sage.combinat.subset.**Subsets**(*s*, *k=None*, *submultiset=False*)

Return the combinatorial class of the subsets of the finite set `s`. The set can be given as a list, Set or any iterable convertible to a set. Alternatively, a nonnegative integer n can be provided in place of `s`; in this case, the result is the combinatorial class of the subsets of the set $\{1, 2, \ldots, n\}$ (i.e. of the Sage `range(1,n+1)`).

A second optional parameter `k` can be given. In this case, `Subsets` returns the combinatorial class of subsets of `s` of size `k`.

Warning

The subsets are returned as Sets. Do not assume that these Sets are ordered; they often are not! (E.g., `Subsets(10).list()[619]` returns `{10, 4, 5, 6, 7}` on my system.) See *SubsetsSorted* for a similar class which returns the subsets as sorted tuples.

Finally the option `submultiset` allows one to deal with sets with repeated elements, usually called multisets. The method then returns the class of all multisets in which every element is contained at most as often as it is contained in `s`. These multisets are encoded as lists.

EXAMPLES:

```
sage: S = Subsets([1, 2, 3]); S
Subsets of {1, 2, 3}
sage: S.cardinality()
8
sage: S.first()
{}
sage: S.last()
{1, 2, 3}
sage: S.random_element() in S
True
sage: S.list()
[{}, {1}, {2}, {3}, {1, 2}, {1, 3}, {2, 3}, {1, 2, 3}]
```

```
>>> from sage.all import *
>>> S = Subsets([Integer(1), Integer(2), Integer(3)]); S
Subsets of {1, 2, 3}
>>> S.cardinality()
8
>>> S.first()
{}
>>> S.last()
{1, 2, 3}
>>> S.random_element() in S
True
```

(continues on next page)

(continued from previous page)

```
>>> S.list()
[{}, {1}, {2}, {3}, {1, 2}, {1, 3}, {2, 3}, {1, 2, 3}]
```

Here is the same example where the set is given as an integer:

```
sage: S = Subsets(3)
sage: S.list()
[{}, {1}, {2}, {3}, {1, 2}, {1, 3}, {2, 3}, {1, 2, 3}]
```

```
>>> from sage.all import *
>>> S = Subsets(Integer(3))
>>> S.list()
[{}, {1}, {2}, {3}, {1, 2}, {1, 3}, {2, 3}, {1, 2, 3}]
```

We demonstrate various the effect of the various options:

```
sage: S = Subsets(3, 2); S
Subsets of {1, 2, 3} of size 2
sage: S.list()
[{1, 2}, {1, 3}, {2, 3}]

sage: S = Subsets([1, 2, 2], submultiset=True); S
SubMultiset of [1, 2, 2]
sage: S.list()
[[], [1], [2], [1, 2], [2, 2], [1, 2, 2]]

sage: S = Subsets([1, 2, 2, 3], 3, submultiset=True); S
SubMultiset of [1, 2, 2, 3] of size 3
sage: S.list()
[[1, 2, 2], [1, 2, 3], [2, 2, 3]]

sage: S = Subsets(['a','b','a','b'], 2, submultiset=True); S.list()
[['a', 'a'], ['a', 'b'], ['b', 'b']]
```

```
>>> from sage.all import *
>>> S = Subsets(Integer(3), Integer(2)); S
Subsets of {1, 2, 3} of size 2
>>> S.list()
[{1, 2}, {1, 3}, {2, 3}]

>>> S = Subsets([Integer(1), Integer(2), Integer(2)], submultiset=True); S
SubMultiset of [1, 2, 2]
>>> S.list()
[[], [1], [2], [1, 2], [2, 2], [1, 2, 2]]

>>> S = Subsets([Integer(1), Integer(2), Integer(2), Integer(3)], Integer(3),␣
↪submultiset=True); S
SubMultiset of [1, 2, 2, 3] of size 3
>>> S.list()
[[1, 2, 2], [1, 2, 3], [2, 2, 3]]

>>> S = Subsets(['a','b','a','b'], Integer(2), submultiset=True); S.list()
```

(continues on next page)

(continued from previous page)

```
[['a', 'a'], ['a', 'b'], ['b', 'b']]
```

And it is possible to play with subsets of subsets:

```
sage: S = Subsets(3)
sage: S2 = Subsets(S); S2
Subsets of Subsets of {1, 2, 3}
sage: S2.cardinality()
256
sage: it = iter(S2)
sage: [next(it) for _ in range(8)]
[{}, {{}}, {{1}}, {{2}}, {{3}}, {{1, 2}},  {{1, 3}}, {{2, 3}}]
sage: S2.random_element()      # random
{{2}, {1, 2, 3}, {}}
sage: [S2.unrank(k) for k in range(256)] == S2.list()
True

sage: S3 = Subsets(S2)
sage: S3.cardinality()
115792089237316195423570985008687907853269984665640564039457584007913129639936
sage: S3.unrank(14123091480)  # random
{{{2}, {1, 2, 3}, {1, 2}, {3}, {}},
 {{1, 2, 3}, {2}, {1}, {1, 3}},
 {{}, {2}, {2, 3}, {1, 2}},
 {{}, {2}, {1, 2, 3}, {1, 2}},
 {},
 {{}, {1}, {1, 2, 3}}}

sage: T = Subsets(S2, 10)
sage: T.cardinality()
278826214642518400
sage: T.unrank(1441231049)  # random
{{{1, 2, 3}, {2}, {2, 3}}, {{3}, {1, 3}, ..., {3}, {1}, {}, {1, 3}}}
```

```
>>> from sage.all import *
>>> S = Subsets(Integer(3))
>>> S2 = Subsets(S); S2
Subsets of Subsets of {1, 2, 3}
>>> S2.cardinality()
256
>>> it = iter(S2)
>>> [next(it) for _ in range(Integer(8))]
[{}, {{}}, {{1}}, {{2}}, {{3}}, {{1, 2}},  {{1, 3}}, {{2, 3}}]
>>> S2.random_element()      # random
{{2}, {1, 2, 3}, {}}
>>> [S2.unrank(k) for k in range(Integer(256))] == S2.list()
True

>>> S3 = Subsets(S2)
>>> S3.cardinality()
115792089237316195423570985008687907853269984665640564039457584007913129639936
>>> S3.unrank(Integer(14123091480))  # random
```

(continues on next page)

(continued from previous page)

```
{{{2}, {1, 2, 3}, {1, 2}, {3}, {}},
 {{1, 2, 3}, {2}, {1}, {1, 3}},
 {{}, {2}, {2, 3}, {1, 2}},
 {{}, {2}, {1, 2, 3}, {1, 2}},
 {},
 {{}, {1}, {1, 2, 3}}}

>>> T = Subsets(S2, Integer(10))
>>> T.cardinality()
278826214642518400
>>> T.unrank(Integer(1441231049))  # random
{{{1, 2, 3}, {2}, {2, 3}}, {{3}, {1, 3}, ..., {3}, {1}, {}, {1, 3}}}
```

class sage.combinat.subset.**SubsetsSorted**(*s*)

Bases: *Subsets_s*

Lightweight class of all subsets of some set S, with each subset being encoded as a sorted tuple.

Used to model indices of algebras given by subsets (so we don't have to explicitly build all 2^n subsets in memory). For example, `CliffordAlgebra`.

element_class

alias of `tuple`

first()

Return the first element of `self`.

EXAMPLES:

```
sage: from sage.combinat.subset import SubsetsSorted
sage: S = SubsetsSorted(range(3))
sage: S.first()
()
```

```
>>> from sage.all import *
>>> from sage.combinat.subset import SubsetsSorted
>>> S = SubsetsSorted(range(Integer(3)))
>>> S.first()
()
```

last()

Return the last element of `self`.

EXAMPLES:

```
sage: from sage.combinat.subset import SubsetsSorted
sage: S = SubsetsSorted(range(3))
sage: S.last()
(0, 1, 2)
```

```
>>> from sage.all import *
>>> from sage.combinat.subset import SubsetsSorted
>>> S = SubsetsSorted(range(Integer(3)))
```

(continues on next page)

(continued from previous page)

```
>>> S.last()
(0, 1, 2)
```

random_element()

Return a random element of `self`.

EXAMPLES:

```
sage: from sage.combinat.subset import SubsetsSorted
sage: S = SubsetsSorted(range(3))
sage: isinstance(S.random_element(), tuple)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.subset import SubsetsSorted
>>> S = SubsetsSorted(range(Integer(3)))
>>> isinstance(S.random_element(), tuple)
True
```

unrank(*r*)

Return the subset which has rank `r`.

EXAMPLES:

```
sage: from sage.combinat.subset import SubsetsSorted
sage: S = SubsetsSorted(range(3))
sage: S.unrank(4)
(0, 1)
```

```
>>> from sage.all import *
>>> from sage.combinat.subset import SubsetsSorted
>>> S = SubsetsSorted(range(Integer(3)))
>>> S.unrank(Integer(4))
(0, 1)
```

class sage.combinat.subset.**Subsets_s**(*s*)

Bases: `Parent`

Subsets of a given set.

EXAMPLES:

```
sage: S = Subsets(4); S
Subsets of {1, 2, 3, 4}
sage: S.cardinality()
16
sage: Subsets(4).list()
[{}, {1}, {2}, {3}, {4},
 {1, 2}, {1, 3}, {1, 4}, {2, 3}, {2, 4}, {3, 4},
 {1, 2, 3}, {1, 2, 4}, {1, 3, 4}, {2, 3, 4},
 {1, 2, 3, 4}]

sage: S = Subsets(Subsets(Subsets(GF(3)))); S
```

(continues on next page)

(continued from previous page)

```
Subsets of Subsets of Subsets of Finite Field of size 3
sage: S.cardinality()
115792089237316195423570985008687907853269984665640564039457584007913129639936
sage: S.unrank(3149254230)  # random
{{{1}, {0, 2}}, {{0, 1, 2}, {0, 1}, {1}, {1, 2}},
 {{2}, {1, 2}, {0, 1, 2}, {0, 2}, {1}, {}},
 {{1, 2}, {0}},
 {{0, 1, 2}, {0, 1}, {0, 2}, {1, 2}}}
```

```
>>> from sage.all import *
>>> S = Subsets(Integer(4)); S
Subsets of {1, 2, 3, 4}
>>> S.cardinality()
16
>>> Subsets(Integer(4)).list()
[{}, {1}, {2}, {3}, {4},
 {1, 2}, {1, 3}, {1, 4}, {2, 3}, {2, 4}, {3, 4},
 {1, 2, 3}, {1, 2, 4}, {1, 3, 4}, {2, 3, 4},
 {1, 2, 3, 4}]

>>> S = Subsets(Subsets(Subsets(GF(Integer(3))))); S
Subsets of Subsets of Subsets of Finite Field of size 3
>>> S.cardinality()
115792089237316195423570985008687907853269984665640564039457584007913129639936
>>> S.unrank(Integer(3149254230))  # random
{{{1}, {0, 2}}, {{0, 1, 2}, {0, 1}, {1}, {1, 2}},
 {{2}, {1, 2}, {0, 1, 2}, {0, 2}, {1}, {}},
 {{1, 2}, {0}},
 {{0, 1, 2}, {0, 1}, {0, 2}, {1, 2}}}
```

cardinality()

Return the number of subsets of the set `s`.

This is given by $2^{|s|}$.

EXAMPLES:

```
sage: Subsets(Set([1,2,3])).cardinality()
8
sage: Subsets([1,2,3,3]).cardinality()
8
sage: Subsets(3).cardinality()
8
```

```
>>> from sage.all import *
>>> Subsets(Set([Integer(1),Integer(2),Integer(3)])).cardinality()
8
>>> Subsets([Integer(1),Integer(2),Integer(3),Integer(3)]).cardinality()
8
>>> Subsets(Integer(3)).cardinality()
8
```

element_class

alias of Set_object_enumerated

first()

Return the first subset of s. Since we aren't restricted to subsets of a certain size, this is always the empty set.

EXAMPLES:

```
sage: Subsets([1,2,3]).first()
{}
sage: Subsets(3).first()
{}
```

```
>>> from sage.all import *
>>> Subsets([Integer(1),Integer(2),Integer(3)]).first()
{}
>>> Subsets(Integer(3)).first()
{}
```

last()

Return the last subset of s. Since we aren't restricted to subsets of a certain size, this is always the set s itself.

EXAMPLES:

```
sage: Subsets([1,2,3]).last()
{1, 2, 3}
sage: Subsets(3).last()
{1, 2, 3}
```

```
>>> from sage.all import *
>>> Subsets([Integer(1),Integer(2),Integer(3)]).last()
{1, 2, 3}
>>> Subsets(Integer(3)).last()
{1, 2, 3}
```

lattice()

Return the lattice of subsets ordered by containment.

EXAMPLES:

```
sage: X = Subsets([7,8,9])
sage: X.lattice()                                                           #␣
↪needs sage.combinat sage.graphs
Finite lattice containing 8 elements
sage: Y = Subsets(0)
sage: Y.lattice()                                                           #␣
↪needs sage.combinat sage.graphs
Finite lattice containing 1 elements
```

```
>>> from sage.all import *
>>> X = Subsets([Integer(7),Integer(8),Integer(9)])
>>> X.lattice()                                                             #␣
↪needs sage.combinat sage.graphs
Finite lattice containing 8 elements
```

(continues on next page)

(continued from previous page)

```
>>> Y = Subsets(Integer(0))
>>> Y.lattice()                                                          #␣
↪needs sage.combinat sage.graphs
Finite lattice containing 1 elements
```

random_element()

Return a random element of the class of subsets of `s` (in other words, a random subset of `s`).

EXAMPLES:

```
sage: Subsets(3).random_element()           # random
{2}
sage: Subsets([4,5,6]).random_element()     # random
{5}

sage: S = Subsets(Subsets(Subsets([0,1,2])))
sage: S.cardinality()
115792089237316195423570985008687907853269984665640564039457584007913129639936
sage: s = S.random_element()
sage: s     # random
{{{1, 2}, {2}, {0}, {1}}, {{1, 2}, {0, 1, 2}, {0, 2}, {0}, {0, 1}}, ..., {{1,␣
↪2}, {2}, {1}}, {{2}, {0, 2}, {}, {1}}}
sage: s in S
True
```

```
>>> from sage.all import *
>>> Subsets(Integer(3)).random_element()           # random
{2}
>>> Subsets([Integer(4),Integer(5),Integer(6)]).random_element()     # random
{5}

>>> S = Subsets(Subsets(Subsets([Integer(0),Integer(1),Integer(2)])))
>>> S.cardinality()
115792089237316195423570985008687907853269984665640564039457584007913129639936
>>> s = S.random_element()
>>> s     # random
{{{1, 2}, {2}, {0}, {1}}, {{1, 2}, {0, 1, 2}, {0, 2}, {0}, {0, 1}}, ..., {{1,␣
↪2}, {2}, {1}}, {{2}, {0, 2}, {}, {1}}}
>>> s in S
True
```

rank(*sub*)

Return the rank of `sub` as a subset of `s`.

EXAMPLES:

```
sage: Subsets(3).rank([])
0
sage: Subsets(3).rank([1,2])
4
sage: Subsets(3).rank([1,2,3])
7
sage: Subsets(3).rank([2,3,4])
```

(continues on next page)

(continued from previous page)

```
Traceback (most recent call last):
...
ValueError: {2, 3, 4} is not a subset of {1, 2, 3}
```

```
>>> from sage.all import *
>>> Subsets(Integer(3)).rank([])
0
>>> Subsets(Integer(3)).rank([Integer(1),Integer(2)])
4
>>> Subsets(Integer(3)).rank([Integer(1),Integer(2),Integer(3)])
7
>>> Subsets(Integer(3)).rank([Integer(2),Integer(3),Integer(4)])
Traceback (most recent call last):
...
ValueError: {2, 3, 4} is not a subset of {1, 2, 3}
```

underlying_set()

Return the set of elements.

EXAMPLES:

```
sage: Subsets(GF(13)).underlying_set()
{0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12}
```

```
>>> from sage.all import *
>>> Subsets(GF(Integer(13))).underlying_set()
{0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12}
```

unrank(*r*)

Return the subset of `s` that has rank `k`.

EXAMPLES:

```
sage: Subsets(3).unrank(0)
{}
sage: Subsets([2,4,5]).unrank(1)
{2}
sage: Subsets([1,2,3]).unrank(257)
Traceback (most recent call last):
...
IndexError: index out of range
```

```
>>> from sage.all import *
>>> Subsets(Integer(3)).unrank(Integer(0))
{}
>>> Subsets([Integer(2),Integer(4),Integer(5)]).unrank(Integer(1))
{2}
>>> Subsets([Integer(1),Integer(2),Integer(3)]).unrank(Integer(257))
Traceback (most recent call last):
...
IndexError: index out of range
```

class sage.combinat.subset.**Subsets_sk**(s, k)

Bases: *Subsets_s*

Subsets of fixed size of a set.

EXAMPLES:

```
sage: S = Subsets([0,1,2,5,7], 3); S
Subsets of {0, 1, 2, 5, 7} of size 3
sage: S.cardinality()
10
sage: S.first(), S.last()
({0, 1, 2}, {2, 5, 7})
sage: S.random_element()  # random
{0, 5, 7}
sage: S([0,2,7])
{0, 2, 7}
sage: S([0,3,5])
Traceback (most recent call last):
...
ValueError: {0, 3, 5} not in Subsets of {0, 1, 2, 5, 7} of size 3
sage: S([0])
Traceback (most recent call last):
...
ValueError: {0} not in Subsets of {0, 1, 2, 5, 7} of size 3
```

```
>>> from sage.all import *
>>> S = Subsets([Integer(0),Integer(1),Integer(2),Integer(5),Integer(7)],␣
↪Integer(3)); S
Subsets of {0, 1, 2, 5, 7} of size 3
>>> S.cardinality()
10
>>> S.first(), S.last()
({0, 1, 2}, {2, 5, 7})
>>> S.random_element()  # random
{0, 5, 7}
>>> S([Integer(0),Integer(2),Integer(7)])
{0, 2, 7}
>>> S([Integer(0),Integer(3),Integer(5)])
Traceback (most recent call last):
...
ValueError: {0, 3, 5} not in Subsets of {0, 1, 2, 5, 7} of size 3
>>> S([Integer(0)])
Traceback (most recent call last):
...
ValueError: {0} not in Subsets of {0, 1, 2, 5, 7} of size 3
```

cardinality()

EXAMPLES:

```
sage: Subsets(Set([1,2,3]), 2).cardinality()
3
sage: Subsets([1,2,3,3], 2).cardinality()
3
```

(continues on next page)

(continued from previous page)

```
sage: Subsets([1,2,3], 1).cardinality()
3
sage: Subsets([1,2,3], 3).cardinality()
1
sage: Subsets([1,2,3], 0).cardinality()
1
sage: Subsets([1,2,3], 4).cardinality()
0
sage: Subsets(3,2).cardinality()
3
sage: Subsets(3,4).cardinality()
0
```

```
>>> from sage.all import *
>>> Subsets(Set([Integer(1),Integer(2),Integer(3)]), Integer(2)).cardinality()
3
>>> Subsets([Integer(1),Integer(2),Integer(3),Integer(3)], Integer(2)).
↪cardinality()
3
>>> Subsets([Integer(1),Integer(2),Integer(3)], Integer(1)).cardinality()
3
>>> Subsets([Integer(1),Integer(2),Integer(3)], Integer(3)).cardinality()
1
>>> Subsets([Integer(1),Integer(2),Integer(3)], Integer(0)).cardinality()
1
>>> Subsets([Integer(1),Integer(2),Integer(3)], Integer(4)).cardinality()
0
>>> Subsets(Integer(3),Integer(2)).cardinality()
3
>>> Subsets(Integer(3),Integer(4)).cardinality()
0
```

first()

Return the first subset of s of size k.

EXAMPLES:

```
sage: Subsets(Set([1,2,3]), 2).first()
{1, 2}
sage: Subsets([1,2,3,3], 2).first()
{1, 2}
sage: Subsets(3,2).first()
{1, 2}
sage: Subsets(3,4).first()
Traceback (most recent call last):
...
EmptySetError
```

```
>>> from sage.all import *
>>> Subsets(Set([Integer(1),Integer(2),Integer(3)]), Integer(2)).first()
{1, 2}
>>> Subsets([Integer(1),Integer(2),Integer(3),Integer(3)], Integer(2)).first()
```

(continues on next page)

(continued from previous page)

```
{1, 2}
>>> Subsets(Integer(3),Integer(2)).first()
{1, 2}
>>> Subsets(Integer(3),Integer(4)).first()
Traceback (most recent call last):
...
EmptySetError
```

last()

Return the last subset of s of size k.

EXAMPLES:

```
sage: Subsets(Set([1,2,3]), 2).last()
{2, 3}
sage: Subsets([1,2,3,3], 2).last()
{2, 3}
sage: Subsets(3,2).last()
{2, 3}
sage: Subsets(3,4).last()
Traceback (most recent call last):
...
EmptySetError
```

```
>>> from sage.all import *
>>> Subsets(Set([Integer(1),Integer(2),Integer(3)]), Integer(2)).last()
{2, 3}
>>> Subsets([Integer(1),Integer(2),Integer(3),Integer(3)], Integer(2)).last()
{2, 3}
>>> Subsets(Integer(3),Integer(2)).last()
{2, 3}
>>> Subsets(Integer(3),Integer(4)).last()
Traceback (most recent call last):
...
EmptySetError
```

random_element()

Return a random element of the class of subsets of `s` of size `k` (in other words, a random subset of `s` of size `k`).

EXAMPLES:

```
sage: s = Subsets(3, 2).random_element()
sage: s in Subsets(3, 2)
True

sage: Subsets(3,4).random_element()
Traceback (most recent call last):
...
EmptySetError
```

```
>>> from sage.all import *
>>> s = Subsets(Integer(3), Integer(2)).random_element()
```

(continues on next page)

(continued from previous page)

```
>>> s in Subsets(Integer(3), Integer(2))
True

>>> Subsets(Integer(3),Integer(4)).random_element()
Traceback (most recent call last):
...
EmptySetError
```

rank(*sub*)

Return the rank of `sub` as a subset of `s` of size `k`.

EXAMPLES:

```
sage: Subsets(3,2).rank([1,2])
0
sage: Subsets([2,3,4],2).rank([3,4])
2
sage: Subsets([2,3,4],2).rank([2])
Traceback (most recent call last):
...
ValueError: {2} is not a subset of length 2 of {2, 3, 4}
sage: Subsets([2,3,4],4).rank([2,3,4,5])
Traceback (most recent call last):
...
ValueError: {2, 3, 4, 5} is not a subset of length 4 of {2, 3, 4}
```

```
>>> from sage.all import *
>>> Subsets(Integer(3),Integer(2)).rank([Integer(1),Integer(2)])
0
>>> Subsets([Integer(2),Integer(3),Integer(4)],Integer(2)).rank([Integer(3),
↪Integer(4)])
2
>>> Subsets([Integer(2),Integer(3),Integer(4)],Integer(2)).rank([Integer(2)])
Traceback (most recent call last):
...
ValueError: {2} is not a subset of length 2 of {2, 3, 4}
>>> Subsets([Integer(2),Integer(3),Integer(4)],Integer(4)).rank([Integer(2),
↪Integer(3),Integer(4),Integer(5)])
Traceback (most recent call last):
...
ValueError: {2, 3, 4, 5} is not a subset of length 4 of {2, 3, 4}
```

unrank(*r*)

Return the subset of `s` of size `k` that has rank `r`.

EXAMPLES:

```
sage: Subsets(3,2).unrank(0)
{1, 2}
sage: Subsets([2,4,5],2).unrank(0)
{2, 4}
sage: Subsets([1,2,8],3).unrank(42)
Traceback (most recent call last):
```

(continues on next page)

(continued from previous page)

```
...
IndexError: index out of range
```

```
>>> from sage.all import *
>>> Subsets(Integer(3),Integer(2)).unrank(Integer(0))
{1, 2}
>>> Subsets([Integer(2),Integer(4),Integer(5)],Integer(2)).unrank(Integer(0))
{2, 4}
>>> Subsets([Integer(1),Integer(2),Integer(8)],Integer(3)).unrank(Integer(42))
Traceback (most recent call last):
...
IndexError: index out of range
```

sage.combinat.subset.**dict_to_list**(*d*)

Return a list whose elements are the elements of `i` of `d` repeated with multiplicity `d[i]`.

EXAMPLES:

```
sage: from sage.combinat.subset import dict_to_list
sage: dict_to_list({'a':1, 'b':3})
['a', 'b', 'b', 'b']
```

```
>>> from sage.all import *
>>> from sage.combinat.subset import dict_to_list
>>> dict_to_list({'a':Integer(1), 'b':Integer(3)})
['a', 'b', 'b', 'b']
```

sage.combinat.subset.**list_to_dict**(*l*)

Return a dictionary of multiplicities and the list of its keys.

INPUT:

- `l` – list with possibly repeated elements

The keys are the elements of `l` (in the same order in which they appear) and values are the multiplicities of each element in `l`.

EXAMPLES:

```
sage: from sage.combinat.subset import list_to_dict
sage: list_to_dict(['a', 'b', 'b', 'b'])
({'a': 1, 'b': 3}, ['a', 'b'])
```

```
>>> from sage.all import *
>>> from sage.combinat.subset import list_to_dict
>>> list_to_dict(['a', 'b', 'b', 'b'])
({'a': 1, 'b': 3}, ['a', 'b'])
```

sage.combinat.subset.**powerset**(*X*)

Iterator over the *list* of all subsets of the iterable `X`, in no particular order. Each list appears exactly once, up to order.

