[1, 3],
 S[2, 1, 1],
 S[2, 2],
 S[3, 1],
 S[4]]
```

```
>>> from sage.all import *
>>> B = DescentAlgebra(QQ, Integer(4)).B()
>>> S = NonCommutativeSymmetricFunctions(QQ).Complete()
>>> list(map(S, B.basis()))  # indirect doctest
[S[1, 1, 1, 1],
 S[1, 1, 2],
 S[1, 2, 1],
 S[1, 3],
 S[2, 1, 1],
 S[2, 2],
 S[3, 1],
 S[4]]
```

class D(*alg*, *prefix='D'*)

Bases: *CombinatorialFreeModule*, BindableClass

The standard basis of a descent algebra.

This basis is indexed by $S \subseteq \{1, 2, \ldots, n-1\}$, and the basis vector indexed by S is the sum of all permutations, taken in the symmetric group algebra RS_n, whose descent set is S. We denote this basis vector by D_S.

Occasionally this basis appears in literature but indexed by compositions of n rather than subsets of $\{1, 2, \ldots, n-1\}$. The equivalence between these two indexings is owed to the bijection from the power set of $\{1, 2, \ldots, n-1\}$ to the set of all compositions of n which sends every subset $\{i_1, i_2, \ldots, i_k\}$ of $\{1, 2, \ldots, n-1\}$ (with $i_1 < i_2 < \cdots < i_k$) to the composition $(i_1, i_2 - i_1, \ldots, i_k - i_{k-1}, n - i_k)$.

The basis element corresponding to a composition p (or to the subset of $\{1, 2, \ldots, n-1\}$) is denoted Δ^p in [Sch2004].

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: D = DA.D()
sage: list(D.basis())
[D{}, D{1}, D{2}, D{3}, D{1, 2}, D{1, 3}, D{2, 3}, D{1, 2, 3}]

sage: DA = DescentAlgebra(QQ, 0)
sage: D = DA.D()
sage: list(D.basis())
[D{}]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> D = DA.D()
>>> list(D.basis())
[D{}, D{1}, D{2}, D{3}, D{1, 2}, D{1, 3}, D{2, 3}, D{1, 2, 3}]

>>> DA = DescentAlgebra(QQ, Integer(0))
>>> D = DA.D()
>>> list(D.basis())
[D{}]
```

one_basis()

Return the identity element, as per `AlgebrasWithBasis.ParentMethods.one_basis`.

EXAMPLES:

```
sage: DescentAlgebra(QQ, 4).D().one_basis()
()
sage: DescentAlgebra(QQ, 0).D().one_basis()
()

sage: all( U * DescentAlgebra(QQ, 3).D().one() == U
....:      for U in DescentAlgebra(QQ, 3).D().basis() )
True
```

```
>>> from sage.all import *
>>> DescentAlgebra(QQ, Integer(4)).D().one_basis()
```

(continues on next page)

(continued from previous page)

```
()
>>> DescentAlgebra(QQ, Integer(0)).D().one_basis()
()

>>> all( U * DescentAlgebra(QQ, Integer(3)).D().one() == U
...      for U in DescentAlgebra(QQ, Integer(3)).D().basis() )
True
```

product_on_basis(S, T)

Return $D_S D_T$, where S and T are subsets of $[n-1]$.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: D = DA.D()
sage: D.product_on_basis((1, 3), (2,))
D{} + D{1} + D{1, 2} + 2*D{1, 2, 3} + D{1, 3} + D{2} + D{2, 3} + D{3}
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> D = DA.D()
>>> D.product_on_basis((Integer(1), Integer(3)), (Integer(2),))
D{} + D{1} + D{1, 2} + 2*D{1, 2, 3} + D{1, 3} + D{2} + D{2, 3} + D{3}
```

to_B_basis(S)

Return D_S as a linear combination of B_p-basis elements.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: D = DA.D()
sage: B = DA.B()
sage: list(map(B, D.basis()))  # indirect doctest
[B[4],
 B[1, 3] - B[4],
 B[2, 2] - B[4],
 B[3, 1] - B[4],
 B[1, 1, 2] - B[1, 3] - B[2, 2] + B[4],
 B[1, 2, 1] - B[1, 3] - B[3, 1] + B[4],
 B[2, 1, 1] - B[2, 2] - B[3, 1] + B[4],
 B[1, 1, 1, 1] - B[1, 1, 2] - B[1, 2, 1] + B[1, 3]
  - B[2, 1, 1] + B[2, 2] + B[3, 1] - B[4]]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> D = DA.D()
>>> B = DA.B()
>>> list(map(B, D.basis()))  # indirect doctest
[B[4],
 B[1, 3] - B[4],
 B[2, 2] - B[4],
 B[3, 1] - B[4],
```

(continues on next page)

(continued from previous page)

```
 B[1, 1, 2] - B[1, 3] - B[2, 2] + B[4],
 B[1, 2, 1] - B[1, 3] - B[3, 1] + B[4],
 B[2, 1, 1] - B[2, 2] - B[3, 1] + B[4],
 B[1, 1, 1, 1] - B[1, 1, 2] - B[1, 2, 1] + B[1, 3]
  - B[2, 1, 1] + B[2, 2] + B[3, 1] - B[4]]
```

to_symmetric_group_algebra_on_basis(*S*)

Return D_S as a linear combination of basis elements in the symmetric group algebra.

EXAMPLES:

```
sage: D = DescentAlgebra(QQ, 4).D()
sage: [D.to_symmetric_group_algebra_on_basis(tuple(b))
....:  for b in Subsets(3)]
[[1, 2, 3, 4],
 [2, 1, 3, 4] + [3, 1, 2, 4] + [4, 1, 2, 3],
 [1, 3, 2, 4] + [1, 4, 2, 3] + [2, 3, 1, 4]
  + [2, 4, 1, 3] + [3, 4, 1, 2],
 [1, 2, 4, 3] + [1, 3, 4, 2] + [2, 3, 4, 1],
 [3, 2, 1, 4] + [4, 2, 1, 3] + [4, 3, 1, 2],
 [2, 1, 4, 3] + [3, 1, 4, 2] + [3, 2, 4, 1]
  + [4, 1, 3, 2] + [4, 2, 3, 1],
 [1, 4, 3, 2] + [2, 4, 3, 1] + [3, 4, 2, 1],
 [4, 3, 2, 1]]
```

```
>>> from sage.all import *
>>> D = DescentAlgebra(QQ, Integer(4)).D()
>>> [D.to_symmetric_group_algebra_on_basis(tuple(b))
...  for b in Subsets(Integer(3))]
[[1, 2, 3, 4],
 [2, 1, 3, 4] + [3, 1, 2, 4] + [4, 1, 2, 3],
 [1, 3, 2, 4] + [1, 4, 2, 3] + [2, 3, 1, 4]
  + [2, 4, 1, 3] + [3, 4, 1, 2],
 [1, 2, 4, 3] + [1, 3, 4, 2] + [2, 3, 4, 1],
 [3, 2, 1, 4] + [4, 2, 1, 3] + [4, 3, 1, 2],
 [2, 1, 4, 3] + [3, 1, 4, 2] + [3, 2, 4, 1]
  + [4, 1, 3, 2] + [4, 2, 3, 1],
 [1, 4, 3, 2] + [2, 4, 3, 1] + [3, 4, 2, 1],
 [4, 3, 2, 1]]
```

class I(*alg*, *prefix='I'*)

Bases: *CombinatorialFreeModule*, BindableClass

The idempotent basis of a descent algebra.

The idempotent basis $(I_p)_{p \models n}$ is a basis for Σ_n whenever the ground ring is a $\mathbf{Q}$-algebra. One way to compute it is using the formula (Theorem 3.3 in [GR1989])

$$I_p = \sum_{q \leq p} \frac{(-1)^{l(q)-l(p)}}{\mathbf{k}(q,p)} B_q,$$

where $\leq$ is the refinement order and $l(r)$ denotes the number of parts of any composition r, and where $\mathbf{k}(q,p)$ is defined as follows: When $q \leq p$, we can write q as a concatenation $q_{(1)}q_{(2)}\cdots q_{(k)}$ with each $q_{(i)}$ being a composition of the i-th entry of p, and then we set $\mathbf{k}(q,p)$ to be the product $l(q_{(1)})l(q_{(2)})\cdots l(q_{(k)})$.

Let $\lambda(p)$ denote the partition obtained from a composition p by sorting. This basis is called the idempotent basis since for any q such that $\lambda(p) = \lambda(q)$, we have:

$$I_p I_q = s(\lambda) I_p$$

where λ denotes $\lambda(p) = \lambda(q)$, and where $s(\lambda)$ is the stabilizer of λ in S_n. (This is part of Theorem 4.2 in [GR1989].)

It is also straightforward to compute the idempotents E_λ for the symmetric group algebra by the formula (Theorem 3.2 in [GR1989]):

$$E_\lambda = \frac{1}{k!} \sum_{\lambda(p)=\lambda} I_p.$$

Note

The basis elements are not orthogonal idempotents.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: I = DA.I()
sage: list(I.basis())
[I[1, 1, 1, 1], I[1, 1, 2], I[1, 2, 1], I[1, 3], I[2, 1, 1], I[2, 2], I[3, 1],
↪ I[4]]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> I = DA.I()
>>> list(I.basis())
[I[1, 1, 1, 1], I[1, 1, 2], I[1, 2, 1], I[1, 3], I[2, 1, 1], I[2, 2], I[3, 1],
↪ I[4]]
```

idempotent(*la*)

Return the idempotent corresponding to the partition `la` of n.

EXAMPLES:

```
sage: I = DescentAlgebra(QQ, 4).I()
sage: E = I.idempotent([3,1]); E
1/2*I[1, 3] + 1/2*I[3, 1]
sage: E*E == E
True
sage: E2 = I.idempotent([2,1,1]); E2
1/6*I[1, 1, 2] + 1/6*I[1, 2, 1] + 1/6*I[2, 1, 1]
sage: E2*E2 == E2
True
sage: E*E2 == I.zero()
True
```

```
>>> from sage.all import *
>>> I = DescentAlgebra(QQ, Integer(4)).I()
```

(continues on next page)

(continued from previous page)

```
>>> E = I.idempotent([Integer(3),Integer(1)]); E
1/2*I[1, 3] + 1/2*I[3, 1]
>>> E*E == E
True
>>> E2 = I.idempotent([Integer(2),Integer(1),Integer(1)]); E2
1/6*I[1, 1, 2] + 1/6*I[1, 2, 1] + 1/6*I[2, 1, 1]
>>> E2*E2 == E2
True
>>> E*E2 == I.zero()
True
```

one()

Return the identity element, which is $B_{[n]}$, in the I basis.

EXAMPLES:

```
sage: DescentAlgebra(QQ, 4).I().one()
1/24*I[1, 1, 1, 1] + 1/6*I[1, 1, 2] + 1/6*I[1, 2, 1]
 + 1/2*I[1, 3] + 1/6*I[2, 1, 1] + 1/2*I[2, 2]
 + 1/2*I[3, 1] + I[4]
sage: DescentAlgebra(QQ, 0).I().one()
I[]
```

```
>>> from sage.all import *
>>> DescentAlgebra(QQ, Integer(4)).I().one()
1/24*I[1, 1, 1, 1] + 1/6*I[1, 1, 2] + 1/6*I[1, 2, 1]
 + 1/2*I[1, 3] + 1/6*I[2, 1, 1] + 1/2*I[2, 2]
 + 1/2*I[3, 1] + I[4]
>>> DescentAlgebra(QQ, Integer(0)).I().one()
I[]
```

one_basis()

The element 1 is not (generally) a basis vector in the I basis, thus this raises a `TypeError`.

EXAMPLES:

```
sage: DescentAlgebra(QQ, 4).I().one_basis()
Traceback (most recent call last):
...
TypeError: 1 is not a basis element in the I basis
```

```
>>> from sage.all import *
>>> DescentAlgebra(QQ, Integer(4)).I().one_basis()
Traceback (most recent call last):
...
TypeError: 1 is not a basis element in the I basis
```

product_on_basis(p, q)

Return $I_p I_q$, where p and q are compositions of n.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: I = DA.I()
sage: p = Composition([1,2,1])
sage: q = Composition([3,1])
sage: I.product_on_basis(p, q)
0
sage: I.product_on_basis(p, p)
2*I[1, 2, 1]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> I = DA.I()
>>> p = Composition([Integer(1),Integer(2),Integer(1)])
>>> q = Composition([Integer(3),Integer(1)])
>>> I.product_on_basis(p, q)
0
>>> I.product_on_basis(p, p)
2*I[1, 2, 1]
```

to_B_basis(p)

Return I_p as a linear combination of B-basis elements.

This is computed using the formula (Theorem 3.3 in [GR1989])

$$I_p = \sum_{q \leq p} \frac{(-1)^{l(q)-l(p)}}{\mathbf{k}(q,p)} B_q,$$

where $\leq$ is the refinement order and $l(r)$ denotes the number of parts of any composition r, and where $\mathbf{k}(q,p)$ is defined as follows: When $q \leq p$, we can write q as a concatenation $q_{(1)}q_{(2)}\cdots q_{(k)}$ with each $q_{(i)}$ being a composition of the i-th entry of p, and then we set $\mathbf{k}(q,p)$ to be $l(q_{(1)})l(q_{(2)})\cdots l(q_{(k)})$.

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: B = DA.B()
sage: I = DA.I()
sage: list(map(B, I.basis()))  # indirect doctest
[B[1, 1, 1, 1],
 -1/2*B[1, 1, 1, 1] + B[1, 1, 2],
 -1/2*B[1, 1, 1, 1] + B[1, 2, 1],
 1/3*B[1, 1, 1, 1] - 1/2*B[1, 1, 2] - 1/2*B[1, 2, 1] + B[1, 3],
 -1/2*B[1, 1, 1, 1] + B[2, 1, 1],
 1/4*B[1, 1, 1, 1] - 1/2*B[1, 1, 2] - 1/2*B[2, 1, 1] + B[2, 2],
 1/3*B[1, 1, 1, 1] - 1/2*B[1, 2, 1] - 1/2*B[2, 1, 1] + B[3, 1],
 -1/4*B[1, 1, 1, 1] + 1/3*B[1, 1, 2] + 1/3*B[1, 2, 1]
  - 1/2*B[1, 3] + 1/3*B[2, 1, 1] - 1/2*B[2, 2]
  - 1/2*B[3, 1] + B[4]]
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> B = DA.B()
>>> I = DA.I()
>>> list(map(B, I.basis()))  # indirect doctest
```

(continues on next page)

(continued from previous page)

```
[B[1, 1, 1, 1],
 -1/2*B[1, 1, 1, 1] + B[1, 1, 2],
 -1/2*B[1, 1, 1, 1] + B[1, 2, 1],
 1/3*B[1, 1, 1, 1] - 1/2*B[1, 1, 2] - 1/2*B[1, 2, 1] + B[1, 3],
 -1/2*B[1, 1, 1, 1] + B[2, 1, 1],
 1/4*B[1, 1, 1, 1] - 1/2*B[1, 1, 2] - 1/2*B[2, 1, 1] + B[2, 2],
 1/3*B[1, 1, 1, 1] - 1/2*B[1, 2, 1] - 1/2*B[2, 1, 1] + B[3, 1],
 -1/4*B[1, 1, 1, 1] + 1/3*B[1, 1, 2] + 1/3*B[1, 2, 1]
  - 1/2*B[1, 3] + 1/3*B[2, 1, 1] - 1/2*B[2, 2]
  - 1/2*B[3, 1] + B[4]]
```

a_realization()

Return a particular realization of `self` (the B-basis).

EXAMPLES:

```
sage: DA = DescentAlgebra(QQ, 4)
sage: DA.a_realization()
Descent algebra of 4 over Rational Field in the subset basis
```

```
>>> from sage.all import *
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> DA.a_realization()
Descent algebra of 4 over Rational Field in the subset basis
```

idempotent

alias of *I*

standard

alias of *D*

subset

alias of *B*

class sage.combinat.descent_algebra.**DescentAlgebraBases**(*base*)

Bases: Category_realization_of_parent

The category of bases of a descent algebra.

class ElementMethods

Bases: object

to_symmetric_group_algebra()

Return `self` in the symmetric group algebra.

EXAMPLES:

```
sage: B = DescentAlgebra(QQ, 4).B()
sage: B[1,3].to_symmetric_group_algebra()
[1, 2, 3, 4] + [2, 1, 3, 4] + [3, 1, 2, 4] + [4, 1, 2, 3]
sage: I = DescentAlgebra(QQ, 4).I()
sage: elt = I(B[1,3])
sage: elt.to_symmetric_group_algebra()
[1, 2, 3, 4] + [2, 1, 3, 4] + [3, 1, 2, 4] + [4, 1, 2, 3]
```

```
>>> from sage.all import *
>>> B = DescentAlgebra(QQ, Integer(4)).B()
>>> B[Integer(1),Integer(3)].to_symmetric_group_algebra()
[1, 2, 3, 4] + [2, 1, 3, 4] + [3, 1, 2, 4] + [4, 1, 2, 3]
>>> I = DescentAlgebra(QQ, Integer(4)).I()
>>> elt = I(B[Integer(1),Integer(3)])
>>> elt.to_symmetric_group_algebra()
[1, 2, 3, 4] + [2, 1, 3, 4] + [3, 1, 2, 4] + [4, 1, 2, 3]
```

class ParentMethods

Bases: object

to_symmetric_group_algebra()

Morphism from self to the symmetric group algebra.

EXAMPLES:

```
sage: D = DescentAlgebra(QQ, 4).D()
sage: D.to_symmetric_group_algebra(D[1,3])
[2, 1, 4, 3] + [3, 1, 4, 2] + [3, 2, 4, 1] + [4, 1, 3, 2] + [4, 2, 3, 1]
sage: B = DescentAlgebra(QQ, 4).B()
sage: B.to_symmetric_group_algebra(B[1,2,1])
[1, 2, 3, 4] + [1, 2, 4, 3] + [1, 3, 4, 2] + [2, 1, 3, 4]
 + [2, 1, 4, 3] + [2, 3, 4, 1] + [3, 1, 2, 4] + [3, 1, 4, 2]
 + [3, 2, 4, 1] + [4, 1, 2, 3] + [4, 1, 3, 2] + [4, 2, 3, 1]
```

```
>>> from sage.all import *
>>> D = DescentAlgebra(QQ, Integer(4)).D()
>>> D.to_symmetric_group_algebra(D[Integer(1),Integer(3)])
[2, 1, 4, 3] + [3, 1, 4, 2] + [3, 2, 4, 1] + [4, 1, 3, 2] + [4, 2, 3, 1]
>>> B = DescentAlgebra(QQ, Integer(4)).B()
>>> B.to_symmetric_group_algebra(B[Integer(1),Integer(2),Integer(1)])
[1, 2, 3, 4] + [1, 2, 4, 3] + [1, 3, 4, 2] + [2, 1, 3, 4]
 + [2, 1, 4, 3] + [2, 3, 4, 1] + [3, 1, 2, 4] + [3, 1, 4, 2]
 + [3, 2, 4, 1] + [4, 1, 2, 3] + [4, 1, 3, 2] + [4, 2, 3, 1]
```

to_symmetric_group_algebra_on_basis(S)

Return the basis element index by S as a linear combination of basis elements in the symmetric group algebra.

EXAMPLES:

```
sage: B = DescentAlgebra(QQ, 3).B()
sage: [B.to_symmetric_group_algebra_on_basis(c)
....:  for c in Compositions(3)]
[[1, 2, 3] + [1, 3, 2] + [2, 1, 3]
  + [2, 3, 1] + [3, 1, 2] + [3, 2, 1],
 [1, 2, 3] + [2, 1, 3] + [3, 1, 2],
 [1, 2, 3] + [1, 3, 2] + [2, 3, 1],
 [1, 2, 3]]
sage: I = DescentAlgebra(QQ, 3).I()
sage: [I.to_symmetric_group_algebra_on_basis(c)
....:  for c in Compositions(3)]
[[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1]
```

(continues on next page)

(continued from previous page)

```
  + [3, 1, 2] + [3, 2, 1],
 1/2*[1, 2, 3] - 1/2*[1, 3, 2] + 1/2*[2, 1, 3]
  - 1/2*[2, 3, 1] + 1/2*[3, 1, 2] - 1/2*[3, 2, 1],
 1/2*[1, 2, 3] + 1/2*[1, 3, 2] - 1/2*[2, 1, 3]
  + 1/2*[2, 3, 1] - 1/2*[3, 1, 2] - 1/2*[3, 2, 1],
 1/3*[1, 2, 3] - 1/6*[1, 3, 2] - 1/6*[2, 1, 3]
  - 1/6*[2, 3, 1] - 1/6*[3, 1, 2] + 1/3*[3, 2, 1]]
```

```
>>> from sage.all import *
>>> B = DescentAlgebra(QQ, Integer(3)).B()
>>> [B.to_symmetric_group_algebra_on_basis(c)
...  for c in Compositions(Integer(3))]
[[1, 2, 3] + [1, 3, 2] + [2, 1, 3]
  + [2, 3, 1] + [3, 1, 2] + [3, 2, 1],
 [1, 2, 3] + [2, 1, 3] + [3, 1, 2],
 [1, 2, 3] + [1, 3, 2] + [2, 3, 1],
 [1, 2, 3]]
>>> I = DescentAlgebra(QQ, Integer(3)).I()
>>> [I.to_symmetric_group_algebra_on_basis(c)
...  for c in Compositions(Integer(3))]
[[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1]
  + [3, 1, 2] + [3, 2, 1],
 1/2*[1, 2, 3] - 1/2*[1, 3, 2] + 1/2*[2, 1, 3]
  - 1/2*[2, 3, 1] + 1/2*[3, 1, 2] - 1/2*[3, 2, 1],
 1/2*[1, 2, 3] + 1/2*[1, 3, 2] - 1/2*[2, 1, 3]
  + 1/2*[2, 3, 1] - 1/2*[3, 1, 2] - 1/2*[3, 2, 1],
 1/3*[1, 2, 3] - 1/6*[1, 3, 2] - 1/6*[2, 1, 3]
  - 1/6*[2, 3, 1] - 1/6*[3, 1, 2] + 1/3*[3, 2, 1]]
```

super_categories()

The super categories of `self`.

EXAMPLES:

```
sage: from sage.combinat.descent_algebra import DescentAlgebraBases
sage: DA = DescentAlgebra(QQ, 4)
sage: bases = DescentAlgebraBases(DA)
sage: bases.super_categories()
[Category of finite dimensional algebras with basis over Rational Field,
 Category of realizations of Descent algebra of 4 over Rational Field]
```

```
>>> from sage.all import *
>>> from sage.combinat.descent_algebra import DescentAlgebraBases
>>> DA = DescentAlgebra(QQ, Integer(4))
>>> bases = DescentAlgebraBases(DA)
>>> bases.super_categories()
[Category of finite dimensional algebras with basis over Rational Field,
 Category of realizations of Descent algebra of 4 over Rational Field]
```

class sage.combinat.diagram_algebras.**AbstractPartitionDiagram**(*parent*, *d*, *check=True*)

Bases: *AbstractSetPartition*

Abstract base class for partition diagrams.

This class represents a single partition diagram, that is used as a basis key for a diagram algebra element. A partition diagram should be a partition of the set $\{1, \ldots, k, -1, \ldots, -k\}$. Each such set partition is regarded as a graph on nodes $\{1, \ldots, k, -1, \ldots, -k\}$ arranged in two rows, with nodes $1, \ldots, k$ in the top row from left to right and with nodes $-1, \ldots, -k$ in the bottom row from left to right, and an edge connecting two nodes if and only if the nodes lie in the same subset of the set partition.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: pd = da.AbstractPartitionDiagrams(2)
sage: pd1 = da.AbstractPartitionDiagram(pd, [[1,2],[-1,-2]])
sage: pd2 = da.AbstractPartitionDiagram(pd, [[1,2],[-1,-2]])
sage: pd1
{{-2, -1}, {1, 2}}
sage: pd1 == pd2
True
sage: pd1 == [[1,2],[-1,-2]]
True
sage: pd1 == ((-2,-1),(2,1))
True
sage: pd1 == SetPartition([[1,2],[-1,-2]])
True
sage: pd3 = da.AbstractPartitionDiagram(pd, [[1,-2],[-1,2]])
sage: pd1 == pd3
False
sage: pd4 = da.AbstractPartitionDiagram(pd, [[1,2],[3,4]])
Traceback (most recent call last):
...
ValueError: {{1, 2}, {3, 4}} does not represent two rows of vertices of order 2
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> pd = da.AbstractPartitionDiagrams(Integer(2))
>>> pd1 = da.AbstractPartitionDiagram(pd, [[Integer(1),Integer(2)],[-Integer(1),-
↪Integer(2)]])
```

(continues on next page)

(continued from previous page)

```
>>> pd2 = da.AbstractPartitionDiagram(pd, [[Integer(1),Integer(2)],[-Integer(1),-
↪Integer(2)]])
>>> pd1
{{-2, -1}, {1, 2}}
>>> pd1 == pd2
True
>>> pd1 == [[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]]
True
>>> pd1 == ((-Integer(2),-Integer(1)),(Integer(2),Integer(1)))
True
>>> pd1 == SetPartition([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]])
True
>>> pd3 = da.AbstractPartitionDiagram(pd, [[Integer(1),-Integer(2)],[-Integer(1),
↪Integer(2)]])
>>> pd1 == pd3
False
>>> pd4 = da.AbstractPartitionDiagram(pd, [[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]])
Traceback (most recent call last):
...
ValueError: {{1, 2}, {3, 4}} does not represent two rows of vertices of order 2
```

base_diagram()

Return the underlying implementation of the diagram.

OUTPUT: tuple of tuples of integers

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: pd = da.AbstractPartitionDiagrams(2)
sage: pd([[1,2],[-1,-2]]).base_diagram() == ((-2,-1),(1,2))
True
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> pd = da.AbstractPartitionDiagrams(Integer(2))
>>> pd([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]]).base_diagram() ==␣
↪((-Integer(2),-Integer(1)),(Integer(1),Integer(2)))
True
```

check()

Check the validity of the input for the diagram.

compose(*other*, *check=True*)

Compose `self` with `other`.

The composition of two diagrams X and Y is given by placing X on top of Y and removing all loops.

OUTPUT:

A tuple where the first entry is the composite diagram and the second entry is how many loop were removed.

> **Note**
>
> This is not really meant to be called directly, but it works to call it this way if desired.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: pd = da.AbstractPartitionDiagrams(2)
sage: pd([[1,2],[-1,-2]]).compose(pd([[1,2],[-1,-2]]))
({{-2, -1}, {1, 2}}, 1)
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> pd = da.AbstractPartitionDiagrams(Integer(2))
>>> pd([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]]).
↪compose(pd([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]]))
({{-2, -1}, {1, 2}}, 1)
```

count_blocks_of_size(*n*)

Count the number of blocks of a given size.

INPUT:

- `n` – positive integer

EXAMPLES:

```
sage: from sage.combinat.diagram_algebras import PartitionDiagram
sage: pd = PartitionDiagram([[1,-3,-5],[2,4],[3,-1,-2],[5],[-4]])
sage: pd.count_blocks_of_size(1)
2
sage: pd.count_blocks_of_size(2)
1
sage: pd.count_blocks_of_size(3)
2
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram_algebras import PartitionDiagram
>>> pd = PartitionDiagram([[Integer(1),-Integer(3),-Integer(5)],[Integer(2),
↪Integer(4)],[Integer(3),-Integer(1),-Integer(2)],[Integer(5)],[-
↪Integer(4)]])
>>> pd.count_blocks_of_size(Integer(1))
2
>>> pd.count_blocks_of_size(Integer(2))
1
>>> pd.count_blocks_of_size(Integer(3))
2
```

diagram()

alias of *base_diagram()*.

dual()

Return the dual diagram of `self` by flipping it top-to-bottom.

EXAMPLES:

```
sage: from sage.combinat.diagram_algebras import PartitionDiagram
sage: D = PartitionDiagram([[1,-1],[2,-2,-3],[3]])
sage: D.dual()
{{-3}, {-2, 2, 3}, {-1, 1}}
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram_algebras import PartitionDiagram
>>> D = PartitionDiagram([[Integer(1),-Integer(1)],[Integer(2),-Integer(2),-
↪Integer(3)],[Integer(3)]])
>>> D.dual()
{{-3}, {-2, 2, 3}, {-1, 1}}
```

is_planar()

Test if the diagram `self` is planar.

A diagram element is planar if the graph of the nodes is planar.

EXAMPLES:

```
sage: from sage.combinat.diagram_algebras import BrauerDiagram
sage: BrauerDiagram([[1,-2],[2,-1]]).is_planar()
False
sage: BrauerDiagram([[1,-1],[2,-2]]).is_planar()
True
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram_algebras import BrauerDiagram
>>> BrauerDiagram([[Integer(1),-Integer(2)],[Integer(2),-Integer(1)]]).is_
↪planar()
False
>>> BrauerDiagram([[Integer(1),-Integer(1)],[Integer(2),-Integer(2)]]).is_
↪planar()
True
```

order()

Return the maximum entry in the diagram element.

A diagram element will be a partition of the set $\{-1, -2, \ldots, -k, 1, 2, \ldots, k\}$. The order of the diagram element is the value k.

EXAMPLES:

```
sage: from sage.combinat.diagram_algebras import PartitionDiagram
sage: PartitionDiagram([[1,-1],[2,-2,-3],[3]]).order()
3
sage: PartitionDiagram([[1,-1]]).order()
1
sage: PartitionDiagram([[1,-3,-5],[2,4],[3,-1,-2],[5],[-4]]).order()
5
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram_algebras import PartitionDiagram
>>> PartitionDiagram([[Integer(1),-Integer(1)],[Integer(2),-Integer(2),-
↪Integer(3)],[Integer(3)]]).order()
```

(continues on next page)

(continued from previous page)

```
3
>>> PartitionDiagram([[Integer(1),-Integer(1)]]).order()
1
>>> PartitionDiagram([[Integer(1),-Integer(3),-Integer(5)],[Integer(2),
↪Integer(4)],[Integer(3),-Integer(1),-Integer(2)],[Integer(5)],[-
↪Integer(4)]]).order()
5
```

propagating_number()

Return the propagating number of the diagram.

The propagating number is the number of blocks with both a positive and negative number.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: pd = da.AbstractPartitionDiagrams(2)
sage: d1 = pd([[1,-2],[2,-1]])
sage: d1.propagating_number()
2
sage: d2 = pd([[1,2],[-2,-1]])
sage: d2.propagating_number()
0
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> pd = da.AbstractPartitionDiagrams(Integer(2))
>>> d1 = pd([[Integer(1),-Integer(2)],[Integer(2),-Integer(1)]])
>>> d1.propagating_number()
2
>>> d2 = pd([[Integer(1),Integer(2)],[-Integer(2),-Integer(1)]])
>>> d2.propagating_number()
0
```

set_partition()

Return the underlying implementation of the diagram as a set of sets.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: pd = da.AbstractPartitionDiagrams(2)
sage: X = pd([[1,2],[-1,-2]]).set_partition(); X
{{-2, -1}, {1, 2}}
sage: X.parent()
Set partitions
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> pd = da.AbstractPartitionDiagrams(Integer(2))
>>> X = pd([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]]).set_
↪partition(); X
{{-2, -1}, {1, 2}}
```

(continues on next page)

(continued from previous page)

```
>>> X.parent()
Set partitions
```

class sage.combinat.diagram_algebras.**AbstractPartitionDiagrams**(*order*, *category=None*)

Bases: Parent, UniqueRepresentation

This is an abstract base class for partition diagrams.

The primary use of this class is to serve as basis keys for diagram algebras, but diagrams also have properties in their own right. Furthermore, this class is meant to be extended to create more efficient contains methods.

INPUT:

- `order` – integer or integer $+1/2$; the order of the diagrams
- `category` – (default: `FiniteEnumeratedSets()`) the category

All concrete classes should implement attributes

- `_name` – the name of the class
- `_diagram_func` – an iterator function that takes the order as its only input

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: pd = da.PartitionDiagrams(2)
sage: pd
Partition diagrams of order 2
sage: pd.an_element() in pd
True
sage: elm = pd([[1,2],[-1,-2]])
sage: elm in pd
True
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> pd = da.PartitionDiagrams(Integer(2))
>>> pd
Partition diagrams of order 2
>>> pd.an_element() in pd
True
>>> elm = pd([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]])
>>> elm in pd
True
```

Element

alias of *AbstractPartitionDiagram*

class sage.combinat.diagram_algebras.**BrauerAlgebra**(*k*, *q*, *base_ring*, *prefix*)

Bases: *SubPartitionAlgebra*, *UnitDiagramMixin*

A Brauer algebra.

The Brauer algebra of rank k is an algebra with basis indexed by the collection of set partitions of $\{1, \ldots, k, -1, \ldots, -k\}$ with block size 2.

This algebra is a subalgebra of the partition algebra. For more information, see *PartitionAlgebra*.

INPUT:

- k – rank of the algebra
- q – the deformation parameter q
- base_ring – (default: None) a ring containing q; if None then just takes the parent of q
- prefix – (default: 'B') a label for the basis elements

EXAMPLES:

We now define the Brauer algebra of rank 2 with parameter x over **Z**:

```
sage: R.<x> = ZZ[]
sage: B = BrauerAlgebra(2, x, R)
sage: B
Brauer Algebra of rank 2 with parameter x
 over Univariate Polynomial Ring in x over Integer Ring
sage: B.basis()
Lazy family (Term map from Brauer diagrams of order 2 to Brauer Algebra
 of rank 2 with parameter x over Univariate Polynomial Ring in x
 over Integer Ring(i))_{i in Brauer diagrams of order 2}
sage: B.basis().keys()
Brauer diagrams of order 2
sage: B.basis().keys()([[-2, 1], [2, -1]])
{{-2, 1}, {-1, 2}}
sage: b = B.basis().list(); b
[B{{-2, -1}, {1, 2}}, B{{-2, 1}, {-1, 2}}, B{{-2, 2}, {-1, 1}}]
sage: b[0]
B{{-2, -1}, {1, 2}}
sage: b[0]^2
x*B{{-2, -1}, {1, 2}}
sage: b[0]^5
x^4*B{{-2, -1}, {1, 2}}
```

```
>>> from sage.all import *
>>> R = ZZ['x']; (x,) = R._first_ngens(1)
>>> B = BrauerAlgebra(Integer(2), x, R)
>>> B
Brauer Algebra of rank 2 with parameter x
 over Univariate Polynomial Ring in x over Integer Ring
>>> B.basis()
Lazy family (Term map from Brauer diagrams of order 2 to Brauer Algebra
 of rank 2 with parameter x over Univariate Polynomial Ring in x
 over Integer Ring(i))_{i in Brauer diagrams of order 2}
>>> B.basis().keys()
Brauer diagrams of order 2
>>> B.basis().keys()([[-Integer(2), Integer(1)], [Integer(2), -Integer(1)]])
{{-2, 1}, {-1, 2}}
>>> b = B.basis().list(); b
[B{{-2, -1}, {1, 2}}, B{{-2, 1}, {-1, 2}}, B{{-2, 2}, {-1, 1}}]
>>> b[Integer(0)]
B{{-2, -1}, {1, 2}}
>>> b[Integer(0)]**Integer(2)
x*B{{-2, -1}, {1, 2}}
```

(continues on next page)

(continued from previous page)

```
>>> b[Integer(0)]**Integer(5)
x^4*B{{-2, -1}, {1, 2}}
```

Note, also that since the symmetric group algebra is contained in the Brauer algebra, there is also a conversion between the two.

```
sage: R.<x> = ZZ[]
sage: B = BrauerAlgebra(2, x, R)
sage: S = SymmetricGroupAlgebra(R, 2)
sage: S([2,1])*B([[1,-1],[2,-2]])
B{{-2, 1}, {-1, 2}}
```

```
>>> from sage.all import *
>>> R = ZZ['x']; (x,) = R._first_ngens(1)
>>> B = BrauerAlgebra(Integer(2), x, R)
>>> S = SymmetricGroupAlgebra(R, Integer(2))
>>> S([Integer(2),Integer(1)])*B([[Integer(1),-Integer(1)],[Integer(2),-
↪Integer(2)]])
B{{-2, 1}, {-1, 2}}
```

jucys_murphy(j)

Return the `j`-th generalized Jucys-Murphy element of `self`.

The j-th Jucys-Murphy element of a Brauer algebra is simply the j-th Jucys-Murphy element of the symmetric group algebra with an extra $(z-1)/2$ term, where `z` is the parameter of the Brauer algebra.

REFERENCES:

EXAMPLES:

```
sage: # needs sage.symbolic
sage: z = var('z')
sage: B = BrauerAlgebra(3,z)
sage: B.jucys_murphy(1)
(1/2*z-1/2)*B{{-3, 3}, {-2, 2}, {-1, 1}}
sage: B.jucys_murphy(3)
-B{{-3, -2}, {-1, 1}, {2, 3}} - B{{-3, -1}, {-2, 2}, {1, 3}}
 + B{{-3, 1}, {-2, 2}, {-1, 3}} + B{{-3, 2}, {-2, 3}, {-1, 1}}
 + (1/2*z-1/2)*B{{-3, 3}, {-2, 2}, {-1, 1}}
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> z = var('z')
>>> B = BrauerAlgebra(Integer(3),z)
>>> B.jucys_murphy(Integer(1))
(1/2*z-1/2)*B{{-3, 3}, {-2, 2}, {-1, 1}}
>>> B.jucys_murphy(Integer(3))
-B{{-3, -2}, {-1, 1}, {2, 3}} - B{{-3, -1}, {-2, 2}, {1, 3}}
 + B{{-3, 1}, {-2, 2}, {-1, 3}} + B{{-3, 2}, {-2, 3}, {-1, 1}}
 + (1/2*z-1/2)*B{{-3, 3}, {-2, 2}, {-1, 1}}
```

options = Current options for Brauer diagram - display: normal

class sage.combinat.diagram_algebras.**BrauerDiagram**(*parent*, *d*, *check=True*)

Bases: *AbstractPartitionDiagram*

A Brauer diagram.

A Brauer diagram for an integer k is a partition of the set $\{1, \dots, k, -1, \dots, -k\}$ with block size 2.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: bd = da.BrauerDiagrams(2)
sage: bd1 = bd([[1,2],[-1,-2]])
sage: bd2 = bd([[1,2,-1,-2]])
Traceback (most recent call last):
...
ValueError: all blocks of {{-2, -1, 1, 2}} must be of size 2
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> bd = da.BrauerDiagrams(Integer(2))
>>> bd1 = bd([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]])
>>> bd2 = bd([[Integer(1),Integer(2),-Integer(1),-Integer(2)]])
Traceback (most recent call last):
...
ValueError: all blocks of {{-2, -1, 1, 2}} must be of size 2
```

bijection_on_free_nodes(*two_line=False*)

Return the induced bijection - as a list of $(x, f(x))$ values - from the free nodes on the top at the Brauer diagram to the free nodes at the bottom of `self`.

OUTPUT:

If `two_line` is `True`, then the output is the induced bijection as a two-row list `(inputs, outputs)`.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: bd = da.BrauerDiagrams(3)
sage: elm = bd([[1,2],[-2,-3],[3,-1]])
sage: elm.bijection_on_free_nodes()
[[3, -1]]
sage: elm2 = bd([[1,-2],[2,-3],[3,-1]])
sage: elm2.bijection_on_free_nodes(two_line=True)
[[1, 2, 3], [-2, -3, -1]]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> bd = da.BrauerDiagrams(Integer(3))
>>> elm = bd([[Integer(1),Integer(2)],[-Integer(2),-Integer(3)],[Integer(3),-
↪Integer(1)]])
>>> elm.bijection_on_free_nodes()
[[3, -1]]
>>> elm2 = bd([[Integer(1),-Integer(2)],[Integer(2),-Integer(3)],[Integer(3),-
↪Integer(1)]])
>>> elm2.bijection_on_free_nodes(two_line=True)
[[1, 2, 3], [-2, -3, -1]]
```

check()

Check the validity of the input for `self`.

involution_permutation_triple(*curt=True*)

Return the involution permutation triple of `self`.

From Graham-Lehrer (see *BrauerDiagrams*), a Brauer diagram is a triple (D_1, D_2, π), where:

- D_1 is a partition of the top nodes;
- D_2 is a partition of the bottom nodes;
- π is the induced permutation on the free nodes.

INPUT:

- `curt` – boolean (default: `True`); if `True`, then return bijection on free nodes as a one-line notation (standardized to look like a permutation), else, return the honest mapping, a list of pairs $(i, -j)$ describing the bijection on free nodes

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: bd = da.BrauerDiagrams(3)
sage: elm = bd([[1,2],[-2,-3],[3,-1]])
sage: elm.involution_permutation_triple()
([(1, 2)], [(-3, -2)], [1])
sage: elm.involution_permutation_triple(curt=False)
([(1, 2)], [(-3, -2)], [[3, -1]])
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> bd = da.BrauerDiagrams(Integer(3))
>>> elm = bd([[Integer(1),Integer(2)],[-Integer(2),-Integer(3)],[Integer(3),-
↪Integer(1)]])
>>> elm.involution_permutation_triple()
([(1, 2)], [(-3, -2)], [1])
>>> elm.involution_permutation_triple(curt=False)
([(1, 2)], [(-3, -2)], [[3, -1]])
```

is_elementary_symmetric()

Check if is elementary symmetric.

Let (D_1, D_2, π) be the Graham-Lehrer representation of the Brauer diagram d. We say d is *elementary symmetric* if $D_1 = D_2$ and π is the identity.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: bd = da.BrauerDiagrams(3)
sage: elm = bd([[1,2],[-1,-2],[3,-3]])
sage: elm.is_elementary_symmetric()
True
sage: elm2 = bd([[1,2],[-1,-3],[3,-2]])
sage: elm2.is_elementary_symmetric()
False
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> bd = da.BrauerDiagrams(Integer(3))
>>> elm = bd([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)],[Integer(3),-
↪Integer(3)]])
>>> elm.is_elementary_symmetric()
True
>>> elm2 = bd([[Integer(1),Integer(2)],[-Integer(1),-Integer(3)],[Integer(3),-
↪Integer(2)]])
>>> elm2.is_elementary_symmetric()
False
```

options = Current options for Brauer diagram - display: normal

perm()

Return the induced bijection on the free nodes of `self` in one-line notation, re-indexed and treated as a permutation.

See also

bijection_on_free_nodes()

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: bd = da.BrauerDiagrams(3)
sage: elm = bd([[1,2],[-2,-3],[3,-1]])
sage: elm.perm()
[1]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> bd = da.BrauerDiagrams(Integer(3))
>>> elm = bd([[Integer(1),Integer(2)],[-Integer(2),-Integer(3)],[Integer(3),-
↪Integer(1)]])
>>> elm.perm()
[1]
```

class sage.combinat.diagram_algebras.**BrauerDiagrams**(*order*, *category=None*)

Bases: *AbstractPartitionDiagrams*

This class represents all Brauer diagrams of integer or integer $+1/2$ order. For more information on Brauer diagrams, see *BrauerAlgebra*.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: bd = da.BrauerDiagrams(2); bd
Brauer diagrams of order 2
sage: bd.list()
[{{-2, -1}, {1, 2}}, {{-2, 1}, {-1, 2}}, {{-2, 2}, {-1, 1}}]

sage: bd = da.BrauerDiagrams(5/2); bd
```

(continues on next page)

(continued from previous page)

```
Brauer diagrams of order 5/2
sage: bd.list()
[{{-3, 3}, {-2, -1}, {1, 2}},
 {{-3, 3}, {-2, 1}, {-1, 2}},
 {{-3, 3}, {-2, 2}, {-1, 1}}]
```

 {{-3, 3}, {-2, 2}, {-1, 1}}]
```

Element

alias of *BrauerDiagram*

cardinality()

Return the cardinality of `self`.

The number of Brauer diagrams of integer order k is $(2k-1)!!$.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: bd = da.BrauerDiagrams(3)
sage: bd.cardinality()
15

sage: bd = da.BrauerDiagrams(7/2)
sage: bd.cardinality()
15
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> bd = da.BrauerDiagrams(Integer(3))
>>> bd.cardinality()
15

>>> bd = da.BrauerDiagrams(Integer(7)/Integer(2))
>>> bd.cardinality()
15
```

from_involution_permutation_triple(*D1_D2_pi*)

Construct a Brauer diagram of `self` from an involution permutation triple.

A Brauer diagram can be represented as a triple where the first entry is a list of arcs on the top row of the diagram, the second entry is a list of arcs on the bottom row of the diagram, and the third entry is a permutation

on the remaining nodes. This triple is called the *involution permutation triple*. For more information, see [GL1996].

INPUT:

- `D1_D2_pi` – list or tuple where the first entry is a list of arcs on the top of the diagram, the second entry is a list of arcs on the bottom of the diagram, and the third entry is a permutation on the free nodes.

REFERENCES:

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: bd = da.BrauerDiagrams(4)
sage: bd.from_involution_permutation_triple([[[1,2]],[[3,4]],[2,1]])
{{-4, -3}, {-2, 3}, {-1, 4}, {1, 2}}
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> bd = da.BrauerDiagrams(Integer(4))
>>> bd.from_involution_permutation_triple([[[Integer(1),Integer(2)]],
↪[[Integer(3),Integer(4)]],[Integer(2),Integer(1)]])
{{-4, -3}, {-2, 3}, {-1, 4}, {1, 2}}
```

options = Current options for Brauer diagram - display: normal

symmetric_diagrams(*l=None*, *perm=None*)

Return the list of Brauer diagrams with symmetric placement of l arcs, and with free nodes permuted according to $perm$.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: bd = da.BrauerDiagrams(4)
sage: bd.symmetric_diagrams(l=1, perm=[2,1])
[{{-4, -2}, {-3, 1}, {-1, 3}, {2, 4}},
 {{-4, -3}, {-2, 1}, {-1, 2}, {3, 4}},
 {{-4, -1}, {-3, 2}, {-2, 3}, {1, 4}},
 {{-4, 2}, {-3, -1}, {-2, 4}, {1, 3}},
 {{-4, 3}, {-3, 4}, {-2, -1}, {1, 2}},
 {{-4, 1}, {-3, -2}, {-1, 4}, {2, 3}}]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> bd = da.BrauerDiagrams(Integer(4))
>>> bd.symmetric_diagrams(l=Integer(1), perm=[Integer(2),Integer(1)])
[{{-4, -2}, {-3, 1}, {-1, 3}, {2, 4}},
 {{-4, -3}, {-2, 1}, {-1, 2}, {3, 4}},
 {{-4, -1}, {-3, 2}, {-2, 3}, {1, 4}},
 {{-4, 2}, {-3, -1}, {-2, 4}, {1, 3}},
 {{-4, 3}, {-3, 4}, {-2, -1}, {1, 2}},
 {{-4, 1}, {-3, -2}, {-1, 4}, {2, 3}}]
```

class sage.combinat.diagram_algebras.**DiagramAlgebra**(*k*, *q*, *base_ring*, *prefix*, *diagrams*, *category=None*)

Bases: *CombinatorialFreeModule*

Abstract class for diagram algebras and is not designed to be used directly.

class Element

Bases: IndexedFreeModuleElement

An element of a diagram algebra.

This subclass provides a few additional methods for partition algebra elements. Most element methods are already implemented elsewhere.

diagram()

Return the underlying diagram of `self` if `self` is a basis element. Raises an error if `self` is not a basis element.

EXAMPLES:

```
sage: R.<x> = ZZ[]
sage: P = PartitionAlgebra(2, x, R)
sage: elt = 3*P([[1,2],[-2,-1]])
sage: elt.diagram()
{{-2, -1}, {1, 2}}
```

```
>>> from sage.all import *
>>> R = ZZ['x']; (x,) = R._first_ngens(1)
>>> P = PartitionAlgebra(Integer(2), x, R)
>>> elt = Integer(3)*P([[Integer(1),Integer(2)],[-Integer(2),-
↪Integer(1)]])
>>> elt.diagram()
{{-2, -1}, {1, 2}}
```

diagrams()

Return the diagrams in the support of `self`.

EXAMPLES:

```
sage: R.<x> = ZZ[]
sage: P = PartitionAlgebra(2, x, R)
sage: elt = 3*P([[1,2],[-2,-1]]) + P([[1,2],[-2], [-1]])
sage: sorted(elt.diagrams(), key=str)
[{{-2, -1}, {1, 2}}, {{-2}, {-1}, {1, 2}}]
```

```
>>> from sage.all import *
>>> R = ZZ['x']; (x,) = R._first_ngens(1)
>>> P = PartitionAlgebra(Integer(2), x, R)
>>> elt = Integer(3)*P([[Integer(1),Integer(2)],[-Integer(2),-
↪Integer(1)]]) + P([[Integer(1),Integer(2)],[-Integer(2)], [-
↪Integer(1)]])
>>> sorted(elt.diagrams(), key=str)
[{{-2, -1}, {1, 2}}, {{-2}, {-1}, {1, 2}}]
```

order()

Return the order of `self`.

The order of a partition algebra is defined as half of the number of nodes in the diagrams.

EXAMPLES:

```
sage: q = var('q')                                                          #␣
↪needs sage.symbolic
sage: PA = PartitionAlgebra(2, q)                                           #␣
↪needs sage.symbolic
sage: PA.order()                                                            #␣
↪needs sage.symbolic
2
```

```
>>> from sage.all import *
>>> q = var('q')                                                          #␣
↪needs sage.symbolic
>>> PA = PartitionAlgebra(Integer(2), q)                                     ␣
↪     # needs sage.symbolic
>>> PA.order()                                                            #␣
↪needs sage.symbolic
2
```

set_partitions()

Return the collection of underlying set partitions indexing the basis elements of a given diagram algebra.

Todo

Is this really necessary? deprecate?

class sage.combinat.diagram_algebras.**DiagramBasis**(*k*, *q*, *base_ring*, *prefix*, *diagrams*, *category=None*)

Bases: *DiagramAlgebra*

Abstract base class for diagram algebras in the diagram basis.

product_on_basis(*d1*, *d2*)

Return the product $D_{d_1} D_{d_2}$ by two basis diagrams.

class sage.combinat.diagram_algebras.**HalfTemperleyLiebDiagrams**(*order*, *defects*)

Bases: UniqueRepresentation, Parent

Half diagrams for the Temperley-Lieb algebra cell modules.

class Element(*parent*, *d*, *check=True*)

Bases: *AbstractPartitionDiagram*

check()

Check the validity of the input of `self`.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: htld = da.HalfTemperleyLiebDiagrams(7, 3)
sage: htld([[1,2], [3,4]])  # indirect doctest
{{1, 2}, {3, 4}}
sage: htld([[1,2], [-1, -2]])  # indirect doctest
Traceback (most recent call last):
...
ValueError: {{-2, -1}, {1, 2}} does not represent a half TL diagram of␣
↪order 7
```

(continues on next page)

(continued from previous page)

```
sage: htld([[1,2,3], [4,5]])  # indirect doctest
Traceback (most recent call last):
...
ValueError: all blocks of {{1, 2, 3}, {4, 5}} must be of size 2
sage: htld([[1,2], [3,4], [5,6]])  # indirect doctest
Traceback (most recent call last):
...
ValueError: {{1, 2}, {3, 4}, {5, 6}} does not have 3 defects
sage: htld([[1,3], [2,4]])  # indirect doctest
Traceback (most recent call last):
...
ValueError: {{1, 3}, {2, 4}} is not planar
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> htld = da.HalfTemperleyLiebDiagrams(Integer(7), Integer(3))
>>> htld([[Integer(1),Integer(2)], [Integer(3),Integer(4)]])  # indirect␣
↪doctest
{{1, 2}, {3, 4}}
>>> htld([[Integer(1),Integer(2)], [-Integer(1), -Integer(2)]])  #␣
↪indirect doctest
Traceback (most recent call last):
...
ValueError: {{-2, -1}, {1, 2}} does not represent a half TL diagram of␣
↪order 7
>>> htld([[Integer(1),Integer(2),Integer(3)], [Integer(4),Integer(5)]])
↪# indirect doctest
Traceback (most recent call last):
...
ValueError: all blocks of {{1, 2, 3}, {4, 5}} must be of size 2
>>> htld([[Integer(1),Integer(2)], [Integer(3),Integer(4)], [Integer(5),
↪Integer(6)]])  # indirect doctest
Traceback (most recent call last):
...
ValueError: {{1, 2}, {3, 4}, {5, 6}} does not have 3 defects
>>> htld([[Integer(1),Integer(3)], [Integer(2),Integer(4)]])  # indirect␣
↪doctest
Traceback (most recent call last):
...
ValueError: {{1, 3}, {2, 4}} is not planar
```

defects()

Return the defects of `self`.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: htld = da.HalfTemperleyLiebDiagrams(7, 3)
sage: d = htld([[1, 2], [4, 5]])
sage: d.defects()
frozenset({3, 6, 7})
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> htld = da.HalfTemperleyLiebDiagrams(Integer(7), Integer(3))
>>> d = htld([[Integer(1), Integer(2)], [Integer(4), Integer(5)]])
>>> d.defects()
frozenset({3, 6, 7})
```

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: htld = da.HalfTemperleyLiebDiagrams(7, 3)
sage: htld.cardinality()
14
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> htld = da.HalfTemperleyLiebDiagrams(Integer(7), Integer(3))
>>> htld.cardinality()
14
```

class sage.combinat.diagram_algebras.**IdealDiagram**(*parent*, *d*, *check=True*)

Bases: *AbstractPartitionDiagram*

The element class for a ideal diagram.

An ideal diagram for an integer k is a partition of the set $\{1, \ldots, k, -1, \ldots, -k\}$ where the propagating number is strictly smaller than the order.

EXAMPLES:

```
sage: from sage.combinat.diagram_algebras import IdealDiagrams as IDs
sage: IDs(2)
Ideal diagrams of order 2
sage: IDs(2).list()
[{{-2, -1, 1, 2}},
 {{-2, 1, 2}, {-1}},
 {{-2}, {-1, 1, 2}},
 {{-2, -1}, {1, 2}},
 {{-2}, {-1}, {1, 2}},
 {{-2, -1, 1}, {2}},
 {{-2, 1}, {-1}, {2}},
 {{-2, -1, 2}, {1}},
 {{-2, 2}, {-1}, {1}},
 {{-2}, {-1, 1}, {2}},
 {{-2}, {-1, 2}, {1}},
 {{-2, -1}, {1}, {2}},
 {{-2}, {-1}, {1}, {2}}]

sage: from sage.combinat.diagram_algebras import PartitionDiagrams as PDs
sage: PDs(4).cardinality() == factorial(4) + IDs(4).cardinality()
True
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram_algebras import IdealDiagrams as IDs
>>> IDs(Integer(2))
Ideal diagrams of order 2
>>> IDs(Integer(2)).list()
[{{-2, -1, 1, 2}},
 {{-2, 1, 2}, {-1}},
 {{-2}, {-1, 1, 2}},
 {{-2, -1}, {1, 2}},
 {{-2}, {-1}, {1, 2}},
 {{-2, -1, 1}, {2}},
 {{-2, 1}, {-1}, {2}},
 {{-2, -1, 2}, {1}},
 {{-2, 2}, {-1}, {1}},
 {{-2}, {-1, 1}, {2}},
 {{-2}, {-1, 2}, {1}},
 {{-2, -1}, {1}, {2}},
 {{-2}, {-1}, {1}, {2}}]

>>> from sage.combinat.diagram_algebras import PartitionDiagrams as PDs
>>> PDs(Integer(4)).cardinality() == factorial(Integer(4)) + IDs(Integer(4)).
↪cardinality()
True
```

check()

Check the validity of the input for `self`.

class sage.combinat.diagram_algebras.**IdealDiagrams**(*order*, *category=None*)

Bases: *AbstractPartitionDiagrams*

All "ideal" diagrams of integer or integer $+1/2$ order.

If k is an integer then an ideal diagram of order k is a partition diagram of order k with propagating number less than k.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: id = da.IdealDiagrams(3)
sage: id.an_element() in id
True
sage: id.cardinality() == len(id.list())
True
sage: da.IdealDiagrams(3/2).list()
[{{-2, -1, 1, 2}},
 {{-2, 1, 2}, {-1}},
 {{-2, -1, 2}, {1}},
 {{-2, 2}, {-1}, {1}}]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> id = da.IdealDiagrams(Integer(3))
>>> id.an_element() in id
True
```

(continues on next page)

(continued from previous page)

```
>>> id.cardinality() == len(id.list())
True
>>> da.IdealDiagrams(Integer(3)/Integer(2)).list()
[{{-2, -1, 1, 2}},
 {{-2, 1, 2}, {-1}},
 {{-2, -1, 2}, {1}},
 {{-2, 2}, {-1}, {1}}]
```

Element

alias of *IdealDiagram*

class sage.combinat.diagram_algebras.**OrbitBasis**(*alg*)

Bases: *DiagramAlgebra*

The orbit basis of the partition algebra.

Let D_π represent the diagram basis element indexed by the partition π, then (see equations (2.14), (2.17) and (2.18) of [BH2017])

$$D_\pi = \sum_{\tau \geq \pi} O_\tau,$$

where the sum is over all partitions τ which are coarser than π and O_τ is the orbit basis element indexed by the partition τ.

If $\mu_{2k}(\pi, \tau)$ represents the Moebius function of the partition lattice, then

$$O_\pi = \sum_{\tau \geq \pi} \mu_{2k}(\pi, \tau) D_\tau.$$

If τ is a partition of ℓ blocks and the i-th block of τ is a union of b_i blocks of π, then

$$\mu_{2k}(\pi, \tau) = \prod_{i=1}^{\ell} (-1)^{b_i - 1} (b_i - 1)!.$$

EXAMPLES:

```
sage: R.<x> = QQ[]
sage: P2 = PartitionAlgebra(2, x, R)
sage: O2 = P2.orbit_basis(); O2
Orbit basis of Partition Algebra of rank 2 with parameter x over
 Univariate Polynomial Ring in x over Rational Field
sage: oa = O2([[1],[-1],[2,-2]]); ob = O2([[-1,-2,2],[1]]); oa, ob
(O{{-2, 2}, {-1}, {1}}, O{{-2, -1, 2}, {1}})
sage: oa * ob
(x-2)*O{{-2, -1, 2}, {1}}
```

```
>>> from sage.all import *
>>> R = QQ['x']; (x,) = R._first_ngens(1)
>>> P2 = PartitionAlgebra(Integer(2), x, R)
>>> O2 = P2.orbit_basis(); O2
Orbit basis of Partition Algebra of rank 2 with parameter x over
 Univariate Polynomial Ring in x over Rational Field
>>> oa = O2([[Integer(1)],[-Integer(1)],[Integer(2),-Integer(2)]]); ob = O2([[-
```

(continues on next page)

(continued from previous page)

```
↪Integer(1),-Integer(2),Integer(2)],[Integer(1)]]); oa, ob
(O{{-2, 2}, {-1}, {1}}, O{{-2, -1, 2}, {1}})
>>> oa * ob
(x-2)*O{{-2, -1, 2}, {1}}
```

We can convert between the two bases:

```
sage: pa = P2(oa); pa
2*P{{-2, -1, 1, 2}} - P{{-2, -1, 2}, {1}} - P{{-2, 1, 2}, {-1}}
 + P{{-2, 2}, {-1}, {1}} - P{{-2, 2}, {-1, 1}}
sage: pa * ob
(-x+2)*P{{-2, -1, 1, 2}} + (x-2)*P{{-2, -1, 2}, {1}}
sage: _ == pa * P2(ob)
True
sage: O2(pa * ob)
(x-2)*O{{-2, -1, 2}, {1}}
```

```
>>> from sage.all import *
>>> pa = P2(oa); pa
2*P{{-2, -1, 1, 2}} - P{{-2, -1, 2}, {1}} - P{{-2, 1, 2}, {-1}}
 + P{{-2, 2}, {-1}, {1}} - P{{-2, 2}, {-1, 1}}
>>> pa * ob
(-x+2)*P{{-2, -1, 1, 2}} + (x-2)*P{{-2, -1, 2}, {1}}
>>> _ == pa * P2(ob)
True
>>> O2(pa * ob)
(x-2)*O{{-2, -1, 2}, {1}}
```

Note that the unit in the orbit basis is not a single diagram, in contrast to the natural diagram basis:

```
sage: P2.one()
P{{-2, 2}, {-1, 1}}
sage: O2.one()
O{{-2, -1, 1, 2}} + O{{-2, 2}, {-1, 1}}
sage: O2.one() == P2.one()
True
```

```
>>> from sage.all import *
>>> P2.one()
P{{-2, 2}, {-1, 1}}
>>> O2.one()
O{{-2, -1, 1, 2}} + O{{-2, 2}, {-1, 1}}
>>> O2.one() == P2.one()
True
```

class Element

Bases: *Element*

to_diagram_basis()

Expand `self` in the natural diagram basis of the partition algebra.

EXAMPLES:

```
sage: R.<x> = QQ[]
sage: P = PartitionAlgebra(2, x, R)
sage: O = P.orbit_basis()
sage: elt = O.an_element(); elt
3*O{{-2}, {-1, 1, 2}} + 2*O{{-2, -1, 1, 2}} + 2*O{{-2, 1, 2}, {-1}}
sage: elt.to_diagram_basis()
3*P{{-2}, {-1, 1, 2}} - 3*P{{-2, -1, 1, 2}} + 2*P{{-2, 1, 2}, {-1}}
sage: pp = P.an_element(); pp
3*P{{-2}, {-1, 1, 2}} + 2*P{{-2, -1, 1, 2}} + 2*P{{-2, 1, 2}, {-1}}
sage: op = pp.to_orbit_basis(); op
3*O{{-2}, {-1, 1, 2}} + 7*O{{-2, -1, 1, 2}} + 2*O{{-2, 1, 2}, {-1}}
sage: pp == op.to_diagram_basis()
True
```

```
>>> from sage.all import *
>>> R = QQ['x']; (x,) = R._first_ngens(1)
>>> P = PartitionAlgebra(Integer(2), x, R)
>>> O = P.orbit_basis()
>>> elt = O.an_element(); elt
3*O{{-2}, {-1, 1, 2}} + 2*O{{-2, -1, 1, 2}} + 2*O{{-2, 1, 2}, {-1}}
>>> elt.to_diagram_basis()
3*P{{-2}, {-1, 1, 2}} - 3*P{{-2, -1, 1, 2}} + 2*P{{-2, 1, 2}, {-1}}
>>> pp = P.an_element(); pp
3*P{{-2}, {-1, 1, 2}} + 2*P{{-2, -1, 1, 2}} + 2*P{{-2, 1, 2}, {-1}}
>>> op = pp.to_orbit_basis(); op
3*O{{-2}, {-1, 1, 2}} + 7*O{{-2, -1, 1, 2}} + 2*O{{-2, 1, 2}, {-1}}
>>> pp == op.to_diagram_basis()
True
```

diagram_basis()

Return the associated partition algebra of `self` in the diagram basis.

EXAMPLES:

```
sage: R.<x> = QQ[]
sage: O2 = PartitionAlgebra(2, x, R).orbit_basis()
sage: P2 = O2.diagram_basis(); P2
Partition Algebra of rank 2 with parameter x over Univariate
Polynomial Ring in x over Rational Field
sage: o2 = O2.an_element(); o2
3*O{{-2}, {-1, 1, 2}} + 2*O{{-2, -1, 1, 2}} + 2*O{{-2, 1, 2}, {-1}}
sage: P2(o2)
3*P{{-2}, {-1, 1, 2}} - 3*P{{-2, -1, 1, 2}} + 2*P{{-2, 1, 2}, {-1}}
```

```
>>> from sage.all import *
>>> R = QQ['x']; (x,) = R._first_ngens(1)
>>> O2 = PartitionAlgebra(Integer(2), x, R).orbit_basis()
>>> P2 = O2.diagram_basis(); P2
Partition Algebra of rank 2 with parameter x over Univariate
Polynomial Ring in x over Rational Field
>>> o2 = O2.an_element(); o2
3*O{{-2}, {-1, 1, 2}} + 2*O{{-2, -1, 1, 2}} + 2*O{{-2, 1, 2}, {-1}}
>>> P2(o2)
```

(continues on next page)

(continued from previous page)

```
3*P{{-2}, {-1, 1, 2}} - 3*P{{-2, -1, 1, 2}} + 2*P{{-2, 1, 2}, {-1}}
```

one()

Return the element 1 of the partition algebra in the orbit basis.

EXAMPLES:

```
sage: R.<x> = QQ[]
sage: P2 = PartitionAlgebra(2, x, R)
sage: O2 = P2.orbit_basis()
sage: O2.one()
O{{-2, -1, 1, 2}} + O{{-2, 2}, {-1, 1}}
```

```
>>> from sage.all import *
>>> R = QQ['x']; (x,) = R._first_ngens(1)
>>> P2 = PartitionAlgebra(Integer(2), x, R)
>>> O2 = P2.orbit_basis()
>>> O2.one()
O{{-2, -1, 1, 2}} + O{{-2, 2}, {-1, 1}}
```

product_on_basis(*d1*, *d2*)

Return the product $O_{d_1} O_{d_2}$ of two elements in the orbit basis `self`.

EXAMPLES:

```
sage: R.<x> = QQ[]
sage: OP = PartitionAlgebra(2, x, R).orbit_basis()
sage: SP = OP.basis().keys(); sp = SP([[-2, -1, 1, 2]])
sage: OP.product_on_basis(sp, sp)
O{{-2, -1, 1, 2}}
sage: o1 = OP.one(); o2 = OP([]); o3 = OP.an_element()
sage: o2 == o1
False
sage: o1 * o1 == o1
True
sage: o3 * o1 == o1 * o3 and o3 * o1 == o3
True
sage: o4 = (3*OP([[-2, -1, 1], [2]]) + 2*OP([[-2, -1, 1, 2]])
....:       + 2*OP([[-2, -1, 2], [1]]))
sage: o4 * o4
6*O{{-2, -1, 1}, {2}} + 4*O{{-2, -1, 1, 2}} + 4*O{{-2, -1, 2}, {1}}
```

```
>>> from sage.all import *
>>> R = QQ['x']; (x,) = R._first_ngens(1)
>>> OP = PartitionAlgebra(Integer(2), x, R).orbit_basis()
>>> SP = OP.basis().keys(); sp = SP([[-Integer(2), -Integer(1), Integer(1),␣
↪Integer(2)]])
>>> OP.product_on_basis(sp, sp)
O{{-2, -1, 1, 2}}
>>> o1 = OP.one(); o2 = OP([]); o3 = OP.an_element()
>>> o2 == o1
False
```

(continues on next page)

(continued from previous page)

```
>>> o1 * o1 == o1
True
>>> o3 * o1 == o1 * o3 and o3 * o1 == o3
True
>>> o4 = (Integer(3)*OP([[-Integer(2), -Integer(1), Integer(1)],␣
↪[Integer(2)]]) + Integer(2)*OP([[-Integer(2), -Integer(1), Integer(1),␣
↪Integer(2)]])
...       + Integer(2)*OP([[-Integer(2), -Integer(1), Integer(2)],␣
↪[Integer(1)]]))
>>> o4 * o4
6*O{{-2, -1, 1}, {2}} + 4*O{{-2, -1, 1, 2}} + 4*O{{-2, -1, 2}, {1}}
```

We compute Examples 4.5 in [BH2017]:

```
sage: R.<x> = QQ[]
sage: P = PartitionAlgebra(3,x); O = P.orbit_basis()
sage: O[[1,2,3],[-1,-2,-3]] * O[[1,2,3],[-1,-2,-3]]
(x-2)*O{{-3, -2, -1}, {1, 2, 3}} + (x-1)*O{{-3, -2, -1, 1, 2, 3}}

sage: P = PartitionAlgebra(4,x); O = P.orbit_basis()
sage: O[[1],[-1],[2,3],[4,-2],[-3,-4]] * O[[1],[2,-2],[3,4],[-1,-3],[-4]]
(x^2-11*x+30)*O{{-4}, {-3, -1}, {-2, 4}, {1}, {2, 3}}
 + (x^2-9*x+20)*O{{-4}, {-3, -1, 1}, {-2, 4}, {2, 3}}
 + (x^2-9*x+20)*O{{-4}, {-3, -1, 2, 3}, {-2, 4}, {1}}
 + (x^2-9*x+20)*O{{-4, 1}, {-3, -1}, {-2, 4}, {2, 3}}
 + (x^2-7*x+12)*O{{-4, 1}, {-3, -1, 2, 3}, {-2, 4}}
 + (x^2-9*x+20)*O{{-4, 2, 3}, {-3, -1}, {-2, 4}, {1}}
 + (x^2-7*x+12)*O{{-4, 2, 3}, {-3, -1, 1}, {-2, 4}}

sage: O[[1,-1],[2,-2],[3],[4,-3],[-4]] * O[[1,-2],[2],[3,-1],[4],[-3],[-4]]
(x-6)*O{{-4}, {-3}, {-2, 1}, {-1, 4}, {2}, {3}}
 + (x-5)*O{{-4}, {-3, 3}, {-2, 1}, {-1, 4}, {2}}
 + (x-5)*O{{-4, 3}, {-3}, {-2, 1}, {-1, 4}, {2}}

sage: P = PartitionAlgebra(6,x); O = P.orbit_basis()
sage: (O[[1,-2,-3],[2,4],[3,5,-6],[6],[-1],[-4,-5]]
....:  * O[[1,-2],[2,3],[4],[5],[6,-4,-5,-6],[-1,-3]])
0

sage: (O[[1,-2],[2,-3],[3,5],[4,-5],[6,-4],[-1],[-6]]

class sage.combinat.diagram_algebras.**PartitionAlgebra**(*k*, *q*, *base_ring*, *prefix*)

Bases: *DiagramBasis*, *UnitDiagramMixin*

A partition algebra.

A partition algebra of rank k over a given ground ring R is an algebra with (R-module) basis indexed by the collection of set partitions of $\{1, \dots, k, -1, \dots, -k\}$. Each such set partition can be represented by a graph on nodes $\{1, \dots, k, -1, \dots, -k\}$ arranged in two rows, with nodes $1, \dots, k$ in the top row from left to right and with nodes $-1, \dots, -k$ in the bottom row from left to right, and edges drawn such that the connected components of the graph are precisely the parts of the set partition. (This choice of edges is often not unique, and so there are often many graphs representing one and the same set partition; the representation nevertheless is useful and vivid. We often speak of "diagrams" to mean graphs up to such equivalence of choices of edges; of course, we could just as well speak of set partitions.)

There is not just one partition algebra of given rank over a given ground ring, but rather a whole family of them,

indexed by the elements of R. More precisely, for every $q \in R$, the partition algebra of rank k over R with parameter q is defined to be the R-algebra with basis the collection of all set partitions of $\{1, \ldots, k, -1, \ldots, -k\}$, where the product of two basis elements is given by the rule

$$a \cdot b = q^N (a \circ b),$$

where $a \circ b$ is the composite set partition obtained by placing the diagram (i.e., graph) of a above the diagram of b, identifying the bottom row nodes of a with the top row nodes of b, and omitting any closed "loops" in the middle. The number N is the number of connected components formed by the omitted loops.

The parameter q is a deformation parameter. Taking $q = 1$ produces the semigroup algebra (over the base ring) of the partition monoid, in which the product of two set partitions is simply given by their composition.

The partition algebra is regarded as an example of a "diagram algebra" due to the fact that its natural basis is given by certain graphs often called diagrams.

There are a number of predefined elements for the partition algebra. We define the cup/cap pair by `a()`. The simple transpositions are denoted `s()`. Finally, we define elements `e()`, where if $i = (2r+1)/2$, then `e(i)` contains the blocks $\{r+1\}$ and $\{-r-1\}$ and if $i \in \mathbf{Z}$, then e_i contains the block $\{-i, -i-1, i, i+1\}$, with all other blocks being $\{-j, j\}$. So we have:

```
sage: P = PartitionAlgebra(4, 0)
sage: P.a(2)
P{{-4, 4}, {-3, -2}, {-1, 1}, {2, 3}}
sage: P.e(3/2)
P{{-4, 4}, {-3, 3}, {-2}, {-1, 1}, {2}}
sage: P.e(2)
P{{-4, 4}, {-3, -2, 2, 3}, {-1, 1}}
sage: P.e(5/2)
P{{-4, 4}, {-3}, {-2, 2}, {-1, 1}, {3}}
sage: P.s(2)
P{{-4, 4}, {-3, 2}, {-2, 3}, {-1, 1}}
```

```
>>> from sage.all import *
>>> P = PartitionAlgebra(Integer(4), Integer(0))
>>> P.a(Integer(2))
P{{-4, 4}, {-3, -2}, {-1, 1}, {2, 3}}
>>> P.e(Integer(3)/Integer(2))
P{{-4, 4}, {-3, 3}, {-2}, {-1, 1}, {2}}
>>> P.e(Integer(2))
P{{-4, 4}, {-3, -2, 2, 3}, {-1, 1}}
>>> P.e(Integer(5)/Integer(2))
P{{-4, 4}, {-3}, {-2, 2}, {-1, 1}, {3}}
>>> P.s(Integer(2))
P{{-4, 4}, {-3, 2}, {-2, 3}, {-1, 1}}
```

An excellent reference for partition algebras and their various subalgebras (Brauer algebra, Temperley–Lieb algebra, etc) is the paper [HR2005].

INPUT:

- `k` – rank of the algebra
- `q` – the deformation parameter q
- `base_ring` – (default: `None`) a ring containing `q`; if `None`, then Sage automatically chooses the parent of `q`
- `prefix` – (default: `'P'`) a label for the basis elements

EXAMPLES:

The following shorthand simultaneously defines the univariate polynomial ring over the rationals as well as the variable x:

```
sage: R.<x> = PolynomialRing(QQ)
sage: R
Univariate Polynomial Ring in x over Rational Field
sage: x
x
sage: x.parent() is R
True
```

```
>>> from sage.all import *
>>> R = PolynomialRing(QQ, names=('x',)); (x,) = R._first_ngens(1)
>>> R
Univariate Polynomial Ring in x over Rational Field
>>> x
x
>>> x.parent() is R
True
```

We now define the partition algebra of rank 2 with parameter x over **Z** in the usual (diagram) basis:

```
sage: R.<x> = ZZ[]
sage: A2 = PartitionAlgebra(2, x, R)
sage: A2
Partition Algebra of rank 2 with parameter x
 over Univariate Polynomial Ring in x over Integer Ring
sage: A2.basis().keys()
Partition diagrams of order 2
sage: A2.basis().keys()([[-2, 1, 2], [-1]])
{{-2, 1, 2}, {-1}}
sage: A2.basis().list()
[P{{-2, -1, 1, 2}}, P{{-2, 1, 2}, {-1}},
 P{{-2}, {-1, 1, 2}}, P{{-2, -1}, {1, 2}},
 P{{-2}, {-1}, {1, 2}}, P{{-2, -1, 1}, {2}},
 P{{-2, 1}, {-1, 2}}, P{{-2, 1}, {-1}, {2}},
 P{{-2, 2}, {-1, 1}}, P{{-2, -1, 2}, {1}},
 P{{-2, 2}, {-1}, {1}}, P{{-2}, {-1, 1}, {2}},
 P{{-2}, {-1, 2}, {1}}, P{{-2, -1}, {1}, {2}},
 P{{-2}, {-1}, {1}, {2}}]
sage: E = A2([[1,2],[-2,-1]]); E
P{{-2, -1}, {1, 2}}
sage: E in A2.basis().list()
True
sage: E^2
x*P{{-2, -1}, {1, 2}}
sage: E^5
x^4*P{{-2, -1}, {1, 2}}
sage: (A2([[2,-2],[-1,1]]) - 2*A2([[1,2],[-1,-2]]))^2
(4*x-4)*P{{-2, -1}, {1, 2}} + P{{-2, 2}, {-1, 1}}
```

```
>>> from sage.all import *
>>> R = ZZ['x']; (x,) = R._first_ngens(1)
>>> A2 = PartitionAlgebra(Integer(2), x, R)
>>> A2
Partition Algebra of rank 2 with parameter x
 over Univariate Polynomial Ring in x over Integer Ring
>>> A2.basis().keys()
Partition diagrams of order 2
>>> A2.basis().keys()([[-Integer(2), Integer(1), Integer(2)], [-Integer(1)]])
{{-2, 1, 2}, {-1}}
>>> A2.basis().list()
[P{{-2, -1, 1, 2}}, P{{-2, 1, 2}, {-1}},
 P{{-2}, {-1, 1, 2}}, P{{-2, -1}, {1, 2}},
 P{{-2}, {-1}, {1, 2}}, P{{-2, -1, 1}, {2}},
 P{{-2, 1}, {-1, 2}}, P{{-2, 1}, {-1}, {2}},
 P{{-2, 2}, {-1, 1}}, P{{-2, -1, 2}, {1}},
 P{{-2, 2}, {-1}, {1}}, P{{-2}, {-1, 1}, {2}},
 P{{-2}, {-1, 2}, {1}}, P{{-2, -1}, {1}, {2}},
 P{{-2}, {-1}, {1}, {2}}]
>>> E = A2([[Integer(1),Integer(2)],[-Integer(2),-Integer(1)]]); E
P{{-2, -1}, {1, 2}}
>>> E in A2.basis().list()
True
>>> E**Integer(2)
x*P{{-2, -1}, {1, 2}}
>>> E**Integer(5)
x^4*P{{-2, -1}, {1, 2}}
>>> (A2([[Integer(2),-Integer(2)],[-Integer(1),Integer(1)]]) -␣
↪Integer(2)*A2([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]]))**Integer(2)
(4*x-4)*P{{-2, -1}, {1, 2}} + P{{-2, 2}, {-1, 1}}
```

Next, we construct an element:

```
sage: a2 = A2.an_element(); a2
3*P{{-2}, {-1, 1, 2}} + 2*P{{-2, -1, 1, 2}} + 2*P{{-2, 1, 2}, {-1}}
```

```
>>> from sage.all import *
>>> a2 = A2.an_element(); a2
3*P{{-2}, {-1, 1, 2}} + 2*P{{-2, -1, 1, 2}} + 2*P{{-2, 1, 2}, {-1}}
```

There is a natural embedding into partition algebras on more elements, by adding identity strands:

```
sage: A4 = PartitionAlgebra(4, x, R)
sage: A4(a2)
3*P{{-4, 4}, {-3, 3}, {-2}, {-1, 1, 2}}
 + 2*P{{-4, 4}, {-3, 3}, {-2, -1, 1, 2}}
 + 2*P{{-4, 4}, {-3, 3}, {-2, 1, 2}, {-1}}
```

```
>>> from sage.all import *
>>> A4 = PartitionAlgebra(Integer(4), x, R)
>>> A4(a2)
3*P{{-4, 4}, {-3, 3}, {-2}, {-1, 1, 2}}
```

(continues on next page)

(continued from previous page)

```
 + 2*P{{-4, 4}, {-3, 3}, {-2, -1, 1, 2}}
 + 2*P{{-4, 4}, {-3, 3}, {-2, 1, 2}, {-1}}
```

Thus, the empty partition corresponds to the identity:

```
sage: A4([])
P{{-4, 4}, {-3, 3}, {-2, 2}, {-1, 1}}
sage: A4(5)
5*P{{-4, 4}, {-3, 3}, {-2, 2}, {-1, 1}}
```

```
>>> from sage.all import *
>>> A4([])
P{{-4, 4}, {-3, 3}, {-2, 2}, {-1, 1}}
>>> A4(Integer(5))
5*P{{-4, 4}, {-3, 3}, {-2, 2}, {-1, 1}}
```

The group algebra of the symmetric group is a subalgebra:

```
sage: S3 = SymmetricGroupAlgebra(ZZ, 3)
sage: s3 = S3.an_element(); s3
[1, 2, 3] + 2*[1, 3, 2] + 3*[2, 1, 3] + [3, 1, 2]
sage: A4(s3)
P{{-4, 4}, {-3, 1}, {-2, 3}, {-1, 2}}
 + 2*P{{-4, 4}, {-3, 2}, {-2, 3}, {-1, 1}}
 + 3*P{{-4, 4}, {-3, 3}, {-2, 1}, {-1, 2}}
 + P{{-4, 4}, {-3, 3}, {-2, 2}, {-1, 1}}
sage: A4([2,1])
P{{-4, 4}, {-3, 3}, {-2, 1}, {-1, 2}}
```

```
>>> from sage.all import *
>>> S3 = SymmetricGroupAlgebra(ZZ, Integer(3))
>>> s3 = S3.an_element(); s3
[1, 2, 3] + 2*[1, 3, 2] + 3*[2, 1, 3] + [3, 1, 2]
>>> A4(s3)
P{{-4, 4}, {-3, 1}, {-2, 3}, {-1, 2}}
 + 2*P{{-4, 4}, {-3, 2}, {-2, 3}, {-1, 1}}
 + 3*P{{-4, 4}, {-3, 3}, {-2, 1}, {-1, 2}}
 + P{{-4, 4}, {-3, 3}, {-2, 2}, {-1, 1}}
>>> A4([Integer(2),Integer(1)])
P{{-4, 4}, {-3, 3}, {-2, 1}, {-1, 2}}
```

Be careful not to confuse the embedding of the group algebra of the symmetric group with the embedding of partial set partitions. The latter are embedded by adding the parts $\{i, -i\}$ if possible, and singletons sets for the remaining parts:

```
sage: A4([[2,1]])
P{{-4, 4}, {-3, 3}, {-2}, {-1}, {1, 2}}
sage: A4([[-1,3],[-2,-3,1]])
P{{-4, 4}, {-3, -2, 1}, {-1, 3}, {2}}
```

```
>>> from sage.all import *
>>> A4([[Integer(2),Integer(1)]])
```

(continues on next page)

(continued from previous page)

```
P{{-4, 4}, {-3, 3}, {-2}, {-1}, {1, 2}}
>>> A4([[-Integer(1),Integer(3)],[-Integer(2),-Integer(3),Integer(1)]])
P{{-4, 4}, {-3, -2, 1}, {-1, 3}, {2}}
```

Another subalgebra is the Brauer algebra, which has perfect matchings as basis elements. The group algebra of the symmetric group is in fact a subalgebra of the Brauer algebra:

```
sage: B3 = BrauerAlgebra(3, x, R)
sage: b3 = B3(s3); b3
B{{-3, 1}, {-2, 3}, {-1, 2}} + 2*B{{-3, 2}, {-2, 3}, {-1, 1}}
 + 3*B{{-3, 3}, {-2, 1}, {-1, 2}} + B{{-3, 3}, {-2, 2}, {-1, 1}}
```

```
>>> from sage.all import *
>>> B3 = BrauerAlgebra(Integer(3), x, R)
>>> b3 = B3(s3); b3
B{{-3, 1}, {-2, 3}, {-1, 2}} + 2*B{{-3, 2}, {-2, 3}, {-1, 1}}
 + 3*B{{-3, 3}, {-2, 1}, {-1, 2}} + B{{-3, 3}, {-2, 2}, {-1, 1}}
```

An important basis of the partition algebra is the *orbit basis*:

```
sage: O2 = A2.orbit_basis()
sage: o2 = O2([[1,2],[-1,-2]]) + O2([[1,2,-1,-2]]); o2
O{{-2, -1}, {1, 2}} + O{{-2, -1, 1, 2}}
```

```
>>> from sage.all import *
>>> O2 = A2.orbit_basis()
>>> o2 = O2([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]]) +␣
↪O2([[Integer(1),Integer(2),-Integer(1),-Integer(2)]]); o2
O{{-2, -1}, {1, 2}} + O{{-2, -1, 1, 2}}
```

The diagram basis element corresponds to the sum of all orbit basis elements indexed by coarser set partitions:

```
sage: A2(o2)
P{{-2, -1}, {1, 2}}
```

```
>>> from sage.all import *
>>> A2(o2)
P{{-2, -1}, {1, 2}}
```

We can convert back from the orbit basis to the diagram basis:

```
sage: o2 = O2.an_element(); o2
3*O{{-2}, {-1, 1, 2}} + 2*O{{-2, -1, 1, 2}} + 2*O{{-2, 1, 2}, {-1}}
sage: A2(o2)
3*P{{-2}, {-1, 1, 2}} - 3*P{{-2, -1, 1, 2}} + 2*P{{-2, 1, 2}, {-1}}
```

```
>>> from sage.all import *
>>> o2 = O2.an_element(); o2
3*O{{-2}, {-1, 1, 2}} + 2*O{{-2, -1, 1, 2}} + 2*O{{-2, 1, 2}, {-1}}
>>> A2(o2)
3*P{{-2}, {-1, 1, 2}} - 3*P{{-2, -1, 1, 2}} + 2*P{{-2, 1, 2}, {-1}}
```

One can work with partition algebras using a symbol for the parameter, leaving the base ring unspecified. This implies that the underlying base ring is Sage's symbolic ring.

```
sage: # needs sage.symbolic
sage: q = var('q')
sage: PA = PartitionAlgebra(2, q); PA
Partition Algebra of rank 2 with parameter q over Symbolic Ring
sage: PA([[1,2],[-2,-1]])^2 == q*PA([[1,2],[-2,-1]])
True
sage: ((PA([[2, -2], [1, -1]]) - 2*PA([[-2, -1], [1, 2]]))^2
....:   == (4*q-4)*PA([[1, 2], [-2, -1]]) + PA([[2, -2], [1, -1]]))
True
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> q = var('q')
>>> PA = PartitionAlgebra(Integer(2), q); PA
Partition Algebra of rank 2 with parameter q over Symbolic Ring
>>> PA([[Integer(1),Integer(2)],[-Integer(2),-Integer(1)]])**Integer(2) ==␣
↪q*PA([[Integer(1),Integer(2)],[-Integer(2),-Integer(1)]])
True
>>> ((PA([[Integer(2), -Integer(2)], [Integer(1), -Integer(1)]]) -␣
↪Integer(2)*PA([[-Integer(2), -Integer(1)], [Integer(1),␣
↪Integer(2)]]))**Integer(2)
...   == (Integer(4)*q-Integer(4))*PA([[Integer(1), Integer(2)], [-Integer(2), -
↪Integer(1)]]) + PA([[Integer(2), -Integer(2)], [Integer(1), -Integer(1)]]))
True
```

The identity element of the partition algebra is the set partition $\{\{1,-1\},\{2,-2\},\ldots,\{k,-k\}\}$:

```
sage: # needs sage.symbolic
sage: P = PA.basis().list()
sage: PA.one()
P{{-2, 2}, {-1, 1}}
sage: PA.one() * P[7] == P[7]
True
sage: P[7] * PA.one() == P[7]
True
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> P = PA.basis().list()
>>> PA.one()
P{{-2, 2}, {-1, 1}}
>>> PA.one() * P[Integer(7)] == P[Integer(7)]
True
>>> P[Integer(7)] * PA.one() == P[Integer(7)]
True
```

We now give some further examples of the use of the other arguments. One may wish to "specialize" the parameter to a chosen element of the base ring:

```
sage: R.<q> = RR[]
```

(continues on next page)

(continued from previous page)

```
sage: PA = PartitionAlgebra(2, q, R, prefix='B')
sage: PA
Partition Algebra of rank 2 with parameter q over
 Univariate Polynomial Ring in q over Real Field with 53 bits of precision
sage: PA([[1,2],[-1,-2]])
1.00000000000000*B{{-2, -1}, {1, 2}}
sage: PA = PartitionAlgebra(2, 5, base_ring=ZZ, prefix='B')
sage: PA
Partition Algebra of rank 2 with parameter 5 over Integer Ring
sage: ((PA([[2, -2], [1, -1]]) - 2*PA([[-2, -1], [1, 2]]))^2
....:   == 16*PA([[-2, -1], [1, 2]]) + PA([[2, -2], [1, -1]]))
True
```

```
>>> from sage.all import *
>>> R = RR['q']; (q,) = R._first_ngens(1)
>>> PA = PartitionAlgebra(Integer(2), q, R, prefix='B')
>>> PA
Partition Algebra of rank 2 with parameter q over
 Univariate Polynomial Ring in q over Real Field with 53 bits of precision
>>> PA([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]])
1.00000000000000*B{{-2, -1}, {1, 2}}
>>> PA = PartitionAlgebra(Integer(2), Integer(5), base_ring=ZZ, prefix='B')
>>> PA
Partition Algebra of rank 2 with parameter 5 over Integer Ring
>>> ((PA([[Integer(2), -Integer(2)], [Integer(1), -Integer(1)]]) -␣
↪Integer(2)*PA([[-Integer(2), -Integer(1)], [Integer(1),␣
↪Integer(2)]]))**Integer(2)
...   == Integer(16)*PA([[-Integer(2), -Integer(1)], [Integer(1), Integer(2)]]) +␣
↪PA([[Integer(2), -Integer(2)], [Integer(1), -Integer(1)]]))
True
```

Symmetric group algebra elements and elements from other subalgebras of the partition algebra (e.g., `BrauerAlgebra` and `TemperleyLiebAlgebra`) can also be coerced into the partition algebra:

```
sage: # needs sage.symbolic
sage: S = SymmetricGroupAlgebra(SR, 2)
sage: B = BrauerAlgebra(2, x, SR)
sage: A = PartitionAlgebra(2, x, SR)
sage: S([2,1]) * A([[1,-1],[2,-2]])
P{{-2, 1}, {-1, 2}}
sage: B([[-1,-2],[2,1]]) * A([[1],[-1],[2,-2]])
P{{-2}, {-1}, {1, 2}}
sage: A([[1],[-1],[2,-2]]) * B([[-1,-2],[2,1]])
P{{-2, -1}, {1}, {2}}
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> S = SymmetricGroupAlgebra(SR, Integer(2))
>>> B = BrauerAlgebra(Integer(2), x, SR)
>>> A = PartitionAlgebra(Integer(2), x, SR)
>>> S([Integer(2),Integer(1)]) * A([[Integer(1),-Integer(1)],[Integer(2),-
↪Integer(2)]])
```

(continues on next page)

(continued from previous page)

```
P{{-2, 1}, {-1, 2}}
>>> B([[-Integer(1),-Integer(2)],[Integer(2),Integer(1)]]) * A([[Integer(1)],[-
↪Integer(1)],[Integer(2),-Integer(2)]])
P{{-2}, {-1}, {1, 2}}
>>> A([[Integer(1)],[-Integer(1)],[Integer(2),-Integer(2)]]) * B([[-Integer(1),-
↪Integer(2)],[Integer(2),Integer(1)]])
P{{-2, -1}, {1}, {2}}
```

The same is true if the elements come from a subalgebra of a partition algebra of smaller order, or if they are defined over a different base ring:

```
sage: R = FractionField(ZZ['q']); q = R.gen()
sage: S = SymmetricGroupAlgebra(ZZ, 2)
sage: B = BrauerAlgebra(2, q, ZZ[q])
sage: A = PartitionAlgebra(3, q, R)
sage: S([2,1]) * A([[1,-1],[2,-3],[3,-2]])
P{{-3, 1}, {-2, 3}, {-1, 2}}
sage: A(B([[-1,-2],[2,1]]))
P{{-3, 3}, {-2, -1}, {1, 2}}
```

```
>>> from sage.all import *
>>> R = FractionField(ZZ['q']); q = R.gen()
>>> S = SymmetricGroupAlgebra(ZZ, Integer(2))
>>> B = BrauerAlgebra(Integer(2), q, ZZ[q])
>>> A = PartitionAlgebra(Integer(3), q, R)
>>> S([Integer(2),Integer(1)]) * A([[Integer(1),-Integer(1)],[Integer(2),-
↪Integer(3)],[Integer(3),-Integer(2)]])
P{{-3, 1}, {-2, 3}, {-1, 2}}
>>> A(B([[-Integer(1),-Integer(2)],[Integer(2),Integer(1)]]))
P{{-3, 3}, {-2, -1}, {1, 2}}
```

class Element

Bases: *Element*

dual()

Return the dual of `self`.

The dual of an element in the partition algebra is formed by taking the dual of each diagram in the support.

EXAMPLES:

```
sage: R.<x> = QQ[]
sage: P = PartitionAlgebra(2, x, R)
sage: elt = P.an_element(); elt
3*P{{-2}, {-1, 1, 2}} + 2*P{{-2, -1, 1, 2}} + 2*P{{-2, 1, 2}, {-1}}
sage: elt.dual()
3*P{{-2, -1, 1}, {2}} + 2*P{{-2, -1, 1, 2}} + 2*P{{-2, -1, 2}, {1}}
```

```
>>> from sage.all import *
>>> R = QQ['x']; (x,) = R._first_ngens(1)
>>> P = PartitionAlgebra(Integer(2), x, R)
>>> elt = P.an_element(); elt
```

(continues on next page)

(continued from previous page)

```
3*P{{-2}, {-1, 1, 2}} + 2*P{{-2, -1, 1, 2}} + 2*P{{-2, 1, 2}, {-1}}
>>> elt.dual()
3*P{{-2, -1, 1}, {2}} + 2*P{{-2, -1, 1, 2}} + 2*P{{-2, -1, 2}, {1}}
```

to_orbit_basis()

Return `self` in the orbit basis of the associated partition algebra.

EXAMPLES:

```
sage: R.<x> = QQ[]
sage: P = PartitionAlgebra(2, x, R)
sage: pp = P.an_element();
sage: pp.to_orbit_basis()
3*O{{-2}, {-1, 1, 2}} + 7*O{{-2, -1, 1, 2}} + 2*O{{-2, 1, 2}, {-1}}
sage: pp = (3*P([[-2], [-1, 1, 2]]) + 2*P([[-2, -1, 1, 2]])
....:       + 2*P([[-2, 1, 2], [-1]])); pp
3*P{{-2}, {-1, 1, 2}} + 2*P{{-2, -1, 1, 2}} + 2*P{{-2, 1, 2}, {-1}}
sage: pp.to_orbit_basis()
3*O{{-2}, {-1, 1, 2}} + 7*O{{-2, -1, 1, 2}} + 2*O{{-2, 1, 2}, {-1}}
```

```
>>> from sage.all import *
>>> R = QQ['x']; (x,) = R._first_ngens(1)
>>> P = PartitionAlgebra(Integer(2), x, R)
>>> pp = P.an_element();
>>> pp.to_orbit_basis()
3*O{{-2}, {-1, 1, 2}} + 7*O{{-2, -1, 1, 2}} + 2*O{{-2, 1, 2}, {-1}}
>>> pp = (Integer(3)*P([[-Integer(2)], [-Integer(1), Integer(1),␣
↪Integer(2)]]) + Integer(2)*P([[-Integer(2), -Integer(1), Integer(1),␣
↪Integer(2)]])
...       + Integer(2)*P([[-Integer(2), Integer(1), Integer(2)], [-
↪Integer(1)]])); pp
3*P{{-2}, {-1, 1, 2}} + 2*P{{-2, -1, 1, 2}} + 2*P{{-2, 1, 2}, {-1}}
>>> pp.to_orbit_basis()
3*O{{-2}, {-1, 1, 2}} + 7*O{{-2, -1, 1, 2}} + 2*O{{-2, 1, 2}, {-1}}
```

L(i)

alias of *jucys_murphy_element()*.

a(i)

Return the element a_i in `self`.

The element a_i is the cap and cup at $(i, i+1)$, so it contains the blocks $\{i, i+1\}$, $\{-i, -i-1\}$. Other blocks are of the form $\{-j, j\}$.

INPUT:

- `i` – integer between 1 and $k-1$

EXAMPLES:

```
sage: R.<n> = QQ[]
sage: P3 = PartitionAlgebra(3, n)
sage: P3.a(1)
P{{-3, 3}, {-2, -1}, {1, 2}}
```

(continues on next page)

(continued from previous page)

```
sage: P3.a(2)
P{{-3, -2}, {-1, 1}, {2, 3}}

sage: P3 = PartitionAlgebra(5/2, n)
sage: P3.a(1)
P{{-3, 3}, {-2, -1}, {1, 2}}
sage: P3.a(2)
Traceback (most recent call last):
...
ValueError: i must be an integer between 1 and 1
```

```
>>> from sage.all import *
>>> R = QQ['n']; (n,) = R._first_ngens(1)
>>> P3 = PartitionAlgebra(Integer(3), n)
>>> P3.a(Integer(1))
P{{-3, 3}, {-2, -1}, {1, 2}}
>>> P3.a(Integer(2))
P{{-3, -2}, {-1, 1}, {2, 3}}

>>> P3 = PartitionAlgebra(Integer(5)/Integer(2), n)
>>> P3.a(Integer(1))
P{{-3, 3}, {-2, -1}, {1, 2}}
>>> P3.a(Integer(2))
Traceback (most recent call last):
...
ValueError: i must be an integer between 1 and 1
```

e(i)

Return the element e_i in `self`.

If $i = (2r+1)/2$, then e_i contains the blocks $\{r+1\}$ and $\{-r-1\}$. If $i \in \mathbf{Z}$, then e_i contains the block $\{-i, -i-1, i, i+1\}$. Other blocks are of the form $\{-j, j\}$.

INPUT:

- `i` – half integer between $1/2$ and $k - 1/2$

EXAMPLES:

```
sage: R.<n> = QQ[]
sage: P3 = PartitionAlgebra(3, n)
sage: P3.e(1)
P{{-3, 3}, {-2, -1, 1, 2}}
sage: P3.e(2)
P{{-3, -2, 2, 3}, {-1, 1}}
sage: P3.e(1/2)
P{{-3, 3}, {-2, 2}, {-1}, {1}}
sage: P3.e(5/2)
P{{-3}, {-2, 2}, {-1, 1}, {3}}
sage: P3.e(0)
Traceback (most recent call last):
...
ValueError: i must be an (half) integer between 1/2 and 5/2
sage: P3.e(3)
```

(continues on next page)

(continued from previous page)

```
Traceback (most recent call last):
...
ValueError: i must be an (half) integer between 1/2 and 5/2

sage: P2h = PartitionAlgebra(5/2,n)
sage: [P2h.e(k/2) for k in range(1,5)]
[P{{-3, 3}, {-2, 2}, {-1}, {1}},
 P{{-3, 3}, {-2, -1, 1, 2}},
 P{{-3, 3}, {-2}, {-1, 1}, {2}},
 P{{-3, -2, 2, 3}, {-1, 1}}]
```

```
>>> from sage.all import *
>>> R = QQ['n']; (n,) = R._first_ngens(1)
>>> P3 = PartitionAlgebra(Integer(3), n)
>>> P3.e(Integer(1))
P{{-3, 3}, {-2, -1, 1, 2}}
>>> P3.e(Integer(2))
P{{-3, -2, 2, 3}, {-1, 1}}
>>> P3.e(Integer(1)/Integer(2))
P{{-3, 3}, {-2, 2}, {-1}, {1}}
>>> P3.e(Integer(5)/Integer(2))
P{{-3}, {-2, 2}, {-1, 1}, {3}}
>>> P3.e(Integer(0))
Traceback (most recent call last):
...
ValueError: i must be an (half) integer between 1/2 and 5/2
>>> P3.e(Integer(3))
Traceback (most recent call last):
...
ValueError: i must be an (half) integer between 1/2 and 5/2

>>> P2h = PartitionAlgebra(Integer(5)/Integer(2),n)
>>> [P2h.e(k/Integer(2)) for k in range(Integer(1),Integer(5))]
[P{{-3, 3}, {-2, 2}, {-1}, {1}},
 P{{-3, 3}, {-2, -1, 1, 2}},
 P{{-3, 3}, {-2}, {-1, 1}, {2}},
 P{{-3, -2, 2, 3}, {-1, 1}}]
```

generator_a(*i*)

alias of *a()*.

generator_e(*i*)

alias of *e()*.

generator_s(*i*)

alias of *s()*.

jucys_murphy_element(*i*)

Return the `i`-th Jucys-Murphy element L_i from [Eny2012].

INPUT:

- `i` – half integer between $1/2$ and k

ALGORITHM:

We use the recursive definition for L_{2i} given in [Cre2020]. See also [Eny2012] and [Eny2013].

Note

$L_{1/2}$ and L_1 differs from [HR2005].

EXAMPLES:

```
sage: R.<n> = QQ[]
sage: P3 = PartitionAlgebra(3, n)
sage: P3.jucys_murphy_element(1/2)
0
sage: P3.jucys_murphy_element(1)
P{{-3, 3}, {-2, 2}, {-1}, {1}}
sage: P3.jucys_murphy_element(2)
P{{-3, 3}, {-2}, {-1, 1}, {2}} - P{{-3, 3}, {-2}, {-1, 1, 2}}
 + P{{-3, 3}, {-2, -1}, {1, 2}} - P{{-3, 3}, {-2, -1, 1}, {2}}
 + P{{-3, 3}, {-2, 1}, {-1, 2}}
sage: P3.jucys_murphy_element(3/2)
n*P{{-3, 3}, {-2, -1, 1, 2}} - P{{-3, 3}, {-2, -1, 2}, {1}}
 - P{{-3, 3}, {-2, 1, 2}, {-1}} + P{{-3, 3}, {-2, 2}, {-1, 1}}
sage: P3.L(3/2) * P3.L(2) == P3.L(2) * P3.L(3/2)
True
```

```
>>> from sage.all import *
>>> R = QQ['n']; (n,) = R._first_ngens(1)
>>> P3 = PartitionAlgebra(Integer(3), n)
>>> P3.jucys_murphy_element(Integer(1)/Integer(2))
0
>>> P3.jucys_murphy_element(Integer(1))
P{{-3, 3}, {-2, 2}, {-1}, {1}}
>>> P3.jucys_murphy_element(Integer(2))
P{{-3, 3}, {-2}, {-1, 1}, {2}} - P{{-3, 3}, {-2}, {-1, 1, 2}}
 + P{{-3, 3}, {-2, -1}, {1, 2}} - P{{-3, 3}, {-2, -1, 1}, {2}}
 + P{{-3, 3}, {-2, 1}, {-1, 2}}
>>> P3.jucys_murphy_element(Integer(3)/Integer(2))
n*P{{-3, 3}, {-2, -1, 1, 2}} - P{{-3, 3}, {-2, -1, 2}, {1}}
 - P{{-3, 3}, {-2, 1, 2}, {-1}} + P{{-3, 3}, {-2, 2}, {-1, 1}}
>>> P3.L(Integer(3)/Integer(2)) * P3.L(Integer(2)) == P3.L(Integer(2)) * P3.
↪L(Integer(3)/Integer(2))
True
```

We test the relations in Lemma 2.2.3(2) in [Cre2020] (v1):

```
sage: k = 4
sage: R.<n> = QQ[]
sage: P = PartitionAlgebra(k, n)
sage: L = [P.L(i/2) for i in range(1,2*k+1)]
sage: all(x.dual() == x for x in L)
True
sage: all(x * y == y * x for x, y in Subsets(L, 2))  # long time
True
```

(continues on next page)

(continued from previous page)

```
sage: Lsum = sum(L)
sage: gens = [P.s(i) for i in range(1,k)]
sage: gens += [P.e(i/2) for i in range(1,2*k)]
sage: all(x * Lsum == Lsum * x for x in gens)
True
```

```
>>> from sage.all import *
>>> k = Integer(4)
>>> R = QQ['n']; (n,) = R._first_ngens(1)
>>> P = PartitionAlgebra(k, n)
>>> L = [P.L(i/Integer(2)) for i in range(Integer(1),Integer(2)*k+Integer(1))]
>>> all(x.dual() == x for x in L)
True
>>> all(x * y == y * x for x, y in Subsets(L, Integer(2)))  # long time
True
>>> Lsum = sum(L)
>>> gens = [P.s(i) for i in range(Integer(1),k)]
>>> gens += [P.e(i/Integer(2)) for i in range(Integer(1),Integer(2)*k)]
>>> all(x * Lsum == Lsum * x for x in gens)
True
```

Also the relations in Lemma 2.2.3(3) in [Cre2020] (v1):

```
sage: all(P.e((2*i+1)/2) * P.sigma(2*i/2) * P.e((2*i+1)/2)
....:     == (n - P.L((2*i-1)/2)) * P.e((2*i+1)/2) for i in range(1,k))
True
sage: all(P.e(i/2) * (P.L(i/2) + P.L((i+1)/2))
....:     == (P.L(i/2) + P.L((i+1)/2)) * P.e(i/2)
....:     == n * P.e(i/2) for i in range(1,2*k))
True
sage: all(P.sigma(2*i/2) * P.e((2*i-1)/2) * P.e(2*i/2)
....:     == P.L(2*i/2) * P.e(2*i/2) for i in range(1,k))
True
sage: all(P.e(2*i/2) * P.e((2*i-1)/2) * P.sigma(2*i/2)

↪in range(Integer(1),ceil(k)))
True
>>> all(P.sigma((Integer(2)*i+Integer(1))/Integer(2)) * P.
↪e((Integer(2)*i+Integer(1))/Integer(2)) * P.e(Integer(2)*i/Integer(2))
...      == P.L(Integer(2)*i/Integer(2)) * P.e(Integer(2)*i/Integer(2)) for i␣
↪in range(Integer(1),floor(k)))
True
>>> all(P.e(Integer(2)*i/Integer(2)) * P.e((Integer(2)*i+Integer(1))/
↪Integer(2)) * P.sigma((Integer(2)*i+Integer(1))/Integer(2))
...      == P.e(Integer(2)*i/Integer(2)) * P.L(Integer(2)*i/Integer(2)) for i␣
↪in range(Integer(1),floor(k)))
True
```

orbit_basis()

Return the orbit basis of `self`.

EXAMPLES:

```
sage: R.<x> = QQ[]
sage: P2 = PartitionAlgebra(2, x, R)
sage: O2 = P2.orbit_basis(); O2
Orbit basis of Partition Algebra of rank 2 with parameter x over
 Univariate Polynomial Ring in x over Rational Field
sage: pp = 7 * P2[{-1}, {-2, 1, 2}] - 2 * P2[{-2}, {-1, 1}, {2}]; pp
-2*P{{-2}, {-1, 1}, {2}} + 7*P{{-2, 1, 2}, {-1}}
sage: op = pp.to_orbit_basis(); op
-2*O{{-2}, {-1, 1}, {2}} - 2*O{{-2}, {-1, 1, 2}}
 - 2*O{{-2, -1, 1}, {2}} + 5*O{{-2, -1, 1, 2}}
 + 7*O{{-2, 1, 2}, {-1}} - 2*O{{-2, 2}, {-1, 1}}
sage: op == O2(op)
True
sage: pp * op.leading_term()
4*P{{-2}, {-1, 1}, {2}} - 4*P{{-2, -1, 1}, {2}}
 + 14*P{{-2, -1, 1, 2}} - 14*P{{-2, 1, 2}, {-1}}
```

```
>>> from sage.all import *
>>> R = QQ['x']; (x,) = R._first_ngens(1)
>>> P2 = PartitionAlgebra(Integer(2), x, R)
>>> O2 = P2.orbit_basis(); O2
Orbit basis of Partition Algebra of rank 2 with parameter x over
 Univariate Polynomial Ring in x over Rational Field
>>> pp = Integer(7) * P2[{-Integer(1)}, {-Integer(2), Integer(1), Integer(2)}
↪] - Integer(2) * P2[{-Integer(2)}, {-Integer(1), Integer(1)}, {Integer(2)}];
↪ pp
-2*P{{-2}, {-1, 1}, {2}} + 7*P{{-2, 1, 2}, {-1}}
>>> op = pp.to_orbit_basis(); op
-2*O{{-2}, {-1, 1}, {2}} - 2*O{{-2}, {-1, 1, 2}}
 - 2*O{{-2, -1, 1}, {2}} + 5*O{{-2, -1, 1, 2}}
 + 7*O{{-2, 1, 2}, {-1}} - 2*O{{-2, 2}, {-1, 1}}
>>> op == O2(op)
True
>>> pp * op.leading_term()
4*P{{-2}, {-1, 1}, {2}} - 4*P{{-2, -1, 1}, {2}}
 + 14*P{{-2, -1, 1, 2}} - 14*P{{-2, 1, 2}, {-1}}
```

potts_representation(*y=None*)

Return the *PottsRepresentation* with magnetic field direction `y` of `self`.

Note

The deformation parameter d of `self` must be a positive integer.

INPUT:

- `y` – (optional) an integer between 1 and d; ignored if the order of `self` is an integer, otherwise the default is 1

EXAMPLES:

```
sage: PA = algebras.Partition(5/2, QQ(4))
sage: PR = PA.potts_representation()

sage: PA = algebras.Partition(5/2, 3/2)
sage: PA.potts_representation()
Traceback (most recent call last):
...
ValueError: the partition algebra deformation parameter must
 be a positive integer
```

```
>>> from sage.all import *
>>> PA = algebras.Partition(Integer(5)/Integer(2), QQ(Integer(4)))
>>> PR = PA.potts_representation()

>>> PA = algebras.Partition(Integer(5)/Integer(2), Integer(3)/Integer(2))
>>> PA.potts_representation()
Traceback (most recent call last):
...
ValueError: the partition algebra deformation parameter must
 be a positive integer
```

s(*i*)

Return the `i`-th simple transposition s_i in `self`.

Borrowing the notation from the symmetric group, the i-th simple transposition s_i has blocks of the form $\{-i, i+1\}$, $\{-i-1, i\}$. Other blocks are of the form $\{-j, j\}$.

INPUT:

- `i` – integer between 1 and $k-1$

EXAMPLES:

```
sage: R.<n> = QQ[]
sage: P3 = PartitionAlgebra(3, n)
sage: P3.s(1)
P{{-3, 3}, {-2, 1}, {-1, 2}}
sage: P3.s(2)
P{{-3, 2}, {-2, 3}, {-1, 1}}

sage: R.<n> = ZZ[]
sage: P2h = PartitionAlgebra(5/2,n)
sage: P2h.s(1)
P{{-3, 3}, {-2, 1}, {-1, 2}}
```

```
>>> from sage.all import *
>>> R = QQ['n']; (n,) = R._first_ngens(1)
>>> P3 = PartitionAlgebra(Integer(3), n)
>>> P3.s(Integer(1))
P{{-3, 3}, {-2, 1}, {-1, 2}}
>>> P3.s(Integer(2))
P{{-3, 2}, {-2, 3}, {-1, 1}}
```

(continues on next page)

(continued from previous page)

```
>>> R = ZZ['n']; (n,) = R._first_ngens(1)
>>> P2h = PartitionAlgebra(Integer(5)/Integer(2),n)
>>> P2h.s(Integer(1))
P{{-3, 3}, {-2, 1}, {-1, 2}}
```

sigma(i)

Return the element σ_i from [Eny2012] of `self`.

INPUT:

- `i` – half integer between $1/2$ and $k - 1/2$

Note

In [Cre2020] and [Eny2013], these are the elements σ_{2i}.

EXAMPLES:

```
sage: R.<n> = QQ[]
sage: P3 = PartitionAlgebra(3, n)
sage: P3.sigma(1)
P{{-3, 3}, {-2, 2}, {-1, 1}}
sage: P3.sigma(3/2)
P{{-3, 3}, {-2, 1}, {-1, 2}}
sage: P3.sigma(2)
-P{{-3, -1, 1, 3}, {-2, 2}} + P{{-3, -1, 3}, {-2, 1, 2}}
 + P{{-3, 1, 3}, {-2, -1, 2}} - P{{-3, 3}, {-2, -1, 1, 2}}
 + P{{-3, 3}, {-2, 2}, {-1, 1}}
sage: P3.sigma(5/2)
-P{{-3, -1, 1, 2}, {-2, 3}} + P{{-3, -1, 2}, {-2, 1, 3}}
 + P{{-3, 1, 2}, {-2, -1, 3}} - P{{-3, 2}, {-2, -1, 1, 3}}
 + P{{-3, 2}, {-2, 3}, {-1, 1}}
```

```
>>> from sage.all import *
>>> R = QQ['n']; (n,) = R._first_ngens(1)
>>> P3 = PartitionAlgebra(Integer(3), n)
>>> P3.sigma(Integer(1))
P{{-3, 3}, {-2, 2}, {-1, 1}}
>>> P3.sigma(Integer(3)/Integer(2))
P{{-3, 3}, {-2, 1}, {-1, 2}}
>>> P3.sigma(Integer(2))
-P{{-3, -1, 1, 3}, {-2, 2}} + P{{-3, -1, 3}, {-2, 1, 2}}
 + P{{-3, 1, 3}, {-2, -1, 2}} - P{{-3, 3}, {-2, -1, 1, 2}}
 + P{{-3, 3}, {-2, 2}, {-1, 1}}
>>> P3.sigma(Integer(5)/Integer(2))
-P{{-3, -1, 1, 2}, {-2, 3}} + P{{-3, -1, 2}, {-2, 1, 3}}
 + P{{-3, 1, 2}, {-2, -1, 3}} - P{{-3, 2}, {-2, -1, 1, 3}}
 + P{{-3, 2}, {-2, 3}, {-1, 1}}
```

We test the relations in Lemma 2.2.3(1) in [Cre2020] (v1):

```
sage: k = 4
sage: R.<x> = QQ[]
sage: P = PartitionAlgebra(k, x)
sage: all(P.sigma(i/2).dual() == P.sigma(i/2)
....:     for i in range(1,2*k))
True
sage: all(P.sigma(i)*P.sigma(i+1/2) == P.sigma(i+1/2)*P.sigma(i) == P.s(i)
....:     for i in range(1,floor(k)))
True
sage: all(P.sigma(i)*P.e(i) == P.e(i)*P.sigma(i) == P.e(i)
....:     for i in range(1,floor(k)))
True
sage: all(P.sigma(i+1/2)*P.e(i) == P.e(i)*P.sigma(i+1/2) == P.e(i)
....:     for i in range(1,floor(k)))
True

sage: k = 9/2
sage: R.<x> = QQ[]
sage: P = PartitionAlgebra(k, x)
sage: all(P.sigma(i/2).dual() == P.sigma(i/2)
....:     for i in range(1,2*k-1))
True
sage: all(P.sigma(i)*P.sigma(i+1/2) == P.sigma(i+1/2)*P.sigma(i) == P.s(i)
....:     for i in range(1,k-1/2))
True
sage: all(P.sigma(i)*P.e(i) == P.e(i)*P.sigma(i) == P.e(i)
....:     for i in range(1,floor(k)))
True
sage: all(P.sigma(i+1/2)*P.e(i) == P.e(i)*P.sigma(i+1/2) == P.e(i)
....:     for i in range(1,floor(k)))
True
```

```
>>> from sage.all import *
>>> k = Integer(4)
>>> R = QQ['x']; (x,) = R._first_ngens(1)
>>> P = PartitionAlgebra(k, x)
>>> all(P.sigma(i/Integer(2)).dual() == P.sigma(i/Integer(2))
...     for i in range(Integer(1),Integer(2)*k))
True
>>> all(P.sigma(i)*P.sigma(i+Integer(1)/Integer(2)) == P.sigma(i+Integer(1)/
↪Integer(2))*P.sigma(i) == P.s(i)
...     for i in range(Integer(1),floor(k)))

↪Integer(2))*P.sigma(i) == P.s(i)
...     for i in range(Integer(1),k-Integer(1)/Integer(2)))
True
>>> all(P.sigma(i)*P.e(i) == P.e(i)*P.sigma(i) == P.e(i)
...     for i in range(Integer(1),floor(k)))
True
>>> all(P.sigma(i+Integer(1)/Integer(2))*P.e(i) == P.e(i)*P.
↪sigma(i+Integer(1)/Integer(2)) == P.e(i)
...     for i in range(Integer(1),floor(k)))
True
```

class sage.combinat.diagram_algebras.**PartitionDiagram**(*parent*, *d*, *check=True*)

Bases: *AbstractPartitionDiagram*

The element class for a partition diagram.

A partition diagram for an integer k is a partition of the set $\{1, \dots, k, -1, \dots, -k\}$

EXAMPLES:

```
sage: from sage.combinat.diagram_algebras import PartitionDiagram,␣
↪PartitionDiagrams
sage: PartitionDiagrams(1)
Partition diagrams of order 1
sage: PartitionDiagrams(1).list()
[{{-1, 1}}, {{-1}, {1}}]
sage: PartitionDiagram([[1,-1]])
{{-1, 1}}
sage: PartitionDiagram(((1,-2),(2,-1))).parent()
Partition diagrams of order 2
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram_algebras import PartitionDiagram, PartitionDiagrams
>>> PartitionDiagrams(Integer(1))
Partition diagrams of order 1
>>> PartitionDiagrams(Integer(1)).list()
[{{-1, 1}}, {{-1}, {1}}]
>>> PartitionDiagram([[Integer(1),-Integer(1)]])
{{-1, 1}}
>>> PartitionDiagram(((Integer(1),-Integer(2)),(Integer(2),-Integer(1)))).parent()
Partition diagrams of order 2
```

class sage.combinat.diagram_algebras.**PartitionDiagrams**(*order*, *category=None*)

Bases: *AbstractPartitionDiagrams*

This class represents all partition diagrams of integer or integer $+1/2$ order.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: pd = da.PartitionDiagrams(1); pd
Partition diagrams of order 1
sage: pd.list()
[{{-1, 1}}, {{-1}, {1}}]

sage: pd = da.PartitionDiagrams(3/2); pd
Partition diagrams of order 3/2
sage: pd.list()
[{{-2, -1, 1, 2}},
 {{-2, 1, 2}, {-1}},
 {{-2, 2}, {-1, 1}},
 {{-2, -1, 2}, {1}},
 {{-2, 2}, {-1}, {1}}]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> pd = da.PartitionDiagrams(Integer(1)); pd
Partition diagrams of order 1
>>> pd.list()
[{{-1, 1}}, {{-1}, {1}}]

>>> pd = da.PartitionDiagrams(Integer(3)/Integer(2)); pd
Partition diagrams of order 3/2
>>> pd.list()
[{{-2, -1, 1, 2}},
 {{-2, 1, 2}, {-1}},
 {{-2, 2}, {-1, 1}},
 {{-2, -1, 2}, {1}},
 {{-2, 2}, {-1}, {1}}]
```

Element

alias of *PartitionDiagram*

cardinality()

The cardinality of partition diagrams of half-integer order n is the $2n$-th Bell number.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: pd = da.PartitionDiagrams(3)
sage: pd.cardinality()
203

sage: pd = da.PartitionDiagrams(7/2)
sage: pd.cardinality()
877
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> pd = da.PartitionDiagrams(Integer(3))
>>> pd.cardinality()
203
```

(continues on next page)

(continued from previous page)

```
>>> pd = da.PartitionDiagrams(Integer(7)/Integer(2))
>>> pd.cardinality()
877
```

class sage.combinat.diagram_algebras.**PlanarAlgebra**(*k*, *q*, *base_ring*, *prefix*)

Bases: *SubPartitionAlgebra*, *UnitDiagramMixin*

A planar algebra.

The planar algebra of rank k is an algebra with basis indexed by the collection of all planar set partitions of $\{1, \dots, k, -1, \dots, -k\}$.

This algebra is thus a subalgebra of the partition algebra. For more information, see *PartitionAlgebra*.

INPUT:

- `k` – rank of the algebra
- `q` – the deformation parameter q
- `base_ring` – (default: `None`) a ring containing `q`; if `None` then just takes the parent of `q`
- `prefix` – (default: `'Pl'`) a label for the basis elements

EXAMPLES:

We define the planar algebra of rank 2 with parameter x over $\mathbf{Z}$:

```
sage: R.<x> = ZZ[]
sage: Pl = PlanarAlgebra(2, x, R); Pl
Planar Algebra of rank 2 with parameter x over Univariate Polynomial Ring in x␣
↪over Integer Ring
sage: Pl.basis().keys()
Planar diagrams of order 2
sage: Pl.basis().keys()([[-1, 1], [2, -2]])
{{-2, 2}, {-1, 1}}
sage: Pl.basis().list()
[Pl{{-2}, {-1}, {1, 2}},
 Pl{{-2}, {-1}, {1}, {2}},
 Pl{{-2, 1}, {-1}, {2}},
 Pl{{-2, 2}, {-1}, {1}},
 Pl{{-2, 1, 2}, {-1}},
 Pl{{-2, 2}, {-1, 1}},
 Pl{{-2}, {-1, 1}, {2}},
 Pl{{-2}, {-1, 2}, {1}},
 Pl{{-2}, {-1, 1, 2}},
 Pl{{-2, -1}, {1, 2}},
 Pl{{-2, -1}, {1}, {2}},
 Pl{{-2, -1, 1}, {2}},
 Pl{{-2, -1, 2}, {1}},
 Pl{{-2, -1, 1, 2}}]
sage: E = Pl([[1,2],[-1,-2]])
sage: E^2 == x*E
True
sage: E^5 == x^4*E
True
```

```
>>> from sage.all import *
>>> R = ZZ['x']; (x,) = R._first_ngens(1)
>>> Pl = PlanarAlgebra(Integer(2), x, R); Pl
Planar Algebra of rank 2 with parameter x over Univariate Polynomial Ring in x␣
↪over Integer Ring
>>> Pl.basis().keys()
Planar diagrams of order 2
>>> Pl.basis().keys()([[-Integer(1), Integer(1)], [Integer(2), -Integer(2)]])
{{-2, 2}, {-1, 1}}
>>> Pl.basis().list()
[Pl{{-2}, {-1}, {1, 2}},
 Pl{{-2}, {-1}, {1}, {2}},
 Pl{{-2, 1}, {-1}, {2}},
 Pl{{-2, 2}, {-1}, {1}},
 Pl{{-2, 1, 2}, {-1}},
 Pl{{-2, 2}, {-1, 1}},
 Pl{{-2}, {-1, 1}, {2}},
 Pl{{-2}, {-1, 2}, {1}},
 Pl{{-2}, {-1, 1, 2}},
 Pl{{-2, -1}, {1, 2}},
 Pl{{-2, -1}, {1}, {2}},
 Pl{{-2, -1, 1}, {2}},
 Pl{{-2, -1, 2}, {1}},
 Pl{{-2, -1, 1, 2}}]
>>> E = Pl([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]])
>>> E**Integer(2) == x*E
True
>>> E**Integer(5) == x**Integer(4)*E
True
```

class sage.combinat.diagram_algebras.**PlanarDiagram**(*parent*, *d*, *check=True*)

Bases: *AbstractPartitionDiagram*

The element class for a planar diagram.

A planar diagram for an integer k is a partition of the set $\{1, \dots, k, -1, \dots, -k\}$ so that the diagram is non-crossing.

EXAMPLES:

```
sage: from sage.combinat.diagram_algebras import PlanarDiagrams
sage: PlanarDiagrams(2)
Planar diagrams of order 2
sage: PlanarDiagrams(2).list()
[{{-2}, {-1}, {1, 2}},
 {{-2}, {-1}, {1}, {2}},
 {{-2, 1}, {-1}, {2}},
 {{-2, 2}, {-1}, {1}},
 {{-2, 1, 2}, {-1}},
 {{-2, 2}, {-1, 1}},
 {{-2}, {-1, 1}, {2}},
 {{-2}, {-1, 2}, {1}},
 {{-2}, {-1, 1, 2}},
 {{-2, -1}, {1, 2}},
```

(continues on next page)

(continued from previous page)

```
 {{-2, -1}, {1}, {2}},
 {{-2, -1, 1}, {2}},
 {{-2, -1, 2}, {1}},
 {{-2, -1, 1, 2}}]
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram_algebras import PlanarDiagrams
>>> PlanarDiagrams(Integer(2))
Planar diagrams of order 2
>>> PlanarDiagrams(Integer(2)).list()
[{{-2}, {-1}, {1, 2}},
 {{-2}, {-1}, {1}, {2}},
 {{-2, 1}, {-1}, {2}},
 {{-2, 2}, {-1}, {1}},
 {{-2, 1, 2}, {-1}},
 {{-2, 2}, {-1, 1}},
 {{-2}, {-1, 1}, {2}},
 {{-2}, {-1, 2}, {1}},
 {{-2}, {-1, 1, 2}},
 {{-2, -1}, {1, 2}},
 {{-2, -1}, {1}, {2}},
 {{-2, -1, 1}, {2}},
 {{-2, -1, 2}, {1}},
 {{-2, -1, 1, 2}}]
```

check()

Check the validity of the input for `self`.

class sage.combinat.diagram_algebras.**PlanarDiagrams**(*order*, *category=None*)

Bases: *AbstractPartitionDiagrams*

All planar diagrams of integer or integer $+1/2$ order.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: pld = da.PlanarDiagrams(1); pld
Planar diagrams of order 1
sage: pld.list()
[{{-1, 1}}, {{-1}, {1}}]

sage: pld = da.PlanarDiagrams(3/2); pld
Planar diagrams of order 3/2
sage: pld.list()
[{{-2, 1, 2}, {-1}},
 {{-2, 2}, {-1}, {1}},
 {{-2, 2}, {-1, 1}},
 {{-2, -1, 2}, {1}},
 {{-2, -1, 1, 2}}]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> pld = da.PlanarDiagrams(Integer(1)); pld
```

(continues on next page)

(continued from previous page)

```
Planar diagrams of order 1
>>> pld.list()
[{{-1, 1}}, {{-1}, {1}}]

>>> pld = da.PlanarDiagrams(Integer(3)/Integer(2)); pld
Planar diagrams of order 3/2
>>> pld.list()
[{{-2, 1, 2}, {-1}},
 {{-2, 2}, {-1}, {1}},
 {{-2, 2}, {-1, 1}},
 {{-2, -1, 2}, {1}},
 {{-2, -1, 1, 2}}]
```

Element

alias of *PlanarDiagram*

cardinality()

Return the cardinality of `self`.

The number of all planar diagrams of order k is the $2k$-th Catalan number.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: pld = da.PlanarDiagrams(3)
sage: pld.cardinality()
132
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> pld = da.PlanarDiagrams(Integer(3))
>>> pld.cardinality()
132
```

class sage.combinat.diagram_algebras.**PottsRepresentation**(*PA*, *y*)

Bases: *CombinatorialFreeModule*

The Potts representation of the partition algebra.

Let $P_n(d)$ be the *PartitionAlgebra* over R with the deformation parameter $d \in \mathbf{Z}_{>0}$ being a positive integer. Recall the multiplication convention of diagrams in $P_n(d)$ computing DD' by placing D above D'.

The *Potts representation* is the right $P_n(d)$-module on $M = V^{\otimes n}$, with $V = R^d$, with the action given as follows. We identify the natural basis vectors in M with words of length n in the alphabet $\{1, \ldots, d\}$ (which we call colors). For a basis vector w and diagram D, define $w \cdot D$ as the sum over all v such that every part in wDv (consider this as coloring the nodes of D) is given by the same color.

If n is a half integer, then there is an extra fixed color for the node $\lceil n \rceil$, which is called the *magnetic field direction* from the physics interpretation of this representation.

EXAMPLES:

In this example, we consider $R = \mathbf{Q}$ and use the Potts representation to construct the centralizer algebra of the left S_{d-1}-action on $V^{\otimes n}$ with $V = \mathbf{Q}^d$ being the permutation action.

```
sage: PA = algebras.Partition(5/2, QQ(2))
sage: PR = PA.potts_representation(2)
sage: mats = [PR.representation_matrix(x) for x in PA.basis()]
sage: MS = mats[0].parent()
sage: CM = MS.submodule(mats)
sage: CM.dimension()
16
```

```
>>> from sage.all import *
>>> PA = algebras.Partition(Integer(5)/Integer(2), QQ(Integer(2)))
>>> PR = PA.potts_representation(Integer(2))
>>> mats = [PR.representation_matrix(x) for x in PA.basis()]
>>> MS = mats[Integer(0)].parent()
>>> CM = MS.submodule(mats)
>>> CM.dimension()
16
```

We check that this commutes with the S_{d-1}-action:

```
sage: all((g * v) * x == g * (v * x) for g in PR.symmetric_group()
....:     for v in PR.basis() for x in PA.basis())
True
```

```
>>> from sage.all import *
>>> all((g * v) * x == g * (v * x) for g in PR.symmetric_group()
...     for v in PR.basis() for x in PA.basis())
True
```

Next, we see that the centralizer of the S_d-action is smaller than the semisimple quotient of the partition algebra:

```
sage: PA.dimension()
52
sage: len(PA.radical_basis())
9
sage: SQ = PA.semisimple_quotient()
sage: SQ.dimension()
43
```

```
>>> from sage.all import *
>>> PA.dimension()
52
>>> len(PA.radical_basis())
9
>>> SQ = PA.semisimple_quotient()
>>> SQ.dimension()
43
```

Next, we get orthogonal idempotents that project onto the central orthogonal idempotents in the semisimple quotient and construct the corresponding Peirce summands $e_i P_n(d) e_i$:

```
sage: # long time
sage: orth_idems = PA.orthogonal_idempotents_central_mod_radical()
```

(continues on next page)

(continued from previous page)

```
sage: algs = [PA.peirce_summand(idm, idm) for idm in orth_idems]
sage: [A.dimension() for A in algs]
[16, 2, 1, 25]
```

```
>>> from sage.all import *
>>> # long time
>>> orth_idems = PA.orthogonal_idempotents_central_mod_radical()
>>> algs = [PA.peirce_summand(idm, idm) for idm in orth_idems]
>>> [A.dimension() for A in algs]
[16, 2, 1, 25]
```

We saw that we obtain the entire endomorphism algebra since $d = 2$ and S_{d-1} is the trivial group. Hence, the 16 dimensional Peirce summand computed above is isomorphic to this endomorphism algebra (both are 4×4 matrix algebras over $\mathbf{Q}$). Hence, we have a natural quotient construction of the centralizer algebra from the partition algebra.

Next, we consider a case with a nontrivial S_d-action (now it is S_d since the partition algebra has integer rank). We perform the same computations as before:

```
sage: PA = algebras.Partition(2, QQ(2))
sage: PA.dimension()
15
sage: PA.semisimple_quotient().dimension()
10
sage: orth_idems = PA.orthogonal_idempotents_central_mod_radical()
sage: algs = [PA.peirce_summand(idm, idm) for idm in orth_idems]
sage: [A.dimension() for A in algs]
[4, 2, 4, 1]

sage: PR = PA.potts_representation()
sage: mats = [PR.representation_matrix(x) for x in PA.basis()]
sage: MS = mats[0].parent()
sage: cat = Algebras(QQ).WithBasis().Subobjects()
sage: CM = MS.submodule(mats, category=cat)
sage: CM.dimension()
8
```

```
>>> from sage.all import *
>>> PA = algebras.Partition(Integer(2), QQ(Integer(2)))
>>> PA.dimension()
15
>>> PA.semisimple_quotient().dimension()
10
>>> orth_idems = PA.orthogonal_idempotents_central_mod_radical()
>>> algs = [PA.peirce_summand(idm, idm) for idm in orth_idems]
>>> [A.dimension() for A in algs]
[4, 2, 4, 1]

>>> PR = PA.potts_representation()
>>> mats = [PR.representation_matrix(x) for x in PA.basis()]
>>> MS = mats[Integer(0)].parent()
>>> cat = Algebras(QQ).WithBasis().Subobjects()
```

(continues on next page)

(continued from previous page)

```
>>> CM = MS.submodule(mats, category=cat)
>>> CM.dimension()
8
```

To do the remainder of the computation, we need to monkey patch a `product_on_basis` method:

```
sage: CM.product_on_basis
NotImplemented
sage: CM.product_on_basis = lambda x,y: CM.retract(CM.basis()[x].lift() * CM.
↪basis()[y].lift())
sage: CM.orthogonal_idempotents_central_mod_radical()
(1/2*B[0] + 1/2*B[3] + 1/2*B[5] + 1/2*B[6],
 1/2*B[0] - 1/2*B[3] + 1/2*B[5] - 1/2*B[6])
sage: CM.peirce_decomposition()
[[Free module generated by {0, 1, 2, 3} over Rational Field,
  Free module generated by {} over Rational Field],
 [Free module generated by {} over Rational Field,
  Free module generated by {0, 1, 2, 3} over Rational Field]]
```

```
>>> from sage.all import *
>>> CM.product_on_basis
NotImplemented
>>> CM.product_on_basis = lambda x,y: CM.retract(CM.basis()[x].lift() * CM.
↪basis()[y].lift())
>>> CM.orthogonal_idempotents_central_mod_radical()
(1/2*B[0] + 1/2*B[3] + 1/2*B[5] + 1/2*B[6],
 1/2*B[0] - 1/2*B[3] + 1/2*B[5] - 1/2*B[6])
>>> CM.peirce_decomposition()
[[Free module generated by {0, 1, 2, 3} over Rational Field,
  Free module generated by {} over Rational Field],
 [Free module generated by {} over Rational Field,
  Free module generated by {0, 1, 2, 3} over Rational Field]]
```

Hence, we see that the centralizer algebra is isomorphic to a product of two 2×2 matrix algebras (over $\mathbf{Q}$), which are naturally a part of the partition algebra decomposition.

Lastly, we verify the commuting actions:

```
sage: all((g * v) * x == g * (v * x) for g in PR.symmetric_group()
....:     for v in PR.basis() for x in PA.basis())
True
```

```
>>> from sage.all import *
>>> all((g * v) * x == g * (v * x) for g in PR.symmetric_group()
...     for v in PR.basis() for x in PA.basis())
True
```

REFERENCES:

- [MR1998]

class Element

Bases: `IndexedFreeModuleElement`

magnetic_field_direction()

Return the magnetic field direction defining `self`.

EXAMPLES:

```
sage: PA = algebras.Partition(7/2, QQ(4))
sage: PR = PA.potts_representation(2)
sage: PR.magnetic_field_direction()
2
```

```
>>> from sage.all import *
>>> PA = algebras.Partition(Integer(7)/Integer(2), QQ(Integer(4)))
>>> PR = PA.potts_representation(Integer(2))
>>> PR.magnetic_field_direction()
2
```

number_of_colors()

Return the number of colors defining `self`.

EXAMPLES:

```
sage: PA = algebras.Partition(3, QQ(4))
sage: PR = PA.potts_representation()
sage: PR.number_of_colors()
4
```

```
>>> from sage.all import *
>>> PA = algebras.Partition(Integer(3), QQ(Integer(4)))
>>> PR = PA.potts_representation()
>>> PR.number_of_colors()
4
```

number_of_factors()

Return the number of factors defining `self`.

EXAMPLES:

```
sage: PA = algebras.Partition(7/2, QQ(4))
sage: PR = PA.potts_representation()
sage: PR.number_of_factors()
3
```

```
>>> from sage.all import *
>>> PA = algebras.Partition(Integer(7)/Integer(2), QQ(Integer(4)))
>>> PR = PA.potts_representation()
>>> PR.number_of_factors()
3
```

partition_algebra()

Return the partition algebra that `self` is a representation of.

EXAMPLES:

```
sage: PA = algebras.Partition(3, QQ(4))
sage: PR = PA.potts_representation()
sage: PR.partition_algebra() is PA
True
```

```
>>> from sage.all import *
>>> PA = algebras.Partition(Integer(3), QQ(Integer(4)))
>>> PR = PA.potts_representation()
>>> PR.partition_algebra() is PA
True
```

representation_matrix(*elt*)

Return the representation matrix of `self` in `self`.

EXAMPLES:

```
sage: PA = algebras.Partition(7/2, QQ(2))
sage: PR = PA.potts_representation()
sage: PR.representation_matrix(PA.an_element())

...      for x in PA.basis() for y in PA.basis())
True
```

symmetric_group()

Return the symmetric group that naturally acts on `self`.

EXAMPLES:

```
sage: PA = algebras.Partition(3, QQ(4))
sage: PR = PA.potts_representation()
sage: PR.symmetric_group()
Symmetric group of order 4! as a permutation group

sage: PA = algebras.Partition(7/2, QQ(4))
sage: PR = PA.potts_representation()
sage: PR.symmetric_group().domain()
{2, 3, 4}
sage: PR = PA.potts_representation(2)
sage: PR.symmetric_group().domain()
{1, 3, 4}
sage: PR = PA.potts_representation(4)
sage: PR.symmetric_group().domain()
{1, 2, 3}
```

```
>>> from sage.all import *
>>> PA = algebras.Partition(Integer(3), QQ(Integer(4)))
>>> PR = PA.potts_representation()
>>> PR.symmetric_group()
Symmetric group of order 4! as a permutation group

>>> PA = algebras.Partition(Integer(7)/Integer(2), QQ(Integer(4)))
>>> PR = PA.potts_representation()
>>> PR.symmetric_group().domain()
{2, 3, 4}
>>> PR = PA.potts_representation(Integer(2))
>>> PR.symmetric_group().domain()
{1, 3, 4}
>>> PR = PA.potts_representation(Integer(4))
>>> PR.symmetric_group().domain()
{1, 2, 3}
```

class sage.combinat.diagram_algebras.**PropagatingIdeal**(*k*, *q*, *base_ring*, *prefix*)

Bases: *SubPartitionAlgebra*

A propagating ideal.

The propagating ideal of rank k is a non-unital algebra with basis indexed by the collection of ideal set partitions of $\{1, \dots, k, -1, \dots, -k\}$. We say a set partition is *ideal* if its propagating number is less than k.

This algebra is a non-unital subalgebra and an ideal of the partition algebra. For more information, see *PartitionAlgebra*.

EXAMPLES:

We now define the propagating ideal of rank 2 with parameter x over $\mathbf{Z}$:

```
sage: R.<x> = QQ[]
sage: I = PropagatingIdeal(2, x, R); I
Propagating Ideal of rank 2 with parameter x
 over Univariate Polynomial Ring in x over Rational Field
sage: I.basis().keys()
Ideal diagrams of order 2
sage: I.basis().list()
[I{{-2, -1, 1, 2}},
 I{{-2, 1, 2}, {-1}},
 I{{-2}, {-1, 1, 2}},
 I{{-2, -1}, {1, 2}},
 I{{-2}, {-1}, {1, 2}},
 I{{-2, -1, 1}, {2}},
 I{{-2, 1}, {-1}, {2}},
 I{{-2, -1, 2}, {1}},
 I{{-2, 2}, {-1}, {1}},
 I{{-2}, {-1, 1}, {2}},
 I{{-2}, {-1, 2}, {1}},
 I{{-2, -1}, {1}, {2}},
 I{{-2}, {-1}, {1}, {2}}]
sage: E = I([[1,2],[-1,-2]])
sage: E^2 == x*E
True
sage: E^5 == x^4*E
True
```

```
>>> from sage.all import *
>>> R = QQ['x']; (x,) = R._first_ngens(1)
>>> I = PropagatingIdeal(Integer(2), x, R); I
Propagating Ideal of rank 2 with parameter x
 over Univariate Polynomial Ring in x over Rational Field
>>> I.basis().keys()
Ideal diagrams of order 2
>>> I.basis().list()
[I{{-2, -1, 1, 2}},
 I{{-2, 1, 2}, {-1}},
 I{{-2}, {-1, 1, 2}},
 I{{-2, -1}, {1, 2}},
 I{{-2}, {-1}, {1, 2}},
 I{{-2, -1, 1}, {2}},
```

(continues on next page)

(continued from previous page)

```
 I{{-2, 1}, {-1}, {2}},
 I{{-2, -1, 2}, {1}},
 I{{-2, 2}, {-1}, {1}},
 I{{-2}, {-1, 1}, {2}},
 I{{-2}, {-1, 2}, {1}},
 I{{-2, -1}, {1}, {2}},
 I{{-2}, {-1}, {1}, {2}}]
>>> E = I([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]])
>>> E**Integer(2) == x*E
True
>>> E**Integer(5) == x**Integer(4)*E
True
```

class Element

Bases: *Element*

An element of a propagating ideal.

We need to take care of exponents since we are not unital.

class sage.combinat.diagram_algebras.**SubPartitionAlgebra**(*k*, *q*, *base_ring*, *prefix*, *diagrams*, *category=None*)

Bases: *DiagramBasis*

A subalgebra of the partition algebra in the diagram basis indexed by a subset of the diagrams.

class Element

Bases: *Element*

to_orbit_basis()

Return `self` in the orbit basis of the associated ambient partition algebra.

EXAMPLES:

```
sage: R.<x> = QQ[]
sage: B = BrauerAlgebra(2, x, R)
sage: bb = B([[-2, -1], [1, 2]]); bb
B{{-2, -1}, {1, 2}}
sage: bb.to_orbit_basis()
O{{-2, -1}, {1, 2}} + O{{-2, -1, 1, 2}}
```

```
>>> from sage.all import *
>>> R = QQ['x']; (x,) = R._first_ngens(1)
>>> B = BrauerAlgebra(Integer(2), x, R)
>>> bb = B([[-Integer(2), -Integer(1)], [Integer(1), Integer(2)]]); bb
B{{-2, -1}, {1, 2}}
>>> bb.to_orbit_basis()
O{{-2, -1}, {1, 2}} + O{{-2, -1, 1, 2}}
```

ambient()

Return the partition algebra `self` is a sub-algebra of.

EXAMPLES:

```
sage: x = var('x')                                                          #␣
↪needs sage.symbolic
sage: BA = BrauerAlgebra(2, x)                                              #␣
↪needs sage.symbolic
sage: BA.ambient()                                                          #␣
↪needs sage.symbolic
Partition Algebra of rank 2 with parameter x over Symbolic Ring
```

```
>>> from sage.all import *
>>> x = var('x')                                                          #␣
↪needs sage.symbolic
>>> BA = BrauerAlgebra(Integer(2), x)                                        ␣
↪     # needs sage.symbolic
>>> BA.ambient()                                                          #␣
↪needs sage.symbolic
Partition Algebra of rank 2 with parameter x over Symbolic Ring
```

lift()

Return the lift map from diagram subalgebra to the ambient space.

EXAMPLES:

```
sage: R.<x> = QQ[]
sage: BA = BrauerAlgebra(2, x, R)
sage: E = BA([[1,2],[-1,-2]])
sage: lifted = BA.lift(E); lifted
B{{-2, -1}, {1, 2}}
sage: lifted.parent() is BA.ambient()
True
```

```
>>> from sage.all import *
>>> R = QQ['x']; (x,) = R._first_ngens(1)
>>> BA = BrauerAlgebra(Integer(2), x, R)
>>> E = BA([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]])
>>> lifted = BA.lift(E); lifted
B{{-2, -1}, {1, 2}}
>>> lifted.parent() is BA.ambient()
True
```

retract(x)

Retract an appropriate partition algebra element to the corresponding element in the partition subalgebra.

EXAMPLES:

```
sage: R.<x> = QQ[]
sage: BA = BrauerAlgebra(2, x, R)
sage: PA = BA.ambient()
sage: E = PA([[1,2], [-1,-2]])
sage: BA.retract(E) in BA
True
```

```
>>> from sage.all import *
>>> R = QQ['x']; (x,) = R._first_ngens(1)
```

(continues on next page)

(continued from previous page)

```
>>> BA = BrauerAlgebra(Integer(2), x, R)
>>> PA = BA.ambient()
>>> E = PA([[Integer(1),Integer(2)], [-Integer(1),-Integer(2)]])
>>> BA.retract(E) in BA
True
```

sage.combinat.diagram_algebras.**TL_diagram_ascii_art**(*diagram*, *use_unicode=False*, *blobs=[]*)

Return ascii art for a Temperley-Lieb diagram `diagram`.

INPUT:

- `diagram` – list of pairs of matchings of the set $\{-1, \ldots, -n, 1, \ldots, n\}$
- `use_unicode` – boolean (default: `False`); whether or not to use unicode art instead of ascii art
- `blobs` – (optional) a list of matchings with blobs on them

EXAMPLES:

```
sage: from sage.combinat.diagram_algebras import TL_diagram_ascii_art
sage: TL = [(-15,-12), (-14,-13), (-11,15), (-10,14), (-9,-6),
....:       (-8,-7), (-5,-4), (-3,1), (-2,-1), (2,3), (4,5),
....:       (6,11), (7, 8), (9,10), (12,13)]
sage: TL_diagram_ascii_art(TL, use_unicode=False)
 o o o o o o o o o o o o o o o
 | `-` `-` | `-` `-` | `-` | |

class sage.combinat.diagram_algebras.**TemperleyLiebAlgebra**(*k*, *q*, *base_ring*, *prefix*)

Bases: *SubPartitionAlgebra*, *UnitDiagramMixin*

A Temperley–Lieb algebra.

The Temperley–Lieb algebra of rank k is an algebra with basis indexed by the collection of planar set partitions of $\{1, \ldots, k, -1, \ldots, -k\}$ with block size 2.

This algebra is thus a subalgebra of the partition algebra. For more information, see *PartitionAlgebra*.

INPUT:

- `k` – rank of the algebra
- `q` – the deformation parameter q
- `base_ring` – (default: `None`) a ring containing `q`; if `None` then just takes the parent of `q`
- `prefix` – (default: `'T'`) a label for the basis elements

EXAMPLES:

We define the Temperley–Lieb algebra of rank 2 with parameter x over $\mathbf{Z}$:

```
sage: R.<x> = ZZ[]
sage: T = TemperleyLiebAlgebra(2, x, R); T
Temperley-Lieb Algebra of rank 2 with parameter x
 over Univariate Polynomial Ring in x over Integer Ring
sage: T.basis()
```

(continues on next page)

(continued from previous page)

```
Lazy family (Term map from Temperley Lieb diagrams of order 2
 to Temperley-Lieb Algebra of rank 2 with parameter x over
 Univariate Polynomial Ring in x over Integer
 Ring(i))_{i in Temperley Lieb diagrams of order 2}
sage: T.basis().keys()
Temperley Lieb diagrams of order 2
sage: T.basis().keys()([[-1, 1], [2, -2]])
{{-2, 2}, {-1, 1}}
sage: b = T.basis().list(); b
[T{{-2, -1}, {1, 2}}, T{{-2, 2}, {-1, 1}}]
sage: b[0]
T{{-2, -1}, {1, 2}}
sage: b[0]^2 == x*b[0]
True
sage: b[0]^5 == x^4*b[0]
True
```

```
>>> from sage.all import *
>>> R = ZZ['x']; (x,) = R._first_ngens(1)
>>> T = TemperleyLiebAlgebra(Integer(2), x, R); T
Temperley-Lieb Algebra of rank 2 with parameter x
 over Univariate Polynomial Ring in x over Integer Ring
>>> T.basis()
Lazy family (Term map from Temperley Lieb diagrams of order 2
 to Temperley-Lieb Algebra of rank 2 with parameter x over
 Univariate Polynomial Ring in x over Integer
 Ring(i))_{i in Temperley Lieb diagrams of order 2}
>>> T.basis().keys()
Temperley Lieb diagrams of order 2
>>> T.basis().keys()([[-Integer(1), Integer(1)], [Integer(2), -Integer(2)]])
{{-2, 2}, {-1, 1}}
>>> b = T.basis().list(); b
[T{{-2, -1}, {1, 2}}, T{{-2, 2}, {-1, 1}}]
>>> b[Integer(0)]
T{{-2, -1}, {1, 2}}
>>> b[Integer(0)]**Integer(2) == x*b[Integer(0)]
True
>>> b[Integer(0)]**Integer(5) == x**Integer(4)*b[Integer(0)]
True
```

The Temperley-Lieb algebra is a cellular algebra, and we verify that the dimensions of the simple modules at $q = 0$ is given by OEIS sequence A050166:

```
sage: for k in range(1,5):
....:     TL = TemperleyLiebAlgebra(2*k, 0, QQ)
....:     print("".join("{:3}".format(TL.cell_module(la).simple_module().
↪dimension())
....:                   for la in reversed(TL.cell_poset()) if la != 0))
  1
  1  2
  1  4  5
  1  6 14 14
```

(continues on next page)

(continued from previous page)

```
sage: for k in range(1,4):
....:     TL = TemperleyLiebAlgebra(2*k+1, 0, QQ)
....:     print("".join("{:3}".format(TL.cell_module(la).simple_module().
↪dimension())
....:                   for la in reversed(TL.cell_poset()) if la != 0))
  1  2
  1  4  5
  1  6 14 14
```

```
>>> from sage.all import *
>>> for k in range(Integer(1),Integer(5)):
...     TL = TemperleyLiebAlgebra(Integer(2)*k, Integer(0), QQ)
...     print("".join("{:3}".format(TL.cell_module(la).simple_module().
↪dimension())
...                   for la in reversed(TL.cell_poset()) if la != Integer(0)))
  1
  1  2
  1  4  5
  1  6 14 14
>>> for k in range(Integer(1),Integer(4)):
...     TL = TemperleyLiebAlgebra(Integer(2)*k+Integer(1), Integer(0), QQ)
...     print("".join("{:3}".format(TL.cell_module(la).simple_module().
↪dimension())
...                   for la in reversed(TL.cell_poset()) if la != Integer(0)))
  1  2
  1  4  5
  1  6 14 14
```

Additional examples when the Temperley-Lieb algebra is not semisimple:

```
sage: TL = TemperleyLiebAlgebra(8, -1, QQ)
sage: for la in TL.cell_poset():
....:     CM = TL.cell_module(la)
....:     if not CM.nonzero_bilinear_form():
....:         continue
....:     print(la, CM.dimension(), CM.simple_module().dimension())
....:
0 14 1
2 28 28
4 20 13
6 7 7
8 1 1
sage: for k in range(1,5):
....:     TL = TemperleyLiebAlgebra(2*k, -1, QQ)
....:     print("".join("{:3}".format(TL.cell_module(la).simple_module().
↪dimension())
....:                   for la in reversed(TL.cell_poset())
....:                    if TL.cell_module(la).nonzero_bilinear_form()))
  1  1
  1  3  1
  1  4  9  1
  1  7 13 28  1
```

(continues on next page)

(continued from previous page)

```
sage: C5.<z5> = CyclotomicField(5)
sage: for k in range(1,5):
....:     TL = TemperleyLiebAlgebra(2*k, z5+~z5, C5)
....:     print("".join("{:3}".format(TL.cell_module(la).simple_module().
↪dimension())
....:                   for la in reversed(TL.cell_poset())

...                   for la in reversed(TL.cell_poset())
...                    if TL.cell_module(la).nonzero_bilinear_form()))
  1  1
  1  3  1
  1  4  9  1
  1  7 13 28  1
>>> C5 = CyclotomicField(Integer(5), names=('z5',)); (z5,) = C5._first_ngens(1)
>>> for k in range(Integer(1),Integer(5)):
...     TL = TemperleyLiebAlgebra(Integer(2)*k, z5+~z5, C5)
...     print("".join("{:3}".format(TL.cell_module(la).simple_module().
↪dimension())
...                   for la in reversed(TL.cell_poset())
...                    if TL.cell_module(la).nonzero_bilinear_form()))
  1  1
  1  3  2
  1  5  8  5
  1  7 20 21 13
```

cell_module_indices(*la*)

Return the indices of the cell module of `self` indexed by `la` .

This is the finite set $M(\lambda)$.

EXAMPLES:

```
sage: R.<q> = QQ[]
sage: TL = TemperleyLiebAlgebra(8, q, R)
sage: TL.cell_module_indices(4)
Half Temperley-Lieb diagrams of order 8 with 4 defects
```

```
>>> from sage.all import *
>>> R = QQ['q']; (q,) = R._first_ngens(1)
>>> TL = TemperleyLiebAlgebra(Integer(8), q, R)
>>> TL.cell_module_indices(Integer(4))
Half Temperley-Lieb diagrams of order 8 with 4 defects
```

cell_poset()

Return the cell poset of `self`.

EXAMPLES:

```
sage: R.<q> = QQ[]
sage: TL = TemperleyLiebAlgebra(7, q, R)
sage: TL.cell_poset().cover_relations()
[[1, 3], [3, 5], [5, 7]]

sage: TL = TemperleyLiebAlgebra(8, q, R)
sage: TL.cell_poset().cover_relations()
[[0, 2], [2, 4], [4, 6], [6, 8]]
```

```
>>> from sage.all import *
>>> R = QQ['q']; (q,) = R._first_ngens(1)
>>> TL = TemperleyLiebAlgebra(Integer(7), q, R)
>>> TL.cell_poset().cover_relations()
[[1, 3], [3, 5], [5, 7]]

>>> TL = TemperleyLiebAlgebra(Integer(8), q, R)
>>> TL.cell_poset().cover_relations()
[[0, 2], [2, 4], [4, 6], [6, 8]]
```

cellular_involution(*x*)

Return the cellular involution of `x` in `self`.

EXAMPLES:

```
sage: TL = TemperleyLiebAlgebra(4, QQ.zero(), QQ)
sage: ascii_art(TL.an_element())
                o o o o       o o o o
   o o o o      | `-` |       | `-` |
2* `-` `-` + 2* `-----` + 3* `---. |
   .-. .-.      .-. .-.       .-. | |
   o o o o      o o o o       o o o o
sage: ascii_art(TL.cellular_involution(TL.an_element()))
                o o o o       o o o o
   o o o o      `-` `-`       `-` | |
2* `-` `-` + 2* .-----. + 3* .---` |
   .-. .-.      | .-. |       | .-. |
   o o o o      o o o o       o o o o
```

```
>>> from sage.all import *
>>> TL = TemperleyLiebAlgebra(Integer(4), QQ.zero(), QQ)
>>> ascii_art(TL.an_element())
                o o o o       o o o o
   o o o o      | `-` |       | `-` |
2* `-` `-` + 2* `-----` + 3* `---. |
   .-. .-.      .-. .-.       .-. | |
   o o o o      o o o o       o o o o
>>> ascii_art(TL.cellular_involution(TL.an_element()))
                o o o o       o o o o
   o o o o      `-` `-`       `-` | |
2* `-` `-` + 2* .-----. + 3* .---` |
   .-. .-.      | .-. |       | .-. |
   o o o o      o o o o       o o o o
```

class sage.combinat.diagram_algebras.**TemperleyLiebDiagram**(*parent*, *d*, *check=True*)

Bases: *AbstractPartitionDiagram*

The element class for a Temperley-Lieb diagram.

A Temperley-Lieb diagram for an integer k is a partition of the set $\{1, \ldots, k, -1, \ldots, -k\}$ so that the blocks are all of size 2 and the diagram is planar.

EXAMPLES:

```
sage: from sage.combinat.diagram_algebras import TemperleyLiebDiagrams
sage: TemperleyLiebDiagrams(2)
Temperley Lieb diagrams of order 2
sage: TemperleyLiebDiagrams(2).list()
[{{-2, -1}, {1, 2}}, {{-2, 2}, {-1, 1}}]
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram_algebras import TemperleyLiebDiagrams
>>> TemperleyLiebDiagrams(Integer(2))
Temperley Lieb diagrams of order 2
>>> TemperleyLiebDiagrams(Integer(2)).list()
[{{-2, -1}, {1, 2}}, {{-2, 2}, {-1, 1}}]
```

check()

Check the validity of the input for `self`.

class sage.combinat.diagram_algebras.**TemperleyLiebDiagrams**(*order*, *category=None*)

Bases: *AbstractPartitionDiagrams*

All Temperley-Lieb diagrams of integer or integer $+1/2$ order.

For more information on Temperley-Lieb diagrams, see *TemperleyLiebAlgebra*.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: td = da.TemperleyLiebDiagrams(3); td
Temperley Lieb diagrams of order 3
sage: td.list()
[{{-3, 3}, {-2, -1}, {1, 2}},
 {{-3, 1}, {-2, -1}, {2, 3}},
```

(continues on next page)

(continued from previous page)

```
 {{-3, -2}, {-1, 1}, {2, 3}},
 {{-3, -2}, {-1, 3}, {1, 2}},
 {{-3, 3}, {-2, 2}, {-1, 1}}]

sage: td = da.TemperleyLiebDiagrams(5/2); td
Temperley Lieb diagrams of order 5/2
sage: td.list()
[{{-3, 3}, {-2, -1}, {1, 2}}, {{-3, 3}, {-2, 2}, {-1, 1}}]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> td = da.TemperleyLiebDiagrams(Integer(3)); td
Temperley Lieb diagrams of order 3
>>> td.list()
[{{-3, 3}, {-2, -1}, {1, 2}},
 {{-3, 1}, {-2, -1}, {2, 3}},
 {{-3, -2}, {-1, 1}, {2, 3}},
 {{-3, -2}, {-1, 3}, {1, 2}},
 {{-3, 3}, {-2, 2}, {-1, 1}}]

>>> td = da.TemperleyLiebDiagrams(Integer(5)/Integer(2)); td
Temperley Lieb diagrams of order 5/2
>>> td.list()
[{{-3, 3}, {-2, -1}, {1, 2}}, {{-3, 3}, {-2, 2}, {-1, 1}}]
```

Element

alias of *TemperleyLiebDiagram*

cardinality()

Return the cardinality of `self`.

The number of Temperley–Lieb diagrams of integer order k is the k-th Catalan number.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: td = da.TemperleyLiebDiagrams(3)
sage: td.cardinality()
5
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> td = da.TemperleyLiebDiagrams(Integer(3))
>>> td.cardinality()
5
```

class sage.combinat.diagram_algebras.**UnitDiagramMixin**

Bases: `object`

Mixin class for diagram algebras that have the unit indexed by the *identity_set_partition()*.

one_basis()

The following constructs the identity element of `self`.

It is not called directly; instead one should use `DA.one()` if `DA` is a defined diagram algebra.

EXAMPLES:

```
sage: R.<x> = QQ[]
sage: P = PartitionAlgebra(2, x, R)
sage: P.one_basis()
{{-2, 2}, {-1, 1}}
```

```
>>> from sage.all import *
>>> R = QQ['x']; (x,) = R._first_ngens(1)
>>> P = PartitionAlgebra(Integer(2), x, R)
>>> P.one_basis()
{{-2, 2}, {-1, 1}}
```

sage.combinat.diagram_algebras.**brauer_diagrams**(*k*)

Return a generator of all Brauer diagrams of order `k`.

A Brauer diagram of order k is a partition diagram of order k with block size 2.

INPUT:

- `k` – the order of the Brauer diagrams

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: [SetPartition(p) for p in da.brauer_diagrams(2)]
[{{-2, -1}, {1, 2}}, {{-2, 1}, {-1, 2}}, {{-2, 2}, {-1, 1}}]
sage: [SetPartition(p) for p in da.brauer_diagrams(5/2)]
[{{-3, 3}, {-2, -1}, {1, 2}},
 {{-3, 3}, {-2, 1}, {-1, 2}},
 {{-3, 3}, {-2, 2}, {-1, 1}}]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> [SetPartition(p) for p in da.brauer_diagrams(Integer(2))]
[{{-2, -1}, {1, 2}}, {{-2, 1}, {-1, 2}}, {{-2, 2}, {-1, 1}}]
>>> [SetPartition(p) for p in da.brauer_diagrams(Integer(5)/Integer(2))]
[{{-3, 3}, {-2, -1}, {1, 2}},
 {{-3, 3}, {-2, 1}, {-1, 2}},
 {{-3, 3}, {-2, 2}, {-1, 1}}]
```

sage.combinat.diagram_algebras.**diagram_latex**(*diagram*, *fill=False*, *edge_options=None*, *edge_additions=None*)

Return latex code for the diagram `diagram` using tikz.

EXAMPLES:

```
sage: from sage.combinat.diagram_algebras import PartitionDiagrams, diagram_latex
sage: P = PartitionDiagrams(2)
sage: D = P([[1,2],[-2,-1]])
sage: print(diagram_latex(D)) # indirect doctest
\begin{tikzpicture}[scale = 0.5,thick, baseline={(0,-1ex/2)}]
\tikzstyle{vertex} = [shape = circle, minimum size = 7pt, inner sep = 1pt]
\node[vertex] (G--2) at (1.5, -1) [shape = circle, draw] {};
\node[vertex] (G--1) at (0.0, -1) [shape = circle, draw] {};
```

(continues on next page)

(continued from previous page)

```
\node[vertex] (G-1) at (0.0, 1) [shape = circle, draw] {};
\node[vertex] (G-2) at (1.5, 1) [shape = circle, draw] {};
\draw[] (G--2) .. controls +(-0.5, 0.5) and +(0.5, 0.5) .. (G--1);
\draw[] (G-1) .. controls +(0.5, -0.5) and +(-0.5, -0.5) .. (G-2);
\end{tikzpicture}
```

```
>>> from sage.all import *
>>> from sage.combinat.diagram_algebras import PartitionDiagrams, diagram_latex
>>> P = PartitionDiagrams(Integer(2))
>>> D = P([[Integer(1),Integer(2)],[-Integer(2),-Integer(1)]])
>>> print(diagram_latex(D)) # indirect doctest
\begin{tikzpicture}[scale = 0.5,thick, baseline={(0,-1ex/2)}]
\tikzstyle{vertex} = [shape = circle, minimum size = 7pt, inner sep = 1pt]
\node[vertex] (G--2) at (1.5, -1) [shape = circle, draw] {};
\node[vertex] (G--1) at (0.0, -1) [shape = circle, draw] {};
\node[vertex] (G-1) at (0.0, 1) [shape = circle, draw] {};
\node[vertex] (G-2) at (1.5, 1) [shape = circle, draw] {};
\draw[] (G--2) .. controls +(-0.5, 0.5) and +(0.5, 0.5) .. (G--1);
\draw[] (G-1) .. controls +(0.5, -0.5) and +(-0.5, -0.5) .. (G-2);
\end{tikzpicture}
```

sage.combinat.diagram_algebras.**ideal_diagrams**(k)

Return a generator of all "ideal" diagrams of order `k`.

An ideal diagram of order k is a partition diagram of order k with propagating number less than k.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: all_diagrams = da.partition_diagrams(2)
sage: [SetPartition(p) for p in all_diagrams if p not in da.ideal_diagrams(2)]
[{{-2, 1}, {-1, 2}}, {{-2, 2}, {-1, 1}}]

sage: all_diagrams = da.partition_diagrams(3/2)
sage: [SetPartition(p) for p in all_diagrams if p not in da.ideal_diagrams(3/2)]
[{{-2, 2}, {-1, 1}}]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> all_diagrams = da.partition_diagrams(Integer(2))
>>> [SetPartition(p) for p in all_diagrams if p not in da.ideal_
↪diagrams(Integer(2))]
[{{-2, 1}, {-1, 2}}, {{-2, 2}, {-1, 1}}]

>>> all_diagrams = da.partition_diagrams(Integer(3)/Integer(2))
>>> [SetPartition(p) for p in all_diagrams if p not in da.ideal_
↪diagrams(Integer(3)/Integer(2))]
[{{-2, 2}, {-1, 1}}]
```

sage.combinat.diagram_algebras.**identity_set_partition**(k)

Return the identity set partition $\{\{1,-1\},\ldots,\{k,-k\}\}$.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: SetPartition(da.identity_set_partition(2))
{{-2, 2}, {-1, 1}}
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> SetPartition(da.identity_set_partition(Integer(2)))
{{-2, 2}, {-1, 1}}
```

sage.combinat.diagram_algebras.**is_planar**(*sp*)

Return `True` if the diagram corresponding to the set partition `sp` is planar; otherwise, return `False`.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: da.is_planar( da.to_set_partition([[1,-2],[2,-1]]))
False
sage: da.is_planar( da.to_set_partition([[1,-1],[2,-2]]))
True
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> da.is_planar( da.to_set_partition([[Integer(1),-Integer(2)],[Integer(2),-
↪Integer(1)]]))
False
>>> da.is_planar( da.to_set_partition([[Integer(1),-Integer(1)],[Integer(2),-
↪Integer(2)]]))
True
```

sage.combinat.diagram_algebras.**pair_to_graph**(*sp1*, *sp2*)

Return a graph consisting of the disjoint union of the graphs of set partitions `sp1` and `sp2` along with edges joining the bottom row (negative numbers) of `sp1` to the top row (positive numbers) of `sp2`.

The vertices of the graph `sp1` appear in the result as pairs `(k, 1)`, whereas the vertices of the graph `sp2` appear as pairs `(k, 2)`.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: sp1 = da.to_set_partition([[1,-2],[2,-1]])
sage: sp2 = da.to_set_partition([[1,-2],[2,-1]])
sage: g = da.pair_to_graph( sp1, sp2 ); g
Graph on 8 vertices

sage: g.vertices(sort=True)
[(-2, 1), (-2, 2), (-1, 1), (-1, 2), (1, 1), (1, 2), (2, 1), (2, 2)]
sage: g.edges(sort=True)
[((-2, 1), (1, 1), None), ((-2, 1), (2, 2), None),
 ((-2, 2), (1, 2), None), ((-1, 1), (1, 2), None),
 ((-1, 1), (2, 1), None), ((-1, 2), (2, 2), None)]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
```

(continues on next page)

(continued from previous page)

```
>>> sp1 = da.to_set_partition([[Integer(1),-Integer(2)],[Integer(2),-Integer(1)]])
>>> sp2 = da.to_set_partition([[Integer(1),-Integer(2)],[Integer(2),-Integer(1)]])
>>> g = da.pair_to_graph( sp1, sp2 ); g
Graph on 8 vertices

>>> g.vertices(sort=True)
[(-2, 1), (-2, 2), (-1, 1), (-1, 2), (1, 1), (1, 2), (2, 1), (2, 2)]
>>> g.edges(sort=True)
[((-2, 1), (1, 1), None), ((-2, 1), (2, 2), None),
 ((-2, 2), (1, 2), None), ((-1, 1), (1, 2), None),
 ((-1, 1), (2, 1), None), ((-1, 2), (2, 2), None)]
```

Another example which used to be wrong until Issue #15958:

```
sage: sp3 = da.to_set_partition([[1, -1], [2], [-2]])
sage: sp4 = da.to_set_partition([[1], [-1], [2], [-2]])
sage: g = da.pair_to_graph( sp3, sp4 ); g
Graph on 8 vertices

sage: g.vertices(sort=True)
[(-2, 1), (-2, 2), (-1, 1), (-1, 2), (1, 1), (1, 2), (2, 1), (2, 2)]
sage: g.edges(sort=True)
[((-2, 1), (2, 2), None), ((-1, 1), (1, 1), None),
 ((-1, 1), (1, 2), None)]
```

```
>>> from sage.all import *
>>> sp3 = da.to_set_partition([[Integer(1), -Integer(1)], [Integer(2)], [-
↪Integer(2)]])
>>> sp4 = da.to_set_partition([[Integer(1)], [-Integer(1)], [Integer(2)], [-
↪Integer(2)]])
>>> g = da.pair_to_graph( sp3, sp4 ); g
Graph on 8 vertices

>>> g.vertices(sort=True)
[(-2, 1), (-2, 2), (-1, 1), (-1, 2), (1, 1), (1, 2), (2, 1), (2, 2)]
>>> g.edges(sort=True)
[((-2, 1), (2, 2), None), ((-1, 1), (1, 1), None),
 ((-1, 1), (1, 2), None)]
```

sage.combinat.diagram_algebras.**partition_diagrams**(*k*)

Return a generator of all partition diagrams of order `k`.

A partition diagram of order $k \in \mathbf{Z}$ to is a set partition of $\{1, \ldots, k, -1, \ldots, -k\}$. If we have $k - 1/2 \in ZZ$, then a partition diagram of order $k \in 1/2\mathbf{Z}$ is a set partition of $\{1, \ldots, k + 1/2, -1, \ldots, -(k + 1/2)\}$ with $k + 1/2$ and $-(k + 1/2)$ in the same block. See [HR2005].

INPUT:

- `k` – the order of the partition diagrams

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: [SetPartition(p) for p in da.partition_diagrams(2)]
```

(continues on next page)

(continued from previous page)

```
[{{-2, -1, 1, 2}},
 {{-2, 1, 2}, {-1}},
 {{-2}, {-1, 1, 2}},
 {{-2, -1}, {1, 2}},
 {{-2}, {-1}, {1, 2}},
 {{-2, -1, 1}, {2}},
 {{-2, 1}, {-1, 2}},
 {{-2, 1}, {-1}, {2}},
 {{-2, 2}, {-1, 1}},
 {{-2, -1, 2}, {1}},
 {{-2, 2}, {-1}, {1}},
 {{-2}, {-1, 1}, {2}},
 {{-2}, {-1, 2}, {1}},
 {{-2, -1}, {1}, {2}},
 {{-2}, {-1}, {1}, {2}}]
sage: [SetPartition(p) for p in da.partition_diagrams(3/2)]
[{{-2, -1, 1, 2}},
 {{-2, 1, 2}, {-1}},
 {{-2, 2}, {-1, 1}},
 {{-2, -1, 2}, {1}},
 {{-2, 2}, {-1}, {1}}]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> [SetPartition(p) for p in da.partition_diagrams(Integer(2))]
[{{-2, -1, 1, 2}},
 {{-2, 1, 2}, {-1}},
 {{-2}, {-1, 1, 2}},
 {{-2, -1}, {1, 2}},
 {{-2}, {-1}, {1, 2}},
 {{-2, -1, 1}, {2}},
 {{-2, 1}, {-1, 2}},
 {{-2, 1}, {-1}, {2}},
 {{-2, 2}, {-1, 1}},
 {{-2, -1, 2}, {1}},
 {{-2, 2}, {-1}, {1}},
 {{-2}, {-1, 1}, {2}},
 {{-2}, {-1, 2}, {1}},
 {{-2, -1}, {1}, {2}},
 {{-2}, {-1}, {1}, {2}}]
>>> [SetPartition(p) for p in da.partition_diagrams(Integer(3)/Integer(2))]
[{{-2, -1, 1, 2}},
 {{-2, 1, 2}, {-1}},
 {{-2, 2}, {-1, 1}},
 {{-2, -1, 2}, {1}},
 {{-2, 2}, {-1}, {1}}]
```

sage.combinat.diagram_algebras.**planar_diagrams**(k)

Return a generator of all planar diagrams of order `k`.

A planar diagram of order k is a partition diagram of order k that has no crossings.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: all_diagrams = [SetPartition(p) for p in da.partition_diagrams(2)]
sage: da2 = [SetPartition(p) for p in da.planar_diagrams(2)]
sage: [p for p in all_diagrams if p not in da2]
[{{-2, 1}, {-1, 2}}]
sage: all_diagrams = [SetPartition(p) for p in da.partition_diagrams(5/2)]
sage: da5o2 = [SetPartition(p) for p in da.planar_diagrams(5/2)]
sage: [p for p in all_diagrams if p not in da5o2]
[{{-3, -1, 3}, {-2, 1, 2}},
 {{-3, -2, 1, 3}, {-1, 2}},
 {{-3, -1, 1, 3}, {-2, 2}},
 {{-3, 1, 3}, {-2, -1, 2}},
 {{-3, 1, 3}, {-2, 2}, {-1}},
 {{-3, 1, 3}, {-2}, {-1, 2}},
 {{-3, -1, 2, 3}, {-2, 1}},
 {{-3, 3}, {-2, 1}, {-1, 2}},
 {{-3, -1, 3}, {-2, 1}, {2}},
 {{-3, -1, 3}, {-2, 2}, {1}}]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> all_diagrams = [SetPartition(p) for p in da.partition_diagrams(Integer(2))]
>>> da2 = [SetPartition(p) for p in da.planar_diagrams(Integer(2))]
>>> [p for p in all_diagrams if p not in da2]
[{{-2, 1}, {-1, 2}}]
>>> all_diagrams = [SetPartition(p) for p in da.partition_diagrams(Integer(5)/
↪Integer(2))]
>>> da5o2 = [SetPartition(p) for p in da.planar_diagrams(Integer(5)/Integer(2))]
>>> [p for p in all_diagrams if p not in da5o2]
[{{-3, -1, 3}, {-2, 1, 2}},
 {{-3, -2, 1, 3}, {-1, 2}},
 {{-3, -1, 1, 3}, {-2, 2}},
 {{-3, 1, 3}, {-2, -1, 2}},
 {{-3, 1, 3}, {-2, 2}, {-1}},
 {{-3, 1, 3}, {-2}, {-1, 2}},
 {{-3, -1, 2, 3}, {-2, 1}},
 {{-3, 3}, {-2, 1}, {-1, 2}},
 {{-3, -1, 3}, {-2, 1}, {2}},
 {{-3, -1, 3}, {-2, 2}, {1}}]
```

sage.combinat.diagram_algebras.**planar_partitions_rec**(*X*)

Iterate over all planar set partitions of X by using a recursive algorithm.

ALGORITHM:

To construct the set partition $\rho = \{\rho_1, \ldots, \rho_k\}$ of $[n]$, we remove the part of the set partition containing the last element of X, which, we consider to be $\rho_k = \{i_1, \ldots, i_m\}$ without loss of generality. The remaining parts come from the planar set partitions of $\{1, \ldots, i_1 - 1\}, \{i_1 + 1, \ldots, i_2 - 1\}, \ldots, \{i_m + 1, \ldots, n\}$.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: list(da.planar_partitions_rec([1,2,3]))
[([1, 2], [3]), ([1], [2], [3]), ([2], [1, 3]), ([1], [2, 3]), ([1, 2, 3],)]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> list(da.planar_partitions_rec([Integer(1),Integer(2),Integer(3)]))
[([1, 2], [3]), ([1], [2], [3]), ([2], [1, 3]), ([1], [2, 3]), ([1, 2, 3],)]
```

sage.combinat.diagram_algebras.**propagating_number**(*sp*)

Return the propagating number of the set partition `sp`.

The propagating number is the number of blocks with both a positive and negative number.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: sp1 = da.to_set_partition([[1,-2],[2,-1]])
sage: sp2 = da.to_set_partition([[1,2],[-2,-1]])
sage: da.propagating_number(sp1)
2
sage: da.propagating_number(sp2)
0
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> sp1 = da.to_set_partition([[Integer(1),-Integer(2)],[Integer(2),-Integer(1)]])
>>> sp2 = da.to_set_partition([[Integer(1),Integer(2)],[-Integer(2),-Integer(1)]])
>>> da.propagating_number(sp1)
2
>>> da.propagating_number(sp2)
0
```

sage.combinat.diagram_algebras.**temperley_lieb_diagrams**(*k*)

Return a generator of all Temperley–Lieb diagrams of order `k`.

A Temperley–Lieb diagram of order k is a partition diagram of order k with block size 2 and is planar.

INPUT:

- `k` – the order of the Temperley–Lieb diagrams

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: [SetPartition(p) for p in da.temperley_lieb_diagrams(2)]
[{{-2, -1}, {1, 2}}, {{-2, 2}, {-1, 1}}]
sage: [SetPartition(p) for p in da.temperley_lieb_diagrams(5/2)]
[{{-3, 3}, {-2, -1}, {1, 2}}, {{-3, 3}, {-2, 2}, {-1, 1}}]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> [SetPartition(p) for p in da.temperley_lieb_diagrams(Integer(2))]
[{{-2, -1}, {1, 2}}, {{-2, 2}, {-1, 1}}]
>>> [SetPartition(p) for p in da.temperley_lieb_diagrams(Integer(5)/Integer(2))]
[{{-3, 3}, {-2, -1}, {1, 2}}, {{-3, 3}, {-2, 2}, {-1, 1}}]
```

sage.combinat.diagram_algebras.**to_Brauer_partition**(*l*, *k=None*)

Same as *to_set_partition()* but assumes omitted elements are connected straight through.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: f = lambda sp: SetPartition(da.to_Brauer_partition(sp))
sage: f([[1,2],[-1,-2]]) == SetPartition([[1,2],[-1,-2]])
True
sage: f([[1,3],[-1,-3]]) == SetPartition([[1,3],[-3,-1],[2,-2]])
True
sage: f([[1,-4],[-3,-1],[3,4]]) == SetPartition([[-3,-1],[2,-2],[1,-4],[3,4]])
True
sage: p = SetPartition([[1,2],[-1,-2],[3,-3],[4,-4]])
sage: SetPartition(da.to_Brauer_partition([[1,2],[-1,-2]], k=4)) == p
True
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> f = lambda sp: SetPartition(da.to_Brauer_partition(sp))
>>> f([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]]) ==␣
↪SetPartition([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)]])
True
>>> f([[Integer(1),Integer(3)],[-Integer(1),-Integer(3)]]) ==␣
↪SetPartition([[Integer(1),Integer(3)],[-Integer(3),-Integer(1)],[Integer(2),-
↪Integer(2)]])
True
>>> f([[Integer(1),-Integer(4)],[-Integer(3),-Integer(1)],[Integer(3),
↪Integer(4)]]) == SetPartition([[-Integer(3),-Integer(1)],[Integer(2),-
↪Integer(2)],[Integer(1),-Integer(4)],[Integer(3),Integer(4)]])
True
>>> p = SetPartition([[Integer(1),Integer(2)],[-Integer(1),-Integer(2)],
↪[Integer(3),-Integer(3)],[Integer(4),-Integer(4)]])
>>> SetPartition(da.to_Brauer_partition([[Integer(1),Integer(2)],[-Integer(1),-
↪Integer(2)]], k=Integer(4))) == p
True
```

sage.combinat.diagram_algebras.**to_graph**(*sp*)

Return a graph representing the set partition `sp`.

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: g = da.to_graph( da.to_set_partition([[1,-2],[2,-1]])); g
Graph on 4 vertices

sage: g.vertices(sort=True)
[-2, -1, 1, 2]
sage: g.edges(sort=True)
[(-2, 1, None), (-1, 2, None)]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> g = da.to_graph( da.to_set_partition([[Integer(1),-Integer(2)],[Integer(2),-
↪Integer(1)]])); g
Graph on 4 vertices
```

(continues on next page)

(continued from previous page)

```
>>> g.vertices(sort=True)
[-2, -1, 1, 2]
>>> g.edges(sort=True)
[(-2, 1, None), (-1, 2, None)]
```

sage.combinat.diagram_algebras.**to_set_partition**(*l*, *k=None*)

Convert input to a set partition of $\{1, \ldots, k, -1, \ldots, -k\}$.

Convert a list of a list of numbers to a set partitions. Each list of numbers in the outer list specifies the numbers contained in one of the blocks in the set partition.

If k is specified, then the set partition will be a set partition of $\{1, \ldots, k, -1, \ldots, -k\}$. Otherwise, k will default to the minimum number needed to contain all of the specified numbers.

INPUT:

- `l` – list of lists of integers
- `k` – integer (default: `None`)

OUTPUT: list of sets

EXAMPLES:

```
sage: import sage.combinat.diagram_algebras as da
sage: f = lambda sp: SetPartition(da.to_set_partition(sp))
sage: f([[1,-1],[2,-2]]) == SetPartition(da.identity_set_partition(2))
True
sage: da.to_set_partition([[1]])
[{1}, {-1}]
sage: da.to_set_partition([[1,-1],[-2,3]],9/2)
[{-1, 1}, {-2, 3}, {2}, {-4, 4}, {-5, 5}, {-3}]
```

```
>>> from sage.all import *
>>> import sage.combinat.diagram_algebras as da
>>> f = lambda sp: SetPartition(da.to_set_partition(sp))
>>> f([[Integer(1),-Integer(1)],[Integer(2),-Integer(2)]]) == SetPartition(da.
↪identity_set_partition(Integer(2)))
True
>>> da.to_set_partition([[Integer(1)]])
[{1}, {-1}]
>>> da.to_set_partition([[Integer(1),-Integer(1)],[-Integer(2),Integer(3)]],
↪Integer(9)/Integer(2))
[{-1, 1}, {-2, 3}, {2}, {-4, 4}, {-5, 5}, {-3}]
```

Dyck words

A class of an object enumerated by the *Catalan numbers*, see [Sta-EC2], [StaCat98] for details.

AUTHORS:

- Mike Hansen
- Dan Drake (2008-05-30): DyckWordBacktracker support
- Florent Hivert (2009-02-01): Bijections with NonDecreasingParkingFunctions

- Christian Stump (2011-12): added combinatorial maps and statistics
- Mike Zabrocki:
  - (2012-10): added pretty print, characteristic function, more functions
  - (2013-01): added inverse of area/dinv, bounce/area map
- Jean–Baptiste Priez, Travis Scrimshaw (2013-05-17): Added ASCII art
- Travis Scrimshaw (2013-07-09): Removed `CombinatorialClass` and added global options.

REFERENCES:

class sage.combinat.dyck_word.**CompleteDyckWords**

Bases: *DyckWords*

Abstract base class for all complete Dyck words.

Element

alias of *DyckWord_complete*

from_Catalan_code(*code*)

Return the Dyck word associated to the given Catalan code `code`.

A Catalan code of length n is a sequence $(a_1, a_2, \ldots, a_n)$ of n integers a_i such that:

- $0 \leq a_i \leq n - i$ for every i;
- if $i < j$ and $a_i > 0$ and $a_j > 0$ and $a_{i+1} = a_{i+2} = \cdots = a_{j-1} = 0$, then $a_i - a_j < j - i$.

It turns out that the Catalan codes of length n are in bijection with Dyck words.

The Catalan code of a Dyck word is example (x) in Richard Stanley's exercises on combinatorial interpretations for Catalan objects. The code in this example is the reverse of the description provided there. See [Sta-EC2] and [StaCat98].

EXAMPLES:

```
sage: DyckWords().from_Catalan_code([])
[]
sage: DyckWords().from_Catalan_code([0])
[1, 0]
sage: DyckWords().from_Catalan_code([0, 1])
[1, 1, 0, 0]
sage: DyckWords().from_Catalan_code([0, 0])
[1, 0, 1, 0]
```

```
>>> from sage.all import *
>>> DyckWords().from_Catalan_code([])
[]
>>> DyckWords().from_Catalan_code([Integer(0)])
[1, 0]
>>> DyckWords().from_Catalan_code([Integer(0), Integer(1)])
[1, 1, 0, 0]
>>> DyckWords().from_Catalan_code([Integer(0), Integer(0)])
[1, 0, 1, 0]
```

from_area_sequence(*code*)

Return the Dyck word associated to the given area sequence `code`.

See *to_area_sequence()* for a definition of the area sequence of a Dyck word.

See also

area(), *to_area_sequence()*.

INPUT:

- `code` – list of integers satisfying `code[0] == 0` and `0 <= code[i+1] <= code[i]+1`

EXAMPLES:

```
sage: DyckWords().from_area_sequence([])
[]
sage: DyckWords().from_area_sequence([0])
[1, 0]
sage: DyckWords().from_area_sequence([0, 1])
[1, 1, 0, 0]
sage: DyckWords().from_area_sequence([0, 0])
[1, 0, 1, 0]
```

```
>>> from sage.all import *
>>> DyckWords().from_area_sequence([])
[]
>>> DyckWords().from_area_sequence([Integer(0)])
[1, 0]
>>> DyckWords().from_area_sequence([Integer(0), Integer(1)])
[1, 1, 0, 0]
>>> DyckWords().from_area_sequence([Integer(0), Integer(0)])
[1, 0, 1, 0]
```

from_non_decreasing_parking_function(*pf*)

Bijection from *non-decreasing parking functions*.

See there the method *to_dyck_word()* for more information.

EXAMPLES:

```
sage: D = DyckWords()
sage: D.from_non_decreasing_parking_function([])
[]
sage: D.from_non_decreasing_parking_function([1])
[1, 0]
sage: D.from_non_decreasing_parking_function([1,1])
[1, 1, 0, 0]
sage: D.from_non_decreasing_parking_function([1,2])
[1, 0, 1, 0]
sage: D.from_non_decreasing_parking_function([1,1,1])
[1, 1, 1, 0, 0, 0]
sage: D.from_non_decreasing_parking_function([1,2,3])
[1, 0, 1, 0, 1, 0]
sage: D.from_non_decreasing_parking_function([1,1,3,3,4,6,6])
[1, 1, 0, 0, 1, 1, 0, 1, 0, 0, 1, 1, 0, 0]
```

```
>>> from sage.all import *
>>> D = DyckWords()
```

(continues on next page)

(continued from previous page)

```
>>> D.from_non_decreasing_parking_function([])
[]
>>> D.from_non_decreasing_parking_function([Integer(1)])
[1, 0]
>>> D.from_non_decreasing_parking_function([Integer(1),Integer(1)])
[1, 1, 0, 0]
>>> D.from_non_decreasing_parking_function([Integer(1),Integer(2)])
[1, 0, 1, 0]
>>> D.from_non_decreasing_parking_function([Integer(1),Integer(1),Integer(1)])
[1, 1, 1, 0, 0, 0]
>>> D.from_non_decreasing_parking_function([Integer(1),Integer(2),Integer(3)])
[1, 0, 1, 0, 1, 0]
>>> D.from_non_decreasing_parking_function([Integer(1),Integer(1),Integer(3),
↪Integer(3),Integer(4),Integer(6),Integer(6)])
[1, 1, 0, 0, 1, 1, 0, 1, 0, 0, 1, 1, 0, 0]
```

from_noncrossing_partition(*ncp*)

Convert a noncrossing partition `ncp` to a Dyck word.

EXAMPLES:

```
sage: DyckWord(noncrossing_partition=[[1,2]]) # indirect doctest
[1, 1, 0, 0]
sage: DyckWord(noncrossing_partition=[[1],[2]])
[1, 0, 1, 0]

sage: dws = DyckWords(5).list()
sage: ncps = [x.to_noncrossing_partition() for x in dws]
sage: dws2 = [DyckWord(noncrossing_partition=x) for x in ncps]
sage: dws == dws2
True
```

```
>>> from sage.all import *
>>> DyckWord(noncrossing_partition=[[Integer(1),Integer(2)]]) # indirect␣
↪doctest
[1, 1, 0, 0]
>>> DyckWord(noncrossing_partition=[[Integer(1)],[Integer(2)]])
[1, 0, 1, 0]

>>> dws = DyckWords(Integer(5)).list()
>>> ncps = [x.to_noncrossing_partition() for x in dws]
>>> dws2 = [DyckWord(noncrossing_partition=x) for x in ncps]
>>> dws == dws2
True
```

class sage.combinat.dyck_word.**CompleteDyckWords_all**

Bases: *CompleteDyckWords*, *DyckWords_all*

All complete Dyck words.

class height_poset

Bases: `UniqueRepresentation`, `Parent`

The poset of complete Dyck words compared componentwise by `heights`.

This is, `D` is smaller than or equal to `D'` if it is weakly below `D'`.

This is implemented by comparison of area sequences.

le(*dw1*, *dw2*)

Compare two Dyck words of equal size, and return `True` if all of the heights of `dw1` are less than or equal to the respective heights of `dw2` .

See also

to_area_sequence()

EXAMPLES:

```
sage: poset = DyckWords().height_poset()
sage: poset.le(DyckWord([]), DyckWord([]))
True
sage: poset.le(DyckWord([1,0]), DyckWord([1,0]))
True
sage: poset.le(DyckWord([1,0,1,0]), DyckWord([1,1,0,0]))
True
sage: poset.le(DyckWord([1,1,0,0]), DyckWord([1,0,1,0]))
False
sage: [poset.le(dw1, dw2)
....:     for dw1 in DyckWords(3) for dw2 in DyckWords(3)]
[True, True, True, True, True, False, True, False, True, True,
False, False, True, True, True, False, False, False, True,
True, False, False, False, False, True]
```

```
>>> from sage.all import *
>>> poset = DyckWords().height_poset()
>>> poset.le(DyckWord([]), DyckWord([]))
True
>>> poset.le(DyckWord([Integer(1),Integer(0)]), DyckWord([Integer(1),
...Integer(0)]))
True
>>> poset.le(DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]),␣
...DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]))
True
>>> poset.le(DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]),␣
...DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]))
False
>>> [poset.le(dw1, dw2)
...     for dw1 in DyckWords(Integer(3)) for dw2 in DyckWords(Integer(3))]
[True, True, True, True, True, False, True, False, True, True,
False, False, True, True, True, False, False, False, True,
True, False, False, False, False, True]
```

class sage.combinat.dyck_word.**CompleteDyckWords_size**(*k*)

Bases: *CompleteDyckWords*, *DyckWords_size*

All complete Dyck words of a given size.

cardinality()

Return the number of complete Dyck words of semilength n, i.e. the n-th *Catalan number*.

EXAMPLES:

```
sage: DyckWords(4).cardinality()
14
sage: ns = list(range(9))
sage: dws = [DyckWords(n) for n in ns]
sage: all(dw.cardinality() == len(dw.list()) for dw in dws)
True
```

```
>>> from sage.all import *
>>> DyckWords(Integer(4)).cardinality()
14
>>> ns = list(range(Integer(9)))
>>> dws = [DyckWords(n) for n in ns]
>>> all(dw.cardinality() == len(dw.list()) for dw in dws)
True
```

random_element()

Return a random complete Dyck word of semilength n.

The algorithm is based on a classical combinatorial fact. One chooses at random a word with n 0s and $n+1$ 1s. One then considers every 1 as an ascending step and every 0 as a descending step, and one finds the lowest point of the path (with respect to a slightly tilted slope). One then cuts the path at this point and builds a Dyck word by exchanging the two parts of the word and removing the initial step.

Todo

extend this to m-Dyck words

EXAMPLES:

```
sage: dw = DyckWords(8)
sage: dw.random_element()  # random
[1, 1, 1, 1, 1, 0, 0, 0, 0, 0, 1, 0, 1, 0, 1, 0]

sage: D = DyckWords(8)
sage: D.random_element() in D
True
```

```
>>> from sage.all import *
>>> dw = DyckWords(Integer(8))
>>> dw.random_element()  # random
[1, 1, 1, 1, 1, 0, 0, 0, 0, 0, 1, 0, 1, 0, 1, 0]

>>> D = DyckWords(Integer(8))
>>> D.random_element() in D
True
```

class sage.combinat.dyck_word.**DyckWord**(*parent*, *l*, *latex_options={}*)

Bases: *CombinatorialElement*

A Dyck word.

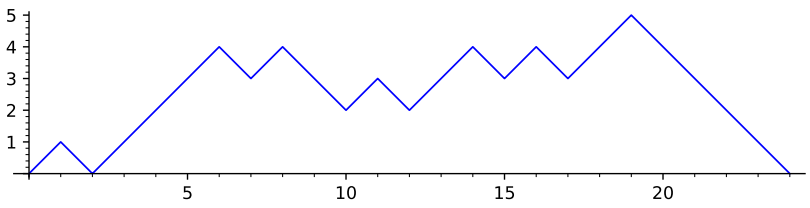
A Dyck word is a sequence of open and close symbols such that every close symbol has a corresponding open symbol preceding it. That is to say, a Dyck word of length n is a list with k entries 1 and $n - k$ entries 0 such that the first i entries always have at least as many 1s among them as 0s. (Here, the 1 serves as the open symbol and the 0 as the close symbol.) Alternatively, the alphabet 1 and 0 can be replaced by other characters such as '(' and ')'.

A Dyck word is *complete* if every open symbol moreover has a corresponding close symbol.

A Dyck word may also be specified by either a noncrossing partition or by an area sequence or the sequence of heights.

A Dyck word may also be thought of as a lattice path in the $\mathbf{Z}^2$ grid, starting at the origin $(0, 0)$, and with steps in the North $N = (0, 1)$ and east $E = (1, 0)$ directions such that it does not pass below the $x = y$ diagonal. The diagonal is referred to as the "main diagonal" in the documentation. A North step is represented by a 1 in the list and an East step is represented by a 0.

Equivalently, the path may be represented with steps in the $NE = (1, 1)$ and the $SE = (1, -1)$ direction such that it does not pass below the horizontal axis.



A path representing a Dyck word (either using N and E steps, or using NE and SE steps) is called a Dyck path.

EXAMPLES:

```
sage: dw = DyckWord([1, 0, 1, 0]); dw
[1, 0, 1, 0]
sage: print(dw)
()()
sage: dw.height()
1
sage: dw.to_noncrossing_partition()
{{1}, {2}}
```

```
>>> from sage.all import *
>>> dw = DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]); dw
[1, 0, 1, 0]
```

(continues on next page)

(continued from previous page)

```
>>> print(dw)

↪pretty_print()
   ___
  | x
 _|  .
|  . .
```

ascent_prime_decomposition()

Decompose this Dyck word into a sequence of ascents and prime Dyck paths.

A Dyck word is *prime* if it is complete and has precisely one return - the final step. In particular, the empty

Dyck path is not prime. Thus, the factorization is unique.

This decomposition yields a sequence of odd length: the words with even indices consist of up steps only, the words with odd indices are prime Dyck paths. The concatenation of the result is the original word.

EXAMPLES:

```
sage: D = DyckWord([1,1,1,0,1,0,1,1,1,1,0,1])
sage: D.ascent_prime_decomposition()
[[1, 1], [1, 0], [], [1, 0], [1, 1, 1], [1, 0], [1]]

sage: DyckWord([]).ascent_prime_decomposition()
[[]]

sage: DyckWord([1,1]).ascent_prime_decomposition()
[[1, 1]]

sage: DyckWord([1,0,1,0]).ascent_prime_decomposition()
[[], [1, 0], [], [1, 0], []]
```

```
>>> from sage.all import *
>>> D = DyckWord([Integer(1),Integer(1),Integer(1),Integer(0),Integer(1),
↪Integer(0),Integer(1),Integer(1),Integer(1),Integer(1),Integer(0),
↪Integer(1)])
>>> D.ascent_prime_decomposition()
[[1, 1], [1, 0], [], [1, 0], [1, 1, 1], [1, 0], [1]]

>>> DyckWord([]).ascent_prime_decomposition()
[[]]

>>> DyckWord([Integer(1),Integer(1)]).ascent_prime_decomposition()
[[1, 1]]

>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]).ascent_prime_
↪decomposition()
[[], [1, 0], [], [1, 0], []]
```

associated_parenthesis(*pos*)

Report the position for the parenthesis in `self` that matches the one at position `pos`.

The positions in `self` are counted from 0.

INPUT:

- `pos` – the index of the parenthesis in the list

OUTPUT:

- Integer representing the index of the matching parenthesis. If no parenthesis matches, return `None`.

EXAMPLES:

```
sage: DyckWord([1, 0]).associated_parenthesis(0)
1
sage: DyckWord([1, 0, 1, 0]).associated_parenthesis(0)
1
sage: DyckWord([1, 0, 1, 0]).associated_parenthesis(1)
```

(continues on next page)

(continued from previous page)

```
0
sage: DyckWord([1, 0, 1, 0]).associated_parenthesis(2)
3
sage: DyckWord([1, 0, 1, 0]).associated_parenthesis(3)
2
sage: DyckWord([1, 1, 0, 0]).associated_parenthesis(0)
3
sage: DyckWord([1, 1, 0, 0]).associated_parenthesis(2)
1
sage: DyckWord([1, 1, 0]).associated_parenthesis(1)
2
sage: DyckWord([1, 1]).associated_parenthesis(0)
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0)]).associated_parenthesis(Integer(0))
1
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).associated_
↪parenthesis(Integer(0))
1
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).associated_
↪parenthesis(Integer(1))
0
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).associated_
↪parenthesis(Integer(2))
3
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).associated_
↪parenthesis(Integer(3))
2
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).associated_
↪parenthesis(Integer(0))
3
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).associated_
↪parenthesis(Integer(2))
1
>>> DyckWord([Integer(1), Integer(1), Integer(0)]).associated_
↪parenthesis(Integer(1))
2
>>> DyckWord([Integer(1), Integer(1)]).associated_parenthesis(Integer(0))
```

catalan_factorization()

Decompose this Dyck word into a sequence of complete Dyck words.

Each element of the list returned is a (possibly empty) complete Dyck word. The original word is obtained by placing an up step between each of these complete Dyck words. Thus, the number of words returned is one more than the final height.

See Section 1.2 of [CC1982] or Lemma 9.1.1 of [Lot2005].

EXAMPLES:

```
sage: D = DyckWord([1,1,1,0,1,0,1,1,1,1,0,1])
sage: D.catalan_factorization()
[[], [], [1, 0, 1, 0], [], [], [1, 0], []]
```

(continues on next page)

(continued from previous page)

```
sage: DyckWord([]).catalan_factorization()
[[]]

sage: DyckWord([1,1]).catalan_factorization()
[[], [], []]

sage: DyckWord([1,0,1,0]).catalan_factorization()
[[1, 0, 1, 0]]
```

```
>>> from sage.all import *
>>> D = DyckWord([Integer(1),Integer(1),Integer(1),Integer(0),Integer(1),
↪Integer(0),Integer(1),Integer(1),Integer(1),Integer(1),Integer(0),
↪Integer(1)])
>>> D.catalan_factorization()
[[], [], [1, 0, 1, 0], [], [], [1, 0], []]

>>> DyckWord([]).catalan_factorization()
[[]]

>>> DyckWord([Integer(1),Integer(1)]).catalan_factorization()
[[], [], []]

>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]).catalan_
↪factorization()
[[1, 0, 1, 0]]
```

height()

Return the height of `self`.

We view the Dyck word as a Dyck path from $(0, 0)$ to $(2n, 0)$ in the first quadrant by letting `1`'s represent steps in the direction $(1, 1)$ and `0`'s represent steps in the direction $(1, -1)$.

The height is the maximum y-coordinate reached.

See also

heights()

EXAMPLES:

```
sage: DyckWord([]).height()
0
sage: DyckWord([1,0]).height()
1
sage: DyckWord([1, 1, 0, 0]).height()
2
sage: DyckWord([1, 1, 0, 1, 0]).height()
2
sage: DyckWord([1, 1, 0, 0, 1, 0]).height()
2
sage: DyckWord([1, 0, 1, 0]).height()
```

(continues on next page)

(continued from previous page)

```
1
sage: DyckWord([1, 1, 0, 0, 1, 1, 1, 0, 0, 0]).height()
3
```

```
>>> from sage.all import *
>>> DyckWord([]).height()
0
>>> DyckWord([Integer(1),Integer(0)]).height()
1
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).height()
2
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(1), Integer(0)]).
↪height()
2
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(0)]).height()
2
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).height()
1
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(1), Integer(1), Integer(0), Integer(0), Integer(0)]).height()
3
```

heights()

Return the heights of `self`.

We view the Dyck word as a Dyck path from $(0,0)$ to $(2n,0)$ in the first quadrant by letting `1`'s represent steps in the direction $(1,1)$ and `0`'s represent steps in the direction $(1,-1)$.

The heights is the sequence of the y-coordinates of all $2n+1$ lattice points along the path.

See also

from_heights(), *min_from_heights()*

EXAMPLES:

```
sage: DyckWord([]).heights()
(0,)
sage: DyckWord([1,0]).heights()
(0, 1, 0)
sage: DyckWord([1, 1, 0, 0]).heights()
(0, 1, 2, 1, 0)
sage: DyckWord([1, 1, 0, 1, 0]).heights()
(0, 1, 2, 1, 2, 1)
sage: DyckWord([1, 1, 0, 0, 1, 0]).heights()
(0, 1, 2, 1, 0, 1, 0)
sage: DyckWord([1, 0, 1, 0]).heights()
(0, 1, 0, 1, 0)
sage: DyckWord([1, 1, 0, 0, 1, 1, 1, 0, 0, 0]).heights()
(0, 1, 2, 1, 0, 1, 2, 3, 2, 1, 0)
```

```
>>> from sage.all import *
>>> DyckWord([]).heights()
(0,)
>>> DyckWord([Integer(1),Integer(0)]).heights()
(0, 1, 0)
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).heights()
(0, 1, 2, 1, 0)
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(1), Integer(0)]).
↪heights()
(0, 1, 2, 1, 2, 1)
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(0)]).heights()
(0, 1, 2, 1, 0, 1, 0)
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).heights()
(0, 1, 0, 1, 0)
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(1), Integer(1), Integer(0), Integer(0), Integer(0)]).heights()
(0, 1, 2, 1, 0, 1, 2, 3, 2, 1, 0)
```

is_complete()

Return `True` if `self` is complete.

A Dyck word d is complete if d contains as many closers as openers.

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 0]).is_complete()
True
sage: DyckWord([1, 0, 1, 1, 0]).is_complete()
False
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).is_complete()
True
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(1), Integer(0)]).is_
↪complete()
False
```

latex_options()

Return the latex options for use in the `_latex_` function as a dictionary.

The default values are set using the options.

- `tikz_scale` – (default: 1) scale for use with the tikz package
- `diagonal` – boolean (default: `False`); value to draw the diagonal or not
- `line width` – (default: `2*tikz_scale`) value representing the line width
- `color` – (default: black) the line color
- `bounce path` – boolean (default: `False`); value to indicate if the bounce path should be drawn
- `peaks` – boolean (default: `False`); value to indicate if the peaks should be displayed
- `valleys` – boolean (default: `False`); value to indicate if the valleys should be displayed

EXAMPLES:

```
sage: D = DyckWord([1,0,1,0,1,0])
sage: D.latex_options()
{'bounce path': False,
 'color': black,
 'diagonal': False,
 'line width': 2,
 'peaks': False,
 'tikz_scale': 1,
 'valleys': False}
```

```
>>> from sage.all import *
>>> D = DyckWord([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0)])
>>> D.latex_options()
{'bounce path': False,
 'color': black,
 'diagonal': False,
 'line width': 2,
 'peaks': False,
 'tikz_scale': 1,
 'valleys': False}
```

Todo

This should probably be merged into DyckWord.options.

length()

Return the length of `self`.

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 0]).length()
4
sage: DyckWord([1, 0, 1, 1, 0]).length()
5
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).length()
4
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(1), Integer(0)]).
↪length()
5
```

number_of_close_symbols()

Return the number of close symbols in `self`.

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 0]).number_of_close_symbols()
2
sage: DyckWord([1, 0, 1, 1, 0]).number_of_close_symbols()
2
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).number_of_
↪close_symbols()
2
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(1), Integer(0)]).
↪number_of_close_symbols()
2
```

number_of_double_rises()

Return a the number of positions in `self` where there are two consecutive 1's.

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 1, 0, 1, 1, 0, 0, 1, 0, 0, 1, 0]).number_of_double_
↪rises()
2
sage: DyckWord([1, 1, 0, 0]).number_of_double_rises()
1
sage: DyckWord([1, 0, 1, 0]).number_of_double_rises()
0
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(1), Integer(0), Integer(0), Integer(1), Integer(0),␣
↪Integer(0), Integer(1), Integer(0)]).number_of_double_rises()
2
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).number_of_
↪double_rises()
1
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).number_of_
↪double_rises()
0
```

number_of_initial_rises()

Return the length of the initial run of `self`.

OUTPUT: nonnegative integer indicating the length of the initial rise

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 0]).number_of_initial_rises()
1
sage: DyckWord([1, 1, 0, 0]).number_of_initial_rises()
2
sage: DyckWord([1, 1, 0, 0, 1, 0]).number_of_initial_rises()
2
sage: DyckWord([1, 0, 1, 1, 0, 0]).number_of_initial_rises()
1
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).number_of_
↪initial_rises()
1
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).number_of_
```

(continues on next page)

(continued from previous page)

```
↪initial_rises()
2
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(0)]).number_of_initial_rises()
2
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(0)]).number_of_initial_rises()
1
```

number_of_open_symbols()

Return the number of open symbols in `self`.

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 0]).number_of_open_symbols()
2
sage: DyckWord([1, 0, 1, 1, 0]).number_of_open_symbols()
3
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).number_of_open_
↪symbols()
2
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(1), Integer(0)]).
↪number_of_open_symbols()
3
```

number_of_peaks()

Return the number of peaks of the Dyck path associated to `self` .

See also

peaks(), *number_of_valleys()*

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 0]).number_of_peaks()
2
sage: DyckWord([1, 1, 0, 0]).number_of_peaks()
1
sage: DyckWord([1,1,0,1,0,1,0,0]).number_of_peaks()
3
sage: DyckWord([]).number_of_peaks()
0
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).number_of_
↪peaks()
2
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).number_of_
↪peaks()
```

(continues on next page)

(continued from previous page)

```
1
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).number_of_peaks()
3
>>> DyckWord([]).number_of_peaks()
0
```

number_of_touch_points()

Return the number of touches of `self` at the main diagonal.

OUTPUT: nonnegative integer

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 0]).number_of_touch_points()
2
sage: DyckWord([1, 1, 0, 0]).number_of_touch_points()
1
sage: DyckWord([1, 1, 0, 0, 1, 0]).number_of_touch_points()
2
sage: DyckWord([1, 0, 1, 1, 0, 0]).number_of_touch_points()
2
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).number_of_
↪touch_points()
2
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).number_of_
↪touch_points()
1
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(0)]).number_of_touch_points()
2
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(0)]).number_of_touch_points()
2
```

number_of_valleys()

Return the number of valleys of `self`.

See also

number_of_peaks(), *valleys()*

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 0]).number_of_valleys()
1
sage: DyckWord([1, 1, 0, 0]).number_of_valleys()
0
sage: DyckWord([1, 1, 0, 0, 1, 0]).number_of_valleys()
1
```

(continues on next page)

(continued from previous page)

```
sage: DyckWord([1, 0, 1, 1, 0, 0]).number_of_valleys()
1
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).number_of_
↪valleys()
1
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).number_of_
↪valleys()
0
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(0)]).number_of_valleys()
1
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(0)]).number_of_valleys()
1
```

peaks()

Return a list of the positions of the peaks of a Dyck word.

A peak is 1 followed by a 0. Note that this does not agree with the definition given in [Hag2008].

See also

valleys(), *number_of_peaks()*

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 0]).peaks()
[0, 2]
sage: DyckWord([1, 1, 0, 0]).peaks()
[1]
sage: DyckWord([1,1,0,1,0,1,0,0]).peaks() # Haglund's def gives 2
[1, 3, 5]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).peaks()
[0, 2]
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).peaks()
[1]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).peaks() # Haglund's def gives 2
[1, 3, 5]
```

plot(***kwds*)

Plot a Dyck word as a continuous path.

EXAMPLES:

```
sage: w = DyckWords(100).random_element()
sage: w.plot()                                                    #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.plot
Graphics object consisting of 1 graphics primitive
```

```
>>> from sage.all import *
>>> w = DyckWords(Integer(100)).random_element()
>>> w.plot()                                                                #␣
↪needs sage.plot
Graphics object consisting of 1 graphics primitive
```

position_of_first_return()

Return the number of vertical steps before the Dyck path returns to the main diagonal.

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 1, 0, 1, 1, 0, 0, 1, 0, 0, 1, 0]).position_of_first_
↪return()
1
sage: DyckWord([1, 1, 1, 0, 1, 1, 0, 0, 1, 0, 0, 1, 0, 0]).position_of_first_
↪return()
7
sage: DyckWord([1, 1, 0, 0]).position_of_first_return()
2
sage: DyckWord([1, 0, 1, 0]).position_of_first_return()
1
sage: DyckWord([]).position_of_first_return()
0
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(1), Integer(0), Integer(0), Integer(1), Integer(0),␣
↪Integer(0), Integer(1), Integer(0)]).position_of_first_return()
1
>>> DyckWord([Integer(1), Integer(1), Integer(1), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(0), Integer(1), Integer(0), Integer(0),␣
↪Integer(1), Integer(0), Integer(0)]).position_of_first_return()
7
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).position_of_
↪first_return()
2
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).position_of_
↪first_return()
1
>>> DyckWord([]).position_of_first_return()
0
```

positions_of_double_rises()

Return a list of positions in `self` where there are two consecutive 1's.

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 1, 0, 1, 1, 0, 0, 1, 0, 0, 1, 0]).positions_of_
↪double_rises()
```

(continues on next page)

(continued from previous page)

```
[2, 5]
sage: DyckWord([1, 1, 0, 0]).positions_of_double_rises()
[0]
sage: DyckWord([1, 0, 1, 0]).positions_of_double_rises()
[]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(1), Integer(0), Integer(0), Integer(1), Integer(0),␣
↪Integer(0), Integer(1), Integer(0)]).positions_of_double_rises()
[2, 5]
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).positions_of_
↪double_rises()
[0]
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).positions_of_
↪double_rises()
[]
```

pp(*type=None*, *labelling=None*, *underpath=True*)

alias of *pretty_print()*.

pretty_print(*type=None*, *labelling=None*, *underpath=True*)

Display a DyckWord as a lattice path in the $\mathbf{Z}^2$ grid.

If the `type` is "N-E", then a cell below the diagonal is indicated by a period, whereas a cell below the path but above the diagonal is indicated by an x. If a list of labels is included, they are displayed along the vertical edges of the Dyck path.

If the `type` is "NE-SE", then the path is simply printed as up steps and down steps.

INPUT:

- `type` – (default: `None`) can either be:
  - `None` to use the option default
  - "N-E" to show `self` as a path of north and east steps, or
  - "NE-SE" to show `self` as a path of north-east and south-east steps.
- `labelling` – (if type is "N-E") a list of labels assigned to the up steps in `self`
- `underpath` – (if type is "N-E", default: `True`) if `True`, the labelling is shown under the path; otherwise, it is shown to the right of the path

EXAMPLES:

```
sage: for D in DyckWords(3): D.pretty_print()

```

```
sage: DyckWord([]).pretty_print()
.
```

```
>>> from sage.all import *
>>> DyckWord([]).pretty_print()
.
```

returns_to_zero()

Return a list of positions where `self` has height 0, excluding the position 0.

EXAMPLES:

```
sage: DyckWord([]).returns_to_zero()
[]
sage: DyckWord([1, 0]).returns_to_zero()
[2]
sage: DyckWord([1, 0, 1, 0]).returns_to_zero()
```

(continues on next page)

(continued from previous page)

```
[2, 4]
sage: DyckWord([1, 1, 0, 0]).returns_to_zero()
[4]
```

```
>>> from sage.all import *
>>> DyckWord([]).returns_to_zero()
[]
>>> DyckWord([Integer(1), Integer(0)]).returns_to_zero()
[2]
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).returns_to_
↪zero()
[2, 4]
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).returns_to_
↪zero()
[4]
```

rise_composition()

The sequences of lengths of runs of 1's in `self`. Also equal to the sequence of lengths of vertical segments in the Dyck path.

EXAMPLES:

```
sage: DyckWord([1, 1, 0, 1, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0]).pretty_print()
          ___
         | x
  _______|  .
 | x x x  . .
 | x x  . . .
_| x  . . . .
| x  . . . . .
|  . . . . . .

sage: DyckWord([1, 1, 0, 1, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0]).rise_composition()
[2, 3, 2]
sage: DyckWord([1,1,0,0]).rise_composition()
[2]
sage: DyckWord([1,0,1,0]).rise_composition()
[1, 1]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(1), Integer(1),␣
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(0)]).pretty_print()
          ___
         | x
  _______|  .
 | x x x  . .
 | x x  . . .
_| x  . . . .
| x  . . . . .
|  . . . . . .
```

(continues on next page)

(continued from previous page)

```
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(1), Integer(1),␣
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(0)]).rise_composition()
[2, 3, 2]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]).rise_composition()
[2]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]).rise_composition()
[1, 1]
```

set_latex_options(*D*)

Set the latex options for use in the `_latex_` function.

The default values are set in the `__init__` function.

- `tikz_scale` – (default: 1) scale for use with the tikz package
- `diagonal` – boolean (default: `False`); value to draw the diagonal or not
- `line width` – (default: `2*tikz_scale`) value representing the line width
- `color` – (default: black) the line color
- `bounce path` – boolean (default: `False`); value to indicate if the bounce path should be drawn
- `peaks` – boolean (default: `False`); value to indicate if the peaks should be displayed
- `valleys` – boolean (default: `False`); value to indicate if the valleys should be displayed

INPUT:

- `D` – dictionary with a list of latex parameters to change

EXAMPLES:

```
sage: D = DyckWord([1,0,1,0,1,0])
sage: D.set_latex_options({"tikz_scale":2})
sage: D.set_latex_options({"valleys":True, "color":"blue"})
```

```
>>> from sage.all import *
>>> D = DyckWord([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0)])
>>> D.set_latex_options({"tikz_scale":Integer(2)})
>>> D.set_latex_options({"valleys":True, "color":"blue"})
```

Todo

This should probably be merged into DyckWord.options.

tamari_interval(*other*)

Return the Tamari interval between `self` and `other` as a *TamariIntervalPoset*.

A "Tamari interval" means an interval in the Tamari order. The Tamari order on the set of Dyck words of size n is the partial order obtained from the Tamari order on the set of binary trees of size n (see *tamari_lequal()*) by means of the Tamari bijection between Dyck words and binary trees (*to_dyck_word_tamari()*).

INPUT:

- `other` – a Dyck word greater or equal to `self` in the Tamari order

EXAMPLES:

```
sage: # needs sage.graphs
sage: dw = DyckWord([1, 1, 0, 1, 0, 0, 1, 0])
sage: ip = dw.tamari_interval(DyckWord([1, 1, 1, 0, 0, 1, 0, 0])); ip
The Tamari interval of size 4 induced by relations [(2, 4), (3, 4), (3, 1),␣
↪(2, 1)]
sage: ip.lower_dyck_word()
[1, 1, 0, 1, 0, 0, 1, 0]
sage: ip.upper_dyck_word()
[1, 1, 1, 0, 0, 1, 0, 0]
sage: ip.interval_cardinality()
4
sage: ip.number_of_tamari_inversions()
2
sage: list(ip.dyck_words())
[[1, 1, 1, 0, 0, 1, 0, 0],
 [1, 1, 1, 0, 0, 0, 1, 0],
 [1, 1, 0, 1, 0, 1, 0, 0],
 [1, 1, 0, 1, 0, 0, 1, 0]]
sage: dw.tamari_interval(DyckWord([1,1,0,0,1,1,0,0]))
Traceback (most recent call last):
...
ValueError: the two Dyck words are not comparable on the Tamari lattice
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> dw = DyckWord([Integer(1), Integer(1), Integer(0), Integer(1), Integer(0),
↪ Integer(0), Integer(1), Integer(0)])
>>> ip = dw.tamari_interval(DyckWord([Integer(1), Integer(1), Integer(1),␣
↪Integer(0), Integer(0), Integer(1), Integer(0), Integer(0)])); ip
The Tamari interval of size 4 induced by relations [(2, 4), (3, 4), (3, 1),␣
↪(2, 1)]
>>> ip.lower_dyck_word()
[1, 1, 0, 1, 0, 0, 1, 0]
>>> ip.upper_dyck_word()
[1, 1, 1, 0, 0, 1, 0, 0]
>>> ip.interval_cardinality()
4
>>> ip.number_of_tamari_inversions()
2
>>> list(ip.dyck_words())
[[1, 1, 1, 0, 0, 1, 0, 0],
 [1, 1, 1, 0, 0, 0, 1, 0],
 [1, 1, 0, 1, 0, 1, 0, 0],
 [1, 1, 0, 1, 0, 0, 1, 0]]
>>> dw.tamari_interval(DyckWord([Integer(1),Integer(1),Integer(0),Integer(0),
↪Integer(1),Integer(1),Integer(0),Integer(0)]))
Traceback (most recent call last):
...
ValueError: the two Dyck words are not comparable on the Tamari lattice
```

to_area_sequence()

Return the area sequence of the Dyck word `self`.

The area sequence of a Dyck word w is defined as follows: Representing the Dyck word w as a Dyck path from $(0,0)$ to (n,n) using N and E steps (this involves padding w by E steps until w reaches the main diagonal if w is not already a complete Dyck path), the area sequence of w is the sequence $(a_1, a_2, \ldots, a_n)$, where a_i is the number of full cells in the i-th row of the rectangle $[0,n] \times [0,n]$ which lie completely above the diagonal. (The cells are the regions into which the rectangle is subdivided by the lines $x = i$ with i integer and the lines $y = j$ with j integer. The i-th row consists of all the cells between the lines $y = i-1$ and $y = i$.)

An alternative definition: Representing the Dyck word w as a Dyck path consisting of NE and SE steps, the area sequence is the sequence of ordinates of all lattice points on the path which are starting points of NE steps.

A list of integers l is the area sequence of some Dyck path if and only if it satisfies $l_0 = 0$ and $0 \leq l_{i+1} \leq l_i + 1$ for $i > 0$.

EXAMPLES:

```
sage: DyckWord([]).to_area_sequence()
[]
sage: DyckWord([1, 0]).to_area_sequence()
[0]
sage: DyckWord([1, 1, 0, 0]).to_area_sequence()
[0, 1]
sage: DyckWord([1, 0, 1, 0]).to_area_sequence()
[0, 0]
sage: all(dw ==
....:     DyckWords().from_area_sequence(dw.to_area_sequence())
....:     for i in range(6) for dw in DyckWords(i))
True
sage: DyckWord([1,0,1,0,1,0,1,0,1,0]).to_area_sequence()
[0, 0, 0, 0, 0]
sage: DyckWord([1,1,1,1,1,0,0,0,0,0]).to_area_sequence()
[0, 1, 2, 3, 4]
sage: DyckWord([1,1,1,1,0,1,0,0,0,0]).to_area_sequence()
[0, 1, 2, 3, 3]
sage: DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).to_area_sequence()
[0, 1, 1, 0, 1, 1, 1]
```

```
>>> from sage.all import *
>>> DyckWord([]).to_area_sequence()
[]
>>> DyckWord([Integer(1), Integer(0)]).to_area_sequence()
[0]
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).to_area_
↪sequence()
[0, 1]
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).to_area_
↪sequence()
[0, 0]
>>> all(dw ==
...     DyckWords().from_area_sequence(dw.to_area_sequence())
...     for i in range(Integer(6)) for dw in DyckWords(i))
```

(continues on next page)

(continued from previous page)

```
True
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0),Integer(1),Integer(0),Integer(1),Integer(0)]).to_area_sequence()
[0, 0, 0, 0, 0]
>>> DyckWord([Integer(1),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(0),Integer(0),Integer(0),Integer(0),Integer(0)]).to_area_sequence()
[0, 1, 2, 3, 4]
>>> DyckWord([Integer(1),Integer(1),Integer(1),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0),Integer(0),Integer(0)]).to_area_sequence()

>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).to_area_sequence()
[0, 1, 1, 0, 1, 1, 1]
```

to_binary_tree(*usemap='1L0R'*)

Return a binary tree recursively constructed from the Dyck path `self` by the map `usemap`. The default `usemap` is `'1L0R'` which means:

- an empty Dyck word is a leaf,
- a non empty Dyck word reads $1L0R$ where L and R correspond to respectively its left and right subtrees.

INPUT:

- `usemap` – string, either `'1L0R'`, `'1R0L'`, `'L1R0'`, `'R1L0'`

Other valid `usemap` are `'1R0L'`, `'L1R0'`, and `'R1L0'`. These correspond to different maps from Dyck paths to binary trees, whose recursive definitions are hopefully clear from the names.

EXAMPLES:

```
sage: # needs sage.graphs
sage: dw = DyckWord([1,0])
sage: dw.to_binary_tree()
[., .]
sage: dw = DyckWord([])
sage: dw.to_binary_tree()
.
sage: dw = DyckWord([1,0,1,1,0,0])
sage: dw.to_binary_tree()
[., [[., .], .]]
sage: dw.to_binary_tree("L1R0")
[[., .], [., .]]
sage: dw = DyckWord([1,0,1,1,0,0,1,1,1,0,1,0,0,0])
sage: dw.to_binary_tree() == dw.to_binary_tree("1R0L").left_right_symmetry()
True
sage: dw.to_binary_tree() == dw.to_binary_tree("L1R0").left_border_symmetry()
False
sage: dw.to_binary_tree("1R0L") == dw.to_binary_tree("L1R0").left_border_
↪symmetry()
True
sage: dw.to_binary_tree("R1L0") == dw.to_binary_tree("L1R0").left_right_
↪symmetry()
True
```

(continues on next page)

(continued from previous page)

```
sage: dw.to_binary_tree("R10L")
Traceback (most recent call last):
...
ValueError: R10L is not a correct map
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> dw = DyckWord([Integer(1),Integer(0)])
>>> dw.to_binary_tree()
[., .]
>>> dw = DyckWord([])
>>> dw.to_binary_tree()
.
>>> dw = DyckWord([Integer(1),Integer(0),Integer(1),Integer(1),Integer(0),
↪Integer(0)])
>>> dw.to_binary_tree()
[., [[., .], .]]
>>> dw.to_binary_tree("L1R0")
[[., .], [., .]]
>>> dw = DyckWord([Integer(1),Integer(0),Integer(1),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(1),Integer(0),Integer(1),
↪Integer(0),Integer(0),Integer(0)])
>>> dw.to_binary_tree() == dw.to_binary_tree("1R0L").left_right_symmetry()
True
>>> dw.to_binary_tree() == dw.to_binary_tree("L1R0").left_border_symmetry()
False
>>> dw.to_binary_tree("1R0L") == dw.to_binary_tree("L1R0").left_border_
↪symmetry()

Traceback (most recent call last):
...
ValueError: R10L is not a correct map
```

to_binary_tree_tamari()

Return the binary tree corresponding to `self` in a way which is consistent with the Tamari orders on the set of Dyck paths and on the set of binary trees.

This is the `'L1R0'` map documented in *to_binary_tree()*.

EXAMPLES:

```
sage: DyckWord([1,0]).to_binary_tree_tamari()                                #␣
↪needs sage.graphs
[., .]
sage: DyckWord([1,0,1,1,0,0]).to_binary_tree_tamari()                        #␣
↪needs sage.graphs
[[., .], [., .]]
sage: DyckWord([1,0,1,0,1,0]).to_binary_tree_tamari()                        #␣
↪needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
[[[., .], .], .]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(0)]).to_binary_tree_tamari()                ␣
↪              # needs sage.graphs
[., .]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(1),Integer(0),
↪Integer(0)]).to_binary_tree_tamari()                          # needs sage.
↪graphs
[[., .], [., .]]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0)]).to_binary_tree_tamari()                          # needs sage.
↪graphs
[[[., .], .], .]
```

to_path_string(*unicode=False*)

Return a path representation of the Dyck word consisting of steps `/` and `\`.

INPUT:

- `unicode` – boolean (default: `False`); whether to use unicode

EXAMPLES:

```
sage: print(DyckWord([1, 0, 1, 0]).to_path_string())
/\/\
sage: print(DyckWord([1, 1, 0, 0]).to_path_string())
 /\
/  \
sage: print(DyckWord([1,1,0,1,1,0,0,1,0,1,0,0]).to_path_string())
    /\
 /\/  \/\/\
/          \
```

```
>>> from sage.all import *
>>> print(DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).to_path_
↪string())
/\/\
>>> print(DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).to_path_
↪string())
 /\
/  \
>>> print(DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(1),
↪Integer(0),Integer(0),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0)]).to_path_string())
    /\
 /\/  \/\/\
/          \
```

to_standard_tableau()

Return a standard tableau of shape (a, b) where a is the number of open symbols and b is the number of close symbols in `self`.

EXAMPLES:

```
sage: DyckWord([]).to_standard_tableau()
[]
sage: DyckWord([1, 0]).to_standard_tableau()
[[1], [2]]
sage: DyckWord([1, 1, 0, 0]).to_standard_tableau()
[[1, 2], [3, 4]]
sage: DyckWord([1, 0, 1, 0]).to_standard_tableau()
[[1, 3], [2, 4]]
sage: DyckWord([1]).to_standard_tableau()
[[1]]
sage: DyckWord([1, 0, 1]).to_standard_tableau()
[[1, 3], [2]]
```

```
>>> from sage.all import *
>>> DyckWord([]).to_standard_tableau()
[]
>>> DyckWord([Integer(1), Integer(0)]).to_standard_tableau()
[[1], [2]]
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).to_standard_
↪tableau()
[[1, 2], [3, 4]]
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).to_standard_
↪tableau()
[[1, 3], [2, 4]]
>>> DyckWord([Integer(1)]).to_standard_tableau()
[[1]]
>>> DyckWord([Integer(1), Integer(0), Integer(1)]).to_standard_tableau()
[[1, 3], [2]]
```

to_tamari_sorting_tuple()

Convert a Dyck word to a Tamari sorting tuple.

The result is a list of integers, one for every up-step from left to right. To each up-step is associated the distance to the corresponding down step in the Dyck word.

This is useful for a faster conversion to binary trees.

EXAMPLES:

```
sage: DyckWord([]).to_tamari_sorting_tuple()
[]
sage: DyckWord([1, 0]).to_tamari_sorting_tuple()
[0]
sage: DyckWord([1, 1, 0, 0]).to_tamari_sorting_tuple()
[1, 0]
sage: DyckWord([1, 0, 1, 0]).to_tamari_sorting_tuple()
[0, 0]
sage: DyckWord([1, 1, 0, 1, 0, 0]).to_tamari_sorting_tuple()
[2, 0, 0]
```

```
>>> from sage.all import *
>>> DyckWord([]).to_tamari_sorting_tuple()
[]
>>> DyckWord([Integer(1), Integer(0)]).to_tamari_sorting_tuple()
```

(continues on next page)

(continued from previous page)

```
[0]
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).to_tamari_
↪sorting_tuple()
[1, 0]
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).to_tamari_
↪sorting_tuple()
[0, 0]
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(1), Integer(0),␣
↪Integer(0)]).to_tamari_sorting_tuple()
[2, 0, 0]
```

See also

to_Catalan_code()

touch_composition()

Return a composition which indicates the positions where `self` returns to the diagonal.

This assumes `self` to be a complete Dyck word.

OUTPUT: a composition of length equal to the length of the Dyck word

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 0]).touch_composition()
[1, 1]
sage: DyckWord([1, 1, 0, 0]).touch_composition()
[2]
sage: DyckWord([1, 1, 0, 0, 1, 0]).touch_composition()
[2, 1]
sage: DyckWord([1, 0, 1, 1, 0, 0]).touch_composition()
[1, 2]
sage: DyckWord([]).touch_composition()
[]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).touch_
↪composition()
[1, 1]
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).touch_
↪composition()
[2]
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(0)]).touch_composition()
[2, 1]
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(0)]).touch_composition()
[1, 2]
>>> DyckWord([]).touch_composition()
[]
```

touch_points()

Return the abscissae (or, equivalently, ordinates) of the points where the Dyck path corresponding to `self`

(comprising NE and SE steps) touches the main diagonal. This includes the last point (if it is on the main diagonal) but excludes the beginning point.

Note that these abscissae are precisely the entries of *returns_to_zero()* divided by 2.

OUTPUT: list of integers indicating where the path touches the diagonal

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 0]).touch_points()
[1, 2]
sage: DyckWord([1, 1, 0, 0]).touch_points()
[2]
sage: DyckWord([1, 1, 0, 0, 1, 0]).touch_points()
[2, 3]
sage: DyckWord([1, 0, 1, 1, 0, 0]).touch_points()
[1, 3]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).touch_points()
[1, 2]
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).touch_points()
[2]
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(0)]).touch_points()
[2, 3]
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(0)]).touch_points()
[1, 3]
```

valleys()

Return a list of the positions of the valleys of a Dyck word.

A valley is 0 followed by a 1.

See also

peaks(), *number_of_valleys()*

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 0]).valleys()
[1]
sage: DyckWord([1, 1, 0, 0]).valleys()
[]
sage: DyckWord([1,1,0,1,0,1,0,0]).valleys()
[2, 4]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).valleys()
[1]
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).valleys()
[]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
```

(continues on next page)

(continued from previous page)

```
↪Integer(1),Integer(0),Integer(0)]).valleys()
[2, 4]
```

class sage.combinat.dyck_word.**DyckWordBacktracker**(*k1*, *k2*)

Bases: *GenericBacktracker*

This class is an iterator for all Dyck words with n opening parentheses and $n - k$ closing parentheses using the backtracker class. It is used by the *DyckWords_size* class.

This is not really meant to be called directly, partially because it fails in a couple corner cases: `DWB(0)` yields `[0]`, not the empty word, and `DWB(k, k+1)` yields something (it shouldn't yield anything). This could be fixed with a sanity check in `_rec()`, but then we'd be doing the sanity check *every time* we generate new objects; instead, we do *one* sanity check in *DyckWords* and assume here that the sanity check has already been made.

AUTHOR:

- Dan Drake (2008-05-30)

class sage.combinat.dyck_word.**DyckWord_complete**(*parent*, *l*, *latex_options={}*)

Bases: *DyckWord*

The class of complete *Dyck words*. A Dyck word is complete, if it contains as many closers as openers.

For further information on Dyck words, see *DyckWords_class*.

area()

Return the area for `self` corresponding to the area of the Dyck path.

One can view a balanced Dyck word as a lattice path from $(0, 0)$ to (n, n) in the first quadrant by letting '1's represent steps in the direction $(1, 0)$ and '0's represent steps in the direction $(0, 1)$. The resulting path will remain weakly above the diagonal $y = x$.

The area statistic is the number of complete squares in the integer lattice which are below the path and above the line $y = x$. The 'half-squares' directly above the line $y = x$ do not contribute to this statistic.

EXAMPLES:

```
sage: dw = DyckWord([1,0,1,0])
sage: dw.area() # 2 half-squares, 0 complete squares
0
```

```
>>> from sage.all import *
>>> dw = DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)])
>>> dw.area() # 2 half-squares, 0 complete squares
0
```

```
sage: dw = DyckWord([1,1,1,0,1,1,1,0,0,0,1,1,0,0,1,0,0,0])
sage: dw.area()
19
```

```
>>> from sage.all import *
>>> dw = DyckWord([Integer(1),Integer(1),Integer(1),Integer(0),Integer(1),
↪Integer(1),Integer(1),Integer(0),Integer(0),Integer(0),Integer(1),
↪Integer(1),Integer(0),Integer(0),Integer(1),Integer(0),Integer(0),
↪Integer(0)])
>>> dw.area()
19
```

```
sage: DyckWord([1,1,1,1,0,0,0,0]).area()

>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(0)]).area()
2
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).area()
3
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0),Integer(1),Integer(0)]).area()
0
```

area_dinv_to_bounce_area_map()

Return the image of `self` under the map which sends a Dyck word with `area` equal to r and `dinv` equal to s to a Dyck word with `bounce` equal to r and `area` equal to s .

The inverse of this map is *bounce_area_to_area_dinv_map()*.

For a definition of this map, see [Hag2008] p. 50 where it is called ζ. However, this map differs from Haglund's map by an application of *reverse()* (as does the definition of the *bounce()* statistic).

EXAMPLES:

```
sage: DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).area_dinv_to_bounce_area_map()
[1, 1, 1, 1, 1, 0, 0, 0, 1, 0, 0, 1, 0, 0]
sage: DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).area()
5
sage: DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).dinv()
13
sage: DyckWord([1,1,1,1,1,0,0,0,1,0,0,1,0,0]).area()
13
sage: DyckWord([1,1,1,1,1,0,0,0,1,0,0,1,0,0]).bounce()
5
sage: DyckWord([1,1,1,1,1,0,0,0,1,0,0,1,0,0]).area_dinv_to_bounce_area_map()
[1, 0, 1, 1, 0, 1, 1, 0, 0, 1, 0, 0, 1, 0]
sage: DyckWord([1,1,0,0]).area_dinv_to_bounce_area_map()
[1, 0, 1, 0]
sage: DyckWord([1,0,1,0]).area_dinv_to_bounce_area_map()
[1, 1, 0, 0]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).area_dinv_to_bounce_area_map()
```

(continues on next page)

(continued from previous page)

```
[1, 1, 1, 1, 1, 0, 0, 0, 1, 0, 0, 1, 0, 0]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).area()
5
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).dinv()
13
>>> DyckWord([Integer(1),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(0),Integer(0),Integer(0),Integer(1),Integer(0),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).area()
13
>>> DyckWord([Integer(1),Integer(1),Integer(1),Integer(1),Integer(1),

[1, 0, 1, 0]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]).area_dinv_to_
↪bounce_area_map()
[1, 1, 0, 0]
```

bounce()

Return the bounce statistic of `self` due to J. Haglund, see [Hag2008].

One can view a balanced Dyck word as a lattice path from $(0,0)$ to (n,n) in the first quadrant by letting '1's represent steps in the direction $(0,1)$ and '0's represent steps in the direction $(1,0)$. The resulting path will remain weakly above the diagonal $y=x$.

We describe the bounce statistic of such a path in terms of what is known as the "bounce path".

We can think of our bounce path as describing the trail of a billiard ball shot West from (n,n), which "bounces" down whenever it encounters a vertical step and "bounces" left when it encounters the line $y=x$.

The bouncing ball will strike the diagonal at the places

$$(0,0),(j_1,j_1),(j_2,j_2),\ldots,(j_r-1,j_r-1),(j_r,j_r)=(n,n).$$

We define the bounce to be the sum $\sum_{i=1}^{r-1} j_i$.

EXAMPLES:

```
sage: DyckWord([1,1,1,0,1,1,1,0,0,0,1,1,0,0,1,0,0,0]).bounce()
7
sage: DyckWord([1,1,1,1,0,0,0,0]).bounce()
0
sage: DyckWord([1,1,1,0,1,0,0,0]).bounce()
1
sage: DyckWord([1,1,1,0,0,1,0,0]).bounce()
```

(continues on next page)

(continued from previous page)

```
2
sage: DyckWord([1,1,1,0,0,0,1,0]).bounce()
3
sage: DyckWord([1,0,1,1,0,1,0,0]).bounce()
3
sage: DyckWord([1,1,0,1,1,0,0,0]).bounce()
1
sage: DyckWord([1,1,0,0,1,1,0,0]).bounce()
2
sage: DyckWord([1,0,1,1,1,0,0,0]).bounce()

↪Integer(1),Integer(0),Integer(0)]).bounce()
2
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(1),Integer(1),
```

(continues on next page)

(continued from previous page)

```
↪Integer(0),Integer(0),Integer(0)]).bounce()
1
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(0)]).bounce()
4
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(1),Integer(0),Integer(0)]).bounce()
3
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0),Integer(1),
↪Integer(0),Integer(1),Integer(0)]).bounce()
5
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(0)]).bounce()
4
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).bounce()
2
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0),Integer(1),Integer(0)]).bounce()
6
```

bounce_area_to_area_dinv_map()

Return the image of the Dyck word under the map which sends a Dyck word with `bounce` equal to r and `area` equal to s to a Dyck word with `area` equal to r and `dinv` equal to s .

This implementation uses a recursive method by saying that the last entry in the area sequence of the Dyck word `self` is equal to the number of touch points of the Dyck path minus 1 of the image of this map.

The inverse of this map is *area_dinv_to_bounce_area_map()*.

For a definition of this map, see [Hag2008] p. 50 where it is called ζ^{-1}. However, this map differs from Haglund's map by an application of *reverse()* (as does the definition of the *bounce()* statistic).

EXAMPLES:

```
sage: DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).bounce_area_to_area_dinv_map()
[1, 1, 0, 0, 1, 1, 1, 1, 0, 0, 1, 0, 0, 0]
sage: DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).area()
5
sage: DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).bounce()
9
sage: DyckWord([1,1,0,0,1,1,1,1,0,0,1,0,0,0]).area()
9
sage: DyckWord([1,1,0,0,1,1,1,1,0,0,1,0,0,0]).dinv()
5
sage: all(D==D.bounce_area_to_area_dinv_map().area_dinv_to_bounce_area_map()␣
↪for D in DyckWords(6))
True
sage: DyckWord([1,1,0,0]).bounce_area_to_area_dinv_map()
[1, 0, 1, 0]
sage: DyckWord([1,0,1,0]).bounce_area_to_area_dinv_map()
[1, 1, 0, 0]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).bounce_area_to_area_dinv_map()
[1, 1, 0, 0, 1, 1, 1, 1, 0, 0, 1, 0, 0, 0]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).area()
5
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).bounce()
9
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0),Integer(1),
↪Integer(1),Integer(1),Integer(1),Integer(0),Integer(0),Integer(1),
↪Integer(0),Integer(0),Integer(0)]).area()
9
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0),Integer(1),
↪Integer(1),Integer(1),Integer(1),Integer(0),Integer(0),Integer(1),
↪Integer(0),Integer(0),Integer(0)]).dinv()
5
>>> all(D==D.bounce_area_to_area_dinv_map().area_dinv_to_bounce_area_map()␣
↪for D in DyckWords(Integer(6)))
True
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]).bounce_area_to_
↪area_dinv_map()
[1, 0, 1, 0]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]).bounce_area_to_
↪area_dinv_map()
[1, 1, 0, 0]
```

bounce_path()

Return the bounce path of `self` formed by starting at (n, n) and traveling West until encountering the first vertical step of `self`, then South until encountering the diagonal, then West again to hit the path, etc. until the $(0, 0)$ point is reached. The path followed by this walk is the bounce path.

See also

bounce()

EXAMPLES:

```
sage: DyckWord([1,1,0,1,0,0]).bounce_path()
[1, 0, 1, 1, 0, 0]
sage: DyckWord([1,1,1,0,0,0]).bounce_path()
[1, 1, 1, 0, 0, 0]
sage: DyckWord([1,0,1,0,1,0]).bounce_path()
[1, 0, 1, 0, 1, 0]
sage: DyckWord([1,1,1,1,0,0,1,0,0,0]).bounce_path()
[1, 1, 0, 0, 1, 1, 1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0)]).bounce_path()
[1, 0, 1, 1, 0, 0]
>>> DyckWord([Integer(1),Integer(1),Integer(1),Integer(0),Integer(0),
↪Integer(0)]).bounce_path()
[1, 1, 1, 0, 0, 0]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0)]).bounce_path()
[1, 0, 1, 0, 1, 0]
>>> DyckWord([Integer(1),Integer(1),Integer(1),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(0),Integer(0),Integer(0)]).bounce_path()
[1, 1, 0, 0, 1, 1, 1, 0, 0, 0]
```

characteristic_symmetric_function(*q=None*, *R=Fraction Field of Multivariate Polynomial Ring in q, t over Rational Field*)

The characteristic function of `self` is the sum of $q^{dinv(D,F)}Q_{ides(read(D,F))}$ over all permutation fillings of the Dyck path representing `self`, where $ides(read(D,F))$ is the descent composition of the inverse of the reading word of the filling.

INPUT:

- `q` – (default: `q = R('q')`) a parameter for the generating function power
- `R` – (default: `R = QQ['q','t'].fraction_field()`) the base ring to do the calculations over

OUTPUT:

- an element of the symmetric functions over the ring `R` (in the Schur basis).

EXAMPLES:

```
sage: R = QQ['q','t'].fraction_field()
sage: q, t = R.gens()
sage: f = sum(t**D.area() * D.characteristic_symmetric_function()           #␣
↪needs sage.modules
....:         for D in DyckWords(3)); f
(q^3+q^2*t+q*t^2+t^3+q*t)*s[1, 1, 1] + (q^2+q*t+t^2+q+t)*s[2, 1] + s[3]
sage: f.nabla(power=-1)                                                     #␣
↪needs sage.modules
s[1, 1, 1]
```

```
>>> from sage.all import *
>>> R = QQ['q','t'].fraction_field()
>>> q, t = R.gens()
>>> f = sum(t**D.area() * D.characteristic_symmetric_function()           #␣
↪needs sage.modules
...         for D in DyckWords(Integer(3))); f
(q^3+q^2*t+q*t^2+t^3+q*t)*s[1, 1, 1] + (q^2+q*t+t^2+q+t)*s[2, 1] + s[3]
>>> f.nabla(power=-Integer(1))                                                ␣
↪     # needs sage.modules
s[1, 1, 1]
```

decomposition_reverse()

Return the involution of `self` with a recursive definition.

If a Dyck word D decomposes as $1D_10D_2$ where D_1 and D_2 are complete Dyck words then the decomposition reverse is $1\phi(D_2)0\phi(D_1)$.

EXAMPLES:

```
sage: DyckWord([1, 1, 0, 1, 0, 0, 1, 1, 0, 1, 0, 1, 0, 0]).decomposition_
↪reverse()
[1, 1, 0, 1, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0]
sage: DyckWord([1, 1, 0, 1, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0]).decomposition_
↪reverse()
[1, 1, 0, 1, 0, 0, 1, 1, 0, 1, 0, 1, 0, 0]
sage: DyckWord([1,1,0,0]).decomposition_reverse()
[1, 0, 1, 0]
sage: DyckWord([1,0,1,0]).decomposition_reverse()
[1, 1, 0, 0]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(1), Integer(0),␣
↪Integer(0), Integer(1), Integer(1), Integer(0), Integer(1), Integer(0),␣
↪Integer(1), Integer(0), Integer(0)]).decomposition_reverse()
[1, 1, 0, 1, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0]
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(1), Integer(1),␣
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(0)]).decomposition_reverse()
[1, 1, 0, 1, 0, 0, 1, 1, 0, 1, 0, 1, 0, 0]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]).decomposition_
↪reverse()
[1, 0, 1, 0]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]).decomposition_
↪reverse()
[1, 1, 0, 0]
```

dinv(*labeling=None*)

Return the dinv statistic of `self` due to M. Haiman, see [Hag2008].

If a labeling is provided then this function returns the dinv of the labeled Dyck word.

INPUT:

- `labeling` – an optional argument to be viewed as the labelings of the vertical edges of the Dyck path

OUTPUT:

- an integer representing the `dinv` statistic of the Dyck path or the labelled Dyck path.

EXAMPLES:

```
sage: DyckWord([1,0,1,0,1,0,1,0,1,0]).dinv()
10
sage: DyckWord([1,1,1,1,1,0,0,0,0,0]).dinv()
0
sage: DyckWord([1,1,1,1,0,1,0,0,0,0]).dinv()
1
sage: DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).dinv()
13
sage: DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).dinv([1,2,3,4,5,6,7])
11
```

(continues on next page)

(continued from previous page)

```
sage: DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).dinv([6,7,5,3,4,2,1])
2
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
...Integer(0),Integer(1),Integer(0),Integer(1),Integer(0)]).dinv()
10
>>> DyckWord([Integer(1),Integer(1),Integer(1),Integer(1),Integer(1),
...Integer(0),Integer(0),Integer(0),Integer(0),Integer(0)]).dinv()
0
>>> DyckWord([Integer(1),Integer(1),Integer(1),Integer(1),Integer(0),
...Integer(1),Integer(0),Integer(0),Integer(0),Integer(0)]).dinv()
1
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
...Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
...Integer(1),Integer(0),Integer(0)]).dinv()
13
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
...Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
...Integer(1),Integer(0),Integer(0)]).dinv([Integer(1),Integer(2),Integer(3),
...Integer(4),Integer(5),Integer(6),Integer(7)])
11
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
...Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
...Integer(1),Integer(0),Integer(0)]).dinv([Integer(6),Integer(7),Integer(5),
...Integer(3),Integer(4),Integer(2),Integer(1)])
2
```

first_return_decomposition()

Decompose a Dyck word into a pair of Dyck words (potentially empty) where the first word consists of the word after the first up step and the corresponding matching closing parenthesis.

EXAMPLES:

```
sage: DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).first_return_decomposition()
([1, 0, 1, 0], [1, 1, 0, 1, 0, 1, 0, 0])
sage: DyckWord([1,1,0,0]).first_return_decomposition()
([1, 0], [])
sage: DyckWord([1,0,1,0]).first_return_decomposition()
([], [1, 0])
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
...Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
...Integer(1),Integer(0),Integer(0)]).first_return_decomposition()
([1, 0, 1, 0], [1, 1, 0, 1, 0, 1, 0, 0])
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]).first_return_
...decomposition()
([1, 0], [])
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]).first_return_
...decomposition()
([], [1, 0])
```

list_parking_functions()

Return all parking functions whose supporting Dyck path is `self`.

EXAMPLES:

```
sage: DyckWord([1,1,0,0,1,0]).list_parking_functions()
[[1, 1, 3], [1, 3, 1], [3, 1, 1]]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0),Integer(1),
↪Integer(0)]).list_parking_functions()
[[1, 1, 3], [1, 3, 1], [3, 1, 1]]
```

major_index()

Return the major index of `self` .

The major index of a Dyck word D is the sum of the positions of the valleys of D (when started counting at position `1`).

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 0]).major_index()
2
sage: DyckWord([1, 1, 0, 0]).major_index()
0
sage: DyckWord([1, 1, 0, 0, 1, 0]).major_index()
4
sage: DyckWord([1, 0, 1, 1, 0, 0]).major_index()
2
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).major_index()
2
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).major_index()
0
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(0)]).major_index()
4
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(0)]).major_index()
2
```

number_of_parking_functions()

Return the number of parking functions with `self` as the supporting Dyck path.

One representation of a parking function is as a pair consisting of a Dyck path and a permutation π such that if $[a_0, a_1, \ldots, a_{n-1}]$ is the area_sequence of the Dyck path (see *to_area_sequence*) then the permutation π satisfies $\pi_i < \pi_{i+1}$ whenever $a_i < a_{i+1}$. This function counts the number of permutations π which satisfy this condition.

EXAMPLES:

```
sage: DyckWord(area_sequence=[0,1,2]).number_of_parking_functions()
1
sage: DyckWord(area_sequence=[0,1,1]).number_of_parking_functions()
```

(continues on next page)

(continued from previous page)

```
3
sage: DyckWord(area_sequence=[0,1,0]).number_of_parking_functions()
3
sage: DyckWord(area_sequence=[0,0,0]).number_of_parking_functions()
6
```

```
>>> from sage.all import *
>>> DyckWord(area_sequence=[Integer(0),Integer(1),Integer(2)]).number_of_
↪parking_functions()
1
>>> DyckWord(area_sequence=[Integer(0),Integer(1),Integer(1)]).number_of_
↪parking_functions()
3
>>> DyckWord(area_sequence=[Integer(0),Integer(1),Integer(0)]).number_of_
↪parking_functions()
3
>>> DyckWord(area_sequence=[Integer(0),Integer(0),Integer(0)]).number_of_
↪parking_functions()
6
```

number_of_tunnels(*tunnel_type='centered'*)

Return the number of tunnels of `self` of type `tunnel_type`.

A tunnel is a pair (a, b) where `a` is the position of an open parenthesis and `b` is the position of the matching close parenthesis. If $a + b = n$ then the tunnel is called *centered* . If $a + b < n$ then the tunnel is called *left* and if $a + b > n$, then the tunnel is called *right*.

INPUT:

- `tunnel_type` – (default: `'centered'`) can be one of the following: `'left'`, `'right'`, `'centered'`, or `'all'`

EXAMPLES:

```
sage: DyckWord([1, 1, 0, 1, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0]).number_of_tunnels()
0
sage: DyckWord([1, 1, 0, 1, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0]).number_of_tunnels(
↪'left')
5
sage: DyckWord([1, 1, 0, 1, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0]).number_of_tunnels(
↪'right')
2
sage: DyckWord([1, 1, 0, 1, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0]).number_of_tunnels(
↪'all')
7
sage: DyckWord([1, 1, 0, 0]).number_of_tunnels('centered')
2
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(1), Integer(1),␣
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(0)]).number_of_tunnels()
0
```

(continues on next page)

(continued from previous page)

```
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(1), Integer(1),␣
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(0)]).number_of_tunnels('left')
5
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(1), Integer(1),␣
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(0)]).number_of_tunnels('right')
2
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(1), Integer(1),␣
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(0), Integer(1),␣
↪Integer(1), Integer(0), Integer(0)]).number_of_tunnels('all')
7
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).number_of_
↪tunnels('centered')
2
```

parking_functions()

Iterate over parking functions whose supporting Dyck path is `self`.

EXAMPLES:

```
sage: list(DyckWord([1,1,0,1,0,0]).parking_functions())
[[1, 1, 2], [1, 2, 1], [2, 1, 1]]
```

```
>>> from sage.all import *
>>> list(DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0)]).parking_functions())
[[1, 1, 2], [1, 2, 1], [2, 1, 1]]
```

pyramid_weight()

Return the pyramid weight of `self`.

A pyramid of `self` is a subsequence of the form 1^h0^h. A pyramid is maximal if it is neither preceded by a 1 nor followed by a 0.

The pyramid weight of a Dyck path is the sum of the lengths of the maximal pyramids and was defined in [DS1992].

EXAMPLES:

```
sage: DyckWord([1,1,0,1,1,1,0,0,1,0,0,0,1,1,0,0]).pyramid_weight()
6
sage: DyckWord([1,1,1,0,0,0]).pyramid_weight()
3
sage: DyckWord([1,0,1,0,1,0]).pyramid_weight()
3
sage: DyckWord([1,1,0,1,0,0]).pyramid_weight()
2
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(1),
↪Integer(1),Integer(0),Integer(0),Integer(1),Integer(0),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(0)]).pyramid_weight()
```

(continues on next page)

(continued from previous page)

```
6
>>> DyckWord([Integer(1),Integer(1),Integer(1),Integer(0),Integer(0),
↪Integer(0)]).pyramid_weight()
3
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0)]).pyramid_weight()
3
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0)]).pyramid_weight()
2
```

reading_permutation()

Return the reading permutation of `self`.

This is the permutation formed by taking the reading word of the Dyck path representing `self` (with N and E steps) if the vertical edges of the Dyck path are labeled from bottom to top with 1 through n and the diagonals are read from top to bottom starting with the diagonal furthest from the main diagonal.

EXAMPLES:

```
sage: DyckWord([1,0,1,0]).reading_permutation()
[2, 1]
sage: DyckWord([1,1,0,0]).reading_permutation()
[2, 1]
sage: DyckWord([1,1,0,1,0,0]).reading_permutation()
[3, 2, 1]
sage: DyckWord([1,1,0,0,1,0]).reading_permutation()
[2, 3, 1]
sage: DyckWord([1,0,1,1,0,0,1,0]).reading_permutation()
[3, 4, 2, 1]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]).reading_
↪permutation()
[2, 1]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]).reading_
↪permutation()
[2, 1]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0)]).reading_permutation()
[3, 2, 1]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0),Integer(1),
↪Integer(0)]).reading_permutation()
[2, 3, 1]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(0)]).reading_permutation()
[3, 4, 2, 1]
```

reverse()

Return the reverse and complement of `self`.

This operation corresponds to flipping the Dyck path across the $y = -x$ line.

EXAMPLES:

```
sage: DyckWord([1,1,0,0,1,0]).reverse()
[1, 0, 1, 1, 0, 0]
sage: DyckWord([1,1,1,0,0,0]).reverse()
[1, 1, 1, 0, 0, 0]
sage: len([D for D in DyckWords(5) if D.reverse() == D])
10
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0),Integer(1),
↪Integer(0)]).reverse()
[1, 0, 1, 1, 0, 0]
>>> DyckWord([Integer(1),Integer(1),Integer(1),Integer(0),Integer(0),
↪Integer(0)]).reverse()
[1, 1, 1, 0, 0, 0]
>>> len([D for D in DyckWords(Integer(5)) if D.reverse() == D])
10
```

semilength()

Return the semilength of `self`.

The semilength of a complete Dyck word d is the number of openers and the number of closers.

EXAMPLES:

```
sage: DyckWord([1, 0, 1, 0]).semilength()
2
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).semilength()
2
```

to_132_avoiding_permutation()

Use the bijection by C. Krattenthaler in [Kra2001] to send `self` to a 132-avoiding permutation.

EXAMPLES:

```
sage: DyckWord([1,1,0,0]).to_132_avoiding_permutation()
[1, 2]
sage: DyckWord([1,0,1,0]).to_132_avoiding_permutation()
[2, 1]
sage: DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).to_132_avoiding_permutation()
[6, 5, 4, 7, 2, 1, 3]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]).to_132_avoiding_
↪permutation()
[1, 2]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]).to_132_avoiding_
↪permutation()
[2, 1]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).to_132_avoiding_permutation()
[6, 5, 4, 7, 2, 1, 3]
```

to_312_avoiding_permutation()

Convert `self` to a 312-avoiding permutation using the bijection by Bandlow and Killpatrick in [BK2001].

This sends the area to the inversion number.

EXAMPLES:

```
sage: DyckWord([1,1,0,0]).to_312_avoiding_permutation()
[2, 1]
sage: DyckWord([1,0,1,0]).to_312_avoiding_permutation()
[1, 2]
sage: p = DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).to_312_avoiding_
↪permutation(); p
[2, 3, 1, 5, 6, 7, 4]
sage: DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).area()
5
sage: p.length()
5
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]).to_312_avoiding_
↪permutation()
[2, 1]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]).to_312_avoiding_
↪permutation()
[1, 2]
>>> p = DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).to_312_avoiding_permutation(); p
[2, 3, 1, 5, 6, 7, 4]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).area()
5
>>> p.length()
5
```

to_321_avoiding_permutation()

Use the bijection (pp. 60-61 of [Knu1973] or section 3.1 of [CK2008]) to send `self` to a 321-avoiding permutation.

It is shown in [EP2004] that it sends the number of centered tunnels to the number of fixed points, the number of right tunnels to the number of excedences, and the semilength plus the height of the middle point to 2 times the length of the longest increasing subsequence.

EXAMPLES:

```
sage: DyckWord([1,0,1,0]).to_321_avoiding_permutation()
[2, 1]
sage: DyckWord([1,1,0,0]).to_321_avoiding_permutation()
[1, 2]
sage: D = DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0])
sage: p = D.to_321_avoiding_permutation()
sage: p
[3, 5, 1, 6, 2, 7, 4]
```

(continues on next page)

(continued from previous page)

```
sage: D.number_of_tunnels()
0
sage: p.number_of_fixed_points()
0
sage: D.number_of_tunnels('right')
4
sage: len(p.weak_excedences())-p.number_of_fixed_points()
4
sage: n = D.semilength()
sage: D.heights()[n] + n
8
sage: 2*p.longest_increasing_subsequence_length()
8
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]).to_321_avoiding_
↪permutation()
[2, 1]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]).to_321_avoiding_
↪permutation()
[1, 2]
>>> D = DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)])
>>> p = D.to_321_avoiding_permutation()
>>> p
[3, 5, 1, 6, 2, 7, 4]
>>> D.number_of_tunnels()
0
>>> p.number_of_fixed_points()
0
>>> D.number_of_tunnels('right')
4
>>> len(p.weak_excedences())-p.number_of_fixed_points()
4
>>> n = D.semilength()
>>> D.heights()[n] + n
8
>>> Integer(2)*p.longest_increasing_subsequence_length()
8
```

to_Catalan_code()

Return the Catalan code associated to `self`.

A Catalan code of length n is a sequence $(a_1, a_2, \ldots, a_n)$ of n integers a_i such that:

- $0 \leq a_i \leq n - i$ for every i;
- if $i < j$ and $a_i > 0$ and $a_j > 0$ and $a_{i+1} = a_{i+2} = \cdots = a_{j-1} = 0$, then $a_i - a_j < j - i$.

It turns out that the Catalan codes of length n are in bijection with Dyck words.

The Catalan code of a Dyck word is example (x) in Richard Stanley's exercises on combinatorial interpretations for Catalan objects. The code in this example is the reverse of the description provided there. See [Sta-EC2] and [StaCat98].

EXAMPLES:

```
sage: DyckWord([]).to_Catalan_code()
[]
sage: DyckWord([1, 0]).to_Catalan_code()
[0]
sage: DyckWord([1, 1, 0, 0]).to_Catalan_code()
[0, 1]
sage: DyckWord([1, 0, 1, 0]).to_Catalan_code()
[0, 0]
sage: all(dw ==
....:     DyckWords().from_Catalan_code(dw.to_Catalan_code())
....:     for i in range(6) for dw in DyckWords(i))
True
```

```
>>> from sage.all import *
>>> DyckWord([]).to_Catalan_code()
[]
>>> DyckWord([Integer(1), Integer(0)]).to_Catalan_code()
[0]
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).to_Catalan_
↪code()
[0, 1]
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0)]).to_Catalan_
↪code()
[0, 0]
>>> all(dw ==
...     DyckWords().from_Catalan_code(dw.to_Catalan_code())
...     for i in range(Integer(6)) for dw in DyckWords(i))
True
```

See also

to_tamari_sorting_tuple()

to_alternating_sign_matrix()

Return `self` as an alternating sign matrix.

This is an inclusion map from Dyck words of length $2n$ to certain $n \times n$ alternating sign matrices.

EXAMPLES:

```
sage: DyckWord([1,1,1,0,1,0,0,0]).to_alternating_sign_matrix()              #␣
↪needs sage.modules
[ 0  0  1  0]
[ 1  0 -1  1]
[ 0  1  0  0]
[ 0  0  1  0]
sage: DyckWord([1,0,1,0,1,1,0,0]).to_alternating_sign_matrix()              #␣
↪needs sage.modules
[1 0 0 0]
[0 1 0 0]
```

(continues on next page)

(continued from previous page)

```
[0 0 0 1]
[0 0 1 0]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(1),Integer(1),Integer(0),Integer(1),
↪Integer(0),Integer(0),Integer(0)]).to_alternating_sign_matrix()
↪ # needs sage.modules
[ 0  0  1  0]
[ 1  0 -1  1]
[ 0  1  0  0]
[ 0  0  1  0]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(1),Integer(0),Integer(0)]).to_alternating_sign_matrix()
↪ # needs sage.modules
[1 0 0 0]
[0 1 0 0]
[0 0 0 1]
[0 0 1 0]
```

to_non_decreasing_parking_function()

Bijection to *non-decreasing parking functions*.

See there the method *to_dyck_word()* for more information.

EXAMPLES:

```
sage: DyckWord([]).to_non_decreasing_parking_function()
[]
sage: DyckWord([1,0]).to_non_decreasing_parking_function()
[1]
sage: DyckWord([1,1,0,0]).to_non_decreasing_parking_function()
[1, 1]
sage: DyckWord([1,0,1,0]).to_non_decreasing_parking_function()
[1, 2]
sage: DyckWord([1,0,1,1,0,1,0,0,1,0]).to_non_decreasing_parking_function()
[1, 2, 2, 3, 5]
```

```
>>> from sage.all import *
>>> DyckWord([]).to_non_decreasing_parking_function()
[]
>>> DyckWord([Integer(1),Integer(0)]).to_non_decreasing_parking_function()
[1]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]).to_non_decreasing_
↪parking_function()
[1, 1]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]).to_non_decreasing_
↪parking_function()
[1, 2]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0),Integer(1),Integer(0)]).to_non_decreasing_
↪parking_function()
[1, 2, 2, 3, 5]
```

to_noncrossing_partition(*bijection=None*)

Bijection of Biane from `self` to a noncrossing partition.

There is an optional parameter `bijection` that indicates if a different bijection from Dyck words to non-crossing partitions should be used (since there are potentially many).

If the parameter `bijection` is "Stump" then the bijection used is from [Stu2008], see also the method *to_noncrossing_permutation()*.

Thanks to Mathieu Dutour for describing the bijection. See also *from_noncrossing_partition()*.

EXAMPLES:

```
sage: DyckWord([]).to_noncrossing_partition()
{}
sage: DyckWord([1, 0]).to_noncrossing_partition()
{{1}}
sage: DyckWord([1, 1, 0, 0]).to_noncrossing_partition()
{{1, 2}}
sage: DyckWord([1, 1, 1, 0, 0, 0]).to_noncrossing_partition()
{{1, 2, 3}}
sage: DyckWord([1, 0, 1, 0, 1, 0]).to_noncrossing_partition()
{{1}, {2}, {3}}
sage: DyckWord([1, 1, 0, 1, 0, 0]).to_noncrossing_partition()
{{1, 3}, {2}}
sage: DyckWord([]).to_noncrossing_partition("Stump")
{}
sage: DyckWord([1, 0]).to_noncrossing_partition("Stump")
{{1}}
sage: DyckWord([1, 1, 0, 0]).to_noncrossing_partition("Stump")
{{1, 2}}
sage: DyckWord([1, 1, 1, 0, 0, 0]).to_noncrossing_partition("Stump")
{{1, 3}, {2}}
sage: DyckWord([1, 0, 1, 0, 1, 0]).to_noncrossing_partition("Stump")
{{1}, {2}, {3}}
sage: DyckWord([1, 1, 0, 1, 0, 0]).to_noncrossing_partition("Stump")
{{1, 2, 3}}
```

```
>>> from sage.all import *
>>> DyckWord([]).to_noncrossing_partition()
{}
>>> DyckWord([Integer(1), Integer(0)]).to_noncrossing_partition()
{{1}}
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).to_noncrossing_
↪partition()
{{1, 2}}
>>> DyckWord([Integer(1), Integer(1), Integer(1), Integer(0), Integer(0),␣
↪Integer(0)]).to_noncrossing_partition()
{{1, 2, 3}}
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0), Integer(1),␣
↪Integer(0)]).to_noncrossing_partition()
{{1}, {2}, {3}}
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(1), Integer(0),␣
↪Integer(0)]).to_noncrossing_partition()
{{1, 3}, {2}}
```

(continues on next page)

(continued from previous page)

```
>>> DyckWord([]).to_noncrossing_partition("Stump")
{}
>>> DyckWord([Integer(1), Integer(0)]).to_noncrossing_partition("Stump")
{{1}}
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).to_noncrossing_
↪partition("Stump")
{{1, 2}}
>>> DyckWord([Integer(1), Integer(1), Integer(1), Integer(0), Integer(0),␣
↪Integer(0)]).to_noncrossing_partition("Stump")
{{1, 3}, {2}}
>>> DyckWord([Integer(1), Integer(0), Integer(1), Integer(0), Integer(1),␣
↪Integer(0)]).to_noncrossing_partition("Stump")
{{1}, {2}, {3}}
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(1), Integer(0),␣
↪Integer(0)]).to_noncrossing_partition("Stump")
{{1, 2, 3}}
```

to_noncrossing_permutation()

Use the bijection by C. Stump in [Stu2008] to send `self` to a non-crossing permutation.

A non-crossing permutation when written in cyclic notation has cycles which are strictly increasing. Sends the area to the inversion number and `self.major_index()` to $n(n-1) - maj(\sigma) - maj(\sigma^{-1})$. Uses the function *pealing()*

EXAMPLES:

```
sage: DyckWord([1,1,0,0]).to_noncrossing_permutation()
[2, 1]
sage: DyckWord([1,0,1,0]).to_noncrossing_permutation()
[1, 2]
sage: p = DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).to_noncrossing_
↪permutation(); p
[2, 3, 1, 5, 6, 7, 4]
sage: DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).area()
5
sage: p.length()
5
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]).to_noncrossing_
↪permutation()
[2, 1]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]).to_noncrossing_
↪permutation()
[1, 2]
>>> p = DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).to_noncrossing_permutation(); p
[2, 3, 1, 5, 6, 7, 4]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).area()
5
```

(continues on next page)

(continued from previous page)

```
>>> p.length()
5
```

to_ordered_tree()

Return the ordered tree corresponding to `self` where the depth of the tree is the maximal height of `self`.

EXAMPLES:

```
sage: # needs sage.graphs
sage: D = DyckWord([1,1,0,0])
sage: D.to_ordered_tree()
[[[]]]
sage: D = DyckWord([1,0,1,0])
sage: D.to_ordered_tree()
[[], []]
sage: D = DyckWord([1, 0, 1, 1, 0, 0])
sage: D.to_ordered_tree()
[[], [[]]]
sage: D = DyckWord([1, 0, 1, 1, 0, 1, 0, 0, 1, 1, 0, 1, 1, 0, 0, 0])
sage: D.to_ordered_tree()
[[], [[], [], [[], [[]]]]]
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> D = DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)])
>>> D.to_ordered_tree()
[[[]]]
>>> D = DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)])
>>> D.to_ordered_tree()
[[], []]
>>> D = DyckWord([Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(0)])
>>> D.to_ordered_tree()
[[], [[]]]
>>> D = DyckWord([Integer(1), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(0), Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(1), Integer(0), Integer(0), Integer(0)])
>>> D.to_ordered_tree()
[[], [[], [], [[], [[]]]]]
```

to_pair_of_standard_tableaux()

Convert `self` to a pair of standard tableaux of the same shape and of length less than or equal to two.

EXAMPLES:

```
sage: DyckWord([1,0,1,0]).to_pair_of_standard_tableaux()
([[1], [2]], [[1], [2]])
sage: DyckWord([1,1,0,0]).to_pair_of_standard_tableaux()
([[1, 2]], [[1, 2]])
sage: DyckWord([1,1,0,1,0,0,1,1,0,1,0,1,0,0]).to_pair_of_standard_tableaux()
([[1, 2, 4, 7], [3, 5, 6]], [[1, 2, 4, 6], [3, 5, 7]])
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]).to_pair_of_
↪standard_tableaux()
([[1], [2]], [[1], [2]])
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]).to_pair_of_
↪standard_tableaux()
([[1, 2]], [[1, 2]])
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(0)]).to_pair_of_standard_tableaux()
([[1, 2, 4, 7], [3, 5, 6]], [[1, 2, 4, 6], [3, 5, 7]])
```

to_partition()

Return the partition associated to `self` .

This partition is determined by thinking of `self` as a lattice path and considering the cells which are above the path but within the $n \times n$ grid and the partition is formed by reading the sequence of the number of cells in this collection in each row.

OUTPUT:

- a partition representing the rows of cells in the square lattice and above the path

EXAMPLES:

```
sage: DyckWord([]).to_partition()
[]
sage: DyckWord([1,0]).to_partition()
[]
sage: DyckWord([1,1,0,0]).to_partition()
[]
sage: DyckWord([1,0,1,0]).to_partition()
[1]
sage: DyckWord([1,0,1,0,1,0]).to_partition()
[2, 1]
sage: DyckWord([1,1,0,0,1,0]).to_partition()
[2]
sage: DyckWord([1,0,1,1,0,0]).to_partition()
[1, 1]
```

```
>>> from sage.all import *
>>> DyckWord([]).to_partition()
[]
>>> DyckWord([Integer(1),Integer(0)]).to_partition()
[]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]).to_partition()
[]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]).to_partition()
[1]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0)]).to_partition()
[2, 1]
>>> DyckWord([Integer(1),Integer(1),Integer(0),Integer(0),Integer(1),
↪Integer(0)]).to_partition()
```

(continues on next page)

(continued from previous page)

```
[2]
>>> DyckWord([Integer(1),Integer(0),Integer(1),Integer(1),Integer(0),
↪Integer(0)]).to_partition()
[1, 1]
```

to_permutation(*map*)

This is simply a method collecting all implemented maps from Dyck words to permutations.

INPUT:

- `map` – defines the map from Dyck words to permutations. These are currently:
  - `Bandlow-Killpatrick`: *to_312_avoiding_permutation()*
  - `Knuth`: *to_321_avoiding_permutation()*
  - `Krattenthaler`: *to_132_avoiding_permutation()*
  - `Stump`: *to_noncrossing_permutation()*

EXAMPLES:

```
sage: D = DyckWord([1,1,1,0,1,0,0,0])
sage: D.pretty_print()
   _____
 _| x x
| x x   .
| x   . .
|   . . .

sage: D.to_permutation(map='Bandlow-Killpatrick')
[3, 4, 2, 1]
sage: D.to_permutation(map='Stump')
[4, 2, 3, 1]
sage: D.to_permutation(map='Knuth')
[1, 2, 4, 3]
sage: D.to_permutation(map='Krattenthaler')
[2, 1, 3, 4]
```

```
>>> from sage.all import *
>>> D = DyckWord([Integer(1),Integer(1),Integer(1),Integer(0),Integer(1),
↪Integer(0),Integer(0),Integer(0)])
>>> D.pretty_print()
   _____
 _| x x
| x x   .
| x   . .
|   . . .