INPUT:

- `X` – an iterable

OUTPUT: iterator of lists

EXAMPLES:

```
sage: list(powerset([1,2,3]))
[[], [1], [2], [1, 2], [3], [1, 3], [2, 3], [1, 2, 3]]
sage: [z for z in powerset([0,[1,2]])]
[[], [0], [[1, 2]], [0, [1, 2]]]
```

```
>>> from sage.all import *
>>> list(powerset([Integer(1),Integer(2),Integer(3)]))
[[], [1], [2], [1, 2], [3], [1, 3], [2, 3], [1, 2, 3]]
>>> [z for z in powerset([Integer(0),[Integer(1),Integer(2)]])]
[[], [0], [[1, 2]], [0, [1, 2]]]
```

Iterating over the power set of an infinite set is also allowed:

```
sage: i = 0
sage: L = []
sage: for x in powerset(ZZ):
....:     if i > 10:
....:         break
....:     else:
....:         i += 1
....:     L.append(x)
sage: print(" ".join(str(x) for x in L))
[] [0] [1] [0, 1] [-1] [0, -1] [1, -1] [0, 1, -1] [2] [0, 2] [1, 2]
```

```
>>> from sage.all import *
>>> i = Integer(0)
>>> L = []
>>> for x in powerset(ZZ):
...     if i > Integer(10):
...         break
...     else:
...         i += Integer(1)
...     L.append(x)
>>> print(" ".join(str(x) for x in L))
[] [0] [1] [0, 1] [-1] [0, -1] [1, -1] [0, 1, -1] [2] [0, 2] [1, 2]
```

You may also use subsets as an alias for powerset:

```
sage: subsets([1,2,3])
<generator object ...powerset at 0x...>
sage: list(subsets([1,2,3]))
[[], [1], [2], [1, 2], [3], [1, 3], [2, 3], [1, 2, 3]]

The reason we return lists instead of sets is that the elements of
sets must be hashable and many structures on which one wants the
powerset consist of non-hashable objects.
```

```
>>> from sage.all import *
>>> subsets([Integer(1),Integer(2),Integer(3)])
```

(continues on next page)

(continued from previous page)

```
<generator object ...powerset at 0x...>
>>> list(subsets([Integer(1),Integer(2),Integer(3)]))
[[], [1], [2], [1, 2], [3], [1, 3], [2, 3], [1, 2, 3]]

The reason we return lists instead of sets is that the elements of
sets must be hashable and many structures on which one wants the
powerset consist of non-hashable objects.
```

AUTHORS:

- William Stein
- Nils Bruin (2006-12-19): rewrite to work for not-necessarily finite objects X.

sage.combinat.subset.**subsets**(*X*)

alias of *powerset()*.

sage.combinat.subset.**uniq**(*L*)

Iterate over the elements of `L`, yielding every element at most once: keep only the first occurrence of any item.

The items must be hashable.

INPUT:

- `L` – iterable

EXAMPLES:

```
sage: L = [1, 1, 8, -5, 3, -5, 'a', 'x', 'a']
sage: it = uniq(L); it
<generator object uniq at ...>
sage: list(it)
[1, 8, -5, 3, 'a', 'x']
```

```
>>> from sage.all import *
>>> L = [Integer(1), Integer(1), Integer(8), -Integer(5), Integer(3), -Integer(5),
↪ 'a', 'x', 'a']
>>> it = uniq(L); it
<generator object uniq at ...>
>>> list(it)
[1, 8, -5, 3, 'a', 'x']
```

Subsets satisfying a hereditary property

sage.combinat.subsets_hereditary.**subsets_with_hereditary_property**(*f*, *X*, *max_obstruction_size=None*, *ncpus=1*)

Return all subsets S of X such that $f(S)$ is true.

The boolean function f must be decreasing, i.e. $f(S) \Rightarrow f(S')$ if $S' \subseteq S$.

This function is implemented to call f as few times as possible. More precisely, f will be called on all sets S such that $f(S)$ is true, as well as on all inclusionwise minimal sets S such that $f(S)$ is false.

The problem that this function answers is also known as the learning problem on monotone boolean functions, or as computing the set of winning coalitions in a simple game.

INPUT:

- `f` – boolean function which takes as input a list of elements from `X`
- `X` – list/iterable
- `max_obstruction_size` – integer; if you know that there is a k such that $f(S)$ is true if and only if $f(S')$ is true for all $S' \subseteq S$ with $S' \leq k$, set `max_obstruction_size=k`. It may dramatically decrease the number of calls to f. Set to `None` by default, meaning $k = |X|$.
- `ncpus` – number of cpus to use for this computation. Note that changing the value from 1 (default) to anything different *enables* parallel computations which can have a cost by itself, so it is not necessarily a good move. In some cases, however, it is a *great* move. Set to `None` to automatically detect and use the maximum number of cpus available.

> **Note**
>
> Parallel computations are performed through the `parallel()` decorator. See its documentation for more information, in particular with respect to the memory context.

EXAMPLES:

Sets whose elements all have the same remainder mod 2:

```
sage: from sage.combinat.subsets_hereditary import subsets_with_hereditary_
↪property
sage: def f(x):
....:     return (not x) or all(xx % 2 == x[0] % 2 for xx in x)
sage: list(subsets_with_hereditary_property(f, range(4)))
[[], [0], [1], [2], [3], [0, 2], [1, 3]]
```

```
>>> from sage.all import *
>>> from sage.combinat.subsets_hereditary import subsets_with_hereditary_property
>>> def f(x):
...     return (not x) or all(xx % Integer(2) == x[Integer(0)] % Integer(2) for␣
↪xx in x)
>>> list(subsets_with_hereditary_property(f, range(Integer(4))))
[[], [0], [1], [2], [3], [0, 2], [1, 3]]
```

Same, on two threads:

```
sage: sorted(subsets_with_hereditary_property(f, range(4), ncpus=2))
[[], [0], [0, 2], [1], [1, 3], [2], [3]]
```

```
>>> from sage.all import *
>>> sorted(subsets_with_hereditary_property(f, range(Integer(4)),␣
↪ncpus=Integer(2)))
[[], [0], [0, 2], [1], [1, 3], [2], [3]]
```

One can use this function to compute the independent sets of a graph. We know, however, that in this case the maximum obstructions are the edges, and have size 2. We can thus set `max_obstruction_size=2`, which reduces the number of calls to f from 91 to 56:

```
sage: # needs sage.graphs
sage: num_calls = 0
sage: g = graphs.PetersenGraph()
```

(continues on next page)

(continued from previous page)

```
sage: def is_independent_set(S):
....:     global num_calls
....:     num_calls += 1
....:     return g.subgraph(S).size() == 0
sage: l1 = list(subsets_with_hereditary_property(is_independent_set,
....:                                            g.vertices(sort=False)))
sage: num_calls
91
sage: num_calls = 0
sage: l2 = list(subsets_with_hereditary_property(is_independent_set,
....:                                            g.vertices(sort=False),
....:                                            max_obstruction_size=2))
sage: num_calls
56
sage: l1 == l2
True
```

```
>>> from sage.all import *
>>> # needs sage.graphs
>>> num_calls = Integer(0)
>>> g = graphs.PetersenGraph()
>>> def is_independent_set(S):
...     global num_calls
...     num_calls += Integer(1)
...     return g.subgraph(S).size() == Integer(0)
>>> l1 = list(subsets_with_hereditary_property(is_independent_set,
...                                            g.vertices(sort=False)))
>>> num_calls
91
>>> num_calls = Integer(0)
>>> l2 = list(subsets_with_hereditary_property(is_independent_set,
...                                            g.vertices(sort=False),
...                                            max_obstruction_size=Integer(2)))
>>> num_calls
56
>>> l1 == l2
True
```

Subsets whose elements satisfy a predicate pairwise

class sage.combinat.subsets_pairwise.**PairwiseCompatibleSubsets**(*ambient*, *predicate*, *maximal=False*, *element_class=<class 'sage.sets.set.Set_object_enumerated'>*)

Bases: `RecursivelyEnumeratedSet_forest`

The set of all subsets of `ambient` whose elements satisfy `predicate` pairwise

INPUT:

- `ambient` – set (or iterable)
- `predicate` – a binary predicate

Assumptions: `predicate` is symmetric (`predicate(x,y) == predicate(y,x)`) and reflexive (`predicate(x,x) == True`).

Note

in fact, `predicate(x,x)` is never called.

Warning

The current name is suboptimal and is subject to change. Suggestions for a good name, and a good user entry point are welcome. Maybe `Subsets(..., independent = predicate)`.

EXAMPLES:

We construct the set of all subsets of $\{4, 5, 6, 8, 9\}$ whose elements are pairwise relatively prime:

```
sage: from sage.combinat.subsets_pairwise import PairwiseCompatibleSubsets
sage: def predicate(x, y): return gcd(x, y) == 1
sage: P = PairwiseCompatibleSubsets( [4,5,6,8,9], predicate); P
An enumerated set with a forest structure
sage: P.list()
[{}, {4}, {4, 5}, {9, 4, 5}, {9, 4}, {5}, {5, 6}, {8, 5}, {8, 9, 5}, {9, 5}, {6},
↪{8}, {8, 9}, {9}]
sage: P.cardinality()
14
sage: P.category()
Category of finite enumerated sets
```

```
>>> from sage.all import *
>>> from sage.combinat.subsets_pairwise import PairwiseCompatibleSubsets
>>> def predicate(x, y): return gcd(x, y) == Integer(1)
>>> P = PairwiseCompatibleSubsets( [Integer(4),Integer(5),Integer(6),Integer(8),
↪Integer(9)], predicate); P
An enumerated set with a forest structure
>>> P.list()
[{}, {4}, {4, 5}, {9, 4, 5}, {9, 4}, {5}, {5, 6}, {8, 5}, {8, 9, 5}, {9, 5}, {6},
↪{8}, {8, 9}, {9}]
>>> P.cardinality()
14
>>> P.category()
Category of finite enumerated sets
```

Here we consider only those subsets which are maximal for inclusion (not yet implemented):

```
sage: P = PairwiseCompatibleSubsets( [4,5,6,8,9], predicate, maximal = True); P
An enumerated set with a forest structure
sage: P.list()                    # todo: not implemented
[{9, 4, 5}, {5, 6}, {8, 9, 5}]
sage: P.cardinality()             # todo: not implemented
14
sage: P.category()
Category of finite enumerated sets
```

```
>>> from sage.all import *
>>> P = PairwiseCompatibleSubsets( [Integer(4),Integer(5),Integer(6),Integer(8),
↪Integer(9)], predicate, maximal = True); P
An enumerated set with a forest structure
>>> P.list()                    # todo: not implemented
[{9, 4, 5}, {5, 6}, {8, 9, 5}]
>>> P.cardinality()             # todo: not implemented
14
>>> P.category()
Category of finite enumerated sets
```

Algorithm

In the following, we order the elements of the ambient set by order of apparition. The elements of `self` are generated by organizing them in a search tree. Each node of this tree is of the form `(subset, rest)`, where:

- `subset` represents an element of `self`, represented by an increasing tuple
- `rest` is the set of all y's such that y appears after x in the ambient set and `predicate(x,y)` holds, represented by a decreasing tuple

The root of this tree is `( (), ambient )`. All the other elements are generated by recursive depth first search, which gives lexicographic order.

children(*subset_rest*)

Return the children of a node in the tree.

post_process(*subset_rest*)

Substitutions over unit cube faces (Rauzy fractals)

This module implements the $E_1^*(\sigma)$ substitution associated with a one-dimensional substitution σ, that acts on unit faces of dimension $(d-1)$ in $\mathbf{R}^d$.

This module defines the following classes and functions:

- `Face` – a class to model a face
- `Patch` – a class to model a finite set of faces
- `E1Star` – a class to model the $E_1^*(\sigma)$ application defined by the substitution sigma

See the documentation of these objects for more information.

The convention for the choice of the unit faces and the definition of $E_1^*(\sigma)$ varies from article to article. Here, unit faces are defined by

$$\begin{aligned} [x,1]^* &= \{x+\lambda e_2+\mu e_3 : \lambda,\mu\in[0,1]\} \\ [x,2]^* &= \{x+\lambda e_1+\mu e_3 : \lambda,\mu\in[0,1]\} \\ [x,3]^* &= \{x+\lambda e_1+\mu e_2 : \lambda,\mu\in[0,1]\} \end{aligned}$$

and the dual substitution $E_1^*(\sigma)$ is defined by

$$E_1^*(\sigma)([x,i]^*) = \bigcup_{k=1,2,3} \bigcup_{s|\sigma(k)=pis} [M^{-1}(x+\ell(s)),k]^*,$$

where $\ell(s)$ is the abelianized of s, and M is the matrix of σ.

REFERENCES:

EXAMPLES:

We start by drawing a simple three-face patch:

```
sage: from sage.combinat.e_one_star import E1Star, Face, Patch
sage: x = [Face((0,0,0),1), Face((0,0,0),2), Face((0,0,0),3)]
sage: P = Patch(x)
sage: P
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(0, 0, 0), 3]*]
sage: P.plot()                    #not tested
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import E1Star, Face, Patch
>>> x = [Face((Integer(0),Integer(0),Integer(0)),Integer(1)), Face((Integer(0),
↪Integer(0),Integer(0)),Integer(2)), Face((Integer(0),Integer(0),Integer(0)),
↪Integer(3))]
>>> P = Patch(x)
>>> P
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(0, 0, 0), 3]*]
>>> P.plot()                    #not tested
```

We apply a substitution to this patch, and draw the result:

```
sage: sigma = WordMorphism({1:[1,2], 2:[1,3], 3:[1]})
sage: E = E1Star(sigma)
sage: E(P)
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(0, 0, 0), 3]*, [(0, 1, -1), 2]*, [(1, 0, -
↪1), 1]*]
sage: E(P).plot()                 #not tested
```

```
>>> from sage.all import *
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)], Integer(2):[Integer(1),
↪Integer(3)], Integer(3):[Integer(1)]})
>>> E = E1Star(sigma)
>>> E(P)
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(0, 0, 0), 3]*, [(0, 1, -1), 2]*, [(1, 0, -
↪1), 1]*]
>>> E(P).plot()                 #not tested
```

Note

- The type of a face is given by an integer in `[1, ..., d]` where `d` is the length of the vector of the face.
- The alphabet of the domain and the codomain of σ must be equal, and they must be of the form `[1, ..., d]`, where `d` is a positive integer corresponding to the length of the vectors of the faces on which $E_1^*(\sigma)$ will act.

```
sage: P = Patch([Face((0,0,0),1), Face((0,0,0),2), Face((0,0,0),3)])
sage: sigma = WordMorphism({1:[1,2], 2:[1,3], 3:[1]})
sage: E = E1Star(sigma)
sage: E(P)
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(0, 0, 0), 3]*, [(0, 1, -1), 2]*, [(1, 0, -
↪1), 1]*]
```

```
>>> from sage.all import *
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),Integer(1)), Face((Integer(0),
↪Integer(0),Integer(0)),Integer(2)), Face((Integer(0),Integer(0),Integer(0)),
↪Integer(3))])
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)], Integer(2):[Integer(1),
↪Integer(3)], Integer(3):[Integer(1)]})
>>> E = E1Star(sigma)
>>> E(P)
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(0, 0, 0), 3]*, [(0, 1, -1), 2]*, [(1, 0, -
↪1), 1]*]
```

The application of an `E1Star` substitution assigns to each new face the color of its preimage. The `repaint` method allows us to repaint the faces of a patch. A single color can also be assigned to every face, by specifying a list of a single color:

```
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: P = E(P, 5)
sage: P.repaint(['green'])
sage: P.plot()                    #not tested
```

```
>>> from sage.all import *
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in [Integer(1),
↪Integer(2),Integer(3)]])
>>> P = E(P, Integer(5))
>>> P.repaint(['green'])
>>> P.plot()                    #not tested
```

A list of colors allows us to color the faces sequentially:

```
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: P = E(P)
sage: P.repaint(['red', 'yellow', 'green', 'blue', 'black'])
sage: P = E(P, 3)
sage: P.plot()                    #not tested
```

```
>>> from sage.all import *
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in [Integer(1),
↪Integer(2),Integer(3)]])
>>> P = E(P)
>>> P.repaint(['red', 'yellow', 'green', 'blue', 'black'])
>>> P = E(P, Integer(3))
>>> P.plot()                    #not tested
```

All the color schemes from `list(matplotlib.cm.datad)` can be used:

```
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: P.repaint(cmap='summer')
sage: P = E(P, 3)
sage: P.plot()                    #not tested
sage: P.repaint(cmap='hsv')
sage: P = E(P, 2)
sage: P.plot()                    #not tested
```

```
>>> from sage.all import *
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in [Integer(1),
↪Integer(2),Integer(3)]])
>>> P.repaint(cmap='summer')
>>> P = E(P, Integer(3))
>>> P.plot()                    #not tested
>>> P.repaint(cmap='hsv')
>>> P = E(P, Integer(2))
>>> P.plot()                    #not tested
```

It is also possible to specify a dictionary to color the faces according to their type:

```
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: P = E(P, 5)
sage: P.repaint({1:(0.7, 0.7, 0.7), 2:(0.5,0.5,0.5), 3:(0.3,0.3,0.3)})
sage: P.plot()                    #not tested
sage: P.repaint({1:'red', 2:'yellow', 3:'green'})
sage: P.plot()                    #not tested
```

```
>>> from sage.all import *
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in [Integer(1),
↪Integer(2),Integer(3)]])
>>> P = E(P, Integer(5))
>>> P.repaint({Integer(1):(RealNumber('0.7'), RealNumber('0.7'), RealNumber('0.7')),␣
↪Integer(2):(RealNumber('0.5'),RealNumber('0.5'),RealNumber('0.5')),␣
↪Integer(3):(RealNumber('0.3'),RealNumber('0.3'),RealNumber('0.3'))})
>>> P.plot()                    #not tested
>>> P.repaint({Integer(1):'red', Integer(2):'yellow', Integer(3):'green'})
>>> P.plot()                    #not tested
```

Let us look at a nice big patch in 3D:

```
sage: sigma = WordMorphism({1:[1,2], 2:[3], 3:[1]})
sage: E = E1Star(sigma)
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: P = P + P.translate([-1,1,0])
sage: P = E(P, 11)
sage: P.plot3d()                  #not tested
```

```
>>> from sage.all import *
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)], Integer(2):[Integer(3)],
↪ Integer(3):[Integer(1)]})
>>> E = E1Star(sigma)
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in [Integer(1),
```

(continues on next page)

(continued from previous page)

```
↪Integer(2),Integer(3)]])
>>> P = P + P.translate([-Integer(1),Integer(1),Integer(0)])
>>> P = E(P, Integer(11))
>>> P.plot3d()                  #not tested
```

Plotting with TikZ pictures is possible:

```
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: s = P.plot_tikz()
sage: print(s)                    #not tested
\begin{tikzpicture}
[x={(-0.216506cm,-0.125000cm)}, y={(0.216506cm,-0.125000cm)}, z={(0.000000cm,0.
↪250000cm)}]
\definecolor{facecolor}{rgb}{0.000,1.000,0.000}
\fill[fill=facecolor, draw=black, shift={(0,0,0)}]
(0, 0, 0) -- (0, 0, 1) -- (1, 0, 1) -- (1, 0, 0) -- cycle;
\definecolor{facecolor}{rgb}{1.000,0.000,0.000}
\fill[fill=facecolor, draw=black, shift={(0,0,0)}]
(0, 0, 0) -- (0, 1, 0) -- (0, 1, 1) -- (0, 0, 1) -- cycle;
\definecolor{facecolor}{rgb}{0.000,0.000,1.000}
\fill[fill=facecolor, draw=black, shift={(0,0,0)}]
(0, 0, 0) -- (1, 0, 0) -- (1, 1, 0) -- (0, 1, 0) -- cycle;
\end{tikzpicture}
```

```
>>> from sage.all import *
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in [Integer(1),
↪Integer(2),Integer(3)]])
>>> s = P.plot_tikz()
>>> print(s)                     #not tested
\begin{tikzpicture}
[x={(-0.216506cm,-0.125000cm)}, y={(0.216506cm,-0.125000cm)}, z={(0.000000cm,0.
↪250000cm)}]
\definecolor{facecolor}{rgb}{0.000,1.000,0.000}
\fill[fill=facecolor, draw=black, shift={(0,0,0)}]
(0, 0, 0) -- (0, 0, 1) -- (1, 0, 1) -- (1, 0, 0) -- cycle;
\definecolor{facecolor}{rgb}{1.000,0.000,0.000}
\fill[fill=facecolor, draw=black, shift={(0,0,0)}]
(0, 0, 0) -- (0, 1, 0) -- (0, 1, 1) -- (0, 0, 1) -- cycle;
\definecolor{facecolor}{rgb}{0.000,0.000,1.000}
\fill[fill=facecolor, draw=black, shift={(0,0,0)}]
(0, 0, 0) -- (1, 0, 0) -- (1, 1, 0) -- (0, 1, 0) -- cycle;
\end{tikzpicture}
```

Plotting patches made of unit segments instead of unit faces:

```
sage: P = Patch([Face([0,0], 1), Face([0,0], 2)])
sage: E = E1Star(WordMorphism({1:[1,2],2:[1]}))
sage: F = E1Star(WordMorphism({1:[1,1,2],2:[2,1]}))
sage: E(P,5).plot()                                                    #␣
↪needs sage.plot
Graphics object consisting of 21 graphics primitives
sage: F(P,3).plot()                                                    #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.plot
Graphics object consisting of 34 graphics primitives
```

```
>>> from sage.all import *
>>> P = Patch([Face([Integer(0),Integer(0)], Integer(1)), Face([Integer(0),
↪Integer(0)], Integer(2))])
>>> E = E1Star(WordMorphism({Integer(1):[Integer(1),Integer(2)],
↪Integer(2):[Integer(1)]}))
>>> F = E1Star(WordMorphism({Integer(1):[Integer(1),Integer(1),Integer(2)],
↪Integer(2):[Integer(2),Integer(1)]}))
>>> E(P,Integer(5)).plot()                                                    ␣
↪     # needs sage.plot
Graphics object consisting of 21 graphics primitives
>>> F(P,Integer(3)).plot()                                                    ␣
↪     # needs sage.plot
Graphics object consisting of 34 graphics primitives
```

Everything works in any dimension (except for the plotting features which only work in dimension two or three):

```
sage: P = Patch([Face((0,0,0,0),1), Face((0,0,0,0),4)])
sage: sigma = WordMorphism({1:[1,2], 2:[1,3], 3:[1,4], 4:[1]})
sage: E = E1Star(sigma)
sage: E(P)
Patch: [[(0, 0, 0, 0), 3]*, [(0, 0, 0, 0), 4]*, [(0, 0, 1, -1), 3]*, [(0, 1, 0, -1),␣
↪2]*, [(1, 0, 0, -1), 1]*]
```

```
>>> from sage.all import *
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0),Integer(0)),Integer(1)),␣
↪Face((Integer(0),Integer(0),Integer(0),Integer(0)),Integer(4))])
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)], Integer(2):[Integer(1),
↪Integer(3)], Integer(3):[Integer(1),Integer(4)], Integer(4):[Integer(1)]})
>>> E = E1Star(sigma)
>>> E(P)
Patch: [[(0, 0, 0, 0), 3]*, [(0, 0, 0, 0), 4]*, [(0, 0, 1, -1), 3]*, [(0, 1, 0, -1),␣
↪2]*, [(1, 0, 0, -1), 1]*]
```

```
sage: sigma = WordMorphism({1:[1,2],2:[1,3],3:[1,4],4:[1,5],5:[1,6],6:[1,7],7:[1,8],
↪8:[1,9],9:[1,10],10:[1,11],11:[1,12],12:[1]})
sage: E = E1Star(sigma)
sage: E
E_1^*(1->12, 10->1,11, 11->1,12, 12->1, 2->13, 3->14, 4->15, 5->16, 6->17, 7->18, 8->
↪19, 9->1,10)
sage: P = Patch([Face((0,0,0,0,0,0,0,0,0,0,0,0),t) for t in [1,2,3]])

class sage.combinat.e_one_star.**E1Star**(*sigma*, *method='suffix'*)

Bases: SageObject

A class to model the $E_1^*(\sigma)$ map associated with a unimodular substitution σ.

INPUT:

- `sigma` – unimodular `WordMorphism`, i.e. such that its incidence matrix has determinant ± 1
- `method` – 'prefix' or 'suffix' (default: `'suffix'`); enables to use an alternative definition $E_1^*(\sigma)$ substitutions, where the abelianized of the prefix` is used instead of the suffix

Note

The alphabet of the domain and the codomain of σ must be equal, and they must be of the form `[1, ...,`

d], where d is a positive integer corresponding to the length of the vectors of the faces on which $E_1^*(\sigma)$ will act.

EXAMPLES:

```
sage: from sage.combinat.e_one_star import E1Star, Face, Patch
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: sigma = WordMorphism({1:[1,2], 2:[1,3], 3:[1]})
sage: E = E1Star(sigma)
sage: E(P)
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(0, 0, 0), 3]*, [(0, 1, -1), 2]*, [(1,␣
↪0, -1), 1]*]
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import E1Star, Face, Patch
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in [Integer(1),
↪Integer(2),Integer(3)]])
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)],␣
↪Integer(2):[Integer(1),Integer(3)], Integer(3):[Integer(1)]})
>>> E = E1Star(sigma)
>>> E(P)
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(0, 0, 0), 3]*, [(0, 1, -1), 2]*, [(1,␣
↪0, -1), 1]*]
```

```
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: sigma = WordMorphism({1:[1,2], 2:[1,3], 3:[1]})
sage: E = E1Star(sigma, method='prefix')
sage: E(P)
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(0, 0, 0), 3]*, [(0, 0, 1), 1]*, [(0,␣
↪0, 1), 2]*]
```

```
>>> from sage.all import *
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in [Integer(1),
↪Integer(2),Integer(3)]])
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)],␣
↪Integer(2):[Integer(1),Integer(3)], Integer(3):[Integer(1)]})
>>> E = E1Star(sigma, method='prefix')
>>> E(P)
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(0, 0, 0), 3]*, [(0, 0, 1), 1]*, [(0,␣
↪0, 1), 2]*]
```

```
sage: x = [Face((0,0,0,0),1), Face((0,0,0,0),4)]
sage: P = Patch(x)
sage: sigma = WordMorphism({1:[1,2], 2:[1,3], 3:[1,4], 4:[1]})
sage: E = E1Star(sigma)
sage: E(P)
Patch: [[(0, 0, 0, 0), 3]*, [(0, 0, 0, 0), 4]*, [(0, 0, 1, -1), 3]*, [(0, 1, 0, -
↪1), 2]*, [(1, 0, 0, -1), 1]*]
```

```
>>> from sage.all import *
>>> x = [Face((Integer(0),Integer(0),Integer(0),Integer(0)),Integer(1)),␣
```

(continues on next page)

(continued from previous page)

```
↪Face((Integer(0),Integer(0),Integer(0),Integer(0)),Integer(4))]
>>> P = Patch(x)
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)],␣
↪Integer(2):[Integer(1),Integer(3)], Integer(3):[Integer(1),Integer(4)],␣
↪Integer(4):[Integer(1)]})
>>> E = E1Star(sigma)
>>> E(P)
Patch: [[(0, 0, 0, 0), 3]*, [(0, 0, 0, 0), 4]*, [(0, 0, 1, -1), 3]*, [(0, 1, 0, -
↪1), 2]*, [(1, 0, 0, -1), 1]*]
```

inverse_matrix()

Return the inverse of the matrix associated with `self`.

EXAMPLES:

```
sage: from sage.combinat.e_one_star import E1Star, Face, Patch
sage: sigma = WordMorphism({1:[1,2], 2:[1,3], 3:[1]})
sage: E = E1Star(sigma)
sage: E.inverse_matrix()
[ 0  1  0]
[ 0  0  1]
[ 1 -1 -1]
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import E1Star, Face, Patch
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)],␣
↪Integer(2):[Integer(1),Integer(3)], Integer(3):[Integer(1)]})
>>> E = E1Star(sigma)
>>> E.inverse_matrix()
[ 0  1  0]
[ 0  0  1]
[ 1 -1 -1]
```

matrix()

Return the matrix associated with `self`.

EXAMPLES:

```
sage: from sage.combinat.e_one_star import E1Star, Face, Patch
sage: sigma = WordMorphism({1:[1,2], 2:[1,3], 3:[1]})
sage: E = E1Star(sigma)
sage: E.matrix()
[1 1 1]
[1 0 0]
[0 1 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import E1Star, Face, Patch
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)],␣
↪Integer(2):[Integer(1),Integer(3)], Integer(3):[Integer(1)]})
>>> E = E1Star(sigma)
>>> E.matrix()
```

(continues on next page)

(continued from previous page)

```
[1 1 1]
[1 0 0]
[0 1 0]
```

sigma()

Return the `WordMorphism` associated with `self`.

EXAMPLES:

```
sage: from sage.combinat.e_one_star import E1Star, Face, Patch
sage: sigma = WordMorphism({1:[1,2], 2:[1,3], 3:[1]})
sage: E = E1Star(sigma)
sage: E.sigma()
WordMorphism: 1->12, 2->13, 3->1
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import E1Star, Face, Patch
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)],␣
↪Integer(2):[Integer(1),Integer(3)], Integer(3):[Integer(1)]})
>>> E = E1Star(sigma)
>>> E.sigma()
WordMorphism: 1->12, 2->13, 3->1
```

class sage.combinat.e_one_star.**Face**(*v*, *t*, *color=None*)

Bases: `SageObject`

A class to model a unit face of arbitrary dimension.

A unit face in dimension d is represented by a d-dimensional vector `v` and a type `t` in $\{1, \ldots, d\}$. The type of the face corresponds to the canonical unit vector to which the face is orthogonal. The optional `color` argument is used in plotting functions.

INPUT:

- `v` – tuple of integers
- `t` – integer in `[1, ..., len(v)]`, type of the face. The face of type i is orthogonal to the canonical vector e_i.
- `color` – color (default: `None`); color of the face, used for plotting only. If `None`, its value is guessed from the face type.

EXAMPLES:

```
sage: from sage.combinat.e_one_star import Face
sage: f = Face((0,2,0), 3)
sage: f.vector()
(0, 2, 0)
sage: f.type()
3
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import Face
>>> f = Face((Integer(0),Integer(2),Integer(0)), Integer(3))
>>> f.vector()
```

(continues on next page)

(continued from previous page)

```
(0, 2, 0)
>>> f.type()
3
```

```
sage: f = Face((0,2,0), 3, color=(0.5, 0.5, 0.5))
sage: f.color()
RGB color (0.5, 0.5, 0.5)
```

```
>>> from sage.all import *
>>> f = Face((Integer(0),Integer(2),Integer(0)), Integer(3), color=(RealNumber('0.
↪5'), RealNumber('0.5'), RealNumber('0.5')))
>>> f.color()
RGB color (0.5, 0.5, 0.5)
```

color(*color=None*)

Return or change the color of the face.

INPUT:

- `color` – string, rgb tuple, color (default: `None`) the new color to assign to the face. If `None`, it returns the color of the face.

OUTPUT: color or None

EXAMPLES:

```
sage: from sage.combinat.e_one_star import Face
sage: f = Face((0,2,0), 3)
sage: f.color()
RGB color (0.0, 0.0, 1.0)
sage: f.color('red')
sage: f.color()
RGB color (1.0, 0.0, 0.0)
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import Face
>>> f = Face((Integer(0),Integer(2),Integer(0)), Integer(3))
>>> f.color()
RGB color (0.0, 0.0, 1.0)
>>> f.color('red')
>>> f.color()
RGB color (1.0, 0.0, 0.0)
```

type()

Return the type of the face.

EXAMPLES:

```
sage: from sage.combinat.e_one_star import Face
sage: f = Face((0,2,0), 3)
sage: f.type()
3
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import Face
>>> f = Face((Integer(0),Integer(2),Integer(0)), Integer(3))
>>> f.type()
3
```

```
sage: f = Face((0,2,0), 3)
sage: f.type()
3
```

```
>>> from sage.all import *
>>> f = Face((Integer(0),Integer(2),Integer(0)), Integer(3))
>>> f.type()
3
```

vector()

Return the vector of the face.

EXAMPLES:

```
sage: from sage.combinat.e_one_star import Face
sage: f = Face((0,2,0), 3)
sage: f.vector()
(0, 2, 0)
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import Face
>>> f = Face((Integer(0),Integer(2),Integer(0)), Integer(3))
>>> f.vector()
(0, 2, 0)
```

class sage.combinat.e_one_star.**Patch**(*faces*, *face_contour=None*)

Bases: SageObject

A class to model a collection of faces. A patch is represented by an immutable set of Faces.

Note

The dimension of a patch is the length of the vectors of the faces in the patch, which is assumed to be the same for every face in the patch.

Note

Since version 4.7.1, Patches are immutable, except for the colors of the faces, which are not taken into account for equality tests and hash functions.

INPUT:

- faces – finite iterable of faces
- face_contour – dictionary (default: None); maps the face type to vectors describing the contour of unit faces. If None, defaults contour are assumed for faces of type 1, 2, 3 or 1, 2, 3. Used in plotting methods

only.

EXAMPLES:

```
sage: from sage.combinat.e_one_star import Face, Patch
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: P
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(0, 0, 0), 3]*]
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import Face, Patch
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in [Integer(1),
↪Integer(2),Integer(3)]])
>>> P
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(0, 0, 0), 3]*]
```

```
sage: face_contour = {}
sage: face_contour[1] = map(vector, [(0,0,0),(0,1,0),(0,1,1),(0,0,1)])
sage: face_contour[2] = map(vector, [(0,0,0),(0,0,1),(1,0,1),(1,0,0)])
sage: face_contour[3] = map(vector, [(0,0,0),(1,0,0),(1,1,0),(0,1,0)])
sage: Patch([Face((0,0,0),t) for t in [1,2,3]], face_contour=face_contour)
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(0, 0, 0), 3]*]
```

```
>>> from sage.all import *
>>> face_contour = {}
>>> face_contour[Integer(1)] = map(vector, [(Integer(0),Integer(0),Integer(0)),
↪(Integer(0),Integer(1),Integer(0)),(Integer(0),Integer(1),Integer(1)),
↪(Integer(0),Integer(0),Integer(1))])
>>> face_contour[Integer(2)] = map(vector, [(Integer(0),Integer(0),Integer(0)),
↪(Integer(0),Integer(0),Integer(1)),(Integer(1),Integer(0),Integer(1)),
↪(Integer(1),Integer(0),Integer(0))])
>>> face_contour[Integer(3)] = map(vector, [(Integer(0),Integer(0),Integer(0)),
↪(Integer(1),Integer(0),Integer(0)),(Integer(1),Integer(1),Integer(0)),
↪(Integer(0),Integer(1),Integer(0))])
>>> Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in [Integer(1),
↪Integer(2),Integer(3)]], face_contour=face_contour)
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(0, 0, 0), 3]*]
```

difference(*other*)

Return the difference of `self` and `other`.

INPUT:

- `other` – a finite iterable of faces or a single face

EXAMPLES:

```
sage: from sage.combinat.e_one_star import Face, Patch
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: P.difference(Face([0,0,0],2))
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 3]*]
sage: P.difference(P)
Patch: []
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import Face, Patch
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in␣
↪[Integer(1),Integer(2),Integer(3)]])
>>> P.difference(Face([Integer(0),Integer(0),Integer(0)],Integer(2)))
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 3]*]
>>> P.difference(P)
Patch: []
```

dimension()

Return the dimension of the vectors of the faces of `self`.

It returns `None` if `self` is the empty patch.

The dimension of a patch is the length of the vectors of the faces in the patch, which is assumed to be the same for every face in the patch.

EXAMPLES:

```
sage: from sage.combinat.e_one_star import Face, Patch
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: P.dimension()
3
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import Face, Patch
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in␣
↪[Integer(1),Integer(2),Integer(3)]])
>>> P.dimension()
3
```

faces_of_color(*color*)

Return a list of the faces that have the given color.

INPUT:

- `color` – color

EXAMPLES:

```
sage: from sage.combinat.e_one_star import Face, Patch
sage: P = Patch([Face((0,0,0),1, 'red'), Face((1,2,0),3, 'blue'), Face((1,2,
↪0),1, 'red')])
sage: sorted(P.faces_of_color('red'))
[[(0, 0, 0), 1]*, [(1, 2, 0), 1]*]
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import Face, Patch
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),Integer(1), 'red'),␣
↪Face((Integer(1),Integer(2),Integer(0)),Integer(3), 'blue'),␣
↪Face((Integer(1),Integer(2),Integer(0)),Integer(1), 'red')])
>>> sorted(P.faces_of_color('red'))
[[(0, 0, 0), 1]*, [(1, 2, 0), 1]*]
```

faces_of_type(*t*)

Return a list of the faces that have type `t`.

INPUT:

- `t` – integer or any other type

EXAMPLES:

```
sage: from sage.combinat.e_one_star import Face, Patch
sage: P = Patch([Face((0,0,0),1), Face((1,2,0),3), Face((1,2,0),1)])
sage: sorted(P.faces_of_type(1))
[[(0, 0, 0), 1]*, [(1, 2, 0), 1]*]
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import Face, Patch
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),Integer(1)),␣
↪Face((Integer(1),Integer(2),Integer(0)),Integer(3)), Face((Integer(1),
↪Integer(2),Integer(0)),Integer(1))])
>>> sorted(P.faces_of_type(Integer(1)))
[[(0, 0, 0), 1]*, [(1, 2, 0), 1]*]
```

faces_of_vector(*v*)

Return a list of the faces whose vector is `v`.

INPUT:

- `v` – a vector

EXAMPLES:

```
sage: from sage.combinat.e_one_star import Face, Patch
sage: P = Patch([Face((0,0,0),1), Face((1,2,0),3), Face((1,2,0),1)])
sage: sorted(P.faces_of_vector([1,2,0]))
[[(1, 2, 0), 1]*, [(1, 2, 0), 3]*]
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import Face, Patch
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),Integer(1)),␣
↪Face((Integer(1),Integer(2),Integer(0)),Integer(3)), Face((Integer(1),
↪Integer(2),Integer(0)),Integer(1))])
>>> sorted(P.faces_of_vector([Integer(1),Integer(2),Integer(0)]))
[[(1, 2, 0), 1]*, [(1, 2, 0), 3]*]
```

occurrences_of(*other*)

Return all positions at which other appears in self, that is, all vectors v such that `set(other.translate(v)) <= set(self)`.

INPUT:

- `other` – a Patch

OUTPUT: list of vectors

EXAMPLES:

```
sage: from sage.combinat.e_one_star import Face, Patch, E1Star
sage: P = Patch([Face([0,0,0], 1), Face([0,0,0], 2), Face([0,0,0], 3)])
sage: Q = Patch([Face([0,0,0], 1), Face([0,0,0], 2)])
sage: P.occurrences_of(Q)
```

(continues on next page)

(continued from previous page)

```
[(0, 0, 0)]
sage: Q = Q.translate([1,2,3])
sage: P.occurrences_of(Q)
[(-1, -2, -3)]
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import Face, Patch, E1Star
>>> P = Patch([Face([Integer(0),Integer(0),Integer(0)], Integer(1)),␣
↪Face([Integer(0),Integer(0),Integer(0)], Integer(2)), Face([Integer(0),
↪Integer(0),Integer(0)], Integer(3))])
>>> Q = Patch([Face([Integer(0),Integer(0),Integer(0)], Integer(1)),␣
↪Face([Integer(0),Integer(0),Integer(0)], Integer(2))])
>>> P.occurrences_of(Q)
[(0, 0, 0)]
>>> Q = Q.translate([Integer(1),Integer(2),Integer(3)])
>>> P.occurrences_of(Q)
[(-1, -2, -3)]
```

```
sage: E = E1Star(WordMorphism({1:[1,2], 2:[1,3], 3:[1]}))
sage: P = Patch([Face([0,0,0], 1), Face([0,0,0], 2), Face([0,0,0], 3)])
sage: P = E(P,4)
sage: Q = Patch([Face([0,0,0], 1), Face([0,0,0], 2)])
sage: L = P.occurrences_of(Q)
sage: sorted(L)
[(0, 0, 0), (0, 0, 1), (0, 1, -1), (1, 0, -1), (1, 1, -3), (1, 1, -2)]
```

```
>>> from sage.all import *
>>> E = E1Star(WordMorphism({Integer(1):[Integer(1),Integer(2)],␣
↪Integer(2):[Integer(1),Integer(3)], Integer(3):[Integer(1)]}))
>>> P = Patch([Face([Integer(0),Integer(0),Integer(0)], Integer(1)),␣
↪Face([Integer(0),Integer(0),Integer(0)], Integer(2)), Face([Integer(0),
↪Integer(0),Integer(0)], Integer(3))])
>>> P = E(P,Integer(4))
>>> Q = Patch([Face([Integer(0),Integer(0),Integer(0)], Integer(1)),␣
↪Face([Integer(0),Integer(0),Integer(0)], Integer(2))])
>>> L = P.occurrences_of(Q)
>>> sorted(L)
[(0, 0, 0), (0, 0, 1), (0, 1, -1), (1, 0, -1), (1, 1, -3), (1, 1, -2)]
```

plot(*projmat=None*, *opacity=0.75*)

Return a 2D graphic object depicting the patch.

INPUT:

- `projmat` – matrix (default: `None`); the projection matrix. Its number of lines must be two. Its number of columns must equal the dimension of the ambient space of the faces. If `None`, the isometric projection is used by default.
- `opacity` – float between `0` and `1` (default: `0.75`) opacity of the face

Warning

Plotting is implemented only for patches in two or three dimensions.

EXAMPLES:

```
sage: from sage.combinat.e_one_star import E1Star, Face, Patch
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: P.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import E1Star, Face, Patch
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in␣
↪[Integer(1),Integer(2),Integer(3)]])
>>> P.plot()                                                                #␣
↪needs sage.plot
Graphics object consisting of 3 graphics primitives
```

```
sage: sigma = WordMorphism({1:[1,2], 2:[1,3], 3:[1]})
sage: E = E1Star(sigma)
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: P = E(P, 5)
sage: P.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 57 graphics primitives
```

```
>>> from sage.all import *
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)],␣
↪Integer(2):[Integer(1),Integer(3)], Integer(3):[Integer(1)]})
>>> E = E1Star(sigma)
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in␣
↪[Integer(1),Integer(2),Integer(3)]])
>>> P = E(P, Integer(5))
>>> P.plot()                                                                #␣
↪needs sage.plot
Graphics object consisting of 57 graphics primitives
```

Plot with a different projection matrix:

```
sage: sigma = WordMorphism({1:[1,2], 2:[1,3], 3:[1]})
sage: E = E1Star(sigma)
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: M = matrix(2, 3, [1,0,-1,0.3,1,-3])
sage: P = E(P, 3)
sage: P.plot(projmat=M)                                                     #␣
↪needs sage.plot
Graphics object consisting of 17 graphics primitives
```

```
>>> from sage.all import *
```

(continues on next page)

(continued from previous page)

```
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)],␣
↪Integer(2):[Integer(1),Integer(3)], Integer(3):[Integer(1)]})
>>> E = E1Star(sigma)
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in␣
↪[Integer(1),Integer(2),Integer(3)]])
>>> M = matrix(Integer(2), Integer(3), [Integer(1),Integer(0),-Integer(1),
↪RealNumber('0.3'),Integer(1),-Integer(3)])
>>> P = E(P, Integer(3))
>>> P.plot(projmat=M)                                                    #␣
↪needs sage.plot
Graphics object consisting of 17 graphics primitives
```

Plot patches made of unit segments:

```
sage: P = Patch([Face([0,0], 1), Face([0,0], 2)])
sage: E = E1Star(WordMorphism({1:[1,2],2:[1]}))
sage: F = E1Star(WordMorphism({1:[1,1,2],2:[2,1]}))
sage: E(P,5).plot()                                                     #␣
↪needs sage.plot
Graphics object consisting of 21 graphics primitives
sage: F(P,3).plot()                                                     #␣
↪needs sage.plot
Graphics object consisting of 34 graphics primitives
```

```
>>> from sage.all import *
>>> P = Patch([Face([Integer(0),Integer(0)], Integer(1)), Face([Integer(0),
↪Integer(0)], Integer(2))])
>>> E = E1Star(WordMorphism({Integer(1):[Integer(1),Integer(2)],
↪Integer(2):[Integer(1)]}))
>>> F = E1Star(WordMorphism({Integer(1):[Integer(1),Integer(1),Integer(2)],
↪Integer(2):[Integer(2),Integer(1)]}))
>>> E(P,Integer(5)).plot()                                                 ␣
↪     # needs sage.plot
Graphics object consisting of 21 graphics primitives
>>> F(P,Integer(3)).plot()                                                 ␣
↪     # needs sage.plot
Graphics object consisting of 34 graphics primitives
```

plot3d()

Return a 3D graphics object depicting the patch.

> **Warning**
>
> 3D plotting is implemented only for patches in three dimensions.

EXAMPLES:

```
sage: from sage.combinat.e_one_star import E1Star, Face, Patch
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: P.plot3d()                #not tested
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import E1Star, Face, Patch
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in␣
↪[Integer(1),Integer(2),Integer(3)]])
>>> P.plot3d()                #not tested
```

```
sage: sigma = WordMorphism({1:[1,2], 2:[1,3], 3:[1]})
sage: E = E1Star(sigma)
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: P = E(P, 5)
sage: P.repaint()
sage: P.plot3d()                #not tested
```

```
>>> from sage.all import *
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)],␣
↪Integer(2):[Integer(1),Integer(3)], Integer(3):[Integer(1)]})
>>> E = E1Star(sigma)
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in␣
↪[Integer(1),Integer(2),Integer(3)]])
>>> P = E(P, Integer(5))
>>> P.repaint()
>>> P.plot3d()                #not tested
```

plot_tikz (*projmat=None*, *print_tikz_env=True*, *edgecolor='black'*, *scale=0.25*, *drawzero=False*, *extra_code_before=''*, *extra_code_after=''*)

Return a string containing some TikZ code to be included into a LaTeX document, depicting the patch.

Warning

Tikz Plotting is implemented only for patches in three dimensions.

INPUT:

- `projmat` – matrix (default: `None`); the projection matrix. Its number of lines must be two. Its number of columns must equal the dimension of the ambient space of the faces. If `None`, the isometric projection is used by default.
- `print_tikz_env` – boolean (default: `True`); if `True`, the tikzpicture environment are printed
- `edgecolor` – string (default: `'black'`); either `'black'` or `'facecolor'` (color of unit face edges)
- `scale` – real number (default: `0.25`) scaling constant for the whole figure
- `drawzero` – boolean (default: `False`); if `True`, mark the origin by a black dot
- `extra_code_before` – string (default: `''`); extra code to include in the tikz picture
- `extra_code_after` – string (default: `''`); extra code to include in the tikz picture

EXAMPLES:

```
sage: from sage.combinat.e_one_star import E1Star, Face, Patch
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: s = P.plot_tikz()
sage: len(s)
```

(continues on next page)

(continued from previous page)

```
602
sage: print(s)       #not tested
\begin{tikzpicture}
[x={(-0.216506cm,-0.125000cm)}, y={(0.216506cm,-0.125000cm)}, z={(0.000000cm,
↪0.250000cm)}]
\definecolor{facecolor}{rgb}{0.000,1.000,0.000}
\fill[fill=facecolor, draw=black, shift={(0,0,0)}]
(0, 0, 0) -- (0, 0, 1) -- (1, 0, 1) -- (1, 0, 0) -- cycle;

(0, 0, 0) -- (1, 0, 0) -- (1, 1, 0) -- (0, 1, 0) -- cycle;
\end{tikzpicture}
```

```
sage: sigma = WordMorphism({1:[1,2], 2:[1,3], 3:[1]})
sage: E = E1Star(sigma)
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: P = E(P, 4)
sage: from sage.misc.latex import latex             #not tested
sage: latex.add_to_preamble('\\usepackage{tikz}')   #not tested
sage: view(P)                        #not tested
```

```
>>> from sage.all import *
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)],␣
↪Integer(2):[Integer(1),Integer(3)], Integer(3):[Integer(1)]})
>>> E = E1Star(sigma)
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in␣
```

(continues on next page)

(continued from previous page)

```
↪[Integer(1),Integer(2),Integer(3)]])
>>> P = E(P, Integer(4))
>>> from sage.misc.latex import latex                    #not tested
>>> latex.add_to_preamble('\\usepackage{tikz}')          #not tested
>>> view(P)                              #not tested
```

Plot using shades of gray (useful for article figures):

```
sage: sigma = WordMorphism({1:[1,2], 2:[1,3], 3:[1]})
sage: E = E1Star(sigma)
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: P.repaint([(0.9, 0.9, 0.9), (0.65,0.65,0.65), (0.4,0.4,0.4)])
sage: P = E(P, 4)
sage: s = P.plot_tikz()
```

```
>>> from sage.all import *
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)],␣
↪Integer(2):[Integer(1),Integer(3)], Integer(3):[Integer(1)]})
>>> E = E1Star(sigma)
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in␣
↪[Integer(1),Integer(2),Integer(3)]])
>>> P.repaint([(RealNumber('0.9'), RealNumber('0.9'), RealNumber('0.9')),␣
↪(RealNumber('0.65'),RealNumber('0.65'),RealNumber('0.65')), (RealNumber('0.4
↪'),RealNumber('0.4'),RealNumber('0.4'))])
>>> P = E(P, Integer(4))
>>> s = P.plot_tikz()
```

Plotting with various options:

```
sage: sigma = WordMorphism({1:[1,2], 2:[1,3], 3:[1]})
sage: E = E1Star(sigma)
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: M = matrix(2,3,[float(u) for u in [1,0,-0.7071,0,1,-0.7071]])
sage: P = E(P, 3)
sage: s = P.plot_tikz(projmat=M, edgecolor='facecolor', scale=0.6,␣
↪drawzero=True)
```

```
>>> from sage.all import *
>>> sigma = WordMorphism({Integer(1):[Integer(1),Integer(2)],␣
↪Integer(2):[Integer(1),Integer(3)], Integer(3):[Integer(1)]})
>>> E = E1Star(sigma)
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in␣
↪[Integer(1),Integer(2),Integer(3)]])
>>> M = matrix(Integer(2),Integer(3),[float(u) for u in [Integer(1),
↪Integer(0),-RealNumber('0.7071'),Integer(0),Integer(1),-RealNumber('0.7071
↪')]])
>>> P = E(P, Integer(3))
>>> s = P.plot_tikz(projmat=M, edgecolor='facecolor', scale=RealNumber('0.6'),
↪ drawzero=True)
```

Adding X, Y, Z axes using the extra code feature:

```
sage: length = 1.5
sage: space = 0.3
sage: axes = ''

```

repaint(*cmap='Set1'*)

Repaint all the faces of `self` from the given color map.

This only changes the colors of the faces of `self`.

INPUT:

- `cmap` – color map (default: `'Set1'`). It can be one of the following:
  - `string` – a coloring map; for available coloring map names type: `sorted(colormaps)`
  - `list` – list of colors to assign cyclically to the faces A list of a single color colors all the faces with the same color
  - `dict` – dictionary of face types mapped to colors, to color the faces according to their type
  - `{}`, the empty dict – shortcut for `{1:'red', 2:'green', 3:'blue'}`

EXAMPLES:

Using a color map:

```
sage: from sage.combinat.e_one_star import Face, Patch
sage: color = (0, 0, 0)
sage: P = Patch([Face((0,0,0),t,color) for t in [1,2,3]])
sage: for f in P: f.color()
RGB color (0.0, 0.0, 0.0)
RGB color (0.0, 0.0, 0.0)
RGB color (0.0, 0.0, 0.0)
sage: P.repaint()
```

(continues on next page)

(continued from previous page)

```
sage: next(iter(P)).color()     #random
RGB color (0.498..., 0.432..., 0.522...)
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import Face, Patch
>>> color = (Integer(0), Integer(0), Integer(0))
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t,color) for t in␣
↪[Integer(1),Integer(2),Integer(3)]])
>>> for f in P: f.color()
RGB color (0.0, 0.0, 0.0)
RGB color (0.0, 0.0, 0.0)
RGB color (0.0, 0.0, 0.0)
>>> P.repaint()
>>> next(iter(P)).color()     #random
RGB color (0.498..., 0.432..., 0.522...)
```

Using a list of colors:

```
sage: P = Patch([Face((0,0,0),t,color) for t in [1,2,3]])
sage: P.repaint([(0.9, 0.9, 0.9), (0.65,0.65,0.65), (0.4,0.4,0.4)])
sage: for f in P: f.color()
RGB color (0.9, 0.9, 0.9)
RGB color (0.65, 0.65, 0.65)
RGB color (0.4, 0.4, 0.4)
```

```
>>> from sage.all import *
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t,color) for t in␣
↪[Integer(1),Integer(2),Integer(3)]])
>>> P.repaint([(RealNumber('0.9'), RealNumber('0.9'), RealNumber('0.9')),␣
↪(RealNumber('0.65'),RealNumber('0.65'),RealNumber('0.65')), (RealNumber('0.4
↪'),RealNumber('0.4'),RealNumber('0.4'))])
>>> for f in P: f.color()
RGB color (0.9, 0.9, 0.9)
RGB color (0.65, 0.65, 0.65)
RGB color (0.4, 0.4, 0.4)
```

Using a dictionary to color faces according to their type:

```
sage: P = Patch([Face((0,0,0),t) for t in [1,2,3]])
sage: P.repaint({1:'black', 2:'yellow', 3:'green'})
sage: P.plot()                    #not tested
sage: P.repaint({})
sage: P.plot()                    #not tested
```

```
>>> from sage.all import *
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),t) for t in␣
↪[Integer(1),Integer(2),Integer(3)]])
>>> P.repaint({Integer(1):'black', Integer(2):'yellow', Integer(3):'green'})
>>> P.plot()                    #not tested
>>> P.repaint({})
>>> P.plot()                    #not tested
```

translate(*v*)

Return a translated copy of `self` by vector v.

INPUT:

- `v` – vector or tuple

EXAMPLES:

```
sage: from sage.combinat.e_one_star import Face, Patch
sage: P = Patch([Face((0,0,0),1), Face((1,2,0),3), Face((1,2,0),1)])
sage: P.translate([-1,-2,0])
Patch: [[(-1, -2, 0), 1]*, [(0, 0, 0), 1]*, [(0, 0, 0), 3]*]
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import Face, Patch
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),Integer(1)),␣
↪Face((Integer(1),Integer(2),Integer(0)),Integer(3)), Face((Integer(1),
↪Integer(2),Integer(0)),Integer(1))])
>>> P.translate([-Integer(1),-Integer(2),Integer(0)])
Patch: [[(-1, -2, 0), 1]*, [(0, 0, 0), 1]*, [(0, 0, 0), 3]*]
```

union(*other*)

Return a Patch consisting of the union of `self` and `other`.

INPUT:

- `other` – a Patch or a Face or a finite iterable of faces

EXAMPLES:

```
sage: from sage.combinat.e_one_star import Face, Patch
sage: P = Patch([Face((0,0,0),1), Face((0,0,0),2)])
sage: P.union(Face((1,2,3), 3))
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(1, 2, 3), 3]*]
sage: P.union([Face((1,2,3), 3), Face((2,3,3), 2)])
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(1, 2, 3), 3]*, [(2, 3, 3), 2]*]
```

```
>>> from sage.all import *
>>> from sage.combinat.e_one_star import Face, Patch
>>> P = Patch([Face((Integer(0),Integer(0),Integer(0)),Integer(1)),␣
↪Face((Integer(0),Integer(0),Integer(0)),Integer(2))])
>>> P.union(Face((Integer(1),Integer(2),Integer(3)), Integer(3)))
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(1, 2, 3), 3]*]
>>> P.union([Face((Integer(1),Integer(2),Integer(3)), Integer(3)),␣
↪Face((Integer(2),Integer(3),Integer(3)), Integer(2))])
Patch: [[(0, 0, 0), 1]*, [(0, 0, 0), 2]*, [(1, 2, 3), 3]*, [(2, 3, 3), 2]*]
```

Subword complex

Fix a Coxeter system (W, S). The subword complex $\mathcal{SC}(Q, w)$ associated to a word $Q \in S^*$ and an element $w \in W$ is the simplicial complex whose ground set is the set of positions in Q and whose facets are complements of sets of positions defining a reduced expression for w.

A subword complex is a shellable sphere if and only if the Demazure product of Q equals w, otherwise it is a shellable ball.

The code is optimized to be used with *ReflectionGroup*, it works as well with *CoxeterGroup*, but many methods fail for *WeylGroup*.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',3]); I = list(W.index_set())          # optional - gap3
sage: Q = I + W.w0.coxeter_sorting_word(I); Q                        # optional - gap3
[1, 2, 3, 1, 2, 3, 1, 2, 1]

sage: S = SubwordComplex(Q,W.w0)                                     # optional - gap3
sage: for F in S: print("{} {}".format(F, F.root_configuration()))                 #␣
↪optional - gap3
(0, 1, 2) [(1, 0, 0), (0, 1, 0), (0, 0, 1)]
(0, 1, 8) [(1, 0, 0), (0, 1, 0), (0, 0, -1)]
(0, 2, 6) [(1, 0, 0), (0, 1, 1), (0, -1, 0)]
(0, 6, 7) [(1, 0, 0), (0, 0, 1), (0, -1, -1)]
(0, 7, 8) [(1, 0, 0), (0, -1, 0), (0, 0, -1)]
(1, 2, 3) [(1, 1, 0), (0, 0, 1), (-1, 0, 0)]
(1, 3, 8) [(1, 1, 0), (-1, 0, 0), (0, 0, -1)]
(2, 3, 4) [(1, 1, 1), (0, 1, 0), (-1, -1, 0)]
(2, 4, 6) [(1, 1, 1), (-1, 0, 0), (0, -1, 0)]
(3, 4, 5) [(0, 1, 0), (0, 0, 1), (-1, -1, -1)]
(3, 5, 8) [(0, 1, 0), (-1, -1, 0), (0, 0, -1)]
(4, 5, 6) [(0, 1, 1), (-1, -1, -1), (0, -1, 0)]
(5, 6, 7) [(-1, 0, 0), (0, 0, 1), (0, -1, -1)]
(5, 7, 8) [(-1, 0, 0), (0, -1, 0), (0, 0, -1)]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(3)]); I = list(W.index_set())          # optional␣
↪- gap3
>>> Q = I + W.w0.coxeter_sorting_word(I); Q                          # optional - gap3
[1, 2, 3, 1, 2, 3, 1, 2, 1]

>>> S = SubwordComplex(Q,W.w0)                                       # optional - gap3
>>> for F in S: print("{} {}".format(F, F.root_configuration()))                 #␣
↪optional - gap3
(0, 1, 2) [(1, 0, 0), (0, 1, 0), (0, 0, 1)]
(0, 1, 8) [(1, 0, 0), (0, 1, 0), (0, 0, -1)]
(0, 2, 6) [(1, 0, 0), (0, 1, 1), (0, -1, 0)]
(0, 6, 7) [(1, 0, 0), (0, 0, 1), (0, -1, -1)]
(0, 7, 8) [(1, 0, 0), (0, -1, 0), (0, 0, -1)]
(1, 2, 3) [(1, 1, 0), (0, 0, 1), (-1, 0, 0)]
(1, 3, 8) [(1, 1, 0), (-1, 0, 0), (0, 0, -1)]
(2, 3, 4) [(1, 1, 1), (0, 1, 0), (-1, -1, 0)]
(2, 4, 6) [(1, 1, 1), (-1, 0, 0), (0, -1, 0)]
(3, 4, 5) [(0, 1, 0), (0, 0, 1), (-1, -1, -1)]
(3, 5, 8) [(0, 1, 0), (-1, -1, 0), (0, 0, -1)]
(4, 5, 6) [(0, 1, 1), (-1, -1, -1), (0, -1, 0)]
(5, 6, 7) [(-1, 0, 0), (0, 0, 1), (0, -1, -1)]
(5, 7, 8) [(-1, 0, 0), (0, -1, 0), (0, 0, -1)]
```

Testing that the implementation also works with CoxeterGroup:

```
sage: W = CoxeterGroup(['A',3]); I = list(W.index_set())
sage: Q = I + W.w0.coxeter_sorting_word(I); Q
[1, 2, 3, 1, 2, 3, 1, 2, 1]
sage: S = SubwordComplex(Q,W.w0); S
Subword complex of type ['A', 3] for Q = (1, 2, 3, 1, 2, 3, 1, 2, 1) and pi = [1, 2,␣
↪3, 1, 2, 1]
sage: P = S.increasing_flip_poset(); P; len(P.cover_relations())
Finite poset containing 14 elements
21
```

```
>>> from sage.all import *
>>> W = CoxeterGroup(['A',Integer(3)]); I = list(W.index_set())
>>> Q = I + W.w0.coxeter_sorting_word(I); Q
[1, 2, 3, 1, 2, 3, 1, 2, 1]
>>> S = SubwordComplex(Q,W.w0); S
Subword complex of type ['A', 3] for Q = (1, 2, 3, 1, 2, 3, 1, 2, 1) and pi = [1, 2,␣
↪3, 1, 2, 1]
>>> P = S.increasing_flip_poset(); P; len(P.cover_relations())
Finite poset containing 14 elements
21
```

The root configuration works:

```
sage: for F in S: print("{} {}".format(F, F.root_configuration()))
(0, 1, 2) [(1, 0, 0), (0, 1, 0), (0, 0, 1)]
(0, 1, 8) [(1, 0, 0), (0, 1, 0), (0, 0, -1)]
(0, 2, 6) [(1, 0, 0), (0, 1, 1), (0, -1, 0)]
(0, 6, 7) [(1, 0, 0), (0, 0, 1), (0, -1, -1)]
(0, 7, 8) [(1, 0, 0), (0, -1, 0), (0, 0, -1)]
(1, 2, 3) [(1, 1, 0), (0, 0, 1), (-1, 0, 0)]
(1, 3, 8) [(1, 1, 0), (-1, 0, 0), (0, 0, -1)]
(2, 3, 4) [(1, 1, 1), (0, 1, 0), (-1, -1, 0)]
(2, 4, 6) [(1, 1, 1), (-1, 0, 0), (0, -1, 0)]
(3, 4, 5) [(0, 1, 0), (0, 0, 1), (-1, -1, -1)]
(3, 5, 8) [(0, 1, 0), (-1, -1, 0), (0, 0, -1)]
(4, 5, 6) [(0, 1, 1), (-1, -1, -1), (0, -1, 0)]
(5, 6, 7) [(-1, 0, 0), (0, 0, 1), (0, -1, -1)]
(5, 7, 8) [(-1, 0, 0), (0, -1, 0), (0, 0, -1)]
```

```
>>> from sage.all import *
>>> for F in S: print("{} {}".format(F, F.root_configuration()))
(0, 1, 2) [(1, 0, 0), (0, 1, 0), (0, 0, 1)]
(0, 1, 8) [(1, 0, 0), (0, 1, 0), (0, 0, -1)]
(0, 2, 6) [(1, 0, 0), (0, 1, 1), (0, -1, 0)]
(0, 6, 7) [(1, 0, 0), (0, 0, 1), (0, -1, -1)]
(0, 7, 8) [(1, 0, 0), (0, -1, 0), (0, 0, -1)]
(1, 2, 3) [(1, 1, 0), (0, 0, 1), (-1, 0, 0)]
(1, 3, 8) [(1, 1, 0), (-1, 0, 0), (0, 0, -1)]
(2, 3, 4) [(1, 1, 1), (0, 1, 0), (-1, -1, 0)]
(2, 4, 6) [(1, 1, 1), (-1, 0, 0), (0, -1, 0)]
(3, 4, 5) [(0, 1, 0), (0, 0, 1), (-1, -1, -1)]
(3, 5, 8) [(0, 1, 0), (-1, -1, 0), (0, 0, -1)]
```

(continues on next page)

(continued from previous page)

```
(4, 5, 6) [(0, 1, 1), (-1, -1, -1), (0, -1, 0)]
(5, 6, 7) [(-1, 0, 0), (0, 0, 1), (0, -1, -1)]
(5, 7, 8) [(-1, 0, 0), (0, -1, 0), (0, 0, -1)]
```

And the weight configuration also works:

```
sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2])
sage: F.extended_weight_configuration()
[(4/3, 2/3), (2/3, 4/3), (-2/3, 2/3), (2/3, 4/3), (-2/3, 2/3)]
sage: F.extended_weight_configuration(coefficients=(1,2))
[(4/3, 2/3), (4/3, 8/3), (-2/3, 2/3), (4/3, 8/3), (-2/3, 2/3)]
```

```
>>> from sage.all import *
>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),Integer(1)],w)
>>> F = SC([Integer(1),Integer(2)])
>>> F.extended_weight_configuration()
[(4/3, 2/3), (2/3, 4/3), (-2/3, 2/3), (2/3, 4/3), (-2/3, 2/3)]
>>> F.extended_weight_configuration(coefficients=(Integer(1),Integer(2)))
[(4/3, 2/3), (4/3, 8/3), (-2/3, 2/3), (4/3, 8/3), (-2/3, 2/3)]
```

One finally can compute the brick polytope, using all functionality on weight configurations, though it does not realize to live in real space:

```
sage: W = CoxeterGroup(['A',3]); I = list(W.index_set())
sage: Q = I + W.w0.coxeter_sorting_word(I)
sage: S = SubwordComplex(Q,W.w0)
sage: S.brick_polytope()                                                    #␣
↪needs sage.geometry.polyhedron
A 3-dimensional polyhedron in QQ^3 defined as the convex hull of 14 vertices

sage: W = CoxeterGroup(['H',3]); I = list(W.index_set())
sage: Q = I + W.w0.coxeter_sorting_word(I)
sage: S = SubwordComplex(Q,W.w0)
sage: S.brick_polytope()                                                    #␣

class sage.combinat.subword_complex.**SubwordComplex**(*Q*, *w*, *algorithm='inductive'*)

Bases: UniqueRepresentation, SimplicialComplex

Fix a Coxeter system (W, S). The subword complex $\mathcal{SC}(Q, w)$ associated to a word $Q \in S^*$ and an element $w \in W$ is the simplicial complex whose ground set is the set of positions in Q and whose facets are complements of sets of positions defining a reduced expression for w.

A subword complex is a shellable sphere if and only if the Demazure product of Q equals w, otherwise it is a shellable ball.

Warning

This implementation only works for groups build using `CoxeterGroup`, and does not work with groups build using `WeylGroup`.

EXAMPLES:

As an example, dual associahedra are subword complexes in type A_{n-1} given by the word $[1, \ldots, n, 1, \ldots, n, 1, \ldots, n-1, \ldots, 1, 2, 1]$ and the permutation w_0.

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w); SC
Subword complex of type ['A', 2] for Q = (1, 2, 1, 2, 1) and pi = [1, 2, 1]
sage: SC.facets()
[(0, 1), (0, 4), (1, 2), (2, 3), (3, 4)]

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w); SC
Subword complex of type ['A', 2] for Q = (1, 2, 1, 2, 1) and pi = [1, 2, 1]
sage: SC.facets()
[(0, 1), (0, 4), (1, 2), (2, 3), (3, 4)]
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),Integer(1)],␣
```

(continues on next page)

(continued from previous page)

```

REFERENCES: [KnuMil], [PilStu]

Element

alias of *SubwordComplexFacet*

barycenter()

Return the barycenter of the brick polytope of `self`.

See also

brick_polytope()

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])                                  # optional - gap3
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)                        # optional - gap3
sage: SC.barycenter()                                               # optional - gap3
(2/3, 4/3)

sage: W = CoxeterGroup(['A',2])
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)
sage: SC.barycenter()
(4/3, 8/3)
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)])                           # optional␣
↪- gap3
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)                # optional - gap3
>>> SC.barycenter()                                          # optional - gap3
(2/3, 4/3)

>>> W = CoxeterGroup(['A',Integer(2)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)
>>> SC.barycenter()
(4/3, 8/3)
```

brick_fan()

Return the brick fan of `self`.

It is the normal fan of the brick polytope of `self`. It is formed by the cones generated by the weight configurations of the facets of `self`.

See also

weight_cone

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.brick_fan()
Rational polyhedral fan in 2-d lattice N

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.brick_fan()
Rational polyhedral fan in 2-d lattice N
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.brick_fan()
Rational polyhedral fan in 2-d lattice N

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.brick_fan()
Rational polyhedral fan in 2-d lattice N
```

brick_polytope(*coefficients=None*)

Return the brick polytope of `self`.

This polytope is the convex hull of the brick vectors of `self`.

INPUT:

- `coefficients` – (optional) a list of coefficients used to scale the fundamental weights

See also

brick_vectors()

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])                              # optional - gap3
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)                    # optional - gap3
sage: X = SC.brick_polytope(); X                                # optional - gap3
A 2-dimensional polyhedron in QQ^2 defined as the convex hull of 5 vertices

sage: Y = SC.brick_polytope(coefficients=[1,2]); Y              # optional - gap3
A 2-dimensional polyhedron in QQ^2 defined as the convex hull of 5 vertices

sage: X == Y                                                    # optional - gap3
False

sage: W = CoxeterGroup(['A',2])
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)
sage: X = SC.brick_polytope(); X
A 2-dimensional polyhedron in QQ^2 defined as the convex hull of 5 vertices

sage: # optional - gap3
sage: W = ReflectionGroup(['H',3])
sage: c = W.index_set(); Q = c + tuple(W.w0.coxeter_sorting_word(c))
sage: SC = SubwordComplex(Q,W.w0)
sage: SC.brick_polytope()
doctest:...:
RuntimeWarning: the polytope is built with rational vertices
A 3-dimensional polyhedron in QQ^3 defined as the convex hull of 32 vertices
```

```

>>> SC.brick_polytope()
doctest:...:
RuntimeWarning: the polytope is built with rational vertices
A 3-dimensional polyhedron in QQ^3 defined as the convex hull of 32 vertices
```

brick_vectors(*coefficients=None*)

Return the list of all brick vectors of facets of `self`.

INPUT:

- `coefficients` – (optional) a list of coefficients used to scale the fundamental weights

See also

brick_vector

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)
sage: SC.brick_vectors()
[(5/3, 7/3), (5/3, 1/3), (2/3, 7/3), (-1/3, 4/3), (-1/3, 1/3)]
sage: SC.brick_vectors(coefficients=(1,2))
[(7/3, 11/3), (7/3, 2/3), (4/3, 11/3), (-2/3, 5/3), (-2/3, 2/3)]

sage: W = CoxeterGroup(['A',2])
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)
sage: SC.brick_vectors()
[(10/3, 14/3), (10/3, 2/3), (4/3, 14/3), (-2/3, 8/3), (-2/3, 2/3)]
sage: SC.brick_vectors(coefficients=(1,2))
[(14/3, 22/3), (14/3, 4/3), (8/3, 22/3), (-4/3, 10/3), (-4/3, 4/3)]
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)
>>> SC.brick_vectors()
[(5/3, 7/3), (5/3, 1/3), (2/3, 7/3), (-1/3, 4/3), (-1/3, 1/3)]
>>> SC.brick_vectors(coefficients=(Integer(1),Integer(2)))
[(7/3, 11/3), (7/3, 2/3), (4/3, 11/3), (-2/3, 5/3), (-2/3, 2/3)]

>>> W = CoxeterGroup(['A',Integer(2)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)
>>> SC.brick_vectors()
[(10/3, 14/3), (10/3, 2/3), (4/3, 14/3), (-2/3, 8/3), (-2/3, 2/3)]
```

(continues on next page)

(continued from previous page)

```
>>> SC.brick_vectors(coefficients=(Integer(1),Integer(2)))
[(14/3, 22/3), (14/3, 4/3), (8/3, 22/3), (-4/3, 10/3), (-4/3, 4/3)]
```

cartan_type()

Return the Cartan type of `self`.

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.cartan_type()
['A', 2]

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.cartan_type()
['A', 2]
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.cartan_type()
['A', 2]

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.cartan_type()
['A', 2]
```

cover_relations(*label=False*)

Return the set of cover relations in the associated poset.

INPUT:

- `label` – boolean (default: `False`); whether or not to label the cover relations by the position of flip

OUTPUT: list of pairs of facets

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])                          # optional - gap3
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)                # optional - gap3
sage: sorted(SC.cover_relations())                          # optional - gap3
[((0, 1), (0, 4)),
 ((0, 1), (1, 2)),
 ((0, 4), (3, 4)),
```

(continues on next page)

(continued from previous page)

```
 ((1, 2), (2, 3)),
 ((2, 3), (3, 4))]

sage: W = CoxeterGroup(['A',2])
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)
sage: sorted(SC.cover_relations())
[((0, 1), (0, 4)),
 ((0, 1), (1, 2)),
 ((0, 4), (3, 4)),
 ((1, 2), (2, 3)),
 ((2, 3), (3, 4))]
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)])                          # optional␣
↪- gap3
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)                 # optional - gap3
>>> sorted(SC.cover_relations())                              # optional - gap3
[((0, 1), (0, 4)),
 ((0, 1), (1, 2)),
 ((0, 4), (3, 4)),
 ((1, 2), (2, 3)),
 ((2, 3), (3, 4))]

>>> W = CoxeterGroup(['A',Integer(2)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)
>>> sorted(SC.cover_relations())
[((0, 1), (0, 4)),
 ((0, 1), (1, 2)),
 ((0, 4), (3, 4)),
 ((1, 2), (2, 3)),
 ((2, 3), (3, 4))]
```

dimension()

Return the dimension of `self`.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])                              # optional - gap3
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)                    # optional - gap3
sage: SC.dimension()                                            # optional - gap3
1

sage: W = CoxeterGroup(['A',2])
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)
sage: SC.dimension()
1
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)])                          # optional␣
↪- gap3
```

(continues on next page)

(continued from previous page)

```
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)                    # optional - gap3
>>> SC.dimension()                                          # optional - gap3
1

>>> W = CoxeterGroup(['A',Integer(2)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)
>>> SC.dimension()
1
```

facets()

Return all facets of `self`.

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.facets()
[(0, 1), (0, 4), (1, 2), (2, 3), (3, 4)]

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.facets()
[(0, 1), (0, 4), (1, 2), (2, 3), (3, 4)]
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.facets()
[(0, 1), (0, 4), (1, 2), (2, 3), (3, 4)]

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.facets()
[(0, 1), (0, 4), (1, 2), (2, 3), (3, 4)]
```

greedy_facet(*side='positive'*)

Return the negative (or positive) greedy facet of `self`.

This is the lexicographically last (or first) facet of `self`.

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.greedy_facet(side='positive')
(0, 1)
sage: SC.greedy_facet(side='negative')
(3, 4)

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.greedy_facet(side='positive')
(0, 1)
sage: SC.greedy_facet(side='negative')
(3, 4)
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.greedy_facet(side='positive')
(0, 1)
>>> SC.greedy_facet(side='negative')
(3, 4)

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.greedy_facet(side='positive')
(0, 1)
>>> SC.greedy_facet(side='negative')
(3, 4)
```

group()

Return the group associated to `self`.

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.group()
Irreducible real reflection group of rank 2 and type A2

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.group()
```

(continues on next page)

(continued from previous page)

```
Finite Coxeter group over Integer Ring with Coxeter matrix:
[1 3]
[3 1]
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.group()
Irreducible real reflection group of rank 2 and type A2

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.group()
Finite Coxeter group over Integer Ring with Coxeter matrix:
[1 3]
[3 1]
```

increasing_flip_graph(*label=True*)

Return the increasing flip graph of the subword complex.

OUTPUT: a directed graph

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])                          # optional - gap3
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)                # optional - gap3
sage: SC.increasing_flip_graph()                            # optional - gap3
Digraph on 5 vertices

sage: W = CoxeterGroup(['A',2])
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)
sage: SC.increasing_flip_graph()
Digraph on 5 vertices
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)])                          # optional␣
↪- gap3
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)                # optional - gap3
>>> SC.increasing_flip_graph()                                 # optional - gap3
Digraph on 5 vertices

>>> W = CoxeterGroup(['A',Integer(2)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)
>>> SC.increasing_flip_graph()
Digraph on 5 vertices
```

increasing_flip_poset()

Return the increasing flip poset of the subword complex.

OUTPUT: a poset

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])                          # optional - gap3
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)                # optional - gap3
sage: SC.increasing_flip_poset()                            # optional - gap3
Finite poset containing 5 elements

sage: W = CoxeterGroup(['A',2])
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)
sage: SC.increasing_flip_poset()
Finite poset containing 5 elements
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)])                          # optional
↪- gap3
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)                # optional - gap3
>>> SC.increasing_flip_poset()                              # optional - gap3
Finite poset containing 5 elements

>>> W = CoxeterGroup(['A',Integer(2)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)
>>> SC.increasing_flip_poset()
Finite poset containing 5 elements
```

interval(I, J)

Return the interval [I,J] in the increasing flip graph subword complex.

INPUT:

- I, J – two facets

OUTPUT: a set of facets

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)
sage: F = SC([1,2])
sage: SC.interval(F, F)
{(1, 2)}

sage: W = CoxeterGroup(['A',2])
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)
sage: F = SC([1,2])
sage: SC.interval(F, F)
{(1, 2)}
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)
>>> F = SC([Integer(1),Integer(2)])
>>> SC.interval(F, F)
{(1, 2)}

>>> W = CoxeterGroup(['A',Integer(2)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)
>>> F = SC([Integer(1),Integer(2)])
>>> SC.interval(F, F)
{(1, 2)}
```

is_ball()

Return `True` if the subword complex `self` is a ball.

This is the case if and only if it is not a sphere.