>>> D.to_permutation(map='Bandlow-Killpatrick')
[3, 4, 2, 1]
>>> D.to_permutation(map='Stump')
[4, 2, 3, 1]
>>> D.to_permutation(map='Knuth')
[1, 2, 4, 3]
```

(continues on next page)

(continued from previous page)

```
>>> D.to_permutation(map='Krattenthaler')
[2, 1, 3, 4]
```

to_triangulation()

Map `self` to a triangulation.

The map from complete Dyck words of length $2n$ to triangulations of $n+2$-gon given by this function is a bijection that can be described as follows.

Consider the Dyck word as a path from $(0,0)$ to (n,n) staying above the diagonal, where 1 is an up step and 0 is a right step. Then each horizontal step has a co-height (0 at the top and $n-1$ at most at the bottom). One reads the Dyck word from left to right. At the beginning, all vertices from 0 to $n+1$ are available. For each horizontal step, one creates an edge from the vertex indexed by the co-height to the next available vertex. This chops out a triangle from the polygon and one removes the middle vertex of this triangle from the list of available vertices.

This bijection has the property that the set of smallest vertices of the edges in a triangulation is an encoding of the co-heights, from which the Dyck word can be easily recovered.

OUTPUT:

a list of pairs (i,j) that are the edges of the triangulations.

EXAMPLES:

```
sage: DyckWord([1, 1, 0, 0]).to_triangulation()
[(0, 2)]

sage: [t.to_triangulation() for t in DyckWords(3)]
[[(2, 4), (1, 4)],
[(2, 4), (0, 2)],
[(1, 3), (1, 4)],
[(1, 3), (0, 3)],
[(0, 2), (0, 3)]]
```

```
>>> from sage.all import *
>>> DyckWord([Integer(1), Integer(1), Integer(0), Integer(0)]).to_
↪triangulation()
[(0, 2)]

>>> [t.to_triangulation() for t in DyckWords(Integer(3))]
[[(2, 4), (1, 4)],
[(2, 4), (0, 2)],
[(1, 3), (1, 4)],
[(1, 3), (0, 3)],
[(0, 2), (0, 3)]]
```

REFERENCES:

- [Cha2005]

to_triangulation_as_graph()

Map `self` to a triangulation and return the result as a graph.

See *to_triangulation()* for the bijection used to map complete Dyck words to triangulations.

OUTPUT:

- a graph containing both the perimeter edges and the inner edges of a triangulation of a regular polygon.

EXAMPLES:

```
sage: g = DyckWord([1, 1, 0, 0, 1, 0]).to_triangulation_as_graph(); g       #␣
↪needs sage.graphs
Graph on 5 vertices
sage: g.edges(sort=True, labels=False)                                      #␣
↪needs sage.graphs
[(0, 1), (0, 4), (1, 2), (1, 3), (1, 4), (2, 3), (3, 4)]
sage: g.show()                          # not tested                        #␣
↪needs sage.graphs
```

```
>>> from sage.all import *
>>> g = DyckWord([Integer(1), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(0)]).to_triangulation_as_graph(); g       # needs sage.graphs
Graph on 5 vertices
>>> g.edges(sort=True, labels=False)                                        #␣
↪needs sage.graphs
[(0, 1), (0, 4), (1, 2), (1, 3), (1, 4), (2, 3), (3, 4)]
>>> g.show()                          # not tested                         #␣
↪needs sage.graphs
```

tunnels()

Return an iterator of ranges of the matching parentheses in the Dyck word `self`.

That is, if `(a,b)` is in `self.tunnels()`, then the matching parenthesis to `self[a]` is `self[b-1]`.

EXAMPLES:

```
sage: list(DyckWord([1, 1, 0, 1, 1, 0, 0, 1, 0, 0]).tunnels())
[(0, 10), (1, 3), (3, 7), (4, 6), (7, 9)]
```

```
>>> from sage.all import *
>>> list(DyckWord([Integer(1), Integer(1), Integer(0), Integer(1), Integer(1),
↪ Integer(0), Integer(0), Integer(1), Integer(0), Integer(0)]).tunnels())
[(0, 10), (1, 3), (3, 7), (4, 6), (7, 9)]
```

class sage.combinat.dyck_word.**DyckWords**

Bases: `UniqueRepresentation`, `Parent`

Dyck words.

A Dyck word is a sequence $(w_1, \ldots, w_n)$ consisting of 1 s and 0 s, with the property that for any i with $1 \leq i \leq n$, the sequence $(w_1, \ldots, w_i)$ contains at least as many 1 s as 0 s.

A Dyck word is balanced if the total number of 1 s is equal to the total number of 0 s. The number of balanced Dyck words of length $2k$ is given by the *Catalan number* C_k.

EXAMPLES:

This class can be called with three keyword parameters `k1`, `k2` and `complete`.

If neither `k1` nor `k2` are specified, then *DyckWords* returns the combinatorial class of all balanced (=complete) Dyck words, unless the keyword `complete` is set to False (in which case it returns the class of all Dyck words).

```
sage: DW = DyckWords(); DW
Complete Dyck words
sage: [] in DW
True
sage: [1, 0, 1, 0] in DW
True
sage: [1, 1, 0] in DW
False
sage: ADW = DyckWords(complete=False); ADW
Dyck words
sage: [] in ADW
True
sage: [1, 0, 1, 0] in ADW
True
sage: [1, 1, 0] in ADW
True
sage: [1, 0, 0] in ADW
False
```

```
>>> from sage.all import *
>>> DW = DyckWords(); DW
Complete Dyck words
>>> [] in DW
True
>>> [Integer(1), Integer(0), Integer(1), Integer(0)] in DW
True
>>> [Integer(1), Integer(1), Integer(0)] in DW
False
>>> ADW = DyckWords(complete=False); ADW
Dyck words
>>> [] in ADW
True
>>> [Integer(1), Integer(0), Integer(1), Integer(0)] in ADW
True
>>> [Integer(1), Integer(1), Integer(0)] in ADW
True
>>> [Integer(1), Integer(0), Integer(0)] in ADW
False
```

If just `k1` is specified, then it returns the balanced Dyck words with `k1` opening parentheses and `k1` closing parentheses.

```
sage: DW2 = DyckWords(2); DW2
Dyck words with 2 opening parentheses and 2 closing parentheses
sage: DW2.first()
[1, 0, 1, 0]
sage: DW2.last()
[1, 1, 0, 0]
sage: DW2.cardinality()
2
sage: DyckWords(100).cardinality() == catalan_number(100)
True
```

```
>>> from sage.all import *
>>> DW2 = DyckWords(Integer(2)); DW2
Dyck words with 2 opening parentheses and 2 closing parentheses
>>> DW2.first()
[1, 0, 1, 0]
>>> DW2.last()
[1, 1, 0, 0]
>>> DW2.cardinality()
2
>>> DyckWords(Integer(100)).cardinality() == catalan_number(Integer(100))
True
```

If `k2` is specified in addition to `k1`, then it returns the Dyck words with `k1` opening parentheses and `k2` closing parentheses.

```
sage: DW32 = DyckWords(3,2); DW32
Dyck words with 3 opening parentheses and 2 closing parentheses
sage: DW32.list()
[[1, 0, 1, 0, 1],
 [1, 0, 1, 1, 0],
 [1, 1, 0, 0, 1],
 [1, 1, 0, 1, 0],
 [1, 1, 1, 0, 0]]
```

```
>>> from sage.all import *
>>> DW32 = DyckWords(Integer(3),Integer(2)); DW32
Dyck words with 3 opening parentheses and 2 closing parentheses
>>> DW32.list()
[[1, 0, 1, 0, 1],
 [1, 0, 1, 1, 0],
 [1, 1, 0, 0, 1],
 [1, 1, 0, 1, 0],
 [1, 1, 1, 0, 0]]
```

Element

alias of *DyckWord*

from_heights(*heights*)

Compute a Dyck word knowing its heights.

We view the Dyck word as a Dyck path from $(0, 0)$ to $(2n, 0)$ in the first quadrant by letting `1`'s represent steps in the direction $(1, 1)$ and `0`'s represent steps in the direction $(1, -1)$.

The *heights()* is the sequence of the y-coordinates of the $2n + 1$ lattice points along this path.

EXAMPLES:

```
sage: from sage.combinat.dyck_word import DyckWord
sage: D = DyckWords(complete=False)
sage: D.from_heights((0,))
[]
sage: D.from_heights((0, 1, 0))
[1, 0]
sage: D.from_heights((0, 1, 2, 1, 0))
[1, 1, 0, 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.dyck_word import DyckWord
>>> D = DyckWords(complete=False)
>>> D.from_heights((Integer(0),))
[]
>>> D.from_heights((Integer(0), Integer(1), Integer(0)))
[1, 0]
>>> D.from_heights((Integer(0), Integer(1), Integer(2), Integer(1),␣
↪Integer(0)))
[1, 1, 0, 0]
```

This also works for incomplete Dyck words:

```
sage: D.from_heights((0, 1, 2, 1, 2, 1))
[1, 1, 0, 1, 0]
sage: D.from_heights((0, 1, 2, 1))
[1, 1, 0]
```

```
>>> from sage.all import *
>>> D.from_heights((Integer(0), Integer(1), Integer(2), Integer(1),␣
↪Integer(2), Integer(1)))
[1, 1, 0, 1, 0]
>>> D.from_heights((Integer(0), Integer(1), Integer(2), Integer(1)))
[1, 1, 0]
```

See also

heights(), *min_from_heights()*

min_from_heights(*heights*)

Compute the smallest Dyck word which achieves or surpasses a given sequence of heights.

INPUT:

- `heights` – a nonempty list or iterable consisting of nonnegative integers, the first of which is 0

OUTPUT:

- The smallest Dyck word whose sequence of heights is componentwise higher-or-equal to `heights`. Here, "smaller" can be understood both in the sense of lexicographic order on the Dyck words, and in the sense of every vertex of the path having the smallest possible height.

See also

- *heights()*
- *from_heights()*

EXAMPLES:

```
sage: D = DyckWords(complete=False)
sage: D.min_from_heights((0,))
```

(continues on next page)

(continued from previous page)

```
[]
sage: D.min_from_heights((0, 1, 0))
[1, 0]
sage: D.min_from_heights((0, 0, 2, 0, 0))
[1, 1, 0, 0]
sage: D.min_from_heights((0, 0, 2, 0, 2, 0))
[1, 1, 0, 1, 0]
sage: D.min_from_heights((0, 0, 1, 0, 1, 0))
[1, 1, 0, 1, 0]
```

```
>>> from sage.all import *
>>> D = DyckWords(complete=False)
>>> D.min_from_heights((Integer(0),))
[]
>>> D.min_from_heights((Integer(0), Integer(1), Integer(0)))
[1, 0]
>>> D.min_from_heights((Integer(0), Integer(0), Integer(2), Integer(0),␣
↪Integer(0)))
[1, 1, 0, 0]
>>> D.min_from_heights((Integer(0), Integer(0), Integer(2), Integer(0),␣
↪Integer(2), Integer(0)))
[1, 1, 0, 1, 0]
>>> D.min_from_heights((Integer(0), Integer(0), Integer(1), Integer(0),␣
↪Integer(1), Integer(0)))
[1, 1, 0, 1, 0]
```

options = Current options for DyckWords - ascii_art: path - diagram_style: grid - display: list - latex_bounce_path: False - latex_color: black - latex_diagonal: False - latex_line_width_scalar: 2 - latex_peaks: False - latex_tikz_scale: 1 - latex_valleys: False

class sage.combinat.dyck_word.**DyckWords_all**

Bases: *DyckWords*

All Dyck words.

class sage.combinat.dyck_word.**DyckWords_size**(*k1*, *k2*)

Bases: *DyckWords*

Dyck words with k_1 openers and k_2 closers.

cardinality()

Return the number of Dyck words with k_1 openers and k_2 closers.

This number is

$$\frac{k_1 - k_2 + 1}{k_1 + 1}\binom{k_1 + k_2}{k_2} = \binom{k_1 + k_2}{k_2} - \binom{k_1 + k_2}{k_2 - 1}$$

if $k_2 \leq k_1 + 1$, and 0 if $k_2 > k_1$ (these numbers are the same if $k_2 = k_1 + 1$).

EXAMPLES:

```
sage: DyckWords(3, 2).cardinality()
5
```

(continues on next page)

(continued from previous page)

```
sage: all(all(DyckWords(p, q).cardinality()
....:           == len(DyckWords(p, q).list()) for q in range(p + 1))
....:       for p in range(7))
True
```

```
>>> from sage.all import *
>>> DyckWords(Integer(3), Integer(2)).cardinality()
5
>>> all(all(DyckWords(p, q).cardinality()
...            == len(DyckWords(p, q).list()) for q in range(p + Integer(1)))
...       for p in range(Integer(7)))
True
```

sage.combinat.dyck_word.**is_a**(*obj*, *k1=None*, *k2=None*)

Test if `obj` is a Dyck word with exactly `k1` open symbols and exactly `k2` close symbols.

If `k1` is not specified, then the number of open symbols can be arbitrary. If `k1` is specified but `k2` is not, then `k2` is set to be `k1`.

EXAMPLES:

```
sage: from sage.combinat.dyck_word import is_a
sage: is_a([1,1,0,0])
True
sage: is_a([1,0,1,0])
True
sage: is_a([1,1,0,0], 2)
True
sage: is_a([1,1,0,0], 3)
False
sage: is_a([1,1,0,0], 3, 2)
False
sage: is_a([1,1,0])
True
sage: is_a([0,1,0])
False
sage: is_a([1,0,0])
False
sage: is_a([1,1,0],2,1)
True
sage: is_a([1,1,0],2)
False
sage: is_a([1,1,0],1,1)
False
```

```
>>> from sage.all import *
>>> from sage.combinat.dyck_word import is_a
>>> is_a([Integer(1),Integer(1),Integer(0),Integer(0)])
True
>>> is_a([Integer(1),Integer(0),Integer(1),Integer(0)])
True
>>> is_a([Integer(1),Integer(1),Integer(0),Integer(0)], Integer(2))
```

(continues on next page)

(continued from previous page)

```
True
>>> is_a([Integer(1),Integer(1),Integer(0),Integer(0)], Integer(3))
False
>>> is_a([Integer(1),Integer(1),Integer(0),Integer(0)], Integer(3), Integer(2))
False
>>> is_a([Integer(1),Integer(1),Integer(0)])
True
>>> is_a([Integer(0),Integer(1),Integer(0)])
False
>>> is_a([Integer(1),Integer(0),Integer(0)])
False
>>> is_a([Integer(1),Integer(1),Integer(0)],Integer(2),Integer(1))
True
>>> is_a([Integer(1),Integer(1),Integer(0)],Integer(2))
False
>>> is_a([Integer(1),Integer(1),Integer(0)],Integer(1),Integer(1))
False
```

sage.combinat.dyck_word.**is_area_sequence**(*seq*)

Test if a sequence l of integers satisfies $l_0 = 0$ and $0 \leq l_{i+1} \leq l_i + 1$ for $i > 0$.

EXAMPLES:

```
sage: from sage.combinat.dyck_word import is_area_sequence
sage: is_area_sequence([0,2,0])
False
sage: is_area_sequence([1,2,3])
False
sage: is_area_sequence([0,1,0])
True
sage: is_area_sequence([0,1,2])
True
sage: is_area_sequence([])
True
```

```
>>> from sage.all import *
>>> from sage.combinat.dyck_word import is_area_sequence
>>> is_area_sequence([Integer(0),Integer(2),Integer(0)])
False
>>> is_area_sequence([Integer(1),Integer(2),Integer(3)])
False
>>> is_area_sequence([Integer(0),Integer(1),Integer(0)])
True
>>> is_area_sequence([Integer(0),Integer(1),Integer(2)])
True
>>> is_area_sequence([])
True
```

sage.combinat.dyck_word.**pealing**(*D*, *return_touches=False*)

A helper function for computing the bijection from a Dyck word to a 231-avoiding permutation using the bijection "Stump". For details see [Stu2008].

See also

to_noncrossing_partition()

EXAMPLES:

```
sage: from sage.combinat.dyck_word import pealing
sage: pealing(DyckWord([1,1,0,0]))
[1, 0, 1, 0]
sage: pealing(DyckWord([1,0,1,0]))
[1, 0, 1, 0]
sage: pealing(DyckWord([1, 1, 0, 0, 1, 1, 1, 0, 0, 0]))
[1, 0, 1, 0, 1, 0, 1, 0, 1, 0]
sage: pealing(DyckWord([1,1,0,0]),return_touches=True)
([1, 0, 1, 0], [[1, 2]])
sage: pealing(DyckWord([1,0,1,0]),return_touches=True)
([1, 0, 1, 0], [])
sage: pealing(DyckWord([1, 1, 0, 0, 1, 1, 1, 0, 0, 0]),return_touches=True)
([1, 0, 1, 0, 1, 0, 1, 0, 1, 0], [[1, 2], [3, 5]])
```

```
>>> from sage.all import *
>>> from sage.combinat.dyck_word import pealing
>>> pealing(DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]))
[1, 0, 1, 0]
>>> pealing(DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]))
[1, 0, 1, 0]
>>> pealing(DyckWord([Integer(1), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(1), Integer(1), Integer(0), Integer(0), Integer(0)]))
[1, 0, 1, 0, 1, 0, 1, 0, 1, 0]
>>> pealing(DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)]),return_
↪touches=True)
([1, 0, 1, 0], [[1, 2]])
>>> pealing(DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)]),return_
↪touches=True)
([1, 0, 1, 0], [])
>>> pealing(DyckWord([Integer(1), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(1), Integer(1), Integer(0), Integer(0), Integer(0)]),return_
↪touches=True)
([1, 0, 1, 0, 1, 0, 1, 0, 1, 0], [[1, 2], [3, 5]])
```

sage.combinat.dyck_word.**replace_parens**(*x*)

A map sending `'('` to `open_symbol` and `')'` to `close_symbol`, and raising an error on any input other than `'('` and `')'`. The values of the constants `open_symbol` and `close_symbol` are subject to change.

This is the inverse map of *replace_symbols()*.

INPUT:

- `x` – either an opening or closing parenthesis

OUTPUT:

- If `x` is an opening parenthesis, replace `x` with the constant `open_symbol`.
- If `x` is a closing parenthesis, replace `x` with the constant `close_symbol`.

- Raise a `ValueError` if `x` is neither an opening nor a closing parenthesis.

See also

replace_symbols()

EXAMPLES:

```
sage: from sage.combinat.dyck_word import replace_parens
sage: replace_parens('(')
1
sage: replace_parens(')')
0
sage: replace_parens(1)
Traceback (most recent call last):
...
ValueError
```

```
>>> from sage.all import *
>>> from sage.combinat.dyck_word import replace_parens
>>> replace_parens('(')
1
>>> replace_parens(')')
0
>>> replace_parens(Integer(1))
Traceback (most recent call last):
...
ValueError
```

sage.combinat.dyck_word.**replace_symbols**(*x*)

A map sending `open_symbol` to `'('` and `close_symbol` to `')'`, and raising an error on any input other than `open_symbol` and `close_symbol`. The values of the constants `open_symbol` and `close_symbol` are subject to change.

This is the inverse map of *replace_parens()*.

INPUT:

- `x` – either `open_symbol` or `close_symbol`

OUTPUT:

- If `x` is `open_symbol`, replace `x` with `'('`.
- If `x` is `close_symbol`, replace `x` with `')'`.
- If `x` is neither `open_symbol` nor `close_symbol`, a `ValueError` is raised.

See also

replace_parens()

EXAMPLES:

```
sage: from sage.combinat.dyck_word import replace_symbols
sage: replace_symbols(1)
'('
sage: replace_symbols(0)
')'
sage: replace_symbols(3)
Traceback (most recent call last):
...
ValueError
```

```
>>> from sage.all import *
>>> from sage.combinat.dyck_word import replace_symbols
>>> replace_symbols(Integer(1))
'('
>>> replace_symbols(Integer(0))
')'
>>> replace_symbols(Integer(3))
Traceback (most recent call last):
...
ValueError
```

Exact cover problem via dancing links

sage.combinat.dlx.**AllExactCovers**(*M*)

Use A. Ajanki's DLXMatrix class to solve the exact cover problem on the matrix M (treated as a dense binary matrix).

EXAMPLES:

```
sage: # needs sage.modules
sage: M = Matrix([[1,1,0],[1,0,1],[0,1,1]])  # no exact covers
sage: for cover in AllExactCovers(M):
....:     print(cover)
sage: M = Matrix([[1,1,0],[1,0,1],[0,0,1],[0,1,0]]) # two exact covers
sage: for cover in AllExactCovers(M):
....:     print(cover)
[(1, 1, 0), (0, 0, 1)]
[(1, 0, 1), (0, 1, 0)]
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> M = Matrix([[Integer(1),Integer(1),Integer(0)],[Integer(1),Integer(0),
↪Integer(1)],[Integer(0),Integer(1),Integer(1)]])  # no exact covers
>>> for cover in AllExactCovers(M):
...     print(cover)
>>> M = Matrix([[Integer(1),Integer(1),Integer(0)],[Integer(1),Integer(0),
↪Integer(1)],[Integer(0),Integer(0),Integer(1)],[Integer(0),Integer(1),
↪Integer(0)]]) # two exact covers
>>> for cover in AllExactCovers(M):
...     print(cover)
[(1, 1, 0), (0, 0, 1)]
[(1, 0, 1), (0, 1, 0)]
```

class sage.combinat.dlx.**DLXMatrix**(*ones*, *initialsolution=None*)

Bases: object

Solve the Exact Cover problem by using the Dancing Links algorithm described by Knuth.

Consider a matrix M with entries of 0 and 1, and compute a subset of the rows of this matrix which sum to the vector of all 1s.

The dancing links algorithm works particularly well for sparse matrices, so the input is a list of lists of the form: (note the 1-index!):

```
[
 [1, [i_11,i_12,...,i_1r]]
 ...
 [m,[i_m1,i_m2,...,i_ms]]
]
```

where M[j][i_jk] = 1.

The first example below corresponds to the matrix:

```
1110
1010
```

(continues on next page)

(continued from previous page)

```
0100
0001
```

which is exactly covered by:

```
1110
0001
```

and

```
1010
0100
0001
```

EXAMPLES:

```
sage: from sage.combinat.dlx import *
sage: ones = [[1,[1,2,3]]]
sage: ones+= [[2,[1,3]]]
sage: ones+= [[3,[2]]]
sage: ones+= [[4,[4]]]
sage: DLXM = DLXMatrix(ones,[4])
sage: for C in DLXM:
....:       print(C)
[4, 1]
[4, 2, 3]
```

```
>>> from sage.all import *
>>> from sage.combinat.dlx import *
>>> ones = [[Integer(1),[Integer(1),Integer(2),Integer(3)]]]
>>> ones+= [[Integer(2),[Integer(1),Integer(3)]]]
>>> ones+= [[Integer(3),[Integer(2)]]]
>>> ones+= [[Integer(4),[Integer(4)]]]
>>> DLXM = DLXMatrix(ones,[Integer(4)])
>>> for C in DLXM:
...       print(C)
[4, 1]
[4, 2, 3]
```

Note

The 0 entry is reserved internally for headers in the sparse representation, so rows and columns begin their indexing with 1. Apologies for any heartache this causes. Blame the original author, or fix it yourself.

next()

Search for the first solution we can find, and return it.

Knuth describes the Dancing Links algorithm recursively, though actually implementing it as a recursive algorithm is permissible only for highly restricted problems. (for example, the original author implemented this for Sudoku, and it works beautifully there)

What follows is an iterative description of DLX:

```
stack <- [(NULL)]
level <- 0
while level >= 0:
    cur <- stack[level]
    if cur = NULL:
        if R[h] = h:
            level <- level - 1
            yield solution
        else:
            cover(best_column)
            stack[level] = best_column
    else if D[cur] != C[cur]:
        if cur != C[cur]:
            delete solution[level]
            for j in L[cur], L[L[cur]], ... , while j != cur:
                uncover(C[j])
        cur <- D[cur]
        solution[level] <- cur
        stack[level] <- cur
        for j in R[cur], R[R[cur]], ... , while j != cur:
            cover(C[j])
        level <- level + 1
        stack[level] <- (NULL)
    else:
        if C[cur] != cur:
            delete solution[level]
            for j in L[cur], L[L[cur]], ... , while j != cur:
                uncover(C[j])
        uncover(cur)
        level <- level - 1
```

sage.combinat.dlx.**OneExactCover**(*M*)

Use A. Ajanki's DLXMatrix class to solve the exact cover problem on the matrix M (treated as a dense binary matrix).

EXAMPLES:

```
sage: M = Matrix([[1,1,0],[1,0,1],[0,1,1]])  # no exact covers                #␣
↪needs sage.modules
sage: OneExactCover(M)                                                        #␣
↪needs sage.modules

sage: M = Matrix([[1,1,0],[1,0,1],[0,0,1],[0,1,0]])  # two exact covers       #␣
↪needs sage.modules
sage: OneExactCover(M)                                                        #␣
↪needs sage.modules
[(1, 1, 0), (0, 0, 1)]
```

```
>>> from sage.all import *
>>> M = Matrix([[Integer(1),Integer(1),Integer(0)],[Integer(1),Integer(0),
↪Integer(1)],[Integer(0),Integer(1),Integer(1)]])  # no exact covers          ␣
↪     # needs sage.modules
>>> OneExactCover(M)                                                          #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.modules

>>> M = Matrix([[Integer(1),Integer(1),Integer(0)],[Integer(1),Integer(0),
↪Integer(1)],[Integer(0),Integer(0),Integer(1)],[Integer(0),Integer(1),
↪Integer(0)]])  # two exact covers          # needs sage.modules
>>> OneExactCover(M)                                                    #␣
↪needs sage.modules
[(1, 1, 0), (0, 0, 1)]
```

Families

This is a backward compatibility stub. Use `sage.sets.family` instead.

Fast computation of combinatorial functions (Cython + mpz)

Currently implemented:

- Stirling numbers of the second kind
- iterators for set partitions
- iterator for Lyndon words
- iterator for perfect matchings
- conjugate of partitions

AUTHORS:

- Fredrik Johansson (2010-10): Stirling numbers of second kind
- Martin Rubey and Travis Scrimshaw (2018): iterators for set partitions, Lyndon words, and perfect matchings

`sage.combinat.combinat_cython.`**`conjugate`**`(`p`)`

Return the conjugate partition associated to the partition `p` as a list.

EXAMPLES:

```
sage: from sage.combinat.combinat_cython import conjugate
sage: conjugate([2,2])
[2, 2]
sage: conjugate([6,3,1])
[3, 2, 2, 1, 1, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat_cython import conjugate
>>> conjugate([Integer(2),Integer(2)])
[2, 2]
>>> conjugate([Integer(6),Integer(3),Integer(1)])
[3, 2, 2, 1, 1, 1]
```

`sage.combinat.combinat_cython.`**`lyndon_word_iterator`**`(`n, k`)`

Generate the Lyndon words of fixed length `k` with `n` letters.

The resulting Lyndon words will be words represented as lists whose alphabet is `range(n)` ($= \{0, 1, \ldots, n-1\}$).

ALGORITHM:

The iterative FKM Algorithm 7.2 from [Rus2003].

EXAMPLES:

```
sage: from sage.combinat.combinat_cython import lyndon_word_iterator
sage: list(lyndon_word_iterator(4, 2))
[[0, 1], [0, 2], [0, 3], [1, 2], [1, 3], [2, 3]]
sage: list(lyndon_word_iterator(2, 4))
[[0, 0, 0, 1], [0, 0, 1, 1], [0, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat_cython import lyndon_word_iterator
>>> list(lyndon_word_iterator(Integer(4), Integer(2)))
[[0, 1], [0, 2], [0, 3], [1, 2], [1, 3], [2, 3]]
>>> list(lyndon_word_iterator(Integer(2), Integer(4)))
[[0, 0, 0, 1], [0, 0, 1, 1], [0, 1, 1, 1]]
```

sage.combinat.combinat_cython.**perfect_matchings_iterator**(*n*)

Iterate over all perfect matchings with `n` parts.

This iterates over all perfect matchings of $\{0, 1, \ldots, 2n-1\}$ using a Gray code for fixed-point-free involutions due to Walsh [Wal2001].

EXAMPLES:

```
sage: from sage.combinat.combinat_cython import perfect_matchings_iterator
sage: list(perfect_matchings_iterator(1))
[[(0, 1)]]
sage: list(perfect_matchings_iterator(2))
[[(0, 1), (2, 3)], [(0, 2), (1, 3)], [(0, 3), (1, 2)]]

sage: list(perfect_matchings_iterator(0))
[[]]
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat_cython import perfect_matchings_iterator
>>> list(perfect_matchings_iterator(Integer(1)))
[[(0, 1)]]
>>> list(perfect_matchings_iterator(Integer(2)))
[[(0, 1), (2, 3)], [(0, 2), (1, 3)], [(0, 3), (1, 2)]]

>>> list(perfect_matchings_iterator(Integer(0)))
[[]]
```

REFERENCES:

- [Wal2001]

sage.combinat.combinat_cython.**set_partition_composition**(*sp1*, *sp2*)

Return a tuple consisting of the composition of the set partitions `sp1` and `sp2` and the number of components removed from the middle rows of the graph.

EXAMPLES:

```
sage: from sage.combinat.combinat_cython import set_partition_composition
sage: sp1 = ((1,-2),(2,-1))
sage: sp2 = ((1,-2),(2,-1))
```

(continues on next page)

(continued from previous page)

```
sage: p, c = set_partition_composition(sp1, sp2)
sage: (SetPartition(p), c) == (SetPartition([[1,-1],[2,-2]]), 0)                #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> from sage.combinat.combinat_cython import set_partition_composition
>>> sp1 = ((Integer(1),-Integer(2)),(Integer(2),-Integer(1)))
>>> sp2 = ((Integer(1),-Integer(2)),(Integer(2),-Integer(1)))
>>> p, c = set_partition_composition(sp1, sp2)
>>> (SetPartition(p), c) == (SetPartition([[Integer(1),-Integer(1)],[Integer(2),-
↪Integer(2)]]), Integer(0))                # needs sage.combinat
True
```

Fast set partition iterators

sage.combinat.set_partition_iterator.**set_partition_iterator**(*base_set*)

A fast iterator for the set partitions of the base set, which returns lists of lists instead of set partitions types.

EXAMPLES:

```
sage: from sage.combinat.set_partition_iterator import set_partition_iterator
sage: list(set_partition_iterator([1,-1,x]))                                   #␣
↪needs sage.symbolic
[[[1, -1, x]],
 [[1, -1], [x]],
 [[1, x], [-1]],
 [[1], [-1, x]],
 [[1], [-1], [x]]]
```

```
>>> from sage.all import *
>>> from sage.combinat.set_partition_iterator import set_partition_iterator
>>> list(set_partition_iterator([Integer(1),-Integer(1),x]))                    ␣
↪              # needs sage.symbolic
[[[1, -1, x]],
 [[1, -1], [x]],
 [[1, x], [-1]],
 [[1], [-1, x]],
 [[1], [-1], [x]]]
```

sage.combinat.set_partition_iterator.**set_partition_iterator_blocks**(*base_set*, *k*)

A fast iterator for the set partitions of the base set into the specified number of blocks, which returns lists of lists instead of set partitions types.

EXAMPLES:

```
sage: from sage.combinat.set_partition_iterator import set_partition_iterator_
↪blocks
sage: list(set_partition_iterator_blocks([1,-1,x], 2))                         #␣
↪needs sage.symbolic
[[[1, x], [-1]], [[1], [-1, x]], [[1, -1], [x]]]
```

```
>>> from sage.all import *
>>> from sage.combinat.set_partition_iterator import set_partition_iterator_blocks
>>> list(set_partition_iterator_blocks([Integer(1),-Integer(1),x], Integer(2)))  ␣
↪                        # needs sage.symbolic
[[[1, x], [-1]], [[1], [-1, x]], [[1, -1], [x]]]
```

Finite state machines, automata, transducers

This module adds support for finite state machines, automata and transducers.

For creating automata and transducers you can use classes

- *Automaton* and *Transducer* (or the more general class *FiniteStateMachine*)

or the generators

- *automata* and *transducers*

which contain *preconstructed and commonly used automata and transducers*. See also the *examples* below.

Contents

FiniteStateMachine and derived classes *Transducer* and *Automaton*

Accessing parts of a finite state machine

state()	Get a state by its label
states()	List of states
iter_states()	Iterator over the states
initial_states()	List of initial states
iter_initial_states()	Iterator over initial states
final_states()	List of final states
iter_final_states()	Iterator over final states
transition()	Get a transition by its states and labels
transitions()	List of transitions
iter_transitions()	Iterator over the transitions
predecessors()	List of predecessors of a state
induced_sub_finite_state_machine()	Induced sub-machine
accessible_components()	Accessible components
coaccessible_components()	Coaccessible components
final_components()	Final components (connected components which cannot be left again)

(Modified) Copies

empty_copy()	Return an empty deep copy
deepcopy()	Return a deep copy
relabeled()	Return a relabeled deep copy
Automaton.with_output()	Extend an automaton to a transducer

Manipulation

add_state()	Add a state
add_states()	Add states
delete_state()	Delete a state
add_transition()	Add a transition
add_transitions_from_function()	Add transitions
input_alphabet	Input alphabet
output_alphabet	Output alphabet
on_duplicate_transition	Hook for handling duplicate transitions
add_from_transition_function()	Add transitions by a transition function
delete_transition()	Delete a transition
remove_epsilon_transitions()	Remove epsilon transitions (not implemented)
split_transitions()	Split transitions with input words of length > 1
determine_alphabets()	Determine input and output alphabets
determine_input_alphabet()	Determine input alphabet
determine_output_alphabet()	Determine output alphabet
construct_final_word_out()	Construct final output by implicitly reading trailing letters; cf. *with_final_word_out()*

Properties

has_state()	Check for a state
has_initial_state()	Check for an initial state
has_initial_states()	Check for initial states
has_final_state()	Check for a final state
has_final_states()	Check for final states
has_transition()	Check for a transition
is_deterministic()	Check for a deterministic machine
is_complete()	Check for a complete machine
is_connected()	Check for a connected machine
Automaton.is_equivalent()	Check for equivalent automata
is_Markov_chain()	Check for a Markov chain
is_monochromatic()	Check whether the colors of all states are equal
number_of_words()	Determine the number of successful paths
asymptotic_moments()	Main terms of expectation and variance of sums of labels
moments_waiting_time()	Moments of the waiting time for first true output
epsilon_successors()	Epsilon successors of a state
Automaton.shannon_parry_markov_chai	Compute Markov chain with Parry measure

Operations

disjoint_union()	Disjoint union
concatenation()	Concatenation
kleene_star()	Kleene star
Automaton.complement()	Complement of an automaton
Automaton.intersection()	Intersection of automata
Transducer.intersection()	Intersection of transducers
Transducer.cartesian_product()	Cartesian product of a transducer with another finite state machine
product_FiniteStateMachine()	Product of finite state machines
composition()	Composition (output of other is input of self)
input_projection()	Input projection (output is deleted)
output_projection()	Output projection (old output is new input)
projection()	Input or output projection
transposition()	Transposition (all transitions are reversed)
with_final_word_out()	Machine with final output constructed by implicitly reading trailing letters, cf. *construct_final_word_out()* for inplace version
Automaton.determinisation()	Determinisation of an automaton
completion()	Completion of a finite state machine
process()	Process input
__call__()	Process input with shortened output
Automaton.process()	Process input of an automaton (output differs from general case)
Transducer.process()	Process input of a transducer (output differs from general case)
iter_process()	Return process iterator
language()	Return all possible output words
Automaton.language()	Return all possible accepted words

Simplification

prepone_output()	Prepone output where possible
equivalence_classes()	List of equivalent states
quotient()	Quotient with respect to equivalence classes
merged_transitions()	Merge transitions while adding input
markov_chain_simplification()	Simplification of a Markov chain
Automaton.minimization()	Minimization of an automaton
Transducer.simplification()	Simplification of a transducer

Conversion

adjacency_matrix()	(Weighted) adjacency `matrix()`
graph()	Underlying `DiGraph`
plot()	Plot

LaTeX output

latex_options()	Set options
set_coordinates()	Set coordinates of the states
default_format_transition_label()	Default formatting of words in transition labels
format_letter_negative()	Format negative numbers as overlined number
format_transition_label_reversed()	Format words in transition labels in reversed order

See also

LaTeX output

FSMState

final_word_out	Final output of a state
is_final	Describe whether a state is final or not
is_initial	Describe whether a state is initial or not
initial_probability	Probability of starting in this state as part of a Markov chain
label()	Label of a state
relabeled()	Return a relabeled deep copy of a state
fully_equal()	Check whether two states are fully equal (including all attributes)

FSMTransition

from_state	State in which transition starts
to_state	State in which transition ends
word_in	Input word of the transition
word_out	Output word of the transition
deepcopy()	Return a deep copy of the transition

FSMProcessIterator

next()	Make one step in processing the input tape
preview_word()	Read a word from the input tape
result()	Return the finished branches during process

Helper Functions

equal()	Check whether all elements of `iterator` are equal
full_group_by()	Group iterable by values of some key
startswith()	Determine whether list starts with the given prefix
FSMLetterSymbol()	Return a string associated to the input letter
FSMWordSymbol()	Return a string associated to a word
duplicate_transition_ignore()	Default function for handling duplicate transitions
duplicate_transition_raise_error()	Raise error when inserting a duplicate transition
duplicate_transition_add_input()	Add input when inserting a duplicate transition

Examples

We start with a general *FiniteStateMachine*. Later there will be also an *Automaton* and a *Transducer*.

A simple finite state machine

We can easily create a finite state machine by

```
sage: fsm = FiniteStateMachine()
sage: fsm
Empty finite state machine
```

```
>>> from sage.all import *
>>> fsm = FiniteStateMachine()
>>> fsm
Empty finite state machine
```

By default this is the empty finite state machine, so not very interesting. Let's create and add some states and transitions:

```
sage: day = fsm.add_state('day')
sage: night = fsm.add_state('night')
sage: sunrise = fsm.add_transition(night, day)
sage: sunset = fsm.add_transition(day, night)
```

```
>>> from sage.all import *
>>> day = fsm.add_state('day')
>>> night = fsm.add_state('night')
>>> sunrise = fsm.add_transition(night, day)
>>> sunset = fsm.add_transition(day, night)
```

Let us look at `sunset` more closely:

```
sage: sunset
Transition from 'day' to 'night': -|-
```

```
>>> from sage.all import *
>>> sunset
Transition from 'day' to 'night': -|-
```

Note that could also have created and added the transitions directly by:

```
sage: fsm.add_transition('day', 'night')
Transition from 'day' to 'night': -|-
```

```
>>> from sage.all import *
>>> fsm.add_transition('day', 'night')
Transition from 'day' to 'night': -|-
```

This would have had added the states automatically, since they are present in the transitions.

Anyhow, we got the following finite state machine:

```
sage: fsm
Finite state machine with 2 states
```

```
>>> from sage.all import *
>>> fsm
Finite state machine with 2 states
```

We can also obtain the underlying `directed graph` by

```
sage: fsm.graph()
Looped multi-digraph on 2 vertices
```

```
>>> from sage.all import *
>>> fsm.graph()
Looped multi-digraph on 2 vertices
```

To visualize a finite state machine, we can use `latex()` and run the result through LaTeX, see the section on *LaTeX output* below.

Alternatively, we could have created the finite state machine above simply by

```
sage: FiniteStateMachine([('night', 'day'), ('day', 'night')])
Finite state machine with 2 states
```

```
>>> from sage.all import *
>>> FiniteStateMachine([('night', 'day'), ('day', 'night')])
Finite state machine with 2 states
```

See *FiniteStateMachine* for a lot of possibilities to create finite state machines.

A simple Automaton (recognizing NAFs)

We want to build an automaton which recognizes non-adjacent forms (NAFs), i.e., sequences which have no adjacent nonzeros. We use 0, 1, and -1 as digits:

```
sage: NAF = Automaton(
....:     {'A': [('A', 0), ('B', 1), ('B', -1)], 'B': [('A', 0)]})
sage: NAF.state('A').is_initial = True
sage: NAF.state('A').is_final = True
sage: NAF.state('B').is_final = True
sage: NAF
Automaton with 2 states
```

```
>>> from sage.all import *
>>> NAF = Automaton(
...     {'A': [('A', Integer(0)), ('B', Integer(1)), ('B', -Integer(1))], 'B': [('A',␣
↪Integer(0))]})
>>> NAF.state('A').is_initial = True
>>> NAF.state('A').is_final = True
>>> NAF.state('B').is_final = True
>>> NAF
Automaton with 2 states
```

Of course, we could have specified the initial and final states directly in the definition of `NAF` by `initial_states=['A']` and `final_states=['A', 'B']`.

So let's test the automaton with some input:

```
sage: NAF([0])
True
sage: NAF([0, 1])
True
sage: NAF([1, -1])
False
sage: NAF([0, -1, 0, 1])
True
sage: NAF([0, -1, -1, -1, 0])
False
sage: NAF([-1, 0, 0, 1, 1])
False
```

```
>>> from sage.all import *
>>> NAF([Integer(0)])
True
>>> NAF([Integer(0), Integer(1)])
True
>>> NAF([Integer(1), -Integer(1)])
False
>>> NAF([Integer(0), -Integer(1), Integer(0), Integer(1)])
True
>>> NAF([Integer(0), -Integer(1), -Integer(1), -Integer(1), Integer(0)])
False
>>> NAF([-Integer(1), Integer(0), Integer(0), Integer(1), Integer(1)])
False
```

Alternatively, we could call that by

```
sage: NAF.process([0, -1, 0, 1])
(True, 'B')
```

```
>>> from sage.all import *
>>> NAF.process([Integer(0), -Integer(1), Integer(0), Integer(1)])
(True, 'B')
```

which gives additionally the state in which we arrived.

We can also let an automaton act on a *word*:

```
sage: # needs sage.combinat
sage: W = Words([-1, 0, 1]); W
Finite and infinite words over {-1, 0, 1}
sage: w = W([1, 0, 1, 0, -1]); w
word: 1,0,1,0,-1
sage: NAF(w)
True
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> W = Words([-Integer(1), Integer(0), Integer(1)]); W
Finite and infinite words over {-1, 0, 1}
>>> w = W([Integer(1), Integer(0), Integer(1), Integer(0), -Integer(1)]); w
word: 1,0,1,0,-1
>>> NAF(w)
True
```

Recognizing NAFs via Automata Operations

Alternatively, we can use automata operations to recognize NAFs; for simplicity, we only use the input alphabet `[0, 1]`. On the one hand, we can construct such an automaton by forbidding the word `11`:

```
sage: forbidden = automata.ContainsWord([1, 1], input_alphabet=[0, 1])
sage: NAF_negative = forbidden.complement()
sage: NAF_negative([1, 1, 0, 1])
False
sage: NAF_negative([1, 0, 1, 0, 1])
True
```

```
>>> from sage.all import *
>>> forbidden = automata.ContainsWord([Integer(1), Integer(1)], input_
↪alphabet=[Integer(0), Integer(1)])
>>> NAF_negative = forbidden.complement()
>>> NAF_negative([Integer(1), Integer(1), Integer(0), Integer(1)])
False
>>> NAF_negative([Integer(1), Integer(0), Integer(1), Integer(0), Integer(1)])
True
```

On the other hand, we can write this as a regular expression and translate that into automata operations:

```
sage: zero = automata.Word([0])
sage: one = automata.Word([1])
sage: epsilon = automata.EmptyWord(input_alphabet=[0, 1])
sage: NAF_positive = (zero + one*zero).kleene_star() * (epsilon + one)
```

```
>>> from sage.all import *
>>> zero = automata.Word([Integer(0)])
>>> one = automata.Word([Integer(1)])
>>> epsilon = automata.EmptyWord(input_alphabet=[Integer(0), Integer(1)])
>>> NAF_positive = (zero + one*zero).kleene_star() * (epsilon + one)
```

We check that the two approaches are equivalent:

```
sage: NAF_negative.is_equivalent(NAF_positive)
True
```

```
>>> from sage.all import *
>>> NAF_negative.is_equivalent(NAF_positive)
True
```

See also

ContainsWord(), *Word()*, *complement()*, *kleene_star()*, *EmptyWord()*, *is_equivalent()*.

LaTeX output

We can visualize a finite state machine by converting it to LaTeX by using the usual function `latex()`. Within LaTeX, TikZ is used for typesetting the graphics, see the Wikipedia article PGF/TikZ.

```
sage: print(latex(NAF))  # abs tol 1e-3
\begin{tikzpicture}[auto, initial text=, >=latex]
\node[state, accepting, initial] (v0) at (3.000000, 0.000000) {$\text{\texttt{A}}$};
\node[state, accepting] (v1) at (-3.000000, 0.000000) {$\text{\texttt{B}}$};
\path[->] (v0) edge[loop above] node {$0$} ();
\path[->] (v0.185.00) edge node[rotate=360.00, anchor=north] {$1, -1$} (v1.355.00);
\path[->] (v1.5.00) edge node[rotate=0.00, anchor=south] {$0$} (v0.175.00);
\end{tikzpicture}
```

```
>>> from sage.all import *
>>> print(latex(NAF))  # abs tol 1e-3
\begin{tikzpicture}[auto, initial text=, >=latex]
\node[state, accepting, initial] (v0) at (3.000000, 0.000000) {$\text{\texttt{A}}$};
\node[state, accepting] (v1) at (-3.000000, 0.000000) {$\text{\texttt{B}}$};
\path[->] (v0) edge[loop above] node {$0$} ();
\path[->] (v0.185.00) edge node[rotate=360.00, anchor=north] {$1, -1$} (v1.355.00);
\path[->] (v1.5.00) edge node[rotate=0.00, anchor=south] {$0$} (v0.175.00);
\end{tikzpicture}
```

We can turn this into a graphical representation.

```
sage: view(NAF) # not tested
```

```
>>> from sage.all import *
>>> view(NAF) # not tested
```

To actually see this, use the live documentation in the Sage notebook and execute the cells in this and the previous section.

Several options can be set to customize the output, see *latex_options()* for details. In particular, we use *format_letter_negative()* to format -1 as $\overline{1}$.

```
sage: NAF.latex_options(
....:     coordinates={'A': (0, 0),
....:                  'B': (6, 0)},
....:     initial_where={'A': 'below'},
```

(continues on next page)

(continued from previous page)

```
....:     format_letter=NAF.format_letter_negative,
....:     format_state_label=lambda x:
....:         r'\mathcal{%s}' % x.label()
....: )
sage: print(latex(NAF))
\begin{tikzpicture}[auto, initial text=, >=latex]
\node[state, accepting, initial, initial where=below] (v0) at (0.000000, 0.000000) {$\
↪mathcal{A}$};
\node[state, accepting] (v1) at (6.000000, 0.000000) {$\mathcal{B}$};
\path[->] (v0) edge[loop above] node {$0$} ();
\path[->] (v0.5.00) edge node[rotate=0.00, anchor=south] {$1, \overline{1}$} (v1.175.
↪00);
\path[->] (v1.185.00) edge node[rotate=360.00, anchor=north] {$0$} (v0.355.00);
\end{tikzpicture}
sage: view(NAF) # not tested
```

```
>>> from sage.all import *
>>> NAF.latex_options(
...     coordinates={'A': (Integer(0), Integer(0)),
...                  'B': (Integer(6), Integer(0))},
...     initial_where={'A': 'below'},
...     format_letter=NAF.format_letter_negative,
...     format_state_label=lambda x:
...         r'\mathcal{%s}' % x.label()
... )
>>> print(latex(NAF))
\begin{tikzpicture}[auto, initial text=, >=latex]
\node[state, accepting, initial, initial where=below] (v0) at (0.000000, 0.000000) {$\
↪mathcal{A}$};
\node[state, accepting] (v1) at (6.000000, 0.000000) {$\mathcal{B}$};
\path[->] (v0) edge[loop above] node {$0$} ();
\path[->] (v0.5.00) edge node[rotate=0.00, anchor=south] {$1, \overline{1}$} (v1.175.
↪00);
\path[->] (v1.185.00) edge node[rotate=360.00, anchor=north] {$0$} (v0.355.00);
\end{tikzpicture}
>>> view(NAF) # not tested
```

To use the output of `latex()` in your own LaTeX file, you have to include

```
\usepackage{tikz}
\usetikzlibrary{automata}
```

into the preamble of your file.

A simple transducer (binary inverter)

Let's build a simple transducer, which rewrites a binary word by inverting each bit:

```
sage: inverter = Transducer({'A': [('A', 0, 1), ('A', 1, 0)]},
....:     initial_states=['A'], final_states=['A'])
```

```
>>> from sage.all import *
>>> inverter = Transducer({'A': [('A', Integer(0), Integer(1)), ('A', Integer(1),␣
↪Integer(0))]},
...     initial_states=['A'], final_states=['A'])
```

We can look at the states and transitions:

```
sage: inverter.states()
['A']
sage: for t in inverter.transitions():
....:     print(t)
Transition from 'A' to 'A': 0|1
Transition from 'A' to 'A': 1|0
```

```
>>> from sage.all import *
>>> inverter.states()
['A']
>>> for t in inverter.transitions():
...     print(t)
Transition from 'A' to 'A': 0|1
Transition from 'A' to 'A': 1|0
```

Now we apply a word to it and see what the transducer does:

```
sage: inverter([0, 1, 0, 0, 1, 1, 0, 0, 0, 1, 1, 1])
[1, 0, 1, 1, 0, 0, 1, 1, 1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> inverter([Integer(0), Integer(1), Integer(0), Integer(0), Integer(1), Integer(1),␣
↪Integer(0), Integer(0), Integer(0), Integer(1), Integer(1), Integer(1)])
[1, 0, 1, 1, 0, 0, 1, 1, 1, 0, 0, 0]
```

`True` means, that we landed in a final state, that state is labeled `'A'`, and we also got an output.

Transducers and (in)finite Words

A transducer can also act on everything iterable, in particular, on Sage's *words*.

```
sage: W = Words([0, 1]); W
Finite and infinite words over {0, 1}
```

```
>>> from sage.all import *
>>> W = Words([Integer(0), Integer(1)]); W
Finite and infinite words over {0, 1}
```

Let us take the inverter from the previous section and feed some finite word into it:

```
sage: w = W([1, 1, 0, 1]); w
word: 1101
sage: inverter(w)
word: 0010
```

```
>>> from sage.all import *
>>> w = W([Integer(1), Integer(1), Integer(0), Integer(1)]); w
word: 1101
>>> inverter(w)
word: 0010
```

We see that the output is again a word (this is a consequence of calling *process()* with automatic_output_type).

We can even input something infinite like an infinite word:

```
sage: tm = words.ThueMorseWord(); tm
word: 01101001100101101001011001101001100101101...
sage: inverter(tm)
word: 10010110011010010110100110010110011010010...
```

```
>>> from sage.all import *
>>> tm = words.ThueMorseWord(); tm
word: 01101001100101101001011001101001100101101...
>>> inverter(tm)
word: 10010110011010010110100110010110011010010...
```

A transducer which performs division by 3 in binary

Now we build a transducer, which divides a binary number by 3. The labels of the states are the remainder of the division. The transition function is

```
sage: def f(state_from, read):
....:     if state_from + read <= 1:
....:         state_to = 2*state_from + read
....:         write = 0
....:     else:
....:         state_to = 2*state_from + read - 3
....:         write = 1
....:     return (state_to, write)
```

```
>>> from sage.all import *
>>> def f(state_from, read):
...     if state_from + read <= Integer(1):
...         state_to = Integer(2)*state_from + read
...         write = Integer(0)
...     else:
...         state_to = Integer(2)*state_from + read - Integer(3)
...         write = Integer(1)
...     return (state_to, write)
```

which assumes reading a binary number from left to right. We get the transducer with

```
sage: D = Transducer(f, initial_states=[0], final_states=[0],
....:                input_alphabet=[0, 1])
```

```
>>> from sage.all import *
>>> D = Transducer(f, initial_states=[Integer(0)], final_states=[Integer(0)],
...                input_alphabet=[Integer(0), Integer(1)])
```

Let us try to divide 12 by 3:

```
sage: D([1, 1, 0, 0])
[0, 1, 0, 0]
```

```
>>> from sage.all import *
>>> D([Integer(1), Integer(1), Integer(0), Integer(0)])
[0, 1, 0, 0]
```

Now we want to divide 13 by 3:

```
sage: D([1, 1, 0, 1])
Traceback (most recent call last):
...
ValueError: Invalid input sequence.
```

```
>>> from sage.all import *
>>> D([Integer(1), Integer(1), Integer(0), Integer(1)])
Traceback (most recent call last):
...
ValueError: Invalid input sequence.
```

The raised `ValueError` means 13 is not divisible by 3.

Gray Code

The Gray code is a binary numeral system where two successive values differ in only one bit, cf. the Wikipedia article Gray_code. The Gray code of an integer n is obtained by a bitwise xor between the binary expansion of n and the binary expansion of $\lfloor n/2 \rfloor$; the latter corresponds to a shift by one position in binary.

The purpose of this example is to construct a transducer converting the standard binary expansion to the Gray code by translating this construction into operations with transducers.

For this construction, the least significant digit is at the left-most position. Note that it is easier to shift everything to the right first, i.e., multiply by 2 instead of building $\lfloor n/2 \rfloor$. Then, we take the input xor with the right shift of the input and forget the first letter.

We first construct a transducer shifting the binary expansion to the right. This requires storing the previously read digit in a state.

```
sage: def shift_right_transition(state, digit):
....:     if state == 'I':
....:         return (digit, None)
....:     return (digit, state)
sage: shift_right_transducer = Transducer(
....:     shift_right_transition,
....:     initial_states=['I'],
....:     input_alphabet=[0, 1],
....:     final_states=[0])
sage: shift_right_transducer.transitions()
[Transition from 'I' to 0: 0|-,
 Transition from 'I' to 1: 1|-,
 Transition from 0 to 0: 0|0,
 Transition from 0 to 1: 1|0,
 Transition from 1 to 0: 0|1,
```

(continues on next page)

(continued from previous page)

```
 Transition from 1 to 1: 1|1]
sage: shift_right_transducer([0, 1, 1, 0])
[0, 1, 1]
sage: shift_right_transducer([1, 0, 0])
[1, 0]
```

```
>>> from sage.all import *
>>> def shift_right_transition(state, digit):
...     if state == 'I':
...         return (digit, None)
...     return (digit, state)
>>> shift_right_transducer = Transducer(
...     shift_right_transition,
...     initial_states=['I'],
...     input_alphabet=[Integer(0), Integer(1)],
...     final_states=[Integer(0)])
>>> shift_right_transducer.transitions()
[Transition from 'I' to 0: 0|-,
 Transition from 'I' to 1: 1|-,
 Transition from 0 to 0: 0|0,
 Transition from 0 to 1: 1|0,
 Transition from 1 to 0: 0|1,
 Transition from 1 to 1: 1|1]
>>> shift_right_transducer([Integer(0), Integer(1), Integer(1), Integer(0)])
[0, 1, 1]
>>> shift_right_transducer([Integer(1), Integer(0), Integer(0)])
[1, 0]
```

The output of the shifts above look a bit weird (from a right-shift transducer, we would expect, for example, that `[1, 0, 0]` was mapped to `[0, 1, 0]`), since we write `None` instead of the zero at the left. Further, note that only 0 is listed as a final state as we have to enforce that a most significant zero is read as the last input letter in order to flush the last digit:

```
sage: shift_right_transducer([0, 1, 0, 1])
Traceback (most recent call last):
...
ValueError: Invalid input sequence.
```

```
>>> from sage.all import *
>>> shift_right_transducer([Integer(0), Integer(1), Integer(0), Integer(1)])
Traceback (most recent call last):
...
ValueError: Invalid input sequence.
```

Next, we construct the transducer performing the xor operation. We also have to take `None` into account as our `shift_right_transducer` waits one iteration until it starts writing output. This corresponds with our intention to forget the first letter.

```
sage: def xor_transition(state, digits):
....:     if digits[0] is None or digits[1] is None:
....:         return (0, None)
....:     return (0, digits[0].__xor__(digits[1]))
sage: from itertools import product
```

(continues on next page)

(continued from previous page)

```
sage: xor_transducer = Transducer(
....:     xor_transition,
....:     initial_states=[0],
....:     final_states=[0],
....:     input_alphabet=list(product([None, 0, 1], [0, 1])))
sage: xor_transducer.transitions()
[Transition from 0 to 0: (None, 0)|-,
 Transition from 0 to 0: (None, 1)|-,
 Transition from 0 to 0: (0, 0)|0,
 Transition from 0 to 0: (0, 1)|1,
 Transition from 0 to 0: (1, 0)|1,
 Transition from 0 to 0: (1, 1)|0]
sage: xor_transducer([(None, 0), (None, 1), (0, 0), (0, 1), (1, 0), (1, 1)])
[0, 1, 1, 0]
sage: xor_transducer([(0, None)])
Traceback (most recent call last):
...
ValueError: Invalid input sequence.
```

```
>>> from sage.all import *
>>> def xor_transition(state, digits):
...     if digits[Integer(0)] is None or digits[Integer(1)] is None:
...         return (Integer(0), None)
...     return (Integer(0), digits[Integer(0)].__xor__(digits[Integer(1)]))
>>> from itertools import product
>>> xor_transducer = Transducer(
...     xor_transition,
...     initial_states=[Integer(0)],
...     final_states=[Integer(0)],
...     input_alphabet=list(product([None, Integer(0), Integer(1)], [Integer(0),␣
↪Integer(1)])))
>>> xor_transducer.transitions()
[Transition from 0 to 0: (None, 0)|-,
 Transition from 0 to 0: (None, 1)|-,
 Transition from 0 to 0: (0, 0)|0,
 Transition from 0 to 0: (0, 1)|1,
 Transition from 0 to 0: (1, 0)|1,
 Transition from 0 to 0: (1, 1)|0]
>>> xor_transducer([(None, Integer(0)), (None, Integer(1)), (Integer(0), Integer(0)),␣
↪(Integer(0), Integer(1)), (Integer(1), Integer(0)), (Integer(1), Integer(1))])
[0, 1, 1, 0]
>>> xor_transducer([(Integer(0), None)])
Traceback (most recent call last):
...
ValueError: Invalid input sequence.
```

The transducer computing the Gray code is then constructed as a *Cartesian product* between the shifted version and the original input (represented here by the `shift_right_transducer` and the *identity transducer*, respectively). This Cartesian product is then fed into the `xor_transducer` as a *composition* of transducers.

```
sage: product_transducer = shift_right_transducer.cartesian_product(transducers.
↪Identity([0, 1]))
```

(continues on next page)

(continued from previous page)

```
sage: Gray_transducer = xor_transducer(product_transducer)
```

```
>>> from sage.all import *
>>> product_transducer = shift_right_transducer.cartesian_product(transducers.
↪Identity([Integer(0), Integer(1)]))
>>> Gray_transducer = xor_transducer(product_transducer)
```

We use *construct_final_word_out()* to make sure that all output is written; otherwise, we would have to make sure that a sufficient number of trailing zeros is read.

```
sage: Gray_transducer.construct_final_word_out([0])
sage: Gray_transducer.transitions()
[Transition from (('I', 0), 0) to ((0, 0), 0): 0|-,
 Transition from (('I', 0), 0) to ((1, 0), 0): 1|-,
 Transition from ((0, 0), 0) to ((0, 0), 0): 0|0,
 Transition from ((0, 0), 0) to ((1, 0), 0): 1|1,
 Transition from ((1, 0), 0) to ((0, 0), 0): 0|1,
 Transition from ((1, 0), 0) to ((1, 0), 0): 1|0]
```

```
>>> from sage.all import *
>>> Gray_transducer.construct_final_word_out([Integer(0)])
>>> Gray_transducer.transitions()
[Transition from (('I', 0), 0) to ((0, 0), 0): 0|-,
 Transition from (('I', 0), 0) to ((1, 0), 0): 1|-,
 Transition from ((0, 0), 0) to ((0, 0), 0): 0|0,
 Transition from ((0, 0), 0) to ((1, 0), 0): 1|1,
 Transition from ((1, 0), 0) to ((0, 0), 0): 0|1,
 Transition from ((1, 0), 0) to ((1, 0), 0): 1|0]
```

There is a *prepackaged transducer* for Gray code, let's see whether they agree. We have to use *relabeled()* to relabel our states with integers.

```
sage: constructed = Gray_transducer.relabeled()
sage: packaged = transducers.GrayCode()
sage: constructed == packaged
True
```

```
>>> from sage.all import *
>>> constructed = Gray_transducer.relabeled()
>>> packaged = transducers.GrayCode()
>>> constructed == packaged
True
```

Finally, we check that this indeed computes the Gray code of the first 10 nonnegative integers.

```
sage: for n in srange(10):
....:     Gray_transducer(n.bits())
[]
[1]
[1, 1]
[0, 1]
[0, 1, 1]
```

(continues on next page)

(continued from previous page)

```
[1, 1, 1]
[1, 0, 1]
[0, 0, 1]
[0, 0, 1, 1]
[1, 0, 1, 1]
```

```
>>> from sage.all import *
>>> for n in srange(Integer(10)):
...     Gray_transducer(n.bits())
[]
[1]
[1, 1]
[0, 1]
[0, 1, 1]
[1, 1, 1]
[1, 0, 1]
[0, 0, 1]
[0, 0, 1, 1]
[1, 0, 1, 1]
```

Using the hook-functions

Let's use the *previous example "division by 3"* to demonstrate the optional state and transition parameters `hook`.

First, we define what those functions should do. In our case, this is just saying in which state we are and which transition we take

```
sage: def state_hook(process, state, output):
....:     print("We are now in State %s." % (state.label(),))
sage: from sage.combinat.finite_state_machine import FSMWordSymbol
sage: def transition_hook(transition, process):
....:     print("Currently we go from %s to %s, "
....:           "reading %s and writing %s." % (
....:               transition.from_state, transition.to_state,
....:               FSMWordSymbol(transition.word_in),
....:               FSMWordSymbol(transition.word_out)))
```

```
>>> from sage.all import *
>>> def state_hook(process, state, output):
...     print("We are now in State %s." % (state.label(),))
>>> from sage.combinat.finite_state_machine import FSMWordSymbol
>>> def transition_hook(transition, process):
...     print("Currently we go from %s to %s, "
...           "reading %s and writing %s." % (
...               transition.from_state, transition.to_state,
...               FSMWordSymbol(transition.word_in),
...               FSMWordSymbol(transition.word_out)))
```

Now, let's add these hook-functions to the existing transducer:

```
sage: for s in D.iter_states():
....:     s.hook = state_hook
```

(continues on next page)

(continued from previous page)

```
sage: for t in D.iter_transitions():
....:     t.hook = transition_hook
```

```
>>> from sage.all import *
>>> for s in D.iter_states():
...     s.hook = state_hook
>>> for t in D.iter_transitions():
...     t.hook = transition_hook
```

Rerunning the process again now gives the following output:

```
sage: D.process([1, 1, 0, 1], check_epsilon_transitions=False)
We are now in State 0.
Currently we go from 0 to 1, reading 1 and writing 0.
We are now in State 1.
Currently we go from 1 to 0, reading 1 and writing 1.
We are now in State 0.
Currently we go from 0 to 0, reading 0 and writing 0.
We are now in State 0.
Currently we go from 0 to 1, reading 1 and writing 0.
We are now in State 1.
(False, 1, [0, 1, 0, 0])
```

```
>>> from sage.all import *
>>> D.process([Integer(1), Integer(1), Integer(0), Integer(1)], check_epsilon_
↪transitions=False)
We are now in State 0.
Currently we go from 0 to 1, reading 1 and writing 0.
We are now in State 1.
Currently we go from 1 to 0, reading 1 and writing 1.
We are now in State 0.
Currently we go from 0 to 0, reading 0 and writing 0.
We are now in State 0.
Currently we go from 0 to 1, reading 1 and writing 0.
We are now in State 1.
(False, 1, [0, 1, 0, 0])
```

The example above just explains the basic idea of using hook-functions. In the following, we will use those hooks more seriously.

Warning

The hooks of the states are also called while exploring the epsilon successors of a state (during processing). In the example above, we used `check_epsilon_transitions=False` to avoid this (and also therefore got a cleaner output).

Warning

The arguments used when calling a hook have changed in Issue #16538 from `hook(state, process)` to `hook(process, state, output)`.

Detecting sequences with same number of 0 and 1

Suppose we have a binary input and want to accept all sequences with the same number of 0 and 1. This cannot be done with a finite automaton. Anyhow, we can make usage of the hook functions to extend our finite automaton by a counter:

```
sage: from sage.combinat.finite_state_machine import FSMState, FSMTransition
sage: C = FiniteStateMachine()
sage: def update_counter(process, state, output):
....:     try:
....:         l = process.preview_word()
....:     except RuntimeError:
....:         raise StopIteration
....:     process.fsm.counter += 1 if l == 1 else -1
....:     if process.fsm.counter > 0:
....:         next_state = 'positive'
....:     elif process.fsm.counter < 0:
....:         next_state = 'negative'
....:     else:
....:         next_state = 'zero'
....:     return FSMTransition(state, process.fsm.state(next_state),
....:                          l, process.fsm.counter)
sage: C.add_state(FSMState('zero', hook=update_counter,
....:             is_initial=True, is_final=True))
'zero'
sage: C.add_state(FSMState('positive', hook=update_counter))
'positive'
sage: C.add_state(FSMState('negative', hook=update_counter))
'negative'
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState, FSMTransition
>>> C = FiniteStateMachine()
>>> def update_counter(process, state, output):
...     try:
...         l = process.preview_word()
...     except RuntimeError:
...         raise StopIteration
...     process.fsm.counter += Integer(1) if l == Integer(1) else -Integer(1)
...     if process.fsm.counter > Integer(0):
...         next_state = 'positive'
...     elif process.fsm.counter < Integer(0):
...         next_state = 'negative'
...     else:
...         next_state = 'zero'
...     return FSMTransition(state, process.fsm.state(next_state),
...                          l, process.fsm.counter)
>>> C.add_state(FSMState('zero', hook=update_counter,
...             is_initial=True, is_final=True))
'zero'
>>> C.add_state(FSMState('positive', hook=update_counter))
'positive'
>>> C.add_state(FSMState('negative', hook=update_counter))
'negative'
```

Now, let's input some sequence:

```
sage: C.counter = 0; C([1, 1, 1, 1, 0, 0])
(False, 'positive', [1, 2, 3, 4, 3, 2])
```

```
>>> from sage.all import *
>>> C.counter = Integer(0); C([Integer(1), Integer(1), Integer(1), Integer(1),␣
↪Integer(0), Integer(0)])
(False, 'positive', [1, 2, 3, 4, 3, 2])
```

The result is False, since there are four 1 but only two 0. We land in the state `positive` and we can also see the values of the counter in each step.

Let's try some other examples:

```
sage: C.counter = 0; C([1, 1, 0, 0])
(True, 'zero', [1, 2, 1, 0])
sage: C.counter = 0; C([0, 1, 0, 0])
(False, 'negative', [-1, 0, -1, -2])
```

```
>>> from sage.all import *
>>> C.counter = Integer(0); C([Integer(1), Integer(1), Integer(0), Integer(0)])
(True, 'zero', [1, 2, 1, 0])
>>> C.counter = Integer(0); C([Integer(0), Integer(1), Integer(0), Integer(0)])
(False, 'negative', [-1, 0, -1, -2])
```

Methods

class sage.combinat.finite_state_machine.**Automaton**(**args*, ***kwargs*)

Bases: *FiniteStateMachine*

This creates an automaton, which is a finite state machine, whose transitions have input labels.

An automaton has additional features like creating a deterministic and a minimized automaton.

See class *FiniteStateMachine* for more information.

EXAMPLES:

We can create an automaton recognizing even numbers (given in binary and read from left to right) in the following way:

```
sage: A = Automaton([('P', 'Q', 0), ('P', 'P', 1),
....:                ('Q', 'P', 1), ('Q', 'Q', 0)],
....:               initial_states=['P'], final_states=['Q'])
sage: A
Automaton with 2 states
sage: A([0])
True
sage: A([1, 1, 0])
True
sage: A([1, 0, 1])
False
```

```
>>> from sage.all import *
>>> A = Automaton([('P', 'Q', Integer(0)), ('P', 'P', Integer(1)),
...                ('Q', 'P', Integer(1)), ('Q', 'Q', Integer(0))],
...               initial_states=['P'], final_states=['Q'])
>>> A
Automaton with 2 states
```

(continues on next page)

(continued from previous page)

```
>>> A([Integer(0)])
True
>>> A([Integer(1), Integer(1), Integer(0)])
True
>>> A([Integer(1), Integer(0), Integer(1)])
False
```

Note that the full output of the commands can be obtained by calling *process()* and looks like this:

```
sage: A.process([1, 0, 1])
(False, 'P')
```

```
>>> from sage.all import *
>>> A.process([Integer(1), Integer(0), Integer(1)])
(False, 'P')
```

cartesian_product(*other*, *only_accessible_components=True*)

alias of *intersection()*.

complement()

Return the complement of this automaton.

OUTPUT: an *Automaton*

If this automaton recognizes language $\mathcal{L}$ over an input alphabet $\mathcal{A}$, then the complement recognizes $\mathcal{A} \setminus \mathcal{L}$.

EXAMPLES:

```
sage: A = automata.Word([0, 1])
sage: [w for w in ([], [0], [1], [0, 0], [0, 1], [1, 0], [1, 1])
....:  if A(w)]
[[0, 1]]
sage: Ac = A.complement()
sage: Ac.transitions()
[Transition from 0 to 1: 0|-,
 Transition from 0 to 3: 1|-,
 Transition from 2 to 3: 0|-,
 Transition from 2 to 3: 1|-,
 Transition from 1 to 2: 1|-,
 Transition from 1 to 3: 0|-,
 Transition from 3 to 3: 0|-,
 Transition from 3 to 3: 1|-]
sage: [w for w in ([], [0], [1], [0, 0], [0, 1], [1, 0], [1, 1])
....:  if Ac(w)]
[[], [0], [1], [0, 0], [1, 0], [1, 1]]
```

```
>>> from sage.all import *
>>> A = automata.Word([Integer(0), Integer(1)])
>>> [w for w in ([], [Integer(0)], [Integer(1)], [Integer(0), Integer(0)],␣
↪[Integer(0), Integer(1)], [Integer(1), Integer(0)], [Integer(1),␣
↪Integer(1)])
...  if A(w)]
[[0, 1]]
```

(continues on next page)

(continued from previous page)

```
>>> Ac = A.complement()
>>> Ac.transitions()
[Transition from 0 to 1: 0|-,
 Transition from 0 to 3: 1|-,
 Transition from 2 to 3: 0|-,
 Transition from 2 to 3: 1|-,
 Transition from 1 to 2: 1|-,
 Transition from 1 to 3: 0|-,
 Transition from 3 to 3: 0|-,
 Transition from 3 to 3: 1|-]
>>> [w for w in ([], [Integer(0)], [Integer(1)], [Integer(0), Integer(0)],␣
↪[Integer(0), Integer(1)], [Integer(1), Integer(0)], [Integer(1),␣
↪Integer(1)])
...  if Ac(w)]
[[], [0], [1], [0, 0], [1, 0], [1, 1]]
```

The automaton must be deterministic:

```
sage: A = automata.Word([0]) * automata.Word([1])
sage: A.complement()
Traceback (most recent call last):
...
ValueError: The finite state machine must be deterministic.
sage: Ac = A.determinisation().complement()
sage: [w for w in ([], [0], [1], [0, 0], [0, 1], [1, 0], [1, 1])
....:  if Ac(w)]
[[], [0], [1], [0, 0], [1, 0], [1, 1]]
```

```
>>> from sage.all import *
>>> A = automata.Word([Integer(0)]) * automata.Word([Integer(1)])
>>> A.complement()
Traceback (most recent call last):
...
ValueError: The finite state machine must be deterministic.
>>> Ac = A.determinisation().complement()
>>> [w for w in ([], [Integer(0)], [Integer(1)], [Integer(0), Integer(0)],␣
↪[Integer(0), Integer(1)], [Integer(1), Integer(0)], [Integer(1),␣
↪Integer(1)])
...  if Ac(w)]
[[], [0], [1], [0, 0], [1, 0], [1, 1]]
```

determinisation()

Return a deterministic automaton which accepts the same input words as the original one.

OUTPUT: a new automaton, which is deterministic

The labels of the states of the new automaton are frozensets of states of `self`. The color of a new state is the frozenset of colors of the constituent states of `self`. Therefore, the colors of the constituent states have to be hashable. However, if all constituent states have color `None`, then the resulting color is `None`, too.

The input alphabet must be specified.

EXAMPLES:

```
sage: aut = Automaton([('A', 'A', 0), ('A', 'B', 1), ('B', 'B', 1)],
....:                 initial_states=['A'], final_states=['B'])
sage: aut.determinisation().transitions()
[Transition from frozenset({'A'}) to frozenset({'A'}): 0|-,
 Transition from frozenset({'A'}) to frozenset({'B'}): 1|-,
 Transition from frozenset({'B'}) to frozenset(): 0|-,
 Transition from frozenset({'B'}) to frozenset({'B'}): 1|-,
 Transition from frozenset() to frozenset(): 0|-,
 Transition from frozenset() to frozenset(): 1|-]
```

```
>>> from sage.all import *
>>> aut = Automaton([('A', 'A', Integer(0)), ('A', 'B', Integer(1)), ('B', 'B
↪', Integer(1))],
...                 initial_states=['A'], final_states=['B'])
>>> aut.determinisation().transitions()
[Transition from frozenset({'A'}) to frozenset({'A'}): 0|-,
 Transition from frozenset({'A'}) to frozenset({'B'}): 1|-,
 Transition from frozenset({'B'}) to frozenset(): 0|-,
 Transition from frozenset({'B'}) to frozenset({'B'}): 1|-,
 Transition from frozenset() to frozenset(): 0|-,
 Transition from frozenset() to frozenset(): 1|-]
```

```
sage: A = Automaton([('A', 'A', 1), ('A', 'A', 0), ('A', 'B', 1),
....:                ('B', 'C', 0), ('C', 'C', 1), ('C', 'C', 0)],
....:               initial_states=['A'], final_states=['C'])
sage: A.determinisation().states()
[frozenset({'A'}),
 frozenset({'A', 'B'}),
 frozenset({'A', 'C'}),
 frozenset({'A', 'B', 'C'})]
```

```
>>> from sage.all import *
>>> A = Automaton([('A', 'A', Integer(1)), ('A', 'A', Integer(0)), ('A', 'B',␣
↪Integer(1)),
...                ('B', 'C', Integer(0)), ('C', 'C', Integer(1)), ('C', 'C',␣
↪Integer(0))],
...               initial_states=['A'], final_states=['C'])
>>> A.determinisation().states()
[frozenset({'A'}),
 frozenset({'A', 'B'}),
 frozenset({'A', 'C'}),
 frozenset({'A', 'B', 'C'})]
```

```
sage: A = Automaton([(0, 1, 1), (0, 2, [1, 1]), (0, 3, [1, 1, 1]),
....:                (1, 0, -1), (2, 0, -2), (3, 0, -3)],
....:               initial_states=[0], final_states=[0, 1, 2, 3])
sage: B = A.determinisation().relabeled().coaccessible_components()
sage: sorted(B.transitions())
[Transition from 0 to 1: 1|-,
 Transition from 1 to 0: -1|-,
 Transition from 1 to 3: 1|-,
 Transition from 3 to 0: -2|-,
```

(continues on next page)

(continued from previous page)

```
 Transition from 3 to 4: 1|-,
 Transition from 4 to 0: -3|-]
```

```
>>> from sage.all import *
>>> A = Automaton([(Integer(0), Integer(1), Integer(1)), (Integer(0),␣
↪Integer(2), [Integer(1), Integer(1)]), (Integer(0), Integer(3), [Integer(1),
↪ Integer(1), Integer(1)]),
...                (Integer(1), Integer(0), -Integer(1)), (Integer(2),␣
↪Integer(0), -Integer(2)), (Integer(3), Integer(0), -Integer(3))],
...               initial_states=[Integer(0)], final_states=[Integer(0),␣
↪Integer(1), Integer(2), Integer(3)])
>>> B = A.determinisation().relabeled().coaccessible_components()
>>> sorted(B.transitions())
[Transition from 0 to 1: 1|-,
 Transition from 1 to 0: -1|-,
 Transition from 1 to 3: 1|-,
 Transition from 3 to 0: -2|-,
 Transition from 3 to 4: 1|-,
 Transition from 4 to 0: -3|-]
```

Note that colors of states have to be hashable:

```
sage: A = Automaton([[0, 0, 0]], initial_states=[0])
sage: A.state(0).color = []
sage: A.determinisation()
Traceback (most recent call last):
...
TypeError: ...unhashable type: 'list'...
sage: A.state(0).color = ()
sage: A.determinisation()
Automaton with 1 state
```

```
>>> from sage.all import *
>>> A = Automaton([[Integer(0), Integer(0), Integer(0)]], initial_
↪states=[Integer(0)])
>>> A.state(Integer(0)).color = []
>>> A.determinisation()
Traceback (most recent call last):
...
TypeError: ...unhashable type: 'list'...
>>> A.state(Integer(0)).color = ()
>>> A.determinisation()
Automaton with 1 state
```

If the colors of all constituent states are `None`, the resulting color is `None`, too (Issue #19199):

```
sage: A = Automaton([(0, 0, 0)],
....:               initial_states=[0],
....:               final_states=[0])
sage: [s.color for s in A.determinisation().iter_states()]
[None]
```

```
>>> from sage.all import *
>>> A = Automaton([(Integer(0), Integer(0), Integer(0))],
...               initial_states=[Integer(0)],
...               final_states=[Integer(0)])
>>> [s.color for s in A.determinisation().iter_states()]
[None]
```

intersection(*other*, *only_accessible_components=True*)

Return a new automaton which accepts an input if it is accepted by both given automata.

INPUT:

- `other` – an automaton
- `only_accessible_components` – if `True` (default), then the result is piped through *accessible_components()*. If no `new_input_alphabet` is given, it is determined by *determine_alphabets()*.

OUTPUT:

A new automaton which computes the intersection (see below) of the languages of `self` and `other`.

The set of states of the new automaton is the Cartesian product of the set of states of both given automata. There is a transition $((A, B), (C, D), a)$ in the new automaton if there are transitions (A, C, a) and (B, D, a) in the old automata.

The methods *intersection()* and *cartesian_product()* are the same (for automata).

EXAMPLES:

```
sage: aut1 = Automaton([('1', '2', 1),
....:                   ('2', '2', 1),
....:                   ('2', '2', 0)],
....:                  initial_states=['1'],
....:                  final_states=['2'],
....:                  determine_alphabets=True)
sage: aut2 = Automaton([('A', 'A', 1),
....:                   ('A', 'B', 0),
....:                   ('B', 'B', 0),
....:                   ('B', 'A', 1)],
....:                  initial_states=['A'],
....:                  final_states=['B'],
....:                  determine_alphabets=True)
sage: res = aut1.intersection(aut2)
sage: (aut1([1, 1]), aut2([1, 1]), res([1, 1]))
(True, False, False)
sage: (aut1([1, 0]), aut2([1, 0]), res([1, 0]))
(True, True, True)
sage: res.transitions()
[Transition from ('1', 'A') to ('2', 'A'): 1|-,
 Transition from ('2', 'A') to ('2', 'B'): 0|-,
 Transition from ('2', 'A') to ('2', 'A'): 1|-,
 Transition from ('2', 'B') to ('2', 'B'): 0|-,
 Transition from ('2', 'B') to ('2', 'A'): 1|-]
```

```
>>> from sage.all import *
>>> aut1 = Automaton([('1', '2', Integer(1)),
...                   ('2', '2', Integer(1)),
...                   ('2', '2', Integer(0))],
...                  initial_states=['1'],
...                  final_states=['2'],
...                  determine_alphabets=True)
>>> aut2 = Automaton([('A', 'A', Integer(1)),
...                   ('A', 'B', Integer(0)),
...                   ('B', 'B', Integer(0)),
...                   ('B', 'A', Integer(1))],
...                  initial_states=['A'],
...                  final_states=['B'],
...                  determine_alphabets=True)
>>> res = aut1.intersection(aut2)
>>> (aut1([Integer(1), Integer(1)]), aut2([Integer(1), Integer(1)]),␣
↪res([Integer(1), Integer(1)]))
(True, False, False)
>>> (aut1([Integer(1), Integer(0)]), aut2([Integer(1), Integer(0)]),␣

 Transition from ('2', 'B') to ('2', 'B'): 0|-,
 Transition from ('2', 'B') to ('2', 'A'): 1|-]
```

For automata with epsilon-transitions, intersection is not well defined. But for any finite state machine, epsilon-transitions can be removed by *remove_epsilon_transitions()*.

```
sage: a1 = Automaton([(0, 0, 0),
....:                 (0, 1, None),
....:                 (1, 1, 1),
....:                 (1, 2, 1)],
....:                 initial_states=[0],
....:                 final_states=[1],
....:                 determine_alphabets=True)
sage: a2 = Automaton([(0, 0, 0), (0, 1, 1), (1, 1, 1)],
....:                 initial_states=[0],
....:                 final_states=[1],
....:                 determine_alphabets=True)
sage: a1.intersection(a2)

>>> a1.intersection(a2)  # not tested
```

is_equivalent(*other*)

Test whether two automata are equivalent, i.e., accept the same language.

INPUT:

- `other` – an *Automaton*

EXAMPLES:

```
sage: A = Automaton([(0, 0, 0), (0, 1, 1), (1, 0, 1)],
....:               initial_states=[0],
....:               final_states=[0])
sage: B = Automaton([('a', 'a', 0), ('a', 'b', 1), ('b', 'a', 1)],
....:               initial_states=['a'],
....:               final_states=['a'])
sage: A.is_equivalent(B)
True
sage: B.add_transition('b', 'a', 0)
Transition from 'b' to 'a': 0|-
sage: A.is_equivalent(B)
False
```

```
>>> from sage.all import *
>>> A = Automaton([(Integer(0), Integer(0), Integer(0)), (Integer(0),␣
↪Integer(1), Integer(1)), (Integer(1), Integer(0), Integer(1))],
...               initial_states=[Integer(0)],
...               final_states=[Integer(0)])
>>> B = Automaton([('a', 'a', Integer(0)), ('a', 'b', Integer(1)), ('b', 'a',␣
↪Integer(1))],
...               initial_states=['a'],
...               final_states=['a'])
>>> A.is_equivalent(B)
True
>>> B.add_transition('b', 'a', Integer(0))
```

(continues on next page)

(continued from previous page)

```
Transition from 'b' to 'a': 0|-
>>> A.is_equivalent(B)
False
```

language(*max_length=None*, ***kwargs*)

Return all words accepted by this automaton.

INPUT:

- `max_length` – integer or `None` (default). Only inputs of length at most `max_length` will be considered. If `None`, then this iterates over all possible words without length restrictions.
- `kwargs` – will be passed on to the *process iterator*. See *process()* for a description.

OUTPUT: an iterator

EXAMPLES:

```
sage: NAF = Automaton(
....:     {'A': [('A', 0), ('B', 1), ('B', -1)],
....:      'B': [('A', 0)]},
....:     initial_states=['A'], final_states=['A', 'B'])
sage: list(NAF.language(3))
[[],
 [0], [-1], [1],
 [-1, 0], [0, 0], [1, 0], [0, -1], [0, 1],
 [-1, 0, 0], [0, -1, 0], [0, 0, 0], [0, 1, 0], [1, 0, 0],
 [-1, 0, -1], [-1, 0, 1], [0, 0, -1],
 [0, 0, 1], [1, 0, -1], [1, 0, 1]]
```

```
>>> from sage.all import *
>>> NAF = Automaton(
...     {'A': [('A', Integer(0)), ('B', Integer(1)), ('B', -Integer(1))],
...      'B': [('A', Integer(0))]},
...     initial_states=['A'], final_states=['A', 'B'])
>>> list(NAF.language(Integer(3)))
[[],
 [0], [-1], [1],
 [-1, 0], [0, 0], [1, 0], [0, -1], [0, 1],
 [-1, 0, 0], [0, -1, 0], [0, 0, 0], [0, 1, 0], [1, 0, 0],
 [-1, 0, -1], [-1, 0, 1], [0, 0, -1],
 [0, 0, 1], [1, 0, -1], [1, 0, 1]]
```

See also

FiniteStateMachine.language(), *process()*.

minimization(*algorithm=None*)

Return the minimization of the input automaton as a new automaton.

INPUT:

- `algorithm` – either Moore's algorithm (by `algorithm='Moore'` or as default for deterministic automata) or Brzozowski's algorithm (when `algorithm='Brzozowski'` or when the automaton is not deterministic) is used.

OUTPUT: a new automaton

The resulting automaton is deterministic and has a minimal number of states.

EXAMPLES:

```
sage: A = Automaton([('A', 'A', 1), ('A', 'A', 0), ('A', 'B', 1),
....:                ('B', 'C', 0), ('C', 'C', 1), ('C', 'C', 0)],
....:               initial_states=['A'], final_states=['C'])
sage: B = A.minimization(algorithm='Brzozowski')
sage: B_trans = B.transitions(B.states()[1])
sage: B_trans # random
[Transition from frozenset({frozenset({'B', 'C'}),
                            frozenset({'A', 'C'}),
                            frozenset({'A', 'B', 'C'})})
            to frozenset({frozenset({'C'}),
                          frozenset({'B', 'C'}),
                          frozenset({'A', 'C'}),
                          frozenset({'A', 'B', 'C'})}):
            0|-,
 Transition from frozenset({frozenset({'B', 'C'}),
                            frozenset({'A', 'C'}),
                            frozenset({'A', 'B', 'C'})})
            to frozenset({frozenset({'B', 'C'}),
                          frozenset({'A', 'C'}),
                          frozenset({'A', 'B', 'C'})}):
            1|-]
sage: len(B.states())
3
sage: C = A.minimization(algorithm='Brzozowski')
sage: C_trans = C.transitions(C.states()[1])
sage: B_trans == C_trans
True
sage: len(C.states())
3
```

```

```

process(**args*, ***kwargs*)

Return whether the automaton accepts the input and the state where the computation stops.

INPUT:

- `input_tape` – the input tape can be a list or an iterable with entries from the input alphabet. If we are working with a multi-tape machine (see parameter `use_multitape_input` and notes below), then the tape is a list or tuple of tracks, each of which can be a list or an iterable with entries from the input alphabet.
- `initial_state` or `initial_states` – the initial state(s) in which the machine starts. Either specify a single one with `initial_state` or a list of them with `initial_states`. If both are given, `ini-`

tial_state will be appended to initial_states. If neither is specified, the initial states of the finite state machine are taken.

- list_of_outputs – (default: None) a boolean or None. If True, then the outputs are given in list form (even if we have no or only one single output). If False, then the result is never a list (an exception is raised if the result cannot be returned). If list_of_outputs=None the method determines automatically what to do (e.g. if a non-deterministic machine returns more than one path, then the output is returned in list form).
- only_accepted – boolean (default: False); if set, then the first argument in the output is guaranteed to be True (if the output is a list, then the first argument of each element will be True).
- full_output – boolean (default: True); if set, then the full output is given, otherwise only whether the sequence is accepted or not (the first entry below only).
- always_include_output – if set (not by default), always return a triple containing the (non-existing) output. This is in order to obtain output compatible with that of *FiniteStateMachine.process()*. If this parameter is set, full_output has no effect.
- format_output – a function that translates the written output (which is in form of a list) to something more readable. By default (None) identity is used here.
- check_epsilon_transitions – boolean (default: True); a boolean. If False, then epsilon transitions are not taken into consideration during process.
- write_final_word_out – boolean (default: True); whether the final output words should be written or not
- use_multitape_input – boolean (default: False); if True, then the multi-tape mode of the process iterator is activated. See also the notes below for multi-tape machines.
- process_all_prefixes_of_input – boolean (default: False); if True, then each prefix of the input word is processed (instead of processing the whole input word at once). Consequently, there is an output generated for each of these prefixes.
- process_iterator_class – (default: None) a class inherited from *FSMProcessIterator*. If None, then *FSMProcessIterator* is taken. An instance of this class is created and is used during the processing.

OUTPUT:

The full output is a pair (or a list of pairs, cf. parameter list_of_outputs), where

- the first entry is True if the input string is accepted and
- the second gives the state reached after processing the input tape (This is a state with label None if the input could not be processed, i.e., if at one point no transition to go on could be found.).

If full_output is False, then only the first entry is returned.

If always_include_output is set, an additional third entry [] is included.

Note that in the case the automaton is not deterministic, all possible paths are taken into account. You can use *determinisation()* to get a deterministic automaton machine.

This function uses an iterator which, in its simplest form, goes from one state to another in each step. To decide which way to go, it uses the input words of the outgoing transitions and compares them to the input tape. More precisely, in each step, the iterator takes an outgoing transition of the current state, whose input label equals the input letter of the tape.

If the choice of the outgoing transition is not unique (i.e., we have a non-deterministic finite state machine), all possibilities are followed. This is done by splitting the process into several branches, one for each of the possible outgoing transitions.

The process (iteration) stops if all branches are finished, i.e., for no branch, there is any transition whose input word coincides with the processed input tape. This can simply happen when the entire tape was read.

Also see *__call__()* for a version of *process()* with shortened output.

Internally this function creates and works with an instance of *FSMProcessIterator*. This iterator can also be obtained with *iter_process()*.

If working with multi-tape finite state machines, all input words of transitions are words of k-tuples of letters. Moreover, the input tape has to consist of k tracks, i.e., be a list or tuple of k iterators, one for each track.

Warning

Working with multi-tape finite state machines is still experimental and can lead to wrong outputs.

EXAMPLES:

In the following examples, we construct an automaton which accepts non-adjacent forms (see also the example on *non-adjacent forms* in the documentation of the module *Finite state machines, automata, transducers*) and then test it by feeding it with several binary digit expansions.

```
sage: NAF = Automaton(
....:     {'_': [('_', 0), ('1', 1)], '1': [('_', 0)]},
....:     initial_states=['_'], final_states=['_', '1'])
sage: [NAF.process(w) for w in [[0], [0, 1], [1, 1], [0, 1, 0, 1],
....:                           [0, 1, 1, 1, 0], [1, 0, 0, 1, 1]]]
[(True, '_'), (True, '1'), (False, None),
 (True, '1'), (False, None), (False, None)]
```

```
>>> from sage.all import *
>>> NAF = Automaton(
...     {'_': [('_', Integer(0)), ('1', Integer(1))], '1': [('_',␣
↪Integer(0))]},
...     initial_states=['_'], final_states=['_', '1'])
>>> [NAF.process(w) for w in [[Integer(0)], [Integer(0), Integer(1)],␣
↪[Integer(1), Integer(1)], [Integer(0), Integer(1), Integer(0), Integer(1)],
...                           [Integer(0), Integer(1), Integer(1), Integer(1),
↪ Integer(0)], [Integer(1), Integer(0), Integer(0), Integer(1), Integer(1)]]]
[(True, '_'), (True, '1'), (False, None),
 (True, '1'), (False, None), (False, None)]
```

If we just want a condensed output, we use:

```
sage: [NAF.process(w, full_output=False)
....:     for w in [[0], [0, 1], [1, 1], [0, 1, 0, 1],
....:               [0, 1, 1, 1, 0], [1, 0, 0, 1, 1]]]
[True, True, False, True, False, False]
```

```
>>> from sage.all import *
>>> [NAF.process(w, full_output=False)
...     for w in [[Integer(0)], [Integer(0), Integer(1)], [Integer(1),␣
↪Integer(1)], [Integer(0), Integer(1), Integer(0), Integer(1)],
...               [Integer(0), Integer(1), Integer(1), Integer(1),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(0)], [Integer(1), Integer(0), Integer(0), Integer(1), Integer(1)]]]
[True, True, False, True, False, False]
```

It is equivalent to:

```
sage: [NAF(w) for w in [[0], [0, 1], [1, 1], [0, 1, 0, 1],
....:                   [0, 1, 1, 1, 0], [1, 0, 0, 1, 1]]]
[True, True, False, True, False, False]
```

```
>>> from sage.all import *
>>> [NAF(w) for w in [[Integer(0)], [Integer(0), Integer(1)], [Integer(1),␣
↪Integer(1)], [Integer(0), Integer(1), Integer(0), Integer(1)],
...                   [Integer(0), Integer(1), Integer(1), Integer(1),␣
↪Integer(0)], [Integer(1), Integer(0), Integer(0), Integer(1), Integer(1)]]]
[True, True, False, True, False, False]
```

The following example illustrates the difference between non-existing paths and reaching a non-final state:

```
sage: NAF.process([2])
(False, None)
sage: NAF.add_transition(('_', 's', 2))
Transition from '_' to 's': 2|-
sage: NAF.process([2])
(False, 's')
```

```
>>> from sage.all import *
>>> NAF.process([Integer(2)])
(False, None)
>>> NAF.add_transition(('_', 's', Integer(2)))
Transition from '_' to 's': 2|-
>>> NAF.process([Integer(2)])
(False, 's')
```

A simple example of a (non-deterministic) multi-tape automaton is the following: It checks whether the two input tapes have the same number of ones:

```
sage: M = Automaton([('=', '=', (1, 1)),
....:                ('=', '=', (None, 0)),
....:                ('=', '=', (0, None)),
....:                ('=', '<', (None, 1)),
....:                ('<', '<', (None, 1)),
....:                ('<', '<', (None, 0)),
....:                ('=', '>', (1, None)),
....:                ('>', '>', (1, None)),
....:                ('>', '>', (0, None))],
....:               initial_states=['='],
....:               final_states=['='])
sage: M.process(([1, 0, 1], [1, 0]), use_multitape_input=True)
(False, '>')
sage: M.process(([0, 1, 0], [0, 1, 1]), use_multitape_input=True)
(False, '<')
sage: M.process(([1, 1, 0, 1], [0, 0, 1, 0, 1, 1]),
```

(continues on next page)

(continued from previous page)

```
....:           use_multitape_input=True)
(True, '=')
```

```
>>> from sage.all import *
>>> M = Automaton([('=', '=', (Integer(1), Integer(1))),
...                ('=', '=', (None, Integer(0))),
...                ('=', '=', (Integer(0), None)),
...                ('=', '<', (None, Integer(1))),
...                ('<', '<', (None, Integer(1))),
...                ('<', '<', (None, Integer(0))),
...                ('=', '>', (Integer(1), None)),
...                ('>', '>', (Integer(1), None)),
...                ('>', '>', (Integer(0), None))],
...               initial_states=['='],
...               final_states=['='])
>>> M.process(([Integer(1), Integer(0), Integer(1)], [Integer(1),␣
↪Integer(0)]), use_multitape_input=True)
(False, '>')
>>> M.process(([Integer(0), Integer(1), Integer(0)], [Integer(0), Integer(1),␣
↪Integer(1)]), use_multitape_input=True)
(False, '<')
>>> M.process(([Integer(1), Integer(1), Integer(0), Integer(1)], [Integer(0),␣
↪Integer(0), Integer(1), Integer(0), Integer(1), Integer(1)]),
...           use_multitape_input=True)
(True, '=')
```

Alternatively, we can use the following (non-deterministic) multi-tape automaton for the same check:

```
sage: N = Automaton([('=', '=', (0, 0)),
....:                ('=', '<', (None, 1)),
....:                ('<', '<', (0, None)),
....:                ('<', '=', (1, None)),
....:                ('=', '>', (1, None)),
....:                ('>', '>', (None, 0)),
....:                ('>', '=', (None, 1))],

shannon_parry_markov_chain()

Compute a time homogeneous Markov chain such that all words of a given length recognized by the original automaton occur as the output with the same weight; the transition probabilities correspond to the Parry measure.

OUTPUT:

A Markov chain. Its input labels are the transition probabilities, the output labels the labels of the original automaton. In order to obtain equal weight for all words of the same length, an "exit weight" is needed. It is stored in the attribute `color` of the states of the Markov chain. The weights of the words of the same length sum up to one up to an exponentially small error.

The stationary distribution of this Markov chain is saved as the initial probabilities of the states.

The transition probabilities correspond to the Parry measure (see [S1948] and [P1964]).

The automaton is assumed to be deterministic, irreducible and aperiodic. All states must be final.

EXAMPLES:

```
sage: NAF = Automaton([(0, 0, 0), (0, 1, 1), (0, 1, -1),
....:                  (1, 0, 0)], initial_states=[0],
....:                 final_states=[0, 1])
sage: P_NAF = NAF.shannon_parry_markov_chain()                              #␣
↪needs sage.symbolic
sage: P_NAF.transitions()                                                   #␣
↪needs sage.symbolic
[Transition from 0 to 0: 1/2|0,
 Transition from 0 to 1: 1/4|1,
 Transition from 0 to 1: 1/4|-1,
 Transition from 1 to 0: 1|0]
sage: for s in P_NAF.iter_states():                                         #␣
↪needs sage.symbolic
....:     print(s.color)
```

(continues on next page)

(continued from previous page)

```
3/4
3/2
```

```
>>> from sage.all import *
>>> NAF = Automaton([(Integer(0), Integer(0), Integer(0)), (Integer(0),␣
↪Integer(1), Integer(1)), (Integer(0), Integer(1), -Integer(1)),
...                   (Integer(1), Integer(0), Integer(0))], initial_
↪states=[Integer(0)],
...                  final_states=[Integer(0), Integer(1)])
>>> P_NAF = NAF.shannon_parry_markov_chain()                                #␣
↪needs sage.symbolic
>>> P_NAF.transitions()                                                     #␣
↪needs sage.symbolic
[Transition from 0 to 0: 1/2|0,
 Transition from 0 to 1: 1/4|1,
 Transition from 0 to 1: 1/4|-1,
 Transition from 1 to 0: 1|0]
>>> for s in P_NAF.iter_states():                                           #␣
↪needs sage.symbolic
...     print(s.color)
3/4
3/2
```

The stationary distribution is also computed and saved as the initial probabilities of the returned Markov chain:

```
sage: for s in P_NAF.states():                                              #␣
↪needs sage.symbolic
....:     print("{} {}".format(s, s.initial_probability))
0 2/3
1 1/3
```

```
>>> from sage.all import *
>>> for s in P_NAF.states():                                                #␣
↪needs sage.symbolic
...     print("{} {}".format(s, s.initial_probability))
0 2/3
1 1/3
```

The automaton is assumed to be deterministic, irreducible and aperiodic:

```
sage: A = Automaton([(0, 0, 0), (0, 1, 1), (1, 1, 1), (1, 1, 0)],
....:               initial_states=[0])
sage: A.shannon_parry_markov_chain()
Traceback (most recent call last):

>>> A.shannon_parry_markov_chain()
Traceback (most recent call last):
...
NotImplementedError: Automaton must be deterministic.
>>> A = Automaton([(Integer(0), Integer(1), Integer(0)), (Integer(1),␣
↪Integer(0), Integer(0))],
...                initial_states=[Integer(0)])
>>> A.shannon_parry_markov_chain()
Traceback (most recent call last):
...
NotImplementedError: Automaton must be aperiodic.
```

All states must be final:

```
sage: A = Automaton([(0, 1, 0), (0, 0, 1), (1, 0, 0)],
....:               initial_states=[0])
sage: A.shannon_parry_markov_chain()
Traceback (most recent call last):
...
NotImplementedError: All states must be final.
```

```
>>> from sage.all import *
>>> A = Automaton([(Integer(0), Integer(1), Integer(0)), (Integer(0),␣
↪Integer(0), Integer(1)), (Integer(1), Integer(0), Integer(0))],
...                initial_states=[Integer(0)])
>>> A.shannon_parry_markov_chain()
Traceback (most recent call last):
...
NotImplementedError: All states must be final.
```

ALGORITHM:

See [HKP2015a], Lemma 4.1.

REFERENCES:

with_output(*word_out_function=None*)

Construct a transducer out of this automaton.

INPUT:

- `word_out_function` – (default: `None`) a function. It transforms a *transition* to the output word for this transition.

  If this is `None`, then the output word will be equal to the input word of each transition.

OUTPUT: a transducer

EXAMPLES:

```
sage: A = Automaton([(0, 0, 'A'), (0, 1, 'B'), (1, 2, 'C')])
sage: T = A.with_output(); T
Transducer with 3 states
sage: T.transitions()
[Transition from 0 to 0: 'A'|'A',
 Transition from 0 to 1: 'B'|'B',
 Transition from 1 to 2: 'C'|'C']
```

```
>>> from sage.all import *
>>> A = Automaton([(Integer(0), Integer(0), 'A'), (Integer(0), Integer(1), 'B
↪'), (Integer(1), Integer(2), 'C')])
>>> T = A.with_output(); T
Transducer with 3 states
>>> T.transitions()
[Transition from 0 to 0: 'A'|'A',
 Transition from 0 to 1: 'B'|'B',
 Transition from 1 to 2: 'C'|'C']
```

This result is in contrast to:

```
sage: Transducer(A).transitions()
[Transition from 0 to 0: 'A'|-,
 Transition from 0 to 1: 'B'|-,
 Transition from 1 to 2: 'C'|-]
```

```
>>> from sage.all import *
>>> Transducer(A).transitions()
[Transition from 0 to 0: 'A'|-,
 Transition from 0 to 1: 'B'|-,
 Transition from 1 to 2: 'C'|-]
```

where no output labels are created.

Here is another example:

```
sage: T2 = A.with_output(lambda t: [c.lower() for c in t.word_in])
sage: T2.transitions()
[Transition from 0 to 0: 'A'|'a',
 Transition from 0 to 1: 'B'|'b',
 Transition from 1 to 2: 'C'|'c']
```

```
>>> from sage.all import *
>>> T2 = A.with_output(lambda t: [c.lower() for c in t.word_in])
>>> T2.transitions()
[Transition from 0 to 0: 'A'|'a',
 Transition from 0 to 1: 'B'|'b',
 Transition from 1 to 2: 'C'|'c']
```

We can obtain the same result by composing two transducers. As inner transducer of the composition, we use *with_output()* without the optional argument `word_out_function` (which makes the output of each transition equal to its input); as outer transducer we use a *map-transducer* (for converting to lower case). This gives

```
sage: L = transducers.map(lambda x: x.lower(), ['A', 'B', 'C'])
sage: L.composition(A.with_output()).relabeled().transitions()
[Transition from 0 to 0: 'A'|'a',
 Transition from 0 to 1: 'B'|'b',
 Transition from 1 to 2: 'C'|'c']
```

```
>>> from sage.all import *
>>> L = transducers.map(lambda x: x.lower(), ['A', 'B', 'C'])
>>> L.composition(A.with_output()).relabeled().transitions()
[Transition from 0 to 0: 'A'|'a',
 Transition from 0 to 1: 'B'|'b',
 Transition from 1 to 2: 'C'|'c']
```

input_projection(), *output_projection()*, *Transducer*, *transducers.map()*.

`sage.combinat.finite_state_machine.`**`FSMLetterSymbol`**`(`*letter*`)`

Return a string associated to the input letter.

INPUT:

- `letter` – the input letter or `None` (representing the empty word)

OUTPUT:

If `letter` is `None` the symbol for the empty word `FSMEmptyWordSymbol` is returned, otherwise the string associated to the letter.

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMLetterSymbol
sage: FSMLetterSymbol(0)
'0'
sage: FSMLetterSymbol(None)
'_'
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMLetterSymbol
>>> FSMLetterSymbol(Integer(0))
'0'
```

(continues on next page)

(continued from previous page)

```
>>> FSMLetterSymbol(None)
'_'
```

class sage.combinat.finite_state_machine.**FSMProcessIterator**(*fsm*, *input_tape=None*, *initial_state=None*, *initial_states=[]*, *use_multitape_input=False*, *check_epsilon_transitions=True*, *write_final_word_out=True*, *format_output=None*, *process_all_prefixes_of_input=False*, ***kwargs*)

Bases: SageObject, Iterator

This class takes an input, feeds it into a finite state machine (automaton or transducer, in particular), tests whether this was successful and calculates the written output.

INPUT:

- `fsm` – the finite state machine on which the input should be processed
- `input_tape` – the input tape can be a list or an iterable with entries from the input alphabet. If we are working with a multi-tape machine (see parameter `use_multitape_input` and notes below), then the tape is a list or tuple of tracks, each of which can be a list or an iterable with entries from the input alphabet.
- `initial_state` or `initial_states` – the initial state(s) in which the machine starts. Either specify a single one with `initial_state` or a list of them with `initial_states`. If both are given, `initial_state` will be appended to `initial_states`. If neither is specified, the initial states of the finite state machine are taken.
- `format_output` – a function that translates the written output (which is in form of a list) to something more readable. By default (`None`) identity is used here.
- `check_epsilon_transitions` – boolean (default: `True`); if `False`, then epsilon transitions are not taken into consideration during process
- `write_final_word_out` – boolean (default: `True`); whether the final output words should be written or not
- `use_multitape_input` – boolean (default: `False`); if `True`, then the multi-tape mode of the process iterator is activated. See also the notes below for multi-tape machines.
- `process_all_prefixes_of_input` – boolean (default: `False`); if `True`, then each prefix of the input word is processed (instead of processing the whole input word at once). Consequently, there is an output generated for each of these prefixes.

OUTPUT: an iterator

In its simplest form, it behaves like an iterator which, in each step, goes from one state to another. To decide which way to go, it uses the input words of the outgoing transitions and compares them to the input tape. More precisely, in each step, the process iterator takes an outgoing transition of the current state, whose input label equals the input letter of the tape. The output label of the transition, if present, is written on the output tape.

If the choice of the outgoing transition is not unique (i.e., we have a non-deterministic finite state machine), all possibilities are followed. This is done by splitting the process into several branches, one for each of the possible outgoing transitions.

The process (iteration) stops if all branches are finished, i.e., for no branch, there is any transition whose input word coincides with the processed input tape. This can simply happen when the entire tape was read. When the process stops, a `StopIteration` exception is thrown.

Warning

Processing an input tape of length n usually takes at least $n+1$ iterations, since there will be $n+1$ states visited (in the case the taken transitions have input words consisting of single letters).

An instance of this class is generated when *FiniteStateMachine.process()* or *FiniteStateMachine.iter_process()* of a finite state machine, an automaton, or a transducer is invoked.

When working with multi-tape finite state machines, all input words of transitions are words of k-tuples of letters. Moreover, the input tape has to consist of k tracks, i.e., be a list or tuple of k iterators, one for each track.

Warning

Working with multi-tape finite state machines is still experimental and can lead to wrong outputs.

EXAMPLES:

The following transducer reads binary words and outputs a word, where blocks of ones are replaced by just a single one. Further only words that end with a zero are accepted.

```
sage: T = Transducer({'A': [('A', 0, 0), ('B', 1, None)],
....:                 'B': [('B', 1, None), ('A', 0, [1, 0])]},
....:     initial_states=['A'], final_states=['A'])
sage: input = [1, 1, 0, 0, 1, 0, 1, 1, 1, 0]
sage: T.process(input)
(True, 'A', [1, 0, 0, 1, 0, 1, 0])
```

```
>>> from sage.all import *
>>> T = Transducer({'A': [('A', Integer(0), Integer(0)), ('B', Integer(1), None)],
...                 'B': [('B', Integer(1), None), ('A', Integer(0), [Integer(1),␣
↪Integer(0)])]},
...     initial_states=['A'], final_states=['A'])
>>> input = [Integer(1), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(0), Integer(1), Integer(1), Integer(1), Integer(0)]
>>> T.process(input)
(True, 'A', [1, 0, 0, 1, 0, 1, 0])
```

The function *FiniteStateMachine.process()* (internally) uses a *FSMProcessIterator*. We can do that manually, too, and get full access to the iteration process:

```
sage: from sage.combinat.finite_state_machine import FSMProcessIterator
sage: it = FSMProcessIterator(T, input_tape=input)
sage: for current in it:
....:     print(current)
process (1 branch)
+ at state 'B'
+-- tape at 1, [[]]
process (1 branch)
+ at state 'B'
+-- tape at 2, [[]]
process (1 branch)
+ at state 'A'
```

(continues on next page)

(continued from previous page)

```
+-- tape at 3, [[1, 0]]

class Current

Bases: `dict`

This class stores the branches which have to be processed during iteration and provides a nicer formatting of them.

This class is derived from `dict`. It is returned by the `next`-function during iteration.

EXAMPLES:

In the following example you can see the dict directly and then the nicer output provided by this class:

```
sage: from sage.combinat.finite_state_machine import FSMProcessIterator
sage: inverter = Transducer({'A': [('A', 0, 1), ('A', 1, 0)]},
....:     initial_states=['A'], final_states=['A'])
sage: it = FSMProcessIterator(inverter, input_tape=[0, 1])
sage: for current in it:
....:     print(dict(current))
....:     print(current)
{((1, 0),): {'A': Branch(tape_cache=tape at 1, outputs=[[1]])}}
process (1 branch)
+ at state 'A'
```

(continues on next page)

(continued from previous page)

```
+-- tape at 1, [[1]]
{((2, 0),): {'A': Branch(tape_cache=tape at 2, outputs=[[1, 0]])}}
process (1 branch)
+ at state 'A'
+-- tape at 2, [[1, 0]]
{}
process (0 branches)
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMProcessIterator
>>> inverter = Transducer({'A': [('A', Integer(0), Integer(1)), ('A',␣
↪Integer(1), Integer(0))]},
...     initial_states=['A'], final_states=['A'])
>>> it = FSMProcessIterator(inverter, input_tape=[Integer(0), Integer(1)])
>>> for current in it:
...     print(dict(current))
...     print(current)
{((1, 0),): {'A': Branch(tape_cache=tape at 1, outputs=[[1]])}}
process (1 branch)
+ at state 'A'
+-- tape at 1, [[1]]
{((2, 0),): {'A': Branch(tape_cache=tape at 2, outputs=[[1, 0]])}}
process (1 branch)
+ at state 'A'
+-- tape at 2, [[1, 0]]
{}
process (0 branches)
```

class FinishedBranch(*accept*, *state*, *output*)

Bases: `tuple`

A `named tuple` representing the attributes of a branch, once it is fully processed.

accept

Alias for field number 0

output

Alias for field number 2

state

Alias for field number 1

next()

Makes one step in processing the input tape.

OUTPUT:

It returns the current status of the iterator (see below). A `StopIteration` exception is thrown when there is/was nothing to do (i.e. all branches ended with previous call of *next()*).

The current status is a dictionary (encapsulated into an instance of *Current*). The keys are positions on the tape. The value corresponding to such a position is again a dictionary, where each entry represents a branch of the process. This dictionary maps the current state of a branch to a pair consisting of a tape cache and a list of output words, which were written during reaching this current state.

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMProcessIterator
sage: inverter = Transducer({'A': [('A', 0, 1), ('A', 1, 0)]},
....:     initial_states=['A'], final_states=['A'])
sage: it = FSMProcessIterator(inverter, input_tape=[0, 1])
sage: next(it)
process (1 branch)
+ at state 'A'
+-- tape at 1, [[1]]
sage: next(it)
process (1 branch)
+ at state 'A'
+-- tape at 2, [[1, 0]]
sage: next(it)
process (0 branches)
sage: next(it)
Traceback (most recent call last):
...
StopIteration
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMProcessIterator
>>> inverter = Transducer({'A': [('A', Integer(0), Integer(1)), ('A',␣
↪Integer(1), Integer(0))]},
...     initial_states=['A'], final_states=['A'])
>>> it = FSMProcessIterator(inverter, input_tape=[Integer(0), Integer(1)])
>>> next(it)
process (1 branch)
+ at state 'A'
+-- tape at 1, [[1]]
>>> next(it)
process (1 branch)
+ at state 'A'
+-- tape at 2, [[1, 0]]
>>> next(it)
process (0 branches)
>>> next(it)
Traceback (most recent call last):
...
StopIteration
```

See also

FiniteStateMachine.process(), *Automaton.process()*, *Transducer.process()*, *FiniteStateMachine.iter_process()*, *FiniteStateMachine.__call__()*, *FSMProcessIterator*.

preview_word(*track_number=None*, *length=1*, *return_word=False*)

Read a word from the input tape.

INPUT:

- `track_number` – integer (default: `None`); if `None`, then a tuple of words (one from each track) is returned

- `length` – (default: `1`) the length of the word(s)
- `return_word` – boolean (default: `False`); if set, then a word is returned, otherwise a single letter (in which case `length` has to be `1`)

OUTPUT: a single letter or a word

An exception `StopIteration` is thrown if the tape (at least one track) has reached its end.

Typically, this method is called from a hook-function of a state.

EXAMPLES:

```
sage: inverter = Transducer({'A': [('A', 0, 'one'),
....:                              ('A', 1, 'zero')]},
....:     initial_states=['A'], final_states=['A'])
sage: def state_hook(process, state, output):
....:     print("We are now in state %s." % (state.label(),))
....:     try:
....:         w = process.preview_word()
....:     except RuntimeError:
....:         raise StopIteration
....:     print("Next on the tape is a %s." % (w,))
sage: inverter.state('A').hook = state_hook
sage: it = inverter.iter_process(
....:     input_tape=[0, 1, 1],
....:     check_epsilon_transitions=False)
sage: for _ in it:
....:     pass
We are now in state A.
Next on the tape is a 0.
We are now in state A.
Next on the tape is a 1.
We are now in state A.
Next on the tape is a 1.
We are now in state A.
sage: it.result()
[Branch(accept=True, state='A', output=['one', 'zero', 'zero'])]
```

```
>>> from sage.all import *
>>> inverter = Transducer({'A': [('A', Integer(0), 'one'),
...                              ('A', Integer(1), 'zero')]},
...     initial_states=['A'], final_states=['A'])
>>> def state_hook(process, state, output):
...     print("We are now in state %s." % (state.label(),))
...     try:
...         w = process.preview_word()
...     except RuntimeError:
...         raise StopIteration
...     print("Next on the tape is a %s." % (w,))
>>> inverter.state('A').hook = state_hook
>>> it = inverter.iter_process(
...     input_tape=[Integer(0), Integer(1), Integer(1)],
...     check_epsilon_transitions=False)
>>> for _ in it:
...     pass
```

(continues on next page)

(continued from previous page)

```
We are now in state A.
Next on the tape is a 0.
We are now in state A.
Next on the tape is a 1.
We are now in state A.
Next on the tape is a 1.
We are now in state A.
>>> it.result()
[Branch(accept=True, state='A', output=['one', 'zero', 'zero'])]
```

result(*format_output=None*)

Return the already finished branches during process.

INPUT:

- `format_output` – a function converting the output from list form to something more readable (default: output the list directly).

OUTPUT:

A list of triples `(accepted, state, output)`.

See also the parameter `format_output` of *FSMProcessIterator*.

EXAMPLES:

```
sage: inverter = Transducer({'A': [('A', 0, 'one'), ('A', 1, 'zero')]},
....:     initial_states=['A'], final_states=['A'])
sage: it = inverter.iter_process(input_tape=[0, 1, 1])
sage: for _ in it:
....:     pass
sage: it.result()
[Branch(accept=True, state='A', output=['one', 'zero', 'zero'])]
sage: it.result(lambda L: ', '.join(L))
[(True, 'A', 'one, zero, zero')]
```

```
>>> from sage.all import *
>>> inverter = Transducer({'A': [('A', Integer(0), 'one'), ('A', Integer(1),
↪'zero')]},
...     initial_states=['A'], final_states=['A'])
>>> it = inverter.iter_process(input_tape=[Integer(0), Integer(1),␣
↪Integer(1)])
>>> for _ in it:
...     pass
>>> it.result()
[Branch(accept=True, state='A', output=['one', 'zero', 'zero'])]
>>> it.result(lambda L: ', '.join(L))
[(True, 'A', 'one, zero, zero')]
```

Using both the parameter `format_output` of *FSMProcessIterator* and the parameter `format_output` of *result()* leads to concatenation of the two functions:

```
sage: it = inverter.iter_process(input_tape=[0, 1, 1],
....:                            format_output=lambda L: ', '.join(L))
sage: for _ in it:
```

(continues on next page)

(continued from previous page)

```
....:     pass
sage: it.result()
[Branch(accept=True, state='A', output='one, zero, zero')]
sage: it.result(lambda L: ', '.join(L))
[(True, 'A', 'o, n, e, ,,  , z, e, r, o, ,,  , z, e, r, o')]
```

```
>>> from sage.all import *
>>> it = inverter.iter_process(input_tape=[Integer(0), Integer(1),␣
↪Integer(1)],
...                            format_output=lambda L: ', '.join(L))
>>> for _ in it:
...     pass
>>> it.result()
[Branch(accept=True, state='A', output='one, zero, zero')]
>>> it.result(lambda L: ', '.join(L))
[(True, 'A', 'o, n, e, ,,  , z, e, r, o, ,,  , z, e, r, o')]
```

class sage.combinat.finite_state_machine.**FSMState**(*label*, *word_out=None*, *is_initial=False*, *is_final=False*, *final_word_out=None*, *initial_probability=None*, *hook=None*, *color=None*, *allow_label_None=False*)

Bases: SageObject

Class for a state of a finite state machine.

INPUT:

- `label` – the label of the state
- `word_out` – (default: `None`) a word that is written when the state is reached
- `is_initial` – (default: `False`)
- `is_final` – (default: `False`)
- `final_word_out` – (default: `None`) a word that is written when the state is reached as the last state of some input; only for final states.
- `initial_probability` – (default: `None`) the probability of starting in this state if it is a state of a Markov chain
- `hook` – (default: `None`) a function which is called when the state is reached during processing input. It takes two input parameters: the first is the current state (to allow using the same hook for several states), the second is the current process iterator object (to have full access to everything; e.g. the next letter from the input tape can be read in). It can output the next transition, i.e. the transition to take next. If it returns `None` the process iterator chooses. Moreover, this function can raise a `StopIteration` exception to stop processing of a finite state machine the input immediately. See also the example below.
- `color` – (default: `None`) in order to distinguish states, they can be given an arbitrary "color" (an arbitrary object). This is used in *FiniteStateMachine.equivalence_classes()*: states of different colors are never considered to be equivalent. Note that *Automaton.determinisation()* requires that `color` is hashable.
- `allow_label_None` – boolean (default: `False`); if `True` allows also `None` as label. Note that a state with label `None` is used in *FSMProcessIterator*.

OUTPUT: a state of a finite state machine

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: A = FSMState('state 1', word_out=0, is_initial=True)
sage: A
'state 1'
sage: A.label()
'state 1'
sage: B = FSMState('state 2')
sage: A == B
False
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
>>> A = FSMState('state 1', word_out=Integer(0), is_initial=True)
>>> A
'state 1'
>>> A.label()
'state 1'
>>> B = FSMState('state 2')
>>> A == B
False
```

We can also define a final output word of a final state which is used if the input of a transducer leads to this state. Such final output words are used in subsequential transducers.

```
sage: C = FSMState('state 3', is_final=True, final_word_out='end')
sage: C.final_word_out
['end']
```

```
>>> from sage.all import *
>>> C = FSMState('state 3', is_final=True, final_word_out='end')
>>> C.final_word_out
['end']
```

The final output word can be a single letter, `None` or a list of letters:

```
sage: A = FSMState('A')
sage: A.is_final = True
sage: A.final_word_out = 2
sage: A.final_word_out
[2]
sage: A.final_word_out = [2, 3]
sage: A.final_word_out
[2, 3]
```

```
>>> from sage.all import *
>>> A = FSMState('A')
>>> A.is_final = True
>>> A.final_word_out = Integer(2)
>>> A.final_word_out
[2]
>>> A.final_word_out = [Integer(2), Integer(3)]
>>> A.final_word_out
[2, 3]
```

Only final states can have a final output word which is not `None`:

```
sage: B = FSMState('B')
sage: B.final_word_out is None
True
sage: B.final_word_out = 2
Traceback (most recent call last):
...
ValueError: Only final states can have a final output word,
but state B is not final.
```

```
>>> from sage.all import *
>>> B = FSMState('B')
>>> B.final_word_out is None
True
>>> B.final_word_out = Integer(2)
Traceback (most recent call last):
...
ValueError: Only final states can have a final output word,
but state B is not final.
```

Setting the `final_word_out` of a final state to `None` is the same as setting it to `[]` and is also the default for a final state:

```
sage: C = FSMState('C', is_final=True)
sage: C.final_word_out
[]
sage: C.final_word_out = None
sage: C.final_word_out
[]
sage: C.final_word_out = []
sage: C.final_word_out
[]
```

```
>>> from sage.all import *
>>> C = FSMState('C', is_final=True)
>>> C.final_word_out
[]
>>> C.final_word_out = None
>>> C.final_word_out
[]
>>> C.final_word_out = []
>>> C.final_word_out
[]
```

It is not allowed to use `None` as a label:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: FSMState(None)
Traceback (most recent call last):
...
ValueError: Label None reserved for a special state,
choose another label.
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
>>> FSMState(None)
Traceback (most recent call last):
...
ValueError: Label None reserved for a special state,
choose another label.
```

This can be overridden by:

```
sage: FSMState(None, allow_label_None=True)
None
```

```
>>> from sage.all import *
>>> FSMState(None, allow_label_None=True)
None
```

Note that *Automaton.determinisation()* requires that `color` is hashable:

```
sage: A = Automaton([[0, 0, 0]], initial_states=[0])
sage: A.state(0).color = []
sage: A.determinisation()
Traceback (most recent call last):
...
TypeError: ...unhashable type: 'list'...
sage: A.state(0).color = ()
sage: A.determinisation()
Automaton with 1 state
```

```
>>> from sage.all import *
>>> A = Automaton([[Integer(0), Integer(0), Integer(0)]], initial_
↪states=[Integer(0)])
>>> A.state(Integer(0)).color = []
>>> A.determinisation()
Traceback (most recent call last):
...
TypeError: ...unhashable type: 'list'...
>>> A.state(Integer(0)).color = ()
>>> A.determinisation()
Automaton with 1 state
```

We can use a hook function of a state to stop processing. This is done by raising a `StopIteration` exception. The following code demonstrates this:

```
sage: T = Transducer([(0, 1, 9, 'a'), (1, 2, 9, 'b'),
....:                 (2, 3, 9, 'c'), (3, 4, 9, 'd')],
....:                initial_states=[0],
....:                final_states=[4],
....:                input_alphabet=[9])
sage: def stop(process, state, output):
....:     raise StopIteration()
sage: T.state(3).hook = stop
```

(continues on next page)

(continued from previous page)

```
sage: T.process([9, 9, 9, 9])
(False, 3, ['a', 'b', 'c'])
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(1), Integer(9), 'a'), (Integer(1),␣
↪Integer(2), Integer(9), 'b'),
...                  (Integer(2), Integer(3), Integer(9), 'c'), (Integer(3),␣
↪Integer(4), Integer(9), 'd')],
...                 initial_states=[Integer(0)],
...                 final_states=[Integer(4)],
...                 input_alphabet=[Integer(9)])
>>> def stop(process, state, output):
...     raise StopIteration()
>>> T.state(Integer(3)).hook = stop
>>> T.process([Integer(9), Integer(9), Integer(9), Integer(9)])
(False, 3, ['a', 'b', 'c'])
```

copy()

Return a (shallow) copy of the state.

OUTPUT: a new state

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: A = FSMState('A')
sage: A.is_initial = True
sage: A.is_final = True
sage: A.final_word_out = [1]
sage: A.color = 'green'
sage: A.initial_probability = 1/2
sage: B = copy(A)
sage: B.fully_equal(A)
True
sage: A.label() is B.label()
True
sage: A.is_initial is B.is_initial
True
sage: A.is_final is B.is_final
True
sage: A.final_word_out is B.final_word_out
True
sage: A.color is B.color
True
sage: A.initial_probability is B.initial_probability
True
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
>>> A = FSMState('A')
>>> A.is_initial = True
>>> A.is_final = True
```

(continues on next page)

(continued from previous page)

```
>>> A.final_word_out = [Integer(1)]
>>> A.color = 'green'
>>> A.initial_probability = Integer(1)/Integer(2)
>>> B = copy(A)
>>> B.fully_equal(A)
True
>>> A.label() is B.label()
True
>>> A.is_initial is B.is_initial
True
>>> A.is_final is B.is_final
True
>>> A.final_word_out is B.final_word_out
True
>>> A.color is B.color
True
>>> A.initial_probability is B.initial_probability
True
```

deepcopy(*memo=None*)

Return a deep copy of the state.