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',3])
sage: w = W.from_reduced_word([2,3,2])
sage: SC = SubwordComplex([3,2,3,2,3], w)
sage: SC.is_ball()
False

sage: SC = SubwordComplex([3,2,1,3,2,3], w)                    # optional - gap3
sage: SC.is_ball()                                             # optional - gap3
True

sage: W = CoxeterGroup(['A',3])
sage: w = W.from_reduced_word([2,3,2])
sage: SC = SubwordComplex([3,2,3,2,3], w)
sage: SC.is_ball()
False
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(3)])
>>> w = W.from_reduced_word([Integer(2),Integer(3),Integer(2)])
>>> SC = SubwordComplex([Integer(3),Integer(2),Integer(3),Integer(2),
↪Integer(3)], w)
>>> SC.is_ball()
False

>>> SC = SubwordComplex([Integer(3),Integer(2),Integer(1),Integer(3),
↪Integer(2),Integer(3)], w)                    # optional - gap3
>>> SC.is_ball()                                             # optional - gap3
True
```

(continues on next page)

(continued from previous page)

```
>>> W = CoxeterGroup(['A',Integer(3)])
>>> w = W.from_reduced_word([Integer(2),Integer(3),Integer(2)])
>>> SC = SubwordComplex([Integer(3),Integer(2),Integer(3),Integer(2),
↪Integer(3)], w)
>>> SC.is_ball()
False
```

is_double_root_free()

Return `True` if `self` is double-root-free.

This means that the root configurations of all facets do not contain a root twice.

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.is_double_root_free()
True

sage: SC = SubwordComplex([1,1,2,2,1,1], w)                # optional - gap3
sage: SC.is_double_root_free()                             # optional - gap3
True

sage: SC = SubwordComplex([1,2,1,2,1,2], w)                # optional - gap3
sage: SC.is_double_root_free()                             # optional - gap3
False

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.is_double_root_free()
True
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.is_double_root_free()
True

>>> SC = SubwordComplex([Integer(1),Integer(1),Integer(2),Integer(2),
↪Integer(1),Integer(1)], w)                    # optional - gap3
>>> SC.is_double_root_free()                               # optional - gap3
True

>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1),Integer(2)], w)                    # optional - gap3
>>> SC.is_double_root_free()                               # optional - gap3
```

(continues on next page)

(continued from previous page)

```
False

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.is_double_root_free()
True
```

is_pure()

Return `True` since all subword complexes are pure.

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',3])
sage: w = W.from_reduced_word([2,3,2])
sage: SC = SubwordComplex([3,2,3,2,3], w)
sage: SC.is_pure()
True

sage: W = CoxeterGroup(['A',3])
sage: w = W.from_reduced_word([2,3,2])
sage: SC = SubwordComplex([3,2,3,2,3], w)
sage: SC.is_pure()
True
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(3)])
>>> w = W.from_reduced_word([Integer(2),Integer(3),Integer(2)])
>>> SC = SubwordComplex([Integer(3),Integer(2),Integer(3),Integer(2),
↪Integer(3)], w)
>>> SC.is_pure()
True

>>> W = CoxeterGroup(['A',Integer(3)])
>>> w = W.from_reduced_word([Integer(2),Integer(3),Integer(2)])
>>> SC = SubwordComplex([Integer(3),Integer(2),Integer(3),Integer(2),
↪Integer(3)], w)
>>> SC.is_pure()
True
```

is_root_independent()

Return `True` if `self` is root-independent.

This means that the root configuration of any (or equivalently all) facets is linearly independent.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])                          # optional - gap3
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)                # optional - gap3
sage: SC.is_root_independent()                              # optional - gap3
```

(continues on next page)

(continued from previous page)

```
True

sage: SC = SubwordComplex([1,2,1,2,1,2], W.w0)              # optional - gap3
sage: SC.is_root_independent()                              # optional - gap3
False

sage: W = CoxeterGroup(['A',2])
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)
sage: SC.is_root_independent()
True
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)])                          # optional␣
↪- gap3
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)                # optional - gap3
>>> SC.is_root_independent()                                  # optional - gap3
True

>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1),Integer(2)], W.w0)               # optional - gap3
>>> SC.is_root_independent()                                  # optional - gap3
False

>>> W = CoxeterGroup(['A',Integer(2)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)
>>> SC.is_root_independent()
True
```

is_sphere()

Return `True` if the subword complex `self` is a sphere.

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',3])
sage: w = W.from_reduced_word([2,3,2])
sage: SC = SubwordComplex([3,2,3,2,3], w)
sage: SC.is_sphere()
True

sage: SC = SubwordComplex([3,2,1,3,2,3], w)                 # optional - gap3
sage: SC.is_sphere()                                        # optional - gap3
False

sage: W = CoxeterGroup(['A',3])
sage: w = W.from_reduced_word([2,3,2])
sage: SC = SubwordComplex([3,2,3,2,3], w)
sage: SC.is_sphere()
True
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(3)])
>>> w = W.from_reduced_word([Integer(2),Integer(3),Integer(2)])
>>> SC = SubwordComplex([Integer(3),Integer(2),Integer(3),Integer(2),
↪Integer(3)], w)
>>> SC.is_sphere()
True

>>> SC = SubwordComplex([Integer(3),Integer(2),Integer(1),Integer(3),
↪Integer(2),Integer(3)], w)                    # optional - gap3
>>> SC.is_sphere()                                          # optional - gap3
False

>>> W = CoxeterGroup(['A',Integer(3)])
>>> w = W.from_reduced_word([Integer(2),Integer(3),Integer(2)])
>>> SC = SubwordComplex([Integer(3),Integer(2),Integer(3),Integer(2),
↪Integer(3)], w)
>>> SC.is_sphere()
True
```

kappa_preimages()

Return a dictionary containing facets of `self` as keys, and list of elements of `self.group()` as values.

See also

kappa_preimage

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: kappa = SC.kappa_preimages()
sage: for F in SC: print("{} {}".format(F, [w.reduced_word() for w in␣
↪kappa[F]]))
(0, 1) [[]]
(0, 4) [[2], [2, 1]]
(1, 2) [[1]]
(2, 3) [[1, 2]]
(3, 4) [[1, 2, 1]]

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: kappa = SC.kappa_preimages()
sage: for F in SC: print("{} {}".format(F, [w.reduced_word() for w in␣
↪kappa[F]]))
(0, 1) [[]]
(0, 4) [[2], [2, 1]]
(1, 2) [[1]]
```

(continues on next page)

(continued from previous page)

```
(2, 3) [[1, 2]]
(3, 4) [[1, 2, 1]]
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> kappa = SC.kappa_preimages()
>>> for F in SC: print("{} {}".format(F, [w.reduced_word() for w in␣
↪kappa[F]]))
(0, 1) [[]]
(0, 4) [[2], [2, 1]]
(1, 2) [[1]]
(2, 3) [[1, 2]]
(3, 4) [[1, 2, 1]]

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> kappa = SC.kappa_preimages()
>>> for F in SC: print("{} {}".format(F, [w.reduced_word() for w in␣
↪kappa[F]]))
(0, 1) [[]]
(0, 4) [[2], [2, 1]]
(1, 2) [[1]]
(2, 3) [[1, 2]]
(3, 4) [[1, 2, 1]]
```

minkowski_summand(*i*)

Return the i th Minkowski summand of `self`.

INPUT:

- `i` – an integer defining a position in the word Q

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])                          # optional - gap3
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)                # optional - gap3
sage: SC.minkowski_summand(1)                               # optional - gap3
A 0-dimensional polyhedron in QQ^2 defined as the convex hull of 1 vertex

sage: W = CoxeterGroup(['A',2])
sage: SC = SubwordComplex([1,2,1,2,1], W.w0)
sage: SC.minkowski_summand(1)
A 0-dimensional polyhedron in QQ^2 defined as the convex hull of 1 vertex
```

```
>>> from sage.all import *
>>> W = ReflectionGroup(['A',Integer(2)])                   # optional␣
↪- gap3
```

(continues on next page)

(continued from previous page)

```
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)                # optional - gap3
>>> SC.minkowski_summand(Integer(1))                                  # optional␣
↪- gap3
A 0-dimensional polyhedron in QQ^2 defined as the convex hull of 1 vertex

>>> W = CoxeterGroup(['A',Integer(2)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], W.w0)
>>> SC.minkowski_summand(Integer(1))
A 0-dimensional polyhedron in QQ^2 defined as the convex hull of 1 vertex
```

pi()

Return the element in the Coxeter group associated to `self`.

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.pi().reduced_word()
[1, 2, 1]

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.pi().reduced_word()
[1, 2, 1]
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.pi().reduced_word()
[1, 2, 1]

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.pi().reduced_word()
[1, 2, 1]
```

word()

Return the word in the simple generators associated to `self`.

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
```

(continues on next page)

(continued from previous page)

```
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.word()
(1, 2, 1, 2, 1)

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: SC.word()
(1, 2, 1, 2, 1)
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.word()
(1, 2, 1, 2, 1)

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)], w)
>>> SC.word()
(1, 2, 1, 2, 1)
```

class sage.combinat.subword_complex.**SubwordComplexFacet**(*parent*, *positions*, *facet_test=True*)

Bases: Simplex, Element

A facet of a subword complex.

Facets of the subword complex $\mathcal{SC}(Q, w)$ are complements of sets of positions in Q defining a reduced expression for w.

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: F = SC[0]; F
(0, 1)

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1], w)
sage: F = SC[0]; F
(0, 1)
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
```

(continues on next page)

(continued from previous page)

```
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),Integer(1)],␣
↪w)
>>> F = SC[Integer(0)]; F
(0, 1)

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),Integer(1)],␣
↪w)
>>> F = SC[Integer(0)]; F
(0, 1)
```

brick_vector(*coefficients=None*)

Return the brick vector of `self`.

This is the sum of the weight vectors in the extended weight configuration.

INPUT:

- `coefficients` – (optional) a list of coefficients used to scale the fundamental weights

See also

extended_weight_configuration()

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2]); F
(1, 2)
sage: F.extended_weight_configuration()
[(2/3, 1/3), (1/3, 2/3), (-1/3, 1/3), (1/3, 2/3), (-1/3, 1/3)]
sage: F.brick_vector()
(2/3, 7/3)
sage: F.brick_vector(coefficients=[1,2])
(4/3, 11/3)

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2])
sage: F.brick_vector()
(4/3, 14/3)
sage: F.brick_vector(coefficients=[1,2])
(8/3, 22/3)
```

```
>>> from sage.all import *
>>> # optional - gap3
```

(continues on next page)

(continued from previous page)

```
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)],w)
>>> F = SC([Integer(1),Integer(2)]); F
(1, 2)
>>> F.extended_weight_configuration()
[(2/3, 1/3), (1/3, 2/3), (-1/3, 1/3), (1/3, 2/3), (-1/3, 1/3)]
>>> F.brick_vector()
(2/3, 7/3)
>>> F.brick_vector(coefficients=[Integer(1),Integer(2)])
(4/3, 11/3)

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)],w)
>>> F = SC([Integer(1),Integer(2)])
>>> F.brick_vector()
(4/3, 14/3)
>>> F.brick_vector(coefficients=[Integer(1),Integer(2)])
(8/3, 22/3)
```

extended_root_configuration()

Return the extended root configuration of `self`.

Let $Q = q_1 \dots q_m \in S^*$ and $w \in W$. The extended root configuration of a facet I of $\mathcal{SC}(Q, w)$ is the sequence $\mathsf{r}(I, 1), \dots, \mathsf{r}(I, m)$ of roots defined by $\mathsf{r}(I, k) = \Pi Q_{[k-1] \setminus I}(\alpha_{q_k})$, where $\Pi Q_{[k-1] \setminus I}$ is the product of the simple reflections q_i for $i \in [k-1] \setminus I$ in this order.

The extended root configuration is used to perform flips efficiently.

See also

flip()

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2]); F
(1, 2)
sage: F.extended_root_configuration()
[(1, 0), (1, 1), (-1, 0), (1, 1), (0, 1)]

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2]); F
(1, 2)
```

(continues on next page)

(continued from previous page)

```
sage: F.extended_root_configuration()
[(1, 0), (1, 1), (-1, 0), (1, 1), (0, 1)]
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)],w)
>>> F = SC([Integer(1),Integer(2)]); F
(1, 2)
>>> F.extended_root_configuration()
[(1, 0), (1, 1), (-1, 0), (1, 1), (0, 1)]

>>> F = SC([Integer(1),Integer(2)]); F
(1, 2)
>>> F.extended_root_configuration()
[(1, 0), (1, 1), (-1, 0), (1, 1), (0, 1)]
```

extended_weight_configuration(*coefficients=None*)

Return the extended weight configuration of `self`.

Let $Q = q_1 \dots q_m \in S^*$ and $w \in W$. The extended weight configuration of a facet I of $\mathcal{SC}(Q, w)$ is the sequence $\mathsf{w}(I, 1), \dots, \mathsf{w}(I, m)$ of weights defined by $\mathsf{w}(I, k) = \Pi Q_{[k-1] \smallsetminus I}(\omega_{q_k})$, where $\Pi Q_{[k-1] \smallsetminus I}$ is the product of the simple reflections q_i for $i \in [k-1] \smallsetminus I$ in this order.

The extended weight configuration is used to compute the brick vector.

INPUT:

- `coefficients` – (optional) a list of coefficients used to scale the fundamental weights

See also

brick_vector()

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2])
sage: F.extended_weight_configuration()
[(2/3, 1/3), (1/3, 2/3), (-1/3, 1/3), (1/3, 2/3), (-1/3, 1/3)]
sage: F.extended_weight_configuration(coefficients=(1,2))
[(2/3, 1/3), (2/3, 4/3), (-1/3, 1/3), (2/3, 4/3), (-1/3, 1/3)]

sage: W = CoxeterGroup(['A',2])
```

(continues on next page)

(continued from previous page)

```
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2])
sage: F.extended_weight_configuration()
[(4/3, 2/3), (2/3, 4/3), (-2/3, 2/3), (2/3, 4/3), (-2/3, 2/3)]
sage: F.extended_weight_configuration(coefficients=(1,2))
[(4/3, 2/3), (4/3, 8/3), (-2/3, 2/3), (4/3, 8/3), (-2/3, 2/3)]
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)],w)
>>> F = SC([Integer(1),Integer(2)])
>>> F.extended_weight_configuration()
[(2/3, 1/3), (1/3, 2/3), (-1/3, 1/3), (1/3, 2/3), (-1/3, 1/3)]
>>> F.extended_weight_configuration(coefficients=(Integer(1),Integer(2)))
[(2/3, 1/3), (2/3, 4/3), (-1/3, 1/3), (2/3, 4/3), (-1/3, 1/3)]

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)],w)
>>> F = SC([Integer(1),Integer(2)])
>>> F.extended_weight_configuration()
[(4/3, 2/3), (2/3, 4/3), (-2/3, 2/3), (2/3, 4/3), (-2/3, 2/3)]
>>> F.extended_weight_configuration(coefficients=(Integer(1),Integer(2)))
[(4/3, 2/3), (4/3, 8/3), (-2/3, 2/3), (4/3, 8/3), (-2/3, 2/3)]
```

flip(*i*, *return_position=False*)

Return the facet obtained after flipping position `i` in `self`.

INPUT:

- `i` – integer; position in the word Q
- `return_position` – boolean (default: `False`); tells whether the new position should be returned as well

OUTPUT:

- The new subword complex facet.
- The new position if `return_position` is `True`.

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2]); F
(1, 2)
sage: F.flip(1)
```

(continues on next page)

(continued from previous page)

```
(2, 3)
sage: F.flip(1, return_position=True)
((2, 3), 3)

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2]); F
(1, 2)
sage: F.flip(1)
(2, 3)
sage: F.flip(1, return_position=True)
((2, 3), 3)
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)],w)
>>> F = SC([Integer(1),Integer(2)]); F
(1, 2)
>>> F.flip(Integer(1))
(2, 3)
>>> F.flip(Integer(1), return_position=True)
((2, 3), 3)

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)],w)
>>> F = SC([Integer(1),Integer(2)]); F
(1, 2)
>>> F.flip(Integer(1))
(2, 3)
>>> F.flip(Integer(1), return_position=True)
((2, 3), 3)
```

is_vertex()

Return `True` if `self` is a vertex of the brick polytope of `self.parent`.

A facet is a vertex of the brick polytope if its root cone is pointed. Note that this property is always satisfied for root-independent subword complexes.

See also

root_cone()

EXAMPLES:

```
sage: # optional - gap3
```

(continues on next page)

(continued from previous page)

```
sage: W = ReflectionGroup(['A',1])
sage: w = W.from_reduced_word([1])
sage: SC = SubwordComplex([1,1,1],w)
sage: F = SC([0,1]); F.is_vertex()
True
sage: F = SC([0,2]); F.is_vertex()
False

sage: # optional - gap3

True
>>> F = SC([Integer(0),Integer(1),Integer(2),Integer(6)]); F.is_vertex()
```

(continues on next page)

(continued from previous page)

```
False
```

kappa_preimage()

Return the fiber of `self` under the κ map.

The κ map sends an element $w \in W$ to the unique facet of $I \in \mathcal{SC}(Q, w)$ such that the root configuration of I is contained in $w(\Phi^+)$. In other words, w is in the preimage of `self` under κ if and only if w^{-1} sends every root in the root configuration to a positive root.

EXAMPLES:

```
sage: W = ReflectionGroup(['A',2])                                  # optional - gap3
sage: w = W.from_reduced_word([1,2,1])                              # optional - gap3
sage: SC = SubwordComplex([1,2,1,2,1],w)                            # optional - gap3

sage: F = SC([1,2]); F                                              # optional - gap3
(1, 2)
sage: F.kappa_preimage()                                            # optional - gap3
[(1,4)(2,3)(5,6)]

sage: F = SC([0,4]); F                                              # optional - gap3
(0, 4)
sage: F.kappa_preimage()                                            # optional - gap3
[(1,3)(2,5)(4,6), (1,2,6)(3,4,5)]

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])

]
```

plot(*list_colors=None*, *labels=[]*, *thickness=3*, *fontsize=14*, *shift=(0, 0)*, *compact=False*, *roots=True*, ***args*)

In type A or B, plot a pseudoline arrangement representing the facet `self`.

Pseudoline arrangements are graphical representations of facets of types A or B subword complexes.

INPUT:

- `list_colors` – list (default: `[]`); to change the colors of the pseudolines
- `labels` – list (default: `[]`); to change the labels of the pseudolines
- `thickness` – integer (default: 3); for the thickness of the pseudolines
- `fontsize` – integer (default: 14); for the size of the font used for labels
- `shift` – couple of coordinates (default: `(0,0)`) to change the origin
- `compact` – boolean (default: `False`); to require a more compact representation
- `roots` – boolean (default: `True`); whether to print the extended root configuration

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2]); F.plot()                                                  #␣
↪needs sage.plot

1-d cone in 1-d lattice N
```

root_configuration()

Return the root configuration of `self`.

Let $Q = q_1 \dots q_m \in S^*$ and $w \in W$. The root configuration of a facet $I = [i_1, \dots, i_n]$ of $\mathcal{SC}(Q, w)$ is the sequence $\mathsf{r}(I, i_1), \dots, \mathsf{r}(I, i_n)$ of roots defined by $\mathsf{r}(I, k) = \Pi Q_{[k-1] \setminus I}(\alpha_{q_k})$, where $\Pi Q_{[k-1] \setminus I}$ is the product of the simple reflections q_i for $i \in [k-1] \setminus I$ in this order.

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2]); F
(1, 2)
sage: F.root_configuration()
[(1, 1), (-1, 0)]
```

(continues on next page)

(continued from previous page)

```

>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)],w)
```

(continues on next page)

(continued from previous page)

```
>>> F = SC([Integer(1),Integer(2)]); F.show()
<BLANKLINE>
```

upper_root_configuration()

Return the positive roots of the root configuration of `self`.

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2]); F
(1, 2)
sage: F.root_configuration()
[(1, 1), (-1, 0)]
sage: F.upper_root_configuration()
[(1, 0)]

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2]); F
(1, 2)
sage: F.upper_root_configuration()
[(1, 0)]
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)],w)
>>> F = SC([Integer(1),Integer(2)]); F
(1, 2)
>>> F.root_configuration()
[(1, 1), (-1, 0)]
>>> F.upper_root_configuration()
[(1, 0)]

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)],w)
>>> F = SC([Integer(1),Integer(2)]); F
(1, 2)
>>> F.upper_root_configuration()
[(1, 0)]
```

weight_cone()

Return the polyhedral cone generated by the weight configuration of `self`.

See also

weight_configuration()

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2]); F
(1, 2)
sage: WC = F.weight_cone(); WC
2-d cone in 2-d lattice N
sage: WC.rays()
N( 1, 2),
N(-1, 1)
in 2-d lattice N

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2]); F
(1, 2)
sage: WC = F.weight_cone(); WC
2-d cone in 2-d lattice N
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)],w)
>>> F = SC([Integer(1),Integer(2)]); F
(1, 2)
>>> WC = F.weight_cone(); WC
2-d cone in 2-d lattice N
>>> WC.rays()
N( 1, 2),
N(-1, 1)
in 2-d lattice N

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)],w)
>>> F = SC([Integer(1),Integer(2)]); F
(1, 2)
>>> WC = F.weight_cone(); WC
2-d cone in 2-d lattice N
```

weight_configuration()

Return the weight configuration of `self`.

Let $Q = q_1 \dots q_m \in S^*$ and $w \in W$. The weight configuration of a facet $I = [i_1, \dots, i_n]$ of $\mathcal{SC}(Q, w)$ is the sequence $\mathsf{w}(I, i_1), \dots, \mathsf{w}(I, i_n)$ of weights defined by $\mathsf{w}(I, k) = \Pi Q_{[k-1] \setminus I}(\omega_{q_k})$, where $\Pi Q_{[k-1] \setminus I}$ is the product of the simple reflections q_i for $i \in [k-1] \setminus I$ in this order.

EXAMPLES:

```
sage: # optional - gap3
sage: W = ReflectionGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2]); F
(1, 2)
sage: F.weight_configuration()
[(1/3, 2/3), (-1/3, 1/3)]

sage: W = CoxeterGroup(['A',2])
sage: w = W.from_reduced_word([1,2,1])
sage: SC = SubwordComplex([1,2,1,2,1],w)
sage: F = SC([1,2]); F
(1, 2)
sage: F.weight_configuration()
[(2/3, 4/3), (-2/3, 2/3)]
```

```
>>> from sage.all import *
>>> # optional - gap3
>>> W = ReflectionGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)],w)
>>> F = SC([Integer(1),Integer(2)]); F
(1, 2)
>>> F.weight_configuration()
[(1/3, 2/3), (-1/3, 1/3)]

>>> W = CoxeterGroup(['A',Integer(2)])
>>> w = W.from_reduced_word([Integer(1),Integer(2),Integer(1)])
>>> SC = SubwordComplex([Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(1)],w)
>>> F = SC([Integer(1),Integer(2)]); F
(1, 2)
>>> F.weight_configuration()
[(2/3, 4/3), (-2/3, 2/3)]
```

Subword complex: auxiliary Cython functions

Subwords

A subword of a word w is a word obtained by deleting the letters at some (non necessarily adjacent) positions in w. It is not to be confused with the notion of factor where one keeps adjacent positions in w. Sometimes it is useful to allow repeated uses of the same letter of w in a "generalized" subword. We call this a subword with repetitions.

For example:

- "bnjr" is a subword of the word "bonjour" but not a factor;
- "njo" is both a factor and a subword of the word "bonjour";

- “nr” is a subword of “bonjour”;
- “rn” is not a subword of “bonjour”;
- “nnu” is not a subword of “bonjour”;
- “nnu” is a subword with repetitions of “bonjour”;

A word can be given either as a string, as a list or as a tuple.

As repetition can occur in the initial word, in general subwords of a given word form an enumerated multiset rather than a set!

Todo

- implement subwords with repetitions
- implement the category of `EnumeratedMultiset` and inheritate from it when needed (i.e. the initial word has repeated letters)

AUTHORS:

- Mike Hansen: initial version
- Florent Hivert (2009/02/06): doc improvements + new methods + bug fixes

`sage.combinat.subword.`**`Subwords`**(*w*, *k=None*, *element_constructor=None*)

Return the set of subwords of `w`.

INPUT:

- `w` – a word (can be a list, a string, a tuple or a word)
- `k` – an optional integer to specify the length of subwords
- `element_constructor` – an optional function that will be used to build the subwords

EXAMPLES:

```
sage: S = Subwords(['a','b','c']); S
Subwords of ['a', 'b', 'c']
sage: S.first()
[]
sage: S.last()
['a', 'b', 'c']
sage: S.list()
[[], ['a'], ['b'], ['c'], ['a', 'b'], ['a', 'c'], ['b', 'c'], ['a', 'b', 'c']]
```

```
>>> from sage.all import *
>>> S = Subwords(['a','b','c']); S
Subwords of ['a', 'b', 'c']
>>> S.first()
[]
>>> S.last()
['a', 'b', 'c']
>>> S.list()
[[], ['a'], ['b'], ['c'], ['a', 'b'], ['a', 'c'], ['b', 'c'], ['a', 'b', 'c']]
```

The same example using string, tuple or a word:

```
sage: S = Subwords('abc'); S
Subwords of 'abc'
sage: S.list()
['', 'a', 'b', 'c', 'ab', 'ac', 'bc', 'abc']

sage: S = Subwords((1,2,3)); S
Subwords of (1, 2, 3)
sage: S.list()
[(), (1,), (2,), (3,), (1, 2), (1, 3), (2, 3), (1, 2, 3)]

sage: w = Word([1,2,3])
sage: S = Subwords(w); S
Subwords of word: 123
sage: S.list()
[word: , word: 1, word: 2, word: 3, word: 12, word: 13, word: 23, word: 123]
```

```
>>> from sage.all import *
>>> S = Subwords('abc'); S
Subwords of 'abc'
>>> S.list()
['', 'a', 'b', 'c', 'ab', 'ac', 'bc', 'abc']

>>> S = Subwords((Integer(1),Integer(2),Integer(3))); S
Subwords of (1, 2, 3)
>>> S.list()
[(), (1,), (2,), (3,), (1, 2), (1, 3), (2, 3), (1, 2, 3)]

>>> w = Word([Integer(1),Integer(2),Integer(3)])
>>> S = Subwords(w); S
Subwords of word: 123
>>> S.list()
[word: , word: 1, word: 2, word: 3, word: 12, word: 13, word: 23, word: 123]
```

Using word with specified length:

```
sage: S = Subwords(['a','b','c'], 2); S
Subwords of ['a', 'b', 'c'] of length 2
sage: S.list()
[['a', 'b'], ['a', 'c'], ['b', 'c']]
```

```
>>> from sage.all import *
>>> S = Subwords(['a','b','c'], Integer(2)); S
Subwords of ['a', 'b', 'c'] of length 2
>>> S.list()
[['a', 'b'], ['a', 'c'], ['b', 'c']]
```

An example that uses the `element_constructor` argument:

```
sage: p = Permutation([3,2,1])
sage: Subwords(p, element_constructor=tuple).list()
[(), (3,), (2,), (1,), (3, 2), (3, 1), (2, 1), (3, 2, 1)]
sage: Subwords(p, 2, element_constructor=tuple).list()
[(3, 2), (3, 1), (2, 1)]
```

```
>>> from sage.all import *
>>> p = Permutation([Integer(3),Integer(2),Integer(1)])
>>> Subwords(p, element_constructor=tuple).list()
[(), (3,), (2,), (1,), (3, 2), (3, 1), (2, 1), (3, 2, 1)]
>>> Subwords(p, Integer(2), element_constructor=tuple).list()
[(3, 2), (3, 1), (2, 1)]
```

class sage.combinat.subword.**Subwords_w**(*w*, *element_constructor*)

Bases: Parent

Subwords of a given word.

cardinality()

EXAMPLES:

```
sage: Subwords([1,2,3]).cardinality()
8
```

```
>>> from sage.all import *
>>> Subwords([Integer(1),Integer(2),Integer(3)]).cardinality()
8
```

first()

EXAMPLES:

```
sage: Subwords([1,2,3]).first()
[]
sage: Subwords((1,2,3)).first()
()
sage: Subwords('123').first()
''
```

```
>>> from sage.all import *
>>> Subwords([Integer(1),Integer(2),Integer(3)]).first()
[]
>>> Subwords((Integer(1),Integer(2),Integer(3))).first()
()
>>> Subwords('123').first()
''
```

last()

EXAMPLES:

```
sage: Subwords([1,2,3]).last()
[1, 2, 3]
sage: Subwords((1,2,3)).last()
(1, 2, 3)
sage: Subwords('123').last()
'123'
```

```
>>> from sage.all import *
>>> Subwords([Integer(1),Integer(2),Integer(3)]).last()
```

(continues on next page)

(continued from previous page)

```
[1, 2, 3]
>>> Subwords((Integer(1),Integer(2),Integer(3))).last()
(1, 2, 3)
>>> Subwords('123').last()
'123'
```

random_element()

Return a random subword with uniform law.

EXAMPLES:

```
sage: S1 = Subwords([1,2,3,2,1,3])
sage: S2 = Subwords([4,6,6,6,7,4,5,5])
sage: for i in range(100):
....:   w = S1.random_element()
....:   if w in S2:
....:       assert not w
sage: for i in range(100):
....:   w = S2.random_element()
....:   if w in S1:
....:       assert not w
```

```
>>> from sage.all import *
>>> S1 = Subwords([Integer(1),Integer(2),Integer(3),Integer(2),Integer(1),
↪Integer(3)])
>>> S2 = Subwords([Integer(4),Integer(6),Integer(6),Integer(6),Integer(7),
↪Integer(4),Integer(5),Integer(5)])
>>> for i in range(Integer(100)):
...   w = S1.random_element()
...   if w in S2:
...       assert not w
>>> for i in range(Integer(100)):
...   w = S2.random_element()
...   if w in S1:
...       assert not w
```

class sage.combinat.subword.**Subwords_wk**(*w*, *k*, *element_constructor*)

Bases: *Subwords_w*

Subwords with fixed length of a given word.

cardinality()

Return the number of subwords of w of length k.

EXAMPLES:

```
sage: Subwords([1,2,3], 2).cardinality()
3
```

```
>>> from sage.all import *
>>> Subwords([Integer(1),Integer(2),Integer(3)], Integer(2)).cardinality()
3
```

first()

EXAMPLES:

```
sage: Subwords([1,2,3],2).first()
[1, 2]
sage: Subwords([1,2,3],0).first()
[]
sage: Subwords((1,2,3),2).first()
(1, 2)
sage: Subwords((1,2,3),0).first()
()
sage: Subwords('123',2).first()
'12'
sage: Subwords('123',0).first()
''
```

```
>>> from sage.all import *
>>> Subwords([Integer(1),Integer(2),Integer(3)],Integer(2)).first()
[1, 2]
>>> Subwords([Integer(1),Integer(2),Integer(3)],Integer(0)).first()
[]
>>> Subwords((Integer(1),Integer(2),Integer(3)),Integer(2)).first()
(1, 2)
>>> Subwords((Integer(1),Integer(2),Integer(3)),Integer(0)).first()
()
>>> Subwords('123',Integer(2)).first()
'12'
>>> Subwords('123',Integer(0)).first()
''
```

last()

EXAMPLES:

```
sage: Subwords([1,2,3],2).last()
[2, 3]
sage: Subwords([1,2,3],0).last()
[]
sage: Subwords((1,2,3),2).last()
(2, 3)
sage: Subwords((1,2,3),0).last()
()
sage: Subwords('123',2).last()
'23'
sage: Subwords('123',0).last()
''
```

```
>>> from sage.all import *
>>> Subwords([Integer(1),Integer(2),Integer(3)],Integer(2)).last()
[2, 3]
>>> Subwords([Integer(1),Integer(2),Integer(3)],Integer(0)).last()
[]
>>> Subwords((Integer(1),Integer(2),Integer(3)),Integer(2)).last()
(2, 3)
```

(continues on next page)

(continued from previous page)

```
>>> Subwords((Integer(1),Integer(2),Integer(3)),Integer(0)).last()
()
>>> Subwords('123',Integer(2)).last()
'23'
>>> Subwords('123',Integer(0)).last()
''
```

random_element()

Return a random subword of given length with uniform law.

EXAMPLES:

```
sage: S1 = Subwords([1,2,3,2,1],3)
sage: S2 = Subwords([4,4,5,5,4,5,4,4],3)
sage: for i in range(100):
....:   w = S1.random_element()
....:   if w in S2:
....:       assert not w
sage: for i in range(100):
....:   w = S2.random_element()
....:   if w in S1:
....:       assert not w
```

```
>>> from sage.all import *
>>> S1 = Subwords([Integer(1),Integer(2),Integer(3),Integer(2),Integer(1)],
↪Integer(3))
>>> S2 = Subwords([Integer(4),Integer(4),Integer(5),Integer(5),Integer(4),
↪Integer(5),Integer(4),Integer(4)],Integer(3))
>>> for i in range(Integer(100)):
...   w = S1.random_element()
...   if w in S2:
...       assert not w
>>> for i in range(Integer(100)):
...   w = S2.random_element()
...   if w in S1:
...       assert not w
```

sage.combinat.subword.**smallest_positions**(*word*, *subword*, *pos=0*)

Return the smallest positions for which `subword` appears as a subword of `word`.

If `pos` is specified, then it returns the positions of the first appearance of subword starting at `pos`.

If `subword` is not found in `word`, then return `False`.

EXAMPLES:

```
sage: sage.combinat.subword.smallest_positions([1,2,3,4], [2,4])
[1, 3]
sage: sage.combinat.subword.smallest_positions([1,2,3,4,4], [2,4])
[1, 3]
sage: sage.combinat.subword.smallest_positions([1,2,3,3,4,4], [3,4])
[2, 4]
sage: sage.combinat.subword.smallest_positions([1,2,3,3,4,4], [3,4],2)
[2, 4]
```

(continues on next page)

(continued from previous page)

```
sage: sage.combinat.subword.smallest_positions([1,2,3,3,4,4], [3,4],3)
[3, 4]
sage: sage.combinat.subword.smallest_positions([1,2,3,4], [2,3])
[1, 2]
sage: sage.combinat.subword.smallest_positions([1,2,3,4], [5,5])
False
sage: sage.combinat.subword.smallest_positions([1,3,3,4,5],[3,5])
[1, 4]
sage: sage.combinat.subword.smallest_positions([1,3,3,5,4,5,3,5],[3,5,3])
[1, 3, 6]
sage: sage.combinat.subword.smallest_positions([1,3,3,5,4,5,3,5],[3,5,3],2)
[2, 3, 6]
sage: sage.combinat.subword.smallest_positions([1,2,3,4,3,4,4],[2,3,3,1])
False
sage: sage.combinat.subword.smallest_positions([1,3,3,5,4,5,3,5],[3,5,3],3)
False
```

```
>>> from sage.all import *
>>> sage.combinat.subword.smallest_positions([Integer(1),Integer(2),Integer(3),
↪Integer(4)], [Integer(2),Integer(4)])
[1, 3]
>>> sage.combinat.subword.smallest_positions([Integer(1),Integer(2),Integer(3),
↪Integer(4),Integer(4)], [Integer(2),Integer(4)])
[1, 3]
>>> sage.combinat.subword.smallest_positions([Integer(1),Integer(2),Integer(3),
↪Integer(3),Integer(4),Integer(4)], [Integer(3),Integer(4)])
[2, 4]

>>> sage.combinat.subword.smallest_positions([Integer(1),Integer(3),Integer(3),
↪Integer(5),Integer(4),Integer(5),Integer(3),Integer(5)],[Integer(3),Integer(5),
↪Integer(3)],Integer(3))
False
```

Super partitions

A super partition of size n and fermionic sector m is a pair consisting of a strict partition of some integer r of length m (that may end in a 0) and an integer partition of $n - r$.

This module provides tools for manipulating super partitions.

Super partitions are the indexing set for symmetric functions in super space.

Super partitions may be input in two different formats: one as a pair consisting of fermionic (strict partition) and a bosonic (partition) part and the other as a list of integer values where the negative entries come first and are listed in strict order followed by the positive values in weak order.

A super partition is displayed as two partitions separated by a semicolon as a default. Super partitions may also be displayed as a weakly increasing sequence of integers that are strict if the numbers are not positive.

These combinatorial objects index the space of symmetric polynomials in two sets of variables, one commuting and one anti-commuting, and they are known as symmetric functions in super space (hence the origin of the name super partitions).

EXAMPLES:

```
sage: SuperPartitions()
Super Partitions
sage: SuperPartitions(2)
Super Partitions of 2
sage: SuperPartitions(2).cardinality()
8
sage: SuperPartitions(4,2)
Super Partitions of 4 and of fermionic sector 2
sage: [[2,0],[1,1]] in SuperPartitions(4,2)
True
sage: [[1,0],[1,1]] in SuperPartitions(4,2)
False
sage: [[1,0],[2,1]] in SuperPartitions(4)
True
sage: [[1,0],[2,2,1]] in SuperPartitions(4)
False
sage: [[1,0],[2,1]] in SuperPartitions()
True
sage: [[1,1],[2,1]] in SuperPartitions()
False
sage: [-2, 0, 1, 1] in SuperPartitions(4,2)
True
sage: [-1, 0, 1, 1] in SuperPartitions(4,2)
False
sage: [-2, -2, 2, 1] in SuperPartitions(7,2)
False
```

```
>>> from sage.all import *
>>> SuperPartitions()
Super Partitions
>>> SuperPartitions(Integer(2))
Super Partitions of 2
>>> SuperPartitions(Integer(2)).cardinality()
8
>>> SuperPartitions(Integer(4),Integer(2))
Super Partitions of 4 and of fermionic sector 2
>>> [[Integer(2),Integer(0)],[Integer(1),Integer(1)]] in SuperPartitions(Integer(4),
↪Integer(2))
True
>>> [[Integer(1),Integer(0)],[Integer(1),Integer(1)]] in SuperPartitions(Integer(4),
↪Integer(2))
False
>>> [[Integer(1),Integer(0)],[Integer(2),Integer(1)]] in SuperPartitions(Integer(4))
True
>>> [[Integer(1),Integer(0)],[Integer(2),Integer(2),Integer(1)]] in␣
↪SuperPartitions(Integer(4))
False
>>> [[Integer(1),Integer(0)],[Integer(2),Integer(1)]] in SuperPartitions()
True
>>> [[Integer(1),Integer(1)],[Integer(2),Integer(1)]] in SuperPartitions()
False
>>> [-Integer(2), Integer(0), Integer(1), Integer(1)] in SuperPartitions(Integer(4),
↪Integer(2))
True
>>> [-Integer(1), Integer(0), Integer(1), Integer(1)] in SuperPartitions(Integer(4),
↪Integer(2))
False
>>> [-Integer(2), -Integer(2), Integer(2), Integer(1)] in SuperPartitions(Integer(7),
↪Integer(2))
False
```

class sage.combinat.superpartition.**SuperPartition**(*parent*, *lst*, *check=True*, *immutable=True*)

Bases: ClonableArray

A super partition.

A *super partition* of size n and fermionic sector m is a pair consisting of a strict partition of some integer r of length m (that may end in a 0) and an integer partition of $n - r$.

EXAMPLES:

```
sage: sp = SuperPartition([[1,0],[2,2,1]]); sp
[1, 0; 2, 2, 1]
sage: sp[0]
(1, 0)
```

(continues on next page)

(continued from previous page)

```
sage: sp[1]
(2, 2, 1)
sage: sp.fermionic_degree()
2
sage: sp.bosonic_degree()
6
sage: sp.length()
5
sage: sp.conjugate()
[4, 2; ]
```

```
>>> from sage.all import *
>>> sp = SuperPartition([[Integer(1),Integer(0)],[Integer(2),Integer(2),
↪Integer(1)]]); sp
[1, 0; 2, 2, 1]
>>> sp[Integer(0)]
(1, 0)
>>> sp[Integer(1)]
(2, 2, 1)
>>> sp.fermionic_degree()
2
>>> sp.bosonic_degree()
6
>>> sp.length()
5
>>> sp.conjugate()
[4, 2; ]
```

a_part()

alias of *antisymmetric_part()*.

add_horizontal_border_strip_star(*h*)

Return a list of super partitions that differ from `self` by a horizontal strip.

The notion of horizontal strip comes from the Pieri rule for the Schur-star basis of symmetric functions in super space (see Theorem 7 from [JL2016]).

INPUT:

- `h` – number of cells in the horizontal strip

OUTPUT: list of super partitions

EXAMPLES:

```
sage: SuperPartition([[4,1],[3]]).add_horizontal_border_strip_star(3)
[[3, 1; 7],
 [4, 1; 6],
 [3, 0; 6, 2],
 [3, 1; 6, 1],
 [4, 0; 5, 2],
 [4, 1; 5, 1],
 [3, 0; 5, 3],
 [3, 1; 5, 2],
```

(continues on next page)

(continued from previous page)

```
 [4, 0; 4, 3],
 [4, 1; 4, 2],
 [4, 1; 3, 3]]
sage: SuperPartition([[2,1],[3]]).add_horizontal_border_strip_star(2)
[[2, 1; 5], [2, 0; 4, 2], [2, 1; 4, 1], [2, 0; 3, 3], [2, 1; 3, 2]]
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(4),Integer(1)],[Integer(3)]]).add_horizontal_
↪border_strip_star(Integer(3))
[[3, 1; 7],
 [4, 1; 6],
 [3, 0; 6, 2],
 [3, 1; 6, 1],
 [4, 0; 5, 2],
 [4, 1; 5, 1],
 [3, 0; 5, 3],
 [3, 1; 5, 2],
 [4, 0; 4, 3],
 [4, 1; 4, 2],
 [4, 1; 3, 3]]
>>> SuperPartition([[Integer(2),Integer(1)],[Integer(3)]]).add_horizontal_
↪border_strip_star(Integer(2))
[[2, 1; 5], [2, 0; 4, 2], [2, 1; 4, 1], [2, 0; 3, 3], [2, 1; 3, 2]]
```

add_horizontal_border_strip_star_bar(*h*)

List super partitions that differ from `self` by a horizontal strip.

The notion of horizontal strip comes from the Pieri rule for the Schur-star-bar basis of symmetric functions in super space (see Theorem 10 from [JL2016]).

INPUT:

- `h` – number of cells in the horizontal strip

OUTPUT: list of super partitions

EXAMPLES:

```
sage: SuperPartition([[4,1],[5,4]]).add_horizontal_border_strip_star_bar(3)
[[4, 1; 8, 4],
 [4, 1; 7, 5],
 [4, 2; 7, 4],
 [4, 1; 7, 4, 1],
 [4, 2; 6, 5],
 [4, 1; 6, 5, 1],
 [4, 3; 6, 4],
 [4, 2; 6, 4, 1],
 [4, 1; 6, 4, 2],
 [4, 3; 5, 5],
 [4, 2; 5, 5, 1],
 [4, 1; 5, 5, 2],
 [4, 3; 5, 4, 1],
 [4, 1; 5, 4, 3]]
sage: SuperPartition([[3,1],[5]]).add_horizontal_border_strip_star_bar(2)

 [4, 2; 5],
 [4, 1; 5, 1],
 [3, 2; 5, 1],
 [3, 1; 5, 2]]
```

antisymmetric_part()

The antisymmetric part as a list of strictly decreasing integers.

OUTPUT: list

EXAMPLES:

```
sage: SuperPartition([[3,1],[2,2,1]]).antisymmetric_part()
[3, 1]
sage: SuperPartition([[2,1,0],[3,3]]).antisymmetric_part()
[2, 1, 0]
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(3),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)]]).antisymmetric_part()
```

(continues on next page)

(continued from previous page)

```
[3, 1]
>>> SuperPartition([[Integer(2),Integer(1),Integer(0)],[Integer(3),
↪Integer(3)]]).antisymmetric_part()
[2, 1, 0]
```

bi_degree()

Return the bidegree of `self`, which is a pair consisting of the bosonic and fermionic degree.

OUTPUT: a tuple of two integers

EXAMPLES:

```
sage: SuperPartition([[3,1],[2,2,1]]).bi_degree()
(9, 2)
sage: SuperPartition([[2,1,0],[3,3]]).bi_degree()
(9, 3)
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(3),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)]]).bi_degree()
(9, 2)
>>> SuperPartition([[Integer(2),Integer(1),Integer(0)],[Integer(3),
↪Integer(3)]]).bi_degree()
(9, 3)
```

bosonic_degree()

Return the bosonic degree of `self`.

The *bosonic degree* is the sum of the sizes of the antisymmetric and symmetric parts.

OUTPUT: integer

EXAMPLES:

```
sage: SuperPartition([[3,1],[2,2,1]]).bosonic_degree()
9
sage: SuperPartition([[2,1,0],[3,3]]).bosonic_degree()
9
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(3),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)]]).bosonic_degree()
9
>>> SuperPartition([[Integer(2),Integer(1),Integer(0)],[Integer(3),
↪Integer(3)]]).bosonic_degree()
9
```

bosonic_length()

Return the length of the partition of the symmetric part.

OUTPUT: integer

EXAMPLES:

```
sage: SuperPartition([[3,1],[2,2,1]]).bosonic_length()
3
sage: SuperPartition([[2,1,0],[3,3]]).bosonic_length()
2
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(3),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)]]).bosonic_length()
3
>>> SuperPartition([[Integer(2),Integer(1),Integer(0)],[Integer(3),
↪Integer(3)]]).bosonic_length()
2
```

check()

Check that `self` is a valid super partition.

EXAMPLES:

```
sage: SP = SuperPartition([[1],[1]])
sage: SP.check()
```

```
>>> from sage.all import *
>>> SP = SuperPartition([[Integer(1)],[Integer(1)]])
>>> SP.check()
```

conjugate()

Conjugate of a super partition.

The *conjugate* of a super partition is defined by conjugating the circled diagram.

OUTPUT: a *SuperPartition*

EXAMPLES:

```
sage: SuperPartition([[3, 1, 0], [4, 3, 2, 1]]).conjugate()
[6, 4, 1; 3]
sage: all(sp == sp.conjugate().conjugate() for sp in SuperPartitions(4))
True
sage: all(sp.conjugate() in SuperPartitions(3,2) for sp in SuperPartitions(3,
↪2))
True
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(3), Integer(1), Integer(0)], [Integer(4),␣
↪Integer(3), Integer(2), Integer(1)]]).conjugate()
[6, 4, 1; 3]
>>> all(sp == sp.conjugate().conjugate() for sp in␣
↪SuperPartitions(Integer(4)))
True
>>> all(sp.conjugate() in SuperPartitions(Integer(3),Integer(2)) for sp in␣
↪SuperPartitions(Integer(3),Integer(2)))
True
```

degree()

alias of *bosonic_degree()*.

dominates(*other*)

Return `True` if and only if `self` dominates `other`.

If the symmetric and anti-symmetric parts of `self` and `other` are not the same size then the result is `False`.

EXAMPLES:

```
sage: LA = SuperPartition([[2,1],[2,1,1]])
sage: LA.dominates([[2,1],[3,1]])
False
sage: LA.dominates([[2,1],[1,1,1,1]])
True
sage: LA.dominates([[3],[2,1,1]])
False
sage: LA.dominates([[1],[1]*6])
False
```

```
>>> from sage.all import *
>>> LA = SuperPartition([[Integer(2),Integer(1)],[Integer(2),Integer(1),
↪Integer(1)]])
>>> LA.dominates([[Integer(2),Integer(1)],[Integer(3),Integer(1)]])
False
>>> LA.dominates([[Integer(2),Integer(1)],[Integer(1),Integer(1),Integer(1),
↪Integer(1)]])
True
>>> LA.dominates([[Integer(3)],[Integer(2),Integer(1),Integer(1)]])
False
>>> LA.dominates([[Integer(1)],[Integer(1)]*Integer(6)])
False
```

fermionic_degree()

Return the fermionic degree of `self`.

The *fermionic degree* is the length of the antisymmetric part.

OUTPUT: integer

EXAMPLES:

```
sage: SuperPartition([[3,1],[2,2,1]]).fermionic_degree()
2
sage: SuperPartition([[2,1,0],[3,3]]).fermionic_degree()
3
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(3),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)]]).fermionic_degree()
2
>>> SuperPartition([[Integer(2),Integer(1),Integer(0)],[Integer(3),
↪Integer(3)]]).fermionic_degree()
3
```

fermionic_sector()

alias of *fermionic_degree()*.

static from_circled_diagram(*shape*, *corners*)

Construct a super partition from a circled diagram.

A circled diagram consists of a partition of the concatenation of the antisymmetric and symmetric parts and a list of addable cells of the partition which indicate the location of the circled cells.

INPUT:

- `shape` – a partition or list of integers
- `corners` – list of removable cells of `shape`

OUTPUT: a *SuperPartition*

EXAMPLES:

```
sage: SuperPartition.from_circled_diagram([3, 2, 2, 1, 1], [(0, 3), (3, 1)])
[3, 1; 2, 2, 1]
sage: SuperPartition.from_circled_diagram([3, 3, 2, 1], [(2, 2), (3, 1), (4,␣
↪0)])
[2, 1, 0; 3, 3]
sage: from_cd = SuperPartition.from_circled_diagram
sage: all(sp == from_cd(*sp.to_circled_diagram()) for sp in␣
↪SuperPartitions(4))
True
```

```
>>> from sage.all import *
>>> SuperPartition.from_circled_diagram([Integer(3), Integer(2), Integer(2),␣
↪Integer(1), Integer(1)], [(Integer(0), Integer(3)), (Integer(3),␣
↪Integer(1))])
[3, 1; 2, 2, 1]
>>> SuperPartition.from_circled_diagram([Integer(3), Integer(3), Integer(2),␣
↪Integer(1)], [(Integer(2), Integer(2)), (Integer(3), Integer(1)),␣
↪(Integer(4), Integer(0))])
[2, 1, 0; 3, 3]
>>> from_cd = SuperPartition.from_circled_diagram
>>> all(sp == from_cd(*sp.to_circled_diagram()) for sp in␣
↪SuperPartitions(Integer(4)))
True
```

length()

Return the length of `self`, which is the sum of the lengths of the antisymmetric and symmetric part.

OUTPUT: integer

EXAMPLES:

```
sage: SuperPartition([[3,1],[2,2,1]]).length()
5
sage: SuperPartition([[2,1,0],[3,3]]).length()
5
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(3),Integer(1)],[Integer(2),Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(1)]]).length()
5
>>> SuperPartition([[Integer(2),Integer(1),Integer(0)],[Integer(3),
↪Integer(3)]]).length()
5
```

s_part()

alias of *symmetric_part()*.

shape_circled_diagram()

A concatenated partition with an extra cell for each antisymmetric part

OUTPUT: a partition

EXAMPLES:

```
sage: SuperPartition([[3,1],[2,2,1]]).shape_circled_diagram()
[4, 2, 2, 2, 1]
sage: SuperPartition([[2,1,0],[3,3]]).shape_circled_diagram()
[3, 3, 3, 2, 1]
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(3),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)]]).shape_circled_diagram()
[4, 2, 2, 2, 1]
>>> SuperPartition([[Integer(2),Integer(1),Integer(0)],[Integer(3),
↪Integer(3)]]).shape_circled_diagram()
[3, 3, 3, 2, 1]
```

sign()

Return the sign of a permutation of cycle type the symmetric part of `self`.

OUTPUT: either 1 or -1

EXAMPLES:

```
sage: SuperPartition([[1,0],[3,1,1]]).sign()
-1
sage: SuperPartition([[1,0],[3,2,1]]).sign()
1
sage: sum(sp.sign()/sp.zee() for sp in SuperPartitions(6,0))
0
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(1),Integer(0)],[Integer(3),Integer(1),
↪Integer(1)]]).sign()
-1
>>> SuperPartition([[Integer(1),Integer(0)],[Integer(3),Integer(2),
↪Integer(1)]]).sign()
1
>>> sum(sp.sign()/sp.zee() for sp in SuperPartitions(Integer(6),Integer(0)))
0
```

symmetric_part()

The symmetric part as a list of weakly decreasing integers.