INPUT:

- `memo` – (default: `None`) a dictionary storing already processed elements

OUTPUT: a new state

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: A = FSMState((1, 3), color=[1, 2],
....:              is_final=True, final_word_out=3,
....:              initial_probability=1/3)
sage: B = deepcopy(A)
sage: B
(1, 3)
sage: B.label() == A.label()
True
sage: B.label is A.label
False
sage: B.color == A.color
True
sage: B.color is A.color
False
sage: B.is_final == A.is_final
True
sage: B.is_final is A.is_final
True
sage: B.final_word_out == A.final_word_out
True
sage: B.final_word_out is A.final_word_out
False
sage: B.initial_probability == A.initial_probability
```

(continues on next page)

(continued from previous page)

```
True
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
>>> A = FSMState((Integer(1), Integer(3)), color=[Integer(1), Integer(2)],
...              is_final=True, final_word_out=Integer(3),
...              initial_probability=Integer(1)/Integer(3))
>>> B = deepcopy(A)
>>> B
(1, 3)
>>> B.label() == A.label()
True
>>> B.label is A.label
False
>>> B.color == A.color
True
>>> B.color is A.color
False
>>> B.is_final == A.is_final
True
>>> B.is_final is A.is_final
True
>>> B.final_word_out == A.final_word_out
True
>>> B.final_word_out is A.final_word_out
False
>>> B.initial_probability == A.initial_probability
True
```

property final_word_out

The final output word of a final state which is written if the state is reached as the last state of the input of the finite state machine. For a non-final state, the value is `None`.

`final_word_out` can be a single letter, a list or `None`, but for a final-state, it is always saved as a list.

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: A = FSMState('A', is_final=True, final_word_out=2)
sage: A.final_word_out
[2]
sage: A.final_word_out = 3
sage: A.final_word_out
[3]
sage: A.final_word_out = [3, 4]
sage: A.final_word_out
[3, 4]
sage: A.final_word_out = None
sage: A.final_word_out
[]
sage: B = FSMState('B')
sage: B.final_word_out is None
True
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
>>> A = FSMState('A', is_final=True, final_word_out=Integer(2))
>>> A.final_word_out
[2]
>>> A.final_word_out = Integer(3)
>>> A.final_word_out
[3]
>>> A.final_word_out = [Integer(3), Integer(4)]
>>> A.final_word_out
[3, 4]
>>> A.final_word_out = None
>>> A.final_word_out
[]
>>> B = FSMState('B')
>>> B.final_word_out is None
True
```

A non-final state cannot have a final output word:

```
sage: B.final_word_out = [3, 4]
Traceback (most recent call last):
...
ValueError: Only final states can have a final
output word, but state B is not final.
```

```
>>> from sage.all import *
>>> B.final_word_out = [Integer(3), Integer(4)]
Traceback (most recent call last):
...
ValueError: Only final states can have a final
output word, but state B is not final.
```

fully_equal(*other*, *compare_color=True*)

Check whether two states are fully equal, i.e., including all attributes except `hook`.

INPUT:

- `self` – a state
- `other` – a state
- `compare_color` – boolean (default: `True`); if `True` colors are compared as well, otherwise not

OUTPUT: boolean

Note that usual comparison by == does only compare the labels.

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: A = FSMState('A')
sage: B = FSMState('A', is_initial=True)
sage: A.fully_equal(B)
False
sage: A == B
```

(continues on next page)

(continued from previous page)

```
True
sage: A.is_initial = True; A.color = 'green'
sage: A.fully_equal(B)
False
sage: A.fully_equal(B, compare_color=False)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
>>> A = FSMState('A')
>>> B = FSMState('A', is_initial=True)
>>> A.fully_equal(B)
False
>>> A == B
True
>>> A.is_initial = True; A.color = 'green'
>>> A.fully_equal(B)
False
>>> A.fully_equal(B, compare_color=False)
True
```

initial_probability = None

property is_final

Describe whether the state is final or not.

`True` if the state is final and `False` otherwise.

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: A = FSMState('A', is_final=True, final_word_out=3)
sage: A.is_final
True
sage: A.is_final = False
Traceback (most recent call last):
...
ValueError: State A cannot be non-final, because it has a
final output word. Only final states can have a final output
word.
sage: A.final_word_out = None
sage: A.is_final = False
sage: A.is_final
False
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
>>> A = FSMState('A', is_final=True, final_word_out=Integer(3))
>>> A.is_final
True
>>> A.is_final = False
Traceback (most recent call last):
...
```

(continues on next page)

(continued from previous page)

```
ValueError: State A cannot be non-final, because it has a
final output word. Only final states can have a final output
word.
>>> A.final_word_out = None
>>> A.is_final = False
>>> A.is_final
False
```

is_initial = False

label()

Return the label of the state.

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: A = FSMState('state')
sage: A.label()
'state'
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
>>> A = FSMState('state')
>>> A.label()
'state'
```

relabeled(*label*, *memo=None*)

Return a deep copy of the state with a new label.

INPUT:

- `label` – the label of new state
- `memo` – (default: `None`) a dictionary storing already processed elements

OUTPUT: a new state

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: A = FSMState('A')
sage: A.relabeled('B')
'B'
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
>>> A = FSMState('A')
>>> A.relabeled('B')
'B'
```

class sage.combinat.finite_state_machine.**FSMTransition**(*from_state*, *to_state*, *word_in=None*, *word_out=None*, *hook=None*)

Bases: `SageObject`

Class for a transition of a finite state machine.

INPUT:

- `from_state` – state from which transition starts
- `to_state` – state in which transition ends
- `word_in` – the input word of the transitions (when the finite state machine is used as automaton)
- `word_out` – the output word of the transitions (when the finite state machine is used as transducer)

OUTPUT: a transition of a finite state machine

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState, FSMTransition
sage: A = FSMState('A')
sage: B = FSMState('B')
sage: S = FSMTransition(A, B, 0, 1)
sage: T = FSMTransition('A', 'B', 0, 1)
sage: T == S
True
sage: U = FSMTransition('A', 'B', 0)
sage: U == T
False
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState, FSMTransition
>>> A = FSMState('A')
>>> B = FSMState('B')
>>> S = FSMTransition(A, B, Integer(0), Integer(1))
>>> T = FSMTransition('A', 'B', Integer(0), Integer(1))
>>> T == S
True
>>> U = FSMTransition('A', 'B', Integer(0))
>>> U == T
False
```

copy()

Return a (shallow) copy of the transition.

OUTPUT: a new transition

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMTransition
sage: t = FSMTransition('A', 'B', 0)
sage: copy(t)
Transition from 'A' to 'B': 0|-
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMTransition
>>> t = FSMTransition('A', 'B', Integer(0))
>>> copy(t)
Transition from 'A' to 'B': 0|-
```

deepcopy(*memo=None*)

Return a deep copy of the transition.

INPUT:

- memo – (default: None) a dictionary storing already processed elements

OUTPUT: a new transition

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMTransition
sage: t = FSMTransition('A', 'B', 0)
sage: deepcopy(t)
Transition from 'A' to 'B': 0|-
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMTransition
>>> t = FSMTransition('A', 'B', Integer(0))
>>> deepcopy(t)
Transition from 'A' to 'B': 0|-
```

from_state = None

State from which the transition starts. Read-only.

to_state = None

State in which the transition ends. Read-only.

word_in = None

Input word of the transition. Read-only.

word_out = None

Output word of the transition. Read-only.

sage.combinat.finite_state_machine.**FSMWordSymbol**(*word*)

Return a string of word. It may returns the symbol of the empty word FSMEmptyWordSymbol.

INPUT:

- word – the input word

OUTPUT: string of word

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMWordSymbol
sage: FSMWordSymbol([0, 1, 1])
'0,1,1'
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMWordSymbol
>>> FSMWordSymbol([Integer(0), Integer(1), Integer(1)])
'0,1,1'
```

class sage.combinat.finite_state_machine.**FiniteStateMachine**(*data=None*, *initial_states=None*, *final_states=None*, *input_alphabet=None*, *output_alphabet=None*, *determine_alphabets=None*, *with_final_word_out=None*, *store_states_dict=True*, *on_duplicate_transition=None*)

Bases: SageObject

Class for a finite state machine.

A finite state machine is a finite set of states connected by transitions.

INPUT:

- data – can be any of the following:
  1. a dictionary of dictionaries (of transitions),
  2. a dictionary of lists (of states or transitions),
  3. a list (of transitions),
  4. a function (transition function),
  5. an other instance of a finite state machine.
- initial_states and final_states – the initial and final states of this machine
- input_alphabet and output_alphabet – the input and output alphabets of this machine
- determine_alphabets – if True, then the function *determine_alphabets()* is called after data was read and processed, if False, then not. If it is None, then it is decided during the construction of the finite state machine whether *determine_alphabets()* should be called.
- with_final_word_out – if given (not None), then the function *with_final_word_out()* (more precisely, its inplace pendant *construct_final_word_out()*) is called with input letters=with_final_word_out at the end of the creation process.
- store_states_dict – if True, then additionally the states are stored in an internal dictionary for speed up
- on_duplicate_transition – a function which is called when a transition is inserted into self which already existed (same from_state, same to_state, same word_in, same word_out).

  This function is assumed to take two arguments, the first being the already existing transition, the second being the new transition (as an *FSMTransition*). The function must return the (possibly modified) original transition.

  By default, we have on_duplicate_transition=None, which is interpreted as on_duplicate_transition=duplicate_transition_ignore, where duplicate_transition_ignore is a predefined function ignoring the occurrence. Other such predefined functions are duplicate_transition_raise_error and duplicate_transition_add_input.

OUTPUT: a finite state machine

The object creation of *Automaton* and *Transducer* is the same as the one described here (i.e. just replace the word FiniteStateMachine by Automaton or Transducer).

Each transition of an automaton has an input label. Automata can, for example, be determinised (see *Automaton.determinisation()*) and minimized (see *Automaton.minimization()*). Each transition of a transducer has an input and an output label. Transducers can, for example, be simplified (see *Transducer.simplification()*).

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState, FSMTransition
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState, FSMTransition
```

See documentation for more examples.

We illustrate the different input formats:

1. The input-data can be a dictionary of dictionaries, where

   - the keys of the outer dictionary are state-labels (from-states of transitions),
   - the keys of the inner dictionaries are state-labels (to-states of transitions),
   - the values of the inner dictionaries specify the transition more precisely.

   The easiest is to use a tuple consisting of an input and an output word:

```
sage: FiniteStateMachine({'a':{'b':(0, 1), 'c':(1, 1)}})
Finite state machine with 3 states
```

```
>>> from sage.all import *
>>> FiniteStateMachine({'a':{'b':(Integer(0), Integer(1)), 'c':(Integer(1),␣
↪Integer(1))}})
Finite state machine with 3 states
```

   Instead of the tuple anything iterable (e.g. a list) can be used as well.

   If you want to use the arguments of *FSMTransition* directly, you can use a dictionary:

```
sage: FiniteStateMachine({'a':{'b':{'word_in':0, 'word_out':1},
....:                           'c':{'word_in':1, 'word_out':1}}})
Finite state machine with 3 states
```

```
>>> from sage.all import *
>>> FiniteStateMachine({'a':{'b':{'word_in':Integer(0), 'word_out':Integer(1)}
↪,
...                        'c':{'word_in':Integer(1), 'word_out':Integer(1)}
↪}})
Finite state machine with 3 states
```

   In the case you already have instances of *FSMTransition*, it is possible to use them directly:

```
sage: FiniteStateMachine({'a':{'b':FSMTransition('a', 'b', 0, 1),
....:                          'c':FSMTransition('a', 'c', 1, 1)}})
Finite state machine with 3 states
```

```
>>> from sage.all import *
>>> FiniteStateMachine({'a':{'b':FSMTransition('a', 'b', Integer(0),␣
↪Integer(1)),
...                        'c':FSMTransition('a', 'c', Integer(1),␣
↪Integer(1))}})
Finite state machine with 3 states
```

2. The input-data can be a dictionary of lists, where the keys are states or label of states.

   The list-elements can be states:

```
sage: a = FSMState('a')
sage: b = FSMState('b')
sage: c = FSMState('c')
```

(continues on next page)

(continued from previous page)

```
sage: FiniteStateMachine({a:[b, c]})
Finite state machine with 3 states
```

```
>>> from sage.all import *
>>> a = FSMState('a')
>>> b = FSMState('b')
>>> c = FSMState('c')
>>> FiniteStateMachine({a:[b, c]})
Finite state machine with 3 states
```

Or the list-elements can simply be labels of states:

```
sage: FiniteStateMachine({'a':['b', 'c']})
Finite state machine with 3 states
```

```
>>> from sage.all import *
>>> FiniteStateMachine({'a':['b', 'c']})
Finite state machine with 3 states
```

The list-elements can also be transitions:

```
sage: FiniteStateMachine({'a':[FSMTransition('a', 'b', 0, 1),
....:                          FSMTransition('a', 'c', 1, 1)]})
Finite state machine with 3 states
```

```
>>> from sage.all import *
>>> FiniteStateMachine({'a':[FSMTransition('a', 'b', Integer(0), Integer(1)),
...                          FSMTransition('a', 'c', Integer(1), Integer(1))]}
↪)
Finite state machine with 3 states
```

Or they can be tuples of a label, an input word and an output word specifying a transition:

```
sage: FiniteStateMachine({'a':[('b', 0, 1), ('c', 1, 1)]})
Finite state machine with 3 states
```

```
>>> from sage.all import *
>>> FiniteStateMachine({'a':[('b', Integer(0), Integer(1)), ('c', Integer(1),␣
↪Integer(1))]})
Finite state machine with 3 states
```

3. The input-data can be a list, where its elements specify transitions:

```
sage: FiniteStateMachine([FSMTransition('a', 'b', 0, 1),
....:                     FSMTransition('a', 'c', 1, 1)])
Finite state machine with 3 states
```

```
>>> from sage.all import *
>>> FiniteStateMachine([FSMTransition('a', 'b', Integer(0), Integer(1)),
...                     FSMTransition('a', 'c', Integer(1), Integer(1))])
Finite state machine with 3 states
```

It is possible to skip `FSMTransition` in the example above:

```
sage: FiniteStateMachine([('a', 'b', 0, 1), ('a', 'c', 1, 1)])
Finite state machine with 3 states
```

```
>>> from sage.all import *
>>> FiniteStateMachine([('a', 'b', Integer(0), Integer(1)), ('a', 'c',␣
↪Integer(1), Integer(1))])
Finite state machine with 3 states
```

The parameters of the transition are given in tuples. Anyhow, anything iterable (e.g. a list) is possible.

You can also name the parameters of the transition. For this purpose you take a dictionary:

```
sage: FiniteStateMachine([{'from_state':'a', 'to_state':'b',
....:                      'word_in':0, 'word_out':1},
....:                     {'from_state':'a', 'to_state':'c',
....:                      'word_in':1, 'word_out':1}])
Finite state machine with 3 states
```

```
>>> from sage.all import *
>>> FiniteStateMachine([{'from_state':'a', 'to_state':'b',
...                      'word_in':Integer(0), 'word_out':Integer(1)},
...                     {'from_state':'a', 'to_state':'c',
...                      'word_in':Integer(1), 'word_out':Integer(1)}])
Finite state machine with 3 states
```

Other arguments, which *FSMTransition* accepts, can be added, too.

4. The input-data can also be function acting as transition function:

   This function has two input arguments:

   1. a label of a state (from which the transition starts),
   2. a letter of the (input-)alphabet (as input-label of the transition).

   It returns a tuple with the following entries:

   1. a label of a state (to which state the transition goes),
   2. a letter of or a word over the (output-)alphabet (as output-label of the transition).

   It may also output a list of such tuples if several transitions from the from-state and the input letter exist (this means that the finite state machine is non-deterministic).

   If the transition does not exist, the function should raise a `LookupError` or return an empty list.

   When constructing a finite state machine in this way, some initial states and an input alphabet have to be specified.

```
sage: def f(state_from, read):
....:     if int(state_from) + read <= 2:
....:         state_to = 2*int(state_from)+read
....:         write = 0
....:     else:
....:         state_to = 2*int(state_from) + read - 5
....:         write = 1
....:     return (str(state_to), write)
```

(continues on next page)

(continued from previous page)

```
sage: F = FiniteStateMachine(f, input_alphabet=[0, 1],
....:                        initial_states=['0'],
....:                        final_states=['0'])
sage: F([1, 0, 1])
(True, '0', [0, 0, 1])
```

```
>>> from sage.all import *
>>> def f(state_from, read):
...     if int(state_from) + read <= Integer(2):
...         state_to = Integer(2)*int(state_from)+read
...         write = Integer(0)
...     else:
...         state_to = Integer(2)*int(state_from) + read - Integer(5)
...         write = Integer(1)
...     return (str(state_to), write)
>>> F = FiniteStateMachine(f, input_alphabet=[Integer(0), Integer(1)],
...                        initial_states=['0'],
...                        final_states=['0'])
>>> F([Integer(1), Integer(0), Integer(1)])
(True, '0', [0, 0, 1])
```

5. The input-data can be an other instance of a finite state machine:

```
sage: F = FiniteStateMachine()
sage: G = Transducer(F)
sage: G == F
True
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine()
>>> G = Transducer(F)
>>> G == F
True
```

   The other parameters cannot be specified in that case. If you want to change these, use the attributes *FSMState.is_initial*, *FSMState.is_final*, *input_alphabet*, *output_alphabet*, *on_duplicate_transition* and methods *determine_alphabets()*, *construct_final_word_out()* on the new machine, respectively.

The following examples demonstrate the use of `on_duplicate_transition`:

```
sage: F = FiniteStateMachine([['a', 'a', 1/2], ['a', 'a', 1/2]])
sage: F.transitions()
[Transition from 'a' to 'a': 1/2|-]
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine([['a', 'a', Integer(1)/Integer(2)], ['a', 'a',␣
↪Integer(1)/Integer(2)]])
>>> F.transitions()
[Transition from 'a' to 'a': 1/2|-]
```

```
sage: from sage.combinat.finite_state_machine import duplicate_transition_raise_
↪error
sage: F1 = FiniteStateMachine([['a', 'a', 1/2], ['a', 'a', 1/2]],
....:                         on_duplicate_transition=duplicate_transition_raise_
↪error)
Traceback (most recent call last):
...
ValueError: Attempting to re-insert transition Transition from 'a' to 'a': 1/2|-
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import duplicate_transition_raise_
↪error
>>> F1 = FiniteStateMachine([['a', 'a', Integer(1)/Integer(2)], ['a', 'a',␣
↪Integer(1)/Integer(2)]],
...                         on_duplicate_transition=duplicate_transition_raise_
↪error)
Traceback (most recent call last):
...
ValueError: Attempting to re-insert transition Transition from 'a' to 'a': 1/2|-
```

Use `duplicate_transition_add_input` to emulate a Markov chain, the input labels are considered as transition probabilities:

```
sage: from sage.combinat.finite_state_machine import duplicate_transition_add_
↪input
sage: F = FiniteStateMachine([['a', 'a', 1/2], ['a', 'a', 1/2]],
....:                        on_duplicate_transition=duplicate_transition_add_
↪input)
sage: F.transitions()
[Transition from 'a' to 'a': 1|-]
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import duplicate_transition_add_input
>>> F = FiniteStateMachine([['a', 'a', Integer(1)/Integer(2)], ['a', 'a',␣
↪Integer(1)/Integer(2)]],
...                        on_duplicate_transition=duplicate_transition_add_input)
>>> F.transitions()
[Transition from 'a' to 'a': 1|-]
```

Use `with_final_word_out` to construct final output:

```
sage: T = Transducer([(0, 1, 0, 0), (1, 0, 0, 0)],
....:                initial_states=[0],
....:                final_states=[0],
....:                with_final_word_out=0)
sage: for s in T.iter_final_states():
....:     print("{} {}".format(s, s.final_word_out))
0 []
1 [0]
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(1), Integer(0), Integer(0)), (Integer(1),
```

(continues on next page)

(continued from previous page)

```
↪ Integer(0), Integer(0), Integer(0))],
...                initial_states=[Integer(0)],
...                final_states=[Integer(0)],
...                with_final_word_out=Integer(0))
>>> for s in T.iter_final_states():
...     print("{} {}".format(s, s.final_word_out))
0 []
1 [0]
```

__call__(**args*, ***kwargs*)

Call either method *composition()* or *process()* (with `full_output=False`). If the input is not finite (`is_finite` of input is `False`), then *iter_process()* (with `iterator_type='simple'`) is called. Moreover, the flag `automatic_output_type` is set (unless `format_output` is specified). See the documentation of these functions for possible parameters.

EXAMPLES:

The following code performs a *composition()*:

```
sage: F = Transducer([('A', 'B', 1, 0), ('B', 'B', 1, 1),
....:                 ('B', 'B', 0, 0)],
....:                initial_states=['A'], final_states=['B'])
sage: G = Transducer([(1, 1, 0, 0), (1, 2, 1, 0),
....:                 (2, 2, 0, 1), (2, 1, 1, 1)],
....:                initial_states=[1], final_states=[1])
sage: H = G(F)
sage: H.states()
[('A', 1), ('B', 1), ('B', 2)]
```

```
>>> from sage.all import *
>>> F = Transducer([('A', 'B', Integer(1), Integer(0)), ('B', 'B', Integer(1),
↪ Integer(1)),
...                 ('B', 'B', Integer(0), Integer(0))],
...                initial_states=['A'], final_states=['B'])
>>> G = Transducer([(Integer(1), Integer(1), Integer(0), Integer(0)),␣
↪(Integer(1), Integer(2), Integer(1), Integer(0)),
...                 (Integer(2), Integer(2), Integer(0), Integer(1)),␣
↪(Integer(2), Integer(1), Integer(1), Integer(1))],
...                initial_states=[Integer(1)], final_states=[Integer(1)])
>>> H = G(F)
>>> H.states()
[('A', 1), ('B', 1), ('B', 2)]
```

An automaton or transducer can also act on an input (a list or other iterable of letters):

```
sage: binary_inverter = Transducer({'A': [('A', 0, 1), ('A', 1, 0)]},
....:                              initial_states=['A'], final_states=['A'])
sage: binary_inverter([0, 1, 0, 0, 1, 1])
[1, 0, 1, 1, 0, 0]
```

```
>>> from sage.all import *
>>> binary_inverter = Transducer({'A': [('A', Integer(0), Integer(1)), ('A',␣
↪Integer(1), Integer(0))]},
```

(continues on next page)

(continued from previous page)

```
...                                initial_states=['A'], final_states=['A'])
>>> binary_inverter([Integer(0), Integer(1), Integer(0), Integer(0),␣
↪Integer(1), Integer(1)])
[1, 0, 1, 1, 0, 0]
```

We can also let them act on *words*:

```
sage: # needs sage.combinat
sage: W = Words([0, 1]); W
Finite and infinite words over {0, 1}
sage: binary_inverter(W([0, 1, 1, 0, 1, 1]))
word: 100100
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> W = Words([Integer(0), Integer(1)]); W
Finite and infinite words over {0, 1}
>>> binary_inverter(W([Integer(0), Integer(1), Integer(1), Integer(0),␣
↪Integer(1), Integer(1)]))
word: 100100
```

Infinite words work as well:

```
sage: # needs sage.combinat
sage: words.FibonacciWord()
word: 0100101001001010010100100101001001010010...
sage: binary_inverter(words.FibonacciWord())
word: 1011010110110101101011011010110110101101...
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> words.FibonacciWord()
word: 0100101001001010010100100101001001010010...
>>> binary_inverter(words.FibonacciWord())
word: 1011010110110101101011011010110110101101...
```

When only one successful path is found in a non-deterministic transducer, the result of that path is returned.

```
sage: T = Transducer([(0, 1, 0, 1), (0, 2, 0, 2)],
....:                initial_states=[0], final_states=[1])
sage: T.process([0])
[(False, 2, [2]), (True, 1, [1])]
sage: T([0])
[1]
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(1), Integer(0), Integer(1)),␣
↪(Integer(0), Integer(2), Integer(0), Integer(2))],
...                initial_states=[Integer(0)], final_states=[Integer(1)])
>>> T.process([Integer(0)])
[(False, 2, [2]), (True, 1, [1])]
```

(continues on next page)

(continued from previous page)

```
>>> T([Integer(0)])
[1]
```

See also

composition(), *process()*, *iter_process()*, *Automaton.process()*, *Transducer.process()*.

accessible_components()

Return a new finite state machine with the accessible states of `self` and all transitions between those states.

OUTPUT:

A finite state machine with the accessible states of `self` and all transitions between those states.

A state is accessible if there is a directed path from an initial state to the state. If `self` has no initial states then a copy of the finite state machine `self` is returned.

EXAMPLES:

```
sage: F = Automaton([(0, 0, 0), (0, 1, 1), (1, 1, 0), (1, 0, 1)],
....:               initial_states=[0])
sage: F.accessible_components()
Automaton with 2 states
```

```
>>> from sage.all import *
>>> F = Automaton([(Integer(0), Integer(0), Integer(0)), (Integer(0),␣
↪Integer(1), Integer(1)), (Integer(1), Integer(1), Integer(0)), (Integer(1),␣
↪Integer(0), Integer(1))],
...               initial_states=[Integer(0)])
>>> F.accessible_components()
Automaton with 2 states
```

```
sage: F = Automaton([(0, 0, 1), (0, 0, 1), (1, 1, 0), (1, 0, 1)],
....:               initial_states=[0])
sage: F.accessible_components()
Automaton with 1 state
```

```
>>> from sage.all import *
>>> F = Automaton([(Integer(0), Integer(0), Integer(1)), (Integer(0),␣
↪Integer(0), Integer(1)), (Integer(1), Integer(1), Integer(0)), (Integer(1),␣
↪Integer(0), Integer(1))],
...               initial_states=[Integer(0)])
>>> F.accessible_components()
Automaton with 1 state
```

coaccessible_components()

add_from_transition_function(*function*, *initial_states=None*, *explore_existing_states=True*)

Construct a finite state machine from a transition function.

INPUT:

- `function` may return a tuple (new_state, output_word) or a list of such tuples
- `initial_states` – if no initial states are given, the already existing initial states of `self` are taken
- `explore_existing_states` – boolean (default: `True`); if `True` (default), then already existing states in `self` (e.g. already given final states) will also be processed if they are reachable from the initial statess

OUTPUT: nothing

EXAMPLES:

```
sage: F = FiniteStateMachine(initial_states=['A'],
....:                        input_alphabet=[0, 1])
sage: def f(state, input):
....:     return [('A', input), ('B', 1-input)]
sage: F.add_from_transition_function(f)
sage: F.transitions()
[Transition from 'A' to 'A': 0|0,
Transition from 'A' to 'B': 0|1,
Transition from 'A' to 'A': 1|1,
Transition from 'A' to 'B': 1|0,
Transition from 'B' to 'A': 0|0,
Transition from 'B' to 'B': 0|1,
Transition from 'B' to 'A': 1|1,
Transition from 'B' to 'B': 1|0]
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine(initial_states=['A'],
...                        input_alphabet=[Integer(0), Integer(1)])
>>> def f(state, input):
...     return [('A', input), ('B', Integer(1)-input)]
>>> F.add_from_transition_function(f)
>>> F.transitions()
[Transition from 'A' to 'A': 0|0,
Transition from 'A' to 'B': 0|1,
Transition from 'A' to 'A': 1|1,
Transition from 'A' to 'B': 1|0,
Transition from 'B' to 'A': 0|0,
Transition from 'B' to 'B': 0|1,
Transition from 'B' to 'A': 1|1,
Transition from 'B' to 'B': 1|0]
```

Initial states can also be given as a parameter:

```
sage: F = FiniteStateMachine(input_alphabet=[0,1])
sage: def f(state, input):
....:     return [('A', input), ('B', 1-input)]
sage: F.add_from_transition_function(f,initial_states=['A'])
sage: F.initial_states()
['A']
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine(input_alphabet=[Integer(0),Integer(1)])
>>> def f(state, input):
...     return [('A', input), ('B', Integer(1)-input)]
>>> F.add_from_transition_function(f,initial_states=['A'])
>>> F.initial_states()
['A']
```

Already existing states in the finite state machine (the final states in the example below) are also explored:

```
sage: F = FiniteStateMachine(initial_states=[0],
....:                        final_states=[1],
....:                        input_alphabet=[0])
sage: def transition_function(state, letter):
....:     return 1 - state, []
sage: F.add_from_transition_function(transition_function)
sage: F.transitions()
[Transition from 0 to 1: 0|-,
 Transition from 1 to 0: 0|-]
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine(initial_states=[Integer(0)],
...                        final_states=[Integer(1)],
...                        input_alphabet=[Integer(0)])
>>> def transition_function(state, letter):
...     return Integer(1) - state, []
>>> F.add_from_transition_function(transition_function)
>>> F.transitions()
[Transition from 0 to 1: 0|-,
 Transition from 1 to 0: 0|-]
```

If `explore_existing_states=False`, however, this behavior is turned off, i.e., already existing states are not explored:

```
sage: F = FiniteStateMachine(initial_states=[0],
....:                        final_states=[1],
....:                        input_alphabet=[0])
sage: def transition_function(state, letter):
....:     return 1 - state, []
sage: F.add_from_transition_function(transition_function,
....:                                explore_existing_states=False)
sage: F.transitions()
[Transition from 0 to 1: 0|-]
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine(initial_states=[Integer(0)],
...                        final_states=[Integer(1)],
...                        input_alphabet=[Integer(0)])
>>> def transition_function(state, letter):
...     return Integer(1) - state, []
>>> F.add_from_transition_function(transition_function,
...                                explore_existing_states=False)
```

(continues on next page)

(continued from previous page)

```
>>> F.transitions()
[Transition from 0 to 1: 0|-]
```

add_state(*state*)

Add a state to the finite state machine and returns the new state. If the state already exists, that existing state is returned.

INPUT:

- `state` is either an instance of *FSMState* or, otherwise, a label of a state.

OUTPUT: the new or existing state

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: F = FiniteStateMachine()
sage: A = FSMState('A', is_initial=True)
sage: F.add_state(A)
'A'
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
>>> F = FiniteStateMachine()
>>> A = FSMState('A', is_initial=True)
>>> F.add_state(A)
'A'
```

add_states(*states*)

Add several states. See add_state for more information.

INPUT:

- `states` – list of states or iterator over states

OUTPUT: nothing

EXAMPLES:

```
sage: F = FiniteStateMachine()
sage: F.add_states(['A', 'B'])
sage: F.states()
['A', 'B']
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine()
>>> F.add_states(['A', 'B'])
>>> F.states()
['A', 'B']
```

add_transition(**args*, ***kwargs*)

Add a transition to the finite state machine and returns the new transition.

If the transition already exists, the return value of `self.on_duplicate_transition` is returned. See the documentation of *FiniteStateMachine*.

INPUT:

The following forms are all accepted:

```
sage: from sage.combinat.finite_state_machine import FSMState, FSMTransition
sage: A = FSMState('A')
sage: B = FSMState('B')

sage: FSM = FiniteStateMachine()
sage: FSM.add_transition(FSMTransition(A, B, 0, 1))
Transition from 'A' to 'B': 0|1

sage: FSM = FiniteStateMachine()
sage: FSM.add_transition(A, B, 0, 1)
Transition from 'A' to 'B': 0|1

sage: FSM = FiniteStateMachine()
sage: FSM.add_transition(A, B, word_in=0, word_out=1)
Transition from 'A' to 'B': 0|1

sage: FSM = FiniteStateMachine()
sage: FSM.add_transition('A', 'B', {'word_in': 0, 'word_out': 1})
Transition from 'A' to 'B': {'word_in': 0, 'word_out': 1}|-

sage: FSM = FiniteStateMachine()
sage: FSM.add_transition(from_state=A, to_state=B,
....:                    word_in=0, word_out=1)
Transition from 'A' to 'B': 0|1

sage: FSM = FiniteStateMachine()
sage: FSM.add_transition({'from_state': A, 'to_state': B,
....:                     'word_in': 0, 'word_out': 1})
Transition from 'A' to 'B': 0|1

sage: FSM = FiniteStateMachine()
sage: FSM.add_transition((A, B, 0, 1))
Transition from 'A' to 'B': 0|1

sage: FSM = FiniteStateMachine()
sage: FSM.add_transition([A, B, 0, 1])
Transition from 'A' to 'B': 0|1
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState, FSMTransition
>>> A = FSMState('A')
>>> B = FSMState('B')

>>> FSM = FiniteStateMachine()
>>> FSM.add_transition(FSMTransition(A, B, Integer(0), Integer(1)))
Transition from 'A' to 'B': 0|1

>>> FSM = FiniteStateMachine()
>>> FSM.add_transition(A, B, Integer(0), Integer(1))
Transition from 'A' to 'B': 0|1
```

(continues on next page)

(continued from previous page)

```
>>> FSM = FiniteStateMachine()
>>> FSM.add_transition(A, B, word_in=Integer(0), word_out=Integer(1))
Transition from 'A' to 'B': 0|1

>>> FSM = FiniteStateMachine()
>>> FSM.add_transition('A', 'B', {'word_in': Integer(0), 'word_out':␣
↪Integer(1)})
Transition from 'A' to 'B': {'word_in': 0, 'word_out': 1}|-

>>> FSM = FiniteStateMachine()
>>> FSM.add_transition(from_state=A, to_state=B,
...                    word_in=Integer(0), word_out=Integer(1))
Transition from 'A' to 'B': 0|1

>>> FSM = FiniteStateMachine()
>>> FSM.add_transition({'from_state': A, 'to_state': B,
...                    'word_in': Integer(0), 'word_out': Integer(1)})
Transition from 'A' to 'B': 0|1

>>> FSM = FiniteStateMachine()
>>> FSM.add_transition((A, B, Integer(0), Integer(1)))
Transition from 'A' to 'B': 0|1

>>> FSM = FiniteStateMachine()
>>> FSM.add_transition([A, B, Integer(0), Integer(1)])
Transition from 'A' to 'B': 0|1
```

If the states `A` and `B` are not instances of *FSMState*, then it is assumed that they are labels of states.

OUTPUT:

The new transition.

add_transitions_from_function(*function*, *labels_as_input=True*)

Add one or more transitions if `function(state, state)` says that there are some.

INPUT:

- `function` – a transition function. Given two states `from_state` and `to_state` (or their labels if `label_as_input` is true), this function shall return a tuple `(word_in, word_out)` to add a transition from `from_state` to `to_state` with input and output labels `word_in` and `word_out`, respectively. If no such addition is to be added, the transition function shall return `None`. The transition function may also return a list of such tuples in order to add multiple transitions between the pair of states.
- `label_as_input` – (default: `True`)

OUTPUT: nothing

EXAMPLES:

```
sage: F = FiniteStateMachine()
sage: F.add_states(['A', 'B', 'C'])
sage: def f(state1, state2):
....:     if state1 == 'C':
....:         return None
....:     return (0, 1)
```

(continues on next page)

(continued from previous page)

```
sage: F.add_transitions_from_function(f)
sage: len(F.transitions())
6
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine()
>>> F.add_states(['A', 'B', 'C'])
>>> def f(state1, state2):
...     if state1 == 'C':
...         return None
...     return (Integer(0), Integer(1))
>>> F.add_transitions_from_function(f)
>>> len(F.transitions())
6
```

Multiple transitions are also possible:

```
sage: F = FiniteStateMachine()
sage: F.add_states([0, 1])
sage: def f(state1, state2):
....:     if state1 != state2:
....:         return [(0, 1), (1, 0)]
....:     return None
sage: F.add_transitions_from_function(f)
sage: F.transitions()
[Transition from 0 to 1: 0|1,
 Transition from 0 to 1: 1|0,
 Transition from 1 to 0: 0|1,
 Transition from 1 to 0: 1|0]
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine()
>>> F.add_states([Integer(0), Integer(1)])
>>> def f(state1, state2):
...     if state1 != state2:
...         return [(Integer(0), Integer(1)), (Integer(1), Integer(0))]
...     return None
>>> F.add_transitions_from_function(f)
>>> F.transitions()
[Transition from 0 to 1: 0|1,
 Transition from 0 to 1: 1|0,
 Transition from 1 to 0: 0|1,
 Transition from 1 to 0: 1|0]
```

adjacency_matrix(*input=None*, *entry=None*)

Return the adjacency matrix of the underlying graph.

INPUT:

- `input` – only transitions with input label `input` are respected
- `entry` – the function `entry` takes a transition and the return value is written in the matrix as the entry `(transition.from_state, transition.to_state)`. The default value (`None`) of entry takes the variable `x` to the power of the sum of the output word of the transition.

OUTPUT: a matrix

If any label of a state is not an integer, the finite state machine is relabeled at the beginning. If there are more than one transitions between two states, then the different return values of `entry` are added up.

EXAMPLES:

```
sage: B = FiniteStateMachine({0:{0:(0, 0), 'a':(1, 0)},
....:                         'a':{2:(0, 0), 3:(1, 0)},
....:                         2:{0:(1, 1), 4:(0, 0)},
....:                         3:{'a':(0, 1), 2:(1, 1)},
....:                         4:{4:(1, 1), 3:(0, 1)}},
....:                        initial_states=[0])
sage: B.adjacency_matrix()                                                    #␣
↪needs sage.symbolic
[1 1 0 0 0]
[0 0 1 1 0]
[x 0 0 0 1]
[0 x x 0 0]
[0 0 0 x x]
```

```
>>> from sage.all import *
>>> B = FiniteStateMachine({Integer(0):{Integer(0):(Integer(0), Integer(0)),
↪'a':(Integer(1), Integer(0))},
...                         'a':{Integer(2):(Integer(0), Integer(0)),␣
↪Integer(3):(Integer(1), Integer(0))},
...                           Integer(2):{Integer(0):(Integer(1), Integer(1)),␣
↪Integer(4):(Integer(0), Integer(0))},
...                           Integer(3):{'a':(Integer(0), Integer(1)),␣
↪Integer(2):(Integer(1), Integer(1))},
...                           Integer(4):{Integer(4):(Integer(1), Integer(1)),␣
↪Integer(3):(Integer(0), Integer(1))}},
...                          initial_states=[Integer(0)])
>>> B.adjacency_matrix()                                                      #␣
↪needs sage.symbolic
[1 1 0 0 0]
[0 0 1 1 0]
[x 0 0 0 1]
[0 x x 0 0]
[0 0 0 x x]
```

This is equivalent to:

```
sage: matrix(B)                                                               #␣
↪needs sage.symbolic
[1 1 0 0 0]
[0 0 1 1 0]
[x 0 0 0 1]
[0 x x 0 0]
[0 0 0 x x]
```

```
>>> from sage.all import *
>>> matrix(B)                                                                 #␣
↪needs sage.symbolic
```

(continues on next page)

(continued from previous page)

```
[1 1 0 0 0]
[0 0 1 1 0]
[x 0 0 0 1]
[0 x x 0 0]
[0 0 0 x x]
```

It is also possible to use other entries in the adjacency matrix:

```
sage: B.adjacency_matrix(entry=(lambda transition: 1))
[1 1 0 0 0]
[0 0 1 1 0]
[1 0 0 0 1]
[0 1 1 0 0]
[0 0 0 1 1]
sage: var('t')                                                              #␣
↪needs sage.symbolic
t
sage: B.adjacency_matrix(1, entry=(lambda transition:                       #␣
↪needs sage.symbolic
....:     exp(I*transition.word_out[0]*t)))
[      0       1       0       0       0]
[      0       0       0       1       0]
[e^(I*t)       0       0       0       0]
[      0       0 e^(I*t)       0       0]
[      0       0       0       0 e^(I*t)]
sage: a = Automaton([(0, 1, 0),
....:                (1, 2, 0),
....:                (2, 0, 1),
....:                (2, 1, 0)],
....:               initial_states=[0],
....:               final_states=[0])
sage: a.adjacency_matrix()                                                  #␣
↪needs sage.symbolic
[0 1 0]
[0 0 1]
[1 1 0]
```

```
>>> from sage.all import *
>>> B.adjacency_matrix(entry=(lambda transition: Integer(1)))
[1 1 0 0 0]
[0 0 1 1 0]
[1 0 0 0 1]
[0 1 1 0 0]
[0 0 0 1 1]
>>> var('t')                                                                #␣
↪needs sage.symbolic
t
>>> B.adjacency_matrix(Integer(1), entry=(lambda transition:                 ␣
↪     # needs sage.symbolic
...      exp(I*transition.word_out[Integer(0)]*t)))
[      0       1       0       0       0]
[      0       0       0       1       0]
```

(continues on next page)

(continued from previous page)

```
[e^(I*t)       0       0       0       0]
[      0       0 e^(I*t)       0       0]
[      0       0       0       0 e^(I*t)]
>>> a = Automaton([(Integer(0), Integer(1), Integer(0)),
...                (Integer(1), Integer(2), Integer(0)),
...                (Integer(2), Integer(0), Integer(1)),
...                (Integer(2), Integer(1), Integer(0))],
...               initial_states=[Integer(0)],
...               final_states=[Integer(0)])
>>> a.adjacency_matrix()                                                    #␣
↪needs sage.symbolic
[0 1 0]
[0 0 1]
[1 1 0]
```

asymptotic_moments(*variable=None*)

Return the main terms of expectation and variance of the sum of output labels and its covariance with the sum of input labels.

INPUT:

- `variable` – a symbol denoting the length of the input, (default: n)

OUTPUT: a dictionary consisting of

- `expectation` – $en + \mathrm{Order}(1)$,
- `variance` – $vn + \mathrm{Order}(1)$,
- `covariance` – $cn + \mathrm{Order}(1)$

for suitable constants e, v and c.

Assume that all input and output labels are numbers and that `self` is complete and has only one final component. Assume further that this final component is aperiodic. Furthermore, assume that there is exactly one initial state and that all states are final.

Denote by X_n the sum of output labels written by the finite state machine when reading a random input word of length n over the input alphabet (assuming equidistribution).

Then the expectation of X_n is $en + O(1)$, the variance of X_n is $vn + O(1)$ and the covariance of X_n and the sum of input labels is $cn + O(1)$, cf. [HKW2015], Theorem 3.9.

In the case of non-integer input or output labels, performance degrades significantly. For rational input and output labels, consider rescaling to integers. This limitation comes from the fact that determinants over polynomial rings can be computed much more efficiently than over the symbolic ring. In fact, we compute (parts) of a trivariate generating function where the input and output labels are exponents of some indeterminates, see [HKW2015], Theorem 3.9 for details. If those exponents are integers, we can use a polynomial ring.

EXAMPLES:

1. A trivial example: write the negative of the input:

```
sage: T = Transducer([(0, 0, 0, 0), (0, 0, 1, -1)],
....:                initial_states=[0],
....:                final_states=[0])
sage: T([0, 1, 1])
[0, -1, -1]
```

(continues on next page)

(continued from previous page)

```
sage: # needs sage.symbolic
sage: moments = T.asymptotic_moments()
sage: moments['expectation']
-1/2*n + Order(1)
sage: moments['variance']
1/4*n + Order(1)
sage: moments['covariance']
-1/4*n + Order(1)
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(0), Integer(0), Integer(0)),␣
↪(Integer(0), Integer(0), Integer(1), -Integer(1))],
...                initial_states=[Integer(0)],
...                final_states=[Integer(0)])
>>> T([Integer(0), Integer(1), Integer(1)])
[0, -1, -1]

>>> # needs sage.symbolic
>>> moments = T.asymptotic_moments()
>>> moments['expectation']
-1/2*n + Order(1)
>>> moments['variance']
1/4*n + Order(1)
>>> moments['covariance']
-1/4*n + Order(1)
```

2. For the case of the Hamming weight of the non-adjacent-form (NAF) of integers, cf. the Wikipedia article Non-adjacent_form and the *example on recognizing NAFs*, the following agrees with the results in [HP2007].

   We first use the transducer to convert the standard binary expansion to the NAF given in [HP2007]. We use the parameter `with_final_word_out` such that we do not have to add sufficiently many trailing zeros:

```
sage: NAF = Transducer([(0, 0, 0, 0),
....:                   (0, '.1', 1, None),
....:                   ('.1', 0, 0, [1, 0]),
....:                   ('.1', 1, 1, [-1, 0]),
....:                   (1, 1, 1, 0),
....:                   (1, '.1', 0, None)],
....:                  initial_states=[0],
....:                  final_states=[0],
....:                  with_final_word_out=[0])
```

```
>>> from sage.all import *
>>> NAF = Transducer([(Integer(0), Integer(0), Integer(0), Integer(0)),
...                   (Integer(0), '.1', Integer(1), None),
...                   ('.1', Integer(0), Integer(0), [Integer(1),␣
↪Integer(0)]),
...                   ('.1', Integer(1), Integer(1), [-Integer(1),␣
↪Integer(0)]),
```

(continues on next page)

(continued from previous page)

```
...                   (Integer(1), Integer(1), Integer(1), Integer(0)),
...                   (Integer(1), '.1', Integer(0), None)],
...                  initial_states=[Integer(0)],
...                  final_states=[Integer(0)],
...                  with_final_word_out=[Integer(0)])
```

As an example, we compute the NAF of 27 by this transducer.

```
sage: binary_27 = 27.bits()
sage: binary_27
[1, 1, 0, 1, 1]
sage: NAF_27 = NAF(binary_27)
sage: NAF_27
[-1, 0, -1, 0, 0, 1, 0]
sage: ZZ(NAF_27, base=2)
27
```

```
>>> from sage.all import *
>>> binary_27 = Integer(27).bits()
>>> binary_27
[1, 1, 0, 1, 1]
>>> NAF_27 = NAF(binary_27)
>>> NAF_27
[-1, 0, -1, 0, 0, 1, 0]
>>> ZZ(NAF_27, base=Integer(2))
27
```

Next, we are only interested in the Hamming weight:

```
sage: def weight(state, input):
....:     if input is None:
....:         result = 0
....:     else:
....:         result = ZZ(input != 0)
....:     return (0, result)
sage: weight_transducer = Transducer(weight,
....:                                input_alphabet=[-1, 0, 1],
....:                                initial_states=[0],
....:                                final_states=[0])
sage: NAFweight = weight_transducer.composition(NAF)
sage: NAFweight.transitions()
[Transition from (0, 0) to (0, 0): 0|0,
 Transition from (0, 0) to ('.1', 0): 1|-,
 Transition from ('.1', 0) to (0, 0): 0|1,0,
 Transition from ('.1', 0) to (1, 0): 1|1,0,
 Transition from (1, 0) to ('.1', 0): 0|-,
 Transition from (1, 0) to (1, 0): 1|0]
sage: NAFweight(binary_27)
[1, 0, 1, 0, 0, 1, 0]
```

```
>>> from sage.all import *
>>> def weight(state, input):
```

(continues on next page)

(continued from previous page)

```
...       if input is None:
...           result = Integer(0)
...       else:
...           result = ZZ(input != Integer(0))
...       return (Integer(0), result)
>>> weight_transducer = Transducer(weight,
...                                input_alphabet=[-Integer(1),␣
↪Integer(0), Integer(1)],
...                                initial_states=[Integer(0)],
...                                final_states=[Integer(0)])
>>> NAFweight = weight_transducer.composition(NAF)
>>> NAFweight.transitions()
[Transition from (0, 0) to (0, 0): 0|0,
 Transition from (0, 0) to ('.1', 0): 1|-,
 Transition from ('.1', 0) to (0, 0): 0|1,0,
 Transition from ('.1', 0) to (1, 0): 1|1,0,
 Transition from (1, 0) to ('.1', 0): 0|-,
 Transition from (1, 0) to (1, 0): 1|0]
>>> NAFweight(binary_27)
[1, 0, 1, 0, 0, 1, 0]
```

Now, we actually compute the asymptotic moments:

```
sage: # needs sage.symbolic
sage: moments = NAFweight.asymptotic_moments()
sage: moments['expectation']
1/3*n + Order(1)
sage: moments['variance']
2/27*n + Order(1)
sage: moments['covariance']
Order(1)
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> moments = NAFweight.asymptotic_moments()
>>> moments['expectation']
1/3*n + Order(1)
>>> moments['variance']
2/27*n + Order(1)
>>> moments['covariance']
Order(1)
```

3. This is Example 3.16 in [HKW2015], where a transducer with variable output labels is given. There, the aim was to choose the output labels of this very simple transducer such that the input and output sum are asymptotically independent, i.e., the constant c vanishes.

```
sage: # needs sage.symbolic
sage: var('a_1, a_2, a_3, a_4')
(a_1, a_2, a_3, a_4)
sage: T = Transducer([[0, 0, 0, a_1], [0, 1, 1, a_3],
....:                 [1, 0, 0, a_4], [1, 1, 1, a_2]],
....:                initial_states=[0], final_states=[0, 1])
```

(continues on next page)

(continued from previous page)

```
sage: moments = T.asymptotic_moments()
verbose 0 (...) Non-integer output weights lead to
significant performance degradation.
sage: moments['expectation']
1/4*(a_1 + a_2 + a_3 + a_4)*n + Order(1)
sage: moments['covariance']
-1/4*(a_1 - a_2)*n + Order(1)
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> var('a_1, a_2, a_3, a_4')
(a_1, a_2, a_3, a_4)
>>> T = Transducer([[Integer(0), Integer(0), Integer(0), a_1],␣
↪[Integer(0), Integer(1), Integer(1), a_3],
...                 [Integer(1), Integer(0), Integer(0), a_4],␣
↪[Integer(1), Integer(1), Integer(1), a_2]],
...                initial_states=[Integer(0)], final_states=[Integer(0),␣
↪Integer(1)])
>>> moments = T.asymptotic_moments()
verbose 0 (...) Non-integer output weights lead to
significant performance degradation.
>>> moments['expectation']
1/4*(a_1 + a_2 + a_3 + a_4)*n + Order(1)
>>> moments['covariance']
-1/4*(a_1 - a_2)*n + Order(1)
```

Therefore, the asymptotic covariance vanishes if and only if $a_2 = a_1$.

4. This is Example 4.3 in [HKW2015], dealing with the transducer converting the binary expansion of an integer into Gray code (cf. the Wikipedia article Gray_code and the *example on Gray code*):

```
sage: # needs sage.symbolic
sage: moments = transducers.GrayCode().asymptotic_moments()
sage: moments['expectation']
1/2*n + Order(1)
sage: moments['variance']
1/4*n + Order(1)
sage: moments['covariance']
Order(1)
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> moments = transducers.GrayCode().asymptotic_moments()
>>> moments['expectation']
1/2*n + Order(1)
>>> moments['variance']
1/4*n + Order(1)
>>> moments['covariance']
Order(1)
```

5. This is the first part of Example 4.4 in [HKW2015], counting the number of 10 blocks in the standard binary expansion. The least significant digit is at the left-most position:

```
sage: block10 = transducers.CountSubblockOccurrences(
....:     [1, 0],
....:     input_alphabet=[0, 1])
sage: sorted(block10.transitions())
[Transition from () to (): 0|0,
 Transition from () to (1,): 1|0,
 Transition from (1,) to (): 0|1,
 Transition from (1,) to (1,): 1|0]

sage: # needs sage.symbolic
sage: moments = block10.asymptotic_moments()
sage: moments['expectation']
1/4*n + Order(1)
sage: moments['variance']
1/16*n + Order(1)
sage: moments['covariance']
Order(1)
```

```
>>> from sage.all import *
>>> block10 = transducers.CountSubblockOccurrences(
...     [Integer(1), Integer(0)],
...     input_alphabet=[Integer(0), Integer(1)])
>>> sorted(block10.transitions())
[Transition from () to (): 0|0,
 Transition from () to (1,): 1|0,
 Transition from (1,) to (): 0|1,
 Transition from (1,) to (1,): 1|0]

>>> # needs sage.symbolic
>>> moments = block10.asymptotic_moments()
>>> moments['expectation']
1/4*n + Order(1)
>>> moments['variance']
1/16*n + Order(1)
>>> moments['covariance']
Order(1)
```

6. This is the second part of Example 4.4 in [HKW2015], counting the number of 11 blocks in the standard binary expansion. The least significant digit is at the left-most position:

```
sage: block11 = transducers.CountSubblockOccurrences(
....:     [1, 1],
....:     input_alphabet=[0, 1])
sage: sorted(block11.transitions())
[Transition from () to (): 0|0,
 Transition from () to (1,): 1|0,
 Transition from (1,) to (): 0|0,
 Transition from (1,) to (1,): 1|1]

sage: # needs sage.symbolic
sage: var('N')
N
sage: moments = block11.asymptotic_moments(N)
```

(continues on next page)

(continued from previous page)

```
sage: moments['expectation']
1/4*N + Order(1)
sage: moments['variance']
5/16*N + Order(1)
sage: correlation = (moments['covariance'].coefficient(N) /
....:                (1/2 * sqrt(moments['variance'].coefficient(N))))
sage: correlation
2/5*sqrt(5)
```

```
>>> from sage.all import *
>>> block11 = transducers.CountSubblockOccurrences(
...     [Integer(1), Integer(1)],
...     input_alphabet=[Integer(0), Integer(1)])
>>> sorted(block11.transitions())
[Transition from () to (): 0|0,
 Transition from () to (1,): 1|0,
 Transition from (1,) to (): 0|0,
 Transition from (1,) to (1,): 1|1]

>>> # needs sage.symbolic
>>> var('N')
N
>>> moments = block11.asymptotic_moments(N)
>>> moments['expectation']
1/4*N + Order(1)
>>> moments['variance']
5/16*N + Order(1)
>>> correlation = (moments['covariance'].coefficient(N) /
...                (Integer(1)/Integer(2) * sqrt(moments['variance'].
↪coefficient(N))))
>>> correlation
2/5*sqrt(5)
```

7. This is Example 4.5 in [HKW2015], counting the number of 01 blocks minus the number of 10 blocks in the standard binary expansion. The least significant digit is at the left-most position:

```
sage: block01 = transducers.CountSubblockOccurrences(
....:     [0, 1],
....:     input_alphabet=[0, 1])
sage: product_01x10 = block01.cartesian_product(block10)
sage: block_difference = transducers.sub([0, 1])(product_01x10)
sage: T = block_difference.simplification().relabeled()
sage: T.transitions()
[Transition from 0 to 2: 0|-1,
 Transition from 0 to 0: 1|0,
 Transition from 1 to 2: 0|0,
 Transition from 1 to 0: 1|0,
 Transition from 2 to 2: 0|0,
 Transition from 2 to 0: 1|1]

sage: # needs sage.symbolic
sage: moments = T.asymptotic_moments()
```

(continues on next page)

(continued from previous page)

```
sage: moments['expectation']
Order(1)
sage: moments['variance']
Order(1)
sage: moments['covariance']
Order(1)
```

```
>>> from sage.all import *
>>> block01 = transducers.CountSubblockOccurrences(
...     [Integer(0), Integer(1)],
...     input_alphabet=[Integer(0), Integer(1)])
>>> product_01x10 = block01.cartesian_product(block10)
>>> block_difference = transducers.sub([Integer(0), Integer(1)])(product_
↪01x10)
>>> T = block_difference.simplification().relabeled()
>>> T.transitions()
[Transition from 0 to 2: 0|-1,
 Transition from 0 to 0: 1|0,
 Transition from 1 to 2: 0|0,
 Transition from 1 to 0: 1|0,
 Transition from 2 to 2: 0|0,
 Transition from 2 to 0: 1|1]

>>> # needs sage.symbolic
>>> moments = T.asymptotic_moments()
>>> moments['expectation']
Order(1)
>>> moments['variance']
Order(1)
>>> moments['covariance']
Order(1)
```

8. The finite state machine must have a unique final component:

```
sage: T = Transducer([(0, -1, -1, -1), (0, 1, 1, 1),
....:                 (-1, -1, -1, -1), (-1, -1, 1, -1),
....:                 (1, 1, -1, 1), (1, 1, 1, 1)],
....:                initial_states=[0],
....:                final_states=[0, 1, -1])
sage: T.asymptotic_moments()
Traceback (most recent call last):
...
NotImplementedError: asymptotic_moments is only
implemented for finite state machines with one final
component.
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), -Integer(1), -Integer(1), -Integer(1)),␣
↪(Integer(0), Integer(1), Integer(1), Integer(1)),
...                 (-Integer(1), -Integer(1), -Integer(1), -Integer(1)),␣
↪(-Integer(1), -Integer(1), Integer(1), -Integer(1)),
...                 (Integer(1), Integer(1), -Integer(1), Integer(1)),␣
```

(continues on next page)

(continued from previous page)

```
↪(Integer(1), Integer(1), Integer(1), Integer(1))],
...                initial_states=[Integer(0)],
...                final_states=[Integer(0), Integer(1), -Integer(1)])
>>> T.asymptotic_moments()
Traceback (most recent call last):
...
NotImplementedError: asymptotic_moments is only
implemented for finite state machines with one final
component.
```

In this particular example, the first letter of the input decides whether we reach the loop at -1 or the loop at 1. In the first case, we have $X_n = -n$, while we have $X_n = n$ in the second case. Therefore, the expectation $E(X_n)$ of X_n is $E(X_n) = 0$. We get $(X_n - E(X_n))^2 = n^2$ in all cases, which results in a variance of n^2.

So this example shows that the variance may be non-linear if there is more than one final component.

ALGORITHM:

See [HKW2015], Theorem 3.9.

REFERENCES:

coaccessible_components()

Return the sub-machine induced by the coaccessible states of this finite state machine.

OUTPUT:

A finite state machine of the same type as this finite state machine.

EXAMPLES:

```
sage: A = automata.ContainsWord([1, 1],
....:     input_alphabet=[0, 1]).complement().minimization().relabeled()
sage: A.transitions()
[Transition from 0 to 0: 0|-,
 Transition from 0 to 0: 1|-,
 Transition from 1 to 2: 0|-,
 Transition from 1 to 0: 1|-,
 Transition from 2 to 2: 0|-,
 Transition from 2 to 1: 1|-]
sage: A.initial_states()
[2]
sage: A.final_states()
[1, 2]
sage: C = A.coaccessible_components()
sage: C.transitions()
[Transition from 1 to 2: 0|-,
 Transition from 2 to 2: 0|-,
 Transition from 2 to 1: 1|-]
```

```
>>> from sage.all import *
>>> A = automata.ContainsWord([Integer(1), Integer(1)],
...     input_alphabet=[Integer(0), Integer(1)]).complement().minimization().
↪relabeled()
>>> A.transitions()
```

(continues on next page)

(continued from previous page)

```
[Transition from 0 to 0: 0|-,
 Transition from 0 to 0: 1|-,
 Transition from 1 to 2: 0|-,
 Transition from 1 to 0: 1|-,
 Transition from 2 to 2: 0|-,
 Transition from 2 to 1: 1|-]
>>> A.initial_states()
[2]
>>> A.final_states()
[1, 2]
>>> C = A.coaccessible_components()
>>> C.transitions()
[Transition from 1 to 2: 0|-,
 Transition from 2 to 2: 0|-,
 Transition from 2 to 1: 1|-]
```

See also

accessible_components(), *induced_sub_finite_state_machine()*

completion(*sink=None*)

Return a completion of this finite state machine.

INPUT:

- `sink` – either an instance of *FSMState* or a label for the sink (default: `None`); if `None`, the least available nonzero integer is used

OUTPUT:

A *FiniteStateMachine* of the same type as this finite state machine.

The resulting finite state machine is a complete version of this finite state machine. A finite state machine is considered to be complete if each transition has an input label of length one and for each pair (q, a) where q is a state and a is an element of the input alphabet, there is exactly one transition from q with input label a.

If this finite state machine is already complete, a deep copy is returned. Otherwise, a new non-final state (usually called a sink) is created and transitions to this sink are introduced as appropriate.

EXAMPLES:

```
sage: F = FiniteStateMachine([(0, 0, 0, 0),
....:                         (0, 1, 1, 1),
....:                         (1, 1, 0, 0)])
sage: F.is_complete()
False
sage: G1 = F.completion()
sage: G1.is_complete()
True
sage: G1.transitions()
[Transition from 0 to 0: 0|0,
 Transition from 0 to 1: 1|1,
 Transition from 1 to 1: 0|0,
 Transition from 1 to 2: 1|-,
```

(continues on next page)

(continued from previous page)

```
 Transition from 2 to 2: 0|-,
 Transition from 2 to 2: 1|-]
sage: G2 = F.completion('Sink')
sage: G2.is_complete()
True
sage: G2.transitions()
[Transition from 0 to 0: 0|0,
 Transition from 0 to 1: 1|1,
 Transition from 1 to 1: 0|0,
 Transition from 1 to 'Sink': 1|-,
 Transition from 'Sink' to 'Sink': 0|-,
 Transition from 'Sink' to 'Sink': 1|-]
sage: F.completion(1)
Traceback (most recent call last):
...
ValueError: The finite state machine already contains a state
'1'.
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine([(Integer(0), Integer(0), Integer(0), Integer(0)),
...                         (Integer(0), Integer(1), Integer(1), Integer(1)),
...                         (Integer(1), Integer(1), Integer(0), Integer(0))])
>>> F.is_complete()
False
>>> G1 = F.completion()
>>> G1.is_complete()
True
>>> G1.transitions()
[Transition from 0 to 0: 0|0,
 Transition from 0 to 1: 1|1,
 Transition from 1 to 1: 0|0,
 Transition from 1 to 2: 1|-,
 Transition from 2 to 2: 0|-,
 Transition from 2 to 2: 1|-]
>>> G2 = F.completion('Sink')
>>> G2.is_complete()
True
>>> G2.transitions()
[Transition from 0 to 0: 0|0,
 Transition from 0 to 1: 1|1,
 Transition from 1 to 1: 0|0,
 Transition from 1 to 'Sink': 1|-,
 Transition from 'Sink' to 'Sink': 0|-,
 Transition from 'Sink' to 'Sink': 1|-]
>>> F.completion(Integer(1))
Traceback (most recent call last):
...
ValueError: The finite state machine already contains a state
'1'.
```

An input alphabet must be given:

```
sage: F = FiniteStateMachine([(0, 0, 0, 0),
....:                         (0, 1, 1, 1),
....:                         (1, 1, 0, 0)],
....:                        determine_alphabets=False)
sage: F.is_complete()
Traceback (most recent call last):
...
ValueError: No input alphabet is given. Try calling
determine_alphabets().
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine([(Integer(0), Integer(0), Integer(0), Integer(0)),
...                         (Integer(0), Integer(1), Integer(1), Integer(1)),
...                         (Integer(1), Integer(1), Integer(0), Integer(0))],
...                        determine_alphabets=False)
>>> F.is_complete()
Traceback (most recent call last):
...
ValueError: No input alphabet is given. Try calling
determine_alphabets().
```

Non-deterministic machines are not allowed.

```
sage: F = FiniteStateMachine([(0, 0, 0, 0), (0, 1, 0, 0)])
sage: F.is_complete()
False
sage: F.completion()
Traceback (most recent call last):
...
ValueError: The finite state machine must be deterministic.
sage: F = FiniteStateMachine([(0, 0, [0, 0], 0)])
sage: F.is_complete()
False
sage: F.completion()
Traceback (most recent call last):
...
ValueError: The finite state machine must be deterministic.
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine([(Integer(0), Integer(0), Integer(0), Integer(0)),␣
↪(Integer(0), Integer(1), Integer(0), Integer(0))])
>>> F.is_complete()
False
>>> F.completion()
Traceback (most recent call last):

ValueError: The finite state machine must be deterministic.
```

See also

is_complete(), *split_transitions()*, *determine_alphabets()*, *is_deterministic()*.

composition(*other*, *algorithm=None*, *only_accessible_components=True*)

Return a new transducer which is the composition of `self` and `other`.

INPUT:

- `other` – a transducer
- `algorithm` – can be one of the following
  - `direct` – the composition is calculated directly

    There can be arbitrarily many initial and final states, but the input and output labels must have length 1.

    Warning

    The output of `other` is fed into `self`.

  - `explorative` – an explorative algorithm is used

    The input alphabet of `self` has to be specified.

    Warning

    The output of `other` is fed into `self`.

  If algorithm is `None`, then the algorithm is chosen automatically (at the moment always `direct`, except when there are output words of `other` or input words of `self` of length greater than 1).

OUTPUT: a new transducer

The labels of the new finite state machine are pairs of states of the original finite state machines. The color of a new state is the tuple of colors of the constituent states.

EXAMPLES:

```
sage: F = Transducer([('A', 'B', 1, 0), ('B', 'A', 0, 1)],
....:                initial_states=['A', 'B'], final_states=['B'],
....:                determine_alphabets=True)
sage: G = Transducer([(1, 1, 1, 0), (1, 2, 0, 1),
....:                 (2, 2, 1, 1), (2, 2, 0, 0)],
....:                initial_states=[1], final_states=[2],

 Transition from (2, 'A') to (2, 'B'): 1|0]
>>> Hd == He
True
```

The following example has output of length > 1, so the explorative algorithm has to be used (and is selected automatically).

```
sage: F = Transducer([('A', 'B', 1, [1, 0]), ('B', 'B', 1, 1),
....:                 ('B', 'B', 0, 0)],
```

(continues on next page)

(continued from previous page)

```
....:                 initial_states=['A'], final_states=['B'])
sage: G = Transducer([(1, 1, 0, 0), (1, 2, 1, 0),
....:                  (2, 2, 0, 1), (2, 1, 1, 1)],
....:                 initial_states=[1], final_states=[1])
sage: He = G.composition(F, algorithm='explorative')
sage: He.transitions()
[Transition from ('A', 1) to ('B', 2): 1|0,1,
 Transition from ('B', 2) to ('B', 2): 0|1,
 Transition from ('B', 2) to ('B', 1): 1|1,
 Transition from ('B', 1) to ('B', 1): 0|0,
 Transition from ('B', 1) to ('B', 2): 1|0]
sage: Ha = G.composition(F)
sage: Ha == He
True
```

```
>>> from sage.all import *
>>> F = Transducer([('A', 'B', Integer(1), [Integer(1), Integer(0)]), ('B', 'B
↪', Integer(1), Integer(1)),
...                 ('B', 'B', Integer(0), Integer(0))],
...                initial_states=['A'], final_states=['B'])
>>> G = Transducer([(Integer(1), Integer(1), Integer(0), Integer(0)),␣
↪(Integer(1), Integer(2), Integer(1), Integer(0)),
...                 (Integer(2), Integer(2), Integer(0), Integer(1)),␣
↪(Integer(2), Integer(1), Integer(1), Integer(1))],
...                initial_states=[Integer(1)], final_states=[Integer(1)])
>>> He = G.composition(F, algorithm='explorative')
>>> He.transitions()
[Transition from ('A', 1) to ('B', 2): 1|0,1,
 Transition from ('B', 2) to ('B', 2): 0|1,
 Transition from ('B', 2) to ('B', 1): 1|1,
 Transition from ('B', 1) to ('B', 1): 0|0,
 Transition from ('B', 1) to ('B', 2): 1|0]
>>> Ha = G.composition(F)
>>> Ha == He
True
```

Final output words are also considered:

```
sage: F = Transducer([('A', 'B', 1, 0), ('B', 'A', 0, 1)],
....:                 initial_states=['A', 'B'],
....:                 final_states=['A', 'B'])
sage: F.state('A').final_word_out = 0
sage: F.state('B').final_word_out = 1
sage: G = Transducer([(1, 1, 1, 0), (1, 2, 0, 1),
....:                  (2, 2, 1, 1), (2, 2, 0, 0)],
....:                 initial_states=[1], final_states=[2])
sage: G.state(2).final_word_out = 0
sage: Hd = F.composition(G, algorithm='direct')
sage: Hd.final_states()
[(2, 'B')]
sage: He = F.composition(G, algorithm='explorative')
sage: He.final_states()
```

(continues on next page)

(continued from previous page)

```
[(2, 'B')]
```

```
>>> from sage.all import *
>>> F = Transducer([('A', 'B', Integer(1), Integer(0)), ('B', 'A', Integer(0),
↪ Integer(1))],
...                initial_states=['A', 'B'],
...                final_states=['A', 'B'])
>>> F.state('A').final_word_out = Integer(0)
>>> F.state('B').final_word_out = Integer(1)
>>> G = Transducer([(Integer(1), Integer(1), Integer(1), Integer(0)),␣
↪(Integer(1), Integer(2), Integer(0), Integer(1)),
...                 (Integer(2), Integer(2), Integer(1), Integer(1)),␣
↪(Integer(2), Integer(2), Integer(0), Integer(0))],
...                initial_states=[Integer(1)], final_states=[Integer(2)])
>>> G.state(Integer(2)).final_word_out = Integer(0)
>>> Hd = F.composition(G, algorithm='direct')
>>> Hd.final_states()
[(2, 'B')]
>>> He = F.composition(G, algorithm='explorative')
>>> He.final_states()
[(2, 'B')]
```

Note that `(2, 'A')` is not final, as the final output 0 of state 2 of G cannot be processed in state `'A'` of F.

```
sage: [s.final_word_out for s in Hd.final_states()]
[[1, 0]]
sage: [s.final_word_out for s in He.final_states()]
[[1, 0]]
sage: Hd == He
True
```

```
>>> from sage.all import *
>>> [s.final_word_out for s in Hd.final_states()]
[[1, 0]]
>>> [s.final_word_out for s in He.final_states()]
[[1, 0]]
>>> Hd == He
True
```

Here is a non-deterministic example with intermediate output length > 1.

```
sage: F = Transducer([(1, 1, 1, ['a', 'a']), (1, 2, 1, 'b'),
....:                 (2, 1, 2, 'a'), (2, 2, 2, 'b')],
....:                initial_states=[1, 2])
sage: G = Transducer([('A', 'A', 'a', 'i'),
....:                 ('A', 'B', 'a', 'l'),
....:                 ('B', 'B', 'b', 'e')],
....:                initial_states=['A', 'B'])
sage: G(F).transitions()
[Transition from (1, 'A') to (1, 'A'): 1|'i','i',
 Transition from (1, 'A') to (1, 'B'): 1|'i','l',
 Transition from (1, 'B') to (2, 'B'): 1|'e',
```

(continues on next page)

(continued from previous page)

```
 Transition from (2, 'A') to (1, 'A'): 2|'i',
 Transition from (2, 'A') to (1, 'B'): 2|'l',
 Transition from (2, 'B') to (2, 'B'): 2|'e']
```

```
>>> from sage.all import *
>>> F = Transducer([(Integer(1), Integer(1), Integer(1), ['a', 'a']),␣
↪(Integer(1), Integer(2), Integer(1), 'b'),
...                 (Integer(2), Integer(1), Integer(2), 'a'), (Integer(2),␣
↪Integer(2), Integer(2), 'b')],
...                 initial_states=[Integer(1), Integer(2)])
>>> G = Transducer([('A', 'A', 'a', 'i'),
...                 ('A', 'B', 'a', 'l'),
...                 ('B', 'B', 'b', 'e')],
...                 initial_states=['A', 'B'])
>>> G(F).transitions()
[Transition from (1, 'A') to (1, 'A'): 1|'i','i',
 Transition from (1, 'A') to (1, 'B'): 1|'i','l',
 Transition from (1, 'B') to (2, 'B'): 1|'e',
 Transition from (2, 'A') to (1, 'A'): 2|'i',
 Transition from (2, 'A') to (1, 'B'): 2|'l',
 Transition from (2, 'B') to (2, 'B'): 2|'e']
```

Be aware that after composition, different transitions may share the same output label (same python object):

```
sage: F = Transducer([ ('A','B',0,0), ('B','A',0,0)],
....:                initial_states=['A'],
....:                final_states=['A'])
sage: F.transitions()[0].word_out is F.transitions()[1].word_out
False
sage: G = Transducer([('C','C',0,1)],
....:                initial_states=['C'],
....:                final_states=['C'])
sage: H = G.composition(F)
sage: H.transitions()[0].word_out is H.transitions()[1].word_out
True
```

```
>>> from sage.all import *
>>> F = Transducer([ ('A','B',Integer(0),Integer(0)), ('B','A',Integer(0),
↪Integer(0))],
...                initial_states=['A'],
...                final_states=['A'])
>>> F.transitions()[Integer(0)].word_out is F.transitions()[Integer(1)].word_
↪out
False
>>> G = Transducer([('C','C',Integer(0),Integer(1))],
...                initial_states=['C'],
...                final_states=['C'])
>>> H = G.composition(F)
>>> H.transitions()[Integer(0)].word_out is H.transitions()[Integer(1)].word_
↪out
True
```

concatenation(*other*)

Concatenate this finite state machine with another finite state machine.

INPUT:

- `other` – a *FiniteStateMachine*

OUTPUT:

A *FiniteStateMachine* of the same type as this finite state machine.

Assume that both finite state machines are automata. If $\mathcal{L}_1$ is the language accepted by this automaton and $\mathcal{L}_2$ is the language accepted by the other automaton, then the language accepted by the concatenated automaton is $\{w_1w_2 \mid w_1 \in \mathcal{L}_1, w_2 \in \mathcal{L}_2\}$ where w_1w_2 denotes the concatenation of the words w_1 and w_2.

Assume that both finite state machines are transducers and that this transducer maps words $w_1 \in \mathcal{L}_1$ to words $f_1(w_1)$ and that the other transducer maps words $w_2 \in \mathcal{L}_2$ to words $f_2(w_2)$. Then the concatenated transducer maps words w_1w_2 with $w_1 \in \mathcal{L}_1$ and $w_2 \in \mathcal{L}_2$ to $f_1(w_1)f_2(w_2)$. Here, w_1w_2 and $f_1(w_1)f_2(w_2)$ again denote concatenation of words.

The input alphabet is the union of the input alphabets (if possible) and `None` otherwise. In the latter case, try calling *determine_alphabets()*.

Instead of `A.concatenation(B)`, the notation `A * B` can be used.

EXAMPLES:

Concatenation of two automata:

```
sage: A = automata.Word([0])
sage: B = automata.Word([1])
sage: C = A.concatenation(B)
sage: C.transitions()
[Transition from (0, 0) to (0, 1): 0|-,
 Transition from (0, 1) to (1, 0): -|-,
 Transition from (1, 0) to (1, 1): 1|-]
sage: [w
....:  for w in ([0, 0], [0, 1], [1, 0], [1, 1])
....:  if C(w)]
[[0, 1]]
sage: from sage.combinat.finite_state_machine import (
....:     Automaton, Transducer)
sage: isinstance(C, Automaton)
True
```

```
>>> from sage.all import *
>>> A = automata.Word([Integer(0)])
>>> B = automata.Word([Integer(1)])
>>> C = A.concatenation(B)
>>> C.transitions()
[Transition from (0, 0) to (0, 1): 0|-,
 Transition from (0, 1) to (1, 0): -|-,
 Transition from (1, 0) to (1, 1): 1|-]
>>> [w
...  for w in ([Integer(0), Integer(0)], [Integer(0), Integer(1)],␣
↪[Integer(1), Integer(0)], [Integer(1), Integer(1)])
...  if C(w)]
[[0, 1]]
```

(continues on next page)

(continued from previous page)

```
>>> from sage.combinat.finite_state_machine import (
...     Automaton, Transducer)
>>> isinstance(C, Automaton)
True
```

Concatenation of two transducers:

```
sage: A = Transducer([(0, 1, 0, 1), (0, 1, 1, 2)],
....:                initial_states=[0],
....:                final_states=[1])
sage: B = Transducer([(0, 1, 0, 1), (0, 1, 1, 0)],
....:                initial_states=[0],
....:                final_states=[1])
sage: C = A.concatenation(B)
sage: C.transitions()
[Transition from (0, 0) to (0, 1): 0|1,
 Transition from (0, 0) to (0, 1): 1|2,
 Transition from (0, 1) to (1, 0): -|-,
 Transition from (1, 0) to (1, 1): 0|1,
 Transition from (1, 0) to (1, 1): 1|0]
sage: [(w, C(w)) for w in ([0, 0], [0, 1], [1, 0], [1, 1])]
[([0, 0], [1, 1]),
 ([0, 1], [1, 0]),
 ([1, 0], [2, 1]),
 ([1, 1], [2, 0])]
sage: isinstance(C, Transducer)
True
```

```
>>> from sage.all import *
>>> A = Transducer([(Integer(0), Integer(1), Integer(0), Integer(1)),␣
↪(Integer(0), Integer(1), Integer(1), Integer(2))],
...                initial_states=[Integer(0)],
...                final_states=[Integer(1)])
>>> B = Transducer([(Integer(0), Integer(1), Integer(0), Integer(1)),␣
↪(Integer(0), Integer(1), Integer(1), Integer(0))],
...                initial_states=[Integer(0)],
...                final_states=[Integer(1)])
>>> C = A.concatenation(B)
>>> C.transitions()
[Transition from (0, 0) to (0, 1): 0|1,
 Transition from (0, 0) to (0, 1): 1|2,
 Transition from (0, 1) to (1, 0): -|-,
 Transition from (1, 0) to (1, 1): 0|1,
 Transition from (1, 0) to (1, 1): 1|0]
>>> [(w, C(w)) for w in ([Integer(0), Integer(0)], [Integer(0), Integer(1)],␣
↪[Integer(1), Integer(0)], [Integer(1), Integer(1)])]
[([0, 0], [1, 1]),
 ([0, 1], [1, 0]),
 ([1, 0], [2, 1]),
 ([1, 1], [2, 0])]
>>> isinstance(C, Transducer)
True
```

Alternative notation as multiplication:

```
sage: C == A * B
True
```

```
>>> from sage.all import *
>>> C == A * B
True
```

Final output words are taken into account:

```
sage: A = Transducer([(0, 1, 0, 1)],
....:                initial_states=[0],
....:                final_states=[1])
sage: A.state(1).final_word_out = 2
sage: B = Transducer([(0, 1, 0, 3)],
....:                initial_states=[0],
....:                final_states=[1])
sage: B.state(1).final_word_out = 4
sage: C = A * B
sage: C([0, 0])
[1, 2, 3, 4]
```

```
>>> from sage.all import *
>>> A = Transducer([(Integer(0), Integer(1), Integer(0), Integer(1))],
...                initial_states=[Integer(0)],
...                final_states=[Integer(1)])
>>> A.state(Integer(1)).final_word_out = Integer(2)
>>> B = Transducer([(Integer(0), Integer(1), Integer(0), Integer(3))],
...                initial_states=[Integer(0)],
...                final_states=[Integer(1)])
>>> B.state(Integer(1)).final_word_out = Integer(4)
>>> C = A * B
>>> C([Integer(0), Integer(0)])
[1, 2, 3, 4]
```

Handling of the input alphabet:

```
sage: A = Automaton([(0, 0, 0)])
sage: B = Automaton([(0, 0, 1)], input_alphabet=[1, 2])
sage: C = Automaton([(0, 0, 2)], determine_alphabets=False)
sage: D = Automaton([(0, 0, [[0, 0]])], input_alphabet=[[0, 0]])
sage: A.input_alphabet
[0]
sage: B.input_alphabet
[1, 2]
sage: C.input_alphabet is None
True
sage: D.input_alphabet
[[0, 0]]
sage: (A * B).input_alphabet
[0, 1, 2]
sage: (A * C).input_alphabet is None
```

(continues on next page)

(continued from previous page)

```
True
sage: (A * D).input_alphabet is None
True
```

```
>>> from sage.all import *
>>> A = Automaton([(Integer(0), Integer(0), Integer(0))])
>>> B = Automaton([(Integer(0), Integer(0), Integer(1))], input_
↪alphabet=[Integer(1), Integer(2)])
>>> C = Automaton([(Integer(0), Integer(0), Integer(2))], determine_
↪alphabets=False)
>>> D = Automaton([(Integer(0), Integer(0), [[Integer(0), Integer(0)]])],␣
↪input_alphabet=[[Integer(0), Integer(0)]])
>>> A.input_alphabet
[0]
>>> B.input_alphabet
[1, 2]
>>> C.input_alphabet is None
True
>>> D.input_alphabet
[[0, 0]]
>>> (A * B).input_alphabet
[0, 1, 2]
>>> (A * C).input_alphabet is None
True
>>> (A * D).input_alphabet is None
True
```

See also

disjoint_union(), *determine_alphabets()*.

construct_final_word_out(*letters*, *allow_non_final=True*)

This is an inplace version of *with_final_word_out()*. See *with_final_word_out()* for documentation and examples.

copy()

Return a (shallow) copy of the finite state machine.

OUTPUT: a new finite state machine

deepcopy(*memo=None*)

Return a deep copy of the finite state machine.

INPUT:

- `memo` – (default: `None`) a dictionary storing already processed elements

OUTPUT: a new finite state machine

EXAMPLES:

```
sage: F = FiniteStateMachine([('A', 'A', 0, 1), ('A', 'A', 1, 0)])
sage: deepcopy(F)
Finite state machine with 1 state
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine([('A', 'A', Integer(0), Integer(1)), ('A', 'A',␣
↪Integer(1), Integer(0))])
>>> deepcopy(F)
Finite state machine with 1 state
```

default_format_letter = <sage.misc.latex.Latex object>

default_format_transition_label(*word*)

Default formatting of words in transition labels for LaTeX output.

INPUT:

- `word` – list of letters

OUTPUT:

String representation of `word` suitable to be typeset in mathematical mode.

- For a non-empty word: Concatenation of the letters, piped through `self.format_letter` and separated by blanks.
- For an empty word: `sage.combinat.finite_state_machine.EmptyWordLaTeX`.

There is also a variant *format_transition_label_reversed()* writing the words in reversed order.

EXAMPLES:

1. Example of a non-empty word:

```
sage: T = Transducer()
sage: print(T.default_format_transition_label(
....:     ['a', 'alpha', 'a_1', '0', 0, (0, 1)]))
\text{\texttt{a}} \text{\texttt{alpha}}
\text{\texttt{a{\char`\_}1}} 0 0 \left(0, 1\right)
```

```
>>> from sage.all import *
>>> T = Transducer()
>>> print(T.default_format_transition_label(
...     ['a', 'alpha', 'a_1', '0', Integer(0), (Integer(0), Integer(1))]))
\text{\texttt{a}} \text{\texttt{alpha}}
\text{\texttt{a{\char`\_}1}} 0 0 \left(0, 1\right)
```

2. In the example above, `'a'` and `'alpha'` should perhaps be symbols:

```
sage: var('a alpha a_1')                                                    #␣
↪needs sage.symbolic
(a, alpha, a_1)
sage: print(T.default_format_transition_label([a, alpha, a_1]))             #␣
↪needs sage.symbolic
a \alpha a_{1}
```

```
>>> from sage.all import *
>>> var('a alpha a_1')                                                      #␣
↪needs sage.symbolic
(a, alpha, a_1)
>>> print(T.default_format_transition_label([a, alpha, a_1]))               #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.symbolic
a \alpha a_{1}
```

3. Example of an empty word:

```
sage: print(T.default_format_transition_label([]))
\varepsilon
```

```
>>> from sage.all import *
>>> print(T.default_format_transition_label([]))
\varepsilon
```

We can change this by setting `sage.combinat.finite_state_machine.EmptyWordLaTeX`:

```
sage: sage.combinat.finite_state_machine.EmptyWordLaTeX = ''
sage: T.default_format_transition_label([])
''
```

```
>>> from sage.all import *
>>> sage.combinat.finite_state_machine.EmptyWordLaTeX = ''
>>> T.default_format_transition_label([])
''
```

Finally, we restore the default value:

```
sage: sage.combinat.finite_state_machine.EmptyWordLaTeX = r'\varepsilon'
```

```
>>> from sage.all import *
>>> sage.combinat.finite_state_machine.EmptyWordLaTeX = r'\varepsilon'
```

4. This method is the default value for `FiniteStateMachine.format_transition_label`. That can be changed to be any other function:

```
sage: A = Automaton([(0, 1, 0)])
sage: def custom_format_transition_label(word):
....:     return "t"
sage: A.latex_options(format_transition_label=custom_format_transition_
↪label)
sage: print(latex(A))
\begin{tikzpicture}[auto, initial text=, >=latex]
\node[state] (v0) at (3.000000, 0.000000) {$0$};
\node[state] (v1) at (-3.000000, 0.000000) {$1$};
\path[->] (v0) edge node[rotate=360.00, anchor=south] {$t$} (v1);
\end{tikzpicture}
```

```
>>> from sage.all import *
>>> A = Automaton([(Integer(0), Integer(1), Integer(0))])
>>> def custom_format_transition_label(word):
...     return "t"
>>> A.latex_options(format_transition_label=custom_format_transition_
↪label)
>>> print(latex(A))
```

(continues on next page)

(continued from previous page)

```
\begin{tikzpicture}[auto, initial text=, >=latex]
\node[state] (v0) at (3.000000, 0.000000) {$0$};
\node[state] (v1) at (-3.000000, 0.000000) {$1$};
\path[->] (v0) edge node[rotate=360.00, anchor=south] {$t$} (v1);
\end{tikzpicture}
```

delete_state(*s*)

Delete a state and all transitions coming or going to this state.

INPUT:

- `s` – a label of a state or an *FSMState*

OUTPUT: nothing

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMTransition
sage: t1 = FSMTransition('A', 'B', 0)
sage: t2 = FSMTransition('B', 'B', 1)
sage: F = FiniteStateMachine([t1, t2])
sage: F.delete_state('A')
sage: F.transitions()
[Transition from 'B' to 'B': 1|-]
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMTransition
>>> t1 = FSMTransition('A', 'B', Integer(0))
>>> t2 = FSMTransition('B', 'B', Integer(1))
>>> F = FiniteStateMachine([t1, t2])
>>> F.delete_state('A')
>>> F.transitions()
[Transition from 'B' to 'B': 1|-]
```

delete_transition(*t*)

Delete a transition by removing it from the list of transitions of the state, where the transition starts.

INPUT:

- `t` – a transition

OUTPUT: nothing

EXAMPLES:

```
sage: F = FiniteStateMachine([('A', 'B', 0), ('B', 'A', 1)])
sage: F.delete_transition(('A', 'B', 0))
sage: F.transitions()
[Transition from 'B' to 'A': 1|-]
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine([('A', 'B', Integer(0)), ('B', 'A', Integer(1))])
>>> F.delete_transition(('A', 'B', Integer(0)))
>>> F.transitions()
[Transition from 'B' to 'A': 1|-]
```

determine_alphabets(*reset=True*)

Determine the input and output alphabet according to the transitions in this finite state machine.

INPUT:

- `reset` – if reset is `True`, then the existing input and output alphabets are erased, otherwise new letters are appended to the existing alphabets.

OUTPUT: nothing

After this operation the input alphabet and the output alphabet of this finite state machine are a list of letters.

Todo

At the moment, the letters of the alphabets need to be hashable.

EXAMPLES:

```
sage: T = Transducer([(1, 1, 1, 0), (1, 2, 2, 1),
....:                 (2, 2, 1, 1), (2, 2, 0, 0)],
....:                final_states=[1],
....:                determine_alphabets=False)
sage: T.state(1).final_word_out = [1, 4]
sage: (T.input_alphabet, T.output_alphabet)
(None, None)
sage: T.determine_alphabets()
sage: (T.input_alphabet, T.output_alphabet)
([0, 1, 2], [0, 1, 4])
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(1), Integer(1), Integer(1), Integer(0)),␣
↪(Integer(1), Integer(2), Integer(2), Integer(1)),
...                 (Integer(2), Integer(2), Integer(1), Integer(1)),␣
↪(Integer(2), Integer(2), Integer(0), Integer(0))],
...                final_states=[Integer(1)],
...                determine_alphabets=False)
>>> T.state(Integer(1)).final_word_out = [Integer(1), Integer(4)]
>>> (T.input_alphabet, T.output_alphabet)
(None, None)
>>> T.determine_alphabets()
>>> (T.input_alphabet, T.output_alphabet)
([0, 1, 2], [0, 1, 4])
```

See also

determine_input_alphabet(), *determine_output_alphabet()*.

determine_input_alphabet(*reset=True*)

Determine the input alphabet according to the transitions of this finite state machine.

INPUT:

- `reset` – boolean (default: `True`); if `True`, then the existing input alphabet is erased, otherwise new letters are appended to the existing alphabet.

OUTPUT: nothing

After this operation the input alphabet of this finite state machine is a list of letters.

Todo

At the moment, the letters of the alphabet need to be hashable.

EXAMPLES:

```
sage: T = Transducer([(1, 1, 1, 0), (1, 2, 2, 1),
....:                 (2, 2, 1, 1), (2, 2, 0, 0)],
....:                final_states=[1],
....:                determine_alphabets=False)
sage: (T.input_alphabet, T.output_alphabet)
(None, None)
sage: T.determine_input_alphabet()
sage: (T.input_alphabet, T.output_alphabet)
([0, 1, 2], None)
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(1), Integer(1), Integer(1), Integer(0)),␣
↪(Integer(1), Integer(2), Integer(2), Integer(1)),
...                 (Integer(2), Integer(2), Integer(1), Integer(1)),␣
↪(Integer(2), Integer(2), Integer(0), Integer(0))],
...                final_states=[Integer(1)],
...                determine_alphabets=False)
>>> (T.input_alphabet, T.output_alphabet)
(None, None)
>>> T.determine_input_alphabet()
>>> (T.input_alphabet, T.output_alphabet)
([0, 1, 2], None)
```

See also

determine_output_alphabet(), *determine_alphabets()*.

determine_output_alphabet(*reset=True*)

Determine the output alphabet according to the transitions of this finite state machine.

INPUT:

- `reset` – boolean (default: `True`); if `True`, then the existing output alphabet is erased, otherwise new letters are appended to the existing alphabet.

OUTPUT: nothing

After this operation the output alphabet of this finite state machine is a list of letters.

Todo

At the moment, the letters of the alphabet need to be hashable.

EXAMPLES:

```
sage: T = Transducer([(1, 1, 1, 0), (1, 2, 2, 1),
....:                 (2, 2, 1, 1), (2, 2, 0, 0)],
....:                final_states=[1],
....:                determine_alphabets=False)
sage: T.state(1).final_word_out = [1, 4]
sage: (T.input_alphabet, T.output_alphabet)
(None, None)
sage: T.determine_output_alphabet()
sage: (T.input_alphabet, T.output_alphabet)
(None, [0, 1, 4])
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(1), Integer(1), Integer(1), Integer(0)),␣
↪(Integer(1), Integer(2), Integer(2), Integer(1)),
...                 (Integer(2), Integer(2), Integer(1), Integer(1)),␣
↪(Integer(2), Integer(2), Integer(0), Integer(0))],
...                final_states=[Integer(1)],
...                determine_alphabets=False)
>>> T.state(Integer(1)).final_word_out = [Integer(1), Integer(4)]
>>> (T.input_alphabet, T.output_alphabet)
(None, None)
>>> T.determine_output_alphabet()
>>> (T.input_alphabet, T.output_alphabet)
(None, [0, 1, 4])
```

See also

determine_input_alphabet(), *determine_alphabets()*.

digraph(*edge_labels='words_in_out'*)

alias of *graph()*.

disjoint_union(*other*)

Return the disjoint union of this and another finite state machine.

INPUT:

- `other` – a *FiniteStateMachine*

OUTPUT:

A finite state machine of the same type as this finite state machine.

In general, the disjoint union of two finite state machines is non-deterministic. In the case of a automata, the language accepted by the disjoint union is the union of the languages accepted by the constituent automata. In the case of transducer, for each successful path in one of the constituent transducers, there will be one successful path with the same input and output labels in the disjoint union.

The labels of the states of the disjoint union are pairs `(i, s)`: for each state `s` of this finite state machine, there is a state `(0, s)` in the disjoint union; for each state `s` of the other finite state machine, there is a state `(1, s)` in the disjoint union.

The input alphabet is the union of the input alphabets (if possible) and `None` otherwise. In the latter case, try calling *`determine_alphabets()`*.

The disjoint union can also be written as `A + B` or `A | B`.

EXAMPLES:

```
sage: A = Automaton([(0, 1, 0), (1, 0, 1)],
....:               initial_states=[0],
....:               final_states=[0])
sage: A([0, 1, 0, 1])
True
sage: B = Automaton([(0, 1, 0), (1, 2, 0), (2, 0, 1)],
....:               initial_states=[0],
....:               final_states=[0])
sage: B([0, 0, 1])
True
sage: C = A.disjoint_union(B)
sage: C
Automaton with 5 states
sage: C.transitions()
[Transition from (0, 0) to (0, 1): 0|-,
 Transition from (0, 1) to (0, 0): 1|-,
 Transition from (1, 0) to (1, 1): 0|-,
 Transition from (1, 1) to (1, 2): 0|-,
 Transition from (1, 2) to (1, 0): 1|-]
sage: C([0, 0, 1])
True
sage: C([0, 1, 0, 1])
True
sage: C([1])
False
sage: C.initial_states()
[(0, 0), (1, 0)]
```

```
>>> from sage.all import *
>>> A = Automaton([(Integer(0), Integer(1), Integer(0)), (Integer(1),␣
↪Integer(0), Integer(1))],
...               initial_states=[Integer(0)],
...               final_states=[Integer(0)])
>>> A([Integer(0), Integer(1), Integer(0), Integer(1)])
True
>>> B = Automaton([(Integer(0), Integer(1), Integer(0)), (Integer(1),␣
↪Integer(2), Integer(0)), (Integer(2), Integer(0), Integer(1))],
...               initial_states=[Integer(0)],
...               final_states=[Integer(0)])
>>> B([Integer(0), Integer(0), Integer(1)])
True
>>> C = A.disjoint_union(B)
>>> C
Automaton with 5 states
```

(continues on next page)

(continued from previous page)

```
>>> C.transitions()
[Transition from (0, 0) to (0, 1): 0|-,
 Transition from (0, 1) to (0, 0): 1|-,
 Transition from (1, 0) to (1, 1): 0|-,
 Transition from (1, 1) to (1, 2): 0|-,
 Transition from (1, 2) to (1, 0): 1|-]
>>> C([Integer(0), Integer(0), Integer(1)])
True
>>> C([Integer(0), Integer(1), Integer(0), Integer(1)])
True
>>> C([Integer(1)])
False
>>> C.initial_states()
[(0, 0), (1, 0)]
```

Instead of `.disjoint_union`, alternative notations are available:

```
sage: C1 = A + B
sage: C1 == C
True
sage: C2 = A | B
sage: C2 == C
True
```

```
>>> from sage.all import *
>>> C1 = A + B
>>> C1 == C
True
>>> C2 = A | B
>>> C2 == C
True
```

In general, the disjoint union is not deterministic.:

```
sage: C.is_deterministic()
False
sage: D = C.determinisation().minimization()
sage: D.is_equivalent(Automaton([(0, 0, 0), (0, 0, 1),
....:     (1, 7, 0), (1, 0, 1), (2, 6, 0), (2, 0, 1),
....:     (3, 5, 0), (3, 0, 1), (4, 0, 0), (4, 2, 1),
....:     (5, 0, 0), (5, 3, 1), (6, 4, 0), (6, 0, 1),
....:     (7, 4, 0), (7, 3, 1)],
....:     initial_states=[1],
....:     final_states=[1, 2, 3]))
True
```

```
>>> from sage.all import *
>>> C.is_deterministic()
False
>>> D = C.determinisation().minimization()
>>> D.is_equivalent(Automaton([(Integer(0), Integer(0), Integer(0)),␣
↪(Integer(0), Integer(0), Integer(1)),
```

(continues on next page)

(continued from previous page)

```
...     (Integer(1), Integer(7), Integer(0)), (Integer(1), Integer(0),␣
↪Integer(1)), (Integer(2), Integer(6), Integer(0)), (Integer(2), Integer(0),␣
↪Integer(1)),
...     (Integer(3), Integer(5), Integer(0)), (Integer(3), Integer(0),␣
↪Integer(1)), (Integer(4), Integer(0), Integer(0)), (Integer(4), Integer(2),␣
↪Integer(1)),
...     (Integer(5), Integer(0), Integer(0)), (Integer(5), Integer(3),␣
↪Integer(1)), (Integer(6), Integer(4), Integer(0)), (Integer(6), Integer(0),␣
↪Integer(1)),
...     (Integer(7), Integer(4), Integer(0)), (Integer(7), Integer(3),␣
↪Integer(1))],
...     initial_states=[Integer(1)],
...     final_states=[Integer(1), Integer(2), Integer(3)]))
True
```

Disjoint union of transducers:

```
sage: T1 = Transducer([(0, 0, 0, 1)],
....:                 initial_states=[0],
....:                 final_states=[0])
sage: T2 = Transducer([(0, 0, 0, 2)],
....:                 initial_states=[0],
....:                 final_states=[0])
sage: T1([0])
[1]
sage: T2([0])
[2]
sage: T = T1.disjoint_union(T2)
sage: T([0])
Traceback (most recent call last):
...
ValueError: Found more than one accepting path.
sage: T.process([0])
[(True, (0, 0), [1]), (True, (1, 0), [2])]
```

```
>>> from sage.all import *
>>> T1 = Transducer([(Integer(0), Integer(0), Integer(0), Integer(1))],
...                 initial_states=[Integer(0)],
...                 final_states=[Integer(0)])
>>> T2 = Transducer([(Integer(0), Integer(0), Integer(0), Integer(2))],
...                 initial_states=[Integer(0)],
...                 final_states=[Integer(0)])
>>> T1([Integer(0)])
[1]
>>> T2([Integer(0)])
[2]
>>> T = T1.disjoint_union(T2)
>>> T([Integer(0)])
Traceback (most recent call last):
...
ValueError: Found more than one accepting path.
>>> T.process([Integer(0)])
```

(continues on next page)

(continued from previous page)

```
[(True, (0, 0), [1]), (True, (1, 0), [2])]
```

Handling of the input alphabet (see Issue #18989):

```
sage: A = Automaton([(0, 0, 0)])
sage: B = Automaton([(0, 0, 1)], input_alphabet=[1, 2])
sage: C = Automaton([(0, 0, 2)], determine_alphabets=False)
sage: D = Automaton([(0, 0, [[0, 0]])], input_alphabet=[[0, 0]])
sage: A.input_alphabet
[0]
sage: B.input_alphabet
[1, 2]
sage: C.input_alphabet is None
True
sage: D.input_alphabet
[[0, 0]]
sage: (A + B).input_alphabet
[0, 1, 2]
sage: (A + C).input_alphabet is None
True
sage: (A + D).input_alphabet is None
True
```

```
>>> from sage.all import *
>>> A = Automaton([(Integer(0), Integer(0), Integer(0))])
>>> B = Automaton([(Integer(0), Integer(0), Integer(1))], input_
↪alphabet=[Integer(1), Integer(2)])
>>> C = Automaton([(Integer(0), Integer(0), Integer(2))], determine_
↪alphabets=False)
>>> D = Automaton([(Integer(0), Integer(0), [[Integer(0), Integer(0)]])],␣
↪input_alphabet=[[Integer(0), Integer(0)]])
>>> A.input_alphabet
[0]
>>> B.input_alphabet
[1, 2]
>>> C.input_alphabet is None
True
>>> D.input_alphabet
[[0, 0]]
>>> (A + B).input_alphabet
[0, 1, 2]
>>> (A + C).input_alphabet is None
True
>>> (A + D).input_alphabet is None
True
```

See also

Automaton.intersection(), *Transducer.intersection()*, *determine_alphabets()*.

empty_copy(*memo=None*, *new_class=None*)

Return an empty deep copy of the finite state machine, i.e., `input_alphabet`, `output_alphabet`, `on_duplicate_transition` are preserved, but states and transitions are not.

INPUT:

- `memo` – dictionary storing already processed elements
- `new_class` – a class for the copy; by default (`None`), the class of `self` is used

OUTPUT: a new finite state machine

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import duplicate_transition_
↪raise_error
sage: F = FiniteStateMachine([('A', 'A', 0, 2), ('A', 'A', 1, 3)],
....:                        input_alphabet=[0, 1],
....:                        output_alphabet=[2, 3],
....:                        on_duplicate_transition=duplicate_transition_
↪raise_error)
sage: FE = F.empty_copy(); FE
Empty finite state machine
sage: FE.input_alphabet
[0, 1]
sage: FE.output_alphabet
[2, 3]
sage: FE.on_duplicate_transition == duplicate_transition_raise_error
True
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import duplicate_transition_raise_
↪error
>>> F = FiniteStateMachine([('A', 'A', Integer(0), Integer(2)), ('A', 'A',␣
↪Integer(1), Integer(3))],
...                        input_alphabet=[Integer(0), Integer(1)],
...                        output_alphabet=[Integer(2), Integer(3)],
...                        on_duplicate_transition=duplicate_transition_raise_
↪error)
>>> FE = F.empty_copy(); FE
Empty finite state machine
>>> FE.input_alphabet
[0, 1]
>>> FE.output_alphabet
[2, 3]
>>> FE.on_duplicate_transition == duplicate_transition_raise_error
True
```

epsilon_successors(*state*)

Return the dictionary with states reachable from `state` without reading anything from an input tape as keys. The values are lists of outputs.

INPUT:

- `state` – the state whose epsilon successors should be determined

OUTPUT: a dictionary mapping states to a list of output words

The states in the output are the epsilon successors of `state`. Each word of the list of output words is a word written when taking a path from `state` to the corresponding state.

EXAMPLES:

```
sage: T = Transducer([(0, 1, None, 'a'), (1, 2, None, 'b')])
sage: T.epsilon_successors(0)
{1: [['a']], 2: [['a', 'b']]}
sage: T.epsilon_successors(1)
{2: [['b']]}
sage: T.epsilon_successors(2)
{}
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(1), None, 'a'), (Integer(1),␣
↪Integer(2), None, 'b')])
>>> T.epsilon_successors(Integer(0))
{1: [['a']], 2: [['a', 'b']]}
>>> T.epsilon_successors(Integer(1))
{2: [['b']]}
>>> T.epsilon_successors(Integer(2))
{}
```

If there is a cycle with only epsilon transitions, then this cycle is only processed once and there is no infinite loop:

```
sage: S = Transducer([(0, 1, None, 'a'), (1, 0, None, 'b')])
sage: S.epsilon_successors(0)
{0: [['a', 'b']], 1: [['a']]}
sage: S.epsilon_successors(1)
{0: [['b']], 1: [['b', 'a']]}
```

```
>>> from sage.all import *
>>> S = Transducer([(Integer(0), Integer(1), None, 'a'), (Integer(1),␣
↪Integer(0), None, 'b')])
>>> S.epsilon_successors(Integer(0))
{0: [['a', 'b']], 1: [['a']]}
>>> S.epsilon_successors(Integer(1))
{0: [['b']], 1: [['b', 'a']]}
```

equivalence_classes()

Return a list of equivalence classes of states.

Two states a and b are equivalent if and only if there is a bijection φ between paths starting at a and paths starting at b with the following properties: Let p_a be a path from a to a' and p_b a path from b to b' such that $\varphi(p_a) = p_b$, then

- $p_a.word_{in} = p_b.word_{in}$,
- $p_a.word_{out} = p_b.word_{out}$,
- a' and b' have the same output label, and
- a' and b' are both final or both non-final and have the same final output word.

The function *equivalence_classes()* returns a list of the equivalence classes to this equivalence relation.

This is one step of Moore's minimization algorithm.

See also

minimization()

EXAMPLES:

```
sage: fsm = FiniteStateMachine([("A", "B", 0, 1), ("A", "B", 1, 0),
....:                           ("B", "C", 0, 0), ("B", "C", 1, 1),
....:                           ("C", "D", 0, 1), ("C", "D", 1, 0),
....:                           ("D", "A", 0, 0), ("D", "A", 1, 1)])
sage: sorted(fsm.equivalence_classes())
[['A', 'C'], ['B', 'D']]
sage: fsm.state("A").is_final = True
sage: sorted(fsm.equivalence_classes())
[['A'], ['B'], ['C'], ['D']]
sage: fsm.state("C").is_final = True
sage: sorted(fsm.equivalence_classes())
[['A', 'C'], ['B', 'D']]
sage: fsm.state("A").final_word_out = 1
sage: sorted(fsm.equivalence_classes())
[['A'], ['B'], ['C'], ['D']]
sage: fsm.state("C").final_word_out = 1
sage: sorted(fsm.equivalence_classes())
[['A', 'C'], ['B', 'D']]
```

```
>>> from sage.all import *
>>> fsm = FiniteStateMachine([("A", "B", Integer(0), Integer(1)), ("A", "B",␣
↪Integer(1), Integer(0)),
...                           ("B", "C", Integer(0), Integer(0)), ("B", "C",␣
↪Integer(1), Integer(1)),
...                           ("C", "D", Integer(0), Integer(1)), ("C", "D",␣
↪Integer(1), Integer(0)),
...                           ("D", "A", Integer(0), Integer(0)), ("D", "A",␣
↪Integer(1), Integer(1))])
>>> sorted(fsm.equivalence_classes())
[['A', 'C'], ['B', 'D']]
>>> fsm.state("A").is_final = True
>>> sorted(fsm.equivalence_classes())
[['A'], ['B'], ['C'], ['D']]
>>> fsm.state("C").is_final = True
>>> sorted(fsm.equivalence_classes())
[['A', 'C'], ['B', 'D']]
>>> fsm.state("A").final_word_out = Integer(1)
>>> sorted(fsm.equivalence_classes())
[['A'], ['B'], ['C'], ['D']]
>>> fsm.state("C").final_word_out = Integer(1)
>>> sorted(fsm.equivalence_classes())
[['A', 'C'], ['B', 'D']]
```

final_components()

Return the final components of a finite state machine as finite state machines.

OUTPUT:

A list of finite state machines, each representing a final component of `self`.

A final component of a transducer `T` is a strongly connected component `C` such that there are no transitions of `T` leaving `C`.

The final components are the only parts of a transducer which influence the main terms of the asymptotic behaviour of the sum of output labels of a transducer, see [HKP2015] and [HKW2015].

EXAMPLES:

```
sage: T = Transducer([['A', 'B', 0, 0], ['B', 'C', 0, 1],
....:                 ['C', 'B', 0, 1], ['A', 'D', 1, 0],
....:                 ['D', 'D', 0, 0], ['D', 'B', 1, 0],
....:                 ['A', 'E', 2, 0], ['E', 'E', 0, 0]])
sage: FC = T.final_components()
sage: sorted(FC[0].transitions())
[Transition from 'B' to 'C': 0|1,
 Transition from 'C' to 'B': 0|1]
sage: FC[1].transitions()
[Transition from 'E' to 'E': 0|0]
```

```
>>> from sage.all import *
>>> T = Transducer([['A', 'B', Integer(0), Integer(0)], ['B', 'C', Integer(0),
↪ Integer(1)],
...                 ['C', 'B', Integer(0), Integer(1)], ['A', 'D', Integer(1),
↪ Integer(0)],
...                 ['D', 'D', Integer(0), Integer(0)], ['D', 'B', Integer(1),
↪ Integer(0)],
...                 ['A', 'E', Integer(2), Integer(0)], ['E', 'E', Integer(0),
↪ Integer(0)]])
>>> FC = T.final_components()
>>> sorted(FC[Integer(0)].transitions())
[Transition from 'B' to 'C': 0|1,
 Transition from 'C' to 'B': 0|1]
>>> FC[Integer(1)].transitions()
[Transition from 'E' to 'E': 0|0]
```

Another example (cycle of length 2):

```
sage: T = Automaton([[0, 1, 0], [1, 0, 0]])
sage: len(T.final_components()) == 1
True
sage: T.final_components()[0].transitions()
[Transition from 0 to 1: 0|-,
 Transition from 1 to 0: 0|-]
```

```
>>> from sage.all import *
>>> T = Automaton([[Integer(0), Integer(1), Integer(0)], [Integer(1),␣
↪Integer(0), Integer(0)]])
>>> len(T.final_components()) == Integer(1)
True
>>> T.final_components()[Integer(0)].transitions()
[Transition from 0 to 1: 0|-,
 Transition from 1 to 0: 0|-]
```

final_states()

Return a list of all final states.

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: A = FSMState('A', is_final=True)
sage: B = FSMState('B', is_initial=True)
sage: C = FSMState('C', is_final=True)
sage: F = FiniteStateMachine([(A, B), (A, C)])
sage: F.final_states()
['A', 'C']
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
>>> A = FSMState('A', is_final=True)
>>> B = FSMState('B', is_initial=True)
>>> C = FSMState('C', is_final=True)
>>> F = FiniteStateMachine([(A, B), (A, C)])
>>> F.final_states()
['A', 'C']
```

format_letter = <sage.misc.latex.Latex object>

format_letter_negative(*letter*)

Format negative numbers as overlined numbers, everything else by standard LaTeX formatting.

INPUT:

- `letter` – anything

OUTPUT:

Overlined absolute value if letter is a negative integer, `latex(letter)` otherwise.

EXAMPLES:

```
sage: A = Automaton([(0, 0, -1)])
sage: list(map(A.format_letter_negative, [-1, 0, 1, 'a', None]))
['\\overline{1}', 0, 1, \text{\texttt{a}}, \mathrm{None}]
sage: A.latex_options(format_letter=A.format_letter_negative)
sage: print(latex(A))
\begin{tikzpicture}[auto, initial text=, >=latex]
\node[state] (v0) at (3.000000, 0.000000) {$0$};
\path[->] (v0) edge[loop above] node {$\overline{1}$} ();
\end{tikzpicture}
```

```
>>> from sage.all import *
>>> A = Automaton([(Integer(0), Integer(0), -Integer(1))])
>>> list(map(A.format_letter_negative, [-Integer(1), Integer(0), Integer(1),
↪'a', None]))
['\\overline{1}', 0, 1, \text{\texttt{a}}, \mathrm{None}]
>>> A.latex_options(format_letter=A.format_letter_negative)
>>> print(latex(A))
\begin{tikzpicture}[auto, initial text=, >=latex]
\node[state] (v0) at (3.000000, 0.000000) {$0$};
```

(continues on next page)

(continued from previous page)

```
\path[->] (v0) edge[loop above] node {$\overline{1}$} ();
\end{tikzpicture}
```

format_transition_label(*word*)

alias of *default_format_transition_label()*.

format_transition_label_reversed(*word*)

Format words in transition labels in reversed order.

INPUT:

- `word` – list of letters

OUTPUT:

String representation of `word` suitable to be typeset in mathematical mode, letters are written in reversed order.

This is the reversed version of *default_format_transition_label()*.

In digit expansions, digits are frequently processed from the least significant to the most significant position, but it is customary to write the least significant digit at the right-most position. Therefore, the labels have to be reversed.

EXAMPLES:

```
sage: T = Transducer([(0, 0, 0, [1, 2, 3])])
sage: T.format_transition_label_reversed([1, 2, 3])
'3 2 1'
sage: T.latex_options(format_transition_label=T.format_transition_label_
↪reversed)
sage: print(latex(T))
\begin{tikzpicture}[auto, initial text=, >=latex]
\node[state] (v0) at (3.000000, 0.000000) {$0$};
\path[->] (v0) edge[loop above] node {$0\mid 3 2 1$} ();
\end{tikzpicture}
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(0), Integer(0), [Integer(1),␣
↪Integer(2), Integer(3)])])
>>> T.format_transition_label_reversed([Integer(1), Integer(2), Integer(3)])
'3 2 1'
>>> T.latex_options(format_transition_label=T.format_transition_label_
↪reversed)
>>> print(latex(T))
\begin{tikzpicture}[auto, initial text=, >=latex]
\node[state] (v0) at (3.000000, 0.000000) {$0$};
\path[->] (v0) edge[loop above] node {$0\mid 3 2 1$} ();
\end{tikzpicture}
```

graph(*edge_labels='words_in_out'*)

Return the graph of the finite state machine with labeled vertices and labeled edges.

INPUT:

- **edge_label – (default: `'words_in_out'`) can be**

- `'words_in_out'` (labels will be strings `'i|o'`)
- a function with which takes as input a transition and outputs (returns) the label

OUTPUT: a `directed graph`

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: A = FSMState('A')
sage: T = Transducer()
sage: T.graph()
Looped multi-digraph on 0 vertices
sage: T.add_state(A)
'A'
sage: T.graph()
Looped multi-digraph on 1 vertex
sage: T.add_transition(('A', 'A', 0, 1))
Transition from 'A' to 'A': 0|1
sage: T.graph()
Looped multi-digraph on 1 vertex
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
>>> A = FSMState('A')
>>> T = Transducer()
>>> T.graph()
Looped multi-digraph on 0 vertices
>>> T.add_state(A)
'A'
>>> T.graph()
Looped multi-digraph on 1 vertex
>>> T.add_transition(('A', 'A', Integer(0), Integer(1)))
Transition from 'A' to 'A': 0|1
>>> T.graph()
Looped multi-digraph on 1 vertex
```

See also

`DiGraph`

has_final_state(*state*)

Return whether `state` is one of the final states of the finite state machine.

INPUT:

- `state` can be a *`FSMState`* or a label.

OUTPUT: boolean

EXAMPLES:

```
sage: FiniteStateMachine(final_states=['A']).has_final_state('A')
True
```

```
>>> from sage.all import *
>>> FiniteStateMachine(final_states=['A']).has_final_state('A')
True
```

has_final_states()

Return whether the finite state machine has a final state.

OUTPUT: boolean

EXAMPLES:

```
sage: FiniteStateMachine().has_final_states()
False
```

```
>>> from sage.all import *
>>> FiniteStateMachine().has_final_states()
False
```

has_initial_state(*state*)

Return whether `state` is one of the initial states of the finite state machine.

INPUT:

- `state` can be a *FSMState* or a label.

OUTPUT: boolean

EXAMPLES:

```
sage: F = FiniteStateMachine([('A', 'A')], initial_states=['A'])
sage: F.has_initial_state('A')
True
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine([('A', 'A')], initial_states=['A'])
>>> F.has_initial_state('A')
True
```

has_initial_states()

Return whether the finite state machine has an initial state.

OUTPUT: boolean

EXAMPLES:

```
sage: FiniteStateMachine().has_initial_states()
False
```

```
>>> from sage.all import *
>>> FiniteStateMachine().has_initial_states()
False
```

has_state(*state*)

Return whether `state` is one of the states of the finite state machine.

INPUT:

- `state` can be a *FSMState* or a label of a state.

OUTPUT: boolean

EXAMPLES:

```
sage: FiniteStateMachine().has_state('A')
False
```

```
>>> from sage.all import *
>>> FiniteStateMachine().has_state('A')
False
```

has_transition(*transition*)

Return whether `transition` is one of the transitions of the finite state machine.

INPUT:

- `transition` has to be a *FSMTransition*.

OUTPUT: boolean

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMTransition
sage: t = FSMTransition('A', 'A', 0, 1)
sage: FiniteStateMachine().has_transition(t)
False
sage: FiniteStateMachine().has_transition(('A', 'A', 0, 1))
Traceback (most recent call last):
...
TypeError: Transition is not an instance of FSMTransition.
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMTransition
>>> t = FSMTransition('A', 'A', Integer(0), Integer(1))
>>> FiniteStateMachine().has_transition(t)
False
>>> FiniteStateMachine().has_transition(('A', 'A', Integer(0), Integer(1)))
Traceback (most recent call last):
...
TypeError: Transition is not an instance of FSMTransition.
```

induced_sub_finite_state_machine(*states*)

Return a sub-finite-state-machine of the finite state machine induced by the given states.

INPUT:

- `states` – list (or an iterator) of states (either labels or instances of *FSMState*) of the sub-finite-state-machine

OUTPUT:

A new finite state machine. It consists (of deep copies) of the given states and (deep copies) of all transitions of `self` between these states.

EXAMPLES:

```
sage: FSM = FiniteStateMachine([(0, 1, 0), (0, 2, 0),
....:                           (1, 2, 0), (2, 0, 0)])
sage: sub_FSM = FSM.induced_sub_finite_state_machine([0, 1])
sage: sub_FSM.states()
[0, 1]
sage: sub_FSM.transitions()
[Transition from 0 to 1: 0|-]
sage: FSM.induced_sub_finite_state_machine([3])
Traceback (most recent call last):
...
ValueError: 3 is not a state of this finite state machine.
```

```
>>> from sage.all import *
>>> FSM = FiniteStateMachine([(Integer(0), Integer(1), Integer(0)),␣
↪(Integer(0), Integer(2), Integer(0)),
...                            (Integer(1), Integer(2), Integer(0)),␣
↪(Integer(2), Integer(0), Integer(0))])
>>> sub_FSM = FSM.induced_sub_finite_state_machine([Integer(0), Integer(1)])
>>> sub_FSM.states()
[0, 1]
>>> sub_FSM.transitions()
[Transition from 0 to 1: 0|-]
>>> FSM.induced_sub_finite_state_machine([Integer(3)])
Traceback (most recent call last):
...
ValueError: 3 is not a state of this finite state machine.
```

initial_states()

Return a list of all initial states.

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: A = FSMState('A', is_initial=True)
sage: B = FSMState('B')
sage: F = FiniteStateMachine([(A, B, 1, 0)])
sage: F.initial_states()
['A']
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
>>> A = FSMState('A', is_initial=True)
>>> B = FSMState('B')
>>> F = FiniteStateMachine([(A, B, Integer(1), Integer(0))])
>>> F.initial_states()
['A']
```

input_alphabet = None

A list of letters representing the input alphabet of the finite state machine.

It can be set by the parameter `input_alphabet` when initializing a finite state machine, see *FiniteStateMachine*.

It can also be set by the method *determine_alphabets()*.

> **See also**
>
> *FiniteStateMachine*, *determine_alphabets()*, *output_alphabet*.

input_projection()

Return an automaton where the output of each transition of `self` is deleted.

OUTPUT: an automaton

EXAMPLES:

```
sage: F = FiniteStateMachine([('A', 'B', 0, 1), ('A', 'A', 1, 1),
....:                         ('B', 'B', 1, 0)])
sage: G = F.input_projection()
sage: G.transitions()
[Transition from 'A' to 'B': 0|-,
 Transition from 'A' to 'A': 1|-,
 Transition from 'B' to 'B': 1|-]
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine([('A', 'B', Integer(0), Integer(1)), ('A', 'A',␣
↪Integer(1), Integer(1)),
...                         ('B', 'B', Integer(1), Integer(0))])
>>> G = F.input_projection()
>>> G.transitions()
[Transition from 'A' to 'B': 0|-,
 Transition from 'A' to 'A': 1|-,
 Transition from 'B' to 'B': 1|-]
```

intersection(*other*)

is_Markov_chain(*is_zero=None*)

Check whether `self` is a Markov chain where the transition probabilities are modeled as input labels.

INPUT:

- `is_zero` – by default (`is_zero=None`), checking for zero is simply done by `is_zero()`. This parameter can be used to provide a more sophisticated check for zero, e.g. in the case of symbolic probabilities, see the examples below.

OUTPUT: boolean

on_duplicate_transition must be *duplicate_transition_add_input()*, the sum of the input weights of the transitions leaving a state must add up to 1 and the sum of initial probabilities must add up to 1 (or all be `None`).