OUTPUT: list

EXAMPLES:

```
sage: SuperPartition([[3,1],[2,2,1]]).symmetric_part()
[2, 2, 1]
sage: SuperPartition([[2,1,0],[3,3]]).symmetric_part()
[3, 3]
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(3),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)]]).symmetric_part()
[2, 2, 1]
>>> SuperPartition([[Integer(2),Integer(1),Integer(0)],[Integer(3),
↪Integer(3)]]).symmetric_part()
[3, 3]
```

to_circled_diagram()

The shape of the circled diagram and a list of addable cells

A circled diagram consists of a partition for the outer shape and a list of removable cells of the partition indicating the location of the circled cells

OUTPUT: list consisting of a partition and a list of pairs of integers

EXAMPLES:

```
sage: SuperPartition([[3,1],[2,2,1]]).to_circled_diagram()
[[3, 2, 2, 1, 1], [(0, 3), (3, 1)]]
sage: SuperPartition([[2,1,0],[3,3]]).to_circled_diagram()
[[3, 3, 2, 1], [(2, 2), (3, 1), (4, 0)]]
sage: from_cd = SuperPartition.from_circled_diagram
sage: all(sp == from_cd(*sp.to_circled_diagram()) for sp in␣
↪SuperPartitions(4))
True
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(3),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)]]).to_circled_diagram()
[[3, 2, 2, 1, 1], [(0, 3), (3, 1)]]
>>> SuperPartition([[Integer(2),Integer(1),Integer(0)],[Integer(3),
↪Integer(3)]]).to_circled_diagram()
[[3, 3, 2, 1], [(2, 2), (3, 1), (4, 0)]]
>>> from_cd = SuperPartition.from_circled_diagram
>>> all(sp == from_cd(*sp.to_circled_diagram()) for sp in␣
↪SuperPartitions(Integer(4)))
True
```

to_composition()

Concatenate the antisymmetric and symmetric parts to a composition.

OUTPUT:

- a (possibly weak) composition

Todo

Composition is for strict compositions, we should use *IntegerVectors* instead.

EXAMPLES:

```
sage: SuperPartition([[3,1],[2,2,1]]).to_composition()
[3, 1, 2, 2, 1]
sage: SuperPartition([[2,1,0],[3,3]]).to_composition()
[2, 1, 0, 3, 3]
sage: SuperPartition([[2,1,0],[3,3]]).to_composition().parent()
Compositions of nonnegative integers
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(3),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)]]).to_composition()
[3, 1, 2, 2, 1]
>>> SuperPartition([[Integer(2),Integer(1),Integer(0)],[Integer(3),
↪Integer(3)]]).to_composition()
[2, 1, 0, 3, 3]
>>> SuperPartition([[Integer(2),Integer(1),Integer(0)],[Integer(3),
↪Integer(3)]]).to_composition().parent()
Compositions of nonnegative integers
```

to_list()

The list of two lists with the antisymmetric and symmetric parts.

EXAMPLES:

```
sage: SuperPartition([[1],[1]]).to_list()
[[1], [1]]
sage: SuperPartition([[],[1]]).to_list()
[[], [1]]
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(1)],[Integer(1)]]).to_list()
[[1], [1]]
>>> SuperPartition([[],[Integer(1)]]).to_list()
[[], [1]]
```

to_partition()

Concatenate and sort the antisymmetric and symmetric parts to a partition.

OUTPUT: a partition

EXAMPLES:

```
sage: SuperPartition([[3,1],[2,2,1]]).to_partition()
[3, 2, 2, 1, 1]
sage: SuperPartition([[2,1,0],[3,3]]).to_partition()
[3, 3, 2, 1]
sage: SuperPartition([[2,1,0],[3,3]]).to_partition().parent()
Partitions
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(3),Integer(1)],[Integer(2),Integer(2),
↪Integer(1)]]).to_partition()
[3, 2, 2, 1, 1]
>>> SuperPartition([[Integer(2),Integer(1),Integer(0)],[Integer(3),
↪Integer(3)]]).to_partition()
[3, 3, 2, 1]
>>> SuperPartition([[Integer(2),Integer(1),Integer(0)],[Integer(3),
↪Integer(3)]]).to_partition().parent()
Partitions
```

zee()

Return the centralizer size of a permutation of cycle type symmetric part of `self`.

OUTPUT: a positive integer

EXAMPLES:

```
sage: SuperPartition([[1,0],[3,1,1]]).zee()
6
sage: SuperPartition([[1],[2,2,1]]).zee()
8
sage: sum(1/sp.zee() for sp in SuperPartitions(6,0))
1
```

```
>>> from sage.all import *
>>> SuperPartition([[Integer(1),Integer(0)],[Integer(3),Integer(1),
↪Integer(1)]]).zee()
6
>>> SuperPartition([[Integer(1)],[Integer(2),Integer(2),Integer(1)]]).zee()
8
>>> sum(Integer(1)/sp.zee() for sp in SuperPartitions(Integer(6),Integer(0)))
1
```

class sage.combinat.superpartition.**SuperPartitions**(*is_infinite=False*)

Bases: `UniqueRepresentation`, `Parent`

Super partitions.

A super partition of size n and fermionic sector m is a pair consisting of a strict partition of some integer r of length m (that may end in a 0) and an integer partition of $n - r$.

INPUT:

- `n` – integer (default: `None`)
- `m` – if `n` is specified, an integer (optional: default `None`)

Super partitions are the indexing set for symmetric functions in super space.

EXAMPLES:

```
sage: SuperPartitions()
Super Partitions
sage: SuperPartitions(2)
Super Partitions of 2
sage: SuperPartitions(2).cardinality()
```

(continues on next page)

(continued from previous page)

```
8
sage: SuperPartitions(4,2)
Super Partitions of 4 and of fermionic sector 2
sage: [[2,0],[1,1]] in SuperPartitions(4,2)
True
sage: [[1,0],[1,1]] in SuperPartitions(4,2)
False
sage: [[1,0],[2,1]] in SuperPartitions(4)
True
sage: [[1,0],[2,2,1]] in SuperPartitions(4)
False
sage: [[1,0],[2,1]] in SuperPartitions()
True
sage: [[1,1],[2,1]] in SuperPartitions()
False
```

```
>>> from sage.all import *
>>> SuperPartitions()
Super Partitions
>>> SuperPartitions(Integer(2))
Super Partitions of 2
>>> SuperPartitions(Integer(2)).cardinality()
8
>>> SuperPartitions(Integer(4),Integer(2))
Super Partitions of 4 and of fermionic sector 2
>>> [[Integer(2),Integer(0)],[Integer(1),Integer(1)]] in␣
↪SuperPartitions(Integer(4),Integer(2))
True
>>> [[Integer(1),Integer(0)],[Integer(1),Integer(1)]] in␣
↪SuperPartitions(Integer(4),Integer(2))
False
>>> [[Integer(1),Integer(0)],[Integer(2),Integer(1)]] in␣
↪SuperPartitions(Integer(4))
True
>>> [[Integer(1),Integer(0)],[Integer(2),Integer(2),Integer(1)]] in␣
↪SuperPartitions(Integer(4))
False
>>> [[Integer(1),Integer(0)],[Integer(2),Integer(1)]] in SuperPartitions()
True
>>> [[Integer(1),Integer(1)],[Integer(2),Integer(1)]] in SuperPartitions()
False
```

Element

alias of *SuperPartition*

options = Current options for SuperPartition - display: default

class sage.combinat.superpartition.**SuperPartitions_all**

Bases: *SuperPartitions*

Initialize `self`.

class sage.combinat.superpartition.**SuperPartitions_n**(*n*)

Initialize `self`.

Super tableaux

AUTHORS:

- Matthew Lancellotti (2007): initial version
- Chaman Agrawal (2019-07-23): modify standard and semistandard tableaux for super tableaux

class sage.combinat.super_tableau.**SemistandardSuperTableau**(*parent*, *t*, *check=True*, *preprocessed=False*)

Bases: *Tableau*

A semistandard super tableau.

A semistandard super tableau is a tableau with primed positive integer entries. As defined in [Muth2019], a semistandard super tableau weakly increases along the rows and down the columns. Also, the letters of even parity (unprimed) strictly increases down the columns, and letters of oddd parity (primed) strictly increases along the rows. Note that Sage uses the English convention for partitions and tableaux; the longer rows are displayed on top.

INPUT:

- `t` – a tableau, a list of iterables, or an empty list

EXAMPLES:

```
sage: t = SemistandardSuperTableau([['1p',2,"3'"],[2,3]]); t
[[1', 2, 3'], [2, 3]]
sage: t.shape()
[3, 2]
sage: t.pp() # pretty printing
1' 2 3'
2 3
sage: t = Tableau([["1p",2],[2]])
sage: s = SemistandardSuperTableau(t); s
[[1', 2], [2]]
sage: SemistandardSuperTableau([]) # The empty tableau
[]
```

```
>>> from sage.all import *
>>> t = SemistandardSuperTableau([['1p',Integer(2),"3'"],[Integer(2),
↪Integer(3)]]); t
[[1', 2, 3'], [2, 3]]
>>> t.shape()
[3, 2]
>>> t.pp() # pretty printing
1' 2 3'
2 3
>>> t = Tableau([["1p",Integer(2)],[Integer(2)]])
>>> s = SemistandardSuperTableau(t); s
[[1', 2], [2]]
```

(continues on next page)

(continued from previous page)

```
>>> SemistandardSuperTableau([]) # The empty tableau
[]
```

check()

Check that `self` is a valid semistandard super tableau.

class sage.combinat.super_tableau.**SemistandardSuperTableaux**(***kwds*)

Bases: *SemistandardTableaux*

The set of semistandard super tableaux.

A semistandard super tableau is a tableau with primed positive integer entries. As defined in [Muth2019], a semistandard super tableau weakly increases along the rows and down the columns. Also, the letters of even parity (unprimed) strictly increases down the columns, and letters of oddd parity (primed) strictly increases along the rows. Note that Sage uses the English convention for partitions and tableaux; the longer rows are displayed on top.

EXAMPLES:

```
sage: SST = SemistandardSuperTableaux(); SST
Semistandard super tableaux
```

```
>>> from sage.all import *
>>> SST = SemistandardSuperTableaux(); SST
Semistandard super tableaux
```

Element

alias of *SemistandardSuperTableau*

class sage.combinat.super_tableau.**SemistandardSuperTableaux_all**

Bases: *SemistandardSuperTableaux*

All semistandard super tableaux.

class sage.combinat.super_tableau.**StandardSuperTableau**(*parent*, *t*, *check=True*, *preprocessed=False*)

Bases: *SemistandardSuperTableau*

A standard super tableau.

A standard super tableau is a semistandard super tableau whose entries are in bijection with positive primed integers $1', 1, 2' \dots n$.

For more information refer [Muth2019].

INPUT:

- `t` – a Tableau, a list of iterables, or an empty list

EXAMPLES:

```
sage: t = StandardSuperTableau([["1'",1,"2'",2,"3'"],[3,"4'"]]); t
[[1', 1, 2', 2, 3'], [3, 4']]
sage: t.shape()
[5, 2]
sage: t.pp() # pretty printing
1' 1 2' 2 3'
3 4'
sage: t.is_standard()
```

(continues on next page)

(continued from previous page)

```
True
sage: StandardSuperTableau([]) # The empty tableau
[]
```

```
>>> from sage.all import *
>>> t = StandardSuperTableau([["1'",Integer(1),"2'",Integer(2),"3'"],[Integer(3),
↪"4'"]]); t
[[1', 1, 2', 2, 3'], [3, 4']]
>>> t.shape()
[5, 2]
>>> t.pp() # pretty printing
1' 1 2' 2 3'
3 4'
>>> t.is_standard()
True
>>> StandardSuperTableau([]) # The empty tableau
[]
```

check()

Check that `self` is a standard tableau.

is_standard()

Return `True` since `self` is a standard super tableau.

EXAMPLES:

```
sage: StandardSuperTableau([['1p', 1], ['2p', 2]]).is_standard()
True
```

```
>>> from sage.all import *
>>> StandardSuperTableau([['1p', Integer(1)], ['2p', Integer(2)]]).is_
↪standard()
True
```

class sage.combinat.super_tableau.**StandardSuperTableaux**(***kwds*)

Bases: *SemistandardSuperTableaux*, Parent

The set of standard super tableaux.

A standard super tableau is a tableau whose entries are primed positive integers, which are strictly increasing in rows and down columns and contains each letters from 1',1,2'…n exactly once.

For more information refer [Muth2019].

INPUT:

- `n` – a nonnegative integer or a partition

EXAMPLES:

```
sage: SST = StandardSuperTableaux()
sage: SST
Standard super tableaux
sage: SST([["1'",1,"2'",2,"3'"],[3,"4'"]])
[[1', 1, 2', 2, 3'], [3, 4']]
```

(continues on next page)

(continued from previous page)

```
sage: SST = StandardSuperTableaux(3)
sage: SST
Standard super tableaux of size 3
sage: SST.first()
[[1', 1, 2']]
sage: SST.last()
[[1'], [1], [2']]
sage: SST.cardinality()
4
sage: SST.list()
[[[1', 1, 2']], [[1', 2'], [1]], [[1', 1], [2']], [[1'], [1], [2']]]
sage: SST = StandardSuperTableaux([3,2])
sage: SST
Standard super tableaux of shape [3, 2]
```

```
>>> from sage.all import *
>>> SST = StandardSuperTableaux()
>>> SST
Standard super tableaux
>>> SST([["1'",Integer(1),"2'",Integer(2),"3'"],[Integer(3),"4'"]])
[[1', 1, 2', 2, 3'], [3, 4']]
>>> SST = StandardSuperTableaux(Integer(3))
>>> SST
Standard super tableaux of size 3
>>> SST.first()
[[1', 1, 2']]
>>> SST.last()
[[1'], [1], [2']]
>>> SST.cardinality()
4
>>> SST.list()
[[[1', 1, 2']], [[1', 2'], [1]], [[1', 1], [2']], [[1'], [1], [2']]]
>>> SST = StandardSuperTableaux([Integer(3),Integer(2)])
>>> SST
Standard super tableaux of shape [3, 2]
```

Element

alias of *StandardSuperTableau*

class sage.combinat.super_tableau.**StandardSuperTableaux_all**

Bases: *StandardSuperTableaux*, DisjointUnionEnumeratedSets

All standard super tableaux.

class sage.combinat.super_tableau.**StandardSuperTableaux_shape**(*p*)

Bases: *StandardSuperTableaux*

Standard super tableaux of a fixed shape p.

cardinality()

Return the number of standard super tableaux of given shape.

The standard super tableaux of a fixed shape p are in bijection with the corresponding standard tableaux (under the alphabet relabeling). Refer *sage.combinat.tableau.StandardTableaux_shape* for more details.

EXAMPLES:

```
sage: StandardSuperTableaux([3,2,1]).cardinality()
16
sage: StandardSuperTableaux([2,2]).cardinality()
2
sage: StandardSuperTableaux([5]).cardinality()
1
sage: StandardSuperTableaux([6,5,5,3]).cardinality()
6651216
sage: StandardSuperTableaux([]).cardinality()
1
```

```
>>> from sage.all import *
>>> StandardSuperTableaux([Integer(3),Integer(2),Integer(1)]).cardinality()
16
>>> StandardSuperTableaux([Integer(2),Integer(2)]).cardinality()
2
>>> StandardSuperTableaux([Integer(5)]).cardinality()
1
>>> StandardSuperTableaux([Integer(6),Integer(5),Integer(5),Integer(3)]).
↪cardinality()
6651216
>>> StandardSuperTableaux([]).cardinality()
1
```

class sage.combinat.super_tableau.**StandardSuperTableaux_size**(*n*)

Bases: *StandardSuperTableaux*, DisjointUnionEnumeratedSets

Standard super tableaux of fixed size n.

EXAMPLES:

```
sage: [ t for t in StandardSuperTableaux(1) ]
[[[1']]]
sage: [ t for t in StandardSuperTableaux(2) ]
[[[1', 1]], [[1'], [1]]]
sage: [ t for t in StandardSuperTableaux(3) ]
[[[1', 1, 2']], [[1', 2'], [1]], [[1', 1], [2']], [[1'], [1], [2']]]
sage: StandardSuperTableaux(4)[:]
[[[1', 1, 2', 2]],
 [[1', 2', 2], [1]],
 [[1', 1, 2], [2']],
 [[1', 1, 2'], [2]],
 [[1', 2'], [1, 2]],
 [[1', 1], [2', 2]],
 [[1', 2], [1], [2']],
 [[1', 2'], [1], [2]],
 [[1', 1], [2'], [2]],
 [[1'], [1], [2'], [2]]]
```

```
>>> from sage.all import *
>>> [ t for t in StandardSuperTableaux(Integer(1)) ]
[[[1']]]
```

(continues on next page)

(continued from previous page)

```
>>> [ t for t in StandardSuperTableaux(Integer(2)) ]
[[[1', 1]], [[1'], [1]]]
>>> [ t for t in StandardSuperTableaux(Integer(3)) ]
[[[1', 1, 2']], [[1', 2'], [1]], [[1', 1], [2']], [[1'], [1], [2']]]
>>> StandardSuperTableaux(Integer(4))[:]
[[[1', 1, 2', 2]],
 [[1', 2', 2], [1]],
 [[1', 1, 2], [2']],
 [[1', 1, 2'], [2]],
 [[1', 2'], [1, 2]],
 [[1', 1], [2', 2]],
 [[1', 2], [1], [2']],
 [[1', 2'], [1], [2]],
 [[1', 1], [2'], [2]],
 [[1'], [1], [2'], [2]]]
```

cardinality()

Return the number of all standard super tableaux of size `n`.

The standard super tableaux of size n are in bijection with the corresponding standard tableaux (under the alphabet relabeling). Refer *sage.combinat.tableau.StandardTableaux_size* for more details.

EXAMPLES:

```
sage: StandardSuperTableaux(3).cardinality()
4
sage: ns = [1,2,3,4,5,6]
sage: sts = [StandardSuperTableaux(n) for n in ns]
sage: all(st.cardinality() == len(st.list()) for st in sts)
True
sage: StandardSuperTableaux(50).cardinality()  # long time
27886995605342342839104615869259776
```

```
>>> from sage.all import *
>>> StandardSuperTableaux(Integer(3)).cardinality()
4
>>> ns = [Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),Integer(6)]
>>> sts = [StandardSuperTableaux(n) for n in ns]
>>> all(st.cardinality() == len(st.list()) for st in sts)
True
>>> StandardSuperTableaux(Integer(50)).cardinality()  # long time
27886995605342342839104615869259776
```

Symmetric group algebra

sage.combinat.symmetric_group_algebra.**HeckeAlgebraSymmetricGroupT**(*R*, *n*, *q=None*)

Return the Hecke algebra of the symmetric group S_n on the T-basis with quantum parameter `q` over the ring R.

If R is a commutative ring and q is an invertible element of R, and if n is a nonnegative integer, then the Hecke algebra of the symmetric group S_n over R with quantum parameter q is defined as the algebra generated by the generators $T_1, T_2, \ldots, T_{n-1}$ with relations

$$T_i T_{i+1} T_i = T_{i+1} T_i T_{i+1}$$

for all $i < n-1$ ("braid relations"),

$$T_i T_j = T_j T_i$$

for all i and j such that $|i-j| > 1$ ("locality relations"), and

$$T_i^2 = q + (q-1)T_i$$

for all i (the "quadratic relations", also known in the form $(T_i+1)(T_i-q) = 0$). (This is only one of several existing definitions in literature, not all of which are fully equivalent. We are following the conventions of [Go1993].) For any permutation $w \in S_n$, we can define an element T_w of this Hecke algebra by setting $T_w = T_{i_1} T_{i_2} \cdots T_{i_k}$, where $w = s_{i_1} s_{i_2} \cdots s_{i_k}$ is a reduced word for w (with s_i meaning the transposition $(i, i+1)$, and the product of permutations being evaluated by first applying s_{i_k}, then $s_{i_{k-1}}$, etc.). This element is independent of the choice of the reduced decomposition, and can be computed in Sage by calling `H[w]` where `H` is the Hecke algebra and `w` is the permutation.

The Hecke algebra of the symmetric group S_n with quantum parameter q over R can be seen as a deformation of the group algebra RS_n; indeed, it becomes RS_n when $q = 1$.

Warning

The multiplication on the Hecke algebra of the symmetric group does *not* follow the global option `mult` of the *Permutations* class (see *options()*). It is always as defined above. It does not match the default option (`mult='l2r'`) of the symmetric group algebra!

EXAMPLES:

```
sage: HeckeAlgebraSymmetricGroupT(QQ, 3)
Hecke algebra of the symmetric group of order 3 on the T basis over Univariate␣
↪Polynomial Ring in q over Rational Field
```

```
>>> from sage.all import *
>>> HeckeAlgebraSymmetricGroupT(QQ, Integer(3))
Hecke algebra of the symmetric group of order 3 on the T basis over Univariate␣
↪Polynomial Ring in q over Rational Field
```

```
sage: HeckeAlgebraSymmetricGroupT(QQ, 3, 2)
Hecke algebra of the symmetric group of order 3 with q=2 on the T basis over␣
↪Rational Field
```

```
>>> from sage.all import *
>>> HeckeAlgebraSymmetricGroupT(QQ, Integer(3), Integer(2))
Hecke algebra of the symmetric group of order 3 with q=2 on the T basis over␣
↪Rational Field
```

The multiplication on the Hecke algebra follows a different convention than the one on the symmetric group algebra does by default:

```
sage: H3 = HeckeAlgebraSymmetricGroupT(QQ, 3)
sage: H3([1,3,2]) * H3([2,1,3])
T[3, 1, 2]
sage: S3 = SymmetricGroupAlgebra(QQ, 3)
sage: S3([1,3,2]) * S3([2,1,3])
```

(continues on next page)

(continued from previous page)

```
[2, 3, 1]

sage: TestSuite(H3).run()
```

```
>>> from sage.all import *
>>> H3 = HeckeAlgebraSymmetricGroupT(QQ, Integer(3))
>>> H3([Integer(1),Integer(3),Integer(2)]) * H3([Integer(2),Integer(1),
↪Integer(3)])
T[3, 1, 2]
>>> S3 = SymmetricGroupAlgebra(QQ, Integer(3))
>>> S3([Integer(1),Integer(3),Integer(2)]) * S3([Integer(2),Integer(1),
↪Integer(3)])
[2, 3, 1]

>>> TestSuite(H3).run()
```

Note

`IwahoriHeckeAlgebra` gives a different implementation of the Iwahori-Hecke algebras of a Coxeter system (W, S). This includes the Hecke algebras of the symmetric group as special case.

class sage.combinat.symmetric_group_algebra.**HeckeAlgebraSymmetricGroup_generic**(*R*, *n*, *q=None*)

Bases: *CombinatorialFreeModule*

one_basis()

Return the identity permutation.

EXAMPLES:

```
sage: HeckeAlgebraSymmetricGroupT(QQ, 3).one()  # indirect doctest
T[1, 2, 3]
```

```
>>> from sage.all import *
>>> HeckeAlgebraSymmetricGroupT(QQ, Integer(3)).one()  # indirect doctest
T[1, 2, 3]
```

q()

Return the variable or parameter q.

EXAMPLES:

```
sage: HeckeAlgebraSymmetricGroupT(QQ, 3).q()
q
sage: HeckeAlgebraSymmetricGroupT(QQ, 3, 2).q()
2
```

```
>>> from sage.all import *
>>> HeckeAlgebraSymmetricGroupT(QQ, Integer(3)).q()
q
```

(continues on next page)

(continued from previous page)

```
>>> HeckeAlgebraSymmetricGroupT(QQ, Integer(3), Integer(2)).q()
2
```

class sage.combinat.symmetric_group_algebra.**HeckeAlgebraSymmetricGroup_t**(*R*, *n*, *q=None*)

Bases: *HeckeAlgebraSymmetricGroup_generic*

algebra_generators()

Return the generators of the algebra.

EXAMPLES:

```
sage: HeckeAlgebraSymmetricGroupT(QQ,3).algebra_generators()
[T[2, 1, 3], T[1, 3, 2]]
```

```
>>> from sage.all import *
>>> HeckeAlgebraSymmetricGroupT(QQ,Integer(3)).algebra_generators()
[T[2, 1, 3], T[1, 3, 2]]
```

jucys_murphy(*k*)

Return the Jucys-Murphy element J_k of the Hecke algebra.

These Jucys-Murphy elements are defined by

$$J_k = (T_{k-1} T_{k-2} \cdots T_1)(T_1 T_2 \cdots T_{k-1}).$$

More explicitly,

$$J_k = q^{k-1} + \sum_{l=1}^{k-1} (q^l - q^{l-1}) T_{(l,k)}.$$

For generic q, the J_k generate a maximal commutative sub-algebra of the Hecke algebra.

Warning

The specialization $q = 1$ does *not* map these elements J_k to the Young-Jucys-Murphy elements of the group algebra RS_n. (Instead, it maps the "reduced" Jucys-Murphy elements $(J_k - q^{k-1})/(q-1)$ to the Young-Jucys-Murphy elements of RS_n.)