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import duplicate_transition_add_
↪input
sage: F = Transducer([[0, 0, 1/4, 0], [0, 1, 3/4, 1],
....:                 [1, 0, 1/2, 0], [1, 1, 1/2, 1]],
....:                on_duplicate_transition=duplicate_transition_add_input)
sage: F.is_Markov_chain()
True
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import duplicate_transition_add_
↪input
>>> F = Transducer([[Integer(0), Integer(0), Integer(1)/Integer(4),␣
↪Integer(0)], [Integer(0), Integer(1), Integer(3)/Integer(4), Integer(1)],
...                 [Integer(1), Integer(0), Integer(1)/Integer(2),␣
↪Integer(0)], [Integer(1), Integer(1), Integer(1)/Integer(2), Integer(1)]],
...                on_duplicate_transition=duplicate_transition_add_input)
>>> F.is_Markov_chain()
True
```

on_duplicate_transition must be *duplicate_transition_add_input()*:

```
sage: F = Transducer([[0, 0, 1/4, 0], [0, 1, 3/4, 1],
....:                 [1, 0, 1/2, 0], [1, 1, 1/2, 1]])
sage: F.is_Markov_chain()
False
```

```
>>> from sage.all import *
>>> F = Transducer([[Integer(0), Integer(0), Integer(1)/Integer(4),␣
↪Integer(0)], [Integer(0), Integer(1), Integer(3)/Integer(4), Integer(1)],
...                 [Integer(1), Integer(0), Integer(1)/Integer(2),␣
↪Integer(0)], [Integer(1), Integer(1), Integer(1)/Integer(2), Integer(1)]])
>>> F.is_Markov_chain()
False
```

Sum of input labels of the transitions leaving states must be 1:

```
sage: F = Transducer([[0, 0, 1/4, 0], [0, 1, 3/4, 1],
....:                 [1, 0, 1/2, 0]],
....:                on_duplicate_transition=duplicate_transition_add_input)
sage: F.is_Markov_chain()
False
```

```
>>> from sage.all import *
>>> F = Transducer([[Integer(0), Integer(0), Integer(1)/Integer(4),␣
↪Integer(0)], [Integer(0), Integer(1), Integer(3)/Integer(4), Integer(1)],
...                 [Integer(1), Integer(0), Integer(1)/Integer(2),␣
↪Integer(0)]],
...                on_duplicate_transition=duplicate_transition_add_input)
>>> F.is_Markov_chain()
False
```

The initial probabilities of all states must be `None` or they must sum up to 1. The initial probabilities of all states have to be set in the latter case:

```
sage: F = Transducer([[0, 0, 1/4, 0], [0, 1, 3/4, 1],
....:                 [1, 0, 1, 0]],
....:                on_duplicate_transition=duplicate_transition_add_input)
sage: F.is_Markov_chain()
True
sage: F.state(0).initial_probability = 1/4
sage: F.is_Markov_chain()
```

(continues on next page)

(continued from previous page)

```
False
sage: F.state(1).initial_probability = 7
sage: F.is_Markov_chain()
False
sage: F.state(1).initial_probability = 3/4
sage: F.is_Markov_chain()
True
```

```
>>> from sage.all import *
>>> F = Transducer([[Integer(0), Integer(0), Integer(1)/Integer(4),␣
↪Integer(0)], [Integer(0), Integer(1), Integer(3)/Integer(4), Integer(1)],
...                 [Integer(1), Integer(0), Integer(1), Integer(0)]],
...                on_duplicate_transition=duplicate_transition_add_input)
>>> F.is_Markov_chain()
True
>>> F.state(Integer(0)).initial_probability = Integer(1)/Integer(4)
>>> F.is_Markov_chain()
False
>>> F.state(Integer(1)).initial_probability = Integer(7)
>>> F.is_Markov_chain()
False
>>> F.state(Integer(1)).initial_probability = Integer(3)/Integer(4)
>>> F.is_Markov_chain()
True
```

If the probabilities are variables in the symbolic ring, `assume()` will do the trick:

```
sage: # needs sage.symbolic
sage: var('p q')
(p, q)
sage: F = Transducer([(0, 0, p, 1), (0, 0, q, 0)],
....:                on_duplicate_transition=duplicate_transition_add_input)
sage: assume(p + q == 1)
sage: (p + q - 1).is_zero()
True
sage: F.is_Markov_chain()
True
sage: forget()
sage: del(p, q)
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> var('p q')
(p, q)
>>> F = Transducer([(Integer(0), Integer(0), p, Integer(1)), (Integer(0),␣
↪Integer(0), q, Integer(0))],
...                on_duplicate_transition=duplicate_transition_add_input)
>>> assume(p + q == Integer(1))
>>> (p + q - Integer(1)).is_zero()
True
>>> F.is_Markov_chain()
True
```

(continues on next page)

(continued from previous page)

```
>>> forget()
>>> del(p, q)
```

If the probabilities are variables in some polynomial ring, the parameter `is_zero` can be used:

```
sage: R.<p, q> = PolynomialRing(QQ)
sage: def is_zero_polynomial(polynomial):
....:     return polynomial in (p + q - 1)*R
sage: F = Transducer([(0, 0, p, 1), (0, 0, q, 0)],
....:                on_duplicate_transition=duplicate_transition_add_input)
sage: F.state(0).initial_probability = p + q
sage: F.is_Markov_chain()
False
sage: F.is_Markov_chain(is_zero_polynomial)                                    #␣
↪needs sage.libs.singular
True
```

```
>>> from sage.all import *
>>> R = PolynomialRing(QQ, names=('p', 'q',)); (p, q,) = R._first_ngens(2)
>>> def is_zero_polynomial(polynomial):
...     return polynomial in (p + q - Integer(1))*R
>>> F = Transducer([(Integer(0), Integer(0), p, Integer(1)), (Integer(0),␣
↪Integer(0), q, Integer(0))],
...                on_duplicate_transition=duplicate_transition_add_input)
>>> F.state(Integer(0)).initial_probability = p + q
>>> F.is_Markov_chain()
False
>>> F.is_Markov_chain(is_zero_polynomial)                                      #␣
↪needs sage.libs.singular
True
```

is_complete()

Return whether the finite state machine is complete.

OUTPUT: boolean

A finite state machine is considered to be complete if each transition has an input label of length one and for each pair (q, a) where q is a state and a is an element of the input alphabet, there is exactly one transition from q with input label a.

EXAMPLES:

```
sage: fsm = FiniteStateMachine([(0, 0, 0, 0),
....:                           (0, 1, 1, 1),
....:                           (1, 1, 0, 0)],
....:                          determine_alphabets=False)
sage: fsm.is_complete()
Traceback (most recent call last):
...
ValueError: No input alphabet is given. Try calling determine_alphabets().
sage: fsm.input_alphabet = [0, 1]
sage: fsm.is_complete()
False
```

(continues on next page)

(continued from previous page)

```
sage: fsm.add_transition((1, 1, 1, 1))
Transition from 1 to 1: 1|1
sage: fsm.is_complete()
True
sage: fsm.add_transition((0, 0, 1, 0))
Transition from 0 to 0: 1|0
sage: fsm.is_complete()
False
```

```
>>> from sage.all import *
>>> fsm = FiniteStateMachine([(Integer(0), Integer(0), Integer(0),␣
↪Integer(0)),
...                            (Integer(0), Integer(1), Integer(1),␣
↪Integer(1)),
...                            (Integer(1), Integer(1), Integer(0),␣
↪Integer(0))],
...                           determine_alphabets=False)
>>> fsm.is_complete()
Traceback (most recent call last):
...
ValueError: No input alphabet is given. Try calling determine_alphabets().
>>> fsm.input_alphabet = [Integer(0), Integer(1)]
>>> fsm.is_complete()
False
>>> fsm.add_transition((Integer(1), Integer(1), Integer(1), Integer(1)))
Transition from 1 to 1: 1|1
>>> fsm.is_complete()
True
>>> fsm.add_transition((Integer(0), Integer(0), Integer(1), Integer(0)))
Transition from 0 to 0: 1|0
>>> fsm.is_complete()
False
```

is_connected()

is_deterministic()

Return whether the finite finite state machine is deterministic.

OUTPUT: boolean

A finite state machine is considered to be deterministic if each transition has input label of length one and for each pair (q, a) where q is a state and a is an element of the input alphabet, there is at most one transition from q with input label a. Furthermore, the finite state may not have more than one initial state.

EXAMPLES:

```
sage: fsm = FiniteStateMachine()
sage: fsm.add_transition(('A', 'B', 0, []))
Transition from 'A' to 'B': 0|-
sage: fsm.is_deterministic()
True
sage: fsm.add_transition(('A', 'C', 0, []))
Transition from 'A' to 'C': 0|-
```

(continues on next page)

(continued from previous page)

```
sage: fsm.is_deterministic()
False
sage: fsm.add_transition(('A', 'B', [0,1], []))
Transition from 'A' to 'B': 0,1|-
sage: fsm.is_deterministic()
False
```

```
>>> from sage.all import *
>>> fsm = FiniteStateMachine()
>>> fsm.add_transition(('A', 'B', Integer(0), []))
Transition from 'A' to 'B': 0|-
>>> fsm.is_deterministic()
True
>>> fsm.add_transition(('A', 'C', Integer(0), []))
Transition from 'A' to 'C': 0|-
>>> fsm.is_deterministic()
False
>>> fsm.add_transition(('A', 'B', [Integer(0),Integer(1)], []))
Transition from 'A' to 'B': 0,1|-
>>> fsm.is_deterministic()
False
```

Check that Issue #18556 is fixed:

```
sage: Automaton().is_deterministic()
True
sage: Automaton(initial_states=[0]).is_deterministic()
True
sage: Automaton(initial_states=[0, 1]).is_deterministic()
False
```

```
>>> from sage.all import *
>>> Automaton().is_deterministic()
True
>>> Automaton(initial_states=[Integer(0)]).is_deterministic()
True
>>> Automaton(initial_states=[Integer(0), Integer(1)]).is_deterministic()
False
```

is_monochromatic()

Check whether the colors of all states are equal.

OUTPUT: boolean

EXAMPLES:

```
sage: G = transducers.GrayCode()
sage: [s.color for s in G.iter_states()]
[None, None, None]
sage: G.is_monochromatic()
True
sage: G.state(1).color = 'blue'
```

(continues on next page)

(continued from previous page)

```
sage: G.is_monochromatic()
False
```

```
>>> from sage.all import *
>>> G = transducers.GrayCode()
>>> [s.color for s in G.iter_states()]
[None, None, None]
>>> G.is_monochromatic()
True
>>> G.state(Integer(1)).color = 'blue'
>>> G.is_monochromatic()
False
```

iter_final_states()

Return an iterator of the final states.

OUTPUT: an iterator over all initial states

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: A = FSMState('A', is_final=True)
sage: B = FSMState('B', is_initial=True)
sage: C = FSMState('C', is_final=True)
sage: F = FiniteStateMachine([(A, B), (A, C)])
sage: [s.label() for s in F.iter_final_states()]
['A', 'C']
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
>>> A = FSMState('A', is_final=True)
>>> B = FSMState('B', is_initial=True)
>>> C = FSMState('C', is_final=True)
>>> F = FiniteStateMachine([(A, B), (A, C)])
>>> [s.label() for s in F.iter_final_states()]
['A', 'C']
```

iter_initial_states()

Return an iterator of the initial states.

OUTPUT: an iterator over all initial states

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: A = FSMState('A', is_initial=True)
sage: B = FSMState('B')
sage: F = FiniteStateMachine([(A, B, 1, 0)])
sage: [s.label() for s in F.iter_initial_states()]
['A']
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
```

(continues on next page)

(continued from previous page)

```
>>> A = FSMState('A', is_initial=True)
>>> B = FSMState('B')
>>> F = FiniteStateMachine([(A, B, Integer(1), Integer(0))])
>>> [s.label() for s in F.iter_initial_states()]
['A']
```

iter_process(*input_tape=None*, *initial_state=None*, *process_iterator_class=None*, *iterator_type=None*, *automatic_output_type=False*, ***kwargs*)

This function returns an iterator for processing the input. See *process()* (which runs this iterator until the end) for more information.

INPUT:

- `iterator_type` – if `None` (default), then an instance of *FSMProcessIterator* is returned. If this is `'simple'` only an iterator over one output is returned (an exception is raised if this is not the case, i.e., if the process has branched).

See *process()* for a description of the other parameters.

OUTPUT: an iterator

EXAMPLES:

We can use *iter_process()* to deal with infinite words:

```
sage: inverter = Transducer({'A': [('A', 0, 1), ('A', 1, 0)]},
....:     initial_states=['A'], final_states=['A'])

sage: # needs sage.combinat
sage: words.FibonacciWord()
word: 0100101001001010010100100101001001010010...
sage: it = inverter.iter_process(
....:     words.FibonacciWord(), iterator_type='simple')
sage: Words([0,1])(it)
word: 1011010110110101101011011010110110101101...
```

```
>>> from sage.all import *
>>> inverter = Transducer({'A': [('A', Integer(0), Integer(1)), ('A',␣
↪Integer(1), Integer(0))]},
...     initial_states=['A'], final_states=['A'])

>>> # needs sage.combinat
>>> words.FibonacciWord()
word: 0100101001001010010100100101001001010010...
>>> it = inverter.iter_process(
...     words.FibonacciWord(), iterator_type='simple')
>>> Words([Integer(0),Integer(1)])(it)
word: 1011010110110101101011011010110110101101...
```

This can also be done by:

```
sage: inverter.iter_process(words.FibonacciWord(),                    #␣
↪needs sage.combinat
....:                       iterator_type='simple',
```

(continues on next page)

(continued from previous page)

```
....:                         automatic_output_type=True)
word: 10110101101101011010110110101101101011101...
```

```
>>> from sage.all import *
>>> inverter.iter_process(words.FibonacciWord(),                              #␣
↪needs sage.combinat
...                       iterator_type='simple',
...                       automatic_output_type=True)
word: 10110101101101011010110110101101101011101...
```

or even simpler by:

```
sage: inverter(words.FibonacciWord())                                          #␣
↪needs sage.combinat
word: 10110101101101011010110110101101101011101...
```

```
>>> from sage.all import *
>>> inverter(words.FibonacciWord())                                            #␣
↪needs sage.combinat
word: 10110101101101011010110110101101101011101...
```

To see what is going on, we use *iter_process()* without arguments:

```
sage: # needs sage.combinat
sage: from itertools import islice
sage: it = inverter.iter_process(words.FibonacciWord())
sage: for current in islice(it, 4r):
....:     print(current)
process (1 branch)
+ at state 'A'
+-- tape at 1, [[1]]
process (1 branch)
+ at state 'A'
+-- tape at 2, [[1, 0]]
process (1 branch)
+ at state 'A'
+-- tape at 3, [[1, 0, 1]]
process (1 branch)
+ at state 'A'
+-- tape at 4, [[1, 0, 1, 1]]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> from itertools import islice
>>> it = inverter.iter_process(words.FibonacciWord())
>>> for current in islice(it, 4):
...     print(current)
process (1 branch)
+ at state 'A'
+-- tape at 1, [[1]]
process (1 branch)
+ at state 'A'
```

(continues on next page)

(continued from previous page)

```
+-- tape at 2, [[1, 0]]
process (1 branch)
+ at state 'A'
+-- tape at 3, [[1, 0, 1]]
process (1 branch)
+ at state 'A'
+-- tape at 4, [[1, 0, 1, 1]]
```

The following show the difference between using the `'simple'`-option and not using it. With this option, we have

```
sage: it = inverter.iter_process(input_tape=[0, 1, 1],
....:                            iterator_type='simple')
sage: for i, o in enumerate(it):
....:     print('step %s: output %s' % (i, o))
step 0: output 1
step 1: output 0
step 2: output 0
```

```
>>> from sage.all import *
>>> it = inverter.iter_process(input_tape=[Integer(0), Integer(1),␣
↪Integer(1)],
...                            iterator_type='simple')
>>> for i, o in enumerate(it):
...     print('step %s: output %s' % (i, o))
step 0: output 1
step 1: output 0
step 2: output 0
```

So *iter_process()* is a generator expression which gives a new output letter in each step (and not more). In many cases this is sufficient.

Doing the same without the `'simple'`-option does not give the output directly; it has to be extracted first. On the other hand, additional information is presented:

```
sage: it = inverter.iter_process(input_tape=[0, 1, 1])
sage: for current in it:
....:     print(current)
process (1 branch)
+ at state 'A'
+-- tape at 1, [[1]]
process (1 branch)
+ at state 'A'
+-- tape at 2, [[1, 0]]
process (1 branch)
+ at state 'A'
+-- tape at 3, [[1, 0, 0]]
process (0 branches)
sage: it.result()
[Branch(accept=True, state='A', output=[1, 0, 0])]
```

```
>>> from sage.all import *
```

(continues on next page)

(continued from previous page)

```
>>> it = inverter.iter_process(input_tape=[Integer(0), Integer(1),␣
↪Integer(1)])
>>> for current in it:
...     print(current)
process (1 branch)
+ at state 'A'
+-- tape at 1, [[1]]
process (1 branch)
+ at state 'A'
+-- tape at 2, [[1, 0]]
process (1 branch)
+ at state 'A'
+-- tape at 3, [[1, 0, 0]]
process (0 branches)
>>> it.result()
[Branch(accept=True, state='A', output=[1, 0, 0])]
```

One can see the growing of the output (the list of lists at the end of each entry).

Even if the transducer has transitions with empty or multiletter output, the simple iterator returns one new output letter in each step:

```
sage: T = Transducer([(0, 0, 0, []),
....:                 (0, 0, 1, [1]),
....:                 (0, 0, 2, [2, 2])],
....:                initial_states=[0])
sage: it = T.iter_process(input_tape=[0, 1, 2, 0, 1, 2],
....:                     iterator_type='simple')
sage: for i, o in enumerate(it):
....:     print('step %s: output %s' % (i, o))
step 0: output 1
step 1: output 2
step 2: output 2
step 3: output 1
step 4: output 2
step 5: output 2
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(0), Integer(0), []),
...                 (Integer(0), Integer(0), Integer(1), [Integer(1)]),
...                 (Integer(0), Integer(0), Integer(2), [Integer(2),␣
↪Integer(2)])],
...                initial_states=[Integer(0)])
>>> it = T.iter_process(input_tape=[Integer(0), Integer(1), Integer(2),␣
↪Integer(0), Integer(1), Integer(2)],
...                     iterator_type='simple')
>>> for i, o in enumerate(it):
...     print('step %s: output %s' % (i, o))
step 0: output 1
step 1: output 2
step 2: output 2
step 3: output 1
```

(continues on next page)

(continued from previous page)

```
step 4: output 2
step 5: output 2
```

FiniteStateMachine.process(), *Automaton.process()*, *Transducer.process()*, *__call__()*, *FSMProcessIterator*.

iter_states()

Return an iterator of the states.

OUTPUT: an iterator of the states of the finite state machine

EXAMPLES:

```
sage: FSM = Automaton([('1', '2', 1), ('2', '2', 0)])
sage: [s.label() for s in FSM.iter_states()]
['1', '2']
```

```
>>> from sage.all import *
>>> FSM = Automaton([('1', '2', Integer(1)), ('2', '2', Integer(0))])
>>> [s.label() for s in FSM.iter_states()]
['1', '2']
```

iter_transitions(*from_state=None*)

Return an iterator of all transitions.

INPUT:

- `from_state` – (default: `None`) if `from_state` is given, then a list of transitions starting there is given

OUTPUT: an iterator of all transitions

EXAMPLES:

```
sage: FSM = Automaton([('1', '2', 1), ('2', '2', 0)])
sage: [(t.from_state.label(), t.to_state.label())
....:     for t in FSM.iter_transitions('1')]
[('1', '2')]
sage: [(t.from_state.label(), t.to_state.label())
....:     for t in FSM.iter_transitions('2')]
[('2', '2')]
sage: [(t.from_state.label(), t.to_state.label())
....:     for t in FSM.iter_transitions()]
[('1', '2'), ('2', '2')]
```

```
>>> from sage.all import *
>>> FSM = Automaton([('1', '2', Integer(1)), ('2', '2', Integer(0))])
>>> [(t.from_state.label(), t.to_state.label())
...     for t in FSM.iter_transitions('1')]
[('1', '2')]
>>> [(t.from_state.label(), t.to_state.label())
...     for t in FSM.iter_transitions('2')]
```

(continues on next page)

(continued from previous page)

```
[('2', '2')]
>>> [(t.from_state.label(), t.to_state.label())
...     for t in FSM.iter_transitions()]
[('1', '2'), ('2', '2')]
```

kleene_star()

Compute the Kleene closure of this finite state machine.

OUTPUT:

A *FiniteStateMachine* of the same type as this finite state machine.

Assume that this finite state machine is an automaton recognizing the language $\mathcal{L}$. Then the Kleene star recognizes the language $\mathcal{L}^* = \{w_1 \dots w_n \mid n \geq 0, w_j \in \mathcal{L} \text{ for all } j\}$.

Assume that this finite state machine is a transducer realizing a function f on some alphabet $\mathcal{L}$. Then the Kleene star realizes a function g on $\mathcal{L}^*$ with $g(w_1 \dots w_n) = f(w_1) \dots f(w_n)$.

EXAMPLES:

Kleene star of an automaton:

```
sage: A = automata.Word([0, 1])
sage: B = A.kleene_star()
sage: B.transitions()
[Transition from 0 to 1: 0|-,
 Transition from 2 to 0: -|-,
 Transition from 1 to 2: 1|-]
sage: isinstance(B, Automaton)
True
sage: [w for w in ([], [0, 1], [0, 1, 0], [0, 1, 0, 1], [0, 1, 1, 1])
....:  if B(w)]
[[],
 [0, 1],
 [0, 1, 0, 1]]
```

```
>>> from sage.all import *
>>> A = automata.Word([Integer(0), Integer(1)])
>>> B = A.kleene_star()
>>> B.transitions()
[Transition from 0 to 1: 0|-,
 Transition from 2 to 0: -|-,
 Transition from 1 to 2: 1|-]
>>> isinstance(B, Automaton)
True
>>> [w for w in ([], [Integer(0), Integer(1)], [Integer(0), Integer(1),␣
↪Integer(0)], [Integer(0), Integer(1), Integer(0), Integer(1)], [Integer(0),␣
↪Integer(1), Integer(1), Integer(1)])
...  if B(w)]
[[],
 [0, 1],
 [0, 1, 0, 1]]
```

Kleene star of a transducer:

```
sage: T = Transducer([(0, 1, 0, 1), (0, 1, 1, 0)],
....:                initial_states=[0],
....:                final_states=[1])
sage: S = T.kleene_star()
sage: S.transitions()
[Transition from 0 to 1: 0|1,
 Transition from 0 to 1: 1|0,
 Transition from 1 to 0: -|-]
sage: isinstance(S, Transducer)
True
sage: for w in ([], [0], [1], [0, 0], [0, 1]):
....:     print("{} {}".format(w, S.process(w)))
[]     (True, 0, [])
[0]    [(True, 0, [1]), (True, 1, [1])]
[1]    [(True, 0, [0]), (True, 1, [0])]
[0, 0] [(True, 0, [1, 1]), (True, 1, [1, 1])]
[0, 1] [(True, 0, [1, 0]), (True, 1, [1, 0])]
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(1), Integer(0), Integer(1)),␣
↪(Integer(0), Integer(1), Integer(1), Integer(0))],
...                initial_states=[Integer(0)],
...                final_states=[Integer(1)])
>>> S = T.kleene_star()
>>> S.transitions()
[Transition from 0 to 1: 0|1,
 Transition from 0 to 1: 1|0,
 Transition from 1 to 0: -|-]
>>> isinstance(S, Transducer)
True
>>> for w in ([], [Integer(0)], [Integer(1)], [Integer(0), Integer(0)],␣
↪[Integer(0), Integer(1)]):
...     print("{} {}".format(w, S.process(w)))
[]     (True, 0, [])
[0]    [(True, 0, [1]), (True, 1, [1])]
[1]    [(True, 0, [0]), (True, 1, [0])]
[0, 0] [(True, 0, [1, 1]), (True, 1, [1, 1])]
[0, 1] [(True, 0, [1, 0]), (True, 1, [1, 0])]
```

Final output words are taken into account:

```
sage: T = Transducer([(0, 1, 0, 1)],
....:                initial_states=[0],
....:                final_states=[1])
sage: T.state(1).final_word_out = 2
sage: S = T.kleene_star()
sage: sorted(S.process([0, 0]))
[(True, 0, [1, 2, 1, 2]), (True, 1, [1, 2, 1, 2])]
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(1), Integer(0), Integer(1))],
...                initial_states=[Integer(0)],
```

(continues on next page)

(continued from previous page)

```
...                 final_states=[Integer(1)])
>>> T.state(Integer(1)).final_word_out = Integer(2)
>>> S = T.kleene_star()
>>> sorted(S.process([Integer(0), Integer(0)]))
[(True, 0, [1, 2, 1, 2]), (True, 1, [1, 2, 1, 2])]
```

Final output words may lead to undesirable situations if initial states and final states coincide:

```
sage: T = Transducer(initial_states=[0], final_states=[0])
sage: T.state(0).final_word_out = 1
sage: T([])
[1]
sage: S = T.kleene_star()
sage: S([])
Traceback (most recent call last):
...
RuntimeError: State 0 is in an epsilon cycle (no input), but
output is written.
```

```
>>> from sage.all import *
>>> T = Transducer(initial_states=[Integer(0)], final_states=[Integer(0)])
>>> T.state(Integer(0)).final_word_out = Integer(1)
>>> T([])
[1]
>>> S = T.kleene_star()
>>> S([])
Traceback (most recent call last):
...
RuntimeError: State 0 is in an epsilon cycle (no input), but
output is written.
```

language(*max_length=None*, ***kwargs*)

Return all words that can be written by this transducer.

INPUT:

- `max_length` – integer or `None` (default). Only output words which come from inputs of length at most `max_length` will be considered. If `None`, then this iterates over all possible words without length restrictions.
- `kwargs` – will be passed on to the *process iterator*. See *process()* for a description.

OUTPUT: an iterator

EXAMPLES:

```
sage: NAF = Transducer([('I', 0, 0, None), ('I', 1, 1, None),
....:                   (0, 0, 0, 0), (0, 1, 1, 0),
....:                   (1, 0, 0, 1), (1, 2, 1, -1),
....:                   (2, 1, 0, 0), (2, 2, 1, 0)],
....:                  initial_states=['I'], final_states=[0],
....:                  input_alphabet=[0, 1])
sage: sorted(NAF.language(4),
....:        key=lambda o: (ZZ(o, base=2), len(o)))
```

(continues on next page)

(continued from previous page)

```
[[], [0], [0, 0], [0, 0, 0],
 [1], [1, 0], [1, 0, 0],
 [0, 1], [0, 1, 0],
 [-1, 0, 1],
 [0, 0, 1],
 [1, 0, 1]]
```

```
>>> from sage.all import *
>>> NAF = Transducer([('I', Integer(0), Integer(0), None), ('I', Integer(1),␣
↪Integer(1), None),
...                   (Integer(0), Integer(0), Integer(0), Integer(0)),␣
↪(Integer(0), Integer(1), Integer(1), Integer(0)),
...                   (Integer(1), Integer(0), Integer(0), Integer(1)),␣
↪(Integer(1), Integer(2), Integer(1), -Integer(1)),
...                   (Integer(2), Integer(1), Integer(0), Integer(0)),␣
↪(Integer(2), Integer(2), Integer(1), Integer(0))],
...                  initial_states=['I'], final_states=[Integer(0)],
...                  input_alphabet=[Integer(0), Integer(1)])
>>> sorted(NAF.language(Integer(4)),
...        key=lambda o: (ZZ(o, base=Integer(2)), len(o)))
[[], [0], [0, 0], [0, 0, 0],
 [1], [1, 0], [1, 0, 0],
 [0, 1], [0, 1, 0],
 [-1, 0, 1],
 [0, 0, 1],
 [1, 0, 1]]
```

```
sage: iterator = NAF.language()
sage: next(iterator)
[]
sage: next(iterator)
[0]
sage: next(iterator)
[1]
sage: next(iterator)
[0, 0]
sage: next(iterator)
[0, 1]
```

```
>>> from sage.all import *
>>> iterator = NAF.language()
>>> next(iterator)
[]
>>> next(iterator)
[0]

Automaton.language(), *process()*.

latex_options(*coordinates=None*, *format_state_label=None*, *format_letter=None*, *format_transition_label=None*, *loop_where=None*, *initial_where=None*, *accepting_style=None*, *accepting_distance=None*, *accepting_where=None*, *accepting_show_empty=None*)

Set options for LaTeX output via `latex()` and therefore `view()`.

INPUT:

- `coordinates` – dictionary or a function mapping labels of states to pairs interpreted as coordinates. If no coordinates are given, states a placed equidistantly on a circle of radius 3. See also *set_coordinates()*.
- `format_state_label` – a function mapping labels of states to a string suitable for typesetting in LaTeX's mathematics mode. If not given, `latex()` is used.
- `format_letter` – a function mapping letters of the input and output alphabets to a string suitable for typesetting in LaTeX's mathematics mode. If not given, *default_format_transition_label()* uses `latex()`.
- `format_transition_label` – a function mapping words over the input and output alphabets to a string suitable for typesetting in LaTeX's mathematics mode. If not given, *default_format_transition_label()* is used.
- `loop_where` – dictionary or a function mapping labels of initial states to one of `'above'`, `'left'`, `'below'`, `'right'`. If not given, `'above'` is used.
- `initial_where` – dictionary or a function mapping labels of initial states to one of `'above'`, `'left'`, `'below'`, `'right'`. If not given, TikZ' default (currently `'left'`) is used.
- `accepting_style` – one of `'accepting by double'` and `'accepting by arrow'`. If not given, `'accepting by double'` is used unless there are non-empty final output words.
- `accepting_distance` – string giving a LaTeX length used for the length of the arrow leading from a final state. If not given, TikZ' default (currently `'3ex'`) is used unless there are non-empty final output words, in which case `'7ex'` is used.
- `accepting_where` – dictionary or a function mapping labels of final states to one of `'above'`, `'left'`, `'below'`, `'right'`. If not given, TikZ' default (currently `'right'`) is used. If the final state has a final output word, it is also possible to give an angle in degrees.
- `accepting_show_empty` – if `True` the arrow of an empty final output word is labeled as well. Note that this implicitly implies `accepting_style='accepting by arrow'`. If not given, the default `False` is used.

OUTPUT: nothing

As TikZ (cf. the Wikipedia article PGF/TikZ) is used to typeset the graphics, the syntax is oriented on TikZ' syntax.

This is a convenience function collecting all options for LaTeX output. All of its functionality can also be achieved by directly setting the attributes

- `coordinates`, `format_label`, `loop_where`, `initial_where`, and `accepting_where` of *FSMState* (here, `format_label` is a callable without arguments, everything else is a specific value);
- `format_label` of *FSMTransition* (`format_label` is a callable without arguments);

- format_state_label, format_letter, format_transition_label, accepting_style, accepting_distance, and accepting_show_empty of *FiniteStateMachine*.

This function, however, also (somewhat) checks its input and serves to collect documentation on all these options.

The function can be called several times, only those arguments which are not None are taken into account. By the same means, it can be combined with directly setting some attributes as outlined above.

EXAMPLES:

See also the section on *LaTeX output* in the introductory examples of this module.

```

markov_chain_simplification()

Consider `self` as Markov chain with probabilities as input labels and simplify it.

OUTPUT: simplified version of `self`

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import duplicate_transition_add_
↪input
sage: T = Transducer([[1, 2, 1/4, 0], [1, -2, 1/4, 0], [1, -2, 1/2, 0],
....:                 [2, 2, 1/4, 1], [2, -2, 1/4, 1], [-2, -2, 1/4, 1],
....:                 [-2, 2, 1/4, 1], [2, 3, 1/2, 2], [-2, 3, 1/2, 2]],
....:                initial_states=[1],
....:                final_states=[3],
....:                on_duplicate_transition=duplicate_transition_add_input)
sage: T1 = T.markov_chain_simplification()
sage: sorted(T1.transitions())
[Transition from ((1,),) to ((2, -2),): 1|0,
 Transition from ((2, -2),) to ((2, -2),): 1/2|1,
 Transition from ((2, -2),) to ((3,),): 1/2|2]
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import duplicate_transition_add_
↪input
>>> T = Transducer([[Integer(1), Integer(2), Integer(1)/Integer(4),␣
↪Integer(0)], [Integer(1), -Integer(2), Integer(1)/Integer(4), Integer(0)],␣
↪[Integer(1), -Integer(2), Integer(1)/Integer(2), Integer(0)],
...                 [Integer(2), Integer(2), Integer(1)/Integer(4),␣
↪Integer(1)], [Integer(2), -Integer(2), Integer(1)/Integer(4), Integer(1)],␣
↪[-Integer(2), -Integer(2), Integer(1)/Integer(4), Integer(1)],
...                 [-Integer(2), Integer(2), Integer(1)/Integer(4),␣
↪Integer(1)], [Integer(2), Integer(3), Integer(1)/Integer(2), Integer(2)], [-
↪Integer(2), Integer(3), Integer(1)/Integer(2), Integer(2)]],
...                initial_states=[Integer(1)],
...                final_states=[Integer(3)],
...                on_duplicate_transition=duplicate_transition_add_input)
>>> T1 = T.markov_chain_simplification()
>>> sorted(T1.transitions())
[Transition from ((1,),) to ((2, -2),): 1|0,
 Transition from ((2, -2),) to ((2, -2),): 1/2|1,
 Transition from ((2, -2),) to ((3,),): 1/2|2]
```

merged_transitions()

Merges transitions which have the same `from_state`, `to_state` and `word_out` while adding their `word_in`.

OUTPUT:

A finite state machine with merged transitions. If no mergers occur, return `self`.

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import duplicate_transition_add_
↪input
sage: T = Transducer([[1, 2, 1/4, 1], [1, -2, 1/4, 1], [1, -2, 1/2, 1],
....:                 [2, 2, 1/4, 1], [2, -2, 1/4, 1], [-2, -2, 1/4, 1],
....:                 [-2, 2, 1/4, 1], [2, 3, 1/2, 1], [-2, 3, 1/2, 1]],
....:                on_duplicate_transition=duplicate_transition_add_input)
sage: T1 = T.merged_transitions()
sage: T1 is T
False
sage: sorted(T1.transitions())
[Transition from -2 to -2: 1/4|1,
 Transition from -2 to 2: 1/4|1,
 Transition from -2 to 3: 1/2|1,
 Transition from 1 to 2: 1/4|1,
 Transition from 1 to -2: 3/4|1,
 Transition from 2 to -2: 1/4|1,
 Transition from 2 to 2: 1/4|1,
 Transition from 2 to 3: 1/2|1]
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import duplicate_transition_add_
↪input
>>> T = Transducer([[Integer(1), Integer(2), Integer(1)/Integer(4),␣
↪Integer(1)], [Integer(1), -Integer(2), Integer(1)/Integer(4), Integer(1)],␣
↪[Integer(1), -Integer(2), Integer(1)/Integer(2), Integer(1)],
...                 [Integer(2), Integer(2), Integer(1)/Integer(4),␣
↪Integer(1)], [Integer(2), -Integer(2), Integer(1)/Integer(4), Integer(1)],␣
↪[-Integer(2), -Integer(2), Integer(1)/Integer(4), Integer(1)],
...                 [-Integer(2), Integer(2), Integer(1)/Integer(4),␣
↪Integer(1)], [Integer(2), Integer(3), Integer(1)/Integer(2), Integer(1)], [-
↪Integer(2), Integer(3), Integer(1)/Integer(2), Integer(1)]],
...                on_duplicate_transition=duplicate_transition_add_input)
>>> T1 = T.merged_transitions()
>>> T1 is T
False
>>> sorted(T1.transitions())
[Transition from -2 to -2: 1/4|1,
 Transition from -2 to 2: 1/4|1,
 Transition from -2 to 3: 1/2|1,
 Transition from 1 to 2: 1/4|1,
 Transition from 1 to -2: 3/4|1,
 Transition from 2 to -2: 1/4|1,
 Transition from 2 to 2: 1/4|1,
 Transition from 2 to 3: 1/2|1]
```

Applying the function again does not change the result:

```
sage: T2 = T1.merged_transitions()
sage: T2 is T1
True
```

```
>>> from sage.all import *
```

(continues on next page)

(continued from previous page)

```
>>> T2 = T1.merged_transitions()
>>> T2 is T1
True
```

moments_waiting_time(*test=<class 'bool'>*, *is_zero=None*, *expectation_only=False*)

If this finite state machine acts as a Markov chain, return the expectation and variance of the number of steps until first writing `True`.

INPUT:

- `test` – (default: `bool`) a callable deciding whether an output label is to be considered `True`. By default, the standard conversion to boolean is used.
- `is_zero` – (default: `None`) a callable deciding whether an expression for a probability is zero. By default, checking for zero is simply done by `is_zero()`. This parameter can be used to provide a more sophisticated check for zero, e.g. in the case of symbolic probabilities, see the examples below. This parameter is passed on to *`is_Markov_chain()`*. This parameter only affects the input of the Markov chain.
- `expectation_only` – boolean (default: `False`); if set, the variance is not computed (in order to save time). By default, the variance is computed.

OUTPUT:

A dictionary (if `expectation_only=False`) consisting of

- `expectation`,
- `variance`.

Otherwise, just the expectation is returned (no dictionary for `expectation_only=True`).

Expectation and variance of the number of steps until first writing `True` (as determined by the parameter `test`).

ALGORITHM:

Relies on a (classical and easy) probabilistic argument, cf. [FGT1992], Eqns. (6) and (7).

For the variance, see [FHP2015], Section 2.

EXAMPLES:

1. The simplest example is to wait for the first 1 in a 0-1-string where both digits appear with probability $1/2$. In fact, the waiting time equals k if and only if the string starts with $0^{k-1}1$. This event occurs with probability 2^{-k}. Therefore, the expected waiting time and the variance are $\sum_{k\geq 1} k2^{-k} = 2$ and $\sum_{k\geq 1}(k-2)^2 2^{-k} = 2$:

```
sage: var('k')                                                          #␣
↪needs sage.symbolic
k
sage: sum(k * 2^(-k), k, 1, infinity)                                   #␣
↪needs sage.symbolic
2
sage: sum((k-2)^2 * 2^(-k), k, 1, infinity)                             #␣
↪needs sage.symbolic
2
```

```
>>> from sage.all import *
>>> var('k')                                                                #␣
↪needs sage.symbolic
k
>>> sum(k * Integer(2)**(-k), k, Integer(1), infinity)                      ␣
↪               # needs sage.symbolic
2
>>> sum((k-Integer(2))**Integer(2) * Integer(2)**(-k), k, Integer(1),␣
↪infinity)                                # needs sage.symbolic
2
```

We now compute the same expectation and variance by using a Markov chain:

```
sage: from sage.combinat.finite_state_machine import (
....:     duplicate_transition_add_input)
sage: T = Transducer(
....:     [(0, 0, 1/2, 0), (0, 0, 1/2, 1)],
....:     on_duplicate_transition=\
....:         duplicate_transition_add_input,
....:     initial_states=[0],
....:     final_states=[0])
sage: T.moments_waiting_time()
{'expectation': 2, 'variance': 2}
sage: T.moments_waiting_time(expectation_only=True)
2
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import (
...     duplicate_transition_add_input)
>>> T = Transducer(
...     [(Integer(0), Integer(0), Integer(1)/Integer(2), Integer(0)),␣
↪(Integer(0), Integer(0), Integer(1)/Integer(2), Integer(1))],
...     on_duplicate_transition=        duplicate_transition_add_input,
...     initial_states=[Integer(0)],
...     final_states=[Integer(0)])
>>> T.moments_waiting_time()
{'expectation': 2, 'variance': 2}
>>> T.moments_waiting_time(expectation_only=True)
2
```

In the following, we replace the output `0` by `-1` and demonstrate the use of the parameter `test`:

```
sage: T.delete_transition((0, 0, 1/2, 0))
sage: T.add_transition((0, 0, 1/2, -1))
Transition from 0 to 0: 1/2|-1
sage: T.moments_waiting_time(test=lambda x: x<0)
{'expectation': 2, 'variance': 2}
```

```
>>> from sage.all import *
>>> T.delete_transition((Integer(0), Integer(0), Integer(1)/Integer(2),␣
↪Integer(0)))
>>> T.add_transition((Integer(0), Integer(0), Integer(1)/Integer(2), -
↪Integer(1)))
```

(continues on next page)

(continued from previous page)

```
Transition from 0 to 0: 1/2|-1
>>> T.moments_waiting_time(test=lambda x: x<Integer(0))
{'expectation': 2, 'variance': 2}
```

2. Make sure that the transducer is actually a Markov chain. Although this is checked by the code, unexpected behaviour may still occur if the transducer looks like a Markov chain. In the following example, we 'forget' to assign probabilities, but due to a coincidence, all 'probabilities' add up to one. Nevertheless, 0 is never written, so the expectation is 1.

```
sage: T = Transducer([(0, 0, 0, 0), (0, 0, 1, 1)],
....:                on_duplicate_transition=\
....:                    duplicate_transition_add_input,
....:                initial_states=[0],
....:                final_states=[0])
sage: T.moments_waiting_time()
{'expectation': 1, 'variance': 0}
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(0), Integer(0), Integer(0)),␣
↪(Integer(0), Integer(0), Integer(1), Integer(1))],
...                on_duplicate_transition=                    duplicate_
↪transition_add_input,
...                initial_states=[Integer(0)],
...                final_states=[Integer(0)])
>>> T.moments_waiting_time()
{'expectation': 1, 'variance': 0}
```

3. If `True` is never written, the moments are `+Infinity`:

```
sage: T = Transducer([(0, 0, 1, 0)],
....:                on_duplicate_transition=\
....:                    duplicate_transition_add_input,
....:                initial_states=[0],
....:                final_states=[0])
sage: T.moments_waiting_time()
{'expectation': +Infinity, 'variance': +Infinity}
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(0), Integer(1), Integer(0))],
...                on_duplicate_transition=                    duplicate_
↪transition_add_input,
...                initial_states=[Integer(0)],
...                final_states=[Integer(0)])
>>> T.moments_waiting_time()
{'expectation': +Infinity, 'variance': +Infinity}
```

4. Let h and r be positive integers. We consider random strings of letters $1, \ldots, r$ where the letter j occurs with probability p_j. Let B be the random variable giving the first position of a block of h consecutive

identical letters. Then

$$\mathbb{E}(B) = \frac{1}{\sum_{i=1}^{r} \frac{1}{p_i^{-1} + \cdots + p_i^{-h}}},$$

$$\mathbb{V}(B) = \frac{\sum_{i=1}^{r} \left(\frac{p_i + p_i^h}{1 - p_i^h} - 2h \frac{p_i^h (1 - p_i)}{(1 - p_i^h)^2} \right)}{\left(\sum_{i=1}^{r} \frac{1}{p_i^{-1} + \cdots + p_i^{-h}} \right)^2}$$

cf. [S1986], p. 62, or [FHP2015], Theorem 1. We now verify this with a transducer approach.

```
sage: # needs sage.libs.singular
sage: def test(h, r):
....:     R = PolynomialRing(
....:             QQ,
....:             names=['p_%d' % j for j in range(r)])
....:     p = R.gens()
....:     def is_zero(polynomial):
....:         return polynomial in (sum(p) - 1) * R
....:     theory_expectation = 1/(sum(1/sum(p[j]^(-i)
....:                     for i in range(1, h+1))
....:                     for j in range(r)))
....:     theory_variance = sum(
....:         (p[i] + p[i]^h)/(1 - p[i]^h)
....:         - 2*h*p[i]^h * (1 - p[i])/(1 - p[i]^h)^2
....:         for i in range(r)
....:         ) * theory_expectation^2
....:     alphabet = list(range(r))
....:     counters = [
....:         transducers.CountSubblockOccurrences([j]*h,
....:                     alphabet)
....:         for j in alphabet]
....:     all_counter = counters[0].cartesian_product(
....:         counters[1:])
....:     adder = transducers.add(input_alphabet=[0, 1],
....:         number_of_operands=r)
....:     probabilities = Transducer(
....:        [(0, 0, p[j], j) for j in alphabet],
....:        initial_states=[0],
....:        final_states=[0],
....:        on_duplicate_transition=\
....:            duplicate_transition_add_input)
....:     chain = adder(all_counter(probabilities))
....:     result = chain.moments_waiting_time(
....:        is_zero=is_zero)
....:     return is_zero((result['expectation'] -
....:                 theory_expectation).numerator()) \
....:             and \
....:             is_zero((result['variance'] -

...         for j in alphabet]
...     all_counter = counters[Integer(0)].cartesian_product(
...         counters[Integer(1):])
...     adder = transducers.add(input_alphabet=[Integer(0), Integer(1)],
...         number_of_operands=r)
...     probabilities = Transducer(
...        [(Integer(0), Integer(0), p[j], j) for j in alphabet],
...        initial_states=[Integer(0)],
...        final_states=[Integer(0)],
...        on_duplicate_transition=           duplicate_transition_add_
↪input)
...     chain = adder(all_counter(probabilities))
...     result = chain.moments_waiting_time(
...        is_zero=is_zero)
...     return is_zero((result['expectation'] -
...                 theory_expectation).numerator())            and       ␣
↪    is_zero((result['variance'] -
...                  theory_variance).numerator())
>>> test(Integer(2), Integer(2))
True
>>> test(Integer(2), Integer(3))
True
>>> test(Integer(3), Integer(3))
True
```

5. Consider the alphabet $\{0, \ldots, r-1\}$, some $1 \leq j \leq r$ and some $h \geq 1$. For some probabilities p_0, …, p_{r-1}, we consider infinite words where the letters occur independently with the given probabilities. The random variable B_j is the first position n such that there exist j of the r letters having an h-run. The expectation of B_j is given in [FHP2015], Theorem 2. Here, we verify this result by using transducers:

```
sage: # needs sage.libs.singular
sage: def test(h, r, j):
....:     R = PolynomialRing(
....:             QQ,
....:             names=['p_%d' % i for i in range(r)])
....:     p = R.gens()
....:     def is_zero(polynomial):
....:         return polynomial in (sum(p) - 1) * R
....:     alphabet = list(range(r))
....:     counters = [
....:         transducers.Wait([0, 1])(
....:             transducers.CountSubblockOccurrences(
....:                 [i]*h,
....:                 alphabet))
....:         for i in alphabet]
....:     all_counter = counters[0].cartesian_product(
....:         counters[1:])
....:     adder = transducers.add(input_alphabet=[0, 1],
....:         number_of_operands=r)
....:     threshold = transducers.map(
....:         f=lambda x: x >= j,
....:         input_alphabet=srange(r+1))
....:     probabilities = Transducer(
....:         [(0, 0, p[i], i) for i in alphabet],
....:         initial_states=[0],
....:         final_states=[0],
....:         on_duplicate_transition=\
....:             duplicate_transition_add_input)
....:     chain = threshold(adder(all_counter(
....:         probabilities)))
....:     result = chain.moments_waiting_time(
....:         is_zero=is_zero,
....:         expectation_only=True)
....:     R_v = PolynomialRing(
....:             QQ,
....:             names=['p_%d' % i for i in range(r)])
....:     v = R_v.gens()

...              expectation += summand
...      return is_zero((result - expectation).            numerator())
>>> test(Integer(2), Integer(3), Integer(2))
True
```

REFERENCES:

number_of_words(*variable=None*, *base_ring=None*)

Return the number of successful input words of given length.

INPUT:

- `variable` – a symbol denoting the length of the words, by default n
- `base_ring` – ring (default: `QQbar`) in which to compute the eigenvalues

OUTPUT: a symbolic expression

EXAMPLES:

```
sage: NAFpm = Automaton([(0, 0, 0), (0, 1, 1),
....:                    (0, 1, -1), (1, 0, 0)],
....:                   initial_states=[0],
....:                   final_states=[0, 1])
sage: N = NAFpm.number_of_words(); N                                    #␣
↪needs sage.symbolic
4/3*2^n - 1/3*(-1)^n
sage: all(len(list(NAFpm.language(s)))                                  #␣
↪needs sage.symbolic
....:     - len(list(NAFpm.language(s-1))) == N.subs(n=s)
....:     for s in srange(1, 6))
True
```

```
>>> from sage.all import *
>>> NAFpm = Automaton([(Integer(0), Integer(0), Integer(0)), (Integer(0),␣
↪Integer(1), Integer(1)),
...                    (Integer(0), Integer(1), -Integer(1)), (Integer(1),␣
↪Integer(0), Integer(0))],
...                   initial_states=[Integer(0)],
...                   final_states=[Integer(0), Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> N = NAFpm.number_of_words(); N                                          #␣
↪needs sage.symbolic
4/3*2^n - 1/3*(-1)^n
>>> all(len(list(NAFpm.language(s)))                                        #␣
↪needs sage.symbolic
...       - len(list(NAFpm.language(s-Integer(1)))) == N.subs(n=s)
...       for s in srange(Integer(1), Integer(6)))
True
```

An example with non-rational eigenvalues. By default, eigenvalues are elements of the `field of algebraic numbers`.

```
sage: NAFp = Automaton([(0, 0, 0), (0, 1, 1),  (1, 0, 0)],
....:                  initial_states=[0],
....:                  final_states=[0, 1])
sage: N = NAFp.number_of_words(); N                                         #␣
↪needs sage.rings.number_field sage.symbolic
1.1708203932499370?*1.618033988749895?^n
- 0.1708203932499369?*(-0.618033988749895?)^n
sage: all(len(list(NAFp.language(s)))                                       #␣
↪needs sage.rings.number_field sage.symbolic
....:       - len(list(NAFp.language(s-1))) == N.subs(n=s)
....:       for s in srange(1, 6))
True
```

```
>>> from sage.all import *
>>> NAFp = Automaton([(Integer(0), Integer(0), Integer(0)), (Integer(0),␣
↪Integer(1), Integer(1)),  (Integer(1), Integer(0), Integer(0))],
...                  initial_states=[Integer(0)],
...                  final_states=[Integer(0), Integer(1)])
>>> N = NAFp.number_of_words(); N                                           #␣
↪needs sage.rings.number_field sage.symbolic
1.1708203932499370?*1.618033988749895?^n
- 0.1708203932499369?*(-0.618033988749895?)^n
>>> all(len(list(NAFp.language(s)))                                         #␣
↪needs sage.rings.number_field sage.symbolic
...       - len(list(NAFp.language(s-Integer(1)))) == N.subs(n=s)
...       for s in srange(Integer(1), Integer(6)))
True
```

We specify a suitable `base_ring` to obtain a radical expression. To do so, we first compute the characteristic polynomial and then construct a number field generated by its roots.

```
sage: # needs sage.rings.number_field sage.symbolic
sage: M = NAFp.adjacency_matrix(entry=lambda t: 1)
sage: M.characteristic_polynomial()
x^2 - x - 1
sage: R.<phi> = NumberField(x^2 - x - 1, embedding=1.6)
sage: N = NAFp.number_of_words(base_ring=R); N
1/2*(1/2*sqrt(5) + 1/2)^n*(3*sqrt(1/5) + 1)
- 1/2*(-1/2*sqrt(5) + 1/2)^n*(3*sqrt(1/5) - 1)
sage: all(len(list(NAFp.language(s)))
```

(continues on next page)

(continued from previous page)

```
....:     - len(list(NAFp.language(s-1))) == N.subs(n=s)
....:     for s in srange(1, 6))
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.number_field sage.symbolic
>>> M = NAFp.adjacency_matrix(entry=lambda t: Integer(1))
>>> M.characteristic_polynomial()
x^2 - x - 1
>>> R = NumberField(x**Integer(2) - x - Integer(1), embedding=RealNumber('1.6
↪'), names=('phi',)); (phi,) = R._first_ngens(1)
>>> N = NAFp.number_of_words(base_ring=R); N
1/2*(1/2*sqrt(5) + 1/2)^n*(3*sqrt(1/5) + 1)
- 1/2*(-1/2*sqrt(5) + 1/2)^n*(3*sqrt(1/5) - 1)
>>> all(len(list(NAFp.language(s)))
...     - len(list(NAFp.language(s-Integer(1)))) == N.subs(n=s)
...     for s in srange(Integer(1), Integer(6)))
True
```

In this special case, we might also use the constant `golden_ratio`:

```
sage: # needs sage.rings.number_field sage.symbolic
sage: R.<phi> = NumberField(x^2-x-1, embedding=golden_ratio)
sage: N = NAFp.number_of_words(base_ring=R); N
1/5*(3*golden_ratio + 1)*golden_ratio^n
- 1/5*(3*golden_ratio - 4)*(-golden_ratio + 1)^n
sage: all(len(list(NAFp.language(s)))
....:     - len(list(NAFp.language(s-1))) == N.subs(n=s)
....:     for s in srange(1, 6))
True
```

```
>>> from sage.all import *
>>> # needs sage.rings.number_field sage.symbolic
>>> R = NumberField(x**Integer(2)-x-Integer(1), embedding=golden_ratio,␣
↪names=('phi',)); (phi,) = R._first_ngens(1)
>>> N = NAFp.number_of_words(base_ring=R); N
1/5*(3*golden_ratio + 1)*golden_ratio^n
- 1/5*(3*golden_ratio - 4)*(-golden_ratio + 1)^n
>>> all(len(list(NAFp.language(s)))
...     - len(list(NAFp.language(s-Integer(1)))) == N.subs(n=s)
...     for s in srange(Integer(1), Integer(6)))
True
```

The adjacency matrix of the following example is a Jordan matrix of size 3 to the eigenvalue 4:

```
sage: J3 = Automaton([(0, 1, -1), (1, 2, -1)],
....:     initial_states=[0],
....:     final_states=[0, 1, 2])
sage: for i in range(3):
....:     for j in range(4):
....:         new_transition = J3.add_transition(i, i, j)
sage: J3.adjacency_matrix(entry=lambda t: 1)
```

(continues on next page)

(continued from previous page)

```
[4 1 0]
[0 4 1]
[0 0 4]
sage: N = J3.number_of_words(); N                                              #␣

↪needs sage.symbolic
...     - len(list(J3.language(s-Integer(1)))) == N.subs(n=s)
...     for s in range(Integer(1), Integer(6)))
True
```

Here is an automaton without cycles, so with eigenvalue 0.

```
sage: A = Automaton([(j, j+1, 0) for j in range(3)],
....:               initial_states=[0],
....:               final_states=list(range(3)))
sage: A.number_of_words()                                                      #␣
↪needs sage.symbolic
1/2*0^(n - 2)*(n - 1)*n + 0^(n - 1)*n + 0^n
```

```
>>> from sage.all import *
>>> A = Automaton([(j, j+Integer(1), Integer(0)) for j in range(Integer(3))],
...               initial_states=[Integer(0)],
...               final_states=list(range(Integer(3))))
>>> A.number_of_words()                                                        #␣
↪needs sage.symbolic
1/2*0^(n - 2)*(n - 1)*n + 0^(n - 1)*n + 0^n
```

on_duplicate_transition(*old_transition*, *new_transition*)

alias of *duplicate_transition_ignore()*.

output_alphabet = None

A list of letters representing the output alphabet of the finite state machine.

It can be set by the parameter `output_alphabet` when initializing a finite state machine, see *FiniteStateMachine*.

It can also be set by the method *determine_alphabets()*.

See also

FiniteStateMachine, *determine_alphabets()*, *input_alphabet*.

output_projection()

Return a automaton where the input of each transition of self is deleted and the new input is the original output.

OUTPUT: an automaton

EXAMPLES:

```
sage: F = FiniteStateMachine([('A', 'B', 0, 1), ('A', 'A', 1, 1),
....:                         ('B', 'B', 1, 0)])
sage: G = F.output_projection()
sage: G.transitions()
[Transition from 'A' to 'B': 1|-,
 Transition from 'A' to 'A': 1|-,
 Transition from 'B' to 'B': 0|-]
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine([('A', 'B', Integer(0), Integer(1)), ('A', 'A',␣
↪Integer(1), Integer(1)),
...                         ('B', 'B', Integer(1), Integer(0))])
>>> G = F.output_projection()
>>> G.transitions()
[Transition from 'A' to 'B': 1|-,
 Transition from 'A' to 'A': 1|-,
 Transition from 'B' to 'B': 0|-]
```

Final output words are also considered correctly:

```
sage: H = Transducer([('A', 'B', 0, 1), ('A', 'A', 1, 1),
....:                 ('B', 'B', 1, 0), ('A', ('final', 0), 0, 0)],
....:                final_states=['A', 'B'])
sage: H.state('B').final_word_out = 2
sage: J = H.output_projection()
sage: J.states()
['A', 'B', ('final', 0), ('final', 1)]
sage: J.transitions()
[Transition from 'A' to 'B': 1|-,
 Transition from 'A' to 'A': 1|-,
 Transition from 'A' to ('final', 0): 0|-,
 Transition from 'B' to 'B': 0|-,
 Transition from 'B' to ('final', 1): 2|-]
```

(continues on next page)

(continued from previous page)

```
sage: J.final_states()
['A', ('final', 1)]
```

```
>>> from sage.all import *
>>> H = Transducer([('A', 'B', Integer(0), Integer(1)), ('A', 'A', Integer(1),
↪ Integer(1)),
...                  ('B', 'B', Integer(1), Integer(0)), ('A', ('final',␣
↪Integer(0)), Integer(0), Integer(0))],
...                final_states=['A', 'B'])
>>> H.state('B').final_word_out = Integer(2)
>>> J = H.output_projection()
>>> J.states()
['A', 'B', ('final', 0), ('final', 1)]
>>> J.transitions()
[Transition from 'A' to 'B': 1|-,
 Transition from 'A' to 'A': 1|-,
 Transition from 'A' to ('final', 0): 0|-,
 Transition from 'B' to 'B': 0|-,
 Transition from 'B' to ('final', 1): 2|-]
>>> J.final_states()
['A', ('final', 1)]
```

plot()

Plots a graph of the finite state machine with labeled vertices and labeled edges.

OUTPUT: a plot of the graph of the finite state machine

predecessors(*state*, *valid_input=None*)

List all predecessors of a state.

INPUT:

- `state` – the state from which the predecessors should be listed
- `valid_input` – if `valid_input` is a list, then we only consider transitions whose input labels are contained in `valid_input`. `state` has to be a *FSMState* (not a label of a state). If input labels of length larger than 1 are used, then `valid_input` has to be a list of lists.

OUTPUT: list of states

EXAMPLES:

```
sage: A = Transducer([('I', 'A', 'a', 'b'), ('I', 'B', 'b', 'c'),
....:                 ('I', 'C', 'c', 'a'), ('A', 'F', 'b', 'a'),
....:                 ('B', 'F', ['c', 'b'], 'b'), ('C', 'F', 'a', 'c')],
....:                initial_states=['I'], final_states=['F'])
sage: A.predecessors(A.state('A'))
['A', 'I']
sage: A.predecessors(A.state('F'), valid_input=['b', 'a'])
['F', 'C', 'A', 'I']
sage: A.predecessors(A.state('F'), valid_input=[['c', 'b'], 'a'])
['F', 'C', 'B']
```

```
>>> from sage.all import *
>>> A = Transducer([('I', 'A', 'a', 'b'), ('I', 'B', 'b', 'c'),
```

(continues on next page)

(continued from previous page)

```
...                 ('I', 'C', 'c', 'a'), ('A', 'F', 'b', 'a'),
...                 ('B', 'F', ['c', 'b'], 'b'), ('C', 'F', 'a', 'c')],
...                initial_states=['I'], final_states=['F'])
>>> A.predecessors(A.state('A'))
['A', 'I']
>>> A.predecessors(A.state('F'), valid_input=['b', 'a'])
['F', 'C', 'A', 'I']
>>> A.predecessors(A.state('F'), valid_input=[['c', 'b'], 'a'])
['F', 'C', 'B']
```

prepone_output()

For all paths, shift the output of the path from one transition to the earliest possible preceding transition of the path.

OUTPUT: nothing

Apply the following to each state s (except initial states) of the finite state machine as often as possible:

If the letter a is a prefix of the output label of all transitions from s (including the final output of s), then remove it from all these labels and append it to all output labels of all transitions leading to s.

We assume that the states have no output labels, but final outputs are allowed.

EXAMPLES:

```
sage: A = Transducer([('A', 'B', 1, 1),
....:                 ('B', 'B', 0, 0),
....:                 ('B', 'C', 1, 0)],
....:                initial_states=['A'],
....:                final_states=['C'])
sage: A.prepone_output()
sage: A.transitions()
[Transition from 'A' to 'B': 1|1,0,
 Transition from 'B' to 'B': 0|0,
 Transition from 'B' to 'C': 1|-]
```

```
>>> from sage.all import *
>>> A = Transducer([('A', 'B', Integer(1), Integer(1)),
...                 ('B', 'B', Integer(0), Integer(0)),
...                 ('B', 'C', Integer(1), Integer(0))],
...                initial_states=['A'],
...                final_states=['C'])
>>> A.prepone_output()
>>> A.transitions()
[Transition from 'A' to 'B': 1|1,0,
 Transition from 'B' to 'B': 0|0,
 Transition from 'B' to 'C': 1|-]
```

```
sage: B = Transducer([('A', 'B', 0, 1),
....:                 ('B', 'C', 1, [1, 1]),
....:                 ('B', 'C', 0, 1)],
....:                initial_states=['A'],
....:                final_states=['C'])
sage: B.prepone_output()
```

(continues on next page)

(continued from previous page)

```
sage: B.transitions()
[Transition from 'A' to 'B': 0|1,1,
 Transition from 'B' to 'C': 1|1,
 Transition from 'B' to 'C': 0|-]
```

```
>>> from sage.all import *
>>> B = Transducer([('A', 'B', Integer(0), Integer(1)),
...                 ('B', 'C', Integer(1), [Integer(1), Integer(1)]),
...                 ('B', 'C', Integer(0), Integer(1))],
...                initial_states=['A'],
...                final_states=['C'])
>>> B.prepone_output()
>>> B.transitions()
[Transition from 'A' to 'B': 0|1,1,
 Transition from 'B' to 'C': 1|1,
 Transition from 'B' to 'C': 0|-]
```

If initial states are not labeled as such, unexpected results may be obtained:

```
sage: C = Transducer([(0,1,0,0)])
sage: C.prepone_output()
verbose 0 (...: finite_state_machine.py, prepone_output)
All transitions leaving state 0 have an output label with
prefix 0.  However, there is no inbound transition and it
is not an initial state. This routine (possibly called by
simplification) therefore erased this prefix from all
outbound transitions.
sage: C.transitions()
[Transition from 0 to 1: 0|-]
```

```
>>> from sage.all import *
>>> C = Transducer([(Integer(0),Integer(1),Integer(0),Integer(0))])
>>> C.prepone_output()
verbose 0 (...: finite_state_machine.py, prepone_output)
All transitions leaving state 0 have an output label with
prefix 0.  However, there is no inbound transition and it
is not an initial state. This routine (possibly called by
simplification) therefore erased this prefix from all
outbound transitions.
>>> C.transitions()
[Transition from 0 to 1: 0|-]
```

Also the final output of final states can be changed:

```
sage: T = Transducer([('A', 'B', 0, 1),
....:                 ('B', 'C', 1, [1, 1]),
....:                 ('B', 'C', 0, 1)],
....:                initial_states=['A'],
....:                final_states=['B'])
sage: T.state('B').final_word_out = [1]
sage: T.prepone_output()
sage: T.transitions()
```

(continues on next page)

(continued from previous page)

```
[Transition from 'A' to 'B': 0|1,1,
 Transition from 'B' to 'C': 1|1,
 Transition from 'B' to 'C': 0|-]
sage: T.state('B').final_word_out
[]
```

```
>>> from sage.all import *
>>> T = Transducer([('A', 'B', Integer(0), Integer(1)),
...                 ('B', 'C', Integer(1), [Integer(1), Integer(1)]),
...                 ('B', 'C', Integer(0), Integer(1))],
...                initial_states=['A'],
...                final_states=['B'])
>>> T.state('B').final_word_out = [Integer(1)]
>>> T.prepone_output()
>>> T.transitions()
[Transition from 'A' to 'B': 0|1,1,
 Transition from 'B' to 'C': 1|1,
 Transition from 'B' to 'C': 0|-]
>>> T.state('B').final_word_out
[]
```

```
sage: S = Transducer([('A', 'B', 0, 1),
....:                 ('B', 'C', 1, [1, 1]),
....:                 ('B', 'C', 0, 1)],
....:                initial_states=['A'],
....:                final_states=['B'])
sage: S.state('B').final_word_out = [0]
sage: S.prepone_output()
sage: S.transitions()
[Transition from 'A' to 'B': 0|1,
 Transition from 'B' to 'C': 1|1,1,
 Transition from 'B' to 'C': 0|1]
sage: S.state('B').final_word_out
[0]
```

```
>>> from sage.all import *
>>> S = Transducer([('A', 'B', Integer(0), Integer(1)),
...                 ('B', 'C', Integer(1), [Integer(1), Integer(1)]),
...                 ('B', 'C', Integer(0), Integer(1))],
...                initial_states=['A'],

>>> S.state('B').final_word_out = [Integer(0)]
>>> S.prepone_output()
>>> S.transitions()
[Transition from 'A' to 'B': 0|1,
 Transition from 'B' to 'C': 1|1,1,
 Transition from 'B' to 'C': 0|1]
>>> S.state('B').final_word_out
[0]
```

Output labels do not have to be hashable:

```
sage: C = Transducer([(0, 1, 0, []),
....:                 (1, 0, 0, [vector([0, 0]), 0]),
....:                 (1, 1, 1, [vector([0, 0]), 1]),
....:                 (0, 0, 1, 0)],
....:                determine_alphabets=False,
....:                initial_states=[0])
sage: C.prepone_output()
sage: sorted(C.transitions())
[Transition from 0 to 1: 0|(0, 0),
 Transition from 0 to 0: 1|0,
 Transition from 1 to 0: 0|0,
 Transition from 1 to 1: 1|1,(0, 0)]
```

```
>>> from sage.all import *
>>> C = Transducer([(Integer(0), Integer(1), Integer(0), []),
...                 (Integer(1), Integer(0), Integer(0), [vector([Integer(0),␣
↪Integer(0)]), Integer(0)]),
...                 (Integer(1), Integer(1), Integer(1), [vector([Integer(0),␣
↪Integer(0)]), Integer(1)]),
...                 (Integer(0), Integer(0), Integer(1), Integer(0))],
...                determine_alphabets=False,
...                initial_states=[Integer(0)])
>>> C.prepone_output()
>>> sorted(C.transitions())
[Transition from 0 to 1: 0|(0, 0),
 Transition from 0 to 0: 1|0,
 Transition from 1 to 0: 0|0,
 Transition from 1 to 1: 1|1,(0, 0)]
```

process(**args*, ***kwargs*)

Return whether the finite state machine accepts the input, the state where the computation stops and which output is generated.

INPUT:

- `input_tape` – the input tape can be a list or an iterable with entries from the input alphabet. If we are working with a multi-tape machine (see parameter `use_multitape_input` and notes below), then the tape is a list or tuple of tracks, each of which can be a list or an iterable with entries from the input alphabet.
- `initial_state` or `initial_states` – the initial state(s) in which the machine starts. Either specify a single one with `initial_state` or a list of them with `initial_states`. If both are given, `initial_state` will be appended to `initial_states`. If neither is specified, the initial states of the finite state machine are taken.
- `list_of_outputs` – (default: `None`) a boolean or `None`. If `True`, then the outputs are given in list form (even if we have no or only one single output). If `False`, then the result is never a list (an exception is raised if the result cannot be returned). If `list_of_outputs=None`, the method determines automatically what to do (e.g. if a non-deterministic machine returns more than one path, then the output is returned in list form).
- `only_accepted` – boolean (default: `False`); if set, then the first argument in the output is guaranteed to be `True` (if the output is a list, then the first argument of each element will be `True`)
- `always_include_output` – if set (not by default), always include the output. This is inconsequential for a *FiniteStateMachine*, but can be used in derived classes where the output is suppressed by

default, cf. *Automaton.process()*.

- `format_output` – a function that translates the written output (which is in form of a list) to something more readable. By default (`None`) identity is used here.
- `check_epsilon_transitions` – boolean (default: `True`); if `False`, then epsilon transitions are not taken into consideration during process
- `write_final_word_out` – boolean (default: `True`); whether the final output words should be written or not
- `use_multitape_input` – boolean (default: `False`); if `True`, then the multi-tape mode of the process iterator is activated. See also the notes below for multi-tape machines.
- `process_all_prefixes_of_input` – boolean (default: `False`); if `True`, then each prefix of the input word is processed (instead of processing the whole input word at once). Consequently, there is an output generated for each of these prefixes.
- `process_iterator_class` – (default: `None`) a class inherited from *FSMProcessIterator*. If `None`, then *FSMProcessIterator* is taken. An instance of this class is created and is used during the processing.
- `automatic_output_type` – boolean (default: `False`); if set and the input has a parent, then the output will have the same parent. If the input does not have a parent, then the output will be of the same type as the input.

OUTPUT:

A triple (or a list of triples, cf. parameter `list_of_outputs`), where

- the first entry is `True` if the input string is accepted,
- the second gives the reached state after processing the input tape (This is a state with label `None` if the input could not be processed, i.e., if at one point no transition to go on could be found.), and
- the third gives a list of the output labels written during processing (in the case the finite state machine runs as transducer).

Note that in the case the finite state machine is not deterministic, all possible paths are taken into account.

This function uses an iterator which, in its simplest form, goes from one state to another in each step. To decide which way to go, it uses the input words of the outgoing transitions and compares them to the input tape. More precisely, in each step, the iterator takes an outgoing transition of the current state, whose input label equals the input letter of the tape. The output label of the transition, if present, is written on the output tape.

If the choice of the outgoing transition is not unique (i.e., we have a non-deterministic finite state machine), all possibilities are followed. This is done by splitting the process into several branches, one for each of the possible outgoing transitions.

The process (iteration) stops if all branches are finished, i.e., for no branch, there is any transition whose input word coincides with the processed input tape. This can simply happen when the entire tape was read.

Also see *__call__()* for a version of *process()* with shortened output.

Internally this function creates and works with an instance of *FSMProcessIterator*. This iterator can also be obtained with *iter_process()*.

If working with multi-tape finite state machines, all input words of transitions are words of k-tuples of letters. Moreover, the input tape has to consist of k tracks, i.e., be a list or tuple of k iterators, one for each track.

Warning

Working with multi-tape finite state machines is still experimental and can lead to wrong outputs.

EXAMPLES:

```
sage: binary_inverter = FiniteStateMachine({'A': [('A', 0, 1), ('A', 1, 0)]},
....:                                      initial_states=['A'], final_
↪states=['A'])
sage: binary_inverter.process([0, 1, 0, 0, 1, 1])
(True, 'A', [1, 0, 1, 1, 0, 0])
```

```
>>> from sage.all import *
>>> binary_inverter = FiniteStateMachine({'A': [('A', Integer(0), Integer(1)),
↪ ('A', Integer(1), Integer(0))]},
...                                      initial_states=['A'], final_states=[
↪'A'])
>>> binary_inverter.process([Integer(0), Integer(1), Integer(0), Integer(0),␣
↪Integer(1), Integer(1)])
(True, 'A', [1, 0, 1, 1, 0, 0])
```

Alternatively, we can invoke this function by:

```
sage: binary_inverter([0, 1, 0, 0, 1, 1])
(True, 'A', [1, 0, 1, 1, 0, 0])
```

```
>>> from sage.all import *
>>> binary_inverter([Integer(0), Integer(1), Integer(0), Integer(0),␣
↪Integer(1), Integer(1)])
(True, 'A', [1, 0, 1, 1, 0, 0])
```

Below we construct a finite state machine which tests if an input is a non-adjacent form, i.e., no two neighboring letters are both nonzero (see also the example on *non-adjacent forms* in the documentation of the module *Finite state machines, automata, transducers*):

```
sage: NAF = FiniteStateMachine(
....:     {'_': [('_', 0), (1, 1)], 1: [('_', 0)]},
....:     initial_states=['_'], final_states=['_', 1])
sage: [NAF.process(w)[0] for w in [[0], [0, 1], [1, 1], [0, 1, 0, 1],
....:                              [0, 1, 1, 1, 0], [1, 0, 0, 1, 1]]]
[True, True, False, True, False, False]
```

```
>>> from sage.all import *
>>> NAF = FiniteStateMachine(
...     {'_': [('_', Integer(0)), (Integer(1), Integer(1))], Integer(1): [('_
↪', Integer(0))]},
...     initial_states=['_'], final_states=['_', Integer(1)])
>>> [NAF.process(w)[Integer(0)] for w in [[Integer(0)], [Integer(0),␣
↪Integer(1)], [Integer(1), Integer(1)], [Integer(0), Integer(1), Integer(0),␣
↪Integer(1)],
...                              [Integer(0), Integer(1), Integer(1), Integer(1),
```

(continues on next page)

(continued from previous page)

```
↪ Integer(0)], [Integer(1), Integer(0), Integer(0), Integer(1), Integer(1)]]]
[True, True, False, True, False, False]
```

Working only with the first component (i.e., returning whether accepted or not) usually corresponds to using the more specialized class *Automaton*.

Non-deterministic finite state machines can be handled as well.

```
sage: T = Transducer([(0, 1, 0, 0), (0, 2, 0, 0)],
....:     initial_states=[0])
sage: T.process([0])
[(False, 1, [0]), (False, 2, [0])]
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(1), Integer(0), Integer(0)),␣
↪(Integer(0), Integer(2), Integer(0), Integer(0))],
...     initial_states=[Integer(0)])
>>> T.process([Integer(0)])
[(False, 1, [0]), (False, 2, [0])]
```

Here is another non-deterministic finite state machine. Note that we use `format_output` (see *FSMProcessIterator*) to convert the written outputs (all characters) to strings.

```
sage: T = Transducer([(0, 1, [0, 0], 'a'), (0, 2, [0, 0, 1], 'b'),
....:                 (0, 1, 1, 'c'), (1, 0, [], 'd'),
....:                 (1, 1, 1, 'e')],
....:                initial_states=[0], final_states=[0, 1])
sage: T.process([0], format_output=lambda o: ''.join(o))
(False, None, None)
sage: T.process([0, 0], format_output=lambda o: ''.join(o))
[(True, 0, 'ad'), (True, 1, 'a')]
sage: T.process([1], format_output=lambda o: ''.join(o))
[(True, 0, 'cd'), (True, 1, 'c')]
sage: T.process([1, 1], format_output=lambda o: ''.join(o))
[(True, 0, 'cdcd'), (True, 0, 'ced'),
 (True, 1, 'cdc'), (True, 1, 'ce')]
sage: T.process([0, 0, 1], format_output=lambda o: ''.join(o))
[(False, 2, 'b'),
 (True, 0, 'adcd'),
 (True, 0, 'aed'),
 (True, 1, 'adc'),
 (True, 1, 'ae')]
sage: T.process([0, 0, 1], format_output=lambda o: ''.join(o),
....:           only_accepted=True)
[(True, 0, 'adcd'), (True, 0, 'aed'),
 (True, 1, 'adc'), (True, 1, 'ae')]
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(1), [Integer(0), Integer(0)], 'a'),␣
↪(Integer(0), Integer(2), [Integer(0), Integer(0), Integer(1)], 'b'),
...                 (Integer(0), Integer(1), Integer(1), 'c'), (Integer(1),␣
↪Integer(0), [], 'd'),
```

(continues on next page)

(continued from previous page)

```
...                 (Integer(1), Integer(1), Integer(1), 'e')],
...                initial_states=[Integer(0)], final_states=[Integer(0),␣
↪Integer(1)])
>>> T.process([Integer(0)], format_output=lambda o: ''.join(o))
(False, None, None)
>>> T.process([Integer(0), Integer(0)], format_output=lambda o: ''.join(o))
[(True, 0, 'ad'), (True, 1, 'a')]
>>> T.process([Integer(1)], format_output=lambda o: ''.join(o))
[(True, 0, 'cd'), (True, 1, 'c')]
>>> T.process([Integer(1), Integer(1)], format_output=lambda o: ''.join(o))
[(True, 0, 'cdcd'), (True, 0, 'ced'),
 (True, 1, 'cdc'), (True, 1, 'ce')]
>>> T.process([Integer(0), Integer(0), Integer(1)], format_output=lambda o: '
↪'.join(o))
[(False, 2, 'b'),
 (True, 0, 'adcd'),
 (True, 0, 'aed'),
 (True, 1, 'adc'),
 (True, 1, 'ae')]
>>> T.process([Integer(0), Integer(0), Integer(1)], format_output=lambda o: '
↪'.join(o),
...           only_accepted=True)
[(True, 0, 'adcd'), (True, 0, 'aed'),
 (True, 1, 'adc'), (True, 1, 'ae')]
```

A simple example of a multi-tape finite state machine is the following: It writes the length of the first tape many letters `a` and then the length of the second tape many letters `b`:

```
sage: M = FiniteStateMachine([(0, 0, (1, None), 'a'),
....:                         (0, 1, [], []),
....:                         (1, 1, (None, 1), 'b')],
....:                        initial_states=[0],
....:                        final_states=[1])
sage: M.process(([1, 1], [1]), use_multitape_input=True)
(True, 1, ['a', 'a', 'b'])
```

```
>>> from sage.all import *
>>> M = FiniteStateMachine([(Integer(0), Integer(0), (Integer(1), None), 'a'),
...                         (Integer(0), Integer(1), [], []),
...                         (Integer(1), Integer(1), (None, Integer(1)), 'b
↪')],
...                        initial_states=[Integer(0)],
...                        final_states=[Integer(1)])
>>> M.process(([Integer(1), Integer(1)], [Integer(1)]), use_multitape_
↪input=True)
(True, 1, ['a', 'a', 'b'])
```

product_FiniteStateMachine(*other*, *function*, *new_input_alphabet=None*, *only_accessible_components=True*, *final_function=None*, *new_class=None*)

Return a new finite state machine whose states are d-tuples of states of the original finite state machines.

INPUT:

- `other` – a finite state machine (for $d = 2$) or a list (or iterable) of $d - 1$ finite state machines
- `function` has to accept d transitions from A_j to B_j for $j \in \{1, \ldots, d\}$ and returns a pair `(word_in, word_out)` which is the label of the transition $A = (A_1, \ldots, A_d)$ to $B = (B_1, \ldots, B_d)$. If there is no transition from A to B, then `function` should raise a `LookupError`.
- `new_input_alphabet` – (optional) the new input alphabet as a list
- `only_accessible_components` – if `True` (default), then the result is piped through *accessible_components()*. If no `new_input_alphabet` is given, it is determined by *determine_alphabets()*.
- `final_function` – a function mapping d final states of the original finite state machines to the final output of the corresponding state in the new finite state machine. By default, the final output is the empty word if both final outputs of the constituent states are empty; otherwise, a `ValueError` is raised.
- `new_class` – class of the new finite state machine. By default (`None`), the class of `self` is used

OUTPUT:

A finite state machine whose states are d-tuples of states of the original finite state machines. A state is initial or final if all constituent states are initial or final, respectively.

The labels of the transitions are defined by `function`.

The final output of a final state is determined by calling `final_function` on the constituent states.

The color of a new state is the tuple of colors of the constituent states of `self` and `other`. However, if all constituent states have color `None`, then the state has color `None`, too.

EXAMPLES:

```
sage: F = Automaton([('A', 'B', 1), ('A', 'A', 0), ('B', 'A', 2)],
....:               initial_states=['A'], final_states=['B'],
....:               determine_alphabets=True)
sage: G = Automaton([(1, 1, 1)], initial_states=[1], final_states=[1])
sage: def addition(transition1, transition2):
....:     return (transition1.word_in[0] + transition2.word_in[0],
....:             None)
sage: H = F.product_FiniteStateMachine(G, addition, [0, 1, 2, 3], only_
↪accessible_components=False)
sage: H.transitions()

↪Integer(4)), (Integer(1),Integer(0),Integer(1)/Integer(4))],
...                 initial_states=[Integer(0)] )
>>> G = Automaton([(Integer(0),Integer(0),Integer(1)), (Integer(1),Integer(1),
↪Integer(3)/Integer(4)), (Integer(1),Integer(0),Integer(1)/Integer(4))],
...                 initial_states=[Integer(0)] )
>>> H = F.product_FiniteStateMachine(G,
...                                  lambda t1,t2: (t1.word_in[Integer(0)]*t2.
↪word_in[Integer(0)], None),
...                                  only_accessible_components=False)
>>> H.states()
[(0, 0), (1, 0), (0, 1), (1, 1)]
```

Also final output words are considered according to the function `final_function`:

```
sage: F = Transducer([(0, 1, 0, 1), (1, 1, 1, 1), (1, 1, 0, 1)],
....:                 final_states=[1])
sage: F.state(1).final_word_out = 1
sage: G = Transducer([(0, 0, 0, 1), (0, 0, 1, 0)], final_states=[0])
sage: G.state(0).final_word_out = 1
sage: def minus(t1, t2):
....:     return (t1.word_in[0] - t2.word_in[0],
....:             t1.word_out[0] - t2.word_out[0])
sage: H = F.product_FiniteStateMachine(G, minus)
Traceback (most recent call last):
...
ValueError: A final function must be given.
sage: def plus(s1, s2):
....:     return s1.final_word_out[0] + s2.final_word_out[0]
sage: H = F.product_FiniteStateMachine(G, minus,
....:                                  final_function=plus)
sage: H.final_states()
[(1, 0)]
sage: H.final_states()[0].final_word_out
[2]
```

```

↪(Integer(0), Integer(0), Integer(1), Integer(0))], final_
↪states=[Integer(0)])
>>> G.state(Integer(0)).final_word_out = Integer(1)
>>> def minus(t1, t2):
...     return (t1.word_in[Integer(0)] - t2.word_in[Integer(0)],
...                 t1.word_out[Integer(0)] - t2.word_out[Integer(0)])
>>> H = F.product_FiniteStateMachine(G, minus)
Traceback (most recent call last):
...
ValueError: A final function must be given.
>>> def plus(s1, s2):
...     return s1.final_word_out[Integer(0)] + s2.final_word_out[Integer(0)]
>>> H = F.product_FiniteStateMachine(G, minus,
...                                  final_function=plus)
>>> H.final_states()
[(1, 0)]
>>> H.final_states()[Integer(0)].final_word_out
[2]
```

Products of more than two finite state machines are also possible:

```
sage: def plus(s1, s2, s3):
....:     if s1.word_in == s2.word_in == s3.word_in:
....:         return (s1.word_in,
....:                 sum(s.word_out[0] for s in (s1, s2, s3)))
....:     else:
....:         raise LookupError
sage: T0 = transducers.CountSubblockOccurrences([0, 0], [0, 1, 2])
sage: T1 = transducers.CountSubblockOccurrences([1, 1], [0, 1, 2])
sage: T2 = transducers.CountSubblockOccurrences([2, 2], [0, 1, 2])
sage: T = T0.product_FiniteStateMachine([T1, T2], plus)
sage: T.transitions()
[Transition from ((), (), ()) to ((0,), (), ()): 0|0,
 Transition from ((), (), ()) to ((), (1,), ()): 1|0,
 Transition from ((), (), ()) to ((), (), (2,)): 2|0,

↪ Integer(0), Integer(1), Integer(2), Integer(2)])
[0, 1, 0, 1, 0, 1, 0, 0, 0, 1]
```

`other` can also be an iterable:

```
sage: T == T0.product_FiniteStateMachine(iter([T1, T2]), plus)
True
```

```
>>> from sage.all import *
>>> T == T0.product_FiniteStateMachine(iter([T1, T2]), plus)
True
```

projection(*what='input'*)

Return an Automaton which transition labels are the projection of the transition labels of the input.

INPUT:

- `what` – (default: `input`) either `input` or `output`

OUTPUT: an automaton

EXAMPLES:

```
sage: F = FiniteStateMachine([('A', 'B', 0, 1), ('A', 'A', 1, 1),
....:                         ('B', 'B', 1, 0)])
sage: G = F.projection(what='output')
sage: G.transitions()
[Transition from 'A' to 'B': 1|-,
 Transition from 'A' to 'A': 1|-,
 Transition from 'B' to 'B': 0|-]
```

```
>>> from sage.all import *
>>> F = FiniteStateMachine([('A', 'B', Integer(0), Integer(1)), ('A', 'A',␣
↪Integer(1), Integer(1)),
...                          ('B', 'B', Integer(1), Integer(0))])
>>> G = F.projection(what='output')
>>> G.transitions()
[Transition from 'A' to 'B': 1|-,
 Transition from 'A' to 'A': 1|-,
 Transition from 'B' to 'B': 0|-]
```

quotient (*classes*)

Construct the quotient with respect to the equivalence classes.

INPUT:

- `classes` is a list of equivalence classes of states.

OUTPUT: a finite state machine

The labels of the new states are tuples of states of the `self`, corresponding to `classes`.

Assume that c is a class, and a and b are states in c. Then there is a bijection φ between the transitions from a and the transitions from b with the following properties: if $\varphi(t_a) = t_b$, then

- $t_a.word_{in} = t_b.word_{in}$,
- $t_a.word_{out} = t_b.word_{out}$, and
- t_a and t_b lead to some equivalent states a' and b'.

Non-initial states may be merged with initial states, the resulting state is an initial state.

All states in a class must have the same `is_final`, `final_word_out` and `word_out` values.

EXAMPLES:

```
sage: fsm = FiniteStateMachine([("A", "B", 0, 1), ("A", "B", 1, 0),
....:                           ("B", "C", 0, 0), ("B", "C", 1, 1),
....:                           ("C", "D", 0, 1), ("C", "D", 1, 0),
....:                           ("D", "A", 0, 0), ("D", "A", 1, 1)])
sage: fsmq = fsm.quotient([[fsm.state("A"), fsm.state("C")],
....:                      [fsm.state("B"), fsm.state("D")]])
sage: fsmq.transitions()
[Transition from ('A', 'C')
              to ('B', 'D'): 0|1,
 Transition from ('A', 'C')
              to ('B', 'D'): 1|0,
 Transition from ('B', 'D')
              to ('A', 'C'): 0|0,
 Transition from ('B', 'D')
              to ('A', 'C'): 1|1]
sage: fsmq.relabeled().transitions()
[Transition from 0 to 1: 0|1,
 Transition from 0 to 1: 1|0,
 Transition from 1 to 0: 0|0,
 Transition from 1 to 0: 1|1]
sage: fsmq1 = fsm.quotient(fsm.equivalence_classes())
sage: fsmq1 == fsmq
```

(continues on next page)

(continued from previous page)

```
True
sage: fsm.quotient([[fsm.state("A"), fsm.state("B"), fsm.state("C"), fsm.
↪state("D")]])
Traceback (most recent call last):
    ...
AssertionError: Transitions of state 'A' and 'B' are incompatible.
```

```
>>> from sage.all import *
>>> fsm = FiniteStateMachine([("A", "B", Integer(0), Integer(1)), ("A", "B",␣
↪Integer(1), Integer(0)),
...                           ("B", "C", Integer(0), Integer(0)), ("B", "C",␣
↪Integer(1), Integer(1)),
...                           ("C", "D", Integer(0), Integer(1)), ("C", "D",␣
↪Integer(1), Integer(0)),
...                           ("D", "A", Integer(0), Integer(0)), ("D", "A",␣
↪Integer(1), Integer(1))])
>>> fsmq = fsm.quotient([[fsm.state("A"), fsm.state("C")],
...                      [fsm.state("B"), fsm.state("D")]])
>>> fsmq.transitions()
[Transition from ('A', 'C')
              to ('B', 'D'): 0|1,
 Transition from ('A', 'C')
              to ('B', 'D'): 1|0,
 Transition from ('B', 'D')
              to ('A', 'C'): 0|0,
 Transition from ('B', 'D')
              to ('A', 'C'): 1|1]
>>> fsmq.relabeled().transitions()
[Transition from 0 to 1: 0|1,
 Transition from 0 to 1: 1|0,
 Transition from 1 to 0: 0|0,
 Transition from 1 to 0: 1|1]
>>> fsmq1 = fsm.quotient(fsm.equivalence_classes())
>>> fsmq1 == fsmq
True
>>> fsm.quotient([[fsm.state("A"), fsm.state("B"), fsm.state("C"), fsm.state(
↪"D")]])
Traceback (most recent call last):
    ...
AssertionError: Transitions of state 'A' and 'B' are incompatible.
```

relabeled(*memo=None*, *labels=None*)

Return a deep copy of the finite state machine, but the states are relabeled.

INPUT:

- `memo` – (default: `None`) a dictionary storing already processed elements
- `labels` – (default: `None`) a dictionary or callable mapping old labels to new labels. If `None`, then the new labels are integers starting with 0.

OUTPUT: a new finite state machine

EXAMPLES:

```
sage: FSM1 = FiniteStateMachine([('A', 'B'), ('B', 'C'), ('C', 'A')])
sage: FSM1.states()
['A', 'B', 'C']
sage: FSM2 = FSM1.relabeled()
sage: FSM2.states()
[0, 1, 2]
sage: FSM3 = FSM1.relabeled(labels={'A': 'a', 'B': 'b', 'C': 'c'})
sage: FSM3.states()
['a', 'b', 'c']
sage: FSM4 = FSM2.relabeled(labels=lambda x: 2*x)
sage: FSM4.states()
[0, 2, 4]
```

```
>>> from sage.all import *
>>> FSM1 = FiniteStateMachine([('A', 'B'), ('B', 'C'), ('C', 'A')])
>>> FSM1.states()
['A', 'B', 'C']
>>> FSM2 = FSM1.relabeled()
>>> FSM2.states()
[0, 1, 2]
>>> FSM3 = FSM1.relabeled(labels={'A': 'a', 'B': 'b', 'C': 'c'})
>>> FSM3.states()
['a', 'b', 'c']
>>> FSM4 = FSM2.relabeled(labels=lambda x: Integer(2)*x)
>>> FSM4.states()
[0, 2, 4]
```

remove_epsilon_transitions()

set_coordinates(*coordinates*, *default=True*)

Set coordinates of the states for the LaTeX representation by a dictionary or a function mapping labels to coordinates.

INPUT:

- `coordinates` – dictionary or a function mapping labels of states to pairs interpreted as coordinates
- `default` – if `True`, then states not given by `coordinates` get a default position on a circle of radius 3.

OUTPUT: nothing

EXAMPLES:

```
sage: F = Automaton([[0, 1, 1], [1, 2, 2], [2, 0, 0]])
sage: F.set_coordinates({0: (0, 0), 1: (2, 0), 2: (1, 1)})
sage: F.state(0).coordinates
(0, 0)
```

```
>>> from sage.all import *
>>> F = Automaton([[Integer(0), Integer(1), Integer(1)], [Integer(1),␣
↪Integer(2), Integer(2)], [Integer(2), Integer(0), Integer(0)]])
>>> F.set_coordinates({Integer(0): (Integer(0), Integer(0)), Integer(1):␣
↪(Integer(2), Integer(0)), Integer(2): (Integer(1), Integer(1))})
```

(continues on next page)

(continued from previous page)

```
>>> F.state(Integer(0)).coordinates
(0, 0)
```

We can also use a function to determine the coordinates:

```
sage: F = Automaton([[0, 1, 1], [1, 2, 2], [2, 0, 0]])
sage: F.set_coordinates(lambda l: (l, 3/(l+1)))
sage: F.state(2).coordinates
(2, 1)
```

```
>>> from sage.all import *
>>> F = Automaton([[Integer(0), Integer(1), Integer(1)], [Integer(1),␣
↪Integer(2), Integer(2)], [Integer(2), Integer(0), Integer(0)]])
>>> F.set_coordinates(lambda l: (l, Integer(3)/(l+Integer(1))))
>>> F.state(Integer(2)).coordinates
(2, 1)
```

split_transitions()

Return a new transducer, where all transitions in `self` with input labels consisting of more than one letter are replaced by a path of the corresponding length.

OUTPUT: a new transducer

EXAMPLES:

```
sage: A = Transducer([('A', 'B', [1, 2, 3], 0)],
....:                initial_states=['A'], final_states=['B'])
sage: A.split_transitions().states()
[('A', ()), ('B', ()),
 ('A', (1,)), ('A', (1, 2))]
```

```
>>> from sage.all import *
>>> A = Transducer([('A', 'B', [Integer(1), Integer(2), Integer(3)],␣
↪Integer(0))],
...                initial_states=['A'], final_states=['B'])
>>> A.split_transitions().states()
[('A', ()), ('B', ()),
 ('A', (1,)), ('A', (1, 2))]
```

state(*state*)

Return the state of the finite state machine.

INPUT:

- `state` – if `state` is not an instance of *FSMState*, then it is assumed that it is the label of a state.

OUTPUT: the state of the finite state machine corresponding to `state`

If no state is found, then a `LookupError` is thrown.

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMState
sage: A = FSMState('A')
sage: FSM = FiniteStateMachine([(A, 'B'), ('C', A)])
```

(continues on next page)

(continued from previous page)

```
sage: FSM.state('A') == A
True
sage: FSM.state('xyz')
Traceback (most recent call last):
...
LookupError: No state with label xyz found.
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMState
>>> A = FSMState('A')
>>> FSM = FiniteStateMachine([(A, 'B'), ('C', A)])
>>> FSM.state('A') == A
True
>>> FSM.state('xyz')
Traceback (most recent call last):
...
LookupError: No state with label xyz found.
```

states()

Return the states of the finite state machine.

OUTPUT: the states of the finite state machine as list

EXAMPLES:

```
sage: FSM = Automaton([('1', '2', 1), ('2', '2', 0)])
sage: FSM.states()
['1', '2']
```

```
>>> from sage.all import *
>>> FSM = Automaton([('1', '2', Integer(1)), ('2', '2', Integer(0))])
>>> FSM.states()
['1', '2']
```

transition(*transition*)

Return the transition of the finite state machine.

INPUT:

- `transition` – if `transition` is not an instance of *FSMTransition*, then it is assumed that it is a tuple `(from_state, to_state, word_in, word_out)`

OUTPUT: the transition of the finite state machine corresponding to `transition`

If no transition is found, then a `LookupError` is thrown.

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import FSMTransition
sage: t = FSMTransition('A', 'B', 0)
sage: F = FiniteStateMachine([t])
sage: F.transition(('A', 'B', 0))
Transition from 'A' to 'B': 0|-
sage: id(t) == id(F.transition(('A', 'B', 0)))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import FSMTransition
>>> t = FSMTransition('A', 'B', Integer(0))
>>> F = FiniteStateMachine([t])
>>> F.transition(('A', 'B', Integer(0)))
Transition from 'A' to 'B': 0|-
>>> id(t) == id(F.transition(('A', 'B', Integer(0))))
True
```

transitions(*from_state=None*)

Return a list of all transitions.

INPUT:

- `from_state` – (default: `None`) if `from_state` is given, then a list of transitions starting there is given

OUTPUT: list of all transitions

EXAMPLES:

```
sage: FSM = Automaton([('1', '2', 1), ('2', '2', 0)])
sage: FSM.transitions()
[Transition from '1' to '2': 1|-,
 Transition from '2' to '2': 0|-]
```

```
>>> from sage.all import *
>>> FSM = Automaton([('1', '2', Integer(1)), ('2', '2', Integer(0))])
>>> FSM.transitions()
[Transition from '1' to '2': 1|-,
 Transition from '2' to '2': 0|-]
```

transposition(*reverse_output_labels=True*)

Return a new finite state machine, where all transitions of the input finite state machine are reversed.

INPUT:

- `reverse_output_labels` – boolean (default: `True`); whether to reverse output labels

EXAMPLES:

```
sage: aut = Automaton([('A', 'A', 0), ('A', 'A', 1), ('A', 'B', 0)],
....:                 initial_states=['A'], final_states=['B'])
sage: aut.transposition().transitions('B')
[Transition from 'B' to 'A': 0|-]
```

```
>>> from sage.all import *
>>> aut = Automaton([('A', 'A', Integer(0)), ('A', 'A', Integer(1)), ('A', 'B
↪', Integer(0))],
...                 initial_states=['A'], final_states=['B'])
>>> aut.transposition().transitions('B')
[Transition from 'B' to 'A': 0|-]
```

```
sage: aut = Automaton([('1', '1', 1), ('1', '2', 0), ('2', '2', 0)],
....:                 initial_states=['1'], final_states=['1', '2'])
sage: aut.transposition().initial_states()
['1', '2']
```

```
>>> from sage.all import *
>>> aut = Automaton([('1', '1', Integer(1)), ('1', '2', Integer(0)), ('2', '2
↪', Integer(0))],
...                 initial_states=['1'], final_states=['1', '2'])
>>> aut.transposition().initial_states()
['1', '2']
```

```
sage: A = Automaton([(0, 1, [1, 0])],
....:     initial_states=[0],
....:     final_states=[1])
sage: A([1, 0])
True
sage: A.transposition()([0, 1])
True
```

```
>>> from sage.all import *
>>> A = Automaton([(Integer(0), Integer(1), [Integer(1), Integer(0)])],
...     initial_states=[Integer(0)],
...     final_states=[Integer(1)])
>>> A([Integer(1), Integer(0)])
True
>>> A.transposition()([Integer(0), Integer(1)])
True
```

```
sage: T = Transducer([(0, 1, [1, 0], [1, 0])],
....:     initial_states=[0],
....:     final_states=[1])
sage: T([1, 0])
[1, 0]
sage: T.transposition()([0, 1])
[0, 1]
sage: T.transposition(reverse_output_labels=False)([0, 1])
[1, 0]
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(1), [Integer(1), Integer(0)],␣
↪[Integer(1), Integer(0)])],
...     initial_states=[Integer(0)],
...     final_states=[Integer(1)])
>>> T([Integer(1), Integer(0)])
[1, 0]
>>> T.transposition()([Integer(0), Integer(1)])
[0, 1]
>>> T.transposition(reverse_output_labels=False)([Integer(0), Integer(1)])
[1, 0]
```

with_final_word_out(*letters*, *allow_non_final=True*)

Construct a new finite state machine with final output words for all states by implicitly reading trailing letters until a final state is reached.

INPUT:

- `letters` – either an element of the input alphabet or a list of such elements. This is repeated cyclically

when needed.

- `allow_non_final` – boolean (default: `True`); whether we allow that some states may be non-final in the resulting finite state machine. I.e., if `False` then each state has to have a path to a final state with input label matching `letters`.

OUTPUT: a finite state machine

The inplace version of this function is *construct_final_word_out()*.

Suppose for the moment a single element `letter` as input for `letters`. This is equivalent to `letters = [letter]`. We will discuss the general case below.

Let `word_in` be a word over the input alphabet and assume that the original finite state machine transforms `word_in` to `word_out` reaching a possibly non-final state `s`. Let further k be the minimum number of letters `letter` such that there is a path from `s` to some final state `f` whose input label consists of k copies of `letter` and whose output label is `path_word_out`. Then the state `s` of the resulting finite state machine is a final state with final output `path_word_out + f.final_word_out`. Therefore, the new finite state machine transforms `word_in` to `word_out + path_word_out + f.final_word_out`.

This is e.g. useful for finite state machines operating on digit expansions: there, it is sometimes required to read a sufficient number of trailing zeros (at the most significant positions) in order to reach a final state and to flush all carries. In this case, this method constructs an essentially equivalent finite state machine in the sense that it not longer requires adding sufficiently many trailing zeros. However, it is the responsibility of the user to make sure that if adding trailing zeros to the input anyway, the output is equivalent.

If `letters` consists of more than one letter, then it is assumed that (not necessarily complete) cycles of `letters` are appended as trailing input.

example on Gray code

EXAMPLES:

1. A simple transducer transforming 00 blocks to 01 blocks:

```
sage: T = Transducer([(0, 1, 0, 0), (1, 0, 0, 1)],
....:                initial_states=[0],
....:                final_states=[0])
sage: T.process([0, 0, 0])
(False, 1, [0, 1, 0])
sage: T.process([0, 0, 0, 0])
(True, 0, [0, 1, 0, 1])
sage: F = T.with_final_word_out(0)
sage: for f in F.iter_final_states():
....:     print("{} {}".format(f, f.final_word_out))
0 []
1 [1]
sage: F.process([0, 0, 0])
(True, 1, [0, 1, 0, 1])
sage: F.process([0, 0, 0, 0])
(True, 0, [0, 1, 0, 1])
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(1), Integer(0), Integer(0)),␣
```

(continues on next page)

(continued from previous page)

```
↪(Integer(1), Integer(0), Integer(0), Integer(1))],
...                initial_states=[Integer(0)],
...                final_states=[Integer(0)])
>>> T.process([Integer(0), Integer(0), Integer(0)])
(False, 1, [0, 1, 0])
>>> T.process([Integer(0), Integer(0), Integer(0), Integer(0)])
(True, 0, [0, 1, 0, 1])
>>> F = T.with_final_word_out(Integer(0))
>>> for f in F.iter_final_states():
...     print("{} {}".format(f, f.final_word_out))
0 []
1 [1]
>>> F.process([Integer(0), Integer(0), Integer(0)])
(True, 1, [0, 1, 0, 1])
>>> F.process([Integer(0), Integer(0), Integer(0), Integer(0)])
(True, 0, [0, 1, 0, 1])
```

2. A more realistic example: Addition of 1 in binary. We construct a transition function transforming the input to its binary expansion:

```
sage: def binary_transition(carry, input):
....:     value = carry + input
....:     if value.mod(2) == 0:
....:         return (value/2, 0)
....:     return ((value-1)/2, 1)
```

```
>>> from sage.all import *
>>> def binary_transition(carry, input):
...     value = carry + input
...     if value.mod(Integer(2)) == Integer(0):
...         return (value/Integer(2), Integer(0))
...     return ((value-Integer(1))/Integer(2), Integer(1))
```

Now, we only have to start with a carry of 1 to get the required transducer:

```
sage: T = Transducer(binary_transition,
....:                input_alphabet=[0, 1],
....:                initial_states=[1],
....:                final_states=[0])
```

```
>>> from sage.all import *
>>> T = Transducer(binary_transition,
...                input_alphabet=[Integer(0), Integer(1)],
...                initial_states=[Integer(1)],
...                final_states=[Integer(0)])
```

We test this for the binary expansion of 7:

```
sage: T.process([1, 1, 1])
(False, 1, [0, 0, 0])
```

```
>>> from sage.all import *
>>> T.process([Integer(1), Integer(1), Integer(1)])
(False, 1, [0, 0, 0])
```

The final carry 1 has not be flushed yet, we have to add a trailing zero:

```
sage: T.process([1, 1, 1, 0])
(True, 0, [0, 0, 0, 1])
```

```
>>> from sage.all import *
>>> T.process([Integer(1), Integer(1), Integer(1), Integer(0)])
(True, 0, [0, 0, 0, 1])
```

We check that with this trailing zero, the transducer performs as advertised:

```
sage: all(ZZ(T(k.bits()+[0]), base=2) == k + 1
....:     for k in srange(16))
True
```

```
>>> from sage.all import *
>>> all(ZZ(T(k.bits()+[Integer(0)]), base=Integer(2)) == k + Integer(1)
...     for k in srange(Integer(16)))
True
```

However, most of the time, we produce superfluous trailing zeros:

```
sage: T(11.bits()+[0])
[0, 0, 1, 1, 0]
```

```
>>> from sage.all import *
>>> T(Integer(11).bits()+[Integer(0)])
[0, 0, 1, 1, 0]
```

We now use this method:

```
sage: F = T.with_final_word_out(0)
sage: for f in F.iter_final_states():
....:     print("{} {}".format(f, f.final_word_out))
1 [1]
0 []
```

```
>>> from sage.all import *
>>> F = T.with_final_word_out(Integer(0))
>>> for f in F.iter_final_states():
...     print("{} {}".format(f, f.final_word_out))
1 [1]
0 []
```

The same tests as above, but we do not have to pad with trailing zeros anymore:

```
sage: F.process([1, 1, 1])
(True, 1, [0, 0, 0, 1])
```

(continues on next page)

(continued from previous page)

```
sage: all(ZZ(F(k.bits()), base=2) == k + 1
....:     for k in srange(16))
True
```

```
>>> from sage.all import *
>>> F.process([Integer(1), Integer(1), Integer(1)])
(True, 1, [0, 0, 0, 1])
>>> all(ZZ(F(k.bits()), base=Integer(2)) == k + Integer(1)
...     for k in srange(Integer(16)))
True
```

No more trailing zero in the output:

```
sage: F(11.bits())
[0, 0, 1, 1]
sage: all(F(k.bits())[-1] == 1
....:     for k in srange(16))
True
```

```
>>> from sage.all import *
>>> F(Integer(11).bits())
[0, 0, 1, 1]
>>> all(F(k.bits())[-Integer(1)] == Integer(1)
...     for k in srange(Integer(16)))
True
```

3. Here is an example, where we allow trailing repeated 10:

```
sage: T = Transducer([(0, 1, 0, 'a'),
....:                 (1, 2, 1, 'b'),
....:                 (2, 0, 0, 'c')],
....:                initial_states=[0],
....:                final_states=[0])
sage: F = T.with_final_word_out([1, 0])
sage: for f in F.iter_final_states():
....:     print(str(f) + ' ' + ''.join(f.final_word_out))
0
1 bc
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(1), Integer(0), 'a'),
...                 (Integer(1), Integer(2), Integer(1), 'b'),
...                 (Integer(2), Integer(0), Integer(0), 'c')],
...                initial_states=[Integer(0)],
...                final_states=[Integer(0)])
>>> F = T.with_final_word_out([Integer(1), Integer(0)])
>>> for f in F.iter_final_states():
...     print(str(f) + ' ' + ''.join(f.final_word_out))
0
1 bc
```

Trying this with trailing repeated 01 does not produce a `final_word_out` for state `1`, but for state `2`:

```
sage: F = T.with_final_word_out([0, 1])
sage: for f in F.iter_final_states():
....:     print(str(f) + ' ' + ''.join(f.final_word_out))
0
2 c
```

```
>>> from sage.all import *
>>> F = T.with_final_word_out([Integer(0), Integer(1)])
>>> for f in F.iter_final_states():
...     print(str(f) + ' ' + ''.join(f.final_word_out))
0
2 c
```

4. Here another example with a more-letter trailing input:

```
sage: T = Transducer([(0, 1, 0, 'a'),
....:                 (1, 2, 0, 'b'), (1, 2, 1, 'b'),
....:                 (2, 3, 0, 'c'), (2, 0, 1, 'e'),
....:                 (3, 1, 0, 'd'), (3, 1, 1, 'd')],
....:                initial_states=[0],
....:                final_states=[0],
....:                with_final_word_out=[0, 0, 1, 1])
sage: for f in T.iter_final_states():
....:     print(str(f) + ' ' + ''.join(f.final_word_out))
0
1 bcdbcdbe
2 cdbe
3 dbe
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(1), Integer(0), 'a'),
...                 (Integer(1), Integer(2), Integer(0), 'b'),␣
↪(Integer(1), Integer(2), Integer(1), 'b'),
...                 (Integer(2), Integer(3), Integer(0), 'c'),␣
↪(Integer(2), Integer(0), Integer(1), 'e'),
...                 (Integer(3), Integer(1), Integer(0), 'd'),␣
↪(Integer(3), Integer(1), Integer(1), 'd')],
...                initial_states=[Integer(0)],
...                final_states=[Integer(0)],
...                with_final_word_out=[Integer(0), Integer(0),␣
↪Integer(1), Integer(1)])
>>> for f in T.iter_final_states():
...     print(str(f) + ' ' + ''.join(f.final_word_out))
0
1 bcdbcdbe
2 cdbe
3 dbe
```

class sage.combinat.finite_state_machine.**Transducer**(*data=None*, *initial_states=None*, *final_states=None*, *input_alphabet=None*, *output_alphabet=None*, *determine_alphabets=None*, *with_final_word_out=None*, *store_states_dict=True*, *on_duplicate_transition=None*)

Bases: *FiniteStateMachine*

This creates a transducer, which is a finite state machine, whose transitions have input and output labels.

A transducer has additional features like creating a simplified transducer.

See class *FiniteStateMachine* for more information.

EXAMPLES:

We can create a transducer performing the addition of 1 (for numbers given in binary and read from right to left) in the following way:

```
sage: T = Transducer([('C', 'C', 1, 0), ('C', 'N', 0, 1),
....:                 ('N', 'N', 0, 0), ('N', 'N', 1, 1)],
....:                initial_states=['C'], final_states=['N'])
sage: T
Transducer with 2 states
sage: T([0])
[1]
sage: T([1,1,0])
[0, 0, 1]
sage: ZZ(T(15.digits(base=2)+[0]), base=2)
16
```

```
>>> from sage.all import *
>>> T = Transducer([('C', 'C', Integer(1), Integer(0)), ('C', 'N', Integer(0),␣
↪Integer(1)),
...                 ('N', 'N', Integer(0), Integer(0)), ('N', 'N', Integer(1),␣
↪Integer(1))],
...                initial_states=['C'], final_states=['N'])
>>> T
Transducer with 2 states
>>> T([Integer(0)])
[1]
>>> T([Integer(1),Integer(1),Integer(0)])
[0, 0, 1]
>>> ZZ(T(Integer(15).digits(base=Integer(2))+[Integer(0)]), base=Integer(2))
16
```

Note that we have padded the binary input sequence by a 0 so that the transducer can reach its final state.

cartesian_product(*other*, *only_accessible_components=True*)

Return a new transducer which can simultaneously process an input with the machines `self` and `other` where the output labels are d-tuples of the original output labels.

INPUT:

- `other` – a finite state machine (if $d = 2$) or a list (or other iterable) of $d - 1$ finite state machines

- only_accessible_components – if True (default), then the result is piped through *accessible_components()*. If no new_input_alphabet is given, it is determined by *determine_alphabets()*.

OUTPUT:

A transducer which can simultaneously process an input with self and the machine(s) in other.

The set of states of the new transducer is the Cartesian product of the set of states of self and other.

Let (A_j, B_j, a_j, b_j) for $j \in \{1, \ldots, d\}$ be transitions in the machines self and in other. Then there is a transition $((A_1, \ldots, A_d), (B_1, \ldots, B_d), a, (b_1, \ldots, b_d))$ in the new transducer if $a_1 = \cdots = a_d =: a$.

EXAMPLES:

```
sage: transducer1 = Transducer([('A', 'A', 0, 0),
....:                           ('A', 'A', 1, 1)],
....:                          initial_states=['A'],
....:                          final_states=['A'],
....:                          determine_alphabets=True)
sage: transducer2 = Transducer([(0, 1, 0, ['b', 'c']),
....:                           (0, 0, 1, 'b'),
....:                           (1, 1, 0, 'a')],
....:                          initial_states=[0],
....:                          final_states=[1],
....:                          determine_alphabets=True)
sage: result = transducer1.cartesian_product(transducer2)
sage: result
Transducer with 2 states
sage: result.transitions()
[Transition from ('A', 0) to ('A', 1): 0|(0, 'b'),(None, 'c'),
 Transition from ('A', 0) to ('A', 0): 1|(1, 'b'),
 Transition from ('A', 1) to ('A', 1): 0|(0, 'a')]
sage: result([1, 0, 0])
[(1, 'b'), (0, 'b'), (None, 'c'),  (0, 'a')]
sage: (transducer1([1, 0, 0]), transducer2([1, 0, 0]))
([1, 0, 0], ['b', 'b', 'c', 'a'])
```

```
>>> from sage.all import *
>>> transducer1 = Transducer([('A', 'A', Integer(0), Integer(0)),
...                           ('A', 'A', Integer(1), Integer(1))],
...                          initial_states=['A'],
...                          final_states=['A'],
...                          determine_alphabets=True)
>>> transducer2 = Transducer([(Integer(0), Integer(1), Integer(0), ['b', 'c
↪']),
...                           (Integer(0), Integer(0), Integer(1), 'b'),
...                           (Integer(1), Integer(1), Integer(0), 'a')],
...                          initial_states=[Integer(0)],
...                          final_states=[Integer(1)],
...                          determine_alphabets=True)
>>> result = transducer1.cartesian_product(transducer2)
>>> result
Transducer with 2 states
>>> result.transitions()
[Transition from ('A', 0) to ('A', 1): 0|(0, 'b'),(None, 'c'),
```

(continues on next page)

(continued from previous page)

```
 Transition from ('A', 0) to ('A', 0): 1|(1, 'b'),
 Transition from ('A', 1) to ('A', 1): 0|(0, 'a')]
>>> result([Integer(1), Integer(0), Integer(0)])
[(1, 'b'), (0, 'b'), (None, 'c'),  (0, 'a')]
>>> (transducer1([Integer(1), Integer(0), Integer(0)]),␣
↪transducer2([Integer(1), Integer(0), Integer(0)]))
([1, 0, 0], ['b', 'b', 'c', 'a'])
```

Also final output words are correctly processed:

```
sage: transducer1.state('A').final_word_out = 2
sage: result = transducer1.cartesian_product(transducer2)
sage: result.final_states()[0].final_word_out
[(2, None)]
```

```
>>> from sage.all import *
>>> transducer1.state('A').final_word_out = Integer(2)
>>> result = transducer1.cartesian_product(transducer2)
>>> result.final_states()[Integer(0)].final_word_out
[(2, None)]
```

The following transducer counts the number of 11 blocks minus the number of 10 blocks over the alphabet `[0, 1]`.

```
sage: count_11 = transducers.CountSubblockOccurrences(
....:     [1, 1],
....:     input_alphabet=[0, 1])
sage: count_10 = transducers.CountSubblockOccurrences(
....:     [1, 0],
....:     input_alphabet=[0, 1])
sage: count_11x10 = count_11.cartesian_product(count_10)
sage: difference = transducers.sub([0, 1])(count_11x10)
sage: T = difference.simplification().relabeled()
sage: T.initial_states()
[1]
sage: sorted(T.transitions())
[Transition from 0 to 1: 0|-1,
 Transition from 0 to 0: 1|1,
 Transition from 1 to 1: 0|0,
 Transition from 1 to 0: 1|0]
sage: input =  [0, 1, 1,  0, 1,  0, 0, 0, 1, 1, 1,  0]
sage: output = [0, 0, 1, -1, 0, -1, 0, 0, 0, 1, 1, -1]
sage: T(input) == output
True
```

```
>>> from sage.all import *
>>> count_11 = transducers.CountSubblockOccurrences(
...     [Integer(1), Integer(1)],
...     input_alphabet=[Integer(0), Integer(1)])
>>> count_10 = transducers.CountSubblockOccurrences(
...     [Integer(1), Integer(0)],
...     input_alphabet=[Integer(0), Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> count_11x10 = count_11.cartesian_product(count_10)
>>> difference = transducers.sub([Integer(0), Integer(1)])(count_11x10)
>>> T = difference.simplification().relabeled()
>>> T.initial_states()
[1]
>>> sorted(T.transitions())
[Transition from 0 to 1: 0|-1,
 Transition from 0 to 0: 1|1,
 Transition from 1 to 1: 0|0,
 Transition from 1 to 0: 1|0]
>>> input =  [Integer(0), Integer(1), Integer(1),  Integer(0), Integer(1), ␣
↪Integer(0), Integer(0), Integer(0), Integer(1), Integer(1), Integer(1), ␣
↪Integer(0)]
>>> output = [Integer(0), Integer(0), Integer(1), -Integer(1), Integer(0), -
↪Integer(1), Integer(0), Integer(0), Integer(0), Integer(1), Integer(1), -
↪Integer(1)]
>>> T(input) == output
True
```

If `other` is an automaton, then *`cartesian_product()`* returns `self` where the input is restricted to the input accepted by `other`.

For example, if the transducer transforms the standard binary expansion into the non-adjacent form and the automaton recognizes the binary expansion without adjacent ones, then the Cartesian product of these two is a transducer which does not change the input (except for changing `a` to `(a, None)` and ignoring a leading 0).

```
sage: NAF = Transducer([(0, 1, 0, None),
....:                   (0, 2, 1, None),
....:                   (1, 1, 0, 0),
....:                   (1, 2, 1, 0),
....:                   (2, 1, 0, 1),
....:                   (2, 3, 1, -1),
....:                   (3, 2, 0, 0),
....:                   (3, 3, 1, 0)],
....:                  initial_states=[0],
....:                  final_states=[1],
....:                  determine_alphabets=True)
sage: aut11 = Automaton([(0, 0, 0), (0, 1, 1), (1, 0, 0)],
....:                   initial_states=[0],
....:                   final_states=[0, 1],
....:                   determine_alphabets=True)
sage: res = NAF.cartesian_product(aut11)
sage: res([1, 0, 0, 1, 0, 1, 0])
[(1, None), (0, None), (0, None), (1, None), (0, None), (1, None)]
```

```
>>> from sage.all import *
>>> NAF = Transducer([(Integer(0), Integer(1), Integer(0), None),
...                   (Integer(0), Integer(2), Integer(1), None),
...                   (Integer(1), Integer(1), Integer(0), Integer(0)),
...                   (Integer(1), Integer(2), Integer(1), Integer(0)),
...                   (Integer(2), Integer(1), Integer(0), Integer(1)),
```

(continues on next page)

(continued from previous page)

```
...                    (Integer(2), Integer(3), Integer(1), -Integer(1)),
...                    (Integer(3), Integer(2), Integer(0), Integer(0)),
...                    (Integer(3), Integer(3), Integer(1), Integer(0))],
...                   initial_states=[Integer(0)],
...                   final_states=[Integer(1)],
...                   determine_alphabets=True)
>>> aut11 = Automaton([(Integer(0), Integer(0), Integer(0)), (Integer(0),␣
↪Integer(1), Integer(1)), (Integer(1), Integer(0), Integer(0))],
...                    initial_states=[Integer(0)],
...                    final_states=[Integer(0), Integer(1)],
...                    determine_alphabets=True)
>>> res = NAF.cartesian_product(aut11)
>>> res([Integer(1), Integer(0), Integer(0), Integer(1), Integer(0),␣
↪Integer(1), Integer(0)])
[(1, None), (0, None), (0, None), (1, None), (0, None), (1, None)]
```

This is obvious because if the standard binary expansion does not have adjacent ones, then it is the same as the non-adjacent form.

Be aware that *cartesian_product()* is not commutative.

```
sage: aut11.cartesian_product(NAF)
Traceback (most recent call last):
...
TypeError: Only an automaton can be intersected with an automaton.
```

```
>>> from sage.all import *
>>> aut11.cartesian_product(NAF)
Traceback (most recent call last):
...
TypeError: Only an automaton can be intersected with an automaton.
```

The Cartesian product of more than two finite state machines can also be computed:

```
sage: T0 = transducers.CountSubblockOccurrences([0, 0], [0, 1, 2])
sage: T1 = transducers.CountSubblockOccurrences([1, 1], [0, 1, 2])
sage: T2 = transducers.CountSubblockOccurrences([2, 2], [0, 1, 2])
sage: T = T0.cartesian_product([T1, T2])
sage: T.transitions()
[Transition from ((), (), ()) to ((0,), (), ()): 0|(0, 0, 0),
 Transition from ((), (), ()) to ((), (1,), ()): 1|(0, 0, 0),
 Transition from ((), (), ()) to ((), (), (2,)): 2|(0, 0, 0),
 Transition from ((0,), (), ()) to ((0,), (), ()): 0|(1, 0, 0),
 Transition from ((0,), (), ()) to ((), (1,), ()): 1|(0, 0, 0),
 Transition from ((0,), (), ()) to ((), (), (2,)): 2|(0, 0, 0),
 Transition from ((), (1,), ()) to ((0,), (), ()): 0|(0, 0, 0),

```

intersection(*other*, *only_accessible_components=True*)

Return a new transducer which accepts an input if it is accepted by both given finite state machines producing the same output.

INPUT:

- `other` – a transducer
- `only_accessible_components` – if `True` (default), then the result is piped through *accessible_components()*. If no `new_input_alphabet` is given, it is determined by *determine_al-*

phabets().

OUTPUT:

A new transducer which computes the intersection (see below) of the languages of `self` and `other`.

The set of states of the transducer is the Cartesian product of the set of states of both given transducer. There is a transition $((A, B), (C, D), a, b)$ in the new transducer if there are transitions (A, C, a, b) and (B, D, a, b) in the old transducers.

EXAMPLES:

```
sage: transducer1 = Transducer([('1', '2', 1, 0),
....:                           ('2', '2', 1, 0),
....:                           ('2', '2', 0, 1)],
....:                          initial_states=['1'],
....:                          final_states=['2'])
sage: transducer2 = Transducer([('A', 'A', 1, 0),
....:                           ('A', 'B', 0, 0),
....:                           ('B', 'B', 0, 1),
....:                           ('B', 'A', 1, 1)],
....:                          initial_states=['A'],
....:                          final_states=['B'])
sage: res = transducer1.intersection(transducer2)
sage: res.transitions()
[Transition from ('1', 'A') to ('2', 'A'): 1|0,
 Transition from ('2', 'A') to ('2', 'A'): 1|0]
```

```
>>> from sage.all import *
>>> transducer1 = Transducer([('1', '2', Integer(1), Integer(0)),
...                           ('2', '2', Integer(1), Integer(0)),
...                           ('2', '2', Integer(0), Integer(1))],
...                          initial_states=['1'],
...                          final_states=['2'])
>>> transducer2 = Transducer([('A', 'A', Integer(1), Integer(0)),
...                           ('A', 'B', Integer(0), Integer(0)),
...                           ('B', 'B', Integer(0), Integer(1)),
...                           ('B', 'A', Integer(1), Integer(1))],
...                          initial_states=['A'],
...                          final_states=['B'])
>>> res = transducer1.intersection(transducer2)
>>> res.transitions()
[Transition from ('1', 'A') to ('2', 'A'): 1|0,
 Transition from ('2', 'A') to ('2', 'A'): 1|0]
```

In general, transducers are not closed under intersection. But for transducer which do not have epsilon-transitions, the intersection is well defined (cf. [BaWo2012]). However, in the next example the intersection of the two transducers is not well defined. The intersection of the languages consists of $(a^n, b^n c^n)$. This set is not recognizable by a *finite* transducer.

```
sage: t1 = Transducer([(0, 0, 'a', 'b'),
....:                  (0, 1, None, 'c'),
....:                  (1, 1, None, 'c')],
....:                 initial_states=[0],
....:                 final_states=[0, 1])
```

(continues on next page)

(continued from previous page)

```
sage: t2 = Transducer([('A', 'A', None, 'b'),
....:                  ('A', 'B', 'a', 'c'),
....:                  ('B', 'B', 'a', 'c')],
....:                 initial_states=['A'],
....:                 final_states=['A', 'B'])
sage: t2.intersection(t1)
Traceback (most recent call last):
...
ValueError: An epsilon-transition (with empty input or output)
was found.
```

```
>>> from sage.all import *
>>> t1 = Transducer([(Integer(0), Integer(0), 'a', 'b'),
...                  (Integer(0), Integer(1), None, 'c'),
...                  (Integer(1), Integer(1), None, 'c')],
...                 initial_states=[Integer(0)],
...                 final_states=[Integer(0), Integer(1)])
>>> t2 = Transducer([('A', 'A', None, 'b'),
...                  ('A', 'B', 'a', 'c'),
...                  ('B', 'B', 'a', 'c')],
...                 initial_states=['A'],
...                 final_states=['A', 'B'])
>>> t2.intersection(t1)
Traceback (most recent call last):
...
ValueError: An epsilon-transition (with empty input or output)
was found.
```

REFERENCES:

process(**args*, ***kwargs*)

Return whether the transducer accepts the input, the state where the computation stops and which output is generated.

INPUT:

- `input_tape` – the input tape can be a list or an iterable with entries from the input alphabet. If we are working with a multi-tape machine (see parameter `use_multitape_input` and notes below), then the tape is a list or tuple of tracks, each of which can be a list or an iterable with entries from the input alphabet.
- `initial_state` or `initial_states` – the initial state(s) in which the machine starts. Either specify a single one with `initial_state` or a list of them with `initial_states`. If both are given, `initial_state` will be appended to `initial_states`. If neither is specified, the initial states of the finite state machine are taken.
- `list_of_outputs` – (default: `None`) a boolean or `None`. If `True`, then the outputs are given in list form (even if we have no or only one single output). If `False`, then the result is never a list (an exception is raised if the result cannot be returned). If `list_of_outputs=None` the method determines automatically what to do (e.g. if a non-deterministic machine returns more than one path, then the output is returned in list form).
- `only_accepted` – boolean (default: `False`); if set, then the first argument in the output is guaranteed to be `True` (if the output is a list, then the first argument of each element will be `True`).

- full_output – boolean (default: True); if set, then the full output is given, otherwise only the generated output (the third entry below only). If the input is not accepted, a ValueError is raised.
- always_include_output – if set (not by default), always include the output. This is inconsequential for a *Transducer*, but can be used in other classes derived from *FiniteStateMachine* where the output is suppressed by default, cf. *Automaton.process()*.
- format_output – a function that translates the written output (which is in form of a list) to something more readable. By default (None) identity is used here.
- check_epsilon_transitions – boolean (default: True); if False, then epsilon transitions are not taken into consideration during process
- write_final_word_out – boolean (default: True); whether the final output words should be written or not
- use_multitape_input – boolean (default: False); if True, then the multi-tape mode of the process iterator is activated. See also the notes below for multi-tape machines.
- process_all_prefixes_of_input – boolean (default: False); if True, then each prefix of the input word is processed (instead of processing the whole input word at once). Consequently, there is an output generated for each of these prefixes.
- process_iterator_class – (default: None) a class inherited from *FSMProcessIterator*. If None, then *FSMProcessIterator* is taken. An instance of this class is created and is used during the processing.
- automatic_output_type – boolean (default: False); if set and the input has a parent, then the output will have the same parent. If the input does not have a parent, then the output will be of the same type as the input.

OUTPUT:

The full output is a triple (or a list of triples, cf. parameter list_of_outputs), where

- the first entry is True if the input string is accepted,
- the second gives the reached state after processing the input tape (This is a state with label None if the input could not be processed, i.e., if at one point no transition to go on could be found.), and
- the third gives a list of the output labels written during processing.

If full_output is False, then only the third entry is returned.

Note that in the case the transducer is not deterministic, all possible paths are taken into account.

This function uses an iterator which, in its simplest form, goes from one state to another in each step. To decide which way to go, it uses the input words of the outgoing transitions and compares them to the input tape. More precisely, in each step, the iterator takes an outgoing transition of the current state, whose input label equals the input letter of the tape. The output label of the transition, if present, is written on the output tape.

If the choice of the outgoing transition is not unique (i.e., we have a non-deterministic finite state machine), all possibilities are followed. This is done by splitting the process into several branches, one for each of the possible outgoing transitions.

The process (iteration) stops if all branches are finished, i.e., for no branch, there is any transition whose input word coincides with the processed input tape. This can simply happen when the entire tape was read.

Also see *__call__()* for a version of *process()* with shortened output.

Internally this function creates and works with an instance of *FSMProcessIterator*. This iterator can also be obtained with *iter_process()*.

If working with multi-tape finite state machines, all input words of transitions are words of k-tuples of letters. Moreover, the input tape has to consist of k tracks, i.e., be a list or tuple of k iterators, one for each track.

Warning

Working with multi-tape finite state machines is still experimental and can lead to wrong outputs.

EXAMPLES:

```
sage: binary_inverter = Transducer({'A': [('A', 0, 1), ('A', 1, 0)]},
....:                              initial_states=['A'], final_states=['A'])
sage: binary_inverter.process([0, 1, 0, 0, 1, 1])
(True, 'A', [1, 0, 1, 1, 0, 0])
```

```
>>> from sage.all import *
>>> binary_inverter = Transducer({'A': [('A', Integer(0), Integer(1)), ('A',␣
↪Integer(1), Integer(0))]},
...                              initial_states=['A'], final_states=['A'])
>>> binary_inverter.process([Integer(0), Integer(1), Integer(0), Integer(0),␣
↪Integer(1), Integer(1)])
(True, 'A', [1, 0, 1, 1, 0, 0])
```

If we are only interested in the output, we can also use:

```
sage: binary_inverter([0, 1, 0, 0, 1, 1])
[1, 0, 1, 1, 0, 0]
```

```
>>> from sage.all import *
>>> binary_inverter([Integer(0), Integer(1), Integer(0), Integer(0),␣
↪Integer(1), Integer(1)])
[1, 0, 1, 1, 0, 0]
```

This can also be used with words as input:

```
sage: # needs sage.combinat
sage: W = Words([0, 1]); W
Finite and infinite words over {0, 1}
sage: w = W([0, 1, 0, 0, 1, 1]); w
word: 010011
sage: binary_inverter(w)
word: 101100
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> W = Words([Integer(0), Integer(1)]); W
Finite and infinite words over {0, 1}
>>> w = W([Integer(0), Integer(1), Integer(0), Integer(0), Integer(1),␣
↪Integer(1)]); w
word: 010011
>>> binary_inverter(w)
word: 101100
```

In this case it is automatically determined that the output is a word. The call above is equivalent to:

```
sage: binary_inverter.process(w,                                                #␣
↪needs sage.combinat
....:                         full_output=False,
....:                         list_of_outputs=False,
....:                         automatic_output_type=True)
word: 101100
```

```
>>> from sage.all import *
>>> binary_inverter.process(w,                                                  #␣
↪needs sage.combinat
...                         full_output=False,
...                         list_of_outputs=False,
...                         automatic_output_type=True)
word: 101100
```

The following transducer transforms 0^n1 to 1^n2:

```
sage: T = Transducer([(0, 0, 0, 1), (0, 1, 1, 2)])
sage: T.state(0).is_initial = True
sage: T.state(1).is_final = True
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(0), Integer(0), Integer(1)),␣
↪(Integer(0), Integer(1), Integer(1), Integer(2))])
>>> T.state(Integer(0)).is_initial = True
>>> T.state(Integer(1)).is_final = True
```

We can see the different possibilities of the output by:

```
sage: [T.process(w) for w in [[1], [0, 1], [0, 0, 1], [0, 1, 1],
....:                         [0], [0, 0], [2, 0], [0, 1, 2]]]
[(True, 1, [2]), (True, 1, [1, 2]),
 (True, 1, [1, 1, 2]), (False, None, None),
 (False, 0, [1]), (False, 0, [1, 1]),
 (False, None, None), (False, None, None)]
```

```
>>> from sage.all import *
>>> [T.process(w) for w in [[Integer(1)], [Integer(0), Integer(1)],␣
↪[Integer(0), Integer(0), Integer(1)], [Integer(0), Integer(1), Integer(1)],
...                         [Integer(0)], [Integer(0), Integer(0)],␣
↪[Integer(2), Integer(0)], [Integer(0), Integer(1), Integer(2)]]]
[(True, 1, [2]), (True, 1, [1, 2]),
 (True, 1, [1, 1, 2]), (False, None, None),
 (False, 0, [1]), (False, 0, [1, 1]),
 (False, None, None), (False, None, None)]
```

If we just want a condensed output, we use:

```
sage: [T.process(w, full_output=False)
....:      for w in [[1], [0, 1], [0, 0, 1]]]
[[2], [1, 2], [1, 1, 2]]
sage: T.process([0], full_output=False)
```

(continues on next page)

(continued from previous page)

```
Traceback (most recent call last):
...
ValueError: Invalid input sequence.
sage: T.process([0, 1, 2], full_output=False)
Traceback (most recent call last):
...
ValueError: Invalid input sequence.
```

```
>>> from sage.all import *
>>> [T.process(w, full_output=False)
...       for w in [[Integer(1)], [Integer(0), Integer(1)], [Integer(0),␣
↪Integer(0), Integer(1)]]]
[[2], [1, 2], [1, 1, 2]]
>>> T.process([Integer(0)], full_output=False)
Traceback (most recent call last):
...
ValueError: Invalid input sequence.
>>> T.process([Integer(0), Integer(1), Integer(2)], full_output=False)
Traceback (most recent call last):
...
ValueError: Invalid input sequence.
```

It is equivalent to:

```
sage: [T(w) for w in [[1], [0, 1], [0, 0, 1]]]
[[2], [1, 2], [1, 1, 2]]
sage: T([0])
Traceback (most recent call last):
...
ValueError: Invalid input sequence.
sage: T([0, 1, 2])
Traceback (most recent call last):

```

```
>>> from sage.all import *
>>> [T(w) for w in [[Integer(1)], [Integer(0), Integer(1)], [Integer(0),␣
↪Integer(0), Integer(1)]]]
[[2], [1, 2], [1, 1, 2]]
>>> T([Integer(0)])
Traceback (most recent call last):
...
ValueError: Invalid input sequence.
>>> T([Integer(0), Integer(1), Integer(2)])
Traceback (most recent call last):
...
ValueError: Invalid input sequence.
```

A cycle with empty input and empty output is correctly processed:

```
sage: T = Transducer([(0, 1, None, None), (1, 0, None, None)],
....:                initial_states=[0], final_states=[1])
```

(continues on next page)

(continued from previous page)

```
sage: T.process([])
[(False, 0, []), (True, 1, [])]
sage: _ = T.add_transition(-1, 0, 0, 'r')
sage: T.state(-1).is_initial = True
sage: T.state(0).is_initial = False
sage: T.process([0])
[(False, 0, ['r']), (True, 1, ['r'])]
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(1), None, None), (Integer(1),␣
↪Integer(0), None, None)],
...                initial_states=[Integer(0)], final_states=[Integer(1)])
>>> T.process([])
[(False, 0, []), (True, 1, [])]
>>> _ = T.add_transition(-Integer(1), Integer(0), Integer(0), 'r')
>>> T.state(-Integer(1)).is_initial = True
>>> T.state(Integer(0)).is_initial = False
>>> T.process([Integer(0)])
[(False, 0, ['r']), (True, 1, ['r'])]
```

If there is a cycle with empty input but non-empty output, the possible outputs would be an infinite set:

```
sage: T = Transducer([(0, 1, None, 'z'), (1, 0, None, None)],
....:                initial_states=[0], final_states=[1])
sage: T.process([])
Traceback (most recent call last):
...
RuntimeError: State 0 is in an epsilon cycle (no input),
but output is written.
```

```
>>> from sage.all import *
>>> T = Transducer([(Integer(0), Integer(1), None, 'z'), (Integer(1),␣
↪Integer(0), None, None)],
...                initial_states=[Integer(0)], final_states=[Integer(1)])
>>> T.process([])
Traceback (most recent call last):
...
RuntimeError: State 0 is in an epsilon cycle (no input),
but output is written.
```

But if this cycle with empty input and non-empty output is not reached, the correct output is produced:

```
sage: _ = T.add_transition(-1, 0, 0, 'r')
sage: T.state(-1).is_initial = True
sage: T.state(0).is_initial = False
sage: T.process([])
(False, -1, [])
sage: T.process([0])
Traceback (most recent call last):
...
RuntimeError: State 0 is in an epsilon cycle (no input),
but output is written.
```

```
>>> from sage.all import *
>>> _ = T.add_transition(-Integer(1), Integer(0), Integer(0), 'r')
>>> T.state(-Integer(1)).is_initial = True
>>> T.state(Integer(0)).is_initial = False
>>> T.process([])
(False, -1, [])
>>> T.process([Integer(0)])
Traceback (most recent call last):
...
RuntimeError: State 0 is in an epsilon cycle (no input),
but output is written.
```

If we set `check_epsilon_transitions=False`, then no transitions with empty input are considered anymore. Thus cycles with empty input are no problem anymore:

```
sage: T.process([0], check_epsilon_transitions=False)
(False, 0, ['r'])
```

```
>>> from sage.all import *
>>> T.process([Integer(0)], check_epsilon_transitions=False)
(False, 0, ['r'])
```

A simple example of a multi-tape transducer is the following: It writes the length of the first tape many letters `a` and then the length of the second tape many letters `b`:

```
sage: M = Transducer([(0, 0, (1, None), 'a'),
....:                 (0, 1, [], []),
....:                 (1, 1, (None, 1), 'b')],
....:                initial_states=[0],
....:                final_states=[1])
sage: M.process(([1, 1], [1]), use_multitape_input=True)
(True, 1, ['a', 'a', 'b'])
```

```
>>> from sage.all import *
>>> M = Transducer([(Integer(0), Integer(0), (Integer(1), None), 'a'),
...                 (Integer(0), Integer(1), [], []),
...                 (Integer(1), Integer(1), (None, Integer(1)), 'b')],
...                initial_states=[Integer(0)],
...                final_states=[Integer(1)])
>>> M.process(([Integer(1), Integer(1)], [Integer(1)]), use_multitape_
↪input=True)
(True, 1, ['a', 'a', 'b'])
```

See also

FiniteStateMachine.process(), *Automaton.process()*, *iter_process()*, *__call__()*, *FSMProcessIterator*.

simplification()

Return a simplified transducer.

OUTPUT: a new transducer

This function simplifies a transducer by Moore's algorithm, first moving common output labels of transitions leaving a state to output labels of transitions entering the state (cf. *prepone_output()*).

The resulting transducer implements the same function as the original transducer.

EXAMPLES:

```
sage: fsm = Transducer([("A", "B", 0, 1), ("A", "B", 1, 0),
....:                   ("B", "C", 0, 0), ("B", "C", 1, 1),
....:                   ("C", "D", 0, 1), ("C", "D", 1, 0),
....:                   ("D", "A", 0, 0), ("D", "A", 1, 1)])
sage: fsms = fsm.simplification()
sage: fsms
Transducer with 2 states
sage: fsms.transitions()
[Transition from ('B', 'D') to ('A', 'C'): 0|0,
 Transition from ('B', 'D') to ('A', 'C'): 1|1,
 Transition from ('A', 'C') to ('B', 'D'): 0|1,
 Transition from ('A', 'C') to ('B', 'D'): 1|0]
sage: fsms.relabeled().transitions()
[Transition from 0 to 1: 0|0,
 Transition from 0 to 1: 1|1,
 Transition from 1 to 0: 0|1,
 Transition from 1 to 0: 1|0]
```

```
>>> from sage.all import *
>>> fsm = Transducer([("A", "B", Integer(0), Integer(1)), ("A", "B",␣
↪Integer(1), Integer(0)),
...                   ("B", "C", Integer(0), Integer(0)), ("B", "C",␣
↪Integer(1), Integer(1)),
...                   ("C", "D", Integer(0), Integer(1)), ("C", "D",␣
↪Integer(1), Integer(0)),
...                   ("D", "A", Integer(0), Integer(0)), ("D", "A",␣

Illustrating the use of colors in order to avoid identification of states:

```
sage: T = Transducer( [[0,0,0,0], [0,1,1,1],
....:                  [1,0,0,0], [1,1,1,1]],
....:                 initial_states=[0],
....:                 final_states=[0,1])
sage: sorted(T.simplification().transitions())
[Transition from (0, 1) to (0, 1): 0|0,
 Transition from (0, 1) to (0, 1): 1|1]
sage: T.state(0).color = 0
sage: T.state(0).color = 1
sage: sorted(T.simplification().transitions())
[Transition from (0,) to (0,): 0|0,
 Transition from (0,) to (1,): 1|1,
 Transition from (1,) to (0,): 0|0,
 Transition from (1,) to (1,): 1|1]
```

```
>>> from sage.all import *
>>> T = Transducer( [[Integer(0),Integer(0),Integer(0),Integer(0)],␣
↪[Integer(0),Integer(1),Integer(1),Integer(1)],
...                  [Integer(1),Integer(0),Integer(0),Integer(0)],␣
↪[Integer(1),Integer(1),Integer(1),Integer(1)]],
...                 initial_states=[Integer(0)],
...                 final_states=[Integer(0),Integer(1)])
>>> sorted(T.simplification().transitions())
[Transition from (0, 1) to (0, 1): 0|0,
 Transition from (0, 1) to (0, 1): 1|1]
>>> T.state(Integer(0)).color = Integer(0)
>>> T.state(Integer(0)).color = Integer(1)
>>> sorted(T.simplification().transitions())
[Transition from (0,) to (0,): 0|0,
 Transition from (0,) to (1,): 1|1,
 Transition from (1,) to (0,): 0|0,
 Transition from (1,) to (1,): 1|1]
```

sage.combinat.finite_state_machine.**duplicate_transition_add_input**(*old_transition*, *new_transition*)

Alternative function for handling duplicate transitions in finite state machines. This implementation adds the input label of the new transition to the input label of the old transition. This is intended for the case where a Markov chain is modelled by a finite state machine using the input labels as transition probabilities.

See the documentation of the `on_duplicate_transition` parameter of *FiniteStateMachine*.

INPUT:

- `old_transition` – a transition in a finite state machine
- `new_transition` – a transition, identical to `old_transition`, which is to be inserted into the finite state machine

OUTPUT:

A transition whose input weight is the sum of the input weights of `old_transition` and `new_transition`.

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import duplicate_transition_add_
↪input
sage: from sage.combinat.finite_state_machine import FSMTransition
sage: duplicate_transition_add_input(FSMTransition('a', 'a', 1/2),
....:                                FSMTransition('a', 'a', 1/2))
Transition from 'a' to 'a': 1|-
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import duplicate_transition_add_input
>>> from sage.combinat.finite_state_machine import FSMTransition
>>> duplicate_transition_add_input(FSMTransition('a', 'a', Integer(1)/Integer(2)),
...                                FSMTransition('a', 'a', Integer(1)/Integer(2)))
Transition from 'a' to 'a': 1|-
```

Input labels must be lists of length 1:

```
sage: duplicate_transition_add_input(FSMTransition('a', 'a', [1, 1]),
....:                                FSMTransition('a', 'a', [1, 1]))
Traceback (most recent call last):
...
TypeError: Trying to use duplicate_transition_add_input on
"Transition from 'a' to 'a': 1,1|-" and
"Transition from 'a' to 'a': 1,1|-",
but input words are assumed to be lists of length 1
```

```
>>> from sage.all import *
>>> duplicate_transition_add_input(FSMTransition('a', 'a', [Integer(1),␣
↪Integer(1)]),
...                                FSMTransition('a', 'a', [Integer(1),␣
↪Integer(1)]))
Traceback (most recent call last):
...
TypeError: Trying to use duplicate_transition_add_input on
"Transition from 'a' to 'a': 1,1|-" and
"Transition from 'a' to 'a': 1,1|-",
but input words are assumed to be lists of length 1
```

`sage.combinat.finite_state_machine.`**`duplicate_transition_ignore`**(*old_transition*, *new_transition*)

Default function for handling duplicate transitions in finite state machines. This implementation ignores the occurrence.

See the documentation of the `on_duplicate_transition` parameter of *FiniteStateMachine*.

INPUT:

- `old_transition` – a transition in a finite state machine
- `new_transition` – a transition, identical to `old_transition`, which is to be inserted into the finite state machine

OUTPUT: the same transition, unchanged

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import duplicate_transition_ignore
sage: from sage.combinat.finite_state_machine import FSMTransition
sage: duplicate_transition_ignore(FSMTransition(0, 0, 1),
....:                             FSMTransition(0, 0, 1))
Transition from 0 to 0: 1|-
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import duplicate_transition_ignore
>>> from sage.combinat.finite_state_machine import FSMTransition
>>> duplicate_transition_ignore(FSMTransition(Integer(0), Integer(0), Integer(1)),
...                             FSMTransition(Integer(0), Integer(0), Integer(1)))
Transition from 0 to 0: 1|-
```

sage.combinat.finite_state_machine.**duplicate_transition_raise_error**(*old_transition*, *new_transition*)

Alternative function for handling duplicate transitions in finite state machines.

This implementation raises a `ValueError`.

See the documentation of the `on_duplicate_transition` parameter of *FiniteStateMachine*.

INPUT:

- `old_transition` – a transition in a finite state machine
- `new_transition` – a transition, identical to `old_transition`, which is to be inserted into the finite state machine

OUTPUT: nothing. A `ValueError` is raised

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import duplicate_transition_raise_
↪error
sage: from sage.combinat.finite_state_machine import FSMTransition
sage: duplicate_transition_raise_error(FSMTransition(0, 0, 1),
....:                                  FSMTransition(0, 0, 1))
Traceback (most recent call last):
...
ValueError: Attempting to re-insert transition Transition from 0 to 0: 1|-
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import duplicate_transition_raise_
↪error
>>> from sage.combinat.finite_state_machine import FSMTransition
>>> duplicate_transition_raise_error(FSMTransition(Integer(0), Integer(0),␣
↪Integer(1)),
...                                  FSMTransition(Integer(0), Integer(0),␣
↪Integer(1)))
Traceback (most recent call last):
...
ValueError: Attempting to re-insert transition Transition from 0 to 0: 1|-
```

sage.combinat.finite_state_machine.**equal**(*iterator*)

Check whether all elements of `iterator` are equal.

INPUT:

- `iterator` – an iterator of the elements to check

OUTPUT: boolean

This implements https://stackoverflow.com/a/3844832/1052778.

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import equal
sage: equal([0, 0, 0])
True
sage: equal([0, 1, 0])
False
sage: equal([])
True
sage: equal(iter([None, None]))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import equal
>>> equal([Integer(0), Integer(0), Integer(0)])
True
>>> equal([Integer(0), Integer(1), Integer(0)])
False
>>> equal([])
True
>>> equal(iter([None, None]))
True
```

We can test other properties of the elements than the elements themselves. In the following example, we check whether all tuples have the same lengths:

```
sage: equal(len(x) for x in [(1, 2), (2, 3), (3, 1)])
True
sage: equal(len(x) for x in [(1, 2), (1, 2, 3), (3, 1)])
False
```

```
>>> from sage.all import *
>>> equal(len(x) for x in [(Integer(1), Integer(2)), (Integer(2), Integer(3)),␣
↪(Integer(3), Integer(1))])
True
>>> equal(len(x) for x in [(Integer(1), Integer(2)), (Integer(1), Integer(2),␣
↪Integer(3)), (Integer(3), Integer(1))])
False
```

sage.combinat.finite_state_machine.**full_group_by**(*l*, *key=None*)

Group iterable `l` by values of `key`.

INPUT:

- iterable `l`
- key function `key`

OUTPUT:

A list of pairs `(k, elements)` such that `key(e)=k` for all `e` in `elements`.

This is similar to `itertools.groupby()` except that lists are returned instead of iterables and no prior sorting is required.

We do not require

- that the keys are sortable (in contrast to the approach via `sorted()` and `itertools.groupby()`) and
- that the keys are hashable (in contrast to the implementation proposed in https://stackoverflow.com/a/15250161).

However, it is required

- that distinct keys have distinct `str`-representations.

The implementation is inspired by https://stackoverflow.com/a/15250161, but non-hashable keys are allowed.

EXAMPLES:

```
sage: # needs sage.symbolic
sage: from sage.combinat.finite_state_machine import full_group_by
sage: t = [2/x, 1/x, 2/x]
sage: r = full_group_by([0, 1, 2], key=lambda i: t[i])
sage: sorted(r, key=lambda p: p[1])
[(2/x, [0, 2]), (1/x, [1])]
sage: from itertools import groupby
sage: for k, elements in groupby(sorted([0, 1, 2],
....:                             key=lambda i:t[i]),
....:                             key=lambda i:t[i]):
....:     print("{} {}".format(k, list(elements)))
2/x [0]
1/x [1]
2/x [2]
```

```
>>> from sage.all import *
>>> # needs sage.symbolic
>>> from sage.combinat.finite_state_machine import full_group_by
>>> t = [Integer(2)/x, Integer(1)/x, Integer(2)/x]
>>> r = full_group_by([Integer(0), Integer(1), Integer(2)], key=lambda i: t[i])
>>> sorted(r, key=lambda p: p[Integer(1)])
[(2/x, [0, 2]), (1/x, [1])]
>>> from itertools import groupby
>>> for k, elements in groupby(sorted([Integer(0), Integer(1), Integer(2)],
...                             key=lambda i:t[i]),
...                             key=lambda i:t[i]):
...     print("{} {}".format(k, list(elements)))
2/x [0]
1/x [1]
2/x [2]
```

Note that the behavior is different from `itertools.groupby()` because neither $1/x < 2/x$ nor $2/x < 1/x$ does hold.

Here, the result `r` has been sorted in order to guarantee a consistent order for the doctest suite.

`sage.combinat.finite_state_machine.`**`setup_latex_preamble`**`()`

This function adds the package `tikz` with support for automata to the preamble of Latex so that the finite state machines can be drawn nicely.

See the section on *LaTeX output* in the introductory examples of this module.

sage.combinat.finite_state_machine.**startswith**(*list_*, *prefix*)

Determine whether list starts with the given prefix.

INPUT:

- `list_` – list
- `prefix` – list representing the prefix

OUTPUT: boolean

Similar to `str.startswith()`.

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import startswith
sage: startswith([1, 2, 3], [1, 2])
True
sage: startswith([1], [1, 2])
False
sage: startswith([1, 3, 2], [1, 2])
False
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import startswith
>>> startswith([Integer(1), Integer(2), Integer(3)], [Integer(1), Integer(2)])
True
>>> startswith([Integer(1)], [Integer(1), Integer(2)])
False
>>> startswith([Integer(1), Integer(3), Integer(2)], [Integer(1), Integer(2)])
False
```

sage.combinat.finite_state_machine.**tupleofwords_to_wordoftuples**(*tupleofwords*)

Transposes a tuple of words over the alphabet to a word of tuples.

INPUT:

- `tupleofwords` – tuple of a list of letters

OUTPUT: list of tuples

Missing letters in the words are padded with the letter `None` (from the empty word).

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import (
....:     tupleofwords_to_wordoftuples)
sage: tupleofwords_to_wordoftuples(
....:     ([1, 2], [3, 4, 5, 6], [7]))
[(1, 3, 7), (2, 4, None), (None, 5, None), (None, 6, None)]
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import (
...     tupleofwords_to_wordoftuples)
>>> tupleofwords_to_wordoftuples(
...     ([Integer(1), Integer(2)], [Integer(3), Integer(4), Integer(5),␣
↪Integer(6)], [Integer(7)]))
[(1, 3, 7), (2, 4, None), (None, 5, None), (None, 6, None)]
```

sage.combinat.finite_state_machine.**wordoftuples_to_tupleofwords**(*wordoftuples*)

Transposes a word of tuples to a tuple of words over the alphabet.

INPUT:

- `wordoftuples` – list of tuples of letters

OUTPUT: a tuple of lists

Letters `None` (empty word) are removed from each word in the output.

EXAMPLES:

```
sage: from sage.combinat.finite_state_machine import (
....:     wordoftuples_to_tupleofwords)
sage: wordoftuples_to_tupleofwords(
....:     [(1, 2), (1, None), (1, None), (1, 2), (None, 2)])
([1, 1, 1, 1], [2, 2, 2])
```

```
>>> from sage.all import *
>>> from sage.combinat.finite_state_machine import (
...     wordoftuples_to_tupleofwords)
>>> wordoftuples_to_tupleofwords(
...     [(Integer(1), Integer(2)), (Integer(1), None), (Integer(1), None),␣
↪(Integer(1), Integer(2)), (None, Integer(2))])
([1, 1, 1, 1], [2, 2, 2])
```

Free dendriform algebras

AUTHORS:

- Frédéric Chapoton (2017)

class sage.combinat.free_dendriform_algebra.**DendriformFunctor**(*vars*)

Bases: `ConstructionFunctor`

A constructor for dendriform algebras.

EXAMPLES:

```
sage: P = algebras.FreeDendriform(ZZ, 'x,y')
sage: x,y = P.gens()
sage: F = P.construction()[0]; F
Dendriform[x,y]

sage: A = GF(5)['a,b']
sage: a, b = A.gens()
sage: F(A)
Free Dendriform algebra on 2 generators ['x', 'y']
 over Multivariate Polynomial Ring in a, b over Finite Field of size 5

sage: f = A.hom([a+b,a-b],A)
sage: F(f)
Generic endomorphism of Free Dendriform algebra on 2 generators ['x', 'y']
 over Multivariate Polynomial Ring in a, b over Finite Field of size 5

sage: F(f)(a * F(A)(x))
(a+b)*B[x[., .]]
```

```
>>> from sage.all import *
>>> P = algebras.FreeDendriform(ZZ, 'x,y')
>>> x,y = P.gens()
>>> F = P.construction()[Integer(0)]; F
Dendriform[x,y]

>>> A = GF(Integer(5))['a,b']
>>> a, b = A.gens()
>>> F(A)
Free Dendriform algebra on 2 generators ['x', 'y']
 over Multivariate Polynomial Ring in a, b over Finite Field of size 5

>>> f = A.hom([a+b,a-b],A)
>>> F(f)
Generic endomorphism of Free Dendriform algebra on 2 generators ['x', 'y']
 over Multivariate Polynomial Ring in a, b over Finite Field of size 5

>>> F(f)(a * F(A)(x))
(a+b)*B[x[., .]]
```

merge(*other*)

Merge `self` with another construction functor, or return `None`.

EXAMPLES:

```
sage: F = sage.combinat.free_dendriform_algebra.DendriformFunctor(['x','y'])
sage: G = sage.combinat.free_dendriform_algebra.DendriformFunctor(['t'])
sage: F.merge(G)
Dendriform[x,y,t]
sage: F.merge(F)
Dendriform[x,y]
```

```
>>> from sage.all import *
>>> F = sage.combinat.free_dendriform_algebra.DendriformFunctor(['x','y'])
>>> G = sage.combinat.free_dendriform_algebra.DendriformFunctor(['t'])
>>> F.merge(G)
Dendriform[x,y,t]
>>> F.merge(F)
Dendriform[x,y]
```

Now some actual use cases:

```
sage: R = algebras.FreeDendriform(ZZ, 'x,y,z')
sage: x,y,z = R.gens()
sage: 1/2 * x
1/2*B[x[., .]]
sage: parent(1/2 * x)
Free Dendriform algebra on 3 generators ['x', 'y', 'z'] over Rational Field

sage: S = algebras.FreeDendriform(QQ, 'zt')
sage: z,t = S.gens()
sage: x + t
B[t[., .]] + B[x[., .]]
```

(continues on next page)

(continued from previous page)

```
sage: parent(x + t)
Free Dendriform algebra on 4 generators ['z', 't', 'x', 'y'] over Rational␣
↪Field
```

```
>>> from sage.all import *
>>> R = algebras.FreeDendriform(ZZ, 'x,y,z')
>>> x,y,z = R.gens()
>>> Integer(1)/Integer(2) * x
1/2*B[x[., .]]
>>> parent(Integer(1)/Integer(2) * x)
Free Dendriform algebra on 3 generators ['x', 'y', 'z'] over Rational Field

>>> S = algebras.FreeDendriform(QQ, 'zt')
>>> z,t = S.gens()
>>> x + t
B[t[., .]] + B[x[., .]]
>>> parent(x + t)
Free Dendriform algebra on 4 generators ['z', 't', 'x', 'y'] over Rational␣
↪Field
```

rank = 9

class sage.combinat.free_dendriform_algebra.**FreeDendriformAlgebra**(*R*, *names=None*)

Bases: *CombinatorialFreeModule*

The free dendriform algebra.

Dendriform algebras are associative algebras, where the associative product $*$ is decomposed as a sum of two binary operations

$$x * y = x \succ y + x \prec y$$

that satisfy the axioms:

$$(x \succ y) \prec z = x \succ (y \prec z),$$

$$(x \prec y) \prec z = x \prec (y * z).$$

$$(x * y) \succ z = x \succ (y \succ z).$$

The free Dendriform algebra on a given set E has an explicit description using (planar) binary trees, just as the free associative algebra can be described using words. The underlying vector space has a basis indexed by finite binary trees endowed with a map from their vertices to E. In this basis, the associative product of two (decorated) binary trees $S * T$ is the sum over all possible ways of identifying (glueing) the rightmost path in S and the leftmost path in T.

The decomposition of the associative product as the sum of two binary operations $\succ$ and $\prec$ is made by separating the terms according to the origin of the root vertex. For $x \succ y$, one keeps the terms where the root vertex comes from y, whereas for $x \prec y$ one keeps the terms where the root vertex comes from x.

The free dendriform algebra can also be considered as the free algebra over the Dendriform operad.

Note

The usual binary operator $*$ is used for the associative product.

EXAMPLES:

```
sage: F = algebras.FreeDendriform(ZZ, 'xyz')
sage: x,y,z = F.gens()
sage: (x * y) * z
B[x[., y[., z[., .]]]] + B[x[., z[y[., .], .]]] + B[y[x[., .], z[., .]]]
 + B[z[x[., y[., .]], .]] + B[z[y[x[., .], .], .]]
```

```
>>> from sage.all import *
>>> F = algebras.FreeDendriform(ZZ, 'xyz')
>>> x,y,z = F.gens()
>>> (x * y) * z
B[x[., y[., z[., .]]]] + B[x[., z[y[., .], .]]] + B[y[x[., .], z[., .]]]
 + B[z[x[., y[., .]], .]] + B[z[y[x[., .], .], .]]
```

The free dendriform algebra is associative:

```
sage: x * (y * z) == (x * y) * z
True
```

```
>>> from sage.all import *
>>> x * (y * z) == (x * y) * z
True
```

The associative product decomposes in two parts:

```
sage: x * y == F.prec(x, y) + F.succ(x, y)
True
```

```
>>> from sage.all import *
>>> x * y == F.prec(x, y) + F.succ(x, y)
True
```

The axioms hold:

```
sage: F.prec(F.succ(x, y), z) == F.succ(x, F.prec(y, z))
True
sage: F.prec(F.prec(x, y), z) == F.prec(x, y * z)
True
sage: F.succ(x * y, z) == F.succ(x, F.succ(y, z))
True
```

```
>>> from sage.all import *
>>> F.prec(F.succ(x, y), z) == F.succ(x, F.prec(y, z))
True
>>> F.prec(F.prec(x, y), z) == F.prec(x, y * z)
True
```

(continues on next page)

(continued from previous page)

```
>>> F.succ(x * y, z) == F.succ(x, F.succ(y, z))
True
```

When there is only one generator, unlabelled trees are used instead:

```
sage: F1 = algebras.FreeDendriform(QQ)
sage: w = F1.gen(0); w
B[[., .]]
sage: w * w * w
B[[., [., [., .]]]] + B[[., [[., .], .]]] + B[[[., .], [., .]]]
 + B[[[., [., .]], .]] + B[[[[., .], .], .]]
```

```
>>> from sage.all import *
>>> F1 = algebras.FreeDendriform(QQ)
>>> w = F1.gen(Integer(0)); w
B[[., .]]
>>> w * w * w
B[[., [., [., .]]]] + B[[., [[., .], .]]] + B[[[., .], [., .]]]
 + B[[[., [., .]], .]] + B[[[[., .], .], .]]
```

The set E can be infinite:

```
sage: F = algebras.FreeDendriform(QQ, ZZ)
sage: w = F.gen(1); w
B[1[., .]]
sage: x = F.gen(2); x
B[-1[., .]]
sage: w*x
B[-1[1[., .], .]] + B[1[., -1[., .]]]
```

```
>>> from sage.all import *
>>> F = algebras.FreeDendriform(QQ, ZZ)
>>> w = F.gen(Integer(1)); w
B[1[., .]]
>>> x = F.gen(Integer(2)); x
B[-1[., .]]
>>> w*x
B[-1[1[., .], .]] + B[1[., -1[., .]]]
```

REFERENCES:

- [LR1998]

algebra_generators()

Return the generators of this algebra.

These are the binary trees with just one vertex.

EXAMPLES:

```
sage: A = algebras.FreeDendriform(ZZ, 'fgh'); A
Free Dendriform algebra on 3 generators ['f', 'g', 'h']
 over Integer Ring
sage: list(A.algebra_generators())
```

(continues on next page)

(continued from previous page)

```
[B[f[., .]], B[g[., .]], B[h[., .]]]

sage: A = algebras.FreeDendriform(QQ, ['x1','x2'])
sage: list(A.algebra_generators())
[B[x1[., .]], B[x2[., .]]]
```

```
>>> from sage.all import *
>>> A = algebras.FreeDendriform(ZZ, 'fgh'); A
Free Dendriform algebra on 3 generators ['f', 'g', 'h']
 over Integer Ring
>>> list(A.algebra_generators())
[B[f[., .]], B[g[., .]], B[h[., .]]]

>>> A = algebras.FreeDendriform(QQ, ['x1','x2'])
>>> list(A.algebra_generators())
[B[x1[., .]], B[x2[., .]]]
```

change_ring(*R*)

Return the free dendriform algebra in the same variables over R.

INPUT:

- `R` – a ring

EXAMPLES:

```
sage: A = algebras.FreeDendriform(ZZ, 'fgh')
sage: A.change_ring(QQ)
Free Dendriform algebra on 3 generators ['f', 'g', 'h'] over
Rational Field
```

```
>>> from sage.all import *
>>> A = algebras.FreeDendriform(ZZ, 'fgh')
>>> A.change_ring(QQ)
Free Dendriform algebra on 3 generators ['f', 'g', 'h'] over
Rational Field
```

construction()

Return a pair `(F, R)`, where `F` is a *DendriformFunctor* and R is a ring, such that `F(R)` returns `self`.

EXAMPLES:

```
sage: P = algebras.FreeDendriform(ZZ, 'x,y')
sage: x,y = P.gens()
sage: F, R = P.construction()
sage: F
Dendriform[x,y]
sage: R
Integer Ring
sage: F(ZZ) is P
True
sage: F(QQ)
Free Dendriform algebra on 2 generators ['x', 'y'] over Rational Field
```

```
>>> from sage.all import *
>>> P = algebras.FreeDendriform(ZZ, 'x,y')
>>> x,y = P.gens()
>>> F, R = P.construction()
>>> F
Dendriform[x,y]
>>> R
Integer Ring
>>> F(ZZ) is P
True
>>> F(QQ)
Free Dendriform algebra on 2 generators ['x', 'y'] over Rational Field
```

coproduct_on_basis(*x*)

Return the coproduct of a binary tree.

EXAMPLES:

```
sage: A = algebras.FreeDendriform(QQ)
sage: x = A.gen(0)
sage: ascii_art(A.coproduct(A.one()))  # indirect doctest
1 # 1

sage: ascii_art(A.coproduct(x))  # indirect doctest
1 # B  + B  # 1
     o    o

sage: A = algebras.FreeDendriform(QQ, 'xyz')
sage: x, y, z = A.gens()
sage: w = A.under(z,A.over(x,y))
sage: A.coproduct(z)
B[.] # B[z[., .]] + B[z[., .]] # B[.]
sage: A.coproduct(w)
B[.] # B[x[z[., .], y[., .]]] + B[x[., .]] # B[z[., y[., .]]] +
B[x[., .]] # B[y[z[., .], .]] + B[x[., y[., .]]] # B[z[., .]] +
B[x[z[., .], .]] # B[y[., .]] + B[x[z[., .], y[., .]]] # B[.]
```

```
>>> from sage.all import *
>>> A = algebras.FreeDendriform(QQ)
>>> x = A.gen(Integer(0))
>>> ascii_art(A.coproduct(A.one()))  # indirect doctest
1 # 1

>>> ascii_art(A.coproduct(x))  # indirect doctest
1 # B  + B  # 1
     o    o

>>> A = algebras.FreeDendriform(QQ, 'xyz')
>>> x, y, z = A.gens()
>>> w = A.under(z,A.over(x,y))
>>> A.coproduct(z)
B[.] # B[z[., .]] + B[z[., .]] # B[.]
>>> A.coproduct(w)
```

(continues on next page)

(continued from previous page)

```
B[.] # B[x[z[., .], y[., .]]] + B[x[., .]] # B[z[., y[., .]]] +
B[x[., .]] # B[y[z[., .], .]] + B[x[., y[., .]]] # B[z[., .]] +
B[x[z[., .], .]] # B[y[., .]] + B[x[z[., .], y[., .]]] # B[.]
```

degree_on_basis(*t*)

Return the degree of a binary tree in the free Dendriform algebra.

This is the number of vertices.

EXAMPLES:

```
sage: A = algebras.FreeDendriform(QQ,'@')
sage: RT = A.basis().keys()
sage: u = RT([], '@')
sage: A.degree_on_basis(u.over(u))
2
```

```
>>> from sage.all import *
>>> A = algebras.FreeDendriform(QQ,'@')
>>> RT = A.basis().keys()
>>> u = RT([], '@')
>>> A.degree_on_basis(u.over(u))
2
```

gen(*i*)

Return the i-th generator of the algebra.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: F = algebras.FreeDendriform(ZZ, 'xyz')
sage: F.gen(0)
B[x[., .]]

sage: F.gen(4)
Traceback (most recent call last):
...
IndexError: argument i (= 4) must be between 0 and 2
```

```
>>> from sage.all import *
>>> F = algebras.FreeDendriform(ZZ, 'xyz')
>>> F.gen(Integer(0))
B[x[., .]]

>>> F.gen(Integer(4))
Traceback (most recent call last):
...
IndexError: argument i (= 4) must be between 0 and 2
```

gens()

Return the generators of `self` (as an algebra).

EXAMPLES:

```
sage: A = algebras.FreeDendriform(ZZ, 'fgh')
sage: A.gens()
(B[f[., .]], B[g[., .]], B[h[., .]])
```

```
>>> from sage.all import *
>>> A = algebras.FreeDendriform(ZZ, 'fgh')
>>> A.gens()
(B[f[., .]], B[g[., .]], B[h[., .]])
```

one_basis()

Return the index of the unit.

EXAMPLES:

```
sage: A = algebras.FreeDendriform(QQ, '@')
sage: A.one_basis()
.
sage: A = algebras.FreeDendriform(QQ, 'xy')
sage: A.one_basis()
.
```

```
>>> from sage.all import *
>>> A = algebras.FreeDendriform(QQ, '@')
>>> A.one_basis()
.
>>> A = algebras.FreeDendriform(QQ, 'xy')
>>> A.one_basis()
.
```

over()

Return the over product.

The over product x/y is the binary tree obtained by grafting the root of y at the rightmost leaf of x.

The usual symbol for this operation is $/$.

See also

product_on_basis(), *succ()*, *prec()*, *under()*

EXAMPLES:

```
sage: A = algebras.FreeDendriform(QQ)
sage: RT = A.basis().keys()
sage: x = A.gen(0)
sage: A.over(x, x)
B[[., [., .]]]
```

```
>>> from sage.all import *
>>> A = algebras.FreeDendriform(QQ)
>>> RT = A.basis().keys()
```

(continues on next page)

(continued from previous page)

```
>>> x = A.gen(Integer(0))
>>> A.over(x, x)
B[[., [., .]]]
```

prec()

Return the $\prec$ dendriform product.

This is the sum over all possible ways to identify the rightmost path in x and the leftmost path in y, with the additional condition that the root vertex of the result comes from x.

The usual symbol for this operation is $\prec$.

See also

product_on_basis(), *succ()*, *over()*, *under()*

EXAMPLES:

```
sage: A = algebras.FreeDendriform(QQ)
sage: RT = A.basis().keys()
sage: x = A.gen(0)
sage: A.prec(x, x)
B[[., [., .]]]
```

```
>>> from sage.all import *
>>> A = algebras.FreeDendriform(QQ)
>>> RT = A.basis().keys()
>>> x = A.gen(Integer(0))
>>> A.prec(x, x)
B[[., [., .]]]
```

prec_product_on_basis(x, y)

Return the $\prec$ dendriform product of two trees.

This is the sum over all possible ways of identifying the rightmost path in x and the leftmost path in y, with the additional condition that the root vertex of the result comes from x.

The usual symbol for this operation is $\prec$.

See also

- *product_on_basis()*, *succ_product_on_basis()*

EXAMPLES:

```
sage: A = algebras.FreeDendriform(QQ)
sage: RT = A.basis().keys()
sage: x = RT([])
sage: A.prec_product_on_basis(x, x)
B[[., [., .]]]
```

```
>>> from sage.all import *
>>> A = algebras.FreeDendriform(QQ)
>>> RT = A.basis().keys()
>>> x = RT([])
>>> A.prec_product_on_basis(x, x)
B[[., [., .]]]
```

product_on_basis(*x*, *y*)

Return the $*$ associative dendriform product of two trees.

This is the sum over all possible ways of identifying the rightmost path in x and the leftmost path in y. Every term corresponds to a shuffle of the vertices on the rightmost path in x and the vertices on the leftmost path in y.

See also

- *succ_product_on_basis()*, *prec_product_on_basis()*

EXAMPLES:

```
sage: A = algebras.FreeDendriform(QQ)
sage: RT = A.basis().keys()
sage: x = RT([])
sage: A.product_on_basis(x, x)
B[[., [., .]]] + B[[[., .], .]]
```

```
>>> from sage.all import *
>>> A = algebras.FreeDendriform(QQ)
>>> RT = A.basis().keys()
>>> x = RT([])
>>> A.product_on_basis(x, x)
B[[., [., .]]] + B[[[., .], .]]
```

some_elements()

Return some elements of the free dendriform algebra.

EXAMPLES:

```
sage: A = algebras.FreeDendriform(QQ)
sage: A.some_elements()
[B[.],
 B[[., .]],
 B[[., [., .]]] + B[[[., .], .]],
 B[.] + B[[., [., .]]] + B[[[., .], .]]]
```

```
>>> from sage.all import *
>>> A = algebras.FreeDendriform(QQ)
>>> A.some_elements()
[B[.],
 B[[., .]],
 B[[., [., .]]] + B[[[., .], .]],
 B[.] + B[[., [., .]]] + B[[[., .], .]]]
```

With several generators:

```
sage: A = algebras.FreeDendriform(QQ, 'xy')
sage: A.some_elements()
[B[.],
 B[x[., .]],
 B[x[., x[., .]]] + B[x[x[., .], .]],
 B[.] + B[x[., x[., .]]] + B[x[x[., .], .]]]
```

```
>>> from sage.all import *
>>> A = algebras.FreeDendriform(QQ, 'xy')
>>> A.some_elements()
[B[.],
 B[x[., .]],
 B[x[., x[., .]]] + B[x[x[., .], .]],
 B[.] + B[x[., x[., .]]] + B[x[x[., .], .]]]
```

succ()

Return the $\succ$ dendriform product.

This is the sum over all possible ways of identifying the rightmost path in x and the leftmost path in y, with the additional condition that the root vertex of the result comes from y.

The usual symbol for this operation is $\succ$.

See also

product_on_basis(), *prec()*, *over()*, *under()*

EXAMPLES:

```
sage: A = algebras.FreeDendriform(QQ)
sage: RT = A.basis().keys()
sage: x = A.gen(0)
sage: A.succ(x, x)
B[[[., .], .]]
```

```
>>> from sage.all import *
>>> A = algebras.FreeDendriform(QQ)
>>> RT = A.basis().keys()
>>> x = A.gen(Integer(0))
>>> A.succ(x, x)
B[[[., .], .]]
```

succ_product_on_basis(x, y)

Return the $\succ$ dendriform product of two trees.

This is the sum over all possible ways to identify the rightmost path in x and the leftmost path in y, with the additional condition that the root vertex of the result comes from y.

The usual symbol for this operation is $\succ$.

See also

- *product_on_basis()*, *prec_product_on_basis()*

EXAMPLES:

```
sage: A = algebras.FreeDendriform(QQ)
sage: RT = A.basis().keys()
sage: x = RT([])
sage: A.succ_product_on_basis(x, x)
B[[[., .], .]]
```

```
>>> from sage.all import *
>>> A = algebras.FreeDendriform(QQ)
>>> RT = A.basis().keys()
>>> x = RT([])
>>> A.succ_product_on_basis(x, x)
B[[[., .], .]]
```

under()

Return the under product.

The over product $x \backslash y$ is the binary tree obtained by grafting the root of x at the leftmost leaf of y.

The usual symbol for this operation is $\backslash$.

See also

product_on_basis(), *succ()*, *prec()*, *over()*

EXAMPLES:

```
sage: A = algebras.FreeDendriform(QQ)
sage: RT = A.basis().keys()
sage: x = A.gen(0)
sage: A.under(x, x)
B[[[., .], .]]
```

```
>>> from sage.all import *
>>> A = algebras.FreeDendriform(QQ)
>>> RT = A.basis().keys()
>>> x = A.gen(Integer(0))
>>> A.under(x, x)
B[[[., .], .]]
```

variable_names()

Return the names of the variables.

EXAMPLES:

```
sage: R = algebras.FreeDendriform(QQ, 'xy')
sage: R.variable_names()
{'x', 'y'}
```

```
>>> from sage.all import *
>>> R = algebras.FreeDendriform(QQ, 'xy')
>>> R.variable_names()
{'x', 'y'}
```

Free modules

class sage.combinat.free_module.**CartesianProductWithFlattening**(*flatten*)

Bases: object

A class for Cartesian product constructor, with partial flattening

class sage.combinat.free_module.**CombinatorialFreeModule**(*R*, *basis_keys=None*, *element_class=None*, *category=None*, *prefix=None*, *names=None*, ***kwds*)

Bases: UniqueRepresentation, Module, IndexedGenerators

Class for free modules with a named basis.

INPUT:

- R – base ring
- basis_keys – list; tuple, family, set, etc. defining the indexing set for the basis of this module
- element_class – the class of which elements of this module should be instances (default: None, in which case the elements are instances of IndexedFreeModuleElement)
- category – the category in which this module lies (optional, default None, in which case use the "category of modules with basis" over the base ring R); this should be a subcategory of ModulesWithBasis

For the options controlling the printing of elements, see IndexedGenerators.

Note

These print options may also be accessed and modified using the print_options() method, after the module has been defined.

EXAMPLES:

We construct a free module whose basis is indexed by the letters a, b, c:

```
sage: F = CombinatorialFreeModule(QQ, ['a','b','c'])
sage: F
Free module generated by {'a', 'b', 'c'} over Rational Field
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(QQ, ['a','b','c'])
>>> F
Free module generated by {'a', 'b', 'c'} over Rational Field
```

Its basis is a family, indexed by a, b, c:

```
sage: e = F.basis()
sage: e
Finite family {'a': B['a'], 'b': B['b'], 'c': B['c']}
```

```
>>> from sage.all import *
>>> e = F.basis()
>>> e
Finite family {'a': B['a'], 'b': B['b'], 'c': B['c']}
```

```
sage: [x for x in e]
[B['a'], B['b'], B['c']]
sage: [k for k in e.keys()]
['a', 'b', 'c']
```

```
>>> from sage.all import *
>>> [x for x in e]
[B['a'], B['b'], B['c']]
>>> [k for k in e.keys()]
['a', 'b', 'c']
```

Let us construct some elements, and compute with them:

```
sage: e['a']
B['a']
sage: 2*e['a']
2*B['a']
sage: e['a'] + 3*e['b']
B['a'] + 3*B['b']
```

```
>>> from sage.all import *
>>> e['a']
B['a']
>>> Integer(2)*e['a']
2*B['a']
>>> e['a'] + Integer(3)*e['b']
B['a'] + 3*B['b']
```

Some uses of `sage.categories.additive_magmas.AdditiveMagmas.ParentMethods.summation()` and *sum()*:

```
sage: F = CombinatorialFreeModule(QQ, [1,2,3,4])
sage: F.summation(F.monomial(1), F.monomial(3))
B[1] + B[3]

sage: F = CombinatorialFreeModule(QQ, [1,2,3,4])
sage: F.sum(F.monomial(i) for i in [1,2,3])
B[1] + B[2] + B[3]
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(QQ, [Integer(1),Integer(2),Integer(3),Integer(4)])
>>> F.summation(F.monomial(Integer(1)), F.monomial(Integer(3)))
B[1] + B[3]

>>> F = CombinatorialFreeModule(QQ, [Integer(1),Integer(2),Integer(3),Integer(4)])
>>> F.sum(F.monomial(i) for i in [Integer(1),Integer(2),Integer(3)])
B[1] + B[2] + B[3]
```

Note that free modules with a given basis and parameters are unique:

```
sage: F1 = CombinatorialFreeModule(QQ, (1,2,3,4))
sage: F1 is F
True
```

```
>>> from sage.all import *
>>> F1 = CombinatorialFreeModule(QQ, (Integer(1),Integer(2),Integer(3),
↪Integer(4)))
>>> F1 is F
True
```

The identity of the constructed free module depends on the order of the basis and on the other parameters, like the prefix. Note that *CombinatorialFreeModule* is a UniqueRepresentation. Hence, two combinatorial free modules evaluate equal if and only if they are identical:

```
sage: F1 = CombinatorialFreeModule(QQ, (1,2,3,4))
sage: F1 is F
True
sage: F1 = CombinatorialFreeModule(QQ, [4,3,2,1])
sage: F1 == F
False
sage: F2 = CombinatorialFreeModule(QQ, [1,2,3,4], prefix='F')
sage: F2 == F
False
```

```
>>> from sage.all import *
>>> F1 = CombinatorialFreeModule(QQ, (Integer(1),Integer(2),Integer(3),
↪Integer(4)))
>>> F1 is F
True
>>> F1 = CombinatorialFreeModule(QQ, [Integer(4),Integer(3),Integer(2),
↪Integer(1)])
>>> F1 == F
False
>>> F2 = CombinatorialFreeModule(QQ, [Integer(1),Integer(2),Integer(3),
↪Integer(4)], prefix='F')
>>> F2 == F
False
```

Because of this, if you create a free module with certain parameters and then modify its prefix or other print options, this affects all modules which were defined using the same parameters.

```
sage: F2.print_options(prefix='x')
sage: F2.prefix()
'x'
sage: F3 = CombinatorialFreeModule(QQ, [1,2,3,4], prefix='F')
sage: F3 is F2   # F3 was defined just like F2
True
sage: F3.prefix()
'x'
sage: F4 = CombinatorialFreeModule(QQ, [1,2,3,4], prefix='F', bracket=True)
sage: F4 == F2   # F4 was NOT defined just like F2
```

(continues on next page)

(continued from previous page)

```
False
sage: F4.prefix()
'F'

sage: F2.print_options(prefix='F') #reset for following doctests
```

```
>>> from sage.all import *
>>> F2.print_options(prefix='x')
>>> F2.prefix()
'x'
>>> F3 = CombinatorialFreeModule(QQ, [Integer(1),Integer(2),Integer(3),
↪Integer(4)], prefix='F')
>>> F3 is F2   # F3 was defined just like F2
True
>>> F3.prefix()
'x'
>>> F4 = CombinatorialFreeModule(QQ, [Integer(1),Integer(2),Integer(3),
↪Integer(4)], prefix='F', bracket=True)
>>> F4 == F2   # F4 was NOT defined just like F2
False
>>> F4.prefix()
'F'

>>> F2.print_options(prefix='F') #reset for following doctests
```

The constructed module is in the category of modules with basis over the base ring:

```
sage: CombinatorialFreeModule(QQ, Partitions()).category()                    #␣
↪needs sage.combinat
Category of vector spaces with basis over Rational Field
```

```
>>> from sage.all import *
>>> CombinatorialFreeModule(QQ, Partitions()).category()                      #␣
↪needs sage.combinat
Category of vector spaces with basis over Rational Field
```

If furthermore the index set is finite (i.e. in the category `Sets().Finite()`), then the module is declared as being finite dimensional:

```
sage: CombinatorialFreeModule(QQ, [1,2,3,4]).category()
Category of finite dimensional vector spaces with basis over Rational Field
sage: CombinatorialFreeModule(QQ, Partitions(3),                              #␣
↪needs sage.combinat
....:                         category=Algebras(QQ).WithBasis()).category()
Category of finite dimensional algebras with basis over Rational Field
```

```
>>> from sage.all import *
>>> CombinatorialFreeModule(QQ, [Integer(1),Integer(2),Integer(3),Integer(4)]).
↪category()
Category of finite dimensional vector spaces with basis over Rational Field
>>> CombinatorialFreeModule(QQ, Partitions(Integer(3)),                        ␣
↪     # needs sage.combinat
```

(continues on next page)

(continued from previous page)

```
...                           category=Algebras(QQ).WithBasis()).category()
Category of finite dimensional algebras with basis over Rational Field
```

See sage.categories.examples.algebras_with_basis and sage.categories.examples.hopf_algebras_with_basis for illustrations of the use of the category keyword, and see *sage.combinat.root_system.weight_space.WeightSpace* for an example of the use of element_class.

Customizing print and LaTeX representations of elements:

```
sage: F = CombinatorialFreeModule(QQ, ['a','b'], prefix='x')
sage: original_print_options = F.print_options()
sage: sorted(original_print_options.items())

(1, 2) - 3*(3, 4)
```

CartesianProduct

alias of *CombinatorialFreeModule_CartesianProduct*

Element

alias of IndexedFreeModuleElement

Tensor

alias of *CombinatorialFreeModule_Tensor*

change_ring(*R*)

Return the base change of `self` to R.

EXAMPLES:

```
sage: F = CombinatorialFreeModule(ZZ, ['a','b','c']); F
Free module generated by {'a', 'b', 'c'} over Integer Ring
sage: F_QQ = F.change_ring(QQ); F_QQ
Free module generated by {'a', 'b', 'c'} over Rational Field
sage: F_QQ.change_ring(ZZ) == F
True

sage: T = F.tensor(F); T
Free module generated by {'a', 'b', 'c'} over Integer Ring
 # Free module generated by {'a', 'b', 'c'} over Integer Ring
sage: T.change_ring(QQ)
Free module generated by {'a', 'b', 'c'} over Rational Field
 # Free module generated by {'a', 'b', 'c'} over Rational Field

sage: G = CombinatorialFreeModule(ZZ, ['x','y']); G
Free module generated by {'x', 'y'} over Integer Ring
sage: T = F.cartesian_product(G); T
Free module generated by {'a', 'b', 'c'} over Integer Ring
 (+) Free module generated by {'x', 'y'} over Integer Ring
sage: T.change_ring(QQ)
Free module generated by {'a', 'b', 'c'} over Rational Field
 (+) Free module generated by {'x', 'y'} over Rational Field
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(ZZ, ['a','b','c']); F
Free module generated by {'a', 'b', 'c'} over Integer Ring
>>> F_QQ = F.change_ring(QQ); F_QQ
Free module generated by {'a', 'b', 'c'} over Rational Field
>>> F_QQ.change_ring(ZZ) == F
True

>>> T = F.tensor(F); T
Free module generated by {'a', 'b', 'c'} over Integer Ring
 # Free module generated by {'a', 'b', 'c'} over Integer Ring
>>> T.change_ring(QQ)
Free module generated by {'a', 'b', 'c'} over Rational Field
 # Free module generated by {'a', 'b', 'c'} over Rational Field

>>> G = CombinatorialFreeModule(ZZ, ['x','y']); G
Free module generated by {'x', 'y'} over Integer Ring
>>> T = F.cartesian_product(G); T
Free module generated by {'a', 'b', 'c'} over Integer Ring
 (+) Free module generated by {'x', 'y'} over Integer Ring
>>> T.change_ring(QQ)
Free module generated by {'a', 'b', 'c'} over Rational Field
 (+) Free module generated by {'x', 'y'} over Rational Field
```

construction()

The construction functor and base ring for `self`.

EXAMPLES:

```
sage: F = CombinatorialFreeModule(QQ, ['a','b','c'],␣
↪category=AlgebrasWithBasis(QQ))
sage: F.construction()
(VectorFunctor, Rational Field)
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(QQ, ['a','b','c'],␣
↪category=AlgebrasWithBasis(QQ))
>>> F.construction()
(VectorFunctor, Rational Field)
```

dimension()

Return the dimension of the free module (which is given by the number of elements in the basis).

EXAMPLES:

```
sage: F = CombinatorialFreeModule(QQ, ['a', 'b', 'c'])
sage: F.dimension()
3
sage: F.basis().cardinality()
3
sage: F.basis().keys().cardinality()
3
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(QQ, ['a', 'b', 'c'])
>>> F.dimension()
3
>>> F.basis().cardinality()
3
>>> F.basis().keys().cardinality()
3
```

Rank is available as a synonym:

```
sage: F.rank()
3
```

```
>>> from sage.all import *
>>> F.rank()
3
```

```
sage: s = SymmetricFunctions(QQ).schur()                                    #␣
↪needs sage.combinat
sage: s.dimension()                                                         #␣
↪needs sage.combinat
+Infinity
```

```
>>> from sage.all import *
>>> s = SymmetricFunctions(QQ).schur()                                    #␣
↪needs sage.combinat
>>> s.dimension()                                                         #␣
↪needs sage.combinat
+Infinity
```

element_class()

The (default) class for the elements of this parent.

Overrides `Parent.element_class()` to force the construction of Python class. This is currently needed to inherit really all the features from categories, and in particular the initialization of `_mul_` in `__init_extra__()`.

EXAMPLES:

```
sage: # needs sage.combinat
sage: A = Algebras(QQ).WithBasis().example(); A
An example of an algebra with basis:
the free algebra on the generators ('a', 'b', 'c') over Rational Field
sage: A.element_class.mro()
[<class 'sage.categories.examples.algebras_with_basis.FreeAlgebra_with_
↪category.element_class'>,
 <class 'sage.modules.with_basis.indexed_element.IndexedFreeModuleElement'>,
 ...]
sage: a,b,c = A.algebra_generators()
sage: a * b
B[word: ab]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> A = Algebras(QQ).WithBasis().example(); A
An example of an algebra with basis:
the free algebra on the generators ('a', 'b', 'c') over Rational Field
>>> A.element_class.mro()
[<class 'sage.categories.examples.algebras_with_basis.FreeAlgebra_with_
↪category.element_class'>,
 <class 'sage.modules.with_basis.indexed_element.IndexedFreeModuleElement'>,
 ...]
>>> a,b,c = A.algebra_generators()
>>> a * b
B[word: ab]
```

from_vector(*vector*, *order=None*, *coerce=True*)

Build an element of `self` from a (sparse) vector.

See also

- *get_order()*
- `to_vector`

EXAMPLES:

```
sage: # needs sage.combinat
sage: QS3 = SymmetricGroupAlgebra(QQ, 3)
sage: b = QS3.from_vector(vector((2, 0, 0, 0, 0, 4))); b
2*[1, 2, 3] + 4*[3, 2, 1]
sage: a = 2*QS3([1,2,3]) + 4*QS3([3,2,1])
sage: a == b
True
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> QS3 = SymmetricGroupAlgebra(QQ, Integer(3))
>>> b = QS3.from_vector(vector((Integer(2), Integer(0), Integer(0),␣
↪Integer(0), Integer(0), Integer(4)))); b
2*[1, 2, 3] + 4*[3, 2, 1]
>>> a = Integer(2)*QS3([Integer(1),Integer(2),Integer(3)]) +␣
↪Integer(4)*QS3([Integer(3),Integer(2),Integer(1)])
>>> a == b
True
```

get_order()

Return the order of the elements in the basis.

EXAMPLES:

```
sage: QS2 = SymmetricGroupAlgebra(QQ,2)                                    #␣
↪needs sage.combinat
sage: QS2.get_order()  # note: order changed on 2009-03-13                 #␣
↪needs sage.combinat
[[2, 1], [1, 2]]
```

```
>>> from sage.all import *
>>> QS2 = SymmetricGroupAlgebra(QQ,Integer(2))                                 ␣
↪     # needs sage.combinat
>>> QS2.get_order()  # note: order changed on 2009-03-13                    #␣
↪needs sage.combinat
[[2, 1], [1, 2]]
```

get_order_key()

Return a comparison key on the basis indices that is compatible with the current term order.

EXAMPLES:

```
sage: A = FiniteDimensionalAlgebrasWithBasis(QQ).example()
sage: A.set_order(['x', 'y', 'a', 'b'])
sage: Akey = A.get_order_key()
sage: sorted(A.basis().keys(), key=Akey)
['x', 'y', 'a', 'b']
sage: A.set_order(list(reversed(A.basis().keys())))
sage: Akey = A.get_order_key()
sage: sorted(A.basis().keys(), key=Akey)
['b', 'a', 'y', 'x']
```

```
>>> from sage.all import *
>>> A = FiniteDimensionalAlgebrasWithBasis(QQ).example()
>>> A.set_order(['x', 'y', 'a', 'b'])
>>> Akey = A.get_order_key()
>>> sorted(A.basis().keys(), key=Akey)
['x', 'y', 'a', 'b']
>>> A.set_order(list(reversed(A.basis().keys())))
>>> Akey = A.get_order_key()
>>> sorted(A.basis().keys(), key=Akey)
['b', 'a', 'y', 'x']
```

is_exact()

Return `True` if elements of `self` have exact representations, which is true of `self` if and only if it is true of `self.basis().keys()` and `self.base_ring()`.

EXAMPLES:

```
sage: GroupAlgebra(GL(3, GF(7))).is_exact()                                    #␣
↪needs sage.groups sage.rings.finite_rings
True
sage: GroupAlgebra(GL(3, GF(7)), RR).is_exact()                                #␣
↪needs sage.groups sage.rings.finite_rings
False
sage: GroupAlgebra(GL(3, pAdicRing(7))).is_exact()  # not implemented, needs␣
↪sage.groups sage.rings.padics
False
```

```
>>> from sage.all import *
>>> GroupAlgebra(GL(Integer(3), GF(Integer(7)))).is_exact()                    ␣
↪              # needs sage.groups sage.rings.finite_rings
True
>>> GroupAlgebra(GL(Integer(3), GF(Integer(7))), RR).is_exact()                ␣
↪              # needs sage.groups sage.rings.finite_rings
False
>>> GroupAlgebra(GL(Integer(3), pAdicRing(Integer(7)))).is_exact()  # not␣
↪implemented, needs sage.groups sage.rings.padics
False
```

linear_combination(*iter_of_elements_coeff*, *factor_on_left=True*)

Return the linear combination $\lambda_1 v_1 + \cdots + \lambda_k v_k$ (resp. the linear combination $v_1\lambda_1 + \cdots + v_k\lambda_k$) where `iter_of_elements_coeff` iterates through the sequence $((v_1, \lambda_1), ..., (v_k, \lambda_k))$.

INPUT:

- `iter_of_elements_coeff` – iterator of pairs `(element, coeff)` with `element` in `self` and `coeff` in `self.base_ring()`
- `factor_on_left` – (optional) if `True`, the coefficients are multiplied from the left if `False`, the coefficients are multiplied from the right

EXAMPLES:

```
sage: F = CombinatorialFreeModule(QQ, [1,2])
sage: f = F.an_element(); f
2*B[1] + 2*B[2]
```

(continues on next page)

(continued from previous page)

```
sage: F.linear_combination( (f,i) for i in range(5) )
20*B[1] + 20*B[2]
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(QQ, [Integer(1),Integer(2)])
>>> f = F.an_element(); f
2*B[1] + 2*B[2]
>>> F.linear_combination( (f,i) for i in range(Integer(5)) )
20*B[1] + 20*B[2]
```

monomial()

Return the basis element indexed by `i`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: F = CombinatorialFreeModule(QQ, ['a', 'b', 'c'])
sage: F.monomial('a')
B['a']
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(QQ, ['a', 'b', 'c'])
>>> F.monomial('a')
B['a']
```

`F.monomial` is in fact (almost) a map:

```
sage: F.monomial
Term map from {'a', 'b', 'c'} to Free module generated by {'a', 'b', 'c'}␣
↪over Rational Field
```

```
>>> from sage.all import *
>>> F.monomial
Term map from {'a', 'b', 'c'} to Free module generated by {'a', 'b', 'c'}␣
↪over Rational Field
```

rank()

alias of *dimension()*.

set_order(*order*)

Set the order of the elements of the basis.

If *set_order()* has not been called, then the ordering is the one used in the generation of the elements of `self`'s associated enumerated set.

Warning

Many cached methods depend on this order, in particular for constructing subspaces and quotients. Changing the order after some computations have been cached does not invalidate the cache, and is likely to introduce inconsistencies.

EXAMPLES:

```
sage: # needs sage.combinat
sage: QS2 = SymmetricGroupAlgebra(QQ,2)
sage: b = list(QS2.basis().keys())
sage: b.reverse()
sage: QS2.set_order(b)
sage: QS2.get_order()
[[2, 1], [1, 2]]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> QS2 = SymmetricGroupAlgebra(QQ,Integer(2))
>>> b = list(QS2.basis().keys())
>>> b.reverse()
>>> QS2.set_order(b)
>>> QS2.get_order()
[[2, 1], [1, 2]]
```

sum(*iter_of_elements*)

Return the sum of all elements in `iter_of_elements`.

Overrides method inherited from commutative additive monoid as it is much faster on dicts directly.

INPUT:

- `iter_of_elements` – iterator of elements of `self`

EXAMPLES:

```
sage: F = CombinatorialFreeModule(QQ,[1,2])
sage: f = F.an_element(); f
2*B[1] + 2*B[2]
sage: F.sum( f for _ in range(5) )
10*B[1] + 10*B[2]
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(QQ,[Integer(1),Integer(2)])
>>> f = F.an_element(); f
2*B[1] + 2*B[2]
>>> F.sum( f for _ in range(Integer(5)) )
10*B[1] + 10*B[2]
```

sum_of_terms(*terms*, *distinct=False*)

Construct a sum of terms of `self`.

INPUT:

- `terms` – list (or iterable) of pairs `(index, coeff)`
- `distinct` – boolean (default: `False`); whether the indices are guaranteed to be distinct

EXAMPLES:

```
sage: F = CombinatorialFreeModule(QQ, ['a', 'b', 'c'])
sage: F.sum_of_terms([('a',2), ('c',3)])
2*B['a'] + 3*B['c']
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(QQ, ['a', 'b', 'c'])
>>> F.sum_of_terms([('a',Integer(2)), ('c',Integer(3))])
2*B['a'] + 3*B['c']
```

If `distinct` is True, then the construction is optimized:

```
sage: F.sum_of_terms([('a',2), ('c',3)], distinct = True)
2*B['a'] + 3*B['c']
```

```
>>> from sage.all import *
>>> F.sum_of_terms([('a',Integer(2)), ('c',Integer(3))], distinct = True)
2*B['a'] + 3*B['c']
```

Warning

Use `distinct=True` only if you are sure that the indices are indeed distinct:

```
sage: F.sum_of_terms([('a',2), ('a',3)], distinct = True)
3*B['a']
```

```
>>> from sage.all import *
>>> F.sum_of_terms([('a',Integer(2)), ('a',Integer(3))], distinct = True)
3*B['a']
```

Extreme case:

```
sage: F.sum_of_terms([])
0
```

```
>>> from sage.all import *
>>> F.sum_of_terms([])
0
```

term(*index*, *coeff=None*)

Construct a term in `self`.

INPUT:

- `index` – the index of a basis element
- `coeff` – an element of the coefficient ring (default: one)

EXAMPLES:

```
sage: F = CombinatorialFreeModule(QQ, ['a', 'b', 'c'])
sage: F.term('a',3)
3*B['a']
sage: F.term('a')
B['a']
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(QQ, ['a', 'b', 'c'])
```

(continues on next page)

(continued from previous page)

```
>>> F.term('a',Integer(3))
3*B['a']
>>> F.term('a')
B['a']
```

Design: should this do coercion on the coefficient ring?

zero()

EXAMPLES:

```
sage: F = CombinatorialFreeModule(QQ, ['a', 'b', 'c'])
sage: F.zero()
0
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(QQ, ['a', 'b', 'c'])
>>> F.zero()
0
```

class sage.combinat.free_module.**CombinatorialFreeModule_CartesianProduct**(*modules*, ***options*)

Bases: *CombinatorialFreeModule*

An implementation of Cartesian products of modules with basis.

EXAMPLES:

We construct two free modules, assign them short names, and construct their Cartesian product:

```
sage: F = CombinatorialFreeModule(ZZ, [4,5]); F.rename('F')
sage: G = CombinatorialFreeModule(ZZ, [4,6]); G.rename('G')
sage: H = CombinatorialFreeModule(ZZ, [4,7]); H.rename('H')
sage: S = cartesian_product([F, G])
sage: S
F (+) G
sage: S.basis()
Lazy family (Term map
 from Disjoint union of Family ({4, 5}, {4, 6})
   to F (+) G(i))_{i in Disjoint union of Family ({4, 5}, {4, 6})}
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(ZZ, [Integer(4),Integer(5)]); F.rename('F')
>>> G = CombinatorialFreeModule(ZZ, [Integer(4),Integer(6)]); G.rename('G')
>>> H = CombinatorialFreeModule(ZZ, [Integer(4),Integer(7)]); H.rename('H')
>>> S = cartesian_product([F, G])
>>> S
F (+) G
>>> S.basis()
Lazy family (Term map
 from Disjoint union of Family ({4, 5}, {4, 6})
   to F (+) G(i))_{i in Disjoint union of Family ({4, 5}, {4, 6})}
```

Note that the indices of the basis elements of F and G intersect non trivially. This is handled by forcing the union to be disjoint:

```
sage: list(S.basis())
[B[(0, 4)], B[(0, 5)], B[(1, 4)], B[(1, 6)]]
```

```
>>> from sage.all import *
>>> list(S.basis())
[B[(0, 4)], B[(0, 5)], B[(1, 4)], B[(1, 6)]]
```

We now compute the Cartesian product of elements of free modules:

```
sage: f =   F.monomial(4) + 2*F.monomial(5)
sage: g = 2*G.monomial(4) +   G.monomial(6)
sage: h =   H.monomial(4) +   H.monomial(7)
sage: cartesian_product([f, g])
B[(0, 4)] + 2*B[(0, 5)] + 2*B[(1, 4)] + B[(1, 6)]
sage: cartesian_product([f, g, h])
B[(0, 4)] + 2*B[(0, 5)] + 2*B[(1, 4)] + B[(1, 6)] + B[(2, 4)] + B[(2, 7)]
sage: cartesian_product([f, g, h]).parent()
F (+) G (+) H
```

```
>>> from sage.all import *
>>> f =   F.monomial(Integer(4)) + Integer(2)*F.monomial(Integer(5))
>>> g = Integer(2)*G.monomial(Integer(4)) +   G.monomial(Integer(6))
>>> h =   H.monomial(Integer(4)) +   H.monomial(Integer(7))
>>> cartesian_product([f, g])
B[(0, 4)] + 2*B[(0, 5)] + 2*B[(1, 4)] + B[(1, 6)]
>>> cartesian_product([f, g, h])
B[(0, 4)] + 2*B[(0, 5)] + 2*B[(1, 4)] + B[(1, 6)] + B[(2, 4)] + B[(2, 7)]
>>> cartesian_product([f, g, h]).parent()
F (+) G (+) H
```

TODO: choose an appropriate semantic for Cartesian products of Cartesian products (associativity?):

```
sage: S = cartesian_product([cartesian_product([F, G]), H])  # todo: not␣
↪implemented
F (+) G (+) H
```

```
>>> from sage.all import *
>>> S = cartesian_product([cartesian_product([F, G]), H])  # todo: not implemented
F (+) G (+) H
```

class Element

Bases: `IndexedFreeModuleElement`

cartesian_embedding(*i*)

Return the natural embedding morphism of the `i`-th Cartesian factor (summand) of `self` into `self`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: F = CombinatorialFreeModule(ZZ, [4,5]); F.rename('F')
sage: G = CombinatorialFreeModule(ZZ, [4,6]); G.rename('G')
```

(continues on next page)

(continued from previous page)

```
sage: S = cartesian_product([F, G])
sage: phi = S.cartesian_embedding(0)
sage: phi(F.monomial(4) + 2 * F.monomial(5))
B[(0, 4)] + 2*B[(0, 5)]
sage: phi(F.monomial(4) + 2 * F.monomial(6)).parent() == S
True
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(ZZ, [Integer(4),Integer(5)]); F.rename('F')
>>> G = CombinatorialFreeModule(ZZ, [Integer(4),Integer(6)]); G.rename('G')
>>> S = cartesian_product([F, G])
>>> phi = S.cartesian_embedding(Integer(0))
>>> phi(F.monomial(Integer(4)) + Integer(2) * F.monomial(Integer(5)))
B[(0, 4)] + 2*B[(0, 5)]
>>> phi(F.monomial(Integer(4)) + Integer(2) * F.monomial(Integer(6))).
↪parent() == S
True
```

cartesian_factors()

Return the factors of the Cartesian product.

EXAMPLES:

```
sage: F = CombinatorialFreeModule(ZZ, [4,5]); F.rename('F')
sage: G = CombinatorialFreeModule(ZZ, [4,6]); G.rename('G')
sage: S = cartesian_product([F, G])
sage: S.cartesian_factors()
(F, G)
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(ZZ, [Integer(4),Integer(5)]); F.rename('F')
>>> G = CombinatorialFreeModule(ZZ, [Integer(4),Integer(6)]); G.rename('G')
>>> S = cartesian_product([F, G])
>>> S.cartesian_factors()
(F, G)
```

cartesian_projection(i)

Return the natural projection onto the i-th Cartesian factor (summand) of `self`.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: F = CombinatorialFreeModule(ZZ, [4,5]); F.rename('F')
sage: G = CombinatorialFreeModule(ZZ, [4,6]); G.rename('G')
sage: S = cartesian_product([F, G])
sage: x = S.monomial((0,4)) + 2 * S.monomial((0,5)) + 3 * S.monomial((1,6))
sage: S.cartesian_projection(0)(x)
B[4] + 2*B[5]
sage: S.cartesian_projection(1)(x)
3*B[6]
```

(continues on next page)

(continued from previous page)

```
sage: S.cartesian_projection(0)(x).parent() == F
True
sage: S.cartesian_projection(1)(x).parent() == G
True
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(ZZ, [Integer(4),Integer(5)]); F.rename('F')
>>> G = CombinatorialFreeModule(ZZ, [Integer(4),Integer(6)]); G.rename('G')
>>> S = cartesian_product([F, G])
>>> x = S.monomial((Integer(0),Integer(4))) + Integer(2) * S.
↪monomial((Integer(0),Integer(5))) + Integer(3) * S.monomial((Integer(1),
↪Integer(6)))
>>> S.cartesian_projection(Integer(0))(x)
B[4] + 2*B[5]
>>> S.cartesian_projection(Integer(1))(x)
3*B[6]
>>> S.cartesian_projection(Integer(0))(x).parent() == F
True
>>> S.cartesian_projection(Integer(1))(x).parent() == G
True
```

summand_embedding(*i*)

alias of *cartesian_embedding()*.

summand_projection(*i*)

alias of *cartesian_projection()*.

class sage.combinat.free_module.**CombinatorialFreeModule_Tensor**(*modules*, ***options*)

Bases: *CombinatorialFreeModule*

Tensor Product of Free Modules.

EXAMPLES:

We construct two free modules, assign them short names, and construct their tensor product:

```
sage: F = CombinatorialFreeModule(ZZ, [1,2]); F.rename('F')
sage: G = CombinatorialFreeModule(ZZ, [3,4]); G.rename('G')
sage: T = tensor([F, G]); T
F # G

sage: T.category()
Category of tensor products of
 finite dimensional modules with basis over Integer Ring

sage: T.construction() # todo: not implemented
[tensor, ]
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(ZZ, [Integer(1),Integer(2)]); F.rename('F')
>>> G = CombinatorialFreeModule(ZZ, [Integer(3),Integer(4)]); G.rename('G')
>>> T = tensor([F, G]); T
F # G
```

(continues on next page)

(continued from previous page)

```
>>> T.category()
Category of tensor products of
 finite dimensional modules with basis over Integer Ring

>>> T.construction() # todo: not implemented
[tensor, ]
```

T is a free module, with same base ring as F and G:

```
sage: T.base_ring()
Integer Ring
```

```
>>> from sage.all import *
>>> T.base_ring()
Integer Ring
```

The basis of T is indexed by tuples of basis indices of F and G:

```
sage: T.basis().keys()
Image of Cartesian product of {1, 2}, {3, 4}
      by The map <class 'tuple'> from Cartesian product of {1, 2}, {3, 4}
sage: T.basis().keys().list()
[(1, 3), (1, 4), (2, 3), (2, 4)]
```

```
>>> from sage.all import *
>>> T.basis().keys()
Image of Cartesian product of {1, 2}, {3, 4}
      by The map <class 'tuple'> from Cartesian product of {1, 2}, {3, 4}
>>> T.basis().keys().list()
[(1, 3), (1, 4), (2, 3), (2, 4)]
```

FIXME: Should elements of a CartesianProduct be tuples (making them hashable)?

Here are the basis elements themselves:

```
sage: T.basis().cardinality()
4
sage: list(T.basis())
[B[1] # B[3], B[1] # B[4], B[2] # B[3], B[2] # B[4]]
```

```
>>> from sage.all import *
>>> T.basis().cardinality()
4
>>> list(T.basis())
[B[1] # B[3], B[1] # B[4], B[2] # B[3], B[2] # B[4]]
```

The tensor product is associative and flattens sub tensor products:

```
sage: H = CombinatorialFreeModule(ZZ, [5,6]); H.rename('H')
sage: tensor([F, tensor([G, H])])
F # G # H
```

(continues on next page)

(continued from previous page)

```
sage: tensor([tensor([F, G]), H])
F # G # H
sage: tensor([F, G, H])
F # G # H
```

```
>>> from sage.all import *
>>> H = CombinatorialFreeModule(ZZ, [Integer(5),Integer(6)]); H.rename('H')
>>> tensor([F, tensor([G, H])])
F # G # H
>>> tensor([tensor([F, G]), H])
F # G # H
>>> tensor([F, G, H])
F # G # H
```

We now compute the tensor product of elements of free modules:

```
sage: f =   F.monomial(1) + 2 * F.monomial(2)
sage: g = 2*G.monomial(3) +     G.monomial(4)
sage: h =   H.monomial(5) +     H.monomial(6)
sage: tensor([f, g])
2*B[1] # B[3] + B[1] # B[4] + 4*B[2] # B[3] + 2*B[2] # B[4]
```

```
>>> from sage.all import *
>>> f =   F.monomial(Integer(1)) + Integer(2) * F.monomial(Integer(2))
>>> g = Integer(2)*G.monomial(Integer(3)) +     G.monomial(Integer(4))
>>> h =   H.monomial(Integer(5)) +     H.monomial(Integer(6))
>>> tensor([f, g])
2*B[1] # B[3] + B[1] # B[4] + 4*B[2] # B[3] + 2*B[2] # B[4]
```

Again, the tensor product is associative on elements:

```
sage: tensor([f, tensor([g, h])]) == tensor([f, g, h])
True
sage: tensor([tensor([f, g]), h]) == tensor([f, g, h])
True
```

```
>>> from sage.all import *
>>> tensor([f, tensor([g, h])]) == tensor([f, g, h])
True
>>> tensor([tensor([f, g]), h]) == tensor([f, g, h])
True
```

Note further that the tensor product spaces need not preexist:

```
sage: t = tensor([f, g, h])
sage: t.parent()
F # G # H
```

```
>>> from sage.all import *
>>> t = tensor([f, g, h])
>>> t.parent()
F # G # H
```

tensor_constructor(*modules*)

INPUT:

- `modules` – tuple $(F_1, \ldots, F_n)$ of free modules whose tensor product is self

Returns the canonical multilinear morphism from $F_1 \times \cdots \times F_n$ to $F_1 \otimes \cdots \otimes F_n$

EXAMPLES:

```
sage: F = CombinatorialFreeModule(ZZ, [1,2]); F.rename('F')
sage: G = CombinatorialFreeModule(ZZ, [3,4]); G.rename('G')
sage: H = CombinatorialFreeModule(ZZ, [5,6]); H.rename('H')

sage: f =   F.monomial(1) + 2*F.monomial(2)
sage: g = 2*G.monomial(3) +   G.monomial(4)
sage: h =   H.monomial(5) +   H.monomial(6)
sage: FG = tensor([F, G])
sage: phi_fg = FG.tensor_constructor((F, G))
sage: phi_fg(f, g)
2*B[1] # B[3] + B[1] # B[4] + 4*B[2] # B[3] + 2*B[2] # B[4]

sage: FGH = tensor([F, G, H])
sage: phi_fgh = FGH.tensor_constructor((F, G, H))
sage: phi_fgh(f, g, h)
2*B[1] # B[3] # B[5] + 2*B[1] # B[3] # B[6] + B[1] # B[4] # B[5]
+ B[1] # B[4] # B[6] + 4*B[2] # B[3] # B[5] + 4*B[2] # B[3] # B[6]
+ 2*B[2] # B[4] # B[5] + 2*B[2] # B[4] # B[6]

sage: phi_fg_h = FGH.tensor_constructor((FG, H))
sage: phi_fg_h(phi_fg(f, g), h)
2*B[1] # B[3] # B[5] + 2*B[1] # B[3] # B[6] + B[1] # B[4] # B[5]
+ B[1] # B[4] # B[6] + 4*B[2] # B[3] # B[5] + 4*B[2] # B[3] # B[6]
+ 2*B[2] # B[4] # B[5] + 2*B[2] # B[4] # B[6]
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(ZZ, [Integer(1),Integer(2)]); F.rename('F')
>>> G = CombinatorialFreeModule(ZZ, [Integer(3),Integer(4)]); G.rename('G')
>>> H = CombinatorialFreeModule(ZZ, [Integer(5),Integer(6)]); H.rename('H')

>>> f =   F.monomial(Integer(1)) + Integer(2)*F.monomial(Integer(2))
>>> g = Integer(2)*G.monomial(Integer(3)) +   G.monomial(Integer(4))
>>> h =   H.monomial(Integer(5)) +   H.monomial(Integer(6))
>>> FG = tensor([F, G])
>>> phi_fg = FG.tensor_constructor((F, G))
>>> phi_fg(f, g)
2*B[1] # B[3] + B[1] # B[4] + 4*B[2] # B[3] + 2*B[2] # B[4]

>>> FGH = tensor([F, G, H])
>>> phi_fgh = FGH.tensor_constructor((F, G, H))
>>> phi_fgh(f, g, h)
2*B[1] # B[3] # B[5] + 2*B[1] # B[3] # B[6] + B[1] # B[4] # B[5]
+ B[1] # B[4] # B[6] + 4*B[2] # B[3] # B[5] + 4*B[2] # B[3] # B[6]
+ 2*B[2] # B[4] # B[5] + 2*B[2] # B[4] # B[6]
```

(continues on next page)

(continued from previous page)

```
>>> phi_fg_h = FGH.tensor_constructor((FG, H))
>>> phi_fg_h(phi_fg(f, g), h)
2*B[1] # B[3] # B[5] + 2*B[1] # B[3] # B[6] + B[1] # B[4] # B[5]
+ B[1] # B[4] # B[6] + 4*B[2] # B[3] # B[5] + 4*B[2] # B[3] # B[6]
+ 2*B[2] # B[4] # B[5] + 2*B[2] # B[4] # B[6]
```

tensor_factors()

Return the tensor factors of this tensor product.

EXAMPLES:

```
sage: F = CombinatorialFreeModule(ZZ, [1,2])
sage: F.rename('F')
sage: G = CombinatorialFreeModule(ZZ, [3,4])
sage: G.rename('G')
sage: T = tensor([F, G]); T
F # G
sage: T.tensor_factors()
(F, G)
```

```
>>> from sage.all import *
>>> F = CombinatorialFreeModule(ZZ, [Integer(1),Integer(2)])
>>> F.rename('F')
>>> G = CombinatorialFreeModule(ZZ, [Integer(3),Integer(4)])
>>> G.rename('G')
>>> T = tensor([F, G]); T
F # G
>>> T.tensor_factors()
(F, G)
```

Free pre-Lie algebras

AUTHORS:

- Florent Hivert, Frédéric Chapoton (2011)

class sage.combinat.free_prelie_algebra.**FreePreLieAlgebra**(*R*, *names=None*)

Bases: *CombinatorialFreeModule*

The free pre-Lie algebra.

Pre-Lie algebras are non-associative algebras, where the product $*$ satisfies

$$(x * y) * z - x * (y * z) = (x * z) * y - x * (z * y).$$

We use here the convention where the associator

$$(x, y, z) := (x * y) * z - x * (y * z)$$

is symmetric in its two rightmost arguments. This is sometimes called a right pre-Lie algebra.

They have appeared in numerical analysis and deformation theory.

The free Pre-Lie algebra on a given set E has an explicit description using rooted trees, just as the free associative algebra can be described using words. The underlying vector space has a basis indexed by finite rooted trees endowed with a map from their vertices to E. In this basis, the product of two (decorated) rooted trees $S * T$ is

the sum over vertices of S of the rooted tree obtained by adding one edge from the root of T to the given vertex of S. The root of these trees is taken to be the root of S. The free pre-Lie algebra can also be considered as the free algebra over the PreLie operad.

Warning

The usual binary operator `*` can be used for the pre-Lie product. Beware that it but must be parenthesized properly, as the pre-Lie product is not associative. By default, a multiple product will be taken with left parentheses.

EXAMPLES:

```
sage: F = algebras.FreePreLie(ZZ, 'xyz')
sage: x,y,z = F.gens()
sage: (x * y) * z
B[x[y[z[]]]] + B[x[y[], z[]]]
sage: (x * y) * z - x * (y * z) == (x * z) * y - x * (z * y)
True
```

```
>>> from sage.all import *
>>> F = algebras.FreePreLie(ZZ, 'xyz')
>>> x,y,z = F.gens()
>>> (x * y) * z
B[x[y[z[]]]] + B[x[y[], z[]]]
>>> (x * y) * z - x * (y * z) == (x * z) * y - x * (z * y)
True
```

The free pre-Lie algebra is non-associative:

```
sage: x * (y * z) == (x * y) * z
False
```

```
>>> from sage.all import *
>>> x * (y * z) == (x * y) * z
False
```

The default product is with left parentheses:

```
sage: x * y * z == (x * y) * z
True
sage: x * y * z * x == ((x * y) * z) * x
True
```

```
>>> from sage.all import *
>>> x * y * z == (x * y) * z
True
>>> x * y * z * x == ((x * y) * z) * x
True
```

The NAP product as defined in [Liv2006] is also implemented on the same vector space:

```
sage: N = F.nap_product
sage: N(x*y,z*z)
B[x[y[], z[z[]]]]
```

```
>>> from sage.all import *
>>> N = F.nap_product
>>> N(x*y,z*z)
B[x[y[], z[z[]]]]
```

When `None` is given as input, unlabelled trees are used instead:

```
sage: F1 = algebras.FreePreLie(QQ, None)
sage: w = F1.gen(0); w
B[[]]
sage: w * w * w * w
B[[[[[[[[[]]]]]]]]] + B[[[[]], [[]]]] + 3*B[[[]], [[[]]]] + B[[[], [], []]]
```

```
>>> from sage.all import *
>>> F1 = algebras.FreePreLie(QQ, None)
>>> w = F1.gen(Integer(0)); w
B[[]]
>>> w * w * w * w
B[[[[[[[[[]]]]]]]]] + B[[[[]], [[]]]] + 3*B[[[]], [[[]]]] + B[[[], [], []]]
```

However, it is equally possible to use labelled trees instead:

```
sage: F1 = algebras.FreePreLie(QQ, 'q')
sage: w = F1.gen(0); w
B[q[]]
sage: w * w * w * w
B[q[q[q[q[[]]]]]] + B[q[q[q[], q[]]]] + 3*B[q[q[], q[q[]]]] + B[q[q[], q[], q[]]]
```

```
>>> from sage.all import *
>>> F1 = algebras.FreePreLie(QQ, 'q')
>>> w = F1.gen(Integer(0)); w
B[q[]]
>>> w * w * w * w
B[q[q[q[q[[]]]]]] + B[q[q[q[], q[]]]] + 3*B[q[q[], q[q[]]]] + B[q[q[], q[], q[]]]
```

The set E can be infinite:

```
sage: F = algebras.FreePreLie(QQ, ZZ)
sage: w = F.gen(1); w
B[1[]]
sage: x = F.gen(2); x
B[-1[]]
sage: y = F.gen(3); y
B[2[]]
sage: w*x
B[1[-1[]]]
sage: (w*x)*y
B[1[-1[2[]]]] + B[1[-1[], 2[]]]
```

(continues on next page)

(continued from previous page)

```
sage: w*(x*y)
B[1[-1[2[]]]]
```

```
>>> from sage.all import *
>>> F = algebras.FreePreLie(QQ, ZZ)
>>> w = F.gen(Integer(1)); w
B[1[]]
>>> x = F.gen(Integer(2)); x
B[-1[]]
>>> y = F.gen(Integer(3)); y
B[2[]]
>>> w*x
B[1[-1[]]]
>>> (w*x)*y
B[1[-1[2[]]]] + B[1[-1[], 2[]]]
>>> w*(x*y)
B[1[-1[2[]]]]
```

Elements of a free pre-Lie algebra can be lifted to the universal enveloping algebra of the associated Lie algebra. The universal enveloping algebra is the Grossman-Larson Hopf algebra:

```
sage: F = algebras.FreePreLie(QQ,'abc')
sage: a,b,c = F.gens()
sage: (a*b+b*c).lift()
B[#[a[b[]]]] + B[#[b[c[]]]]
```

```
>>> from sage.all import *
>>> F = algebras.FreePreLie(QQ,'abc')
>>> a,b,c = F.gens()
>>> (a*b+b*c).lift()
B[#[a[b[]]]] + B[#[b[c[]]]]
```

Note

Variables names can be `None`, a list of strings, a string or an integer. When `None` is given, unlabelled rooted trees are used. When a single string is given, each letter is taken as a variable. See *sage.combinat.words.alphabet.build_alphabet()*.

Warning

Beware that the underlying combinatorial free module is based either on `RootedTrees` or on `LabelledRootedTrees`, with no restriction on the labellings. This means that all code calling the `basis()` method would not give meaningful results, since it returns many "chaff" elements that do not belong to the algebra.

REFERENCES:

- [ChLi]
- [Liv2006]

class Element

Bases: IndexedFreeModuleElement

lift()

Lift element to the Grossman-Larson algebra.

EXAMPLES:

```
sage: F = algebras.FreePreLie(QQ,'abc')
sage: elt = F.an_element().lift(); elt
B[#[a[a[a[a[]]]]]] + B[#[a[a[], a[a[]]]]]
sage: parent(elt)
Grossman-Larson Hopf algebra on 3 generators ['a', 'b', 'c']
over Rational Field
```

```
>>> from sage.all import *
>>> F = algebras.FreePreLie(QQ,'abc')
>>> elt = F.an_element().lift(); elt
B[#[a[a[a[a[]]]]]] + B[#[a[a[], a[a[]]]]]
>>> parent(elt)
Grossman-Larson Hopf algebra on 3 generators ['a', 'b', 'c']
over Rational Field
```

valuation()

Return the valuation of `self`.

EXAMPLES:

```
sage: a = algebras.FreePreLie(QQ).gen(0)
sage: a.valuation()
1
sage: (a*a).valuation()
2

sage: a, b = algebras.FreePreLie(QQ,'ab').gens()
sage: (a+b).valuation()
1
sage: (a*b).valuation()
2
sage: (a*b+a).valuation()
1
```

```
>>> from sage.all import *
>>> a = algebras.FreePreLie(QQ).gen(Integer(0))
>>> a.valuation()
1
>>> (a*a).valuation()
2

>>> a, b = algebras.FreePreLie(QQ,'ab').gens()
>>> (a+b).valuation()
1
>>> (a*b).valuation()
2
```

(continues on next page)

(continued from previous page)

```
>>> (a*b+a).valuation()
1
```

algebra_generators()

Return the generators of this algebra.

These are the rooted trees with just one vertex.

EXAMPLES:

```
sage: A = algebras.FreePreLie(ZZ, 'fgh'); A
Free PreLie algebra on 3 generators ['f', 'g', 'h']
 over Integer Ring
sage: list(A.algebra_generators())
[B[f[]], B[g[]], B[h[]]]

sage: A = algebras.FreePreLie(QQ, ['x1','x2'])
sage: list(A.algebra_generators())
[B[x1[]], B[x2[]]]
```

```
>>> from sage.all import *
>>> A = algebras.FreePreLie(ZZ, 'fgh'); A
Free PreLie algebra on 3 generators ['f', 'g', 'h']
 over Integer Ring
>>> list(A.algebra_generators())
[B[f[]], B[g[]], B[h[]]]

>>> A = algebras.FreePreLie(QQ, ['x1','x2'])
>>> list(A.algebra_generators())
[B[x1[]], B[x2[]]]
```

bracket_on_basis(x, y)

Return the Lie bracket of two trees.

This is the commutator $[x, y] = x * y - y * x$ of the pre-Lie product.

See also

pre_Lie_product_on_basis()

EXAMPLES:

```
sage: A = algebras.FreePreLie(QQ, None)
sage: RT = A.basis().keys()
sage: x = RT([RT([])])
sage: y = RT([x])
sage: A.bracket_on_basis(x, y)
-B[[[[]], [[]]]] + B[[[]], [[[]]]] - B[[[[]], [[]]]]
```

```
>>> from sage.all import *
>>> A = algebras.FreePreLie(QQ, None)
>>> RT = A.basis().keys()
```

(continues on next page)

(continued from previous page)

```
>>> x = RT([RT([])])
>>> y = RT([x])
>>> A.bracket_on_basis(x, y)
-B[[[[], [[]]]]] + B[[[], [[[]]]]] - B[[[[]], [[]]]]
```

change_ring(*R*)

Return the free pre-Lie algebra in the same variables over R.

INPUT:

- `R` – a ring

EXAMPLES:

```
sage: A = algebras.FreePreLie(ZZ, 'fgh')
sage: A.change_ring(QQ)
Free PreLie algebra on 3 generators ['f', 'g', 'h'] over
Rational Field
```

```
>>> from sage.all import *
>>> A = algebras.FreePreLie(ZZ, 'fgh')
>>> A.change_ring(QQ)
Free PreLie algebra on 3 generators ['f', 'g', 'h'] over
Rational Field
```

construction()

Return a pair `(F, R)`, where `F` is a *PreLieFunctor* and R is a ring, such that `F(R)` returns `self`.

EXAMPLES:

```
sage: P = algebras.FreePreLie(ZZ, 'x,y')
sage: x,y = P.gens()
sage: F, R = P.construction()
sage: F
PreLie[x,y]
sage: R
Integer Ring
sage: F(ZZ) is P
True
sage: F(QQ)
Free PreLie algebra on 2 generators ['x', 'y'] over Rational Field
```

```
>>> from sage.all import *
>>> P = algebras.FreePreLie(ZZ, 'x,y')
>>> x,y = P.gens()
>>> F, R = P.construction()
>>> F
PreLie[x,y]
>>> R
Integer Ring
>>> F(ZZ) is P
True
>>> F(QQ)
Free PreLie algebra on 2 generators ['x', 'y'] over Rational Field
```

corolla(*x*, *y*, *n*, *N*)

Return the corolla obtained with `x` as root and `y` as leaves.

INPUT:

- `x`, `y` – two elements
- `n` – integer; width of the corolla
- `N` – integer; truncation order (up to order `N` included)

OUTPUT:

the sum over all possible ways to graft `n` copies of `y` on top of `x` (with at most `N` vertices in total)

This operation can be defined by induction starting from the pre-Lie product.

EXAMPLES:

```
sage: A = algebras.FreePreLie(QQ)
sage: a = A.gen(0)
sage: b = A.corolla(a,a,1,4); b
B[[[[]]]]
sage: A.corolla(b,b,2,7)
B[[[[[[]]]]]] + B[[[[[[]]]]]] + 2*B[[[[[]]]]] + B[[[[[[]]]]]] + B[[[], [[]], [[]]]]

sage: A = algebras.FreePreLie(QQ, 'o')
sage: a = A.gen(0)
sage: b = A.corolla(a,a,1,4)

sage: A = algebras.FreePreLie(QQ,'ab')
sage: a, b = A.gens()
sage: A.corolla(a,b,1,4)
B[a[b[]]]
sage: A.corolla(b,a,3,4)
B[b[a[], a[], a[]]]

sage: A.corolla(a+b,a+b,2,4)
B[a[a[], a[]]] + 2*B[a[a[], b[]]] + B[a[b[], b[]]] + B[b[a[], a[]]] +
2*B[b[a[], b[]]] + B[b[b[], b[]]]
```

```
>>> from sage.all import *
>>> A = algebras.FreePreLie(QQ)
>>> a = A.gen(Integer(0))
>>> b = A.corolla(a,a,Integer(1),Integer(4)); b
B[[[[]]]]
>>> A.corolla(b,b,Integer(2),Integer(7))
B[[[[[[]]]]]] + B[[[[[[]]]]]] + 2*B[[[[[]]]]] + B[[[[[[]]]]]] + B[[[], [[]], [[]]]]

>>> A = algebras.FreePreLie(QQ, 'o')
>>> a = A.gen(Integer(0))
>>> b = A.corolla(a,a,Integer(1),Integer(4))

>>> A = algebras.FreePreLie(QQ,'ab')
>>> a, b = A.gens()
>>> A.corolla(a,b,Integer(1),Integer(4))
B[a[b[]]]
```

(continues on next page)

(continued from previous page)

```
>>> A.corolla(b,a,Integer(3),Integer(4))
B[b[a[], a[], a[]]]

>>> A.corolla(a+b,a+b,Integer(2),Integer(4))
B[a[a[], a[]]] + 2*B[a[a[], b[]]] + B[a[b[], b[]]] + B[b[a[], a[]]] +
2*B[b[a[], b[]]] + B[b[b[], b[]]]
```

degree_on_basis(*t*)

Return the degree of a rooted tree in the free Pre-Lie algebra.

This is the number of vertices.

EXAMPLES:

```
sage: A = algebras.FreePreLie(QQ, None)
sage: RT = A.basis().keys()
sage: A.degree_on_basis(RT([RT([])]))
2
```

```
>>> from sage.all import *
>>> A = algebras.FreePreLie(QQ, None)
>>> RT = A.basis().keys()
>>> A.degree_on_basis(RT([RT([])]))
2
```

gen(*i*)

Return the `i`-th generator of the algebra.

INPUT:

- `i` – integer

EXAMPLES:

```
sage: F = algebras.FreePreLie(ZZ, 'xyz')
sage: F.gen(0)
B[x[]]

sage: F.gen(4)
Traceback (most recent call last):
...
IndexError: argument i (= 4) must be between 0 and 2
```

```
>>> from sage.all import *
>>> F = algebras.FreePreLie(ZZ, 'xyz')
>>> F.gen(Integer(0))
B[x[]]

>>> F.gen(Integer(4))
Traceback (most recent call last):
...
IndexError: argument i (= 4) must be between 0 and 2
```

gens()

Return the generators of `self` (as an algebra).

EXAMPLES:

```
sage: A = algebras.FreePreLie(ZZ, 'fgh')
sage: A.gens()
(B[f[]], B[g[]], B[h[]])
```

```
>>> from sage.all import *
>>> A = algebras.FreePreLie(ZZ, 'fgh')
>>> A.gens()
(B[f[]], B[g[]], B[h[]])
```

group_product(*x*, *y*, *n*, *N=10*)

Return the truncated group product of `x` and `y`.

This is a weighted sum of all corollas with up to `n` leaves, with `x` as root and `y` as leaves.

The result is computed up to order `N` (included).

When considered with infinitely many terms and infinite precision, this is an analogue of the Baker-Campbell-Hausdorff formula: it defines an associative product on the completed free pre-Lie algebra.

INPUT:

- `x`, `y` – two elements
- `n` – integer; the maximal width of corollas
- `N` – integer (default: 10); truncation order

EXAMPLES:

In the free pre-Lie algebra with one generator:

```
sage: PL = algebras.FreePreLie(QQ)
sage: a = PL.gen(0)
sage: PL.group_product(a, a, 3, 3)
B[[]] + B[[[]]] + 1/2*B[[[], []]]
```

```
>>> from sage.all import *
>>> PL = algebras.FreePreLie(QQ)
>>> a = PL.gen(Integer(0))
>>> PL.group_product(a, a, Integer(3), Integer(3))
B[[]] + B[[[]]] + 1/2*B[[[], []]]
```

In the free pre-Lie algebra with several generators:

```
sage: PL = algebras.FreePreLie(QQ,'@O')
sage: a, b = PL.gens()
sage: PL.group_product(a, b, 3, 3)
B[@[]] + B[@[O[]]] + 1/2*B[@[O[], O[]]]
sage: PL.group_product(a, b, 3, 10)
B[@[]] + B[@[O[]]] + 1/2*B[@[O[], O[]]] + 1/6*B[@[O[], O[], O[]]]
```

```
>>> from sage.all import *
>>> PL = algebras.FreePreLie(QQ,'@O')
>>> a, b = PL.gens()
>>> PL.group_product(a, b, Integer(3), Integer(3))
B[@[]] + B[@[O[]]] + 1/2*B[@[O[], O[]]]
>>> PL.group_product(a, b, Integer(3), Integer(10))
B[@[]] + B[@[O[]]] + 1/2*B[@[O[], O[]]] + 1/6*B[@[O[], O[], O[]]]
```

nap_product()

Return the NAP product.

See also

nap_product_on_basis()

EXAMPLES:

```
sage: A = algebras.FreePreLie(QQ, None)
sage: RT = A.basis().keys()
sage: x = A(RT([RT([])]))
sage: A.nap_product(x, x)
B[[[], [[]]]]
```

```
>>> from sage.all import *
>>> A = algebras.FreePreLie(QQ, None)
>>> RT = A.basis().keys()
>>> x = A(RT([RT([])]))
>>> A.nap_product(x, x)
B[[[], [[]]]]
```

nap_product_on_basis(x, y)

Return the NAP product of two trees.

This is the grafting of the root of y over the root of x. The root of the resulting tree is the root of x.

See also

nap_product()

EXAMPLES:

```
sage: A = algebras.FreePreLie(QQ, None)
sage: RT = A.basis().keys()
sage: x = RT([RT([])])
sage: A.nap_product_on_basis(x, x)
B[[[], [[]]]]
```

```
>>> from sage.all import *
>>> A = algebras.FreePreLie(QQ, None)
>>> RT = A.basis().keys()
>>> x = RT([RT([])])
```

(continues on next page)

(continued from previous page)

```
>>> A.nap_product_on_basis(x, x)
B[[[], [[]]]]
```

pre_Lie_product()

Return the pre-Lie product.

See also

pre_Lie_product_on_basis()

EXAMPLES:

```
sage: A = algebras.FreePreLie(QQ, None)
sage: RT = A.basis().keys()
sage: x = A(RT([RT([])]))
sage: A.pre_Lie_product(x, x)
B[[[[[[[[]]]]]]]] + B[[[], [[]]]]
```

```
>>> from sage.all import *
>>> A = algebras.FreePreLie(QQ, None)
>>> RT = A.basis().keys()
>>> x = A(RT([RT([])]))
>>> A.pre_Lie_product(x, x)
B[[[[[[[[]]]]]]]] + B[[[], [[]]]]
```

pre_Lie_product_on_basis(x, y)

alias of *product_on_basis()*.

product_on_basis(x, y)

Return the pre-Lie product of two trees.

This is the sum over all graftings of the root of y over a vertex of x. The root of the resulting trees is the root of x.

See also

pre_Lie_product()

EXAMPLES:

```
sage: A = algebras.FreePreLie(QQ, None)
sage: RT = A.basis().keys()
sage: x = RT([RT([])])
sage: A.product_on_basis(x, x)
B[[[[[[[[]]]]]]]] + B[[[], [[]]]]
```

```
>>> from sage.all import *
>>> A = algebras.FreePreLie(QQ, None)
>>> RT = A.basis().keys()
>>> x = RT([RT([])])
```

(continues on next page)

(continued from previous page)

```
>>> A.product_on_basis(x, x)
B[[[[[[[[[[]]]]]]]]]] + B[[[]]] + B[[[]]] + B[[[[[]]]]]
```

some_elements()

Return some elements of the free pre-Lie algebra.

EXAMPLES:

```
sage: A = algebras.FreePreLie(QQ, None)
sage: A.some_elements()
[B[[]], B[[[]]], B[[[[[[[[[[]]]]]]]]]] + B[[[]]] + B[[[]]] + B[[[
```

```
>>> from sage.all import *
>>> R = algebras.FreePreLie(QQ, 'xy')
>>> R.variable_names()
{'x', 'y'}

>>> R = algebras.FreePreLie(QQ, None)
>>> R.variable_names()
{'o'}
```

class sage.combinat.free_prelie_algebra.**PreLieFunctor**(*vars*)

Bases: ConstructionFunctor

A constructor for pre-Lie algebras.

EXAMPLES:

```
sage: P = algebras.FreePreLie(ZZ, 'x,y')
sage: x,y = P.gens()
sage: F = P.construction()[0]; F
PreLie[x,y]

sage: A = GF(5)['a,b']
sage: a, b = A.gens()
sage: F(A)
Free PreLie algebra on 2 generators ['x', 'y'] over Multivariate Polynomial Ring␣
↪in a, b over Finite Field of size 5

sage: f = A.hom([a+b,a-b],A)
sage: F(f)
Generic endomorphism of Free PreLie algebra on 2 generators ['x', 'y']
over Multivariate Polynomial Ring in a, b over Finite Field of size 5

sage: F(f)(a * F(A)(x))
(a+b)*B[x[]]
```

```
>>> from sage.all import *
>>> P = algebras.FreePreLie(ZZ, 'x,y')
>>> x,y = P.gens()
>>> F = P.construction()[Integer(0)]; F
PreLie[x,y]

>>> A = GF(Integer(5))['a,b']
>>> a, b = A.gens()
>>> F(A)
Free PreLie algebra on 2 generators ['x', 'y'] over Multivariate Polynomial Ring␣
↪in a, b over Finite Field of size 5

>>> f = A.hom([a+b,a-b],A)
>>> F(f)
Generic endomorphism of Free PreLie algebra on 2 generators ['x', 'y']
over Multivariate Polynomial Ring in a, b over Finite Field of size 5

>>> F(f)(a * F(A)(x))
(a+b)*B[x[]]
```

merge(*other*)

Merge `self` with another construction functor, or return None.

EXAMPLES:

```
sage: F = sage.combinat.free_prelie_algebra.PreLieFunctor(['x','y'])
sage: G = sage.combinat.free_prelie_algebra.PreLieFunctor(['t'])
sage: F.merge(G)
PreLie[x,y,t]
sage: F.merge(F)
PreLie[x,y]
```

```
>>> from sage.all import *
>>> F = sage.combinat.free_prelie_algebra.PreLieFunctor(['x','y'])
>>> G = sage.combinat.free_prelie_algebra.PreLieFunctor(['t'])
>>> F.merge(G)
PreLie[x,y,t]
>>> F.merge(F)
PreLie[x,y]
```

Now some actual use cases:

```
sage: R = algebras.FreePreLie(ZZ, 'xyz')
sage: x,y,z = R.gens()
sage: 1/2 * x
1/2*B[x[]]
sage: parent(1/2 * x)
Free PreLie algebra on 3 generators ['x', 'y', 'z'] over Rational Field

sage: S = algebras.FreePreLie(QQ, 'zt')
sage: z,t = S.gens()
sage: x + t
B[t[]] + B[x[]]
sage: parent(x + t)
Free PreLie algebra on 4 generators ['z', 't', 'x', 'y'] over Rational Field
```

```
>>> from sage.all import *
>>> R = algebras.FreePreLie(ZZ, 'xyz')
>>> x,y,z = R.gens()
>>> Integer(1)/Integer(2) * x
1/2*B[x[]]
>>> parent(Integer(1)/Integer(2) * x)
Free PreLie algebra on 3 generators ['x', 'y', 'z'] over Rational Field

>>> S = algebras.FreePreLie(QQ, 'zt')
>>> z,t = S.gens()
>>> x + t
B[t[]] + B[x[]]
>>> parent(x + t)
Free PreLie algebra on 4 generators ['z', 't', 'x', 'y'] over Rational Field
```

rank = 9

sage.combinat.free_prelie_algebra.**corolla_gen**(*tx*, *list_ty*, *labels=True*)

Yield the terms in the corolla with given bottom tree and top trees.

These are the possible terms in the simultaneous grafting of the top trees on vertices of the bottom tree.

INPUT:

- `tx` – a tree
- `list_ty` – list of trees

EXAMPLES:

```
sage: from sage.combinat.free_prelie_algebra import corolla_gen
sage: a = algebras.FreePreLie(QQ).gen(0)
sage: ta = a.support()[0]
sage: list(corolla_gen(ta,[ta],False))
[[[]]]

sage: a, b = algebras.FreePreLie(QQ,'ab').gens()
sage: ta = a.support()[0]
sage: tb = b.support()[0]
sage: ab = (a*b).support()[0]
sage: list(corolla_gen(ta,[tb]))
[a[b[]]]
sage: list(corolla_gen(tb,[ta,ta]))
[b[a[], a[]]]
sage: list(corolla_gen(ab,[ab,ta]))
[a[a[], b[], a[b[]]], a[a[b[]], b[a[]]], a[a[], b[a[b[]]]],
a[b[a[], a[b[]]]]]
```

```
>>> from sage.all import *
>>> from sage.combinat.free_prelie_algebra import corolla_gen
>>> a = algebras.FreePreLie(QQ).gen(Integer(0))
>>> ta = a.support()[Integer(0)]
>>> list(corolla_gen(ta,[ta],False))
[[[]]]

>>> a, b = algebras.FreePreLie(QQ,'ab').gens()
>>> ta = a.support()[Integer(0)]
>>> tb = b.support()[Integer(0)]
>>> ab = (a*b).support()[Integer(0)]
>>> list(corolla_gen(ta,[tb]))
[a[b[]]]
>>> list(corolla_gen(tb,[ta,ta]))
[b[a[], a[]]]
>>> list(corolla_gen(ab,[ab,ta]))
[a[a[], b[], a[b[]]], a[a[b[]], b[a[]]], a[a[], b[a[b[]]]],
a[b[a[], a[b[]]]]]
```

sage.combinat.free_prelie_algebra.**tree_from_sortkey**(*ch*, *labels=True*)

Transform a list of `(valence, label)` into a tree and a remainder.

This is like an inverse of the `sort_key` method.

INPUT:

- `ch` – list of pairs `(integer, label)`
- `labels` – boolean (default: `True`); whether to use labelled trees

OUTPUT:

a pair `(tree, remainder of the input)`

EXAMPLES:

```
sage: from sage.combinat.free_prelie_algebra import tree_from_sortkey
sage: a = algebras.FreePreLie(QQ).gen(0)
sage: t = (a*a*a*a).support()
sage: all(tree_from_sortkey(u.sort_key(), False)[0] == u for u in t)
True

sage: a, b = algebras.FreePreLie(QQ,'ab').gens()
sage: t = (a*b*a*b).support()
sage: all(tree_from_sortkey(u.sort_key())[0] == u for u in t)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.free_prelie_algebra import tree_from_sortkey
>>> a = algebras.FreePreLie(QQ).gen(Integer(0))
>>> t = (a*a*a*a).support()
>>> all(tree_from_sortkey(u.sort_key(), False)[Integer(0)] == u for u in t)
True

>>> a, b = algebras.FreePreLie(QQ,'ab').gens()
>>> t = (a*b*a*b).support()
>>> all(tree_from_sortkey(u.sort_key())[Integer(0)] == u for u in t)
True
```

Free quasi-symmetric functions

AUTHORS:

- Frédéric Chapoton, Darij Grinberg (2017)

class sage.combinat.fqsym.**FQSymBases**(*base*)

Bases: `Category_realization_of_parent`

The category of graded bases of $FQSym$ indexed by permutations.

class ElementMethods

Bases: `object`

omega_involution()

Return the image of the element `self` of $FQSym$ under the omega involution.

The ω involution is defined as the linear map $FQSym \to FQSym$ that sends each basis element F_u of the F-basis of $FQSym$ to the basis element $F_{u \circ w_0}$, where w_0 is the longest word (i.e., $w_0(i) = n+1-i$) in the symmetric group S_n that contains u. The ω involution is a graded algebra automorphism and a coalgebra anti-automorphism of $FQSym$. Every permutation $u \in S_n$ satisfies

$$\omega(F_u) = F_{u \circ w_0}, \qquad \omega(G_u) = G_{w_0 \circ u},$$

where standard notations for classical bases of $FQSym$ are being used (that is, F for the F-basis, and G for the G-basis). In other words, writing permutations in one-line notation, we have

$$\omega(F_{(u_1,u_2,\ldots,u_n)}) = F_{(u_n,u_{n-1},\ldots,u_1)}, \qquad \omega(G_{(u_1,u_2,\ldots,u_n)}) = G_{(n+1-u_1,n+1-u_2,\ldots,n+1-u_n)}.$$

If we also consider the ω involution (*omega_involution()*) of the quasisymmetric functions (by slight abuse of notation), and if we let π be the canonical projection $FQSym \to QSym$, then $\pi \circ \omega = \omega \circ \pi$.

Additionally, consider the ψ involution (*psi_involution()*) of the noncommutative symmetric functions, and if we let ι be the canonical inclusion $NSym \to FQSym$, then $\omega \circ \iota = \iota \circ \psi$.

Todo

Duality?

psi_involution(), *star_involution()*

EXAMPLES:

```
sage: FQSym = algebras.FQSym(ZZ)
sage: F = FQSym.F()
sage: F[[2,3,1]].omega_involution()
F[1, 3, 2]
sage: (3*F[[1]] - 4*F[[]] + 5*F[[1,2]]).omega_involution()
-4*F[] + 3*F[1] + 5*F[2, 1]
sage: G = FQSym.G()
sage: G[[2,3,1]].omega_involution()
G[2, 1, 3]
sage: M = FQSym.M()
sage: M[[2,3,1]].omega_involution()
-M[1, 2, 3] - M[2, 1, 3] - M[3, 1, 2]
```

```
>>> from sage.all import *
>>> FQSym = algebras.FQSym(ZZ)
>>> F = FQSym.F()
>>> F[[Integer(2),Integer(3),Integer(1)]].omega_involution()
F[1, 3, 2]
>>> (Integer(3)*F[[Integer(1)]] - Integer(4)*F[[]] +␣
↪Integer(5)*F[[Integer(1),Integer(2)]]).omega_involution()
-4*F[] + 3*F[1] + 5*F[2, 1]
>>> G = FQSym.G()
>>> G[[Integer(2),Integer(3),Integer(1)]].omega_involution()
G[2, 1, 3]
>>> M = FQSym.M()
>>> M[[Integer(2),Integer(3),Integer(1)]].omega_involution()
-M[1, 2, 3] - M[2, 1, 3] - M[3, 1, 2]
```

The omega involution is an algebra homomorphism:

```
sage: (F[1,2] * F[1]).omega_involution()
F[2, 1, 3] + F[2, 3, 1] + F[3, 2, 1]
sage: F[1,2].omega_involution() * F[1].omega_involution()
F[2, 1, 3] + F[2, 3, 1] + F[3, 2, 1]
```

```
>>> from sage.all import *
>>> (F[Integer(1),Integer(2)] * F[Integer(1)]).omega_involution()
F[2, 1, 3] + F[2, 3, 1] + F[3, 2, 1]
>>> F[Integer(1),Integer(2)].omega_involution() * F[Integer(1)].omega_
↪involution()
F[2, 1, 3] + F[2, 3, 1] + F[3, 2, 1]
```

The omega involution intertwines the antipode and the inverse of the antipode:

```
sage: all( F(I).antipode().omega_involution().antipode()
....:      == F(I).omega_involution()
....:      for I in Permutations(4) )
True
```

```
>>> from sage.all import *
>>> all( F(I).antipode().omega_involution().antipode()
...      == F(I).omega_involution()
...      for I in Permutations(Integer(4)) )
True
```

Testing the $\pi \circ \omega = \omega \circ \pi$ relation noticed above:

```
sage: all( M[I].omega_involution().to_qsym()
....:      == M[I].to_qsym().omega_involution()
....:      for I in Permutations(4) )
True
```

```
>>> from sage.all import *
>>> all( M[I].omega_involution().to_qsym()
...      == M[I].to_qsym().omega_involution()
...      for I in Permutations(Integer(4)) )
True
```

Testing the $\omega \circ \iota = \iota \circ \psi$ relation:

```
sage: NSym = NonCommutativeSymmetricFunctions(ZZ)
sage: S = NSym.S()
sage: all( S[I].psi_involution().to_fqsym() == S[I].to_fqsym().omega_
↪involution()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(ZZ)
>>> S = NSym.S()
>>> all( S[I].psi_involution().to_fqsym() == S[I].to_fqsym().omega_
↪involution()
```

(continues on next page)

(continued from previous page)

```
...       for I in Compositions(Integer(4)) )
True
```

Todo

Check further commutative squares.

psi_involution()

Return the image of the element `self` of $FQSym$ under the psi involution.

The ψ involution is defined as the linear map $FQSym \to FQSym$ that sends each basis element F_u of the F-basis of $FQSym$ to the basis element $F_{w_0 \circ u}$, where w_0 is the longest word (i.e., $w_0(i) = n+1-i$) in the symmetric group S_n that contains u. The ψ involution is a graded coalgebra automorphism and an algebra anti-automorphism of $FQSym$. Every permutation $u \in S_n$ satisfies

$$\psi(F_u) = F_{w_0 \circ u}, \qquad \psi(G_u) = G_{u \circ w_0},$$

where standard notations for classical bases of $FQSym$ are being used (that is, F for the F-basis, and G for the G-basis). In other words, writing permutations in one-line notation, we have

$$\psi(F_{(u_1,u_2,\ldots,u_n)}) = F_{(n+1-u_1,n+1-u_2,\ldots,n+1-u_n)}, \qquad \psi(G_{(u_1,u_2,\ldots,u_n)}) = G_{(u_n,u_{n-1},\ldots,u_1)}.$$

If we also consider the ψ involution (*psi_involution()*) of the quasisymmetric functions (by slight abuse of notation), and if we let π be the canonical projection $FQSym \to QSym$, then $\pi \circ \psi = \psi \circ \pi$.

Additionally, consider the ω involution (*omega_involution()*) of the noncommutative symmetric functions, and if we let ι be the canonical inclusion $NSym \to FQSym$, then $\psi \circ \iota = \iota \circ \omega$.

star_involution()

Return the image of the element `self` of $FQSym$ under the star involution.

The star involution is defined as the linear map $FQSym \to FQSym$ that sends each basis element F_u of the F-basis of $FQSym$ to the basis element $F_{w_0 \circ u \circ w_0}$, where w_0 is the longest word (i.e., $w_0(i) = n + 1 - i$) in the symmetric group S_n that contains u. The star involution is a graded Hopf algebra anti-automorphism of $FQSym$. It is denoted by $f \mapsto f^*$. Every permutation $u \in S_n$ satisfies

$$(F_u)^* = F_{w_0 \circ u \circ w_0}, \qquad (G_u)^* = G_{w_0 \circ u \circ w_0}, \qquad (\mathcal{M}_u)^* = \mathcal{M}_{w_0 \circ u \circ w_0},$$

where standard notations for classical bases of $FQSym$ are being used (that is, F for the F-basis, G for the G-basis, and $\mathcal{M}$ for the Monomial basis). In other words, writing permutations in one-line notation, we have

$$(F_{(u_1,u_2,\ldots,u_n)})^* = F_{(n+1-u_n,n+1-u_{n-1},\ldots,n+1-u_1)}, \qquad (G_{(u_1,u_2,\ldots,u_n)})^* = G_{(n+1-u_n,n+1-u_{n-1},\ldots,n+1-u_1)},$$

and

$$(\mathcal{M}_{(u_1,u_2,\ldots,u_n)})^* = \mathcal{M}_{(n+1-u_n,n+1-u_{n-1},\ldots,n+1-u_1)}.$$

Let us denote the star involution by $(*)$ as well.

If we also denote by $(*)$ the star involution of of the quasisymmetric functions (*star_involution()*) and if we let $\pi : FQSym \to QSym$ be the canonical projection then $\pi \circ (*) = (*) \circ \pi$. Similar for the noncommutative symmetric functions (*star_involution()*) with $\pi : NSym \to FQSym$ being the canonical inclusion and the word quasisymmetric functions (*star_involution()*) with $\pi : FQSym \to WQSym$ the canonical inclusion.

Todo

Duality?

See also

omega_involution(), *psi_involution()*

EXAMPLES:

```
sage: FQSym = algebras.FQSym(ZZ)
sage: F = FQSym.F()
sage: F[[2,3,1]].star_involution()
F[3, 1, 2]
sage: (3*F[[1]] - 4*F[[]] + 5*F[[1,2]]).star_involution()
-4*F[] + 3*F[1] + 5*F[1, 2]
sage: G = FQSym.G()
sage: G[[2,3,1]].star_involution()
G[3, 1, 2]
sage: M = FQSym.M()
sage: M[[2,3,1]].star_involution()
M[3, 1, 2]
```

```
>>> from sage.all import *
>>> FQSym = algebras.FQSym(ZZ)
>>> F = FQSym.F()
>>> F[[Integer(2),Integer(3),Integer(1)]].star_involution()
F[3, 1, 2]
>>> (Integer(3)*F[[Integer(1)]] - Integer(4)*F[[]] +␣
↪Integer(5)*F[[Integer(1),Integer(2)]]).star_involution()
-4*F[] + 3*F[1] + 5*F[1, 2]
>>> G = FQSym.G()
>>> G[[Integer(2),Integer(3),Integer(1)]].star_involution()
G[3, 1, 2]
>>> M = FQSym.M()
>>> M[[Integer(2),Integer(3),Integer(1)]].star_involution()
M[3, 1, 2]
```

The star involution commutes with the antipode:

```
sage: all( F(I).antipode().star_involution()
....:      == F(I).star_involution().antipode()
....:      for I in Permutations(4) )
True
```

```
>>> from sage.all import *
>>> all( F(I).antipode().star_involution()
...      == F(I).star_involution().antipode()
...      for I in Permutations(Integer(4)) )
True
```

Testing the $\pi \circ (*) = (*) \circ \pi$ relation:

```
sage: all( M[I].star_involution().to_qsym()
....:      == M[I].to_qsym().star_involution()
....:      for I in Permutations(4) )
True
```

```
>>> from sage.all import *
>>> all( M[I].star_involution().to_qsym()
...      == M[I].to_qsym().star_involution()
...      for I in Permutations(Integer(4)) )
True
```

Similar for $NSym$:

```
sage: NSym = NonCommutativeSymmetricFunctions(ZZ)
sage: S = NSym.S()
sage: all( S[I].star_involution().to_fqsym() == S[I].to_fqsym().star_
↪involution()
....:      for I in Compositions(4) )
True
```

```
>>> from sage.all import *
>>> NSym = NonCommutativeSymmetricFunctions(ZZ)
>>> S = NSym.S()
>>> all( S[I].star_involution().to_fqsym() == S[I].to_fqsym().star_
↪involution()
...      for I in Compositions(Integer(4)) )
True
```

Similar for $WQSym$:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: all( F(I).to_wqsym().star_involution()
....:      == F(I).star_involution().to_wqsym()
....:      for I in Permutations(4) )
True
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> all( F(I).to_wqsym().star_involution()
...      == F(I).star_involution().to_wqsym()
...      for I in Permutations(Integer(4)) )
True
```

Todo

Check further commutative squares.

to_qsym()

Return the image of `self` under the canonical projection $FQSym \to QSym$.

The canonical projection $FQSym \to QSym$ is a surjective homomorphism of Hopf algebras. It sends a basis element F_w of $FQSym$ to the basis element $F_{\mathrm{Comp}\, w}$ of the fundamental basis of $QSym$, where Comp w stands for the descent composition (*sage.combinat.permutation.Permutation.descents_composition()*) of the permutation w.

See also

QuasiSymmetricFunctions for a definition of $QSym$.

EXAMPLES:

```
sage: G = algebras.FQSym(QQ).G()
sage: x = G[1, 3, 2]
sage: x.to_qsym()
F[2, 1]
sage: G[2, 3, 1].to_qsym()
F[1, 2]
sage: F = algebras.FQSym(QQ).F()
sage: F[2, 3, 1].to_qsym()
F[2, 1]
sage: (F[2, 3, 1] + F[1, 3, 2] + F[1, 2, 3]).to_qsym()
2*F[2, 1] + F[3]
sage: F2 = algebras.FQSym(GF(2)).F()
sage: F2[2, 3, 1].to_qsym()
F[2, 1]
sage: (F2[2, 3, 1] + F2[1, 3, 2] + F2[1, 2, 3]).to_qsym()
F[3]
```

```
>>> from sage.all import *
>>> G = algebras.FQSym(QQ).G()
>>> x = G[Integer(1), Integer(3), Integer(2)]
>>> x.to_qsym()
F[2, 1]
>>> G[Integer(2), Integer(3), Integer(1)].to_qsym()
F[1, 2]
>>> F = algebras.FQSym(QQ).F()
>>> F[Integer(2), Integer(3), Integer(1)].to_qsym()
F[2, 1]
>>> (F[Integer(2), Integer(3), Integer(1)] + F[Integer(1), Integer(3),␣
↪Integer(2)] + F[Integer(1), Integer(2), Integer(3)]).to_qsym()
2*F[2, 1] + F[3]
>>> F2 = algebras.FQSym(GF(Integer(2))).F()
>>> F2[Integer(2), Integer(3), Integer(1)].to_qsym()
F[2, 1]
>>> (F2[Integer(2), Integer(3), Integer(1)] + F2[Integer(1), Integer(3),␣
↪Integer(2)] + F2[Integer(1), Integer(2), Integer(3)]).to_qsym()
F[3]
```

to_symmetric_group_algebra(*n=None*)

Return the element of a symmetric group algebra corresponding to the element `self` of $FQSym$.

INPUT:

- `n` – integer (default: the maximal degree of `self`); the rank of the target symmetric group algebra

EXAMPLES:

```
sage: A = algebras.FQSym(QQ).G()
sage: x = A([1,3,2,4]) + 5/2 * A([2,3,4,1])
sage: x.to_symmetric_group_algebra()
[1, 3, 2, 4] + 5/2*[4, 1, 2, 3]
```

```
>>> from sage.all import *
>>> A = algebras.FQSym(QQ).G()
>>> x = A([Integer(1),Integer(3),Integer(2),Integer(4)]) + Integer(5)/
↪Integer(2) * A([Integer(2),Integer(3),Integer(4),Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> x.to_symmetric_group_algebra()
[1, 3, 2, 4] + 5/2*[4, 1, 2, 3]
```

to_wqsym()

Return the image of `self` under the canonical inclusion map $FQSym \to WQSym$.

The canonical inclusion map $FQSym \to WQSym$ is an injective homomorphism of Hopf algebras. It sends a basis element G_w of $FQSym$ to the sum of basis elements $\mathbf{M}_u$ of $WQSym$, where u ranges over all packed words whose standardization is w.

See also

WordQuasiSymmetricFunctions for a definition of $WQSym$.

EXAMPLES:

```
sage: G = algebras.FQSym(QQ).G()
sage: x = G[1, 3, 2]
sage: x.to_wqsym()
M[{1}, {3}, {2}] + M[{1, 3}, {2}]
sage: G[1, 2].to_wqsym()
M[{1}, {2}] + M[{1, 2}]
sage: F = algebras.FQSym(QQ).F()
sage: F[3, 1, 2].to_wqsym()
M[{3}, {1}, {2}] + M[{3}, {1, 2}]
sage: G[2, 3, 1].to_wqsym()
M[{3}, {1}, {2}] + M[{3}, {1, 2}]
```

```
>>> from sage.all import *
>>> G = algebras.FQSym(QQ).G()
>>> x = G[Integer(1), Integer(3), Integer(2)]
>>> x.to_wqsym()
M[{1}, {3}, {2}] + M[{1, 3}, {2}]
>>> G[Integer(1), Integer(2)].to_wqsym()
M[{1}, {2}] + M[{1, 2}]
>>> F = algebras.FQSym(QQ).F()
>>> F[Integer(3), Integer(1), Integer(2)].to_wqsym()
M[{3}, {1}, {2}] + M[{3}, {1, 2}]
>>> G[Integer(2), Integer(3), Integer(1)].to_wqsym()
M[{3}, {1}, {2}] + M[{3}, {1, 2}]
```

class ParentMethods

Bases: `object`

basis(*degree=None*)

The basis elements (optionally: of the specified degree).

OUTPUT: Family

EXAMPLES:

```
sage: FQSym = algebras.FQSym(QQ)
sage: G = FQSym.G()
sage: G.basis()
Lazy family (Term map from Standard permutations to Free Quasi-symmetric␣
↪functions over Rational Field in the G basis(i))_{i in Standard␣
↪permutations}
sage: G.basis().keys()
Standard permutations
sage: G.basis(degree=3).keys()
Standard permutations of 3
sage: G.basis(degree=3).list()
[G[1, 2, 3], G[1, 3, 2], G[2, 1, 3], G[2, 3, 1], G[3, 1, 2], G[3, 2, 1]]
```

```
>>> from sage.all import *
>>> FQSym = algebras.FQSym(QQ)
>>> G = FQSym.G()
>>> G.basis()
Lazy family (Term map from Standard permutations to Free Quasi-symmetric␣
↪functions over Rational Field in the G basis(i))_{i in Standard␣
↪permutations}
>>> G.basis().keys()
Standard permutations
>>> G.basis(degree=Integer(3)).keys()
Standard permutations of 3
>>> G.basis(degree=Integer(3)).list()
[G[1, 2, 3], G[1, 3, 2], G[2, 1, 3], G[2, 3, 1], G[3, 1, 2], G[3, 2, 1]]
```

from_symmetric_group_algebra(*x*)

Return the element of $FQSym$ corresponding to the element x of a symmetric group algebra.

EXAMPLES:

```
sage: A = algebras.FQSym(QQ).F()
sage: SGA4 = SymmetricGroupAlgebra(QQ, 4)
sage: x = SGA4([1,3,2,4]) + 5/2 * SGA4([1,2,4,3])
sage: A.from_symmetric_group_algebra(x)
5/2*F[1, 2, 4, 3] + F[1, 3, 2, 4]
sage: A.from_symmetric_group_algebra(SGA4.zero())
0
```

```
>>> from sage.all import *
>>> A = algebras.FQSym(QQ).F()
>>> SGA4 = SymmetricGroupAlgebra(QQ, Integer(4))
>>> x = SGA4([Integer(1),Integer(3),Integer(2),Integer(4)]) + Integer(5)/
↪Integer(2) * SGA4([Integer(1),Integer(2),Integer(4),Integer(3)])
>>> A.from_symmetric_group_algebra(x)
5/2*F[1, 2, 4, 3] + F[1, 3, 2, 4]
>>> A.from_symmetric_group_algebra(SGA4.zero())
0
```

is_field(*proof=True*)

Return whether this $FQSym$ is a field.

EXAMPLES:

```
sage: F = algebras.FQSym(QQ).F()
sage: F.is_field()
False
```

```
>>> from sage.all import *
>>> F = algebras.FQSym(QQ).F()
>>> F.is_field()
False
```

one_basis()

Return the index of the unit.

EXAMPLES:

```
sage: A = algebras.FQSym(QQ).F()
sage: A.one_basis()
[]
```

```
>>> from sage.all import *
>>> A = algebras.FQSym(QQ).F()
>>> A.one_basis()
[]
```

prec()

Return the $\prec$ product.

On the F-basis of FQSym, this product is determined by $F_x \prec F_y = \sum F_z$, where the sum ranges over all z in the shifted shuffle of x and y with the additional condition that the first letter of the result comes from x.

The usual symbol for this operation is $\prec$.

See also

product(), *succ()*

EXAMPLES:

```
sage: A = algebras.FQSym(QQ).F()
sage: x = A([2,1])
sage: A.prec(x, x)
F[2, 1, 4, 3] + F[2, 4, 1, 3] + F[2, 4, 3, 1]
sage: y = A([2,1,3])
sage: A.prec(x, y)
F[2, 1, 4, 3, 5] + F[2, 4, 1, 3, 5] + F[2, 4, 3, 1, 5]
 + F[2, 4, 3, 5, 1]
sage: A.prec(y, x)
F[2, 1, 3, 5, 4] + F[2, 1, 5, 3, 4] + F[2, 1, 5, 4, 3]
 + F[2, 5, 1, 3, 4] + F[2, 5, 1, 4, 3] + F[2, 5, 4, 1, 3]
```

```
>>> from sage.all import *
>>> A = algebras.FQSym(QQ).F()
```

(continues on next page)

(continued from previous page)

```
>>> x = A([Integer(2),Integer(1)])
>>> A.prec(x, x)
F[2, 1, 4, 3] + F[2, 4, 1, 3] + F[2, 4, 3, 1]
>>> y = A([Integer(2),Integer(1),Integer(3)])
>>> A.prec(x, y)
F[2, 1, 4, 3, 5] + F[2, 4, 1, 3, 5] + F[2, 4, 3, 1, 5]
 + F[2, 4, 3, 5, 1]
>>> A.prec(y, x)
F[2, 1, 3, 5, 4] + F[2, 1, 5, 3, 4] + F[2, 1, 5, 4, 3]
 + F[2, 5, 1, 3, 4] + F[2, 5, 1, 4, 3] + F[2, 5, 4, 1, 3]
```

prec_by_coercion(x, y)

Return $x \prec y$, computed using coercion to the F-basis.

See *prec()* for the definition of the objects involved.

EXAMPLES:

```
sage: G = algebras.FQSym(ZZ).G()
sage: a = G([1])
sage: b = G([2, 3, 1])
sage: G.prec(a, b) + G.succ(a, b) == a * b # indirect doctest
True
```

```
>>> from sage.all import *
>>> G = algebras.FQSym(ZZ).G()
>>> a = G([Integer(1)])
>>> b = G([Integer(2), Integer(3), Integer(1)])
>>> G.prec(a, b) + G.succ(a, b) == a * b # indirect doctest
True
```

some_elements()

Return some elements of the free quasi-symmetric functions.

EXAMPLES:

```
sage: A = algebras.FQSym(QQ)
sage: F = A.F()
sage: F.some_elements()
[F[], F[1], F[1, 2] + F[2, 1], F[] + F[1, 2] + F[2, 1]]
sage: G = A.G()
sage: G.some_elements()
[G[], G[1], G[1, 2] + G[2, 1], G[] + G[1, 2] + G[2, 1]]
sage: M = A.M()
sage: M.some_elements()
[M[], M[1], M[1, 2] + 2*M[2, 1], M[] + M[1, 2] + 2*M[2, 1]]
```

```
>>> from sage.all import *
>>> A = algebras.FQSym(QQ)
>>> F = A.F()
>>> F.some_elements()
[F[], F[1], F[1, 2] + F[2, 1], F[] + F[1, 2] + F[2, 1]]
>>> G = A.G()
```

(continues on next page)

(continued from previous page)

```
>>> G.some_elements()
[G[], G[1], G[1, 2] + G[2, 1], G[] + G[1, 2] + G[2, 1]]
>>> M = A.M()
>>> M.some_elements()
[M[], M[1], M[1, 2] + 2*M[2, 1], M[] + M[1, 2] + 2*M[2, 1]]
```

succ()

Return the $\succ$ product.

On the F-basis of FQSym, this product is determined by $F_x \succ F_y = \sum F_z$, where the sum ranges over all z in the shifted shuffle of x and y with the additional condition that the first letter of the result comes from y.

The usual symbol for this operation is $\succ$.

See also

product(), *prec()*

EXAMPLES:

```
sage: A = algebras.FQSym(QQ).F()
sage: x = A([1])
sage: A.succ(x, x)
F[2, 1]
sage: y = A([3,1,2])
sage: A.succ(x, y)
F[4, 1, 2, 3] + F[4, 2, 1, 3] + F[4, 2, 3, 1]
sage: A.succ(y, x)
F[4, 3, 1, 2]
```

```
>>> from sage.all import *
>>> A = algebras.FQSym(QQ).F()
>>> x = A([Integer(1)])
>>> A.succ(x, x)
F[2, 1]
>>> y = A([Integer(3),Integer(1),Integer(2)])
>>> A.succ(x, y)
F[4, 1, 2, 3] + F[4, 2, 1, 3] + F[4, 2, 3, 1]
>>> A.succ(y, x)
F[4, 3, 1, 2]
```

succ_by_coercion(x, y)

Return $x \succ y$, computed using coercion to the F-basis.

See *succ()* for the definition of the objects involved.

EXAMPLES:

```
sage: G = algebras.FQSym(ZZ).G()
sage: G.succ(G([1]), G([2, 3, 1])) # indirect doctest
G[2, 3, 4, 1] + G[3, 2, 4, 1] + G[4, 2, 3, 1]
```

```
>>> from sage.all import *
>>> G = algebras.FQSym(ZZ).G()
>>> G.succ(G([Integer(1)]), G([Integer(2), Integer(3), Integer(1)])) #␣
↪indirect doctest
G[2, 3, 4, 1] + G[3, 2, 4, 1] + G[4, 2, 3, 1]
```

super_categories()

The super categories of `self`.

EXAMPLES:

```
sage: from sage.combinat.fqsym import FQSymBases
sage: FQSym = algebras.FQSym(ZZ)
sage: bases = FQSymBases(FQSym)
sage: bases.super_categories()
[Category of realizations of Free Quasi-symmetric functions over Integer Ring,
 Join of Category of realizations of Hopf algebras over Integer Ring
   and Category of graded algebras over Integer Ring
   and Category of graded coalgebras over Integer Ring,
 Category of graded connected Hopf algebras with basis over Integer Ring]
```

```
>>> from sage.all import *
>>> from sage.combinat.fqsym import FQSymBases
>>> FQSym = algebras.FQSym(ZZ)
>>> bases = FQSymBases(FQSym)
>>> bases.super_categories()
[Category of realizations of Free Quasi-symmetric functions over Integer Ring,
 Join of Category of realizations of Hopf algebras over Integer Ring
   and Category of graded algebras over Integer Ring
   and Category of graded coalgebras over Integer Ring,
 Category of graded connected Hopf algebras with basis over Integer Ring]
```

class sage.combinat.fqsym.**FQSymBasis_abstract**(*alg*)

Bases: *CombinatorialFreeModule*, BindableClass

Abstract base class for bases of FQSym.

This must define two attributes:

- `_prefix` – the basis prefix
- `_basis_name` – the name of the basis and must match one of the names that the basis can be constructed from FQSym

class sage.combinat.fqsym.**FreeQuasisymmetricFunctions**(*R*)

Bases: UniqueRepresentation, Parent

The free quasi-symmetric functions.

The Hopf algebra $FQSym$ of free quasi-symmetric functions over a commutative ring R is the free R-module with basis indexed by all permutations (i.e., the indexing set is the disjoint union of all symmetric groups). Its product is determined by the shifted shuffles of two permutations, whereas its coproduct is given by splitting a permutation (regarded as a word) into two (at every possible point) and standardizing the two pieces. This Hopf algebra was introduced in [MR]. See [GriRei18] (Chapter 8) for a treatment using modern notations.

In more detail: For each $n \geq 0$, consider the symmetric group S_n. Let S be the disjoint union of the S_n over all $n \geq 0$. Then, $FQSym$ is the free R-module with basis $(F_w)_{w \in S}$. This R-module is graded, with the n-th graded

component being spanned by all F_w for $w \in S_n$. A multiplication is defined on $FQSym$ as follows: For any two permutations $u \in S_k$ and $v \in S_l$, we set

$$F_u F_v = \sum F_w,$$

where the sum is over all shuffles of u with $v[k]$. Here, the permutations u and v are regarded as words (by writing them in one-line notation), and $v[k]$ means the word obtained from v by increasing each letter by k (for example, $(1,4,2,3)[5] = (6,9,7,8)$); and the shuffles w are translated back into permutations. This defines an associative multiplication on $FQSym$; its unity is F_e, where e is the identity permutation in S_0.

In Section 1.3 of [AguSot05], Aguiar and Sottile construct a different basis of $FQSym$. Their basis, called the *monomial basis* and denoted by $(\mathcal{M}_u)$, is also indexed by permutations. It is connected to the above F-basis by the relation

$$F_u = \sum_v \mathcal{M}_v,$$

where the sum ranges over all permutations v such that each inversion of u is an inversion of v. (An *inversion* of a permutation w means a pair (i,j) of positions satisfying $i < j$ and $w(i) > w(j)$.) The above relation yields a unitriangular change-of-basis matrix, and thus can be used to compute the $\mathcal{M}_u$ by Mobius inversion.

Another classical basis of $FQSym$ is $(G_w)_{w \in S}$, where $G_w = F_{w^{-1}}$. This is just a relabeling of the basis $(F_w)_{w \in S}$, but is a more natural choice from some viewpoints.

The algebra $FQSym$ is often identified with ("realized as") a subring of the ring of all bounded-degree noncommutative power series in countably many indeterminates (i.e., elements in $R\langle\langle x_1, x_2, x_3, \ldots\rangle\rangle$ of bounded degree). Namely, consider words over the alphabet $\{1, 2, 3, \ldots\}$; every noncommutative power series is an infinite R-linear combination of these words. Consider the R-linear map that sends each G_u to the sum of all words whose standardization (also known as "standard permutation"; see `standard_permutation()`) is u. This map is an injective R-algebra homomorphism, and thus embeds $FQSym$ into the latter ring.

As an associative algebra, $FQSym$ has the richer structure of a dendriform algebra. This means that the associative product $\star$ is decomposed as a sum of two binary operations

$$xy = x \succ y + x \prec y$$

that satisfy the axioms:

$$(x \succ y) \prec z = x \succ (y \prec z),$$

$$(x \prec y) \prec z = x \prec (yz),$$

$$(xy) \succ z = x \succ (y \succ z).$$

These two binary operations are defined similarly to the (associative) product above: We set

$$F_u \prec F_v = \sum F_w,$$

where the sum is now over all shuffles of u with $v[k]$ whose first letter is taken from u (rather than from $v[k]$). Similarly,

$$F_u \succ F_v = \sum F_w,$$

where the sum is over all remaining shuffles of u with $v[k]$.

Todo

Decide what $1 \prec 1$ and $1 \succ 1$ are.

> **Note**
>
> The usual binary operator * is used for the associative product.

EXAMPLES:

```
sage: F = algebras.FQSym(ZZ).F()
sage: x,y,z = F([1]), F([1,2]), F([1,3,2])
sage: (x * y) * z
F[1, 2, 3, 4, 6, 5] + ...
```

```
>>> from sage.all import *
>>> F = algebras.FQSym(ZZ).F()
>>> x,y,z = F([Integer(1)]), F([Integer(1),Integer(2)]), F([Integer(1),Integer(3),
↪Integer(2)])
>>> (x * y) * z
F[1, 2, 3, 4, 6, 5] + ...
```

The product of $FQSym$ is associative:

```
sage: x * (y * z) == (x * y) * z
True
```

```
>>> from sage.all import *
>>> x * (y * z) == (x * y) * z
True
```

The associative product decomposes into two parts:

```
sage: x * y == F.prec(x, y) + F.succ(x, y)
True
```

```
>>> from sage.all import *
>>> x * y == F.prec(x, y) + F.succ(x, y)
True
```

The axioms of a dendriform algebra hold:

```
sage: F.prec(F.succ(x, y), z) == F.succ(x, F.prec(y, z))
True
sage: F.prec(F.prec(x, y), z) == F.prec(x, y * z)
True
sage: F.succ(x * y, z) == F.succ(x, F.succ(y, z))
True
```

```
>>> from sage.all import *
>>> F.prec(F.succ(x, y), z) == F.succ(x, F.prec(y, z))
True
>>> F.prec(F.prec(x, y), z) == F.prec(x, y * z)
True
>>> F.succ(x * y, z) == F.succ(x, F.succ(y, z))
True
```

$FQSym$ is also known as the Malvenuto-Reutenauer algebra:

```
sage: algebras.MalvenutoReutenauer(ZZ)
Free Quasi-symmetric functions over Integer Ring
```

```
>>> from sage.all import *
>>> algebras.MalvenutoReutenauer(ZZ)
Free Quasi-symmetric functions over Integer Ring
```

- [GriRei18]

class F(*alg*)

Bases: *FQSymBasis_abstract*

The F-basis of $FQSym$.

This is the basis (F_w), with w ranging over all permutations. See the documentation of *FreeQuasisymmetricFunctions* for details.

EXAMPLES:

```
sage: FQSym = algebras.FQSym(QQ)
sage: FQSym.F()
Free Quasi-symmetric functions over Rational Field in the F basis
```

```
>>> from sage.all import *
>>> FQSym = algebras.FQSym(QQ)
>>> FQSym.F()
Free Quasi-symmetric functions over Rational Field in the F basis
```

class Element

Bases: IndexedFreeModuleElement

to_symmetric_group_algebra(*n=None*)

Return the element of a symmetric group algebra corresponding to the element `self` of $FQSym$.

INPUT:

• `n` – integer (default: the maximal degree of `self`); the rank of the target symmetric group algebra

EXAMPLES:

```
sage: A = algebras.FQSym(QQ).F()
sage: x = A([1,3,2,4]) + 5/2 * A([1,2,4,3])
sage: x.to_symmetric_group_algebra()
5/2*[1, 2, 4, 3] + [1, 3, 2, 4]
sage: x.to_symmetric_group_algebra(n=7)
5/2*[1, 2, 4, 3, 5, 6, 7] + [1, 3, 2, 4, 5, 6, 7]
sage: a = A.zero().to_symmetric_group_algebra(); a
0
sage: parent(a)
Symmetric group algebra of order 0 over Rational Field
```

(continues on next page)

(continued from previous page)

```
sage: y = A([1,3,2,4]) + 5/2 * A([2,1])
sage: y.to_symmetric_group_algebra()
[1, 3, 2, 4] + 5/2*[2, 1, 3, 4]
sage: y.to_symmetric_group_algebra(6)
[1, 3, 2, 4, 5, 6] + 5/2*[2, 1, 3, 4, 5, 6]
```

```
>>> from sage.all import *
>>> A = algebras.FQSym(QQ).F()
>>> x = A([Integer(1),Integer(3),Integer(2),Integer(4)]) + Integer(5)/
↪Integer(2) * A([Integer(1),Integer(2),Integer(4),Integer(3)])
>>> x.to_symmetric_group_algebra()
5/2*[1, 2, 4, 3] + [1, 3, 2, 4]
>>> x.to_symmetric_group_algebra(n=Integer(7))
5/2*[1, 2, 4, 3, 5, 6, 7] + [1, 3, 2, 4, 5, 6, 7]
>>> a = A.zero().to_symmetric_group_algebra(); a
0
>>> parent(a)
Symmetric group algebra of order 0 over Rational Field

>>> y = A([Integer(1),Integer(3),Integer(2),Integer(4)]) + Integer(5)/
↪Integer(2) * A([Integer(2),Integer(1)])
>>> y.to_symmetric_group_algebra()
[1, 3, 2, 4] + 5/2*[2, 1, 3, 4]
>>> y.to_symmetric_group_algebra(Integer(6))
[1, 3, 2, 4, 5, 6] + 5/2*[2, 1, 3, 4, 5, 6]
```

coproduct_on_basis(*x*)

Return the coproduct of F_σ for σ a permutation (here, σ is `x`).

EXAMPLES:

```
sage: A = algebras.FQSym(QQ).F()
sage: x = A([1])
sage: ascii_art(A.coproduct(A.one()))  # indirect doctest
1 # 1

sage: ascii_art(A.coproduct(x))  # indirect doctest
1 # F    + F    # 1
     [1]    [1]

sage: A = algebras.FQSym(QQ).F()
sage: x, y, z = A([1]), A([2,1]), A([3,2,1])
sage: A.coproduct(z)
F[] # F[3, 2, 1] + F[1] # F[2, 1] + F[2, 1] # F[1]
+ F[3, 2, 1] # F[]
```

```
>>> from sage.all import *
>>> A = algebras.FQSym(QQ).F()
>>> x = A([Integer(1)])
>>> ascii_art(A.coproduct(A.one()))  # indirect doctest
1 # 1
```

(continues on next page)

(continued from previous page)

```
>>> ascii_art(A.coproduct(x))  # indirect doctest
1 # F    + F    # 1
     [1]    [1]

>>> A = algebras.FQSym(QQ).F()
>>> x, y, z = A([Integer(1)]), A([Integer(2),Integer(1)]), A([Integer(3),
↪Integer(2),Integer(1)])
>>> A.coproduct(z)
F[] # F[3, 2, 1] + F[1] # F[2, 1] + F[2, 1] # F[1]
+ F[3, 2, 1] # F[]
```

degree_on_basis(*t*)

Return the degree of a permutation in the algebra of free quasi-symmetric functions.

This is the size of the permutation (i.e., the n for which the permutation belongs to S_n).

EXAMPLES:

```
sage: A = algebras.FQSym(QQ).F()
sage: u = Permutation([2,1])
sage: A.degree_on_basis(u)
2
```

```
>>> from sage.all import *
>>> A = algebras.FQSym(QQ).F()
>>> u = Permutation([Integer(2),Integer(1)])
>>> A.degree_on_basis(u)
2
```

prec_product_on_basis(*x*, *y*)

Return the $\prec$ product of two permutations.

This is the shifted shuffle of x and y with the additional condition that the first letter of the result comes from x.

The usual symbol for this operation is $\prec$.

See also

product_on_basis(), *succ_product_on_basis()*

EXAMPLES:

```
sage: A = algebras.FQSym(QQ).F()
sage: x = Permutation([1,2])
sage: A.prec_product_on_basis(x, x)
F[1, 2, 3, 4] + F[1, 3, 2, 4] + F[1, 3, 4, 2]
sage: y = Permutation([])
sage: A.prec_product_on_basis(x, y) == A(x)
True
sage: A.prec_product_on_basis(y, x) == 0
True
```

```
>>> from sage.all import *
>>> A = algebras.FQSym(QQ).F()
>>> x = Permutation([Integer(1),Integer(2)])
>>> A.prec_product_on_basis(x, x)
F[1, 2, 3, 4] + F[1, 3, 2, 4] + F[1, 3, 4, 2]
>>> y = Permutation([])
>>> A.prec_product_on_basis(x, y) == A(x)
True
>>> A.prec_product_on_basis(y, x) == Integer(0)
True
```

product_on_basis(*x*, *y*)

Return the $*$ associative product of two permutations.

This is the shifted shuffle of x and y.

See also

succ_product_on_basis(), *prec_product_on_basis()*

EXAMPLES:

```
sage: A = algebras.FQSym(QQ).F()
sage: x = Permutation([1])
sage: A.product_on_basis(x, x)
F[1, 2] + F[2, 1]
```

```
>>> from sage.all import *
>>> A = algebras.FQSym(QQ).F()
>>> x = Permutation([Integer(1)])
>>> A.product_on_basis(x, x)
F[1, 2] + F[2, 1]
```

succ_product_on_basis(*x*, *y*)

Return the $\succ$ product of two permutations.

This is the shifted shuffle of x and y with the additional condition that the first letter of the result comes from y.

The usual symbol for this operation is $\succ$.

See also

- *product_on_basis()*, *prec_product_on_basis()*

EXAMPLES:

```
sage: A = algebras.FQSym(QQ).F()
sage: x = Permutation([1,2])
sage: A.succ_product_on_basis(x, x)
F[3, 1, 2, 4] + F[3, 1, 4, 2] + F[3, 4, 1, 2]
sage: y = Permutation([])
```

(continues on next page)

(continued from previous page)

```
sage: A.succ_product_on_basis(x, y) == 0
True
sage: A.succ_product_on_basis(y, x) == A(x)
True
```

```
>>> from sage.all import *
>>> A = algebras.FQSym(QQ).F()
>>> x = Permutation([Integer(1),Integer(2)])
>>> A.succ_product_on_basis(x, x)
F[3, 1, 2, 4] + F[3, 1, 4, 2] + F[3, 4, 1, 2]
>>> y = Permutation([])
>>> A.succ_product_on_basis(x, y) == Integer(0)
True
>>> A.succ_product_on_basis(y, x) == A(x)
True
```

class G(*alg*)

Bases: *FQSymBasis_abstract*

The G-basis of $FQSym$.

This is the basis (G_w), with w ranging over all permutations. See the documentation of *FreeQuasisymmetricFunctions* for details.

EXAMPLES:

```
sage: FQSym = algebras.FQSym(QQ)
sage: G = FQSym.G(); G
Free Quasi-symmetric functions over Rational Field in the G basis

sage: G([3, 1, 2]).coproduct()
G[] # G[3, 1, 2] + G[1] # G[2, 1] + G[1, 2] # G[1]
 + G[3, 1, 2] # G[]

sage: G([3, 1, 2]) * G([2, 1])
G[3, 1, 2, 5, 4] + G[4, 1, 2, 5, 3] + G[4, 1, 3, 5, 2]
 + G[4, 2, 3, 5, 1] + G[5, 1, 2, 4, 3] + G[5, 1, 3, 4, 2]
 + G[5, 1, 4, 3, 2] + G[5, 2, 3, 4, 1] + G[5, 2, 4, 3, 1]
 + G[5, 3, 4, 2, 1]
```

```
>>> from sage.all import *
>>> FQSym = algebras.FQSym(QQ)
>>> G = FQSym.G(); G
Free Quasi-symmetric functions over Rational Field in the G basis

>>> G([Integer(3), Integer(1), Integer(2)]).coproduct()
G[] # G[3, 1, 2] + G[1] # G[2, 1] + G[1, 2] # G[1]
 + G[3, 1, 2] # G[]

>>> G([Integer(3), Integer(1), Integer(2)]) * G([Integer(2), Integer(1)])
G[3, 1, 2, 5, 4] + G[4, 1, 2, 5, 3] + G[4, 1, 3, 5, 2]
 + G[4, 2, 3, 5, 1] + G[5, 1, 2, 4, 3] + G[5, 1, 3, 4, 2]
 + G[5, 1, 4, 3, 2] + G[5, 2, 3, 4, 1] + G[5, 2, 4, 3, 1]
```

(continues on next page)

(continued from previous page)

```
 + G[5, 3, 4, 2, 1]
```

degree_on_basis(*t*)

Return the degree of a permutation in the algebra of free quasi-symmetric functions.

This is the size of the permutation (i.e., the n for which the permutation belongs to S_n).

EXAMPLES:

```
sage: A = algebras.FQSym(QQ).G()
sage: u = Permutation([2,1])
sage: A.degree_on_basis(u)
2
```

```
>>> from sage.all import *
>>> A = algebras.FQSym(QQ).G()
>>> u = Permutation([Integer(2),Integer(1)])
>>> A.degree_on_basis(u)
2
```

class M(*alg*)

Bases: *FQSymBasis_abstract*

The M-basis of $FQSym$.

This is the Monomial basis $(\mathcal{M}_w)$, with w ranging over all permutations. See the documentation of *FreeQuasisymmetricFunctions* for details.

EXAMPLES:

```
sage: FQSym = algebras.FQSym(QQ)
sage: M = FQSym.M(); M
Free Quasi-symmetric functions over Rational Field in the Monomial basis

sage: M([3, 1, 2]).coproduct()
M[] # M[3, 1, 2] + M[1] # M[1, 2] + M[3, 1, 2] # M[]
sage: M([3, 2, 1]).coproduct()
M[] # M[3, 2, 1] + M[1] # M[2, 1] + M[2, 1] # M[1]
 + M[3, 2, 1] # M[]

sage: M([1, 2]) * M([1])
M[1, 2, 3] + 2*M[1, 3, 2] + M[2, 3, 1] + M[3, 1, 2]
```

```
>>> from sage.all import *
>>> FQSym = algebras.FQSym(QQ)
>>> M = FQSym.M(); M
Free Quasi-symmetric functions over Rational Field in the Monomial basis

>>> M([Integer(3), Integer(1), Integer(2)]).coproduct()
M[] # M[3, 1, 2] + M[1] # M[1, 2] + M[3, 1, 2] # M[]
>>> M([Integer(3), Integer(2), Integer(1)]).coproduct()
M[] # M[3, 2, 1] + M[1] # M[2, 1] + M[2, 1] # M[1]
 + M[3, 2, 1] # M[]
```

(continues on next page)

(continued from previous page)

```
>>> M([Integer(1), Integer(2)]) * M([Integer(1)])
M[1, 2, 3] + 2*M[1, 3, 2] + M[2, 3, 1] + M[3, 1, 2]
```

class Element

Bases: IndexedFreeModuleElement

star_involution()

Return the image of the element `self` of $FQSym$ under the star involution.

See *star_involution()* for a definition of the involution and for examples.

See also

omega_involution(), *psi_involution()*

EXAMPLES:

```
sage: FQSym = algebras.FQSym(ZZ)
sage: M = FQSym.M()
sage: M[[2,3,1]].star_involution()
M[3, 1, 2]
sage: M[[]].star_involution()
M[]
```

```
>>> from sage.all import *
>>> FQSym = algebras.FQSym(ZZ)
>>> M = FQSym.M()
>>> M[[Integer(2),Integer(3),Integer(1)]].star_involution()
M[3, 1, 2]
>>> M[[]].star_involution()
M[]
```

coproduct_on_basis(x)

Return the coproduct of $\mathcal{M}_\sigma$ for σ a permutation (here, σ is `x`).

This uses Theorem 3.1 in [AguSot05].

EXAMPLES:

```
sage: M = algebras.FQSym(QQ).M()
sage: x = M([1])
sage: ascii_art(M.coproduct(M.one()))  # indirect doctest
1 # 1

sage: ascii_art(M.coproduct(x))  # indirect doctest
1 # M    + M    # 1
     [1]    [1]

sage: M.coproduct(M([2, 1, 3]))
M[] # M[2, 1, 3] + M[2, 1, 3] # M[]
sage: M.coproduct(M([2, 3, 1]))
M[] # M[2, 3, 1] + M[1, 2] # M[1] + M[2, 3, 1] # M[]
sage: M.coproduct(M([3, 2, 1]))
```

(continues on next page)

(continued from previous page)

```
M[] # M[3, 2, 1] + M[1] # M[2, 1] + M[2, 1] # M[1]
+ M[3, 2, 1] # M[]
sage: M.coproduct(M([3, 4, 2, 1]))
M[] # M[3, 4, 2, 1] + M[1, 2] # M[2, 1] + M[2, 3, 1] # M[1]
 + M[3, 4, 2, 1] # M[]
sage: M.coproduct(M([3, 4, 1, 2]))
M[] # M[3, 4, 1, 2] + M[1, 2] # M[1, 2] + M[3, 4, 1, 2] # M[]
```

```
>>> from sage.all import *
>>> M = algebras.FQSym(QQ).M()
>>> x = M([Integer(1)])
>>> ascii_art(M.coproduct(M.one()))  # indirect doctest
1 # 1

>>> ascii_art(M.coproduct(x))  # indirect doctest
1 # M    + M    # 1
     [1]    [1]

>>> M.coproduct(M([Integer(2), Integer(1), Integer(3)]))
M[] # M[2, 1, 3] + M[2, 1, 3] # M[]
>>> M.coproduct(M([Integer(2), Integer(3), Integer(1)]))
M[] # M[2, 3, 1] + M[1, 2] # M[1] + M[2, 3, 1] # M[]
>>> M.coproduct(M([Integer(3), Integer(2), Integer(1)]))
M[] # M[3, 2, 1] + M[1] # M[2, 1] + M[2, 1] # M[1]
+ M[3, 2, 1] # M[]
>>> M.coproduct(M([Integer(3), Integer(4), Integer(2), Integer(1)]))
M[] # M[3, 4, 2, 1] + M[1, 2] # M[2, 1] + M[2, 3, 1] # M[1]
 + M[3, 4, 2, 1] # M[]
>>> M.coproduct(M([Integer(3), Integer(4), Integer(1), Integer(2)]))
M[] # M[3, 4, 1, 2] + M[1, 2] # M[1, 2] + M[3, 4, 1, 2] # M[]
```

degree_on_basis(*t*)

Return the degree of a permutation in the algebra of free quasi-symmetric functions.

This is the size of the permutation (i.e., the n for which the permutation belongs to S_n).

EXAMPLES:

```
sage: A = algebras.FQSym(QQ).M()
sage: u = Permutation([2,1])
sage: A.degree_on_basis(u)
2
```

```
>>> from sage.all import *
>>> A = algebras.FQSym(QQ).M()
>>> u = Permutation([Integer(2),Integer(1)])
>>> A.degree_on_basis(u)
2
```

a_realization()

Return a particular realization of `self` (the F-basis).

EXAMPLES:

```
sage: FQSym = algebras.FQSym(QQ)
sage: FQSym.a_realization()
Free Quasi-symmetric functions over Rational Field in the F basis
```

```
>>> from sage.all import *
>>> FQSym = algebras.FQSym(QQ)
>>> FQSym.a_realization()
Free Quasi-symmetric functions over Rational Field in the F basis
```

Fully commutative elements of Coxeter groups

An element w in a Coxeter system (W,S) is fully commutative (FC) if every two reduced words of w can be related by a sequence of only commutation relations, i.e., relations of the form $st = ts$ where s, t are commuting generators in S. See [Ste1996].

Authors:

- Chase Meadors, Tianyuan Xu (2020): Initial version

Acknowledgements

A draft of this code was written during an REU project at University of Colorado Boulder. We thank Rachel Castro, Joel Courtney, Thomas Magnuson and Natalie Schoenhals for their contribution to the project and the code.

class sage.combinat.fully_commutative_elements.**FullyCommutativeElement**

Bases: NormalizedClonableList

A fully commutative (FC) element in a Coxeter system.

An element w in a Coxeter system (W,S) is fully commutative (FC) if every two reduced word of w can be related by a sequence of only commutation relations, i.e., relations of the form $st = ts$ where s, t are commuting generators in S.

Every FC element has a canonical reduced word called its Cartier–Foata form. See [Gre2006]. We will normalize each FC element to this form.

check()

Called automatically when an element is created.

EXAMPLES:

```
sage: CoxeterGroup(['A', 3]).fully_commutative_elements()([1, 2]) # indirect␣
↪doctest
[1, 2]
sage: CoxeterGroup(['A', 3]).fully_commutative_elements()([1, 2, 1]) #␣
↪indirect doctest
Traceback (most recent call last):
...
ValueError: the input is not a reduced word of a fully commutative element
```

```
>>> from sage.all import *
>>> CoxeterGroup(['A', Integer(3)]).fully_commutative_elements()([Integer(1),␣
↪Integer(2)]) # indirect doctest
[1, 2]
>>> CoxeterGroup(['A', Integer(3)]).fully_commutative_elements()([Integer(1),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(2), Integer(1)]) # indirect doctest
Traceback (most recent call last):
...
ValueError: the input is not a reduced word of a fully commutative element
```

coset_decomposition(*J*, *side='left'*)

Return the coset decomposition of `self` with respect to the parabolic subgroup generated by `J`.

INPUT:

- `J` – subset of the generating set S of the Coxeter system
- `side` – string (default: `'left'`); if the value is set to 'right', then the function returns the tuple (w'^J, w'_J) from the coset decomposition $w = w'^J \cdot w'_J$ of w with respect to J

OUTPUT:

The tuple of elements (w_J, w^J) such that $w = w_J \cdot w^J$, w_J is generated by the elements in J, and w^J has no left descent from J. This tuple is unique and satisfies the equation $\ell(w) = \ell(w_J) + \ell(w^J)$, where ℓ denotes Coxeter length, by general theory; see Proposition 2.4.4 of [BB2005].

EXAMPLES:

```
sage: FC = CoxeterGroup(['B', 6]).fully_commutative_elements()
sage: w = FC([1, 6, 2, 5, 4, 6, 5])
sage: w.coset_decomposition({1})
([1], [6, 2, 5, 4, 6, 5])
sage: w.coset_decomposition({1}, side = 'right')
([1, 6, 2, 5, 4, 6, 5], [])
sage: w.coset_decomposition({5, 6})
([6, 5, 6], [1, 2, 4, 5])
sage: w.coset_decomposition({5, 6}, side='right')
([1, 6, 2, 5, 4], [6, 5])
```

```
>>> from sage.all import *
>>> FC = CoxeterGroup(['B', Integer(6)]).fully_commutative_elements()
>>> w = FC([Integer(1), Integer(6), Integer(2), Integer(5), Integer(4),␣
↪Integer(6), Integer(5)])
>>> w.coset_decomposition({Integer(1)})
([1], [6, 2, 5, 4, 6, 5])
>>> w.coset_decomposition({Integer(1)}, side = 'right')
([1, 6, 2, 5, 4, 6, 5], [])
>>> w.coset_decomposition({Integer(5), Integer(6)})
([6, 5, 6], [1, 2, 4, 5])
>>> w.coset_decomposition({Integer(5), Integer(6)}, side='right')
([1, 6, 2, 5, 4], [6, 5])
```

Note

The factor w_J of the coset decomposition $w = w_J \cdot w^J$ can be obtained by greedily "pulling left descents of w that are in J to the left"; see the proof of [BB2005]. This greedy algorithm works for all elements in Coxeter group, but it becomes especially simple for FC elements because descents are easier to find for FC elements.

descents(*side='left'*)

Obtain the set of descents on the appropriate side of `self`.

INPUT:

- `side` – string (default: `'left'`); if set to 'right', find the right descents

A generator s is called a left or right descent of an element w if $l(sw)$ or $l(ws)$ is smaller than $l(w)$, respectively. If w is FC, then s is a left descent of w if and only if s appears to in the word and every generator to the left of the leftmost s in the word commutes with s. A similar characterization exists for right descents of FC elements.

EXAMPLES:

```
sage: FC = CoxeterGroup(['B', 5]).fully_commutative_elements()
sage: w = FC([1, 4, 3, 5, 2, 4, 3])
sage: sorted(w.descents())
[1, 4]
sage: w.descents(side='right')
{3}
sage: FC = CoxeterGroup(['A', 5]).fully_commutative_elements()
sage: sorted(FC([1, 4, 3, 5, 2, 4, 3]).descents())
[1, 4]
```

```
>>> from sage.all import *
>>> FC = CoxeterGroup(['B', Integer(5)]).fully_commutative_elements()
>>> w = FC([Integer(1), Integer(4), Integer(3), Integer(5), Integer(2),␣
↪Integer(4), Integer(3)])
>>> sorted(w.descents())
[1, 4]
>>> w.descents(side='right')
{3}
>>> FC = CoxeterGroup(['A', Integer(5)]).fully_commutative_elements()
>>> sorted(FC([Integer(1), Integer(4), Integer(3), Integer(5), Integer(2),␣
↪Integer(4), Integer(3)]).descents())
[1, 4]
```

find_descent()

find_descent(*s*, *side='left'*)

Check if `s` is a descent of `self` and find its position if so.

A generator s is called a left or right descent of an element w if $l(sw)$ or $l(ws)$ is smaller than $l(w)$, respectively. If w is FC, then s is a left descent of w if and only if s appears to in the word and every generator to the left of the leftmost s in the word commutes with s. A similar characterization exists for right descents of FC elements.

INPUT:

- `s` – integer representing a generator of the Coxeter system
- `side` – string (default: `'left'`); if the argument is set to 'right', the function checks if `s` is a right descent of `self` and finds the index of the rightmost occurrence of `s` if so

OUTPUT:

Determine if the generator `s` is a left descent of `self`; return the index of the leftmost occurrence of `s` in `self` if so and return `None` if not.

EXAMPLES:

```
sage: FC = CoxeterGroup(['B', 5]).fully_commutative_elements()
sage: w = FC([1, 4, 3, 5, 2, 4, 3])
sage: w.find_descent(1)
0
sage: w.find_descent(1, side='right')

sage: w.find_descent(4)
1
sage: w.find_descent(4, side='right')

sage: w.find_descent(3)
```

```
>>> from sage.all import *
>>> FC = CoxeterGroup(['B', Integer(5)]).fully_commutative_elements()
>>> w = FC([Integer(1), Integer(4), Integer(3), Integer(5), Integer(2),␣
↪Integer(4), Integer(3)])
>>> w.find_descent(Integer(1))
0
>>> w.find_descent(Integer(1), side='right')
<BLANKLINE>
>>> w.find_descent(Integer(4))
1
>>> w.find_descent(Integer(4), side='right')
<BLANKLINE>
>>> w.find_descent(Integer(3))
<BLANKLINE>
```

group_element()

Get the actual element of the Coxeter group associated with `self.parent()` corresponding to `self`.

EXAMPLES:

```
sage: W = CoxeterGroup(['A', 3])
sage: FC = W.fully_commutative_elements()
sage: x = FC([1, 2])
sage: x.group_element()
[ 0 -1  1]
[ 1 -1  1]
[ 0  0  1]
sage: x.group_element() in W
True
```

```
>>> from sage.all import *
>>> W = CoxeterGroup(['A', Integer(3)])
>>> FC = W.fully_commutative_elements()
>>> x = FC([Integer(1), Integer(2)])
>>> x.group_element()
```

(continues on next page)

(continued from previous page)

```
[ 0 -1  1]
[ 1 -1  1]
[ 0  0  1]
>>> x.group_element() in W
True
```

has_descent(*s*, *side='left'*)

Determine if `s` is a descent on the appropriate side of `self`.

INPUT:

- `side` – string (default: `'left'`); if set to 'right', determine if `self` has `s` as a right descent

OUTPUT: boolean

EXAMPLES:

```
sage: FC = CoxeterGroup(['B', 5]).fully_commutative_elements()
sage: w = FC([1, 4, 3, 5, 2, 4, 3])
sage: w.has_descent(1)
True
sage: w.has_descent(1, side='right')
False
sage: w.has_descent(4)
True
sage: w.has_descent(4, side='right')
False
```

```
>>> from sage.all import *
>>> FC = CoxeterGroup(['B', Integer(5)]).fully_commutative_elements()
>>> w = FC([Integer(1), Integer(4), Integer(3), Integer(5), Integer(2),␣
↪Integer(4), Integer(3)])
>>> w.has_descent(Integer(1))
True
>>> w.has_descent(Integer(1), side='right')
False
>>> w.has_descent(Integer(4))
True
>>> w.has_descent(Integer(4), side='right')
False
```

See also

find_descent()

heap(***kargs*)

Create the heap poset of `self`.

The heap of an FC element w is a labeled poset that can be defined from any reduced word of w. Different reduced words yield isomorphic labeled posets, so the heap is well defined.

Heaps are very useful for visualizing and studying FC elements; see, for example, [Ste1996] and [GX2020].

INPUT:

- `self` – list; a reduced word $w = s_0...s_{k-1}$ of an FC element
- `one_index` – boolean (default: `False`); setting the value to True will change the underlying set of the poset to $\{1, 2, \ldots, n\}$
- `display_labeling` – boolean (default: `False`); setting the value to `True` will display the label s_i for each element i of the poset

OUTPUT:

A labeled poset where the underlying set is $\{0, 1, ..., k-1\}$ and where each element i carries s_i as its label. The partial order $\prec$ on the poset is defined by declaring $i \prec j$ if $i < j$ and $m(s_i, s_j) \neq 2$.

EXAMPLES:

```
sage: FC = CoxeterGroup(['A', 5]).fully_commutative_elements()
sage: FC([1, 4, 3, 5, 2, 4]).heap().cover_relations()
[[1, 2], [1, 3], [2, 5], [2, 4], [3, 5], [0, 4]]
sage: FC([1, 4, 3, 5, 4, 2]).heap(one_index=True).cover_relations()
[[2, 3], [2, 4], [3, 6], [3, 5], [4, 6], [1, 5]]
```

```
>>> from sage.all import *
>>> FC = CoxeterGroup(['A', Integer(5)]).fully_commutative_elements()
>>> FC([Integer(1), Integer(4), Integer(3), Integer(5), Integer(2),␣
↪Integer(4)]).heap().cover_relations()
[[1, 2], [1, 3], [2, 5], [2, 4], [3, 5], [0, 4]]
>>> FC([Integer(1), Integer(4), Integer(3), Integer(5), Integer(4),␣
↪Integer(2)]).heap(one_index=True).cover_relations()
[[2, 3], [2, 4], [3, 6], [3, 5], [4, 6], [1, 5]]
```

is_fully_commutative()

Check if `self` is the reduced word of an FC element.

To check if `self` is FC, we use the well-known characterization that an element w in a Coxeter system (W, S) is FC if and only if for every pair of generators $s, t \in S$ for which $m(s, t) > 2$, no reduced word of w contains the 'braid' word $sts...$ of length $m(s, t)$ as a contiguous subword. See [Ste1996].

check() is an alias of this method, and is called automatically when an element is created.

EXAMPLES:

```
sage: FC = CoxeterGroup(['A', 3]).fully_commutative_elements()
sage: x = FC([1, 2]); x.is_fully_commutative()
True
sage: x = FC.element_class(FC, [1, 2, 1], check=False); x.is_fully_
↪commutative()
False
```

```
>>> from sage.all import *
>>> FC = CoxeterGroup(['A', Integer(3)]).fully_commutative_elements()
>>> x = FC([Integer(1), Integer(2)]); x.is_fully_commutative()
True
>>> x = FC.element_class(FC, [Integer(1), Integer(2), Integer(1)],␣
↪check=False); x.is_fully_commutative()
False
```

n_value()

Calculate the n-value of `self`.

The *n-value* of a fully commutative element is the *width* (length of any longest antichain) of its heap. The n-value is important as it coincides with Lusztig's a-value for FC elements in all Weyl and affine Weyl groups as well as so-called star-reducible groups; see [GX2020].

EXAMPLES:

```
sage: FC = CoxeterGroup(['A', 5]).fully_commutative_elements()
sage: FC([1,3]).n_value()
2
sage: FC([1,2,3]).n_value()
1
sage: FC([1,3,2]).n_value()
2
sage: FC([1,3,2,5]).n_value()
3
```

```
>>> from sage.all import *
>>> FC = CoxeterGroup(['A', Integer(5)]).fully_commutative_elements()
>>> FC([Integer(1),Integer(3)]).n_value()
2
>>> FC([Integer(1),Integer(2),Integer(3)]).n_value()
1
>>> FC([Integer(1),Integer(3),Integer(2)]).n_value()
2
>>> FC([Integer(1),Integer(3),Integer(2),Integer(5)]).n_value()
3
```

normalize()

Mutate `self` into Cartier-Foata normal form.

EXAMPLES:

The following reduced words express the same FC elements in B_5:

```
sage: FC = CoxeterGroup(['B', 5]).fully_commutative_elements()
sage: FC([1, 4, 3, 5, 2, 4, 3]) # indirect doctest
[1, 4, 3, 5, 2, 4, 3]
sage: FC([4, 1, 3, 5, 2, 4, 3]) # indirect doctest
[1, 4, 3, 5, 2, 4, 3]
sage: FC([4, 3, 1, 5, 4, 2, 3]) # indirect doctest
[1, 4, 3, 5, 2, 4, 3]
```

```
>>> from sage.all import *
>>> FC = CoxeterGroup(['B', Integer(5)]).fully_commutative_elements()
>>> FC([Integer(1), Integer(4), Integer(3), Integer(5), Integer(2),␣
↪Integer(4), Integer(3)]) # indirect doctest
[1, 4, 3, 5, 2, 4, 3]
>>> FC([Integer(4), Integer(1), Integer(3), Integer(5), Integer(2),␣
↪Integer(4), Integer(3)]) # indirect doctest
[1, 4, 3, 5, 2, 4, 3]
>>> FC([Integer(4), Integer(3), Integer(1), Integer(5), Integer(4),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(2), Integer(3)]) # indirect doctest
[1, 4, 3, 5, 2, 4, 3]
```

Note

The Cartier–Foata form of a reduced word of an FC element w can be found recursively by repeatedly moving left descents of elements to the left and ordering the left descents from small to large. In the above example, the left descents of the element are 4 and 1, therefore the Cartier–Foata form of the element is the concatenation of [1,4] with the Cartier–Foata form of the remaining part of the word. See [Gre2006].

See also

descents()

plot_heap()

Display the Hasse diagram of the heap of `self`.

The Hasse diagram is rendered in the lattice $S \times \mathbf{N}$, with every element i in the poset drawn as a point labelled by its label s_i. Every point is placed in the column for its label at a certain level. The levels start at 0 and the level k of an element i is the maximal number k such that the heap contains a chain $i_0 \prec i_1 \prec ... \prec i_k$ where $i_k = i$. See [Ste1996] and [GX2020].

OUTPUT: GraphicsObject

EXAMPLES:

```
sage: FC = CoxeterGroup(['B', 5]).fully_commutative_elements()
sage: FC([3,2,4,3,1]).plot_heap()                                          #␣
↪needs sage.plot
Graphics object consisting of 15 graphics primitives
```

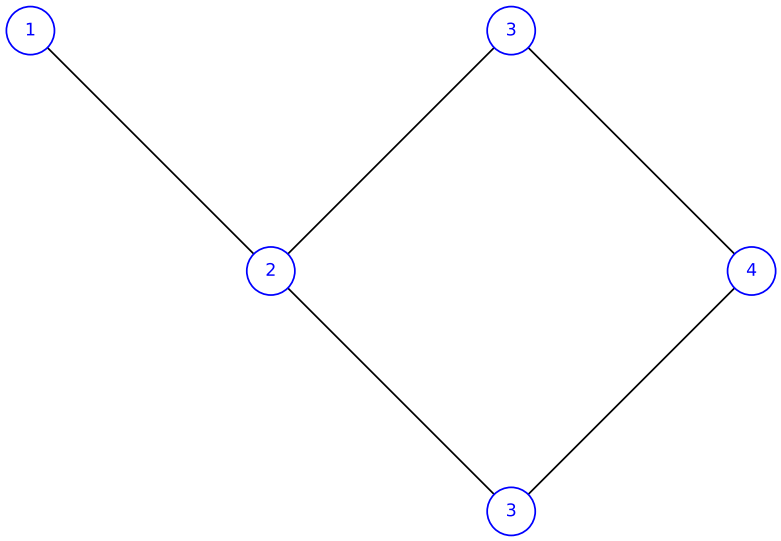
```
>>> from sage.all import *
>>> FC = CoxeterGroup(['B', Integer(5)]).fully_commutative_elements()
>>> FC([Integer(3),Integer(2),Integer(4),Integer(3),Integer(1)]).plot_heap() ␣
↪                                          # needs sage.plot
Graphics object consisting of 15 graphics primitives
```

star_operation(*J*, *direction*, *side='left'*)

Apply a star operation on `self` relative to two noncommuting generators.

Star operations were first defined on elements of Coxeter groups by Kazhdan and Lusztig in [KL1979] with respect to pair of generators s, t such that $m(s,t) = 3$. Later, Lusztig generalized the definition in [Lus1985], via coset decompositions, to allow star operations with respect to any pair of generators s, t such that $m(s,t) \geq 3$. Given such a pair, we can potentially perform four types of star operations corresponding to all combinations of a 'direction' and a 'side': upper left, lower left, upper right and lower right; see [Gre2006].

Let w be an element in W and let J be any pair $\{s,t\}$ of noncommuting generators in S. Consider the coset decomposition $w = w_J \cdot {}^J w$ of w relative to J. Then an upper left star operation is defined on w if and only if $1 \leq l(w_J) \leq m(s,t) - 2$; when this is the case, the operation returns $x \cdot w_J \cdot w^J$ where x is the letter J different from the leftmost letter of w_J. A lower left star operation is defined on w if and only if $2 \leq l(w_J) \leq m(s,t) - 1$; when this is the case, the operation removes the leftmost letter of w_J from w. Similar facts hold for right star operations. See [Gre2006].



The facts of the previous paragraph hold in general, even if w is not FC. Note that if f is a star operation of any kind, then for every element $w \in W$, the elements w and $f(w)$ are either both FC or both not FC.

INPUT:

- `J` – set of two integers representing two noncommuting generators of the Coxeter system
- `direction` – string, `'upper'` or `'lower'`; the function performs an upper or lower star operation according to `direction`
- `side` – string (default: `'left'`); if this is set to 'right', the function performs a right star operation

OUTPUT:

The Cartier–Foata form of the result of the star operation if the operation is defined on `self`, `None` otherwise.

EXAMPLES:

We will compute all star operations on the following FC element in type B_6 relative to $J = \{5, 6\}$:

```
sage: FC = CoxeterGroup(['B', 6]).fully_commutative_elements()
sage: w = FC([1, 6, 2, 5, 4, 6, 5])
```

```
>>> from sage.all import *
>>> FC = CoxeterGroup(['B', Integer(6)]).fully_commutative_elements()
>>> w = FC([Integer(1), Integer(6), Integer(2), Integer(5), Integer(4),␣
↪Integer(6), Integer(5)])
```

Whether and how a left star operations can be applied depend on the coset decomposition $w = w_J \cdot w^J$:

```
sage: w.coset_decomposition({5, 6})
([6, 5, 6], [1, 2, 4, 5])
```

```
>>> from sage.all import *
>>> w.coset_decomposition({Integer(5), Integer(6)})
([6, 5, 6], [1, 2, 4, 5])
```

Only the lower star operation is defined on the left on w:

```
sage: w.star_operation({5,6}, 'upper')

sage: w.star_operation({5,6}, 'lower')
[1, 5, 2, 4, 6, 5]
```

```
>>> from sage.all import *
>>> w.star_operation({Integer(5),Integer(6)}, 'upper')
<BLANKLINE>
>>> w.star_operation({Integer(5),Integer(6)}, 'lower')
[1, 5, 2, 4, 6, 5]
```

Whether and how a right star operations can be applied depend on the coset decomposition $w = w^J \cdot w_J$:

```
sage: w.coset_decomposition({5, 6}, side='right')
([1, 6, 2, 5, 4], [6, 5])
```

```
>>> from sage.all import *
>>> w.coset_decomposition({Integer(5), Integer(6)}, side='right')
([1, 6, 2, 5, 4], [6, 5])
```

Both types of right star operations on defined for this example:

```
sage: w.star_operation({5, 6}, 'upper', side='right')
[1, 6, 2, 5, 4, 6, 5, 6]

sage: w.star_operation({5, 6}, 'lower', side='right')
[1, 6, 2, 5, 4, 6]
```

```
>>> from sage.all import *
>>> w.star_operation({Integer(5), Integer(6)}, 'upper', side='right')
[1, 6, 2, 5, 4, 6, 5, 6]

>>> w.star_operation({Integer(5), Integer(6)}, 'lower', side='right')
[1, 6, 2, 5, 4, 6]
```

class sage.combinat.fully_commutative_elements.**FullyCommutativeElements**(*coxeter_group*)

Bases: UniqueRepresentation, Parent

Class for the set of fully commutative (FC) elements of a Coxeter system.

Coxeter systems with finitely many FC elements, or *FC-finite* Coxeter systems, are classified by Stembridge in [Ste1996]. They fall into seven families, namely the groups of types $A_n, B_n, D_n, E_n, F_n, H_n$ and $I_2(m)$.

INPUT:

- data – CoxeterMatrix, CartanType, or the usual datum that can is taken in the constructors for these classes (see *sage.combinat.root_system.coxeter_group.CoxeterGroup()*)

OUTPUT:

The class of fully commutative elements in the Coxeter group constructed from data. This will belong to the category of enumerated sets. If the Coxeter data corresponds to a Cartan type, the category is further refined to either finite enumerated sets or infinite enumerated sets depending on whether the Coxeter group is FC-finite; the refinement is not carried out if data is a Coxeter matrix not corresponding to a Cartan type.

Todo

It would be ideal to implement the aforementioned refinement to finite and infinite enumerated sets for all possible `data`, regardless of whether it corresponds to a Cartan type. Doing so requires determining if an arbitrary Coxeter matrix corresponds to a Cartan type. It may be best to address this issue in `sage.combinat.root_system`. On the other hand, the refinement in the general case may be unnecessary in light of the fact that Stembridge's classification of FC-finite groups contains a very small number of easily-recognizable families.

EXAMPLES:

Create the enumerate set of fully commutative elements in B_3:

```
sage: FC = CoxeterGroup(['B', 3]).fully_commutative_elements(); FC
Fully commutative elements of Finite Coxeter group over Number Field in a with␣
↪defining polynomial x^2 - 2 with a = 1.414213562373095? with Coxeter matrix:
[1 3 2]
[3 1 4]
[2 4 1]
```

```
>>> from sage.all import *
>>> FC = CoxeterGroup(['B', Integer(3)]).fully_commutative_elements(); FC
Fully commutative elements of Finite Coxeter group over Number Field in a with␣
↪defining polynomial x^2 - 2 with a = 1.414213562373095? with Coxeter matrix:
[1 3 2]
[3 1 4]
[2 4 1]
```

Construct elements:

```
sage: FC([])
[]
sage: FC([1,2])
[1, 2]
sage: FC([2,3,2])
[2, 3, 2]
sage: FC([3,2,3])
[3, 2, 3]
```

```
>>> from sage.all import *
>>> FC([])
[]
>>> FC([Integer(1),Integer(2)])
[1, 2]
>>> FC([Integer(2),Integer(3),Integer(2)])
[2, 3, 2]
>>> FC([Integer(3),Integer(2),Integer(3)])
[3, 2, 3]
```

Elements are normalized to Cartier–Foata normal form upon construction:

```
sage: FC([3,1])
[1, 3]
sage: FC([2,3,1])
```

(continues on next page)

(continued from previous page)

```
[2, 1, 3]
sage: FC([1,3]) == FC([3,1])
True
```

```
>>> from sage.all import *
>>> FC([Integer(3),Integer(1)])
[1, 3]
>>> FC([Integer(2),Integer(3),Integer(1)])
[2, 1, 3]
>>> FC([Integer(1),Integer(3)]) == FC([Integer(3),Integer(1)])
True
```

Attempting to create an element from an input that is not the reduced word of a fully commutative element throws a `ValueError`:

```
sage: FC([1,2,1])
Traceback (most recent call last):
...
ValueError: the input is not a reduced word of a fully commutative element
sage: FC([2,3,2,3])
Traceback (most recent call last):
...
ValueError: the input is not a reduced word of a fully commutative element
```

```
>>> from sage.all import *
>>> FC([Integer(1),Integer(2),Integer(1)])
Traceback (most recent call last):
...
ValueError: the input is not a reduced word of a fully commutative element
>>> FC([Integer(2),Integer(3),Integer(2),Integer(3)])
Traceback (most recent call last):
...
ValueError: the input is not a reduced word of a fully commutative element
```

Enumerate the FC elements in A_3:

```
sage: FCA3 = CoxeterGroup(['A', 3]).fully_commutative_elements()
sage: FCA3.category()
Category of finite enumerated sets
sage: FCA3.list()
[[],
 [1],
 [2],
 [3],
 [2, 1],
 [1, 3],
 [1, 2],
 [3, 2],
 [2, 3],
 [3, 2, 1],
 [2, 1, 3],
 [1, 3, 2],
```

(continues on next page)

(continued from previous page)

```
 [1, 2, 3],
 [2, 1, 3, 2]]
```

```
>>> from sage.all import *
>>> FCA3 = CoxeterGroup(['A', Integer(3)]).fully_commutative_elements()
>>> FCA3.category()
Category of finite enumerated sets
>>> FCA3.list()
[[],
 [1],
 [2],
 [3],
 [2, 1],
 [1, 3],
 [1, 2],
 [3, 2],
 [2, 3],
 [3, 2, 1],
 [2, 1, 3],
 [1, 3, 2],
 [1, 2, 3],
 [2, 1, 3, 2]]
```

Count the FC elements in B_8:

```
sage: FCB8 = CoxeterGroup(['B', 8]).fully_commutative_elements()
sage: len(FCB8)    # long time (7 seconds)
14299
```

```
>>> from sage.all import *
>>> FCB8 = CoxeterGroup(['B', Integer(8)]).fully_commutative_elements()
>>> len(FCB8)    # long time (7 seconds)
14299
```

Iterate through the FC elements of length up to 2 in the non-FC-finite group affine A_2:

```
sage: FCAffineA2 = CoxeterGroup(['A', 2, 1]).fully_commutative_elements()
sage: FCAffineA2.category()
Category of infinite enumerated sets
sage: list(FCAffineA2.iterate_to_length(2))
[[], [0], [1], [2], [1, 0], [2, 0], [0, 1], [2, 1], [0, 2], [1, 2]]
```

```
>>> from sage.all import *
>>> FCAffineA2 = CoxeterGroup(['A', Integer(2), Integer(1)]).fully_commutative_
↪elements()
>>> FCAffineA2.category()
Category of infinite enumerated sets
>>> list(FCAffineA2.iterate_to_length(Integer(2)))
[[], [0], [1], [2], [1, 0], [2, 0], [0, 1], [2, 1], [0, 2], [1, 2]]
```

The cardinality of the set is determined from the classification of FC-finite Coxeter groups:

```
sage: CoxeterGroup('A2').fully_commutative_elements().category()
Category of finite enumerated sets
sage: CoxeterGroup('B7').fully_commutative_elements().category()
Category of finite enumerated sets
sage: CoxeterGroup('A3~').fully_commutative_elements().category()
Category of infinite enumerated sets
sage: CoxeterGroup('F4~').fully_commutative_elements().category()
Category of finite enumerated sets
sage: CoxeterGroup('E8~').fully_commutative_elements().category()
Category of finite enumerated sets
sage: CoxeterGroup('F4~xE8~').fully_commutative_elements().category()
Category of finite enumerated sets
sage: CoxeterGroup('B4~xE8~').fully_commutative_elements().category()
Category of infinite enumerated sets
```

```
>>> from sage.all import *
>>> CoxeterGroup('A2').fully_commutative_elements().category()
Category of finite enumerated sets
>>> CoxeterGroup('B7').fully_commutative_elements().category()
Category of finite enumerated sets
>>> CoxeterGroup('A3~').fully_commutative_elements().category()
Category of infinite enumerated sets
>>> CoxeterGroup('F4~').fully_commutative_elements().category()
Category of finite enumerated sets
>>> CoxeterGroup('E8~').fully_commutative_elements().category()
Category of finite enumerated sets
>>> CoxeterGroup('F4~xE8~').fully_commutative_elements().category()
Category of finite enumerated sets
>>> CoxeterGroup('B4~xE8~').fully_commutative_elements().category()
Category of infinite enumerated sets
```

Element

alias of *FullyCommutativeElement*

coxeter_group()

Obtain the Coxeter group associated with `self`.

EXAMPLES:

```
sage: FCA3 = CoxeterGroup(['A', 3]).fully_commutative_elements()
sage: FCA3.coxeter_group()
Finite Coxeter group over Integer Ring with Coxeter matrix:
[1 3 2]
[3 1 3]
[2 3 1]
```

```
>>> from sage.all import *
>>> FCA3 = CoxeterGroup(['A', Integer(3)]).fully_commutative_elements()
>>> FCA3.coxeter_group()
Finite Coxeter group over Integer Ring with Coxeter matrix:
[1 3 2]
[3 1 3]
[2 3 1]
```

iterate_to_length(*length*)

Iterate through the elements of this class up to a maximum length.

INPUT:

- `length` – integer; maximum length of element to generate

OUTPUT: generator for elements of `self` of length up to `length`

EXAMPLES:

The following example produces all FC elements of length up to 2 in the group A_3:

```
sage: FCA3 = CoxeterGroup(['A', 3]).fully_commutative_elements()
sage: list(FCA3.iterate_to_length(2))
[[], [1], [2], [3], [2, 1], [1, 3], [1, 2], [3, 2], [2, 3]]
```

```
>>> from sage.all import *
>>> FCA3 = CoxeterGroup(['A', Integer(3)]).fully_commutative_elements()
>>> list(FCA3.iterate_to_length(Integer(2)))
[[], [1], [2], [3], [2, 1], [1, 3], [1, 2], [3, 2], [2, 3]]
```

The lists for length 4 and 5 are the same since 4 is the maximum length of an FC element in A_3:

```
sage: list(FCA3.iterate_to_length(4))
[[], [1], [2], [3], [2, 1], [1, 3], [1, 2], [3, 2], [2, 3],
 [3, 2, 1], [2, 1, 3], [1, 3, 2], [1, 2, 3], [2, 1, 3, 2]]
sage: list(FCA3.iterate_to_length(5))
[[], [1], [2], [3], [2, 1], [1, 3], [1, 2], [3, 2], [2, 3],
 [3, 2, 1], [2, 1, 3], [1, 3, 2], [1, 2, 3], [2, 1, 3, 2]]
sage: list(FCA3.iterate_to_length(4)) == list(FCA3)
True
```

```
>>> from sage.all import *
>>> list(FCA3.iterate_to_length(Integer(4)))
[[], [1], [2], [3], [2, 1], [1, 3], [1, 2], [3, 2], [2, 3],
 [3, 2, 1], [2, 1, 3], [1, 3, 2], [1, 2, 3], [2, 1, 3, 2]]
>>> list(FCA3.iterate_to_length(Integer(5)))
[[], [1], [2], [3], [2, 1], [1, 3], [1, 2], [3, 2], [2, 3],
 [3, 2, 1], [2, 1, 3], [1, 3, 2], [1, 2, 3], [2, 1, 3, 2]]
>>> list(FCA3.iterate_to_length(Integer(4))) == list(FCA3)
True
```

The following example produces all FC elements of length up to 4 in the affine Weyl group $\tilde{A}_2$:

```
sage: FCAffineA2 = CoxeterGroup(['A', 2, 1]).fully_commutative_elements()
sage: FCAffineA2.category()
Category of infinite enumerated sets
sage: list(FCAffineA2.iterate_to_length(4))
[[], [0], [1], [2], [1, 0], [2, 0], [0, 1], [2, 1], [0, 2],
 [1, 2], [2, 1, 0], [1, 2, 0], [2, 0, 1], [0, 2, 1], [1, 0, 2],
 [0, 1, 2], [0, 2, 1, 0], [0, 1, 2, 0], [1, 2, 0, 1],
 [1, 0, 2, 1], [2, 1, 0, 2], [2, 0, 1, 2]]
```

```
>>> from sage.all import *
>>> FCAffineA2 = CoxeterGroup(['A', Integer(2), Integer(1)]).fully_
↪commutative_elements()
>>> FCAffineA2.category()
Category of infinite enumerated sets
>>> list(FCAffineA2.iterate_to_length(Integer(4)))
[[], [0], [1], [2], [1, 0], [2, 0], [0, 1], [2, 1], [0, 2],
 [1, 2], [2, 1, 0], [1, 2, 0], [2, 0, 1], [0, 2, 1], [1, 0, 2],
 [0, 1, 2], [0, 2, 1, 0], [0, 1, 2, 0], [1, 2, 0, 1],
 [1, 0, 2, 1], [2, 1, 0, 2], [2, 0, 1, 2]]
```

Fully packed loops

class sage.combinat.fully_packed_loop.**FullyPackedLoop**(*parent*, *generator*)

Bases: Element

A class for fully packed loops.

A fully packed loop is a collection of non-intersecting lattice paths on a square grid such that every vertex is part of some path, and the paths are either closed internal loops or have endpoints corresponding to alternate points on the boundary [Pro2001]. They are known to be in bijection with alternating sign matrices.

See also

AlternatingSignMatrix

To each fully packed loop, we assign a link pattern, which is the non-crossing matching attained by seeing which points on the boundary are connected by open paths in the fully packed loop.

We can create a fully packed loop using the corresponding alternating sign matrix and also extract the link pattern:

```
sage: A = AlternatingSignMatrix([[0, 0, 1], [0, 1, 0], [1, 0, 0]])
sage: fpl = FullyPackedLoop(A)
sage: fpl.link_pattern()
[(1, 4), (2, 3), (5, 6)]
sage: fpl
   |         |
   |         |
   + ── +    +
        |    |
        |    |
── +    +    + ──
   |    |
   |    |
   +    + ── +
   |         |
   |         |
sage: B = AlternatingSignMatrix([[1, 0, 0], [0, 1, 0], [0, 0, 1]])
```

(continues on next page)

(continued from previous page)

```
sage: fplb = FullyPackedLoop(B)
sage: fplb.link_pattern()
[(1, 6), (2, 5), (3, 4)]
sage: fplb
   |          |
   |          |
   +    + — — +
   |    |
   |    |
— — +    +    + — —
        |    |
        |    |
   + — — +    +
   |          |
   |          |
```

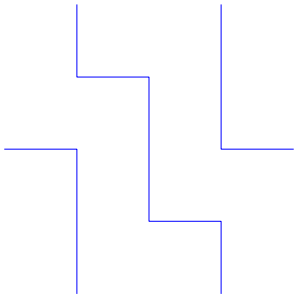
```
>>> from sage.all import *
>>> A = AlternatingSignMatrix([[Integer(0), Integer(0), Integer(1)], [Integer(0),␣
↪Integer(1), Integer(0)], [Integer(1), Integer(0), Integer(0)]])
>>> fpl = FullyPackedLoop(A)
>>> fpl.link_pattern()
[(1, 4), (2, 3), (5, 6)]
>>> fpl
   |          |
   |          |
   + — — +    +
        |    |
        |    |
— — +    +    + — —
   |    |
   |    |
   +    + — — +
   |          |
   |          |
>>> B = AlternatingSignMatrix([[Integer(1), Integer(0), Integer(0)], [Integer(0),␣
↪Integer(1), Integer(0)], [Integer(0), Integer(0), Integer(1)]])
>>> fplb = FullyPackedLoop(B)
>>> fplb.link_pattern()
[(1, 6), (2, 5), (3, 4)]
>>> fplb
   |          |
   |          |
   +    + — — +
   |    |
   |    |
— — +    +    + — —
        |    |
        |    |
   + — — +    +
   |          |
   |          |
```

The class also has a plot method:

```
sage: fpl.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```
>>> from sage.all import *
>>> fpl.plot()                                                                #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

which gives:



Note that we can also create a fully packed loop from a six vertex model configuration:

```
sage: S = SixVertexModel(3, boundary_conditions='ice').from_alternating_sign_
↪matrix(A)
sage: S
    ^    ^    ^
    |    |    |
--> # -> # -> # <--
    ^    ^    |
    |    |    V
--> # -> # <- # <--
    ^    |    |
    |    V    V
--> # <- # <- # <--
    |    |    |
    V    V    V
sage: fpl = FullyPackedLoop(S)
sage: fpl
   |         |
   |         |
   + ── +    +
        |    |
        |    |
── +    +    + ──
   |    |
   |    |
   +    + ── +
   |         |
   |         |
```

```
>>> from sage.all import *
>>> S = SixVertexModel(Integer(3), boundary_conditions='ice').from_alternating_
↪sign_matrix(A)
>>> S
    ^    ^    ^
    |    |    |
--> # -> # -> # <--
    ^    ^    |
    |    |    V
--> # -> # <- # <--
    ^    |    |
    |    V    V
--> # <- # <- # <--
    |    |    |
    V    V    V
>>> fpl = FullyPackedLoop(S)
>>> fpl
   |          |
   |          |
   + ── +     +
         |    |
         |    |
── +     +     + ──
   |     |
   |     |
   +     + ── +
   |          |
   |          |
```

Once we have a fully packed loop we can obtain the corresponding alternating sign matrix:

```
sage: fpl.to_alternating_sign_matrix()
[0 0 1]
[0 1 0]
[1 0 0]
```

```
>>> from sage.all import *
>>> fpl.to_alternating_sign_matrix()
[0 0 1]
[0 1 0]
[1 0 0]
```

Here are some more examples using bigger ASMs:

```
sage: A = AlternatingSignMatrix([[0,1,0,0],[0,0,1,0],[1,-1,0,1],[0,1,0,0]])
sage: S = SixVertexModel(4, boundary_conditions='ice').from_alternating_sign_
↪matrix(A)
sage: fpl = FullyPackedLoop(S)
sage: fpl.link_pattern()
[(1, 2), (3, 6), (4, 5), (7, 8)]
sage: fpl
   |          |
   |          |
```

(continues on next page)

(continued from previous page)

```
   + ── + ── +    + ──
                  |
                  |
── +    + ── + ── +
   |    |
   |    |
   +    +    + ── + ──
   |    |    |
   |    |    |
── +    +    + ── +
        |         |
        |         |

sage: m = AlternatingSignMatrix([[0,0,1,0,0,0],
....:                            [1,0,-1,0,1,0],
....:                            [0,0,0,1,0,0],

>>> ncp = fpl.link_pattern()
>>> rotated_ncp=[]
>>> for a, b in ncp:
...      for i in range(Integer(13)):
...          a,b=a%Integer(14)+Integer(1),b%Integer(14)+Integer(1);
...      rotated_ncp.append((a,b))
>>> PerfectMatching(mat.gyration().to_fully_packed_loop().link_pattern()) ==   ␣
↪PerfectMatching(rotated_ncp)
True

>>> mat = AlternatingSignMatrix([[Integer(0),Integer(0),Integer(0),Integer(1),
↪Integer(0),Integer(0)], [Integer(0),Integer(0),Integer(1),-Integer(1),
↪Integer(1),Integer(0)],
...      [Integer(0),Integer(1),Integer(0),Integer(0),-Integer(1),Integer(1)],␣
↪[Integer(1),Integer(0),-Integer(1),Integer(1),Integer(0),Integer(0)],␣
↪[Integer(0),Integer(0),Integer(1),Integer(0),Integer(0),Integer(0)],␣
↪[Integer(0),Integer(0),Integer(0),Integer(0),Integer(1),Integer(0)]])
>>> fpl = FullyPackedLoop(mat) # n =6
>>> ncp = fpl.link_pattern()
>>> rotated_ncp=[]
>>> for a, b in ncp:
...      for i in range(Integer(11)):
...          a,b=a%Integer(12)+Integer(1),b%Integer(12)+Integer(1);
...      rotated_ncp.append((a,b))
>>> PerfectMatching(mat.gyration().to_fully_packed_loop().link_pattern()) ==   ␣
↪PerfectMatching(rotated_ncp)
True
```

More examples:

We can initiate a fully packed loop using an alternating sign matrix:

```
sage: A = AlternatingSignMatrix([[0, 0, 1], [0, 1, 0], [1, 0, 0]])
sage: fpl = FullyPackedLoop(A)
sage: fpl
    |         |
    |         |
    + — +     +
        |     |
        |     |
 — +    +     + —
    |    |
```

(continues on next page)

(continued from previous page)

```
    |    |
    +    + -- +
    |         |
    |         |
sage: FullyPackedLoops(3)(A) == fpl
True
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrix([[Integer(0), Integer(0), Integer(1)], [Integer(0),␣
↪Integer(1), Integer(0)], [Integer(1), Integer(0), Integer(0)]])
>>> fpl = FullyPackedLoop(A)
>>> fpl
    |         |
    |         |
    + -- +    +
         |    |
         |    |
 -- +    +    + --
    |    |
    |    |
    +    + -- +
    |         |
    |         |
>>> FullyPackedLoops(Integer(3))(A) == fpl
True
```

We can also input a matrix:

```
sage: FullyPackedLoop([[0, 0, 1], [0, 1, 0], [1, 0, 0]])
    |         |
    |         |
    + -- +    +
         |    |
         |    |
 -- +    +    + --
    |    |
    |    |
    +    + -- +
    |         |
    |         |
sage: FullyPackedLoop([[0, 0, 1], [0, 1, 0], [1, 0, 0]]) ==\
....: FullyPackedLoops(3)([[0, 0, 1], [0, 1, 0], [1, 0, 0]])
True
```

```
>>> from sage.all import *
>>> FullyPackedLoop([[Integer(0), Integer(0), Integer(1)], [Integer(0),␣
↪Integer(1), Integer(0)], [Integer(1), Integer(0), Integer(0)]])
    |         |
    |         |
    + -- +    +
         |    |
         |    |
```

(continues on next page)

(continued from previous page)

```
 ── +    +    + ──
    |    |
    |    |
    +    + ── +
    |         |
    |         |
>>> FullyPackedLoop([[Integer(0), Integer(0), Integer(1)], [Integer(0),␣
↪Integer(1), Integer(0)], [Integer(1), Integer(0), Integer(0)]])␣
↪==FullyPackedLoops(Integer(3))([[Integer(0), Integer(0), Integer(1)],␣
↪[Integer(0), Integer(1), Integer(0)], [Integer(1), Integer(0), Integer(0)]])
True
```

Otherwise we initiate a fully packed loop using a six vertex model:

```
sage: S = SixVertexModel(3, boundary_conditions='ice').from_alternating_sign_
↪matrix(A)
sage: fpl = FullyPackedLoop(S)
sage: fpl
    |         |
    |         |
    + ── +    +
         |    |
         |    |
 ── +    +    + ──
    |    |
    |    |
    +    + ── +
    |         |
    |         |

sage: FullyPackedLoops(3)(S) == FullyPackedLoop(S)
True

sage: fpl.six_vertex_model().to_alternating_sign_matrix()
[0 0 1]
[0 1 0]
[1 0 0]
```

```
>>> from sage.all import *
>>> S = SixVertexModel(Integer(3), boundary_conditions='ice').from_alternating_
↪sign_matrix(A)
>>> fpl = FullyPackedLoop(S)
>>> fpl
    |         |
    |         |
    + ── +    +
         |    |
         |    |
 ── +    +    + ──
    |    |
    |    |
    +    + ── +
```

(continues on next page)

(continued from previous page)

```
    |         |
    |         |

>>> FullyPackedLoops(Integer(3))(S) == FullyPackedLoop(S)
True

>>> fpl.six_vertex_model().to_alternating_sign_matrix()
[0 0 1]
[0 1 0]
[1 0 0]
```

We can also input the matrix associated to a six vertex model:

```
sage: SixVertexModel(2)([[3,1],[5,3]])
    ^    ^
    |    |
--> # <- # <--
    |    ^
    V    |
--> # -> # <--
    |    |
    V    V

sage: FullyPackedLoop([[3,1],[5,3]])
    |
    |
    +    + ——
    |    |
    |    |
 —— +    +
         |
         |

sage: FullyPackedLoops(2)([[3,1],[5,3]]) == FullyPackedLoop([[3,1],[5,3]])
True
```

```
>>> from sage.all import *
>>> SixVertexModel(Integer(2))([[Integer(3),Integer(1)],[Integer(5),Integer(3)]])
    ^    ^
    |    |
--> # <- # <--
    |    ^
    V    |
--> # -> # <--
    |    |
    V    V

>>> FullyPackedLoop([[Integer(3),Integer(1)],[Integer(5),Integer(3)]])
    |
    |
    +    + ——
    |    |
```

(continues on next page)

(continued from previous page)

```
    |     |
 ── +     +
          |
          |

>>> FullyPackedLoops(Integer(2))([[Integer(3),Integer(1)],[Integer(5),
↪Integer(3)]]) == FullyPackedLoop([[Integer(3),Integer(1)],[Integer(5),
↪Integer(3)]])
True
```

Note that the matrix corresponding to a six vertex model without the ice boundary condition is not allowed:

```
sage: SixVertexModel(2)([[3,1],[5,5]])
    ^     ^
    |     |
--> # <- # <--
    |     ^
    V     V
--> # -> # -->
    |     |
    V     V

sage: FullyPackedLoop([[3,1],[5,5]])
Traceback (most recent call last):
...
ValueError: invalid alternating sign matrix

sage: FullyPackedLoops(2)([[3,1],[5,5]])
Traceback (most recent call last):
...
ValueError: invalid alternating sign matrix
```

```
>>> from sage.all import *
>>> SixVertexModel(Integer(2))([[Integer(3),Integer(1)],[Integer(5),Integer(5)]])
    ^     ^
    |     |
--> # <- # <--
    |     ^
    V     V
--> # -> # -->
    |     |
    V     V

>>> FullyPackedLoop([[Integer(3),Integer(1)],[Integer(5),Integer(5)]])
Traceback (most recent call last):
...
ValueError: invalid alternating sign matrix

>>> FullyPackedLoops(Integer(2))([[Integer(3),Integer(1)],[Integer(5),
↪Integer(5)]])
Traceback (most recent call last):
...
```

(continues on next page)

(continued from previous page)

```
ValueError: invalid alternating sign matrix
```

Note that if anything else is used to generate the fully packed loop an error will occur:

```
sage: fpl = FullyPackedLoop(5)
Traceback (most recent call last):
...
ValueError: invalid alternating sign matrix

sage: fpl = FullyPackedLoop((1, 2, 3))
Traceback (most recent call last):
...
ValueError: the alternating sign matrices must be square

sage: SVM = SixVertexModel(3)[0]
sage: FullyPackedLoop(SVM)
Traceback (most recent call last):
...
ValueError: invalid alternating sign matrix
```

```
>>> from sage.all import *
>>> fpl = FullyPackedLoop(Integer(5))
Traceback (most recent call last):
...
ValueError: invalid alternating sign matrix

>>> fpl = FullyPackedLoop((Integer(1), Integer(2), Integer(3)))
Traceback (most recent call last):
...
ValueError: the alternating sign matrices must be square

>>> SVM = SixVertexModel(Integer(3))[Integer(0)]
>>> FullyPackedLoop(SVM)
Traceback (most recent call last):
...
ValueError: invalid alternating sign matrix
```

gyration()

Return the fully packed loop obtained by applying gyration to the alternating sign matrix in bijection with `self`.

Gyration was first defined in [Wie2000] as an action on fully-packed loops.

EXAMPLES:

```
sage: A = AlternatingSignMatrix([[1, 0, 0],[0, 1, 0],[0, 0, 1]])
sage: fpl = FullyPackedLoop(A)
sage: fpl.gyration().to_alternating_sign_matrix()
```

(continues on next page)

(continued from previous page)

```
[0 0 1]
[0 1 0]
[1 0 0]
sage: asm = AlternatingSignMatrix([[0, 0, 1],[1, 0, 0],[0, 1, 0]])
sage: f = FullyPackedLoop(asm)
sage: f.gyration().to_alternating_sign_matrix()
[0 1 0]
[0 0 1]
[1 0 0]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrix([[Integer(1), Integer(0), Integer(0)],
↪[Integer(0), Integer(1), Integer(0)],[Integer(0), Integer(0), Integer(1)]])
>>> fpl = FullyPackedLoop(A)
>>> fpl.gyration().to_alternating_sign_matrix()
[0 0 1]
[0 1 0]
[1 0 0]
>>> asm = AlternatingSignMatrix([[Integer(0), Integer(0), Integer(1)],
↪[Integer(1), Integer(0), Integer(0)],[Integer(0), Integer(1), Integer(0)]])
>>> f = FullyPackedLoop(asm)
>>> f.gyration().to_alternating_sign_matrix()
[0 1 0]
[0 0 1]
[1 0 0]
```

link_pattern()

Return a link pattern corresponding to a fully packed loop.

Here we define a link pattern LP to be a partition of the list $[1, ..., 2k]$ into 2-element sets (such a partition is also known as a perfect matching) such that the following non-crossing condition holds: Let the numbers $1, ..., 2k$ be written on the perimeter of a circle. For every 2-element set (a, b) of the partition LP, draw an arc linking the two numbers a and b. We say that LP is non-crossing if every arc can be drawn so that no two arcs intersect.

Since every endpoint of a fully packed loop fpl is connected to a different endpoint, there is a natural surjection from the fully packed loops on an nxn grid onto the link patterns on the list $[1, \ldots, 2n]$. The pairs of connected endpoints of a fully packed loop fpl correspond to the 2-element tuples of the corresponding link pattern.

See also

PerfectMatching

Note

by convention, we choose the top left vertex to be even. See [Pro2001] and [Str2015].

EXAMPLES:

We can extract the underlying link pattern (a non-crossing partition) from a fully packed loop:

```
sage: A = AlternatingSignMatrix([[0, 1, 0], [1, -1, 1], [0, 1, 0]])
sage: fpl = FullyPackedLoop(A)
sage: fpl.link_pattern()
[(1, 2), (3, 6), (4, 5)]

sage: B = AlternatingSignMatrix([[1, 0, 0], [0, 1, 0], [0, 0, 1]])
sage: fpl = FullyPackedLoop(B)
sage: fpl.link_pattern()
[(1, 6), (2, 5), (3, 4)]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrix([[Integer(0), Integer(1), Integer(0)],␣
↪[Integer(1), -Integer(1), Integer(1)], [Integer(0), Integer(1),␣
↪Integer(0)]])
>>> fpl = FullyPackedLoop(A)
>>> fpl.link_pattern()
[(1, 2), (3, 6), (4, 5)]

>>> B = AlternatingSignMatrix([[Integer(1), Integer(0), Integer(0)],␣
↪[Integer(0), Integer(1), Integer(0)], [Integer(0), Integer(0), Integer(1)]])
>>> fpl = FullyPackedLoop(B)
>>> fpl.link_pattern()
[(1, 6), (2, 5), (3, 4)]
```

Gyration on an alternating sign matrix/fully packed loop `fpl` corresponds to a rotation (i.e. a becomes a-1 mod 2n) of the link pattern corresponding to `fpl`:

```
sage: ASMs = AlternatingSignMatrices(3).list()
sage: ncp = FullyPackedLoop(ASMs[1]).link_pattern()
sage: rotated_ncp=[]
sage: for a, b in ncp:
....:     for i in range(5):
....:         a,b=a%6+1,b%6+1;
....:     rotated_ncp.append((a,b))
sage: PerfectMatching(ASMs[1].gyration().to_fully_packed_loop().link_
↪pattern()) ==\
....:     PerfectMatching(rotated_ncp)
True

sage: fpl = FullyPackedLoop(ASMs[0])
sage: ncp = fpl.link_pattern()
sage: rotated_ncp=[]
sage: for a, b in ncp:
....:     for i in range(5):
....:         a,b=a%6+1,b%6+1;
....:     rotated_ncp.append((a,b))
sage: PerfectMatching(ASMs[0].gyration().to_fully_packed_loop().link_
↪pattern()) ==\
....:     PerfectMatching(rotated_ncp)
True

sage: mat = AlternatingSignMatrix([[0,0,1,0,0,0,0],[1,0,-1,0,1,0,0],[0,0,1,0,
↪0,0,0],

↪  PerfectMatching(rotated_ncp)
True
```

plot(*link=True*, *loop=True*, *loop_fill=False*, ***options*)

Return a graphical object of the Fully Packed Loop.

Each option can be specified separately for links (the curves that join boundary points) and the loops. In order to do so, you need to prefix its name with either `'link_'` or `'loop_'`. As an example, setting `color='red'` will color both links and loops in red while setting `link_color='red'` will only apply the color option for the links.

INPUT:

- `link`, `loop` – boolean (default: `True`); whether to plot the links or the loops
- `color`, `link_color`, `loop_color` – (optional) string or RGB triple
- `colors`, `link_colors`, `loop_colors` – (optional) list of colors
- `color_map`, `link_color_map`, `loop_color_map` – (string, optional) a name of a matplotlib color map for the link or the loop

- `link_color_randomize` – boolean (default: `False`); when `link_colors` or `link_color_map` is specified it randomizes its order. Setting this option to `True` makes it unlikely to have two neighboring links with the same color.
- `loop_fill` – boolean (default: `False`); whether to fill the interior of the loops

EXAMPLES:

To plot the fully packed loop associated to the following alternating sign matrix

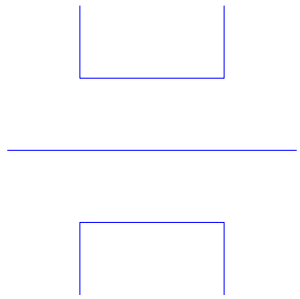
$$\begin{pmatrix} 0 & 1 & 1 \\ 1 & -1 & 1 \\ 0 & 1 & 0 \end{pmatrix}$$

simply do:

```
sage: A = AlternatingSignMatrix([[0, 1, 0], [1, -1, 1], [0, 1, 0]])
sage: fpl = FullyPackedLoop(A)
sage: fpl.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrix([[Integer(0), Integer(1), Integer(0)],␣
↪[Integer(1), -Integer(1), Integer(1)], [Integer(0), Integer(1),␣
↪Integer(0)]])
>>> fpl = FullyPackedLoop(A)
>>> fpl.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

The resulting graphics is as follows



You can also have the three links in different colors with:

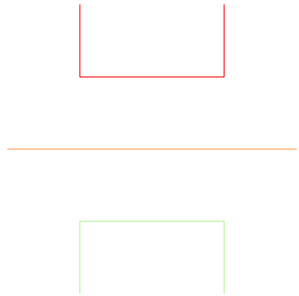
```
sage: A = AlternatingSignMatrix([[0, 1, 0], [1, -1, 1], [0, 1, 0]])
sage: fpl = FullyPackedLoop(A)
sage: fpl.plot(link_color_map='rainbow')                                      #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrix([[Integer(0), Integer(1), Integer(0)],␣
↪[Integer(1), -Integer(1), Integer(1)], [Integer(0), Integer(1),␣
↪Integer(0)]])
```

(continues on next page)

(continued from previous page)

```
>>> fpl = FullyPackedLoop(A)
>>> fpl.plot(link_color_map='rainbow')                                    #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```



You can plot the 42 fully packed loops of size 4×4 using:

```
sage: G = [fpl.plot(link_color_map='winter', loop_color='black')           #␣
↪needs sage.plot
....:      for fpl in FullyPackedLoops(4)]
sage: graphics_array(G, 7, 6)                                              #␣
↪needs sage.plot
Graphics Array of size 7 x 6
```

```
>>> from sage.all import *
>>> G = [fpl.plot(link_color_map='winter', loop_color='black')             #␣
↪needs sage.plot
...      for fpl in FullyPackedLoops(Integer(4))]
>>> graphics_array(G, Integer(7), Integer(6))                               ␣
↪              # needs sage.plot
Graphics Array of size 7 x 6
```

Here is an example of a 20×20 fully packed loop:

```
sage: s = "00000000000+0000000000000000+00-0+00000000000+00-00+0-+00000\
....: 0000+-00+00-+00000000+00-0000+0000-+00000000+000-0+0-+0-+000\
....: 000+-000+-00+0000000+-+-000+00-+0-000+000+-000+-0+0000000-0+\
....: 0000+0-+0-+00000-+00000+-+0-0+-00+0000000000+-0000+0-00+0000\
....: 000000+0-000+000000000000000+0000-00+00000000+0000-000+00000\
....: 00+0-00+0000000000000000+-0000+000000-+000000+00-0000+-00+00\
....: 00000000+-0000+00000000000000+0000000000"
sage: a = matrix(20, [{'0':0, '+':1, '-': -1}[i] for i in s])
sage: fpl = FullyPackedLoop(a)
sage: fpl.plot(loop_fill=True, loop_color_map='rainbow')                   #␣
↪needs sage.plot
Graphics object consisting of 27 graphics primitives
```

```
>>> from sage.all import *
>>> s = "00000000000+0000000000000000+00-0+00000000000+00-00+0-+00000\
... 0000+-00+00-+00000000+00-0000+0000-+00000000+000-0+0-+0-+000\

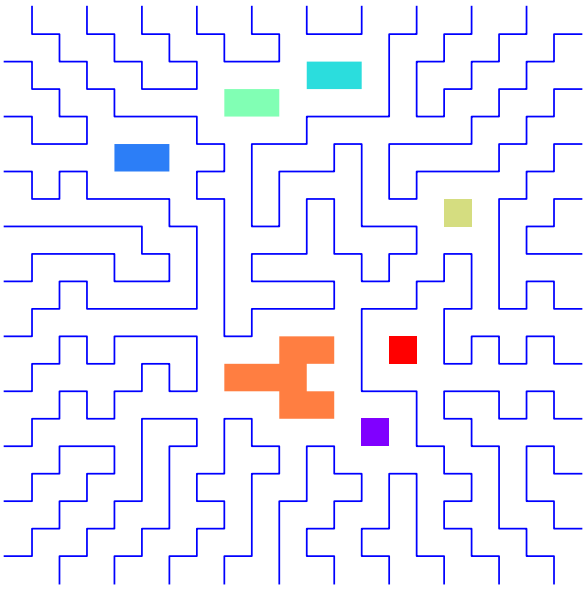
↪needs sage.plot
Graphics object consisting of 27 graphics primitives
```



six_vertex_model()

Return the underlying six vertex model configuration.

EXAMPLES:

```
sage: B = AlternatingSignMatrix([[1, 0, 0], [0, 1, 0], [0, 0, 1]])
sage: fpl = FullyPackedLoop(B)
sage: fpl
   |         |
   |         |
   +    + -- +
   |    |
   |    |
-- +    +    + --
        |    |
        |    |
   + -- +    +
   |         |
   |         |
sage: fpl.six_vertex_model()
    ^    ^    ^
```

(continues on next page)

(continued from previous page)

```
    |     |     |
--> # <- # <- # <--
    |     ^     ^
    V     |     |
--> # -> # <- # <--
    |     |     ^
    V     V     |
--> # -> # -> # <--
    |     |     |
    V     V     V
```

```
>>> from sage.all import *
>>> B = AlternatingSignMatrix([[Integer(1), Integer(0), Integer(0)],␣
↪[Integer(0), Integer(1), Integer(0)], [Integer(0), Integer(0), Integer(1)]])
>>> fpl = FullyPackedLoop(B)
>>> fpl
   |           |
   |           |
   +     + ── +
   |     |
   |     |
── +     +     + ──
         |     |
         |     |
   + ── +     +
   |           |
   |           |

    |     |     |
    V     V     V
```

to_alternating_sign_matrix()

Return the alternating sign matrix corresponding to this class.

See also

AlternatingSignMatrix

EXAMPLES:

```
sage: A = AlternatingSignMatrix([[0, 1, 0], [1, -1, 1], [0, 1, 0]])
sage: S = SixVertexModel(3, boundary_conditions='ice').from_alternating_sign_
```

(continues on next page)

(continued from previous page)

```
↪matrix(A)
sage: fpl = FullyPackedLoop(S)
sage: fpl.to_alternating_sign_matrix()
[ 0  1  0]
[ 1 -1  1]
[ 0  1  0]
sage: A = AlternatingSignMatrix([[0,1,0,0],[0,0,1,0],[1,-1,0,1],[0,1,0,0]])
sage: S = SixVertexModel(4, boundary_conditions='ice').from_alternating_sign_
↪matrix(A)
sage: fpl = FullyPackedLoop(S)
sage: fpl.to_alternating_sign_matrix()
[ 0  1  0  0]
[ 0  0  1  0]
[ 1 -1  0  1]
[ 0  1  0  0]
```

```
>>> from sage.all import *
>>> A = AlternatingSignMatrix([[Integer(0), Integer(1), Integer(0)],␣
↪[Integer(1), -Integer(1), Integer(1)], [Integer(0), Integer(1),␣
↪Integer(0)]])
>>> S = SixVertexModel(Integer(3), boundary_conditions='ice').from_
↪alternating_sign_matrix(A)
>>> fpl = FullyPackedLoop(S)
>>> fpl.to_alternating_sign_matrix()
[ 0  1  0]
[ 1 -1  1]
[ 0  1  0]
>>> A = AlternatingSignMatrix([[Integer(0),Integer(1),Integer(0),Integer(0)],
↪[Integer(0),Integer(0),Integer(1),Integer(0)],[Integer(1),-Integer(1),
↪Integer(0),Integer(1)],[Integer(0),Integer(1),Integer(0),Integer(0)]])
>>> S = SixVertexModel(Integer(4), boundary_conditions='ice').from_
↪alternating_sign_matrix(A)
>>> fpl = FullyPackedLoop(S)
>>> fpl.to_alternating_sign_matrix()
[ 0  1  0  0]
[ 0  0  1  0]
[ 1 -1  0  1]
[ 0  1  0  0]
```

class sage.combinat.fully_packed_loop.**FullyPackedLoops**(*n*)

Bases: Parent, UniqueRepresentation

Class of all fully packed loops on an $n \times n$ grid.

They are known to be in bijection with alternating sign matrices.

See also

AlternatingSignMatrices

INPUT:

- n – the number of row (and column) or grid

EXAMPLES:

This will create an instance to manipulate the fully packed loops of size 3:

```
sage: FPLs = FullyPackedLoops(3)
sage: FPLs
Fully packed loops on a 3x3 grid
sage: FPLs.cardinality()
7
```

```
>>> from sage.all import *
>>> FPLs = FullyPackedLoops(Integer(3))
>>> FPLs
Fully packed loops on a 3x3 grid
>>> FPLs.cardinality()
7
```

When using the square ice model, it is known that the number of configurations is equal to the number of alternating sign matrices:

```
sage: M = FullyPackedLoops(1)
sage: len(M)
1
sage: M = FullyPackedLoops(4)
sage: len(M)
42
sage: all(len(SixVertexModel(n, boundary_conditions='ice'))
....:     == FullyPackedLoops(n).cardinality() for n in range(1, 7))
True
```

```
>>> from sage.all import *
>>> M = FullyPackedLoops(Integer(1))
>>> len(M)
1
>>> M = FullyPackedLoops(Integer(4))
>>> len(M)
42
>>> all(len(SixVertexModel(n, boundary_conditions='ice'))
...     == FullyPackedLoops(n).cardinality() for n in range(Integer(1),␣
↪Integer(7)))
True
```

Element

alias of *FullyPackedLoop*

cardinality()

Return the cardinality of `self`.

The number of fully packed loops on $n \times n$ grid

$$\prod_{k=0}^{n-1} \frac{(3k+1)!}{(n+k)!} = \frac{1!4!7!10!\cdots(3n-2)!}{n!(n+1)!(n+2)!(n+3)!\cdots(2n-1)!}.$$

EXAMPLES:

```
sage: [AlternatingSignMatrices(n).cardinality() for n in range(10)]
[1, 1, 2, 7, 42, 429, 7436, 218348, 10850216, 911835460]
```

```
>>> from sage.all import *
>>> [AlternatingSignMatrices(n).cardinality() for n in range(Integer(10))]
[1, 1, 2, 7, 42, 429, 7436, 218348, 10850216, 911835460]
```

size()

Return the size of the matrices in `self`.

Functions that compute some of the sequences in Sloane's tables

EXAMPLES:

Type `sloane.[tab]` to see a list of the sequences that are defined.

```
sage: a = sloane.A000005; a
The integer sequence tau(n), which is the number of divisors of n.
sage: a(1)
1
sage: a(6)
4
sage: a(100)
9
```

```
>>> from sage.all import *
>>> a = sloane.A000005; a
The integer sequence tau(n), which is the number of divisors of n.
>>> a(Integer(1))
1
>>> a(Integer(6))
4
>>> a(Integer(100))
9
```

Type `d._eval??` to see how the function that computes an individual term of the sequence is implemented.

The input must be a positive integer:

```
sage: a(0)
Traceback (most recent call last):
...
ValueError: input n (=0) must be a positive integer
sage: a(1/3)
Traceback (most recent call last):
...
TypeError: input must be an int or Integer
```

```
>>> from sage.all import *
>>> a(Integer(0))
Traceback (most recent call last):
...
ValueError: input n (=0) must be a positive integer
```

(continues on next page)

(continued from previous page)

```
>>> a(Integer(1)/Integer(3))
Traceback (most recent call last):
...
TypeError: input must be an int or Integer
```

You can also change how a sequence prints:

```
sage: a = sloane.A000005; a
The integer sequence tau(n), which is the number of divisors of n.
sage: a.rename('(..., tau(n), ...)')
sage: a
(..., tau(n), ...)
sage: a.reset_name()
sage: a
The integer sequence tau(n), which is the number of divisors of n.
```

```
>>> from sage.all import *
>>> a = sloane.A000005; a
The integer sequence tau(n), which is the number of divisors of n.
>>> a.rename('(..., tau(n), ...)')
>>> a
(..., tau(n), ...)
>>> a.reset_name()
>>> a
The integer sequence tau(n), which is the number of divisors of n.
```

See also

- If you want to get more informations relative to a sequence (references, links, examples, programs, …), you can use the On-Line Encyclopedia of Integer Sequences provided by the `OEIS` module.
- If you plan to do a lot of automatic searches for subsequences, you should consider installing `SloaneEncyclopedia`, a local partial copy of the OEIS.

class sage.combinat.sloane_functions.**A000005**

Bases: *SloaneSequence*

The sequence $tau(n)$, which is the number of divisors of n.

This sequence is also denoted $d(n)$ (also called $\tau(n)$ or $\sigma_0(n)$), the number of divisors of n.

INPUT:

- `n` – positive integer

EXAMPLES:

```
sage: d = sloane.A000005; d
The integer sequence tau(n), which is the number of divisors of n.
sage: d(1)
1
sage: d(6)
4
sage: d(51)
4
sage: d(100)
9
sage: d(0)
Traceback (most recent call last):
...
ValueError: input n (=0) must be a positive integer
sage: d.list(10)
[1, 2, 2, 3, 2, 4, 2, 4, 3, 4]
```

```
>>> from sage.all import *
>>> d = sloane.A000005; d
The integer sequence tau(n), which is the number of divisors of n.
>>> d(Integer(1))
1
>>> d(Integer(6))
4
```

(continues on next page)

(continued from previous page)

```
>>> d(Integer(51))
4
>>> d(Integer(100))
9
>>> d(Integer(0))
Traceback (most recent call last):

cf()

EXAMPLES:

```
sage: it = sloane.A000009.cf()
sage: [next(it) for i in range(14)]
[1, 1, 1, 2, 2, 3, 4, 5, 6, 8, 10, 12, 15, 18]
```

```
>>> from sage.all import *
>>> it = sloane.A000009.cf()
>>> [next(it) for i in range(Integer(14))]
[1, 1, 1, 2, 2, 3, 4, 5, 6, 8, 10, 12, 15, 18]
```

list(n)

EXAMPLES:

```
sage: sloane.A000009.list(14)
[1, 1, 1, 2, 2, 3, 4, 5, 6, 8, 10, 12, 15, 18]
```

```
>>> from sage.all import *
>>> sloane.A000009.list(Integer(14))
[1, 1, 1, 2, 2, 3, 4, 5, 6, 8, 10, 12, 15, 18]
```

class sage.combinat.sloane_functions.**A000010**

Bases: *SloaneSequence*

The integer sequence A000010 is Euler's totient function.

Number of positive integers $i < n$ that are relative prime to n. Number of totatives of n.

Euler totient function $\phi(n)$: count numbers n and prime to n. `euler_phi` is a standard Sage function implemented in PARI.

INPUT:

- n – nonnegative integer

OUTPUT: integer; function value

EXAMPLES:

```
sage: a = sloane.A000010; a
Euler's totient function
sage: a(1)
1
sage: a(0)
Traceback (most recent call last):
...
ValueError: input n (=0) must be a positive integer
sage: a(11)
10
sage: a.list(12)
[1, 1, 2, 2, 4, 2, 6, 4, 6, 4, 10, 4]
sage: a(1/3)
Traceback (most recent call last):
...
TypeError: input must be an int or Integer
```

```
>>> from sage.all import *
>>> a = sloane.A000010; a
Euler's totient function
>>> a(Integer(1))
1
>>> a(Integer(0))
Traceback (most recent call last):
...
ValueError: input n (=0) must be a positive integer
>>> a(Integer(11))
10
>>> a.list(Integer(12))
[1, 1, 2, 2, 4, 2, 6, 4, 6, 4, 10, 4]
>>> a(Integer(1)/Integer(3))
Traceback (most recent call last):
...
TypeError: input must be an int or Integer
```

AUTHORS:

- Jaap Spies (2007-01-12)

class sage.combinat.sloane_functions.**A000012**

Bases: *SloaneSequence*

The all 1s sequence.

INPUT:

- n – nonnegative integer

OUTPUT: integer; function value

EXAMPLES:

```
sage: a = sloane.A000012; a
The all 1s sequence.
sage: a(1)
1
sage: a(2007)
1
sage: a.list(12)
[1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1]
```

```
>>> from sage.all import *
>>> a = sloane.A000012; a
The all 1s sequence.
>>> a(Integer(1))
1
>>> a(Integer(2007))
1
>>> a.list(Integer(12))
[1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1]
```

AUTHORS:

- Jaap Spies (2007-01-12)

class sage.combinat.sloane_functions.**A000015**

Bases: *SloaneSequence*

Smallest prime power $\geq n$ (where 1 is considered a prime power).

INPUT:

- `n` – nonnegative integer

OUTPUT: integer; function value

EXAMPLES:

```
sage: a = sloane.A000015; a
Smallest prime power >= n.
sage: a(1)
1
sage: a(8)
8
sage: a(305)
307
sage: a(-4)

class sage.combinat.sloane_functions.**A000027**

Bases: *SloaneSequence*

The natural numbers. Also called the whole numbers, the counting numbers or the positive integers.

The following examples are tests of SloaneSequence more than A000027.

EXAMPLES:

```
sage: s = sloane.A000027; s
The natural numbers.
sage: s(10)
10
```

```
>>> from sage.all import *
>>> s = sloane.A000027; s
The natural numbers.
>>> s(Integer(10))
10
```

Index n is interpreted as _eval(n):

```
sage: s[10]
10
```

```
>>> from sage.all import *
>>> s[Integer(10)]
10
```

Slices are interpreted with absolute offsets, so the following returns the terms of the sequence up to but not including the third term:

```
sage: s[:3]
[1, 2]
```

(continues on next page)

(continued from previous page)

```
sage: s[3:6]
[3, 4, 5]
sage: s.list(5)
[1, 2, 3, 4, 5]
```

```
>>> from sage.all import *
>>> s[:Integer(3)]
[1, 2]
>>> s[Integer(3):Integer(6)]
[3, 4, 5]
>>> s.list(Integer(5))
[1, 2, 3, 4, 5]
```

```

class sage.combinat.sloane_functions.**A000120**

Bases: *SloaneSequence*

1s-counting sequence: number of 1s in binary expansion of n.

INPUT:

- `n` – nonnegative integer

OUTPUT: integer; function value

EXAMPLES:

```
sage: a = sloane.A000120;a
1s-counting sequence: number of 1s in binary expansion of n.
sage: a(0)
0
sage: a(2)
1
sage: a(12)
2
sage: a.list(12)
[0, 1, 1, 2, 1, 2, 2, 3, 1, 2, 2, 3]
```

```
>>> from sage.all import *
>>> a = sloane.A000120;a
1s-counting sequence: number of 1s in binary expansion of n.
>>> a(Integer(0))
```

(continues on next page)

(continued from previous page)

```
0
>>> a(Integer(2))
1
>>> a(Integer(12))
2
>>> a.list(Integer(12))
[0, 1, 1, 2, 1, 2, 2, 3, 1, 2, 2, 3]
```

AUTHORS:

- Jaap Spies (2007-01-26)

f(*n*)

EXAMPLES:

```
sage: [sloane.A000120.f(n) for n in range(10)]
[0, 1, 1, 2, 1, 2, 2, 3, 1, 2]
```

```
>>> from sage.all import *
>>> [sloane.A000120.f(n) for n in range(Integer(10))]
[0, 1, 1, 2, 1, 2, 2, 3, 1, 2]
```

class sage.combinat.sloane_functions.**A000124**

Bases: *SloaneSequence*

Central polygonal numbers (the Lazy Caterer's sequence): $n(n+1)/2+1$.

Or, maximal number of pieces formed when slicing a pancake with n cuts.

INPUT:

- n – nonnegative integer

OUTPUT: integer; function value

EXAMPLES:

```
sage: a = sloane.A000124;a
Central polygonal numbers (the Lazy Caterer's sequence): n(n+1)/2 + 1.
sage: a(0)
1
sage: a(1)
2
sage: a(2)
4
sage: a(9)
46
sage: a.list(10)
[1, 2, 4, 7, 11, 16, 22, 29, 37, 46]
```

```
>>> from sage.all import *
>>> a = sloane.A000124;a
Central polygonal numbers (the Lazy Caterer's sequence): n(n+1)/2 + 1.
>>> a(Integer(0))
1
```

(continues on next page)

(continued from previous page)

```
>>> a(Integer(1))
2
>>> a(Integer(2))
4
>>> a(Integer(9))
46
>>> a.list(Integer(10))
[1, 2, 4, 7, 11, 16, 22, 29, 37, 46]
```

AUTHORS:

- Jaap Spies (2007-01-25)

class sage.combinat.sloane_functions.**A000129**

Bases: *RecurrenceSequence2*

Pell numbers: $a(0) = 0, a(1) = 1$; for $n > 1$, $a(n) = 2a(n-1) + a(n-2)$.

Denominators of continued fraction convergents to $\sqrt{2}$.

See also A001333

INPUT:

- `n` – nonnegative integer

OUTPUT: integer; function value

EXAMPLES:

```
sage: a = sloane.A000129;a
Pell numbers: a(0) = 0, a(1) = 1; for n > 1, a(n) = 2*a(n-1) + a(n-2).

class sage.combinat.sloane_functions.**A000261**

Bases: *ExtremesOfPermanentsSequence*

$a(n) = n * a(n-1) + (n-3) * a(n-2)$, with $a(1) = 1$, $a(2) = 1$.

With offset 1, permanent of (0,1)-matrix of size $n \times (n+d)$ with $d = 3$ and n zeros not on a line. This is a special case of Theorem 2.3 of Seok-Zun Song et al. Extremes of permanents of (0,1)-matrices, p. 201-202.

Seok-Zun Song et al., Extremes of permanents of (0,1)-matrices, Lin. Algebra and its Applic. 373 (2003), p. 197-210.

class sage.combinat.sloane_functions.**A001694**

Bases: *SloaneSequence*

This function returns the n-th Powerful Number:

A positive integer n is powerful if for every prime p dividing n, p^2 also divides n.

INPUT:

- `n` – nonnegative integer

OUTPUT: integer; function value

EXAMPLES:

```
sage: a = sloane.A001694; a
Powerful Numbers (also called squarefull, square-full or 2-full numbers).
sage: a.offset
1
sage: a(1)

is_powerful(*n*)

Return `True` if and only if n is a powerful number.

A positive integer n is powerful if for every prime p dividing n, p^2 also divides n.

See OEIS sequence A001694.

INPUT:

- `n` – integer

OUTPUT: `True` if n is a powerful number, else `False`

EXAMPLES:

```
sage: a = sloane.A001694
sage: a.is_powerful(2500)
True
sage: a.is_powerful(20)
False
```

```
>>> from sage.all import *
>>> a = sloane.A001694
>>> a.is_powerful(Integer(2500))
True
>>> a.is_powerful(Integer(20))
False
```

class sage.combinat.sloane_functions.**A010060**

Bases: *SloaneSequence*

Thue-Morse sequence.

Let A_k denote the first 2^k terms; then $A_0 = 0$, and for $k \geq 0$, $A_{k+1} = A_k B_k$, where B_k is obtained from A_k by interchanging 0s and 1s.

INPUT:

- n – nonnegative integer

OUTPUT: integer; function value

EXAMPLES:

```
sage: a = sloane.A010060;a
Thue-Morse sequence.
sage: a(0)
0
sage: a(1)
1
sage: a(2)

Bases: *SloaneSequence*

Function returns solutions to the Dancing School problem with n girls and $n + 3$ boys.

The value is $per(B)$, the permanent of the (0,1)-matrix B of size $n \times n + 3$ with $b(i, j) = 1$ if and only if $i \leq j \leq i + n$.

class sage.combinat.sloane_functions.**A109814**

Bases: *SloaneSequence*

The n th term of the sequence $a(n)$ is the largest k such that n can be written as sum of k consecutive integers.

By definition, n is the sum of at most $a(n)$ consecutive positive integers. Suppose n is to be written as sum of k consecutive integers starting with m, then $2n = k(2m + k - 1)$. Only one of the factors is odd. For each odd divisor d of n there is a unique corresponding $k = min(d, 2n/d)$. $a(n)$ can be alternatively defined as the largest among those k .

>>> a(Integer(1)/Integer(3))
Traceback (most recent call last):
...
TypeError: input must be an int or Integer
```

AUTHORS:

- Jaap Spies (2007-01-13)

is_number_of_the_third_kind(*n*)

Return `True` if and only if n is a number of the third kind.

A number is of the third kind if it can be written as a sum of at least three consecutive positive integers. Odd primes can only be written as a sum of two consecutive integers. Powers of 2 do not have a representation as a sum of k consecutive integers (other than the trivial $n = n$ for $k = 1$).

See: http://www.jaapspies.nl/mathfiles/problem2005-2C.pdf

INPUT:

- `n` – positive integer

OUTPUT: `True` if n is not prime and not a power of 2

EXAMPLES:

```
sage: a = sloane.A111774
sage: a.is_number_of_the_third_kind(6)
True
sage: a.is_number_of_the_third_kind(100)
True
sage: a.is_number_of_the_third_kind(16)
False
sage: a.is_number_of_the_third_kind(97)
False
```

```
>>> from sage.all import *
>>> a = sloane.A111774
```

(continues on next page)

(continued from previous page)

```
>>> a.is_number_of_the_third_kind(Integer(6))
True
>>> a.is_number_of_the_third_kind(Integer(100))
True
>>> a.is_number_of_the_third_kind(Integer(16))
False
>>> a.is_number_of_the_third_kind(Integer(97))
False
```

AUTHORS:

- Jaap Spies (2006-12-09)

list(*n*)

EXAMPLES:

```
sage: sloane.A111774.list(12)
[6, 9, 10, 12, 14, 15, 18, 20, 21, 22, 24, 25]
```

```
>>> from sage.all import *
>>> sloane.A111774.list(Integer(12))
[6, 9, 10, 12, 14, 15, 18, 20, 21, 22, 24, 25]
```

class sage.combinat.sloane_functions.**A111775**

Bases: *SloaneSequence*

Number of ways n can be written as a sum of at least three consecutive integers.

Powers of 2 and (odd) primes can not be written as a sum of at least three consecutive integers. $a(n)$ strongly depends on the number of odd divisors of n (A001227): Suppose n is to be written as sum of k consecutive integers starting with m, then $2n = k(2m + k - 1)$. Only one of the factors is odd. For each odd divisor of n there is a unique corresponding k, $k = 1$ and $k = 2$ must be excluded.

See: http://www.jaapspies.nl/mathfiles/problem2005-2C.pdf

INPUT:

- `n` – nonnegative integer

OUTPUT: integer; function value

EXAMPLES:

```
sage: a = sloane.A111775; a
Number of ways n can be written as a sum of at least three consecutive integers.
```

```
>>> from sage.all import *
>>> a = sloane.A111775; a
Number of ways n can be written as a sum of at least three consecutive integers.
```

```
sage: a(1)
0
sage: a(0)
0
```

```
>>> from sage.all import *
>>> a(Integer(1))
0
>>> a(Integer(0))
0
```

We have a(15)=2 because 15 = 4+5+6 and 15 = 1+2+3+4+5. The number of odd divisors of 15 is 4.

```
sage: a(15)
2
```

```
>>> from sage.all import *
>>> a(Integer(15))
2
```

```
sage: a(100)
2
sage: a(256)
0
sage: a(29)
0
sage: a.list(20)
[0, 0, 0, 0, 0, 0, 1, 0, 0, 1, 1, 0, 1, 0, 1, 2, 0, 0, 2, 0]
sage: a(1/3)
Traceback (most recent call last):
...
TypeError: input must be an int or Integer
```

```
>>> from sage.all import *
>>> a(Integer(100))
2
>>> a(Integer(256))
0
>>> a(Integer(29))
0
>>> a.list(Integer(20))
[0, 0, 0, 0, 0, 0, 1, 0, 0, 1, 1, 0, 1, 0, 1, 2, 0, 0, 2, 0]
>>> a(Integer(1)/Integer(3))
Traceback (most recent call last):
...
TypeError: input must be an int or Integer
```

class sage.combinat.sloane_functions.**A111787**

Bases: *SloaneSequence*

This function returns the n-th number of Sloane's sequence A111787

$a(n) = 0$ if n is an odd prime or a power of 2. For numbers of the third kind (see A111774) we proceed as follows: suppose n is to be written as sum of k consecutive integers starting with m, then $2n = k(2m + k - 1)$. Let p be the smallest odd prime divisor of n then $a(n) = min(p, 2n/p)$.

See: http://www.jaapspies.nl/mathfiles/problem2005-2C.pdf

INPUT:

- `n` – nonnegative integer

OUTPUT: integer; function value

EXAMPLES:

```
sage: a = sloane.A111787; a
a(n) is the least k >= 3 such that n can be written as sum of k consecutive␣
↪integers. a(n)=0 if such a k does not exist.

class sage.combinat.sloane_functions.**ExponentialNumbers**(*a*)

Bases: *SloaneSequence*

A sequence of Exponential numbers.

EXAMPLES:

```
sage: from sage.combinat.sloane_functions import ExponentialNumbers
sage: ExponentialNumbers(0)
Sequence of Exponential numbers around 0
```

```
>>> from sage.all import *
>>> from sage.combinat.sloane_functions import ExponentialNumbers
>>> ExponentialNumbers(Integer(0))
Sequence of Exponential numbers around 0
```

class sage.combinat.sloane_functions.**ExtremesOfPermanentsSequence**(*offset=1*)

Bases: *SloaneSequence*

gen(*a0*, *a1*, *d*)

EXAMPLES:

```
sage: it = sloane.A000153.gen(0,1,2)
sage: [next(it) for i in range(5)]
[0, 1, 2, 7, 32]
```

```
>>> from sage.all import *
>>> it = sloane.A000153.gen(Integer(0),Integer(1),Integer(2))
>>> [next(it) for i in range(Integer(5))]
[0, 1, 2, 7, 32]
```

list(*n*)

EXAMPLES:

```
sage: sloane.A000153.list(8)
[0, 1, 2, 7, 32, 181, 1214, 9403]
```

```
>>> from sage.all import *
>>> sloane.A000153.list(Integer(8))
[0, 1, 2, 7, 32, 181, 1214, 9403]
```

class sage.combinat.sloane_functions.**ExtremesOfPermanentsSequence2**(*offset=1*)

Bases: *ExtremesOfPermanentsSequence*

gen(*a0*, *a1*, *d*)

EXAMPLES:

```
sage: from sage.combinat.sloane_functions import ExtremesOfPermanentsSequence2
sage: e = ExtremesOfPermanentsSequence2()
sage: it = e.gen(6,43,6)
sage: [next(it) for i in range(5)]
[6, 43, 307, 2542, 23799]
```

```
>>> from sage.all import *
>>> from sage.combinat.sloane_functions import ExtremesOfPermanentsSequence2
>>> e = ExtremesOfPermanentsSequence2()
>>> it = e.gen(Integer(6),Integer(43),Integer(6))
>>> [next(it) for i in range(Integer(5))]
[6, 43, 307, 2542, 23799]
```

class sage.combinat.sloane_functions.**RecurrenceSequence**(*offset=1*)

Bases: *SloaneSequence*

list(*n*)

EXAMPLES:

```
sage: sloane.A001110.list(8)
[0, 1, 36, 1225, 41616, 1413721, 48024900, 1631432881]
```

```
>>> from sage.all import *
>>> sloane.A001110.list(Integer(8))
[0, 1, 36, 1225, 41616, 1413721, 48024900, 1631432881]
```

class sage.combinat.sloane_functions.**RecurrenceSequence2**(*offset=1*)

Bases: *SloaneSequence*

list(*n*)

EXAMPLES:

```
sage: sloane.A001906.list(10)
[0, 1, 3, 8, 21, 55, 144, 377, 987, 2584]
```

```
>>> from sage.all import *
>>> sloane.A001906.list(Integer(10))
[0, 1, 3, 8, 21, 55, 144, 377, 987, 2584]
```

class sage.combinat.sloane_functions.**Sloane**

Bases: SageObject

A collection of Sloane generating functions.

This class inspects sage.combinat.sloane_functions, accumulating all the SloaneSequence classes starting with 'A'. These are listed for tab completion, but not instantiated until requested.

EXAMPLES:

Ensure we have lots of entries:

```
sage: len(sloane.__dir__()) > 100
True
```

```
>>> from sage.all import *
>>> len(sloane.__dir__()) > Integer(100)
True
```

Ensure none are being incorrectly returned:

```
sage: [ None for n in sloane.__dir__() if not n.startswith('A') ]
[]
```

```
>>> from sage.all import *
>>> [ None for n in sloane.__dir__() if not n.startswith('A') ]
[]
```

Ensure we can access dynamic constructions and cache correctly:

```
sage: s = sloane.A000587
sage: s is sloane.A000587
True
```

```
>>> from sage.all import *
>>> s = sloane.A000587
>>> s is sloane.A000587
True
```

Ensure that we can access other functions in parent classes:

```
sage: sloane.__class__
<class 'sage.combinat.sloane_functions.Sloane'>
```

```
>>> from sage.all import *
>>> sloane.__class__
<class 'sage.combinat.sloane_functions.Sloane'>
```

AUTHORS:

- Nick Alexander

class sage.combinat.sloane_functions.**SloaneSequence**(*offset=1*)

Bases: SageObject

Base class for a Sloane integer sequence.

list(*n*)

Return n terms of the sequence:

```
sequence[offset], sequence[offset+1], ..., sequence[offset+n-1].
```

EXAMPLES:

```
sage: sloane.A000012.list(4)
[1, 1, 1, 1]
```

```
>>> from sage.all import *
>>> sloane.A000012.list(Integer(4))
[1, 1, 1, 1]
```

sage.combinat.sloane_functions.**perm_mh**(*m*, *h*)

This functions calculates $f(g, h)$ from Sloane's sequences A079908-A079928

INPUT:

- m – positive integer
- h – nonnegative integer

OUTPUT: permanent of the $m \times (m + h)$ matrix, etc.

EXAMPLES:

```
sage: from sage.combinat.sloane_functions import perm_mh
sage: perm_mh(3,3)
36
sage: perm_mh(3,4)
76
```

```
>>> from sage.all import *
>>> from sage.combinat.sloane_functions import perm_mh
>>> perm_mh(Integer(3),Integer(3))
36
>>> perm_mh(Integer(3),Integer(4))
76
```

AUTHORS:

- Jaap Spies (2006)

sage.combinat.sloane_functions.**recur_gen2**(*a0*, *a1*, *a2*, *a3*)

Homogeneous general second-order linear recurrence generator with fixed coefficients.

a(0) = a0, a(1) = a1, a(n) = a2*a(n-1) + a3*a(n-2)

EXAMPLES:

```
sage: from sage.combinat.sloane_functions import recur_gen2
sage: it = recur_gen2(1,1,1,1)
sage: [next(it) for i in range(10)]
[1, 1, 2, 3, 5, 8, 13, 21, 34, 55]
```

```
>>> from sage.all import *
>>> from sage.combinat.sloane_functions import recur_gen2
>>> it = recur_gen2(Integer(1),Integer(1),Integer(1),Integer(1))
>>> [next(it) for i in range(Integer(10))]
[1, 1, 2, 3, 5, 8, 13, 21, 34, 55]
```

sage.combinat.sloane_functions.**recur_gen2b**(*a0*, *a1*, *a2*, *a3*, *b*)

Inhomogeneous second-order linear recurrence generator with fixed coefficients and $b = f(n)$

$a(0) = a0, a(1) = a1, a(n) = a2 * a(n-1) + a3 * a(n-2) + f(n)$.

EXAMPLES:

```
sage: from sage.combinat.sloane_functions import recur_gen2b
sage: it = recur_gen2b(1,1,1,1, lambda n: 0)
sage: [next(it) for i in range(10)]
[1, 1, 2, 3, 5, 8, 13, 21, 34, 55]
```

```
>>> from sage.all import *
>>> from sage.combinat.sloane_functions import recur_gen2b
>>> it = recur_gen2b(Integer(1),Integer(1),Integer(1),Integer(1), lambda n:␣
↪Integer(0))
>>> [next(it) for i in range(Integer(10))]
[1, 1, 2, 3, 5, 8, 13, 21, 34, 55]
```

sage.combinat.sloane_functions.**recur_gen3**(*a0*, *a1*, *a2*, *a3*, *a4*, *a5*)

Homogeneous general third-order linear recurrence generator with fixed coefficients

a(0) = a0, a(1) = a1, a(2) = a2, a(n) = a3*a(n-1) + a4*a(n-2) + a5*a(n-3)

EXAMPLES:

```
sage: from sage.combinat.sloane_functions import recur_gen3
sage: it = recur_gen3(1,1,1,1,1,1)
sage: [next(it) for i in range(10)]
[1, 1, 1, 3, 5, 9, 17, 31, 57, 105]
```

```
>>> from sage.all import *
>>> from sage.combinat.sloane_functions import recur_gen3
>>> it = recur_gen3(Integer(1),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1))
>>> [next(it) for i in range(Integer(10))]
[1, 1, 1, 3, 5, 9, 17, 31, 57, 105]
```

Gelfand-Tsetlin patterns

AUTHORS:

- Travis Scrimshaw (2013-15-03): initial version

class sage.combinat.gelfand_tsetlin_patterns.**GelfandTsetlinPattern**

Bases: ClonableArray

A Gelfand-Tsetlin (sometimes written as Gelfand-Zetlin or Gelfand-Cetlin) pattern. They were originally defined in [GC50].

A Gelfand-Tsetlin pattern is a triangular array:

$$\begin{array}{ccccccccc} a_{1,1} & & a_{1,2} & & a_{1,3} & & \cdots & & a_{1,n} \\ & a_{2,2} & & a_{2,3} & & \cdots & & a_{2,n} & \\ & & a_{3,3} & & \cdots & & a_{3,n} & & \\ & & & \ddots & & & & & \\ & & & & a_{n,n} & & & & \end{array}$$

such that $a_{i,j} \geq a_{i+1,j+1} \geq a_{i,j+1}$.

Gelfand-Tsetlin patterns are in bijection with semistandard Young tableaux by the following algorithm. Let G be a Gelfand-Tsetlin pattern with $\lambda^{(k)}$ being the $(n-k+1)$-st row (note that this is a partition). The definition of G implies

$$\lambda^{(0)} \subseteq \lambda^{(1)} \subseteq \cdots \subseteq \lambda^{(n)},$$

where $\lambda^{(0)}$ is the empty partition, and each skew shape $\lambda^{(k)}/\lambda^{(k-1)}$ is a horizontal strip. Thus define $T(G)$ by inserting k into the squares of the skew shape $\lambda^{(k)}/\lambda^{(k-1)}$, for $k = 1, \ldots, n$.

To each entry in a Gelfand-Tsetlin pattern, one may attach a decoration of a circle or a box (or both or neither). These decorations appear in the study of Weyl group multiple Dirichlet series, and are implemented here following the exposition in [BBF].

Note

We use the "right-hand" rule for determining circled and boxed entries.

Warning

The entries in Sage are 0-based and are thought of as flushed to the left in a matrix. In other words, the coordinates of entries in the Gelfand-Tsetlin patterns are thought of as the matrix:

$$\begin{bmatrix} g_{0,0} & g_{0,1} & g_{0,2} & \cdots & g_{0,n-2} & g_{n-1,n-1} \\ g_{1,0} & g_{1,1} & g_{1,2} & \cdots & g_{1,n-2} & \\ g_{2,0} & g_{2,1} & g_{2,2} & \cdots & & \\ \vdots & \vdots & \vdots & & & \\ g_{n-2,0} & g_{n-2,1} & & & & \\ g_{n-1,0} & & & & & \end{bmatrix}.$$

However, in the discussions, we will be using the **standard** numbering system.

EXAMPLES:

```
sage: G = GelfandTsetlinPattern([[3, 2, 1], [2, 1], [1]]); G
[[3, 2, 1], [2, 1], [1]]
sage: G.pp()
  3  2  1
    2  1
       1
sage: G = GelfandTsetlinPattern([[7, 7, 4, 0], [7, 7, 3], [7, 5], [5]]); G.pp()
  7  7  4  0
    7  7  3
       7  5
          5
sage: G.to_tableau().pp()
  1  1  1  1  1  2  2
  2  2  2  2  2  3  3
  3  3  3  4
```

```
>>> from sage.all import *
>>> G = GelfandTsetlinPattern([[Integer(3), Integer(2), Integer(1)], [Integer(2),␣
↪Integer(1)], [Integer(1)]]); G
[[3, 2, 1], [2, 1], [1]]
>>> G.pp()
  3  2  1
    2  1
       1
>>> G = GelfandTsetlinPattern([[Integer(7), Integer(7), Integer(4), Integer(0)],␣
↪[Integer(7), Integer(7), Integer(3)], [Integer(7), Integer(5)], [Integer(5)]]);␣
```

(continues on next page)

(continued from previous page)

```
↪G.pp()
  7     7     4     0
    7     7     3
      7     5
        5
>>> G.to_tableau().pp()
  1  1  1  1  1  2  2
  2  2  2  2  2  3  3
  3  3  3  4
```

Tokuyama_coefficient(*name='t'*)

Return the Tokuyama coefficient attached to `self`.

Following the exposition of [BBF], Tokuyama's formula asserts

$$\sum_G (t+1)^{s(G)} t^{l(G)} z_1^{d_{n+1}} z_2^{d_n - d_{n+1}} \cdots z_{n+1}^{d_1 - d_2} = s_\lambda(z_1, \ldots, z_{n+1}) \prod_{i<j} (z_j + t z_i),$$

where the sum is over all strict Gelfand-Tsetlin patterns with fixed top row $\lambda + \rho$, with λ a partition with at most $n+1$ parts and $\rho = (n, n-1, \ldots, 1, 0)$, and s_λ is a Schur function.

INPUT:

- `name` – (default: `'t'`) an alternative name for the variable t

EXAMPLES:

```
sage: P = GelfandTsetlinPattern([[3,2,1],[2,2],[2]])
sage: P.Tokuyama_coefficient()
0
sage: G = GelfandTsetlinPattern([[3,2,1],[3,1],[2]])
sage: G.Tokuyama_coefficient()
t^2 + t
sage: G = GelfandTsetlinPattern([[2,1,0],[1,1],[1]])
sage: G.Tokuyama_coefficient()
0
sage: G = GelfandTsetlinPattern([[5,3,2,1,0],[4,3,2,0],[4,2,1],[3,2],[3]])
sage: G.Tokuyama_coefficient()
t^8 + 3*t^7 + 3*t^6 + t^5
```

```
>>> from sage.all import *
>>> P = GelfandTsetlinPattern([[Integer(3),Integer(2),Integer(1)],[Integer(2),
↪Integer(2)],[Integer(2)]])
>>> P.Tokuyama_coefficient()
0
>>> G = GelfandTsetlinPattern([[Integer(3),Integer(2),Integer(1)],[Integer(3),
↪Integer(1)],[Integer(2)]])
>>> G.Tokuyama_coefficient()
t^2 + t
>>> G = GelfandTsetlinPattern([[Integer(2),Integer(1),Integer(0)],[Integer(1),
↪Integer(1)],[Integer(1)]])
>>> G.Tokuyama_coefficient()
0
>>> G = GelfandTsetlinPattern([[Integer(5),Integer(3),Integer(2),Integer(1),
```

(continues on next page)

(continued from previous page)

```
↪Integer(0)],[Integer(4),Integer(3),Integer(2),Integer(0)],[Integer(4),
↪Integer(2),Integer(1)],[Integer(3),Integer(2)],[Integer(3)]])
>>> G.Tokuyama_coefficient()
t^8 + 3*t^7 + 3*t^6 + t^5
```

bender_knuth_involution(i)

Return the image of `self` under the i-th Bender-Knuth involution.

If the triangle `self` has size n then this is defined for $0 < i < n$.

The entries of `self` can take values in any ordered ring. Usually, this will be the integers but can also be the rationals or the real numbers.

This implements the construction of the Bender-Knuth involution using toggling due to Berenstein-Kirillov.

This agrees with the Bender-Knuth involution on semistandard tableaux.

EXAMPLES:

```
sage: G = GelfandTsetlinPattern([[5,3,2,1,0],[4,3,2,0],[4,2,1],[3,2],[3]])
sage: G.bender_knuth_involution(2)
[[5, 3, 2, 1, 0], [4, 3, 2, 0], [4, 2, 1], [4, 1], [3]]

sage: G = GelfandTsetlinPattern([[3,2,0],[2.2,0],[2]])
sage: G.bender_knuth_involution(2)
[[3, 2, 0], [2.80000000000000, 2], [2]]
```

```
>>> from sage.all import *
>>> G = GelfandTsetlinPattern([[Integer(5),Integer(3),Integer(2),Integer(1),
↪Integer(0)],[Integer(4),Integer(3),Integer(2),Integer(0)],[Integer(4),
↪Integer(2),Integer(1)],[Integer(3),Integer(2)],[Integer(3)]])
>>> G.bender_knuth_involution(Integer(2))
[[5, 3, 2, 1, 0], [4, 3, 2, 0], [4, 2, 1], [4, 1], [3]]

>>> G = GelfandTsetlinPattern([[Integer(3),Integer(2),Integer(0)],[RealNumber(
↪'2.2'),Integer(0)],[Integer(2)]])
>>> G.bender_knuth_involution(Integer(2))
[[3, 2, 0], [2.80000000000000, 2], [2]]
```

boxed_entries()

Return the position of the boxed entries of `self`.

Using the *right-hand* rule, an entry $a_{i,j}$ is boxed if $a_{i,j} = a_{i-1,j-1}$; i.e., $a_{i,j}$ has the same value as its neighbor to the northwest.

EXAMPLES:

```
sage: G = GelfandTsetlinPattern([[3,2,1],[3,1],[1]])
sage: G.boxed_entries()
((1, 0),)
```

```
>>> from sage.all import *
>>> G = GelfandTsetlinPattern([[Integer(3),Integer(2),Integer(1)],[Integer(3),
↪Integer(1)],[Integer(1)]])
```

(continues on next page)

(continued from previous page)

```
>>> G.boxed_entries()
((1, 0),)
```

check()

Check that this is a valid Gelfand-Tsetlin pattern.

EXAMPLES:

```
sage: G = GelfandTsetlinPatterns()
sage: G([[3,2,1],[2,1],[1]]).check()
```

```
>>> from sage.all import *
>>> G = GelfandTsetlinPatterns()
>>> G([[Integer(3),Integer(2),Integer(1)],[Integer(2),Integer(1)],
↪[Integer(1)]]).check()
```

circled_entries()

Return the circled entries of `self`.

Using the *right-hand* rule, an entry $a_{i,j}$ is circled if $a_{i,j} = a_{i-1,j}$; i.e., $a_{i,j}$ has the same value as its neighbor to the northeast.

EXAMPLES:

```
sage: G = GelfandTsetlinPattern([[3,2,1],[3,1],[1]])
sage: G.circled_entries()
((1, 1), (2, 0))
```

```
>>> from sage.all import *
>>> G = GelfandTsetlinPattern([[Integer(3),Integer(2),Integer(1)],[Integer(3),
↪Integer(1)],[Integer(1)]])
>>> G.circled_entries()
((1, 1), (2, 0))
```

is_strict()

Return `True` if `self` is a strict Gelfand-Tsetlin pattern.

A Gelfand-Tsetlin pattern is said to be *strict* if every row is strictly decreasing.

EXAMPLES:

```
sage: GelfandTsetlinPattern([[7,3,1],[6,2],[4]]).is_strict()
True
sage: GelfandTsetlinPattern([[3,2,1],[3,1],[1]]).is_strict()
True
sage: GelfandTsetlinPattern([[6,0,0],[3,0],[2]]).is_strict()
False
```

```
>>> from sage.all import *
>>> GelfandTsetlinPattern([[Integer(7),Integer(3),Integer(1)],[Integer(6),
↪Integer(2)],[Integer(4)]]).is_strict()
True
>>> GelfandTsetlinPattern([[Integer(3),Integer(2),Integer(1)],[Integer(3),
```

(continues on next page)

(continued from previous page)

```
↪Integer(1)],[Integer(1)]]).is_strict()
True
>>> GelfandTsetlinPattern([[Integer(6),Integer(0),Integer(0)],[Integer(3),
↪Integer(0)],[Integer(2)]]).is_strict()
False
```

number_of_boxes()

Return the number of boxed entries. See *boxed_entries()*.

EXAMPLES:

```
sage: G = GelfandTsetlinPattern([[3,2,1],[3,1],[1]])
sage: G.number_of_boxes()
1
```

```
>>> from sage.all import *
>>> G = GelfandTsetlinPattern([[Integer(3),Integer(2),Integer(1)],[Integer(3),
↪Integer(1)],[Integer(1)]])
>>> G.number_of_boxes()
1
```

number_of_circles()

Return the number of boxed entries. See *circled_entries()*.

EXAMPLES:

```
sage: G = GelfandTsetlinPattern([[3,2,1],[3,1],[1]])
sage: G.number_of_circles()
2
```

```
>>> from sage.all import *
>>> G = GelfandTsetlinPattern([[Integer(3),Integer(2),Integer(1)],[Integer(3),
↪Integer(1)],[Integer(1)]])
>>> G.number_of_circles()
2
```

number_of_special_entries()

Return the number of special entries. See *special_entries()*.

EXAMPLES:

```
sage: G = GelfandTsetlinPattern([[4,2,1],[4,1],[2]])
sage: G.number_of_special_entries()
1
```

```
>>> from sage.all import *
>>> G = GelfandTsetlinPattern([[Integer(4),Integer(2),Integer(1)],[Integer(4),
↪Integer(1)],[Integer(2)]])
>>> G.number_of_special_entries()
1
```

pp()

Pretty print `self`.

EXAMPLES:

```
sage: G = GelfandTsetlinPatterns()
sage: G([[3,2,1],[2,1],[1]]).pp()
  3     2     1
     2     1
        1
```

```
>>> from sage.all import *
>>> G = GelfandTsetlinPatterns()
>>> G([[Integer(3),Integer(2),Integer(1)],[Integer(2),Integer(1)],
↪[Integer(1)]]).pp()
  3     2     1
     2     1
        1
```

row_sums()

Return the list of row sums.

For a Gelfand-Tsetlin pattern G, the i-th row sum d_i is

$$d_i = d_i(G) = \sum_{j=i}^{n} a_{i,j}.$$

EXAMPLES:

```
sage: G = GelfandTsetlinPattern([[5,3,2,1,0],[4,3,2,0],[4,2,1],[3,2],[3]])
sage: G.row_sums()
[11, 9, 7, 5, 3]
sage: G = GelfandTsetlinPattern([[3,2,1],[3,1],[2]])
sage: G.row_sums()
[6, 4, 2]
```

```
>>> from sage.all import *
>>> G = GelfandTsetlinPattern([[Integer(5),Integer(3),Integer(2),Integer(1),
↪Integer(0)],[Integer(4),Integer(3),Integer(2),Integer(0)],[Integer(4),
↪Integer(2),Integer(1)],[Integer(3),Integer(2)],[Integer(3)]])
>>> G.row_sums()
[11, 9, 7, 5, 3]
>>> G = GelfandTsetlinPattern([[Integer(3),Integer(2),Integer(1)],[Integer(3),
↪Integer(1)],[Integer(2)]])
>>> G.row_sums()
[6, 4, 2]
```

special_entries()

Return the special entries.

An entry $a_{i,j}$ is special if $a_{i-1,j-1} > a_{i,j} > a_{i-1,j}$, that is to say, the entry is neither boxed nor circled and is **not** in the first row. The name was coined by [Tok88].

EXAMPLES:

```
sage: G = GelfandTsetlinPattern([[3,2,1],[3,1],[1]])
sage: G.special_entries()
```

(continues on next page)

(continued from previous page)

```
()
sage: G = GelfandTsetlinPattern([[4,2,1],[4,1],[2]])
sage: G.special_entries()
((2, 0),)
```

```
>>> from sage.all import *
>>> G = GelfandTsetlinPattern([[Integer(3),Integer(2),Integer(1)],[Integer(3),
↪Integer(1)],[Integer(1)]])
>>> G.special_entries()
()
>>> G = GelfandTsetlinPattern([[Integer(4),Integer(2),Integer(1)],[Integer(4),
↪Integer(1)],[Integer(2)]])
>>> G.special_entries()
((2, 0),)
```

to_tableau()

Return `self` as a semistandard Young tableau.

The conversion from a Gelfand-Tsetlin pattern to a semistandard Young tableaux is as follows. Let G be a Gelfand-Tsetlin pattern with $\lambda^{(k)}$ being the $(n-k+1)$-st row (note that this is a partition). The definition of G implies

$$\lambda^{(0)} \subseteq \lambda^{(1)} \subseteq \cdots \subseteq \lambda^{(n)},$$

where $\lambda^{(0)}$ is the empty partition, and each skew shape $\lambda^{(k)}/\lambda^{(k-1)}$ is a horizontal strip. Thus define $T(G)$ by inserting k into the squares of the skew shape $\lambda^{(k)}/\lambda^{(k-1)}$, for $k = 1, \ldots, n$.

EXAMPLES:

```
sage: G = GelfandTsetlinPatterns()
sage: elt = G([[3,2,1],[2,1],[1]])
sage: T = elt.to_tableau(); T
[[1, 2, 3], [2, 3], [3]]
sage: T.pp()
  1  2  3
  2  3
  3
sage: G(T) == elt
True
```

```
>>> from sage.all import *
>>> G = GelfandTsetlinPatterns()
>>> elt = G([[Integer(3),Integer(2),Integer(1)],[Integer(2),Integer(1)],
↪[Integer(1)]])
>>> T = elt.to_tableau(); T
[[1, 2, 3], [2, 3], [3]]
>>> T.pp()
  1  2  3
  2  3
  3
>>> G(T) == elt
True
```

weight()

Return the weight of `self`.

Define the weight of G to be the content of the tableau to which G corresponds under the bijection between Gelfand-Tsetlin patterns and semistandard tableaux. More precisely,

$$\mathrm{wt}(G) = (d_n, d_{n-1} - d_n, \ldots, d_1 - d_2),$$

where the d_i are the row sums.

EXAMPLES:

```
sage: G = GelfandTsetlinPattern([[2,1,0],[1,0],[1]])
sage: G.weight()
(1, 0, 2)
sage: G = GelfandTsetlinPattern([[4,2,1],[3,1],[2]])
sage: G.weight()
(2, 2, 3)
```

```
>>> from sage.all import *
>>> G = GelfandTsetlinPattern([[Integer(2),Integer(1),Integer(0)],[Integer(1),
↪Integer(0)],[Integer(1)]])
>>> G.weight()
(1, 0, 2)
>>> G = GelfandTsetlinPattern([[Integer(4),Integer(2),Integer(1)],[Integer(3),
↪Integer(1)],[Integer(2)]])
>>> G.weight()
(2, 2, 3)
```

class sage.combinat.gelfand_tsetlin_patterns.**GelfandTsetlinPatterns**(*n*, *k*, *strict*)

Bases: `UniqueRepresentation`, `Parent`

Gelfand-Tsetlin patterns.

INPUT:

- `n` – the width or depth of the array, also known as the rank
- `k` – (default: `None`) if specified, this is the maximum value that can occur in the patterns
- `top_row` – (default: `None`) if specified, this is the fixed top row of all patterns
- `strict` – (default: `False`) set to `True` if all patterns are strict patterns

Element

alias of *GelfandTsetlinPattern*

random_element()

Return a uniformly random Gelfand-Tsetlin pattern.

EXAMPLES:

```
sage: g = GelfandTsetlinPatterns(4, 5)
sage: x = g.random_element()
sage: x in g
True
sage: len(x)
4
```

(continues on next page)

(continued from previous page)

```
sage: all(y in range(5+1) for z in x for y in z)
True
sage: x.check()
```

```
>>> from sage.all import *
>>> g = GelfandTsetlinPatterns(Integer(4), Integer(5))
>>> x = g.random_element()
>>> x in g
True
>>> len(x)
4
>>> all(y in range(Integer(5)+Integer(1)) for z in x for y in z)
True
>>> x.check()
```

```
sage: g = GelfandTsetlinPatterns(4, 5, strict=True)
sage: x = g.random_element()
sage: x in g
True
sage: len(x)
4
sage: all(y in range(5+1) for z in x for y in z)
True
sage: x.check()
sage: x.is_strict()
True
```

```
>>> from sage.all import *
>>> g = GelfandTsetlinPatterns(Integer(4), Integer(5), strict=True)
>>> x = g.random_element()
>>> x in g
True
>>> len(x)
4
>>> all(y in range(Integer(5)+Integer(1)) for z in x for y in z)
True
>>> x.check()
>>> x.is_strict()
True
```

class sage.combinat.gelfand_tsetlin_patterns.**GelfandTsetlinPatternsTopRow**(*top_row*, *strict*)

Bases: *GelfandTsetlinPatterns*

Gelfand-Tsetlin patterns with a fixed top row.

Tokuyama_formula(*name='t'*)

Return the Tokuyama formula of `self`.

Following the exposition of [BBF], Tokuyama's formula asserts

$$\sum_G (t+1)^{s(G)} t^{l(G)} z_1^{d_{n+1}} z_2^{d_n - d_{n+1}} \cdots z_{n+1}^{d_1 - d_2} = s_\lambda(z_1, \ldots, z_{n+1}) \prod_{i<j} (z_j + t z_i),$$

where the sum is over all strict Gelfand-Tsetlin patterns with fixed top row $\lambda + \rho$, with λ a partition with at most $n+1$ parts and $\rho = (n, n-1, \ldots, 1, 0)$, and s_λ is a Schur function.

INPUT:

- `name` – (default: `'t'`) an alternative name for the variable t

EXAMPLES:

```
sage: GT = GelfandTsetlinPatterns(top_row=[2,1,0],strict=True)
sage: GT.Tokuyama_formula()
t^3*x1^2*x2 + t^2*x1*x2^2 + t^2*x1^2*x3 + t^2*x1*x2*x3 + t*x1*x2*x3 + t*x2^
↪2*x3 + t*x1*x3^2 + x2*x3^2
sage: GT = GelfandTsetlinPatterns(top_row=[3,2,1],strict=True)
sage: GT.Tokuyama_formula()
t^3*x1^3*x2^2*x3 + t^2*x1^2*x2^3*x3 + t^2*x1^3*x2*x3^2 + t^2*x1^2*x2^2*x3^2 +␣
↪t*x1^2*x2^2*x3^2 + t*x1*x2^3*x3^2 + t*x1^2*x2*x3^3 + x1*x2^2*x3^3
sage: GT = GelfandTsetlinPatterns(top_row=[1,1,1],strict=True)
sage: GT.Tokuyama_formula()
0
```

```
>>> from sage.all import *
>>> GT = GelfandTsetlinPatterns(top_row=[Integer(2),Integer(1),Integer(0)],
↪strict=True)
>>> GT.Tokuyama_formula()
t^3*x1^2*x2 + t^2*x1*x2^2 + t^2*x1^2*x3 + t^2*x1*x2*x3 + t*x1*x2*x3 + t*x2^
↪2*x3 + t*x1*x3^2 + x2*x3^2
>>> GT = GelfandTsetlinPatterns(top_row=[Integer(3),Integer(2),Integer(1)],
↪strict=True)
>>> GT.Tokuyama_formula()
t^3*x1^3*x2^2*x3 + t^2*x1^2*x2^3*x3 + t^2*x1^3*x2*x3^2 + t^2*x1^2*x2^2*x3^2 +␣
↪t*x1^2*x2^2*x3^2 + t*x1*x2^3*x3^2 + t*x1^2*x2*x3^3 + x1*x2^2*x3^3
>>> GT = GelfandTsetlinPatterns(top_row=[Integer(1),Integer(1),Integer(1)],
↪strict=True)
>>> GT.Tokuyama_formula()
0
```

random_element()

Return a uniformly random Gelfand-Tsetlin pattern with specified top row.

EXAMPLES:

```
sage: g = GelfandTsetlinPatterns(top_row = [4, 3, 1, 1])
sage: x = g.random_element()
sage: x in g
True
sage: x[0] == [4, 3, 1, 1]
True
sage: x.check()

sage: g = GelfandTsetlinPatterns(top_row=[4, 3, 2, 1], strict=True)
sage: x = g.random_element()
sage: x in g
True
sage: x[0] == [4, 3, 2, 1]
```

(continues on next page)

(continued from previous page)

```
True
sage: x.is_strict()
True
sage: x.check()
```

```
>>> from sage.all import *
>>> g = GelfandTsetlinPatterns(top_row = [Integer(4), Integer(3), Integer(1),␣
↪Integer(1)])
>>> x = g.random_element()
>>> x in g
True
>>> x[Integer(0)] == [Integer(4), Integer(3), Integer(1), Integer(1)]
True
>>> x.check()

>>> g = GelfandTsetlinPatterns(top_row=[Integer(4), Integer(3), Integer(2),␣
↪Integer(1)], strict=True)
>>> x = g.random_element()
>>> x in g
True
>>> x[Integer(0)] == [Integer(4), Integer(3), Integer(2), Integer(1)]
True
>>> x.is_strict()
True
>>> x.check()
```

top_row()

Return the top row of `self`.

EXAMPLES:

```
sage: G = GelfandTsetlinPatterns(top_row=[4,4,3,1])
sage: G.top_row()
(4, 4, 3, 1)
```

```
>>> from sage.all import *
>>> G = GelfandTsetlinPatterns(top_row=[Integer(4),Integer(4),Integer(3),
↪Integer(1)])
>>> G.top_row()
(4, 4, 3, 1)
```

Generalized Tamari lattices

These lattices depend on three parameters a, b and m, where a and b are positive integers and m is a nonnegative integer.

The elements are *Dyck paths* in the $(a \times b)$-rectangle. The order relation depends on m.

To use the provided functionality, you should import Generalized Tamari lattices by typing:

```
sage: from sage.combinat.tamari_lattices import GeneralizedTamariLattice
```

```
>>> from sage.all import *
>>> from sage.combinat.tamari_lattices import GeneralizedTamariLattice
```

Then,

```
sage: GeneralizedTamariLattice(3,2)
Finite lattice containing 2 elements
sage: GeneralizedTamariLattice(4,3)
Finite lattice containing 5 elements
```

```
>>> from sage.all import *
>>> GeneralizedTamariLattice(Integer(3),Integer(2))
Finite lattice containing 2 elements
>>> GeneralizedTamariLattice(Integer(4),Integer(3))
Finite lattice containing 5 elements
```

The classical **Tamari lattices** are special cases of this construction and are also available directly using the catalogue of posets, as follows:

```
sage: posets.TamariLattice(3)
Finite lattice containing 5 elements
```

```
>>> from sage.all import *
>>> posets.TamariLattice(Integer(3))
Finite lattice containing 5 elements
```

See also

For more detailed information see *TamariLattice()*, *GeneralizedTamariLattice()*.

sage.combinat.tamari_lattices.**DexterSemilattice**(*n*)

Return the n-th Dexter meet-semilattice.

INPUT:

- `n` – nonnegative integer (the index)

OUTPUT: a finite meet-semilattice

The elements of the semilattice are *Dyck paths* in the $(n+1 \times n)$-rectangle.

EXAMPLES:

```
sage: posets.DexterSemilattice(3)
Finite meet-semilattice containing 5 elements

sage: P = posets.DexterSemilattice(4); P
Finite meet-semilattice containing 14 elements
sage: len(P.maximal_chains())
15
sage: len(P.maximal_elements())
4
sage: P.chain_polynomial()
q^5 + 19*q^4 + 47*q^3 + 42*q^2 + 14*q + 1
```

```
>>> from sage.all import *
>>> posets.DexterSemilattice(Integer(3))
```

(continues on next page)

(continued from previous page)

```
Finite meet-semilattice containing 5 elements

>>> P = posets.DexterSemilattice(Integer(4)); P
Finite meet-semilattice containing 14 elements
>>> len(P.maximal_chains())
15
>>> len(P.maximal_elements())
4
>>> P.chain_polynomial()
q^5 + 19*q^4 + 47*q^3 + 42*q^2 + 14*q + 1
```

- [Cha18]

sage.combinat.tamari_lattices.**GeneralizedTamariLattice**(*a*, *b*, *m=1*)

Return the (a, b)-Tamari lattice of parameter m.

INPUT:

- a, b – integers with $a \geq b$
- m – a nonnegative rational number such that $a \geq bm$

OUTPUT:

- a finite lattice (special case of the alt ν-Tamari lattices in [CC2023])

The elements of the lattice are *Dyck paths* in the $(a \times b)$-rectangle.

The parameter m (slope) is used only to define the covering relations. When the slope m is 0, two paths are comparable if and only if one is always above the other.

The usual Tamari lattice of index b is the special case $a = b + 1$ and $m = 1$.

Other special cases give the m-Tamari lattices studied in [BMFPR2011], or the rational Tamari lattices when a and b are coprime and m = a/b (see [PRV2017]).

EXAMPLES:

```
sage: from sage.combinat.tamari_lattices import GeneralizedTamariLattice
sage: GeneralizedTamariLattice(3,2)
Finite lattice containing 2 elements
sage: GeneralizedTamariLattice(4,3)
Finite lattice containing 5 elements
sage: GeneralizedTamariLattice(7,5,2)
Traceback (most recent call last):
...
ValueError: the condition a>=b*m does not hold
sage: P = GeneralizedTamariLattice(5,3); P
Finite lattice containing 7 elements
sage: P = GeneralizedTamariLattice(5, 3, m=5/3); P
Finite lattice containing 7 elements
```

```
>>> from sage.all import *
>>> from sage.combinat.tamari_lattices import GeneralizedTamariLattice
>>> GeneralizedTamariLattice(Integer(3),Integer(2))
Finite lattice containing 2 elements
```

(continues on next page)

(continued from previous page)

```
>>> GeneralizedTamariLattice(Integer(4),Integer(3))
Finite lattice containing 5 elements
>>> GeneralizedTamariLattice(Integer(7),Integer(5),Integer(2))
Traceback (most recent call last):
...
ValueError: the condition a>=b*m does not hold
>>> P = GeneralizedTamariLattice(Integer(5),Integer(3)); P
Finite lattice containing 7 elements
>>> P = GeneralizedTamariLattice(Integer(5), Integer(3), m=Integer(5)/Integer(3));
↪ P
Finite lattice containing 7 elements
```

- [CC2023]

sage.combinat.tamari_lattices.**TamariLattice**(*n*, *m=1*)

Return the n-th Tamari lattice.

Using the slope parameter m, one can also get the m-Tamari lattices.

INPUT:

- `n` – nonnegative integer (the index)
- `m` – nonnegative integer (the slope, default: 1)

OUTPUT: a finite lattice

In the usual case, the elements of the lattice are *Dyck paths* in the $(n+1 \times n)$-rectangle. For a general slope m, the elements are Dyck paths in the $(mn+1 \times n)$-rectangle.

See Tamari lattice for mathematical background.

EXAMPLES:

```
sage: posets.TamariLattice(3)
Finite lattice containing 5 elements

sage: posets.TamariLattice(3, 2)
Finite lattice containing 12 elements
```

```
>>> from sage.all import *
>>> posets.TamariLattice(Integer(3))
Finite lattice containing 5 elements

>>> posets.TamariLattice(Integer(3), Integer(2))
Finite lattice containing 12 elements
```

REFERENCES:

- [BMFPR2011]

sage.combinat.tamari_lattices.**paths_in_triangle**(*i*, *j*, *a*, *b*)

Return all Dyck paths from $(0,0)$ to (i,j) in the $(a \times b)$-rectangle.

This means that at each step of the path, one has $ay \geq bx$.

A path is represented by a sequence of 0 and 1, where 0 is an horizontal step $(1,0)$ and 1 is a vertical step $(0,1)$.

INPUT:

- `a`, `b` – integers with $a \geq b$
- `i`, `j` – nonnegative integers with $1 \geq \frac{j}{b} \geq \frac{i}{a} \geq 0$

OUTPUT: list of paths

EXAMPLES:

```
sage: from sage.combinat.tamari_lattices import paths_in_triangle
sage: paths_in_triangle(2,2,2,2)
[(1, 0, 1, 0), (1, 1, 0, 0)]
sage: paths_in_triangle(2,3,4,4)
[(1, 0, 1, 0, 1), (1, 1, 0, 0, 1), (1, 0, 1, 1, 0),
(1, 1, 0, 1, 0), (1, 1, 1, 0, 0)]
sage: paths_in_triangle(2,1,4,4)
Traceback (most recent call last):
...
ValueError: the endpoint is not valid
sage: paths_in_triangle(3,2,5,3)
[(1, 0, 1, 0, 0), (1, 1, 0, 0, 0)]
```

```
>>> from sage.all import *
>>> from sage.combinat.tamari_lattices import paths_in_triangle
>>> paths_in_triangle(Integer(2),Integer(2),Integer(2),Integer(2))
[(1, 0, 1, 0), (1, 1, 0, 0)]
>>> paths_in_triangle(Integer(2),Integer(3),Integer(4),Integer(4))
[(1, 0, 1, 0, 1), (1, 1, 0, 0, 1), (1, 0, 1, 1, 0),
(1, 1, 0, 1, 0), (1, 1, 1, 0, 0)]
>>> paths_in_triangle(Integer(2),Integer(1),Integer(4),Integer(4))
Traceback (most recent call last):
...
ValueError: the endpoint is not valid
>>> paths_in_triangle(Integer(3),Integer(2),Integer(5),Integer(3))
[(1, 0, 1, 0, 0), (1, 1, 0, 0, 0)]
```

sage.combinat.tamari_lattices.**swap**(*p*, *i*, *m=1*)

Perform a covering move in the (a,b)-Tamari lattice of slope parameter m.

The letter at position i in p must be a 0, followed by at least one 1.

INPUT:

- `p` – a Dyck path in the $(a \times b)$-rectangle
- `i` – integer between 0 and $a + b - 1$

OUTPUT: a Dyck path in the $(a \times b)$-rectangle

EXAMPLES:

```
sage: from sage.combinat.tamari_lattices import swap
sage: swap((1,0,1,0,0),1)
(1, 1, 0, 0, 0)
sage: swap((1,1,0,0,1,1,0,0,0),3)
(1, 1, 0, 1, 1, 0, 0, 0, 0)
sage: swap((1,0,1,0,1,0,0,0), 1, 1)
(1, 1, 0, 0, 1, 0, 0, 0)
sage: swap((1,0,1,0,1,0,0,0), 1, 5/3)
(1, 1, 0, 1, 0, 0, 0, 0)
```

```
>>> from sage.all import *
>>> from sage.combinat.tamari_lattices import swap
>>> swap((Integer(1),Integer(0),Integer(1),Integer(0),Integer(0)),Integer(1))
(1, 1, 0, 0, 0)
>>> swap((Integer(1),Integer(1),Integer(0),Integer(0),Integer(1),Integer(1),
↪Integer(0),Integer(0),Integer(0)),Integer(3))
(1, 1, 0, 1, 1, 0, 0, 0, 0)
>>> swap((Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(0)), Integer(1), Integer(1))
(1, 1, 0, 0, 1, 0, 0, 0)
>>> swap((Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(0)), Integer(1), Integer(5)/Integer(3))
(1, 1, 0, 1, 0, 0, 0, 0)
```

sage.combinat.tamari_lattices.**swap_dexter**(p, i)

Perform covering moves in the (a, b)-Dexter posets.

The letter at position i in p must be a 0, followed by at least one 1.

INPUT:

- `p` – a Dyck path in the $(a \times b)$-rectangle
- `i` – integer between 0 and $a + b - 1$

OUTPUT:

- a list of Dyck paths in the $(a \times b)$-rectangle

EXAMPLES:

```
sage: from sage.combinat.tamari_lattices import swap_dexter
sage: swap_dexter((1,0,1,0,0),1)
[(1, 1, 0, 0, 0)]
sage: swap_dexter((1,1,0,0,1,1,0,0,0),3)
[(1, 1, 0, 1, 1, 0, 0, 0, 0), (1, 1, 1, 1, 0, 0, 0, 0, 0)]
sage: swap_dexter((1,1,0,1,0,0,0),2)
[]
```

```
>>> from sage.all import *
>>> from sage.combinat.tamari_lattices import swap_dexter
>>> swap_dexter((Integer(1),Integer(0),Integer(1),Integer(0),Integer(0)),
↪Integer(1))
[(1, 1, 0, 0, 0)]
>>> swap_dexter((Integer(1),Integer(1),Integer(0),Integer(0),Integer(1),
```

(continues on next page)

(continued from previous page)

```
↪Integer(1),Integer(0),Integer(0),Integer(0)),Integer(3))
[(1, 1, 0, 1, 1, 0, 0, 0, 0), (1, 1, 1, 1, 0, 0, 0, 0, 0)]
>>> swap_dexter((Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(0)),Integer(2))
[]
```

Gray codes

Functions

sage.combinat.gray_codes.**combinations**(*n*, *t*)

Iterator through the switches of the revolving door algorithm.

The revolving door algorithm is a way to generate all combinations of a set (i.e. the subset of given cardinality) in such way that two consecutive subsets differ by one element. At each step, the iterator output a pair `(i,j)` where the item `i` has to be removed and `j` has to be added.

The ground set is always $\{0, 1, ..., n-1\}$. Note that `n` can be infinity in that algorithm.

See [Knu2011] Section 7.2.1.3, "Generating All Combinations".

INPUT:

- `n` – integer or `Infinity`; size of the ground set
- `t` – integer; size of the subsets

EXAMPLES:

```
sage: from sage.combinat.gray_codes import combinations
sage: b = [1, 1, 1, 0, 0]
sage: for i,j in combinations(5,3):
....:     b[i] = 0; b[j] = 1
....:     print(b)
[1, 0, 1, 1, 0]
[0, 1, 1, 1, 0]
[1, 1, 0, 1, 0]
[1, 0, 0, 1, 1]
[0, 1, 0, 1, 1]
[0, 0, 1, 1, 1]
[1, 0, 1, 0, 1]
[0, 1, 1, 0, 1]
[1, 1, 0, 0, 1]

sage: s = set([0,1])
sage: for i,j in combinations(4,2):
....:     s.remove(i)
....:     s.add(j)
....:     print(sorted(s))
[1, 2]
[0, 2]
[2, 3]
[1, 3]
[0, 3]
```

```
>>> from sage.all import *
>>> from sage.combinat.gray_codes import combinations
>>> b = [Integer(1), Integer(1), Integer(1), Integer(0), Integer(0)]
>>> for i,j in combinations(Integer(5),Integer(3)):
...     b[i] = Integer(0); b[j] = Integer(1)
...     print(b)
[1, 0, 1, 1, 0]
[0, 1, 1, 1, 0]
[1, 1, 0, 1, 0]
[1, 0, 0, 1, 1]
[0, 1, 0, 1, 1]
[0, 0, 1, 1, 1]
[1, 0, 1, 0, 1]
[0, 1, 1, 0, 1]
[1, 1, 0, 0, 1]

>>> s = set([Integer(0),Integer(1)])
>>> for i,j in combinations(Integer(4),Integer(2)):
...     s.remove(i)
...     s.add(j)
...     print(sorted(s))
[1, 2]
[0, 2]
[2, 3]
[1, 3]
[0, 3]
```

Note that `n` can be infinity:

```
sage: c = combinations(Infinity,4)
sage: s = set([0,1,2,3])
sage: for _ in range(10):
....:     i,j = next(c)
....:     s.remove(i); s.add(j)
....:     print(sorted(s))
[0, 1, 3, 4]
[1, 2, 3, 4]
[0, 2, 3, 4]
[0, 1, 2, 4]
[0, 1, 4, 5]
[1, 2, 4, 5]
[0, 2, 4, 5]
[2, 3, 4, 5]
[1, 3, 4, 5]
[0, 3, 4, 5]
sage: for _ in range(1000):
....:     i,j = next(c)
....:     s.remove(i); s.add(j)
sage: sorted(s)
[0, 4, 13, 14]
```

```
>>> from sage.all import *
>>> c = combinations(Infinity,Integer(4))
```

(continues on next page)

(continued from previous page)

```
>>> s = set([Integer(0),Integer(1),Integer(2),Integer(3)])
>>> for _ in range(Integer(10)):
...     i,j = next(c)
...     s.remove(i); s.add(j)
...     print(sorted(s))
[0, 1, 3, 4]
[1, 2, 3, 4]
[0, 2, 3, 4]
[0, 1, 2, 4]
[0, 1, 4, 5]
[1, 2, 4, 5]
[0, 2, 4, 5]
[2, 3, 4, 5]
[1, 3, 4, 5]
[0, 3, 4, 5]
>>> for _ in range(Integer(1000)):
...     i,j = next(c)
...     s.remove(i); s.add(j)
>>> sorted(s)
[0, 4, 13, 14]
```

sage.combinat.gray_codes.**product**(*m*)

Iterator over the switch for the iteration of the product $[m_0] \times [m_1] \ldots \times [m_k]$.

The iterator return at each step a pair `(p,i)` which corresponds to the modification to perform to get the next element. More precisely, one has to apply the increment `i` at the position `p`. By construction, the increment is either `+1` or `-1`.

This is algorithm H in [Knu2011] Section 7.2.1.1, "Generating All n-Tuples": loopless reflected mixed-radix Gray generation.

INPUT:

- `m` – list or tuple of positive integers that correspond to the size of the sets in the product

EXAMPLES:

```
sage: from sage.combinat.gray_codes import product
sage: l = [0,0,0]
sage: for p,i in product([3,3,3]):
....:     l[p] += i
....:     print(l)
[1, 0, 0]
[2, 0, 0]
[2, 1, 0]
[1, 1, 0]
[0, 1, 0]
[0, 2, 0]
[1, 2, 0]
[2, 2, 0]
[2, 2, 1]
[1, 2, 1]
[0, 2, 1]
[0, 1, 1]
```

(continues on next page)

(continued from previous page)

```

```

Grossman-Larson Hopf algebras

AUTHORS:

- Frédéric Chapoton (2017)

class sage.combinat.grossman_larson_algebras.**GrossmanLarsonAlgebra**(*R*, *names=None*)

Bases: *CombinatorialFreeModule*

The Grossman-Larson Hopf Algebra.

The Grossman-Larson Hopf Algebras are Hopf algebras with a basis indexed by forests of decorated rooted trees. They are the universal enveloping algebras of free pre-Lie algebras, seen as Lie algebras.

The Grossman-Larson Hopf algebra on a given set E has an explicit description using rooted forests. The underlying vector space has a basis indexed by finite rooted forests endowed with a map from their vertices to E (called the "labeling"). In this basis, the product of two (decorated) rooted forests $S * T$ is a sum over all maps from the set of roots of T to the union of a singleton $\{\#\}$ and the set of vertices of S. Given such a map, one defines a new forest as follows. Starting from the disjoint union of all rooted trees of S and T, one adds an edge from every root of T to its image when this image is not the fake vertex labelled $\#$. The coproduct sends a rooted forest T to the sum of all tensors $T_1 \otimes T_2$ obtained by splitting the connected components of T into two subsets and letting T_1 be the forest formed by the first subset and T_2 the forest formed by the second. This yields a connected graded Hopf algebra (the degree of a forest is its number of vertices).

See [Pana2002] (Section 2) and [GroLar1]. (Note that both references use rooted trees rather than rooted forests, so think of each rooted forest grafted onto a new root. Also, the product is reversed, so they are defining the opposite algebra structure.)

Warning

For technical reasons, instead of using forests as labels for the basis, we use rooted trees. Their root vertex should be considered as a fake vertex. This fake root vertex is labelled `'#'` when labels are present.

EXAMPLES:

```
sage: G = algebras.GrossmanLarson(QQ, 'xy')
sage: x, y = G.single_vertex_all()
sage: ascii_art(x*y)
B  + B
 #       #_
 |      / /
 x     x y
 |
 y

sage: ascii_art(x*x*x)
B  + B      + 3*B      + B
 #       #          #_       _#__
```

(continues on next page)

(continued from previous page)

```
 |       |         / /      / / /
 x       x_       x x      x x x
 |      / /         |
 x     x x          x
 |
 x
```

```
>>> from sage.all import *
>>> G = algebras.GrossmanLarson(QQ, 'xy')
>>> x, y = G.single_vertex_all()
>>> ascii_art(x*y)
B  + B
 #       #_
 |      / /
 x     x y
 |
 y

>>> ascii_art(x*x*x)
B  + B      + 3*B      + B
 #       #          #_       _#__
 |       |         / /      / / /
 x       x_       x x      x x x
 |      / /         |
 x     x x          x
 |
 x
```

The Grossman-Larson algebra is associative:

```
sage: z = x * y
sage: x * (y * z) == (x * y) * z
True
```

```
>>> from sage.all import *
>>> z = x * y
>>> x * (y * z) == (x * y) * z
True
```

It is not commutative:

```
sage: x * y == y * x
False
```

```
>>> from sage.all import *
>>> x * y == y * x
False
```

When `None` is given as input, unlabelled forests are used instead; this corresponds to a 1-element set E:

```
sage: G = algebras.GrossmanLarson(QQ, None)
sage: x = G.single_vertex_all()[0]
```

(continues on next page)

(continued from previous page)

```
sage: ascii_art(x*x)
B  + B

 |      / /
 o     o o
 |
 o
```

```
>>> from sage.all import *
>>> G = algebras.GrossmanLarson(QQ, None)
>>> x = G.single_vertex_all()[Integer(0)]
>>> ascii_art(x*x)
B  + B
 o       o_
 |      / /
 o     o o
 |
 o
```

Note

Variables names can be `None`, a list of strings, a string or an integer. When `None` is given, unlabelled rooted forests are used. When a single string is given, each letter is taken as a variable. See *sage.combinat.words.alphabet.build_alphabet()*.

Warning

Beware that the underlying combinatorial free module is based either on `RootedTrees` or on `LabelledRootedTrees`, with no restriction on the labellings. This means that all code calling the `basis()` method would not give meaningful results, since it returns many "chaff" elements that do not belong to the algebra.

REFERENCES:

- [Pana2002]
- [GroLar1]

antipode_on_basis(*x*)

Return the antipode of a forest.

EXAMPLES:

```
sage: G = algebras.GrossmanLarson(QQ,2)
sage: x, y = G.single_vertex_all()
sage: G.antipode(x)  # indirect doctest
-B[#[0[]]]

sage: G.antipode(y*x)  # indirect doctest
B[#[0[1[]]]] + B[#[0[], 1[]]]
```

```
>>> from sage.all import *
>>> G = algebras.GrossmanLarson(QQ,Integer(2))
>>> x, y = G.single_vertex_all()
>>> G.antipode(x)  # indirect doctest
-B[#[0[]]]

>>> G.antipode(y*x)  # indirect doctest
B[#[0[1[]]]] + B[#[0[], 1[]]]
```

change_ring(*R*)

Return the Grossman-Larson algebra in the same variables over R.

INPUT:

- `R` – a ring

EXAMPLES:

```
sage: A = algebras.GrossmanLarson(ZZ, 'fgh')
sage: A.change_ring(QQ)
Grossman-Larson Hopf algebra on 3 generators ['f', 'g', 'h']
over Rational Field
```

```
>>> from sage.all import *
>>> A = algebras.GrossmanLarson(ZZ, 'fgh')
>>> A.change_ring(QQ)
Grossman-Larson Hopf algebra on 3 generators ['f', 'g', 'h']
over Rational Field
```

coproduct_on_basis(*x*)

Return the coproduct of a forest.

EXAMPLES:

```
sage: G = algebras.GrossmanLarson(QQ,2)
sage: x, y = G.single_vertex_all()
sage: ascii_art(G.coproduct(x))  # indirect doctest
1 # B  + B  # 1
     #    #
     |    |
     0    0

sage: Delta_xy = G.coproduct(y*x)
sage: ascii_art(Delta_xy)  # random indirect doctest
1 # B     + 1 # B  + B  # B  + B     # 1 + B  # B  + B  # 1
       #_         #    #    #       #_         #    #    #
      / /         |    |    |      / /         |    |    |
     0 1          1    0    1     0 1          1    0    1
                  |                                     |
                  0                                     0
```

```
>>> from sage.all import *
>>> G = algebras.GrossmanLarson(QQ,Integer(2))
>>> x, y = G.single_vertex_all()
```

(continues on next page)

(continued from previous page)

```
>>> ascii_art(G.coproduct(x))  # indirect doctest
1 # B  + B  # 1
     #    #
     |    |
     0    0

>>> Delta_xy = G.coproduct(y*x)
>>> ascii_art(Delta_xy)  # random indirect doctest
1 # B     + 1 # B  + B  # B  + B     # 1 + B  # B  + B  # 1
       #_         #    #    #       #_         #    #    #
      / /         |    |    |      / /         |    |    |
     0 1          1    0    1     0 1          1    0    1
                  |                                     |
                  0                                     0
```

counit_on_basis(*x*)

Return the counit on a basis element.

This is zero unless the forest x is empty.

EXAMPLES:

```
sage: A = algebras.GrossmanLarson(QQ, 'xy')
sage: RT = A.basis().keys()
sage: x = RT([RT([],'x')],'#')
sage: A.counit_on_basis(x)
0
sage: A.counit_on_basis(RT([],'#'))
1
```

```
>>> from sage.all import *
>>> A = algebras.GrossmanLarson(QQ, 'xy')
>>> RT = A.basis().keys()
>>> x = RT([RT([],'x')],'#')
>>> A.counit_on_basis(x)
0
>>> A.counit_on_basis(RT([],'#'))
1
```

degree_on_basis(*t*)

Return the degree of a rooted forest in the Grossman-Larson algebra.

This is the total number of vertices of the forest.

EXAMPLES:

```
sage: A = algebras.GrossmanLarson(QQ, '@')
sage: RT = A.basis().keys()
sage: A.degree_on_basis(RT([RT([])]))
1
```

```
>>> from sage.all import *
>>> A = algebras.GrossmanLarson(QQ, '@')
```

(continues on next page)

(continued from previous page)

```
>>> RT = A.basis().keys()
>>> A.degree_on_basis(RT([RT([])]))
1
```

one_basis()

Return the empty rooted forest.

EXAMPLES:

```
sage: A = algebras.GrossmanLarson(QQ, 'ab')
sage: A.one_basis()
#[]

sage: A = algebras.GrossmanLarson(QQ, None)
sage: A.one_basis()
[]
```

```
>>> from sage.all import *
>>> A = algebras.GrossmanLarson(QQ, 'ab')
>>> A.one_basis()
#[]

>>> A = algebras.GrossmanLarson(QQ, None)
>>> A.one_basis()
[]
```

product_on_basis(x, y)

Return the product of two forests x and y.

This is the sum over all possible ways for the components of the forest y to either fall side-by-side with components of x or be grafted on a vertex of x.

EXAMPLES:

```
sage: A = algebras.GrossmanLarson(QQ, None)
sage: RT = A.basis().keys()
sage: x = RT([RT([])])
sage: A.product_on_basis(x, x)
B[[[[]]]] + B[[[], []]]
```

```
>>> from sage.all import *
>>> A = algebras.GrossmanLarson(QQ, None)
>>> RT = A.basis().keys()
>>> x = RT([RT([])])
>>> A.product_on_basis(x, x)
B[[[[]]]] + B[[[], []]]
```

Check that the product is the correct one:

```
sage: A = algebras.GrossmanLarson(QQ, 'uv')
sage: RT = A.basis().keys()
sage: Tu = RT([RT([],'u')],'#')
sage: Tv = RT([RT([],'v')],'#')
```

(continues on next page)

(continued from previous page)

```
sage: A.product_on_basis(Tu, Tv)
B[#[u[v[]]]] + B[#[u[], v[]]]
```

```
>>> from sage.all import *
>>> A = algebras.GrossmanLarson(QQ, 'uv')
>>> RT = A.basis().keys()
>>> Tu = RT([RT([],'u')],'#')
>>> Tv = RT([RT([],'v')],'#')
>>> A.product_on_basis(Tu, Tv)
B[#[u[v[]]]] + B[#[u[], v[]]]
```

single_vertex(*i*)

Return the `i`-th rooted forest with one vertex.

This is the rooted forest with just one vertex, labelled by the `i`-th element of the label list.

See also

single_vertex_all().

INPUT:

- `i` – nonnegative integer

EXAMPLES:

```
sage: F = algebras.GrossmanLarson(ZZ, 'xyz')
sage: F.single_vertex(0)
B[#[x[]]]

sage: F.single_vertex(4)
Traceback (most recent call last):
...
IndexError: argument i (= 4) must be between 0 and 2
```

```
>>> from sage.all import *
>>> F = algebras.GrossmanLarson(ZZ, 'xyz')
>>> F.single_vertex(Integer(0))
B[#[x[]]]

>>> F.single_vertex(Integer(4))
Traceback (most recent call last):
...
IndexError: argument i (= 4) must be between 0 and 2
```

single_vertex_all()

Return the rooted forests with one vertex in `self`.

They freely generate the Lie algebra of primitive elements as a pre-Lie algebra.

See also

single_vertex().

EXAMPLES:

```
sage: A = algebras.GrossmanLarson(ZZ, 'fgh')
sage: A.single_vertex_all()
(B[#[f[]]], B[#[g[]]], B[#[h[]]])

sage: A = algebras.GrossmanLarson(QQ, ['x1','x2'])
sage: A.single_vertex_all()
(B[#[x1[]]], B[#[x2[]]])

sage: A = algebras.GrossmanLarson(ZZ, None)
sage: A.single_vertex_all()
(B[[[]]],)
```

```
>>> from sage.all import *
>>> A = algebras.GrossmanLarson(ZZ, 'fgh')
>>> A.single_vertex_all()
(B[#[f[]]], B[#[g[]]], B[#[h[]]])

>>> A = algebras.GrossmanLarson(QQ, ['x1','x2'])
>>> A.single_vertex_all()
(B[#[x1[]]], B[#[x2[]]])

>>> A = algebras.GrossmanLarson(ZZ, None)
>>> A.single_vertex_all()
(B[[[]]],)
```

some_elements()

Return some elements of the Grossman-Larson Hopf algebra.

EXAMPLES:

```
sage: A = algebras.GrossmanLarson(QQ, None)
sage: A.some_elements()
[B[[[]]], B[[]] + B[[[[]]]] + B[[[], []]],
4*B[[[[]]]] + 4*B[[[], []]]]
```

```
>>> from sage.all import *
>>> A = algebras.GrossmanLarson(QQ, None)
>>> A.some_elements()
[B[[[]]], B[[]] + B[[[[]]]] + B[[[], []]],
4*B[[[[]]]] + 4*B[[[], []]]]
```

With several generators:

```
sage: A = algebras.GrossmanLarson(QQ, 'xy')
sage: A.some_elements()
[B[#[x[]]],
```

(continues on next page)

(continued from previous page)

```
 B[#[]] + B[#[x[x[]]]] + B[#[x[], x[]]],
 B[#[x[x[]]]] + 3*B[#[x[y[]]]] + B[#[x[], x[]]] + 3*B[#[x[], y[]]]]
```

```
>>> from sage.all import *
>>> A = algebras.GrossmanLarson(QQ, 'xy')
>>> A.some_elements()
[B[#[x[]]],
 B[#[]] + B[#[x[x[]]]] + B[#[x[], x[]]],
 B[#[x[x[]]]] + 3*B[#[x[y[]]]] + B[#[x[], x[]]] + 3*B[#[x[], y[]]]]
```

variable_names()

Return the names of the variables.

This returns the set E (as a family).

EXAMPLES:

```
sage: R = algebras.GrossmanLarson(QQ, 'xy')
sage: R.variable_names()
{'x', 'y'}

sage: R = algebras.GrossmanLarson(QQ, ['a','b'])
sage: R.variable_names()
{'a', 'b'}

sage: R = algebras.GrossmanLarson(QQ, 2)
sage: R.variable_names()
{0, 1}

sage: R = algebras.GrossmanLarson(QQ, None)
sage: R.variable_names()
{'o'}
```

```
>>> from sage.all import *
>>> R = algebras.GrossmanLarson(QQ, 'xy')
>>> R.variable_names()
{'x', 'y'}

>>> R = algebras.GrossmanLarson(QQ, ['a','b'])
>>> R.variable_names()
{'a', 'b'}

>>> R = algebras.GrossmanLarson(QQ, Integer(2))
>>> R.variable_names()
{0, 1}

>>> R = algebras.GrossmanLarson(QQ, None)
>>> R.variable_names()
{'o'}
```

Growth diagrams and dual graded graphs

AUTHORS:

- Martin Rubey (2016-09): Initial version
- Martin Rubey (2017-09): generalize, more rules, improve documentation
- Travis Scrimshaw (2017-09): switch to rule-based framework

Todo

- provide examples for the P and Q-symbol in the skew case
- when shape is given, check that it is compatible with filling or labels
- optimize rules, mainly for *RuleRSK* and *RuleBurge*
- implement backward rules for *sage.combinat.growth.Rules.Domino*
- implement backward rule from [LLMSSZ2013], [LS2007]
- make semistandard extension generic
- accommodate dual filtered graphs

A guided tour

Growth diagrams, invented by Sergey Fomin [Fom1994], [Fom1995], provide a vast generalization of the Robinson-Schensted-Knuth (RSK) correspondence between matrices with nonnegative integer entries and pairs of semi-standard Young tableaux of the same shape.

The main fact is that many correspondences similar to RSK can be defined by providing a pair of so-called local rules: a 'forward' rule, whose input are three vertices y, t and x of a certain directed graph (in the case of Robinson-Schensted: the directed graph corresponding to Young's lattice) and an integer (in the case of Robinson-Schensted: 0 or 1), and whose output is a fourth vertex z. This rule should be invertible in the following sense: there is a so-called 'backward' rule that recovers the integer and t given y, z and x.

As an example, the growth rules for the classical RSK correspondence are provided by *RuleRSK*. To produce a growth diagram, pass the rule and a permutation to *GrowthDiagram*:

```
sage: RuleRSK = GrowthDiagram.rules.RSK()
sage: w = [2,3,6,1,4,5]; G = GrowthDiagram(RuleRSK, w); G
0  0  0  1  0  0
1  0  0  0  0  0
0  1  0  0  0  0
0  0  0  0  1  0
0  0  0  0  0  1
0  0  1  0  0  0
```

```
>>> from sage.all import *
>>> RuleRSK = GrowthDiagram.rules.RSK()
>>> w = [Integer(2),Integer(3),Integer(6),Integer(1),Integer(4),Integer(5)]; G =␣
↪GrowthDiagram(RuleRSK, w); G
0  0  0  1  0  0
1  0  0  0  0  0
0  1  0  0  0  0
0  0  0  0  1  0
```

(continues on next page)

(continued from previous page)

```
0  0  0  0  0  1
0  0  1  0  0  0
```

The forward rule just mentioned assigns 49 partitions to the corners of each of the 36 cells of this matrix (i.e., the vertices of a $(6+1) \times (6+1)$ grid graph), with the exception of the corners on the left and top boundary, which are initialized with the empty partition. More precisely, for each cell, the *forward_rule()* computes the partition z labelling the lower right corner, given the content c of a cell and the other three partitions:

```
t --- x
|  c  |
y --- z
```

Warning

Note that, by default, a growth diagram is printed with matrix coordinates, the origin being in the top-left corner. Thus, the growth is from the top left to the bottom right and the P-symbol is computed along the right hand border.

This can be changed using *GrowthDiagram.options*:

```
sage: RuleRSK = GrowthDiagram.rules.RSK()
sage: pi = [4,2,1,3]; H = GrowthDiagram(RuleRSK, pi); H
  0  0  1  0
  0  1  0  0
  0  0  0  1
  1  0  0  0
sage: GrowthDiagram.options.convention = "cartesian"
sage: H
  1  0  0  0
  0  0  0  1
  0  1  0  0
  0  0  1  0
sage: GrowthDiagram.options._reset()
```

```
>>> from sage.all import *
>>> RuleRSK = GrowthDiagram.rules.RSK()
>>> pi = [Integer(4),Integer(2),Integer(1),Integer(3)]; H = GrowthDiagram(RuleRSK,␣
↪pi); H
  0  0  1  0
  0  1  0  0
  0  0  0  1
  1  0  0  0
>>> GrowthDiagram.options.convention = "cartesian"
>>> H
  1  0  0  0
  0  0  0  1
  0  1  0  0
  0  0  1  0
>>> GrowthDiagram.options._reset()
```

Within this documentation, we stick to matrix coordinates.

The partitions along the boundary opposite of the origin, reading from the bottom left to the top right, are obtained by using the method *out_labels()*:

```
sage: G.out_labels()
[[],
 [1],
 [2],
 [3],
 [3, 1],
 [3, 2],
 [4, 2],
 [4, 1],
 [3, 1],
 [2, 1],
 [1, 1],
 [1],
 []]
```

```
>>> from sage.all import *
>>> G.out_labels()
[[],
 [1],
 [2],
 [3],
 [3, 1],
 [3, 2],
 [4, 2],
 [4, 1],
 [3, 1],
 [2, 1],
 [1, 1],
 [1],
 []]
```

However, in the case of a rectangular filling, it is more practical to split this sequence of labels in two. Interpreting the sequence of partitions along the right boundary as a standard Young tableau, we then obtain the so-called *P_symbol()*, the partitions along the bottom boundary yield the so-called *Q_symbol()*. These coincide with the output of the classical *RSK()* insertion algorithm:

```
sage: ascii_art([G.P_symbol(), G.Q_symbol()])
[   1  3  4  5     1  2  3  6 ]
[   2  6       ,   4  5        ]
sage: ascii_art(RSK(w))
[   1  3  4  5     1  2  3  6 ]
[   2  6       ,   4  5        ]
```

```
>>> from sage.all import *
>>> ascii_art([G.P_symbol(), G.Q_symbol()])
[   1  3  4  5     1  2  3  6 ]
[   2  6       ,   4  5        ]
>>> ascii_art(RSK(w))
[   1  3  4  5     1  2  3  6 ]
[   2  6       ,   4  5        ]
```

The filling can be recovered knowing the partitions labelling the corners of the bottom and the right boundary alone, by repeatedly applying the *backward_rule()*. Therefore, to initialize a *GrowthDiagram*, we can provide these labels

instead of the filling:

```
sage: GrowthDiagram(RuleRSK, labels=G.out_labels())
0  0  0  1  0  0
1  0  0  0  0  0
0  1  0  0  0  0
0  0  0  0  1  0
0  0  0  0  0  1
0  0  1  0  0  0
```

```
>>> from sage.all import *
>>> GrowthDiagram(RuleRSK, labels=G.out_labels())
0  0  0  1  0  0
1  0  0  0  0  0
0  1  0  0  0  0
0  0  0  0  1  0
0  0  0  0  0  1
0  0  1  0  0  0
```

Invocation

In general, growth diagrams are defined for $0-1$-fillings of arbitrary skew shapes. In the case of the Robinson-Schensted-Knuth correspondence, even arbitrary nonnegative integers are allowed. In other cases, entries may be either zero or an r-th root of unity - for example, *RuleDomino* insertion is defined for signed permutations, that is, $r = 2$. Traditionally, words and permutations are also used to specify a filling in special cases.

To accommodate all this, the filling may be passed in various ways. The most general possibility is to pass a dictionary of coordinates to (signed) entries, where zeros can be omitted. In this case, when the parameter `shape` is not explicitly specified, it is assumed to be the minimal rectangle containing the origin and all coordinates with nonzero entries.

For example, consider the following generalized permutation:

```
1 2 2 2 4 4
4 2 3 3 2 3
```

that we encode as the dictionary:

```
sage: P = {(1-1,4-1): 1, (2-1,2-1): 1, (2-1,3-1): 2, (4-1,2-1): 1, (4-1,3-1): 1}
```

```
>>> from sage.all import *
>>> P = {(Integer(1)-Integer(1),Integer(4)-Integer(1)): Integer(1), (Integer(2)-
↪Integer(1),Integer(2)-Integer(1)): Integer(1), (Integer(2)-Integer(1),Integer(3)-
↪Integer(1)): Integer(2), (Integer(4)-Integer(1),Integer(2)-Integer(1)): Integer(1),␣
↪(Integer(4)-Integer(1),Integer(3)-Integer(1)): Integer(1)}
```

Note that we are subtracting 1 from all entries because of zero-based indexing. We obtain:

```
sage: GrowthDiagram(RuleRSK, P)
0  0  0  0
0  1  0  1
0  2  0  1
1  0  0  0
```

```
>>> from sage.all import *
>>> GrowthDiagram(RuleRSK, P)
0  0  0  0
0  1  0  1
0  2  0  1
1  0  0  0
```

Alternatively, we could create the same growth diagram using a matrix.

Let us also mention that one can pass the arguments specifying a growth diagram directly to the rule:

```
sage: RuleRSK(P)
0  0  0  0
0  1  0  1
0  2  0  1
1  0  0  0
```

```
>>> from sage.all import *
>>> RuleRSK(P)
0  0  0  0
0  1  0  1
0  2  0  1
1  0  0  0
```

In contrast to the classical insertion algorithms, growth diagrams immediately generalize to fillings whose shape is an arbitrary skew partition:

```
sage: GrowthDiagram(RuleRSK, [3,1,2], shape=SkewPartition([[3,3,2],[1,1]]))
.  1  0
.  0  1
1  0
```

```
>>> from sage.all import *
>>> GrowthDiagram(RuleRSK, [Integer(3),Integer(1),Integer(2)],␣
↪shape=SkewPartition([[Integer(3),Integer(3),Integer(2)],[Integer(1),Integer(1)]]))
.  1  0
.  0  1
1  0
```

As an important example, consider the Stanley-Sundaram correspondence between oscillating tableaux and (partial) perfect matchings. Perfect matchings of $\{1, \ldots, 2r\}$ are in bijection with $0-1$-fillings of a triangular shape with $2r-1$ rows, such that for each k there is either exactly one nonzero entry in row k or exactly one nonzero entry in column $2r-k$. Explicitly, if (i, j) is a pair in the perfect matching, the entry in column $i-1$ and row $2r-j$ equals 1. For example:

```
sage: m = [[1,5],[3,4],[2,7],[6,8]]
sage: G = RuleRSK({(i-1, 8-j): 1 for i,j in m}, shape=[7,6,5,4,3,2,1]); G
0  0  0  0  0  1  0
0  1  0  0  0  0
0  0  0  0  0
1  0  0  0
0  0  1
0  0
0
```

```
>>> from sage.all import *
>>> m = [[Integer(1),Integer(5)],[Integer(3),Integer(4)],[Integer(2),Integer(7)],
↪[Integer(6),Integer(8)]]
>>> G = RuleRSK({(i-Integer(1), Integer(8)-j): Integer(1) for i,j in m},␣
↪shape=[Integer(7),Integer(6),Integer(5),Integer(4),Integer(3),Integer(2),
↪Integer(1)]); G
0  0  0  0  0  1  0
0  1  0  0  0  0
0  0  0  0  0
1  0  0  0
0  0  1
0  0
0
```

The partitions labelling the bottom right corners along the boundary opposite of the origin then form a so-called oscillating tableau - the remaining partitions along the bottom right boundary are redundant:

```
sage: G.out_labels()[1::2]
[[1], [1, 1], [2, 1], [1, 1], [1], [1, 1], [1]]
```

```
>>> from sage.all import *
>>> G.out_labels()[Integer(1)::Integer(2)]
[[1], [1, 1], [2, 1], [1, 1], [1], [1, 1], [1]]
```

Another great advantage of growth diagrams is that we immediately have access to a skew version of the correspondence, by providing different initialization for the labels on the side of the origin. We reproduce the original example of Bruce Sagan and Richard Stanley, see also Tom Roby's thesis [Rob1991]:

```
sage: w = {(1-1,4-1): 1, (2-1,2-1): 1, (4-1,3-1): 1}
sage: T = SkewTableau([[None, None], [None, 5], [1]])
sage: U = SkewTableau([[None, None], [None, 3], [5]])
sage: labels = T.to_chain()[::-1] + U.to_chain()[1:]
sage: G = GrowthDiagram(RuleRSK, filling=w, shape=[5,5,5,5,5], labels=labels); G
0  0  0  0  0
0  1  0  0  0
0  0  0  1  0
1  0  0  0  0
0  0  0  0  0
sage: ascii_art([G.P_symbol(), G.Q_symbol()])
[   .  .  2  3    .  .  1  4 ]
[   .  .          .  .       ]
[   .  4          .  2       ]
[   1             3          ]
[   5        ,    5          ]
```

```
>>> from sage.all import *
>>> w = {(Integer(1)-Integer(1),Integer(4)-Integer(1)): Integer(1), (Integer(2)-
↪Integer(1),Integer(2)-Integer(1)): Integer(1), (Integer(4)-Integer(1),Integer(3)-
↪Integer(1)): Integer(1)}
>>> T = SkewTableau([[None, None], [None, Integer(5)], [Integer(1)]])
>>> U = SkewTableau([[None, None], [None, Integer(3)], [Integer(5)]])
>>> labels = T.to_chain()[::-Integer(1)] + U.to_chain()[Integer(1):]
>>> G = GrowthDiagram(RuleRSK, filling=w, shape=[Integer(5),Integer(5),Integer(5),
```

(continues on next page)

(continued from previous page)

```
↪Integer(5),Integer(5)], labels=labels); G
0  0  0  0  0
0  1  0  0  0
0  0  0  1  0
1  0  0  0  0
0  0  0  0  0
>>> ascii_art([G.P_symbol(), G.Q_symbol()])
[   .  .  2  3    .  .  1  4 ]
[   .  .          .  .       ]
[   .  4          .  2       ]
[   1             3          ]
[   5        ,    5          ]
```

Similarly, there is a correspondence for skew oscillating tableau. Let us conclude by reproducing Example 4.2.6 from [Rob1991]. The oscillating tableau, as given, is:

```
sage: o = [[2,1],[2,2],[3,2],[4,2],[4,1],[4,1,1],[3,1,1],[3,1],[3,2],[3,1],[2,1]]
```

```
>>> from sage.all import *
>>> o = [[Integer(2),Integer(1)],[Integer(2),Integer(2)],[Integer(3),Integer(2)],
↪[Integer(4),Integer(2)],[Integer(4),Integer(1)],[Integer(4),Integer(1),Integer(1)],
↪[Integer(3),Integer(1),Integer(1)],[Integer(3),Integer(1)],[Integer(3),Integer(2)],
↪[Integer(3),Integer(1)],[Integer(2),Integer(1)]]
```

From this, we have to construct the list of labels of the corners along the bottom right boundary. The labels with odd indices are given by the oscillating tableau, the other labels are obtained by taking the smaller of the two neighbouring partitions:

```
sage: l = [o[i//2] if is_even(i) else min(o[(i-1)//2],o[(i+1)//2])
....:      for i in range(2*len(o)-1)]
sage: la = list(range(len(o)-2, 0, -1))
sage: G = RuleRSK(labels=l[1:-1], shape=la); G
0  0  0  0  0  0  0  1  0
0  1  0  0  0  0  0  0
0  0  0  0  0  0  0
0  0  0  0  0  0
0  0  1  0  0
0  0  0  0
0  0  0
0  0
0
```

```
>>> from sage.all import *
>>> l = [o[i//Integer(2)] if is_even(i) else min(o[(i-Integer(1))//Integer(2)],
↪o[(i+Integer(1))//Integer(2)])
...       for i in range(Integer(2)*len(o)-Integer(1))]
>>> la = list(range(len(o)-Integer(2), Integer(0), -Integer(1)))
>>> G = RuleRSK(labels=l[Integer(1):-Integer(1)], shape=la); G
0  0  0  0  0  0  0  1  0
0  1  0  0  0  0  0  0
0  0  0  0  0  0  0
0  0  0  0  0  0
```

(continues on next page)

(continued from previous page)

```
0  0  1  0  0
0  0  0  0
0  0  0
0  0
0
```

The skew tableaux can now be read off the partitions labelling the left and the top boundary. These can be accessed using the method *in_labels()*:

```
sage: ascii_art(SkewTableau(chain=G.in_labels()[len(o)-2:]),
....:           SkewTableau(chain=G.in_labels()[len(o)-2::-1]))
.  1  .  7
5     4
```

```
>>> from sage.all import *
>>> ascii_art(SkewTableau(chain=G.in_labels()[len(o)-Integer(2):]),
...           SkewTableau(chain=G.in_labels()[len(o)-Integer(2)::-Integer(1)]))
.  1  .  7
5     4
```

Rules currently available

As mentioned at the beginning, the Robinson-Schensted-Knuth correspondence is just a special case of growth diagrams. In particular, we have implemented the following local rules:

- RSK (*RuleRSK*).
- A variation of RSK originally due to Burge (*RuleBurge*).
- A correspondence producing binary words originally due to Viennot (*RuleBinaryWord*).
- A correspondence producing domino tableaux (*RuleDomino*) originally due to Barbasch and Vogan.
- A correspondence for shifted shapes (*RuleShiftedShapes*), where the original insertion algorithm is due to Sagan and Worley, and Haiman.
- The Sylvester correspondence, producing binary trees (*RuleSylvester*).
- The Young-Fibonacci correspondence (*RuleYoungFibonacci*).
- LLMS insertion (*RuleLLMS*).

Displaying diagrams

Since labels usually take a significant amount of space, only the filling is shown when displaying a diagram using ASCII art. However, the LaTeX output shows the diagram as usually typeset, including edge labels.:

```
sage: shape = SkewPartition([[5,5,5,4,4],[4,3]])
sage: f = [3, 5, 4, 2, 1]
sage: view(GrowthDiagram.rules.RSK()(f, shape))                          # not␣
↪tested
sage: view(GrowthDiagram.rules.Sylvester()(f, shape))                    # not␣
↪tested
sage: view(GrowthDiagram.rules.BinaryWord()(f, shape))                   # not␣
↪tested
```

(continues on next page)

(continued from previous page)

```
sage: f = [3, 5, -4, 2, 1]
sage: view(GrowthDiagram.rules.Domino()(f, shape))                    # not␣
↪tested
```

```
>>> from sage.all import *
>>> shape = SkewPartition([[Integer(5),Integer(5),Integer(5),Integer(4),Integer(4)],
↪[Integer(4),Integer(3)]])
>>> f = [Integer(3), Integer(5), Integer(4), Integer(2), Integer(1)]
>>> view(GrowthDiagram.rules.RSK()(f, shape))                         # not tested
>>> view(GrowthDiagram.rules.Sylvester()(f, shape))                   # not tested
>>> view(GrowthDiagram.rules.BinaryWord()(f, shape))                  # not tested
>>> f = [Integer(3), Integer(5), -Integer(4), Integer(2), Integer(1)]
>>> view(GrowthDiagram.rules.Domino()(f, shape))                      # not tested
```

Edge labels are also displayed:

```
sage: LLMS3 = GrowthDiagram.rules.LLMS(3)
sage: G = LLMS3([4,1,2,6,3,5])
sage: view(G)                                                         # not␣
↪tested
```

```
>>> from sage.all import *
>>> LLMS3 = GrowthDiagram.rules.LLMS(Integer(3))
>>> G = LLMS3([Integer(4),Integer(1),Integer(2),Integer(6),Integer(3),Integer(5)])
>>> view(G)                                                           # not tested
```

Background

At the heart of Fomin's framework is the notion of dual graded graphs. This is a pair of digraphs P, Q (multiple edges being allowed) on the same set of vertices V, that satisfy the following conditions:

- the graphs are graded, that is, there is a function $\rho : V \to \mathbf{N}$, such that for any edge (v, w) of P and also of Q we have $\rho(w) = \rho(v) + 1$,
- there is a vertex 0 with rank zero, and
- there is a positive integer r such that $DU = UD + rI$ on the free $\mathbf{Z}$-module $\mathbf{Z}[V]$, where D is the down operator of Q, assigning to each vertex the formal sum of its predecessors, U is the up operator of P, assigning to each vertex the formal sum of its successors, and I is the identity operator.

Note that the condition $DU = UD + rI$ is symmetric with respect to the interchange of the graphs P and Q, because the up operator of a graph is the transpose of its down operator.

For example, taking for both P and Q to be Young's lattice and $r = 1$, we obtain the dual graded graphs for classical Schensted insertion.

Given such a pair of graphs, there is a bijection between the r-colored permutations on k letters and pairs (p, q), where p is a path in P from zero to a vertex of rank k and q is a path in Q from zero to the same vertex.

It turns out that - in principle - this bijection can always be described by so-called local forward and backward rules, see [Fom1995] for a detailed description. Knowing at least the forward rules, or the backward rules, you can implement your own growth diagram class.

Implementing your own growth diagrams

The class *GrowthDiagram* is written so that it is easy to implement growth diagrams you come across in your research. Moreover, the class tolerates some deviations from Fomin's definitions. For example, although the general Robinson-Schensted-Knuth correspondence between integer matrices and semistandard tableaux is, strictly speaking, not a growth on dual graded graphs, it is supported by our framework.

For illustration, let us implement a growth diagram class with the backward rule only. Suppose that the vertices of the graph are the nonnegative integers, the rank is given by the integer itself, and the backward rule is $(y, z, x) \mapsto (\min(x, y), 0)$ if $y = z$ or $x = z$ and $(y, z, x) \mapsto (\min(x, y), 1)$ otherwise.

We first need to import the base class for a rule:

```
sage: from sage.combinat.growth import Rule
```

```
>>> from sage.all import *
>>> from sage.combinat.growth import Rule
```

Next, we implement the backward rule and the rank function and provide the bottom element `zero` of the graph. For more information, see *Rule*.

```
sage: class RulePascal(Rule):
....:     zero = 0
....:     def rank(self, v): return v
....:     def backward_rule(self, y, z, x):
....:         return (min(x,y), 0 if y==z or x==z else 1)
```

```
>>> from sage.all import *
>>> class RulePascal(Rule):
...     zero = Integer(0)
...     def rank(self, v): return v
...     def backward_rule(self, y, z, x):
...         return (min(x,y), Integer(0) if y==z or x==z else Integer(1))
```

We can now compute the filling corresponding to a sequence of labels as follows:

```
sage: GrowthDiagram(RulePascal(), labels=[0,1,2,1,2,1,0])
1  0  0
0  0  1
0  1
```

```
>>> from sage.all import *
>>> GrowthDiagram(RulePascal(), labels=[Integer(0),Integer(1),Integer(2),Integer(1),
↪Integer(2),Integer(1),Integer(0)])
1  0  0
0  0  1
0  1
```

Of course, since we have not provided the forward rule, we cannot compute the labels belonging to a filling:

```
sage: GrowthDiagram(RulePascal(), [3,1,2])
Traceback (most recent call last):
...
AttributeError: 'RulePascal' object has no attribute 'forward_rule'...
```

```
>>> from sage.all import *
>>> GrowthDiagram(RulePascal(), [Integer(3),Integer(1),Integer(2)])
Traceback (most recent call last):
...
AttributeError: 'RulePascal' object has no attribute 'forward_rule'...
```

We now re-implement the rule where we provide the dual graded graphs:

```
sage: class RulePascal(Rule):
....:     zero = 0
....:     def rank(self, v): return v
....:     def backward_rule(self, y, z, x):
....:         return (min(x,y), 0 if y==z or x==z else 1)
....:     def vertices(self, n): return [n]
....:     def is_P_edge(self, v, w): return w == v + 1
....:     def is_Q_edge(self, v, w): return w == v + 1
```

```
>>> from sage.all import *
>>> class RulePascal(Rule):
...     zero = Integer(0)
...     def rank(self, v): return v
...     def backward_rule(self, y, z, x):
...         return (min(x,y), Integer(0) if y==z or x==z else Integer(1))
...     def vertices(self, n): return [n]
...     def is_P_edge(self, v, w): return w == v + Integer(1)
...     def is_Q_edge(self, v, w): return w == v + Integer(1)
```

Are they really dual?

```
sage: RulePascal()._check_duality(3)
Traceback (most recent call last):
...
ValueError: D U - U D differs from 1 I for vertex 3:
D U = [3]
U D + 1 I = [3, 3]
```

```
>>> from sage.all import *
>>> RulePascal()._check_duality(Integer(3))
Traceback (most recent call last):
...
ValueError: D U - U D differs from 1 I for vertex 3:
D U = [3]
U D + 1 I = [3, 3]
```

With our current definition, duality fails - in fact, there are no dual graded graphs on the integers without multiple edges. Consequently, also the backward rule cannot work as `backward_rule` requires additional information (the edge labels as arguments).

Let us thus continue with the example from Section 4.7 of [Fom1995] instead, which defines dual graded graphs with multiple edges on the integers. The color `self.zero_edge`, which defaults to `0`, is reserved for degenerate edges, but may also be used for the unique edge if one of the graphs has no multiple edges. For greater clarity in this example we set it to `None`:

```
sage: class RulePascal(Rule):
....:     zero = 0
....:     has_multiple_edges = True
....:     zero_edge = None
....:     def rank(self, v): return v
....:     def vertices(self, n): return [n]
....:     def is_P_edge(self, v, w): return [0] if w == v + 1 else []
....:     def is_Q_edge(self, v, w): return list(range(w)) if w == v+1 else []
```

```
>>> from sage.all import *
>>> class RulePascal(Rule):
...     zero = Integer(0)
...     has_multiple_edges = True
...     zero_edge = None
...     def rank(self, v): return v
...     def vertices(self, n): return [n]
...     def is_P_edge(self, v, w): return [Integer(0)] if w == v + Integer(1) else []
...     def is_Q_edge(self, v, w): return list(range(w)) if w == v+Integer(1) else []
```

We verify these are 1-dual at level 5:

```
sage: RulePascal()._check_duality(5)
```

```
>>> from sage.all import *
>>> RulePascal()._check_duality(Integer(5))
```

Finally, let us provide the backward rule. The arguments of the rule are vertices together with the edge labels now, specifying the path from the lower left to the upper right of the cell. The horizontal edges come from Q, whereas the vertical edges come from P.

Thus, the definition in Section 4.7 of [Fom1995] translates as follows:

```
sage: class RulePascal(Rule):
....:     zero = 0
....:     has_multiple_edges = True
....:     zero_edge = None
....:     def rank(self, v): return v
....:     def vertices(self, n): return [n]
....:     def is_P_edge(self, v, w): return [0] if w == v + 1 else []
....:     def is_Q_edge(self, v, w): return list(range(w)) if w == v+1 else []
....:     def backward_rule(self, y, g, z, h, x):
....:         if g is None:
....:             return (h, x, None, 0)
....:         if h is None:
....:             return (None, y, g, 0)
....:         if g == 0:
....:             return (None, y, None, 1)
....:         return (0, x - 1, g - 1, 0)
```

```
>>> from sage.all import *
>>> class RulePascal(Rule):
...     zero = Integer(0)
...     has_multiple_edges = True
```

(continues on next page)

(continued from previous page)

```
...       zero_edge = None
...       def rank(self, v): return v
...       def vertices(self, n): return [n]
...       def is_P_edge(self, v, w): return [Integer(0)] if w == v + Integer(1) else []
...       def is_Q_edge(self, v, w): return list(range(w)) if w == v+Integer(1) else []
...       def backward_rule(self, y, g, z, h, x):
...           if g is None:
...               return (h, x, None, Integer(0))
...           if h is None:
...               return (None, y, g, Integer(0))
...           if g == Integer(0):
...               return (None, y, None, Integer(1))
...           return (Integer(0), x - Integer(1), g - Integer(1), Integer(0))
```

The labels are now alternating between vertices and edge-colors:

```
sage: GrowthDiagram(RulePascal(), labels=[0,0,1,0,2,0,1,0,0])
1  0
0  1

sage: GrowthDiagram(RulePascal(), labels=[0,0,1,1,2,0,1,0,0])
0  1
1  0
```

```
>>> from sage.all import *
>>> GrowthDiagram(RulePascal(), labels=[Integer(0),Integer(0),Integer(1),Integer(0),
↪Integer(2),Integer(0),Integer(1),Integer(0),Integer(0)])
1  0
0  1

>>> GrowthDiagram(RulePascal(), labels=[Integer(0),Integer(0),Integer(1),Integer(1),
↪Integer(2),Integer(0),Integer(1),Integer(0),Integer(0)])
0  1
1  0
```

class sage.combinat.growth.**GrowthDiagram**(*rule*, *filling=None*, *shape=None*, *labels=None*)

Bases: SageObject

A generalized Schensted growth diagram in the sense of Fomin.

Growth diagrams were introduced by Sergey Fomin [Fom1994], [Fom1995] and provide a vast generalization of the Robinson-Schensted-Knuth (RSK) correspondence between matrices with nonnegative integer entries and pairs of semistandard Young tableaux of the same shape.

A growth diagram is based on the notion of *dual graded graphs*, a pair of digraphs P, Q (multiple edges being allowed) on the same set of vertices V, that satisfy the following conditions:

- the graphs are graded, that is, there is a function $\rho : V \to \mathbf{N}$, such that for any edge (v, w) of P and also of Q we have $\rho(w) = \rho(v) + 1$,
- there is a vertex 0 with rank zero, and
- there is a positive integer r such that $DU = UD + rI$ on the free $\mathbf{Z}$-module $\mathbf{Z}[V]$, where D is the down operator of Q, assigning to each vertex the formal sum of its predecessors, U is the up operator of P, assigning to each vertex the formal sum of its successors, and I is the identity operator.

Growth diagrams are defined by providing a pair of local rules: a 'forward' rule, whose input are three vertices y, t and x of the dual graded graphs and an integer, and whose output is a fourth vertex z. This rule should be invertible in the following sense: there is a so-called 'backward' rule that recovers the integer and t given y, z and x.

All implemented growth diagram rules are available by `GrowthDiagram.rules.<tab>`. The current list is:

- *RuleRSK* – RSK
- *RuleBurge* – a variation of RSK originally due to Burge
- *RuleBinaryWord* – a correspondence producing binary words originally due to Viennot
- *RuleDomino* – a correspondence producing domino tableaux originally due to Barbasch and Vogan
- *RuleShiftedShapes* – a correspondence for shifted shapes, where the original insertion algorithm is due to Sagan and Worley, and Haiman.
- *RuleSylvester* – the Sylvester correspondence, producing binary trees
- *RuleYoungFibonacci* – the Young-Fibonacci correspondence
- *RuleLLMS* – LLMS insertion

INPUT:

- `rule` – *Rule*; the growth diagram rule
- `filling` – (optional) a dictionary whose keys are coordinates and values are integers, a list of lists of integers, or a word with integer values; if a word, then negative letters but without repetitions are allowed and interpreted as coloured permutations
- `shape` – (optional) a (possibly skew) partition
- `labels` – (optional) a list that specifies a path whose length in the half-perimeter of the shape; more details given below

If `filling` is not given, then the growth diagram is determined by applying the backward rule to `labels` decorating the boundary opposite of the origin of the `shape`. In this case, `labels` are interpreted as labelling the boundary opposite of the origin.

Otherwise, `shape` is inferred from `filling` or `labels` if possible and `labels` is set to `rule.zero` if not specified. Here, `labels` are labelling the boundary on the side of the origin.

For `labels`, if `rule.has_multiple_edges` is `True`, then the elements should be of the form $(v_1, e_1, \ldots, e_{n-1}, v_n)$, where n is the half-perimeter of `shape`, and (v_{i-1}, e_i, v_i) is an edge in the dual graded graph for all i. Otherwise, it is a list of n vertices.

Note

Coordinates are of the form `(col, row)` where the P-symbol is labelling the last column and the Q-symbol the last row. This convention is different from Fomin's convention, who uses a Cartesian coordinate system.

It is chosen such that for permutations, the same growth diagram is constructed when passing the permutation matrix instead.

The display of growth diagrams can be modified by setting *GrowthDiagram.options*.

EXAMPLES:

We create a growth diagram using the forward RSK rule and a permutation:

```
sage: RuleRSK = GrowthDiagram.rules.RSK()
sage: pi = Permutation([4, 1, 2, 3])
sage: G = GrowthDiagram(RuleRSK, pi); G
0  1  0  0
0  0  1  0
0  0  0  1
1  0  0  0
sage: G.out_labels()
[[], [1], [1, 1], [2, 1], [3, 1], [3], [2], [1], []]
```

```
>>> from sage.all import *
>>> RuleRSK = GrowthDiagram.rules.RSK()
>>> pi = Permutation([Integer(4), Integer(1), Integer(2), Integer(3)])
>>> G = GrowthDiagram(RuleRSK, pi); G
0  1  0  0
0  0  1  0
0  0  0  1
1  0  0  0
>>> G.out_labels()
[[], [1], [1, 1], [2, 1], [3, 1], [3], [2], [1], []]
```

Passing the permutation matrix instead gives the same result:

```
sage: G = GrowthDiagram(RuleRSK, pi.to_matrix())                                #␣
↪needs sage.modules
sage: ascii_art([G.P_symbol(), G.Q_symbol()])                                   #␣
↪needs sage.modules
[   1  2  3    1  3  4 ]
[   4      ,   2       ]
```

```
>>> from sage.all import *
>>> G = GrowthDiagram(RuleRSK, pi.to_matrix())                                  #␣
↪needs sage.modules
>>> ascii_art([G.P_symbol(), G.Q_symbol()])                                     #␣
↪needs sage.modules
[   1  2  3    1  3  4 ]
[   4      ,   2       ]
```

We give the same example but using a skew shape:

```
sage: shape = SkewPartition([[4,4,4,2],[1,1]])
sage: G = GrowthDiagram(RuleRSK, pi, shape=shape); G
.  1  0  0
.  0  1  0
0  0  0  1
1  0
sage: G.out_labels()
[[], [1], [1, 1], [1], [2], [3], [2], [1], []]
```

```
>>> from sage.all import *
>>> shape = SkewPartition([[Integer(4),Integer(4),Integer(4),Integer(2)],
↪[Integer(1),Integer(1)]])
```

(continues on next page)

(continued from previous page)

```
>>> G = GrowthDiagram(RuleRSK, pi, shape=shape); G
.  1  0  0
.  0  1  0
0  0  0  1
1  0
>>> G.out_labels()
[[], [1], [1, 1], [1], [2], [3], [2], [1], []]
```

We construct a growth diagram using the backwards RSK rule by specifying the labels:

```
sage: GrowthDiagram(RuleRSK, labels=G.out_labels())
0  1  0  0
0  0  1  0
0  0  0  1
1  0
```

```
>>> from sage.all import *
>>> GrowthDiagram(RuleRSK, labels=G.out_labels())
0  1  0  0
0  0  1  0
0  0  0  1
1  0
```

P_chain()

Return the labels along the vertical boundary of a rectangular growth diagram.

EXAMPLES:

```
sage: BinaryWord = GrowthDiagram.rules.BinaryWord()
sage: G = GrowthDiagram(BinaryWord, [4, 1, 2, 3])
sage: G.P_chain()
[word: , word: 1, word: 11, word: 111, word: 1011]
```

```
>>> from sage.all import *
>>> BinaryWord = GrowthDiagram.rules.BinaryWord()
>>> G = GrowthDiagram(BinaryWord, [Integer(4), Integer(1), Integer(2),␣
↪Integer(3)])
>>> G.P_chain()
[word: , word: 1, word: 11, word: 111, word: 1011]
```

Check that Issue #25631 is fixed:

```
sage: BinaryWord = GrowthDiagram.rules.BinaryWord()
sage: BinaryWord(filling={}).P_chain()
[word: ]
```

```
>>> from sage.all import *
>>> BinaryWord = GrowthDiagram.rules.BinaryWord()
>>> BinaryWord(filling={}).P_chain()
[word: ]
```

P_symbol()

Return the labels along the vertical boundary of a rectangular growth diagram as a generalized standard tableau.

EXAMPLES:

```
sage: RuleRSK = GrowthDiagram.rules.RSK()
sage: G = GrowthDiagram(RuleRSK, [[0,1,0], [1,0,2]])
sage: ascii_art([G.P_symbol(), G.Q_symbol()])
[   1  2  2    1  3  3 ]
[   2      ,   2       ]
```

```
>>> from sage.all import *
>>> RuleRSK = GrowthDiagram.rules.RSK()
>>> G = GrowthDiagram(RuleRSK, [[Integer(0),Integer(1),Integer(0)],␣
↪[Integer(1),Integer(0),Integer(2)]])
>>> ascii_art([G.P_symbol(), G.Q_symbol()])
[   1  2  2    1  3  3 ]
[   2      ,   2       ]
```

Q_chain()

Return the labels along the horizontal boundary of a rectangular growth diagram.

EXAMPLES:

```
sage: BinaryWord = GrowthDiagram.rules.BinaryWord()
sage: G = GrowthDiagram(BinaryWord, [[0,1,0,0], [0,0,1,0], [0,0,0,1], [1,0,0,
↪0]])
sage: G.Q_chain()
[word: , word: 1, word: 10, word: 101, word: 1011]
```

```
>>> from sage.all import *
>>> BinaryWord = GrowthDiagram.rules.BinaryWord()
>>> G = GrowthDiagram(BinaryWord, [[Integer(0),Integer(1),Integer(0),
↪Integer(0)], [Integer(0),Integer(0),Integer(1),Integer(0)], [Integer(0),
↪Integer(0),Integer(0),Integer(1)], [Integer(1),Integer(0),Integer(0),
↪Integer(0)]])
>>> G.Q_chain()
[word: , word: 1, word: 10, word: 101, word: 1011]
```

Check that Issue #25631 is fixed:

```
sage: BinaryWord = GrowthDiagram.rules.BinaryWord()
sage: BinaryWord(filling={}).Q_chain()
[word: ]
```

```
>>> from sage.all import *
>>> BinaryWord = GrowthDiagram.rules.BinaryWord()
>>> BinaryWord(filling={}).Q_chain()
[word: ]
```

Q_symbol()

Return the labels along the horizontal boundary of a rectangular growth diagram as a generalized standard tableau.

EXAMPLES:

```
sage: RuleRSK = GrowthDiagram.rules.RSK()
sage: G = GrowthDiagram(RuleRSK, [[0,1,0], [1,0,2]])
sage: ascii_art([G.P_symbol(), G.Q_symbol()])
[   1  2  2    1  3  3 ]
[   2     ,    2       ]
```

```
>>> from sage.all import *
>>> RuleRSK = GrowthDiagram.rules.RSK()
>>> G = GrowthDiagram(RuleRSK, [[Integer(0),Integer(1),Integer(0)],␣
↪[Integer(1),Integer(0),Integer(2)]])
>>> ascii_art([G.P_symbol(), G.Q_symbol()])
[   1  2  2    1  3  3 ]
[   2     ,    2       ]
```

conjugate()

Return the conjugate growth diagram of `self`.

This is the growth diagram with the filling reflected over the main diagonal.

The sequence of labels along the boundary on the side of the origin is the reversal of the corresponding sequence of the original growth diagram.

When the filling is a permutation, the conjugate filling corresponds to its inverse.

EXAMPLES:

```
sage: RuleRSK = GrowthDiagram.rules.RSK()
sage: G = GrowthDiagram(RuleRSK, [[0,1,0], [1,0,2]])
sage: Gc = G.conjugate()
sage: (Gc.P_symbol(), Gc.Q_symbol()) == (G.Q_symbol(), G.P_symbol())
True
```

```
>>> from sage.all import *
>>> RuleRSK = GrowthDiagram.rules.RSK()
>>> G = GrowthDiagram(RuleRSK, [[Integer(0),Integer(1),Integer(0)],␣
↪[Integer(1),Integer(0),Integer(2)]])
>>> Gc = G.conjugate()
>>> (Gc.P_symbol(), Gc.Q_symbol()) == (G.Q_symbol(), G.P_symbol())
True
```

filling()

Return the filling of the diagram as a dictionary.

EXAMPLES:

```
sage: RuleRSK = GrowthDiagram.rules.RSK()
sage: G = GrowthDiagram(RuleRSK, [[0,1,0], [1,0,2]])
sage: G.filling()
{(0, 1): 1, (1, 0): 1, (2, 1): 2}
```

```
>>> from sage.all import *
>>> RuleRSK = GrowthDiagram.rules.RSK()
>>> G = GrowthDiagram(RuleRSK, [[Integer(0),Integer(1),Integer(0)],␣
```

(continues on next page)

(continued from previous page)

```
↪[Integer(1),Integer(0),Integer(2)]])
>>> G.filling()
{(0, 1): 1, (1, 0): 1, (2, 1): 2}
```

half_perimeter()

Return half the perimeter of the shape of the growth diagram.

in_labels()

Return the labels along the boundary on the side of the origin.

EXAMPLES:

```
sage: RuleRSK = GrowthDiagram.rules.RSK()
sage: G = GrowthDiagram(RuleRSK, labels=[[2,2],[3,2],[3,3],[3,2]]); G
1 0
sage: G.in_labels()
[[2, 2], [2, 2], [2, 2], [3, 2]]
```

```
>>> from sage.all import *
>>> RuleRSK = GrowthDiagram.rules.RSK()
>>> G = GrowthDiagram(RuleRSK, labels=[[Integer(2),Integer(2)],[Integer(3),
↪Integer(2)],[Integer(3),Integer(3)],[Integer(3),Integer(2)]]); G
1 0
>>> G.in_labels()
[[2, 2], [2, 2], [2, 2], [3, 2]]
```

is_rectangular()

Return `True` if the shape of the growth diagram is rectangular.

EXAMPLES:

```
sage: RuleRSK = GrowthDiagram.rules.RSK()
sage: GrowthDiagram(RuleRSK, [2,3,1]).is_rectangular()
True
sage: GrowthDiagram(RuleRSK, [[1,0,1],[0,1]]).is_rectangular()
False
```

```
>>> from sage.all import *
>>> RuleRSK = GrowthDiagram.rules.RSK()
>>> GrowthDiagram(RuleRSK, [Integer(2),Integer(3),Integer(1)]).is_
↪rectangular()
True
>>> GrowthDiagram(RuleRSK, [[Integer(1),Integer(0),Integer(1)],[Integer(0),
↪Integer(1)]]).is_rectangular()
False
```

options = Current options for GrowthDiagram - convention: matrix - x_unit: 0.9em - y_unit: 0.9em

out_labels()

Return the labels along the boundary opposite of the origin.

EXAMPLES:

```
sage: RuleRSK = GrowthDiagram.rules.RSK()
sage: G = GrowthDiagram(RuleRSK, [[0,1,0], [1,0,2]])
sage: G.out_labels()
[[], [1], [1, 1], [3, 1], [1], []]
```

```
>>> from sage.all import *
>>> RuleRSK = GrowthDiagram.rules.RSK()
>>> G = GrowthDiagram(RuleRSK, [[Integer(0),Integer(1),Integer(0)],␣
↪[Integer(1),Integer(0),Integer(2)]])
>>> G.out_labels()
[[], [1], [1, 1], [3, 1], [1], []]
```

rotate()

Return the growth diagram with the filling rotated by 180 degrees.

The rotated growth diagram is initialized with `labels=None`, that is, all labels along the boundary on the side of the origin are set to `rule.zero`.

For RSK-growth diagrams and rectangular fillings, this corresponds to evacuation of the P- and the Q-symbol.

EXAMPLES:

```
sage: RuleRSK = GrowthDiagram.rules.RSK()
sage: G = GrowthDiagram(RuleRSK, [[0,1,0], [1,0,2]])
sage: Gc = G.rotate()
sage: ascii_art([Gc.P_symbol(), Gc.Q_symbol()])
[   1  1  1    1  1  2 ]
[   2     ,    3       ]

sage: ascii_art([Tableau(t).evacuation()
....:            for t in [G.P_symbol(), G.Q_symbol()]])
[   1  1  1    1  1  2 ]
[   2     ,    3       ]
```

```
>>> from sage.all import *
>>> RuleRSK = GrowthDiagram.rules.RSK()
>>> G = GrowthDiagram(RuleRSK, [[Integer(0),Integer(1),Integer(0)],␣
↪[Integer(1),Integer(0),Integer(2)]])
>>> Gc = G.rotate()
>>> ascii_art([Gc.P_symbol(), Gc.Q_symbol()])
[   1  1  1    1  1  2 ]
[   2     ,    3       ]

>>> ascii_art([Tableau(t).evacuation()
...            for t in [G.P_symbol(), G.Q_symbol()]])
[   1  1  1    1  1  2 ]
[   2     ,    3       ]
```

rules

alias of *Rules*

shape()

Return the shape of the growth diagram as a skew partition.

> **Warning**
>
> In the literature the label on the corner opposite of the origin of a rectangular filling is often called the shape of the filling. This method returns the shape of the region instead.

EXAMPLES:

```
sage: RuleRSK = GrowthDiagram.rules.RSK()
sage: GrowthDiagram(RuleRSK, [1]).shape()
[1] / []
```

```
>>> from sage.all import *
>>> RuleRSK = GrowthDiagram.rules.RSK()
>>> GrowthDiagram(RuleRSK, [Integer(1)]).shape()
[1] / []
```

to_biword()

Return the filling as a biword, if the shape is rectangular.

EXAMPLES:

```
sage: RuleRSK = GrowthDiagram.rules.RSK()
sage: P = Tableau([[1,2,2],[2]])
sage: Q = Tableau([[1,3,3],[2]])
sage: bw = RSK_inverse(P, Q); bw
[[1, 2, 3, 3], [2, 1, 2, 2]]
sage: G = GrowthDiagram(RuleRSK, labels=Q.to_chain()[:-1]+P.to_chain()[::-1]);
↪ G
0  1  0
1  0  2

sage: P = SemistandardTableau([[1, 1, 2], [2]])
sage: Q = SemistandardTableau([[1, 2, 2], [2]])
sage: G = GrowthDiagram(RuleRSK, labels=Q.to_chain()[:-1]+P.to_chain()[::-1]);
↪ G
0  2
1  1
sage: G.to_biword()
([1, 2, 2, 2], [2, 1, 1, 2])
sage: RSK([1, 2, 2, 2], [2, 1, 1, 2])
[[[1, 1, 2], [2]], [[1, 2, 2], [2]]]
```

```
>>> from sage.all import *
>>> RuleRSK = GrowthDiagram.rules.RSK()
>>> P = Tableau([[Integer(1),Integer(2),Integer(2)],[Integer(2)]])
>>> Q = Tableau([[Integer(1),Integer(3),Integer(3)],[Integer(2)]])
>>> bw = RSK_inverse(P, Q); bw
[[1, 2, 3, 3], [2, 1, 2, 2]]
>>> G = GrowthDiagram(RuleRSK, labels=Q.to_chain()[:-Integer(1)]+P.to_
↪chain()[::-Integer(1)]); G
0  1  0
1  0  2
```

(continues on next page)

(continued from previous page)

```
>>> P = SemistandardTableau([[Integer(1), Integer(1), Integer(2)],␣
↪[Integer(2)]])
>>> Q = SemistandardTableau([[Integer(1), Integer(2), Integer(2)],␣
↪[Integer(2)]])
>>> G = GrowthDiagram(RuleRSK, labels=Q.to_chain()[:-Integer(1)]+P.to_
↪chain()[::-Integer(1)]); G
0  2
1  1
>>> G.to_biword()
([1, 2, 2, 2], [2, 1, 1, 2])
>>> RSK([Integer(1), Integer(2), Integer(2), Integer(2)], [Integer(2),␣
↪Integer(1), Integer(1), Integer(2)])
[[[1, 1, 2], [2]], [[1, 2, 2], [2]]]
```

to_word()

Return the filling as a word, if the shape is rectangular and there is at most one nonzero entry in each column, which must be 1.

EXAMPLES:

```
sage: RuleRSK = GrowthDiagram.rules.RSK()
sage: w = [3,3,2,4,1]; G = GrowthDiagram(RuleRSK, w)
sage: G
0  0  0  0  1
0  0  1  0  0
1  1  0  0  0
0  0  0  1  0
sage: G.to_word()
[3, 3, 2, 4, 1]
```

```
>>> from sage.all import *
>>> RuleRSK = GrowthDiagram.rules.RSK()
>>> w = [Integer(3),Integer(3),Integer(2),Integer(4),Integer(1)]; G =␣
↪GrowthDiagram(RuleRSK, w)
>>> G
0  0  0  0  1
0  0  1  0  0
1  1  0  0  0
0  0  0  1  0
>>> G.to_word()
[3, 3, 2, 4, 1]
```

class sage.combinat.growth.**Rule**

Bases: UniqueRepresentation, SageObject

Generic base class for a rule for a growth diagram.

Subclasses may provide the following attributes:

- zero – the zero element of the vertices of the graphs
- r – (default: 1) the parameter in the equation $DU - UD = rI$
- allowed_contents – (default: [1, ..., r]) an enumeration of the allowed contents of a cell

- has_multiple_edges – boolean (default: False); if the dual graded graph has multiple edges and therefore edges are triples consisting of two vertices and a label
- zero_edge – (default: 0) the zero label of the edges of the graphs used for degenerate edges. It is allowed to use this label also for other edges.

Subclasses may provide the following methods:

- normalize_vertex – a function that converts its input to a vertex
- vertices – a function that takes a nonnegative integer as input and returns the list of vertices on this rank
- rank – the rank function of the dual graded graphs
- forward_rule – a function with input (y, t, x, content) or (y, e, t, f, x, content) if has_multiple_edges is True. (y, e, t) is an edge in the graph P, (t, f, x) an edge in the graph Q. It should return the fourth vertex z, or, if has_multiple_edges is True, the path (g, z, h) from y to x.
- backward_rule – a function with input (y, z, x) or (y, g, z, h, x) if has_multiple_edges is True. (y, g, z) is an edge in the graph Q, (z, h, x) an edge in the graph P. It should return the fourth vertex and the content (t, content), or, if has_multiple_edges is True, the path from y to x and the content as (e, t, f, content).
- is_P_edge, is_Q_edge – functions that take two vertices as arguments and return True or False, or, if multiple edges are allowed, the list of edge labels of the edges from the first vertex to the second in the respective graded graph. These are only used for checking user input and providing the dual graded graph, and are therefore not mandatory.

Note that the class *GrowthDiagram* is able to use partially implemented subclasses just fine. Suppose that MyRule is such a subclass. Then:

- GrowthDiagram(MyRule, my_filling) requires only an implementation of forward_rule, zero and possibly has_multiple_edges.
- GrowthDiagram(MyRule, labels=my_labels, shape=my_shape) requires only an implementation of backward_rule and possibly has_multiple_edges, provided that the labels my_labels are given as needed by backward_rule.
- GrowthDiagram(MyRule, labels=my_labels) additionally needs an implementation of rank to deduce the shape.

In particular, this allows to implement rules which do not quite fit Fomin's notion of dual graded graphs. An example would be Bloom and Saracino's variant of the RSK correspondence [BS2012], where a backward rule is not available.

Similarly:

- MyRule.P_graph only requires an implementation of vertices, is_P_edge and possibly has_multiple_edges is required, mutatis mutandis for MyRule.Q_graph.
- MyRule._check_duality requires P_graph and Q_graph.

In particular, this allows to work with dual graded graphs without local rules.

_test_local_rules(*N=5*, ***options*)

Test trivial properties of local rules for the first few levels.

P_graph(*n*)

Return the first n levels of the first dual graded graph.

The non-degenerate edges in the vertical direction come from this graph.

EXAMPLES:

```
sage: Domino = GrowthDiagram.rules.Domino()
sage: Domino.P_graph(3)
Finite poset containing 8 elements
```

```
>>> from sage.all import *
>>> Domino = GrowthDiagram.rules.Domino()
>>> Domino.P_graph(Integer(3))
Finite poset containing 8 elements
```

Q_graph(*n*)

Return the first `n` levels of the second dual graded graph.

The non-degenerate edges in the horizontal direction come from this graph.

EXAMPLES:

```
sage: Domino = GrowthDiagram.rules.Domino()
sage: Q = Domino.Q_graph(3); Q
Finite poset containing 8 elements

sage: Q.upper_covers(Partition([1,1]))
[[1, 1, 1, 1], [3, 1], [2, 2]]
```

```
>>> from sage.all import *
>>> Domino = GrowthDiagram.rules.Domino()
>>> Q = Domino.Q_graph(Integer(3)); Q
Finite poset containing 8 elements

>>> Q.upper_covers(Partition([Integer(1),Integer(1)]))
[[1, 1, 1, 1], [3, 1], [2, 2]]
```

allowed_contents()

Return an enumeration of the allowed contents, excluding zero.

By default, this is `[1,...,r]`. It is used by the `TestSuite` in *_test_local_rules*.

EXAMPLES:

```
sage: Domino = GrowthDiagram.rules.Domino()
sage: Domino.allowed_contents
[1, -1]
```

```
>>> from sage.all import *
>>> Domino = GrowthDiagram.rules.Domino()
>>> Domino.allowed_contents
[1, -1]
```

has_multiple_edges = False

latex_vertex(*v*)

Return LaTeX used to typeset a vertex.

EXAMPLES:

```
sage: from sage.combinat.growth import Rule
sage: Rule().latex_vertex(5)
5
```

```
>>> from sage.all import *
>>> from sage.combinat.growth import Rule
>>> Rule().latex_vertex(Integer(5))
5
```

normalize_vertex(*v*)

Return v as a vertex of the dual graded graph.

This is a default implementation, returning its argument.

EXAMPLES:

```
sage: from sage.combinat.growth import Rule
sage: Rule().normalize_vertex("hello") == "hello"
True
```

```
>>> from sage.all import *
>>> from sage.combinat.growth import Rule
>>> Rule().normalize_vertex("hello") == "hello"
True
```

r = 1

zero_edge = 0

class sage.combinat.growth.**RuleBinaryWord**

Bases: *Rule*

A rule modelling a Schensted-like correspondence for binary words.

EXAMPLES:

```
sage: BinaryWord = GrowthDiagram.rules.BinaryWord()
sage: GrowthDiagram(BinaryWord, [3,1,2])
0  1  0
0  0  1
1  0  0
```

```
>>> from sage.all import *
>>> BinaryWord = GrowthDiagram.rules.BinaryWord()
>>> GrowthDiagram(BinaryWord, [Integer(3),Integer(1),Integer(2)])
0  1  0
0  0  1
1  0  0
```

The vertices of the dual graded graph are binary words:

```
sage: BinaryWord.vertices(3)
[word: 100, word: 101, word: 110, word: 111]
```

```
>>> from sage.all import *
>>> BinaryWord.vertices(Integer(3))
[word: 100, word: 101, word: 110, word: 111]
```

Note that, instead of passing the rule to *GrowthDiagram*, we can also use call the rule to create growth diagrams. For example:

```
sage: BinaryWord([2,4,1,3]).P_chain()
[word: , word: 1, word: 10, word: 101, word: 1101]
sage: BinaryWord([2,4,1,3]).Q_chain()
[word: , word: 1, word: 11, word: 110, word: 1101]
```

```
>>> from sage.all import *
>>> BinaryWord([Integer(2),Integer(4),Integer(1),Integer(3)]).P_chain()
[word: , word: 1, word: 10, word: 101, word: 1101]
>>> BinaryWord([Integer(2),Integer(4),Integer(1),Integer(3)]).Q_chain()
[word: , word: 1, word: 11, word: 110, word: 1101]
```

The Kleitman Greene invariant is the descent word, encoded by the positions of the zeros:

```
sage: pi = Permutation([4,1,8,3,6,5,2,7,9])
sage: G = BinaryWord(pi); G
0  1  0  0  0  0  0  0  0
0  0  0  0  0  0  1  0  0
0  0  0  1  0  0  0  0  0
1  0  0  0  0  0  0  0  0
0  0  0  0  0  1  0  0  0
0  0  0  0  1  0  0  0  0
0  0  0  0  0  0  0  1  0
0  0  1  0  0  0  0  0  0
0  0  0  0  0  0  0  0  1
sage: pi.descents()
[1, 3, 5, 6]
```

```
>>> from sage.all import *
>>> pi = Permutation([Integer(4),Integer(1),Integer(8),Integer(3),Integer(6),
↪Integer(5),Integer(2),Integer(7),Integer(9)])
>>> G = BinaryWord(pi); G
0  1  0  0  0  0  0  0  0
0  0  0  0  0  0  1  0  0
0  0  0  1  0  0  0  0  0
1  0  0  0  0  0  0  0  0
0  0  0  0  0  1  0  0  0
0  0  0  0  1  0  0  0  0
0  0  0  0  0  0  0  1  0
0  0  1  0  0  0  0  0  0
0  0  0  0  0  0  0  0  1
>>> pi.descents()
[1, 3, 5, 6]
```

backward_rule(*y*, *z*, *x*)

Return the content and the input shape.

See [Fom1995] Lemma 4.6.1, page 40.

- `y`, `z`, `x` – three binary words from a cell in a growth diagram, labelled as:

```
  x
y z
```

OUTPUT:

A pair `(t, content)` consisting of the shape of the fourth word and the content of the cell according to Viennot's bijection [Vie1983].

forward_rule(*y*, *t*, *x*, *content*)

Return the output shape given three shapes and the content.

See [Fom1995] Lemma 4.6.1, page 40.

INPUT:

- `y`, `t`, `x` – three binary words from a cell in a growth diagram, labelled as:

```
t x
y
```

- `content` – 0 or 1; the content of the cell

OUTPUT:

The fourth binary word `z` according to Viennot's bijection [Vie1983].

EXAMPLES:

```
sage: BinaryWord = GrowthDiagram.rules.BinaryWord()

sage: BinaryWord.forward_rule([], [], [], 1)
word: 1

sage: BinaryWord.forward_rule([1], [1], [1], 1)
word: 11
```

```
>>> from sage.all import *
>>> BinaryWord = GrowthDiagram.rules.BinaryWord()

>>> BinaryWord.forward_rule([], [], [], Integer(1))
word: 1

>>> BinaryWord.forward_rule([Integer(1)], [Integer(1)], [Integer(1)],␣
↪Integer(1))
word: 11
```

if `x != y` append last letter of `x` to `y`:

```
sage: BinaryWord.forward_rule([1,0], [1], [1,1], 0)
word: 101
```

```
>>> from sage.all import *
>>> BinaryWord.forward_rule([Integer(1),Integer(0)], [Integer(1)],␣
↪[Integer(1),Integer(1)], Integer(0))
word: 101
```

if `x == y != t` append `0` to `y`:

```
sage: BinaryWord.forward_rule([1,1], [1], [1,1], 0)
word: 110
```

```
>>> from sage.all import *
>>> BinaryWord.forward_rule([Integer(1),Integer(1)], [Integer(1)],␣
↪[Integer(1),Integer(1)], Integer(0))
word: 110
```

is_P_edge(*v*, *w*)

Return whether `(v, w)` is a P-edge of `self`.

`(v, w)` is an edge if `v` is obtained from `w` by deleting a letter.

EXAMPLES:

```
sage: BinaryWord = GrowthDiagram.rules.BinaryWord()
sage: v = BinaryWord.vertices(2)[1]; v
word: 11
sage: [w for w in BinaryWord.vertices(3) if BinaryWord.is_P_edge(v, w)]
[word: 101, word: 110, word: 111]
sage: [w for w in BinaryWord.vertices(4) if BinaryWord.is_P_edge(v, w)]
[]
```

```
>>> from sage.all import *
>>> BinaryWord = GrowthDiagram.rules.BinaryWord()
>>> v = BinaryWord.vertices(Integer(2))[Integer(1)]; v
word: 11
>>> [w for w in BinaryWord.vertices(Integer(3)) if BinaryWord.is_P_edge(v, w)]
[word: 101, word: 110, word: 111]
>>> [w for w in BinaryWord.vertices(Integer(4)) if BinaryWord.is_P_edge(v, w)]
[]
```

is_Q_edge(*v*, *w*)

Return whether `(v, w)` is a Q-edge of `self`.

`(w, v)` is an edge if `w` is obtained from `v` by appending a letter.

EXAMPLES:

```
sage: BinaryWord = GrowthDiagram.rules.BinaryWord()
sage: v = BinaryWord.vertices(2)[0]; v
word: 10
sage: [w for w in BinaryWord.vertices(3) if BinaryWord.is_Q_edge(v, w)]
[word: 100, word: 101]
sage: [w for w in BinaryWord.vertices(4) if BinaryWord.is_Q_edge(v, w)]
[]
```

```
>>> from sage.all import *
>>> BinaryWord = GrowthDiagram.rules.BinaryWord()
>>> v = BinaryWord.vertices(Integer(2))[Integer(0)]; v
word: 10
>>> [w for w in BinaryWord.vertices(Integer(3)) if BinaryWord.is_Q_edge(v, w)]
```

(continues on next page)

(continued from previous page)

```
[word: 100, word: 101]
>>> [w for w in BinaryWord.vertices(Integer(4)) if BinaryWord.is_Q_edge(v, w)]
[]
```

normalize_vertex(*v*)

Return v as a binary word.

EXAMPLES:

```
sage: BinaryWord = GrowthDiagram.rules.BinaryWord()
sage: BinaryWord.normalize_vertex([0,1]).parent()
Finite words over {0, 1}
```

```
>>> from sage.all import *
>>> BinaryWord = GrowthDiagram.rules.BinaryWord()
>>> BinaryWord.normalize_vertex([Integer(0),Integer(1)]).parent()
Finite words over {0, 1}
```

rank(*v*)

Return the rank of v: number of letters of the word.

EXAMPLES:

```
sage: BinaryWord = GrowthDiagram.rules.BinaryWord()
sage: BinaryWord.rank(BinaryWord.vertices(3)[0])
3
```

```
>>> from sage.all import *
>>> BinaryWord = GrowthDiagram.rules.BinaryWord()
>>> BinaryWord.rank(BinaryWord.vertices(Integer(3))[Integer(0)])
3
```

vertices(*n*)

Return the vertices of the dual graded graph on level n.

EXAMPLES:

```
sage: BinaryWord = GrowthDiagram.rules.BinaryWord()
sage: BinaryWord.vertices(3)
[word: 100, word: 101, word: 110, word: 111]
```

```
>>> from sage.all import *
>>> BinaryWord = GrowthDiagram.rules.BinaryWord()
>>> BinaryWord.vertices(Integer(3))
[word: 100, word: 101, word: 110, word: 111]
```

zero = word:

class sage.combinat.growth.**RuleBurge**

Bases: *RulePartitions*

A rule modelling Burge insertion.

EXAMPLES:

```
sage: Burge = GrowthDiagram.rules.Burge()
sage: GrowthDiagram(Burge, labels=[[],[1,1,1],[2,1,1,1],[2,1,1],[2,1],[1,1],[]])
1  1
0  1
1  0
1  0
```

```
>>> from sage.all import *
>>> Burge = GrowthDiagram.rules.Burge()
>>> GrowthDiagram(Burge, labels=[[],[Integer(1),Integer(1),Integer(1)],
↪[Integer(2),Integer(1),Integer(1),Integer(1)],[Integer(2),Integer(1),
↪Integer(1)],[Integer(2),Integer(1)],[Integer(1),Integer(1)],[]])
1  1
0  1
1  0
1  0
```

The vertices of the dual graded graph are integer partitions:

```
sage: Burge.vertices(3)
Partitions of the integer 3
```

```
>>> from sage.all import *
>>> Burge.vertices(Integer(3))
Partitions of the integer 3
```

The local rules implemented provide Burge's correspondence between matrices with nonnegative integer entries and pairs of semistandard tableaux, the *P_symbol()* and the *Q_symbol()*. For permutations, it reduces to classical Schensted insertion.

Instead of passing the rule to *GrowthDiagram*, we can also call the rule to create growth diagrams. For example:

```
sage: m = matrix([[2,0,0,1,0],[1,1,0,0,0], [0,0,0,0,3]])
sage: G = Burge(m); G
2  0  0  1  0
1  1  0  0  0
0  0  0  0  3

sage: ascii_art([G.P_symbol(), G.Q_symbol()])
[   1  2  3    1  2  5 ]
[   1  3       1  5    ]
[   1  3       1  5    ]
[   2      ,   4       ]
```

```
>>> from sage.all import *
>>> m = matrix([[Integer(2),Integer(0),Integer(0),Integer(1),Integer(0)],
↪[Integer(1),Integer(1),Integer(0),Integer(0),Integer(0)], [Integer(0),
↪Integer(0),Integer(0),Integer(0),Integer(3)]])
>>> G = Burge(m); G
2  0  0  1  0
1  1  0  0  0
0  0  0  0  3
```

(continues on next page)

(continued from previous page)

```
>>> ascii_art([G.P_symbol(), G.Q_symbol()])
[   1  2  3    1  2  5 ]
[   1  3       1  5    ]
[   1  3       1  5    ]
[   2     ,    4       ]
```

For rectangular fillings, the Kleitman-Greene invariant is the shape of the `P_symbol()`. Put differently, it is the partition labelling the lower right corner of the filling (recall that we are using matrix coordinates). It can be computed alternatively as the transpose of the partition $(\mu_1, \ldots, \mu_n)$, where $\mu_1 + \cdots + \mu_i$ is the maximal sum of entries in a collection of i pairwise disjoint sequences of cells with weakly decreasing row indices and weakly increasing column indices.

backward_rule(*y*, *z*, *x*)

Return the content and the input shape.

See [Kra2006] $(B^4 0) - (B^4 2)$. (In the arXiv version of the article there is a typo: in the computation of carry in $(B^4 2)$, ρ must be replaced by λ).

INPUT:

- `y`, `z`, `x` – three partitions from a cell in a growth diagram, labelled as:

```
  x
y z
```

OUTPUT:

A pair `(t, content)` consisting of the shape of the fourth partition according to the Burge correspondence and the content of the cell.

EXAMPLES:

```
sage: Burge = GrowthDiagram.rules.Burge()
sage: Burge.backward_rule([1,1,1],[2,1,1,1],[2,1,1])
([1, 1], 0)
```

```
>>> from sage.all import *
>>> Burge = GrowthDiagram.rules.Burge()
>>> Burge.backward_rule([Integer(1),Integer(1),Integer(1)],[Integer(2),
↪Integer(1),Integer(1),Integer(1)],[Integer(2),Integer(1),Integer(1)])
([1, 1], 0)
```

forward_rule(*y*, *t*, *x*, *content*)

Return the output shape given three shapes and the content.

See [Kra2006] $(F^4 0) - (F^4 2)$.

INPUT:

- `y`, `t`, `x` – three from a cell in a growth diagram, labelled as:

```
t x
y
```

- `content` – nonnegative integer; the content of the cell

OUTPUT: the fourth partition according to the Burge correspondence

EXAMPLES:

```
sage: Burge = GrowthDiagram.rules.Burge()
sage: Burge.forward_rule([2,1],[2,1],[2,1],1)
[3, 1]

sage: Burge.forward_rule([1],[],[2],2)
[2, 1, 1, 1]
```

```
>>> from sage.all import *
>>> Burge = GrowthDiagram.rules.Burge()
>>> Burge.forward_rule([Integer(2),Integer(1)],[Integer(2),Integer(1)],
↪[Integer(2),Integer(1)],Integer(1))
[3, 1]

>>> Burge.forward_rule([Integer(1)],[],[Integer(2)],Integer(2))
[2, 1, 1, 1]
```

class sage.combinat.growth.**RuleCompositions**

Bases: *Rule*

A base class for growth diagrams on the composition poset.

These were introduced by Stephanie van Willigenburg in [vW2020], cf. [TvW2018].

The vertices of the dual graded graph are *Compositions*:

```
sage: L = GrowthDiagram.rules.LeftCompositions()
sage: L.vertices(3)
Compositions of 3
```

```
>>> from sage.all import *
>>> L = GrowthDiagram.rules.LeftCompositions()
>>> L.vertices(Integer(3))
Compositions of 3
```

The saturated chains in the *sage.combinat.growth.Rule.Q_graph()* are not in the OEIS as of 2026:

```
sage: [len(L.Q_graph(n).maximal_chains()) for n in range(1,8)]
[1, 1, 2, 6, 19, 69, 285]
```

```
>>> from sage.all import *
>>> [len(L.Q_graph(n).maximal_chains()) for n in range(Integer(1),Integer(8))]
[1, 1, 2, 6, 19, 69, 285]
```

is_Q_edge(*v*, *w*)

Return whether `(v, w)` is a Q-edge of `self`.

`(v, w)` is an edge if any right most occurrence of a letter in `w` can be decreased by one to obtain `v`.

Compare with Example 3.2 of [vW2020]:

```
sage: L = GrowthDiagram.rules.LeftCompositions()
sage: L._Q_in_edges(Composition([2,1,3]))  # indirect doctest
[([1, 1, 3], [2, 1, 3], 0),
```

(continues on next page)

(continued from previous page)

```
 ([2, 1, 2], [2, 1, 3], 0),
 ([2, 3], [2, 1, 3], 0)]
```

```
>>> from sage.all import *
>>> L = GrowthDiagram.rules.LeftCompositions()
>>> L._Q_in_edges(Composition([Integer(2),Integer(1),Integer(3)]))  #␣
↪indirect doctest
[([1, 1, 3], [2, 1, 3], 0),
 ([2, 1, 2], [2, 1, 3], 0),
 ([2, 3], [2, 1, 3], 0)]
```

normalize_vertex(*v*)

Return v as a composition.

EXAMPLES:

```
sage: L = GrowthDiagram.rules.LeftCompositions()
sage: L.normalize_vertex([2,3,1,2])
[2, 3, 1, 2]
```

```
>>> from sage.all import *
>>> L = GrowthDiagram.rules.LeftCompositions()
>>> L.normalize_vertex([Integer(2),Integer(3),Integer(1),Integer(2)])
[2, 3, 1, 2]
```

rank(*v*)

Return the rank of v: the size of the composition.

EXAMPLES:

```
sage: L = GrowthDiagram.rules.LeftCompositions()
sage: L.rank(L.vertices(3)[0])
3
```

```
>>> from sage.all import *
>>> L = GrowthDiagram.rules.LeftCompositions()
>>> L.rank(L.vertices(Integer(3))[Integer(0)])
3
```

vertices(*n*)

Return the vertices of the dual graded graph on level n.

EXAMPLES:

```
sage: L = GrowthDiagram.rules.LeftCompositions()
sage: L.vertices(3)
Compositions of 3
```

```
>>> from sage.all import *
>>> L = GrowthDiagram.rules.LeftCompositions()
>>> L.vertices(Integer(3))
Compositions of 3
```

zero = []

class sage.combinat.growth.**RuleDomino**

Bases: *Rule*

A rule modelling domino insertion.

EXAMPLES:

```
sage: Domino = GrowthDiagram.rules.Domino()
sage: GrowthDiagram(Domino, [[1,0,0],[0,0,1],[0,-1,0]])
1  0  0
0  0  1
0 -1  0
```

```
>>> from sage.all import *
>>> Domino = GrowthDiagram.rules.Domino()
>>> GrowthDiagram(Domino, [[Integer(1),Integer(0),Integer(0)],[Integer(0),
↪Integer(0),Integer(1)],[Integer(0),-Integer(1),Integer(0)]])
1  0  0
0  0  1
0 -1  0
```

The vertices of the dual graded graph are integer partitions whose Ferrers diagram can be tiled with dominoes:

```
sage: Domino.vertices(2)
[[4], [3, 1], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> Domino.vertices(Integer(2))
[[4], [3, 1], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
```

Instead of passing the rule to *GrowthDiagram*, we can also call the rule to create growth diagrams. For example, let us check Figure 3 in [Lam2004]:

```
sage: G = Domino([[0,0,0,-1],[0,0,1,0],[-1,0,0,0],[0,1,0,0]]); G
 0  0  0 -1
 0  0  1  0
-1  0  0  0
 0  1  0  0

sage: ascii_art([G.P_symbol(), G.Q_symbol()])
[   1  2  4    1  2  2 ]
[   1  2  4    1  3  3 ]
[   3  3   ,   4  4    ]
```

```
>>> from sage.all import *
>>> G = Domino([[Integer(0),Integer(0),Integer(0),-Integer(1)],[Integer(0),
↪Integer(0),Integer(1),Integer(0)],[-Integer(1),Integer(0),Integer(0),
↪Integer(0)],[Integer(0),Integer(1),Integer(0),Integer(0)]]); G
 0  0  0 -1
 0  0  1  0
-1  0  0  0
 0  1  0  0
```

(continues on next page)

(continued from previous page)

```
>>> ascii_art([G.P_symbol(), G.Q_symbol()])
[   1  2  4    1  2  2 ]
[   1  2  4    1  3  3 ]
[   3  3   ,   4  4    ]
```

The spin of a domino tableau is half the number of vertical dominoes:

```
sage: def spin(T):
....:     return sum(2*len(set(row)) - len(row) for row in T)/4
```

```
>>> from sage.all import *
>>> def spin(T):
...     return sum(Integer(2)*len(set(row)) - len(row) for row in T)/Integer(4)
```

According to [Lam2004], the number of negative entries in the signed permutation equals the sum of the spins of the two associated tableaux:

```
sage: pi = [3,-1,2,4,-5]
sage: G = Domino(pi)
sage: list(G.filling().values()).count(-1) == spin(G.P_symbol()) + spin(G.Q_
↪symbol())
True
```

```
>>> from sage.all import *
>>> pi = [Integer(3),-Integer(1),Integer(2),Integer(4),-Integer(5)]
>>> G = Domino(pi)
>>> list(G.filling().values()).count(-Integer(1)) == spin(G.P_symbol()) + spin(G.
↪Q_symbol())
True
```

Negating all signs transposes all the partitions:

```
sage: G.P_symbol() == Domino([-e for e in pi]).P_symbol().conjugate()
True
```

```
>>> from sage.all import *
>>> G.P_symbol() == Domino([-e for e in pi]).P_symbol().conjugate()
True
```

P_symbol(*P_chain*)

Return the labels along the vertical boundary of a rectangular growth diagram as a (skew) domino tableau.

EXAMPLES:

```
sage: Domino = GrowthDiagram.rules.Domino()
sage: G = Domino([[0,1,0],[0,0,-1],[1,0,0]])
sage: G.P_symbol().pp()
1  1
2  3
2  3
```

```
>>> from sage.all import *
>>> Domino = GrowthDiagram.rules.Domino()
>>> G = Domino([[Integer(0),Integer(1),Integer(0)],[Integer(0),Integer(0),-
↪Integer(1)],[Integer(1),Integer(0),Integer(0)]])
>>> G.P_symbol().pp()
1  1
2  3
2  3
```

Q_symbol(*P_chain*)

alias of *P_symbol()*.

allowed_contents = [1, -1]

forward_rule(*y*, *t*, *x*, *content*)

Return the output shape given three shapes and the content.

See [Lam2004] Section 3.1.

INPUT:

- `y`, `t`, `x` – three partitions from a cell in a growth diagram, labelled as:

```
t x
y
```

- `content` – -1, 0 or 1; the content of the cell

OUTPUT: the fourth partition according to domino insertion

EXAMPLES:

```
sage: Domino = GrowthDiagram.rules.Domino()
```

```
>>> from sage.all import *
>>> Domino = GrowthDiagram.rules.Domino()
```

Rule 1:

```
sage: Domino.forward_rule([], [], [], 1)
[2]

sage: Domino.forward_rule([1,1], [1,1], [1,1], 1)
[3, 1]
```

```
>>> from sage.all import *
>>> Domino.forward_rule([], [], [], Integer(1))
[2]

>>> Domino.forward_rule([Integer(1),Integer(1)], [Integer(1),Integer(1)],␣
↪[Integer(1),Integer(1)], Integer(1))
[3, 1]
```

Rule 2:

```
sage: Domino.forward_rule([1,1], [1,1], [1,1], -1)
[1, 1, 1, 1]
```

```
>>> from sage.all import *
>>> Domino.forward_rule([Integer(1),Integer(1)], [Integer(1),Integer(1)],␣
↪[Integer(1),Integer(1)], -Integer(1))
[1, 1, 1, 1]
```

Rule 3:

```
sage: Domino.forward_rule([1,1], [1,1], [2,2], 0)
[2, 2]
```

```
>>> from sage.all import *
>>> Domino.forward_rule([Integer(1),Integer(1)], [Integer(1),Integer(1)],␣
↪[Integer(2),Integer(2)], Integer(0))
[2, 2]
```

Rule 4:

```
sage: Domino.forward_rule([2,2,2], [2,2], [3,3], 0)
[3, 3, 2]

sage: Domino.forward_rule([2], [], [1,1], 0)
[2, 2]

sage: Domino.forward_rule([1,1], [], [2], 0)
[2, 2]

sage: Domino.forward_rule([2], [], [2], 0)
[2, 2]

sage: Domino.forward_rule([4], [2], [4], 0)
[4, 2]

sage: Domino.forward_rule([1,1,1,1], [1,1], [1,1,1,1], 0)
[2, 2, 1, 1]

sage: Domino.forward_rule([2,1,1], [2], [4], 0)
[4, 1, 1]
```

```
>>> from sage.all import *
>>> Domino.forward_rule([Integer(2),Integer(2),Integer(2)], [Integer(2),
↪Integer(2)], [Integer(3),Integer(3)], Integer(0))
[3, 3, 2]

>>> Domino.forward_rule([Integer(2)], [], [Integer(1),Integer(1)], Integer(0))
[2, 2]

>>> Domino.forward_rule([Integer(1),Integer(1)], [], [Integer(2)], Integer(0))
[2, 2]
```

(continues on next page)

(continued from previous page)

```
>>> Domino.forward_rule([Integer(2)], [], [Integer(2)], Integer(0))
[2, 2]

>>> Domino.forward_rule([Integer(4)], [Integer(2)], [Integer(4)], Integer(0))
[4, 2]

>>> Domino.forward_rule([Integer(1),Integer(1),Integer(1),Integer(1)],␣
↪[Integer(1),Integer(1)], [Integer(1),Integer(1),Integer(1),Integer(1)],␣
↪Integer(0))
[2, 2, 1, 1]

>>> Domino.forward_rule([Integer(2),Integer(1),Integer(1)], [Integer(2)],␣
↪[Integer(4)], Integer(0))
[4, 1, 1]
```

is_P_edge(*v*, *w*)

Return whether `(v, w)` is a P-edge of `self`.

`(v, w)` is an edge if `v` is obtained from `w` by deleting a domino.

EXAMPLES:

```
sage: Domino = GrowthDiagram.rules.Domino()
sage: v = Domino.vertices(2)[1]; ascii_art(v)
***
*
sage: ascii_art([w for w in Domino.vertices(3) if Domino.is_P_edge(v, w)])
[              *** ]
[              *   ]
[ *****  ***  *   ]
[ *    , ***, *   ]
sage: [w for w in Domino.vertices(4) if Domino.is_P_edge(v, w)]
[]
```

```
>>> from sage.all import *
>>> Domino = GrowthDiagram.rules.Domino()
>>> v = Domino.vertices(Integer(2))[Integer(1)]; ascii_art(v)
***
*
>>> ascii_art([w for w in Domino.vertices(Integer(3)) if Domino.is_P_edge(v,␣
↪w)])
[              *** ]
[              *   ]
[ *****  ***  *   ]
[ *    , ***, *   ]
>>> [w for w in Domino.vertices(Integer(4)) if Domino.is_P_edge(v, w)]
[]
```

is_Q_edge(*v*, *w*)

alias of *is_P_edge()*.

latex_vertex(*v*)

Return LaTeX used to typeset a vertex.

EXAMPLES:

```
sage: Domino = GrowthDiagram.rules.Domino()
sage: Domino.latex_vertex(-42)
\bar{ 42 }
```

```
>>> from sage.all import *
>>> Domino = GrowthDiagram.rules.Domino()
>>> Domino.latex_vertex(-Integer(42))
\bar{ 42 }
```

normalize_vertex(*v*)

Return v as a partition.

EXAMPLES:

```
sage: Domino = GrowthDiagram.rules.Domino()
sage: Domino.normalize_vertex([3,1]).parent()
Partitions
```

```
>>> from sage.all import *
>>> Domino = GrowthDiagram.rules.Domino()
>>> Domino.normalize_vertex([Integer(3),Integer(1)]).parent()
Partitions
```

r = 2

rank(*v*)

Return the rank of v.

The rank of a vertex is half the size of the partition, which equals the number of dominoes in any filling.

EXAMPLES:

```
sage: Domino = GrowthDiagram.rules.Domino()
sage: Domino.rank(Domino.vertices(3)[0])
3
```

```
>>> from sage.all import *
>>> Domino = GrowthDiagram.rules.Domino()
>>> Domino.rank(Domino.vertices(Integer(3))[Integer(0)])
3
```

vertices(*n*)

Return the vertices of the dual graded graph on level n.

EXAMPLES:

```
sage: Domino = GrowthDiagram.rules.Domino()
sage: Domino.vertices(2)
[[4], [3, 1], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> Domino = GrowthDiagram.rules.Domino()
```

(continues on next page)

(continued from previous page)

```
>>> Domino.vertices(Integer(2))
[[4], [3, 1], [2, 2], [2, 1, 1], [1, 1, 1, 1]]
```

zero = []

class sage.combinat.growth.**RuleLLMS**(*k*)

Bases: *Rule*

A rule modelling the Schensted correspondence for affine permutations.

EXAMPLES:

```
sage: LLMS3 = GrowthDiagram.rules.LLMS(3)
sage: GrowthDiagram(LLMS3, [3,1,2])
0  1  0
0  0  1
1  0  0
```

```
>>> from sage.all import *
>>> LLMS3 = GrowthDiagram.rules.LLMS(Integer(3))
>>> GrowthDiagram(LLMS3, [Integer(3),Integer(1),Integer(2)])
0  1  0
0  0  1
1  0  0
```

The vertices of the dual graded graph are *Cores*:

```
sage: LLMS3.vertices(4)
3-Cores of length 4
```

```
>>> from sage.all import *
>>> LLMS3.vertices(Integer(4))
3-Cores of length 4
```

Let us check the example in Figure 1 in [LS2007]. Note that, instead of passing the rule to *GrowthDiagram*, we can also call the rule to create growth diagrams:

```
sage: G = LLMS3([4,1,2,6,3,5]); G
0  1  0  0  0  0
0  0  1  0  0  0
0  0  0  0  1  0
1  0  0  0  0  0
0  0  0  0  0  1
0  0  0  1  0  0
```

```
>>> from sage.all import *
>>> G = LLMS3([Integer(4),Integer(1),Integer(2),Integer(6),Integer(3),
↪Integer(5)]); G
0  1  0  0  0  0
0  0  1  0  0  0
0  0  0  0  1  0
1  0  0  0  0  0
```

(continues on next page)

(continued from previous page)

```
0  0  0  0  0  1
0  0  0  1  0  0
```

The *P_symbol()* is a *StrongTableau*:

```
sage: G.P_symbol().pp()
-1 -2 -3 -5
 3  5
-4 -6
 5
 6
```

```
>>> from sage.all import *
>>> G.P_symbol().pp()
-1 -2 -3 -5
 3  5
-4 -6
 5
 6
```

The *Q_symbol()* is a *WeakTableau*:

```
sage: G.Q_symbol().pp()
1  3  4  5
2  5
3  6
5
6
```

```
>>> from sage.all import *
>>> G.Q_symbol().pp()
1  3  4  5
2  5
3  6
5
6
```

Let us also check Example 6.2 in [LLMSSZ2013]:

```
sage: G = LLMS3([4,1,3,2])
sage: G.P_symbol().pp()
-1 -2  3
-3
-4

sage: G.Q_symbol().pp()
1  3  4
2
3
```

```
>>> from sage.all import *
>>> G = LLMS3([Integer(4),Integer(1),Integer(3),Integer(2)])
```

(continues on next page)

(continued from previous page)

```
>>> G.P_symbol().pp()
-1 -2  3
-3
-4

>>> G.Q_symbol().pp()
1  3  4
2
3
```

Similarly, for 2-cores:

```
sage: LLMS2 = GrowthDiagram.rules.LLMS(2)
sage: G = LLMS2([4,1,3,2])
sage: G.P_symbol().pp()
 -1 -2  3  4
  2 -3  4
  3  4
 -4
sage: G.Q_symbol().pp()
  1  2  3  4
  2  3  4
  3  4
  4
```

```
>>> from sage.all import *
>>> LLMS2 = GrowthDiagram.rules.LLMS(Integer(2))
>>> G = LLMS2([Integer(4),Integer(1),Integer(3),Integer(2)])
>>> G.P_symbol().pp()
 -1 -2  3  4
  2 -3  4
  3  4
 -4
>>> G.Q_symbol().pp()
  1  2  3  4
  2  3  4
  3  4
  4
```

P_symbol(*P_chain*)

Return the labels along the vertical boundary of a rectangular growth diagram as a skew *StrongTableau*.

EXAMPLES:

```
sage: LLMS4 = GrowthDiagram.rules.LLMS(4)
sage: G = LLMS4([3,4,1,2])
sage: G.P_symbol().pp()
-1 -2
-3 -4
```

```
>>> from sage.all import *
>>> LLMS4 = GrowthDiagram.rules.LLMS(Integer(4))
```

(continues on next page)

(continued from previous page)

```
>>> G = LLMS4([Integer(3),Integer(4),Integer(1),Integer(2)])
>>> G.P_symbol().pp()
-1 -2
-3 -4
```

Q_symbol(*Q_chain*)

Return the labels along the horizontal boundary of a rectangular growth diagram as a skew *WeakTableau*.

EXAMPLES:

```