EXAMPLES:

```
sage: H3 = HeckeAlgebraSymmetricGroupT(QQ,3)
sage: j2 = H3.jucys_murphy(2); j2
q*T[1, 2, 3] + (q-1)*T[2, 1, 3]
sage: j3 = H3.jucys_murphy(3); j3
q^2*T[1, 2, 3] + (q^2-q)*T[1, 3, 2] + (q-1)*T[3, 2, 1]
sage: j2*j3 == j3*j2
True
sage: j0 = H3.jucys_murphy(1); j0 == H3.one()
True
sage: H3.jucys_murphy(0)
Traceback (most recent call last):
...
ValueError: k (= 0) must be between 1 and n (= 3)
```

```
>>> from sage.all import *
>>> H3 = HeckeAlgebraSymmetricGroupT(QQ,Integer(3))
>>> j2 = H3.jucys_murphy(Integer(2)); j2
q*T[1, 2, 3] + (q-1)*T[2, 1, 3]
>>> j3 = H3.jucys_murphy(Integer(3)); j3
q^2*T[1, 2, 3] + (q^2-q)*T[1, 3, 2] + (q-1)*T[3, 2, 1]
>>> j2*j3 == j3*j2
True
>>> j0 = H3.jucys_murphy(Integer(1)); j0 == H3.one()
True
>>> H3.jucys_murphy(Integer(0))
Traceback (most recent call last):
...
ValueError: k (= 0) must be between 1 and n (= 3)
```

product_on_basis(*perm1*, *perm2*)

EXAMPLES:

```
sage: H3 = HeckeAlgebraSymmetricGroupT(QQ, 3, 1)
sage: a = H3([2,1,3])+2*H3([1,2,3])-H3([3,2,1])
sage: a^2 #indirect doctest
6*T[1, 2, 3] + 4*T[2, 1, 3] - T[2, 3, 1]
- T[3, 1, 2] - 4*T[3, 2, 1]
```

```
>>> from sage.all import *
>>> H3 = HeckeAlgebraSymmetricGroupT(QQ, Integer(3), Integer(1))
>>> a = H3([Integer(2),Integer(1),Integer(3)])+Integer(2)*H3([Integer(1),
↪Integer(2),Integer(3)])-H3([Integer(3),Integer(2),Integer(1)])
>>> a**Integer(2) #indirect doctest
6*T[1, 2, 3] + 4*T[2, 1, 3] - T[2, 3, 1]
- T[3, 1, 2] - 4*T[3, 2, 1]
```

```
sage: QS3 = SymmetricGroupAlgebra(QQ, 3)
sage: a = QS3([2,1,3])+2*QS3([1,2,3])-QS3([3,2,1])
sage: a^2
6*[1, 2, 3] + 4*[2, 1, 3] - [2, 3, 1] - [3, 1, 2] - 4*[3, 2, 1]
```

```
>>> from sage.all import *
>>> QS3 = SymmetricGroupAlgebra(QQ, Integer(3))
>>> a = QS3([Integer(2),Integer(1),Integer(3)])+Integer(2)*QS3([Integer(1),
↪Integer(2),Integer(3)])-QS3([Integer(3),Integer(2),Integer(1)])
>>> a**Integer(2)
6*[1, 2, 3] + 4*[2, 1, 3] - [2, 3, 1] - [3, 1, 2] - 4*[3, 2, 1]
```

t(*i*)

Return the element T_i of the Hecke algebra `self`.

EXAMPLES:

```
sage: H3 = HeckeAlgebraSymmetricGroupT(QQ,3)
sage: H3.t(1)
T[2, 1, 3]
```

(continues on next page)

(continued from previous page)

```
sage: H3.t(2)
T[1, 3, 2]
sage: H3.t(0)
Traceback (most recent call last):
...
ValueError: i (= 0) must be between 1 and n-1 (= 2)
```

```
>>> from sage.all import *
>>> H3 = HeckeAlgebraSymmetricGroupT(QQ,Integer(3))
>>> H3.t(Integer(1))
T[2, 1, 3]
>>> H3.t(Integer(2))
T[1, 3, 2]
>>> H3.t(Integer(0))
Traceback (most recent call last):
...
ValueError: i (= 0) must be between 1 and n-1 (= 2)
```

t_action(*a*, *i*)

Return the product $T_i \cdot a$.

EXAMPLES:

```
sage: H3 = HeckeAlgebraSymmetricGroupT(QQ, 3)
sage: a = H3([2,1,3])+2*H3([1,2,3])
sage: H3.t_action(a, 1)
q*T[1, 2, 3] + (q+1)*T[2, 1, 3]
sage: H3.t(1)*a
q*T[1, 2, 3] + (q+1)*T[2, 1, 3]
```

```
>>> from sage.all import *
>>> H3 = HeckeAlgebraSymmetricGroupT(QQ, Integer(3))
>>> a = H3([Integer(2),Integer(1),Integer(3)])+Integer(2)*H3([Integer(1),
↪Integer(2),Integer(3)])
>>> H3.t_action(a, Integer(1))
q*T[1, 2, 3] + (q+1)*T[2, 1, 3]
>>> H3.t(Integer(1))*a
q*T[1, 2, 3] + (q+1)*T[2, 1, 3]
```

t_action_on_basis(*perm*, *i*)

Return the product $T_i \cdot T_{perm}$, where `perm` is a permutation in the symmetric group S_n.

EXAMPLES:

```
sage: H3 = HeckeAlgebraSymmetricGroupT(QQ, 3)
sage: H3.t_action_on_basis(Permutation([2,1,3]), 1)
q*T[1, 2, 3] + (q-1)*T[2, 1, 3]
sage: H3.t_action_on_basis(Permutation([1,2,3]), 1)
T[2, 1, 3]
sage: H3 = HeckeAlgebraSymmetricGroupT(QQ, 3, 1)
sage: H3.t_action_on_basis(Permutation([2,1,3]), 1)
T[1, 2, 3]
```

(continues on next page)

(continued from previous page)

```
sage: H3.t_action_on_basis(Permutation([1,3,2]), 2)
T[1, 2, 3]
```

```
>>> from sage.all import *
>>> H3 = HeckeAlgebraSymmetricGroupT(QQ, Integer(3))
>>> H3.t_action_on_basis(Permutation([Integer(2),Integer(1),Integer(3)]),␣
↪Integer(1))
q*T[1, 2, 3] + (q-1)*T[2, 1, 3]
>>> H3.t_action_on_basis(Permutation([Integer(1),Integer(2),Integer(3)]),␣
↪Integer(1))
T[2, 1, 3]
>>> H3 = HeckeAlgebraSymmetricGroupT(QQ, Integer(3), Integer(1))
>>> H3.t_action_on_basis(Permutation([Integer(2),Integer(1),Integer(3)]),␣
↪Integer(1))
T[1, 2, 3]
>>> H3.t_action_on_basis(Permutation([Integer(1),Integer(3),Integer(2)]),␣
↪Integer(2))
T[1, 2, 3]
```

class sage.combinat.symmetric_group_algebra.**KLCellularBasis**(*SGA*)

Bases: *SGACellularBasis*

The Kazhdan-Lusztig C' basis (at $q = 1$) of the symmetric group algebra realized as a cellular basis

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(GF(3), 5)
sage: KL = SGA.kazhdan_lusztig_cellular_basis()
sage: for la in KL.simple_module_parameterization():
....:     CM = KL.cell_module(la)
....:     print(la, CM.dimension(), CM.simple_module().dimension())
[2, 2, 1] 5 4
[3, 1, 1] 6 6
[3, 2] 5 1
[4, 1] 4 4
[5] 1 1
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(GF(Integer(3)), Integer(5))
>>> KL = SGA.kazhdan_lusztig_cellular_basis()
>>> for la in KL.simple_module_parameterization():
...     CM = KL.cell_module(la)
...     print(la, CM.dimension(), CM.simple_module().dimension())
[2, 2, 1] 5 4
[3, 1, 1] 6 6
[3, 2] 5 1
[4, 1] 4 4
[5] 1 1
```

class sage.combinat.symmetric_group_algebra.**MurphyBasis**(*SGA*)

Bases: *SGACellularBasis*

The Murphy basis of a symmetric group algebra.

Let R be a commutative ring, and let $A = R[S_n]$ denote the group algebra (over R) of S_n. The *Murphy basis* is the basis of A defined as follows. Let S, T be standard tableaux of shape λ. Define T^λ as the standard tableau of shape λ with the first row filled with $1, \ldots, \lambda_1$, the second row $\lambda_1 + 1, \ldots, \lambda_1 + \lambda_2$, and so on. Let $d(S)$ be the unique permutation such that $S = T^\lambda d(S)$ under the natural action. Then the Murphy basis element indexed by S and T is

$$M_{S'T'} = d(S)^{-1} R_\lambda d(T),$$

where S' denotes the conjugate tableau. The Murphy basis is a `cellular basis` of A.

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(GF(3), 5)
sage: M = SGA.murphy_basis()
sage: for la in M.simple_module_parameterization():
....:     CM = M.cell_module(la)
....:     print(la, CM.dimension(), CM.simple_module().dimension())
[2, 2, 1] 5 4
[3, 1, 1] 6 6
[3, 2] 5 1
[4, 1] 4 4
[5] 1 1
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(GF(Integer(3)), Integer(5))
>>> M = SGA.murphy_basis()
>>> for la in M.simple_module_parameterization():
...     CM = M.cell_module(la)
...     print(la, CM.dimension(), CM.simple_module().dimension())
[2, 2, 1] 5 4
[3, 1, 1] 6 6
[3, 2] 5 1
[4, 1] 4 4
[5] 1 1
```

REFERENCES:

- [DJM1998]
- [Mathas2004]

class sage.combinat.symmetric_group_algebra.**SGACellularBasis**(*SGA*)

Bases: `CellularBasis`

A cellular basis of the symmetric group algebra.

one()

Return the element 1 in `self`.

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(GF(3), 4)
sage: M = SGA.murphy_basis()
sage: M.one()
C([4], [[1, 2, 3, 4]], [[1, 2, 3, 4]])
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(GF(Integer(3)), Integer(4))
>>> M = SGA.murphy_basis()
>>> M.one()
C([4], [[1, 2, 3, 4]], [[1, 2, 3, 4]])
```

one_basis()

Return the index of the basis element for the multiplicative identity.

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(GF(3), 4)
sage: M = SGA.murphy_basis()
sage: M.one_basis()
([4], [[1, 2, 3, 4]], [[1, 2, 3, 4]])
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(GF(Integer(3)), Integer(4))
>>> M = SGA.murphy_basis()
>>> M.one_basis()
([4], [[1, 2, 3, 4]], [[1, 2, 3, 4]])
```

sage.combinat.symmetric_group_algebra.**SymmetricGroupAlgebra**(*R*, *W*, *category=None*)

Return the symmetric group algebra of order `W` over the ring `R`.

INPUT:

- `W` – a symmetric group; alternatively an integer n can be provided, as shorthand for `Permutations(n)`.
- `R` – a base ring
- `category` – a category (default: the category of `W`)

This supports several implementations of the symmetric group. At this point this has been tested with `W=Permutations(n)` and `W=SymmetricGroup(n)`.

Warning

Some features are failing in the latter case, in particular if the domain of the symmetric group is not $1, \ldots, n$.

Note

The brave can also try setting `W=WeylGroup(['A',n-1])`, but little support for this currently exists.

EXAMPLES:

```
sage: QS3 = SymmetricGroupAlgebra(QQ, 3); QS3
Symmetric group algebra of order 3 over Rational Field
sage: QS3(1)
[1, 2, 3]
sage: QS3(2)
2*[1, 2, 3]
sage: basis = [QS3(p) for p in Permutations(3)]
```

(continues on next page)

(continued from previous page)

```
sage: a = sum(basis); a
[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1] + [3, 1, 2] + [3, 2, 1]
sage: a^2
6*[1, 2, 3] + 6*[1, 3, 2] + 6*[2, 1, 3] + 6*[2, 3, 1]
+ 6*[3, 1, 2] + 6*[3, 2, 1]
sage: a^2 == 6*a
True
sage: b = QS3([3, 1, 2])
sage: b
[3, 1, 2]
sage: b*a
[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1] + [3, 1, 2] + [3, 2, 1]
sage: b*a == a
True
```

```
>>> from sage.all import *
>>> QS3 = SymmetricGroupAlgebra(QQ, Integer(3)); QS3
Symmetric group algebra of order 3 over Rational Field
>>> QS3(Integer(1))
[1, 2, 3]
>>> QS3(Integer(2))
2*[1, 2, 3]
>>> basis = [QS3(p) for p in Permutations(Integer(3))]
>>> a = sum(basis); a
[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1] + [3, 1, 2] + [3, 2, 1]
>>> a**Integer(2)
6*[1, 2, 3] + 6*[1, 3, 2] + 6*[2, 1, 3] + 6*[2, 3, 1]
+ 6*[3, 1, 2] + 6*[3, 2, 1]
>>> a**Integer(2) == Integer(6)*a
True
>>> b = QS3([Integer(3), Integer(1), Integer(2)])
>>> b
[3, 1, 2]
>>> b*a
[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1] + [3, 1, 2] + [3, 2, 1]
>>> b*a == a
True
```

We now construct the symmetric group algebra by providing explicitly the underlying group:

```
sage: SGA = SymmetricGroupAlgebra(QQ, Permutations(4)); SGA
Symmetric group algebra of order 4 over Rational Field
sage: SGA.group()
Standard permutations of 4
sage: SGA.an_element()
[1, 2, 3, 4] + 2*[1, 2, 4, 3] + 3*[1, 3, 2, 4] + [4, 1, 2, 3]

sage: SGA = SymmetricGroupAlgebra(QQ, SymmetricGroup(4)); SGA
Symmetric group algebra of order 4 over Rational Field
sage: SGA.group()
Symmetric group of order 4! as a permutation group
sage: SGA.an_element()
```

(continues on next page)

(continued from previous page)

```
() + (2,3,4) + 2*(1,3)(2,4) + 3*(1,4)(2,3)

sage: SGA = SymmetricGroupAlgebra(QQ, WeylGroup(["A",3], prefix='s')); SGA
Symmetric group algebra of order 4 over Rational Field
sage: SGA.group()
Weyl Group of type ['A', 3] (as a matrix group acting
on the ambient space)
sage: SGA.an_element()
s1*s2*s3 + ... + 1
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(QQ, Permutations(Integer(4))); SGA
Symmetric group algebra of order 4 over Rational Field
>>> SGA.group()
Standard permutations of 4
>>> SGA.an_element()
[1, 2, 3, 4] + 2*[1, 2, 4, 3] + 3*[1, 3, 2, 4] + [4, 1, 2, 3]

>>> SGA = SymmetricGroupAlgebra(QQ, SymmetricGroup(Integer(4))); SGA
Symmetric group algebra of order 4 over Rational Field
>>> SGA.group()
Symmetric group of order 4! as a permutation group
>>> SGA.an_element()
() + (2,3,4) + 2*(1,3)(2,4) + 3*(1,4)(2,3)

>>> SGA = SymmetricGroupAlgebra(QQ, WeylGroup(["A",Integer(3)], prefix='s')); SGA
Symmetric group algebra of order 4 over Rational Field
>>> SGA.group()
Weyl Group of type ['A', 3] (as a matrix group acting
on the ambient space)
>>> SGA.an_element()
s1*s2*s3 + ... + 1
```

The preferred way to construct the symmetric group algebra is to go through the usual `algebra` method:

```
sage: SGA = Permutations(3).algebra(QQ); SGA
Symmetric group algebra of order 3 over Rational Field
sage: SGA.group()
Standard permutations of 3

sage: SGA = SymmetricGroup(3).algebra(QQ); SGA
Symmetric group algebra of order 3 over Rational Field
sage: SGA.group()
Symmetric group of order 3! as a permutation group
```

```
>>> from sage.all import *
>>> SGA = Permutations(Integer(3)).algebra(QQ); SGA
Symmetric group algebra of order 3 over Rational Field
>>> SGA.group()
Standard permutations of 3

>>> SGA = SymmetricGroup(Integer(3)).algebra(QQ); SGA
```

(continues on next page)

(continued from previous page)

```
Symmetric group algebra of order 3 over Rational Field
>>> SGA.group()
Symmetric group of order 3! as a permutation group
```

The canonical embedding from the symmetric group algebra of order n to the symmetric group algebra of order $p > n$ is available as a coercion:

```
sage: QS3 = SymmetricGroupAlgebra(QQ, 3)
sage: QS4 = SymmetricGroupAlgebra(QQ, 4)
sage: QS4.coerce_map_from(QS3)
Generic morphism:
  From: Symmetric group algebra of order 3 over Rational Field
  To:   Symmetric group algebra of order 4 over Rational Field

sage: x3  = QS3([3,1,2]) + 2 * QS3([2,3,1]); x3
2*[2, 3, 1] + [3, 1, 2]
sage: QS4(x3)
2*[2, 3, 1, 4] + [3, 1, 2, 4]
```

```
>>> from sage.all import *
>>> QS3 = SymmetricGroupAlgebra(QQ, Integer(3))
>>> QS4 = SymmetricGroupAlgebra(QQ, Integer(4))
>>> QS4.coerce_map_from(QS3)
Generic morphism:
  From: Symmetric group algebra of order 3 over Rational Field
  To:   Symmetric group algebra of order 4 over Rational Field

>>> x3  = QS3([Integer(3),Integer(1),Integer(2)]) + Integer(2) * QS3([Integer(2),
↪Integer(3),Integer(1)]); x3
2*[2, 3, 1] + [3, 1, 2]
>>> QS4(x3)
2*[2, 3, 1, 4] + [3, 1, 2, 4]
```

This allows for mixed expressions:

```
sage: x4  = 3 * QS4([3, 1, 4, 2])
sage: x3 + x4
2*[2, 3, 1, 4] + [3, 1, 2, 4] + 3*[3, 1, 4, 2]

sage: QS0 = SymmetricGroupAlgebra(QQ, 0)
sage: QS1 = SymmetricGroupAlgebra(QQ, 1)
sage: x0 = QS0([])
sage: x1 = QS1([1])
sage: x0 * x1
[1]
sage: x3 - (2*x0 + x1) - x4
-3*[1, 2, 3, 4] + 2*[2, 3, 1, 4] + [3, 1, 2, 4] - 3*[3, 1, 4, 2]
```

```
>>> from sage.all import *
>>> x4  = Integer(3) * QS4([Integer(3), Integer(1), Integer(4), Integer(2)])
>>> x3 + x4
2*[2, 3, 1, 4] + [3, 1, 2, 4] + 3*[3, 1, 4, 2]
```

(continues on next page)

(continued from previous page)

```
>>> QS0 = SymmetricGroupAlgebra(QQ, Integer(0))
>>> QS1 = SymmetricGroupAlgebra(QQ, Integer(1))
>>> x0 = QS0([])
>>> x1 = QS1([Integer(1)])
>>> x0 * x1
[1]
>>> x3 - (Integer(2)*x0 + x1) - x4
-3*[1, 2, 3, 4] + 2*[2, 3, 1, 4] + [3, 1, 2, 4] - 3*[3, 1, 4, 2]
```

Caveat: to achieve this, constructing `SymmetricGroupAlgebra(QQ, 10)` currently triggers the construction of all symmetric group algebras of smaller order. Is this a feature we really want to have?

Warning

The semantics of multiplication in symmetric group algebras with index set `Permutations(n)` is determined by the order in which permutations are multiplied, which currently defaults to "in such a way that multiplication is associative with permutations acting on integers from the right", but can be changed to the opposite order at runtime by setting the global variable `Permutations.options['mult']` (see *sage.combinat.permutation.Permutations.options()*). On the other hand, the semantics of multiplication in symmetric group algebras with index set `SymmetricGroup(n)` does not depend on this global variable. (This has the awkward consequence that the coercions between these two sorts of symmetric group algebras do not respect multiplication when this global variable is set to `'r2l'`.) In view of this, it is recommended that code not rely on the usual multiplication function, but rather use the methods *left_action_product()* and *right_action_product()* for multiplying permutations (these methods don't depend on the setting). See Issue #14885 for more information.

We conclude by constructing the algebra of the symmetric group as a monoid algebra:

```
sage: QS3 = SymmetricGroupAlgebra(QQ, 3, category=Monoids())
sage: QS3.category()
Category of finite dimensional cellular monoid algebras
over Rational Field
sage: TestSuite(QS3).run(skip=['_test_construction'])
```

```
>>> from sage.all import *
>>> QS3 = SymmetricGroupAlgebra(QQ, Integer(3), category=Monoids())
>>> QS3.category()
Category of finite dimensional cellular monoid algebras
over Rational Field
>>> TestSuite(QS3).run(skip=['_test_construction'])
```

class sage.combinat.symmetric_group_algebra.**SymmetricGroupAlgebra_n**(*R*, *W*, *category*)

Bases: GroupAlgebra_class

algebra_generators()

Return generators of this group algebra (as algebra) as a list of permutations.

The generators used for the group algebra of S_n are the transposition $(2, 1)$ and the n-cycle $(1, 2, \ldots, n)$, unless $n \leq 1$ (in which case no generators are needed).

EXAMPLES:

```
sage: SymmetricGroupAlgebra(ZZ,5).algebra_generators()
Family ([2, 1, 3, 4, 5], [2, 3, 4, 5, 1])

sage: SymmetricGroupAlgebra(QQ,0).algebra_generators()
Family ()

sage: SymmetricGroupAlgebra(QQ,1).algebra_generators()
Family ()
```

```
>>> from sage.all import *
>>> SymmetricGroupAlgebra(ZZ,Integer(5)).algebra_generators()
Family ([2, 1, 3, 4, 5], [2, 3, 4, 5, 1])

>>> SymmetricGroupAlgebra(QQ,Integer(0)).algebra_generators()
Family ()

>>> SymmetricGroupAlgebra(QQ,Integer(1)).algebra_generators()
Family ()
```

antipode(x)

Return the image of the element `x` of `self` under the antipode of the Hopf algebra `self` (where the comultiplication is the usual one on a group algebra).

Explicitly, this is obtained by replacing each permutation σ by σ^{-1} in `x` while keeping all coefficients as they are.

EXAMPLES:

```
sage: QS4 = SymmetricGroupAlgebra(QQ, 4)
sage: QS4.antipode(2 * QS4([1, 3, 4, 2]) - 1/2 * QS4([1, 4, 2, 3]))
-1/2*[1, 3, 4, 2] + 2*[1, 4, 2, 3]
sage: all( QS4.antipode(QS4(p)) == QS4(p.inverse())
....:      for p in Permutations(4) )
True

sage: ZS3 = SymmetricGroupAlgebra(ZZ, 3)
sage: ZS3.antipode(ZS3.zero())
0
sage: ZS3.antipode(-ZS3(Permutation([2, 3, 1])))
-[3, 1, 2]
```

```
>>> from sage.all import *
>>> QS4 = SymmetricGroupAlgebra(QQ, Integer(4))
>>> QS4.antipode(Integer(2) * QS4([Integer(1), Integer(3), Integer(4),␣
↪Integer(2)]) - Integer(1)/Integer(2) * QS4([Integer(1), Integer(4),␣
↪Integer(2), Integer(3)]))
-1/2*[1, 3, 4, 2] + 2*[1, 4, 2, 3]
>>> all( QS4.antipode(QS4(p)) == QS4(p.inverse())
...      for p in Permutations(Integer(4)) )
True

>>> ZS3 = SymmetricGroupAlgebra(ZZ, Integer(3))
>>> ZS3.antipode(ZS3.zero())
```

(continues on next page)

(continued from previous page)

```
0
>>> ZS3.antipode(-ZS3(Permutation([Integer(2), Integer(3), Integer(1)])))
-[3, 1, 2]
```

binary_unshuffle_sum(k)

Return the k-th binary unshuffle sum in the group algebra `self`.

The k-th binary unshuffle sum in the symmetric group algebra RS_n over a ring R is defined as the sum of all permutations $\sigma \in S_n$ satisfying $\sigma(1) < \sigma(2) < \cdots < \sigma(k)$ and $\sigma(k+1) < \sigma(k+2) < \cdots < \sigma(n)$.

This element has the property that, if it is denoted by t_k, and if the k-th semi-RSW element (see *semi_rsw_element()*) is denoted by s_k, then $s_k S(t_k)$ and $t_k S(s_k)$ both equal the k-th Reiner-Saliola-Welker shuffling element of RS_n (see *rsw_shuffling_element()*).

The k-th binary unshuffle sum is the image of the complete non-commutative symmetric function $S^{(k,n-k)}$ in the ring of non-commutative symmetric functions under the canonical projection on the symmetric group algebra (through the descent algebra).

EXAMPLES:

The binary unshuffle sums on $\mathbf{Q}S_3$:

```
sage: QS3 = SymmetricGroupAlgebra(QQ, 3)
sage: QS3.binary_unshuffle_sum(0)
[1, 2, 3]
sage: QS3.binary_unshuffle_sum(1)
[1, 2, 3] + [2, 1, 3] + [3, 1, 2]
sage: QS3.binary_unshuffle_sum(2)
[1, 2, 3] + [1, 3, 2] + [2, 3, 1]
sage: QS3.binary_unshuffle_sum(3)
[1, 2, 3]
sage: QS3.binary_unshuffle_sum(4)
0
```

```
>>> from sage.all import *
>>> QS3 = SymmetricGroupAlgebra(QQ, Integer(3))
>>> QS3.binary_unshuffle_sum(Integer(0))
[1, 2, 3]
>>> QS3.binary_unshuffle_sum(Integer(1))
[1, 2, 3] + [2, 1, 3] + [3, 1, 2]
>>> QS3.binary_unshuffle_sum(Integer(2))
[1, 2, 3] + [1, 3, 2] + [2, 3, 1]
>>> QS3.binary_unshuffle_sum(Integer(3))
[1, 2, 3]
>>> QS3.binary_unshuffle_sum(Integer(4))
0
```

Let us check the relation with the k-th Reiner-Saliola-Welker shuffling element stated in the docstring:

```
sage: def test_rsw(n):
....:     ZSn = SymmetricGroupAlgebra(ZZ, n)
....:     for k in range(1, n):
....:         a = ZSn.semi_rsw_element(k)
....:         b = ZSn.binary_unshuffle_sum(k)
```

(continues on next page)

(continued from previous page)

```
....:         c = ZSn.left_action_product(a, ZSn.antipode(b))
....:         d = ZSn.left_action_product(b, ZSn.antipode(a))
....:         e = ZSn.rsw_shuffling_element(k)
....:         if c != e or d != e:
....:             return False
....:     return True
sage: test_rsw(3)
True
sage: test_rsw(4)  # long time
True
sage: test_rsw(5)  # long time
True
```

```
>>> from sage.all import *
>>> def test_rsw(n):
...     ZSn = SymmetricGroupAlgebra(ZZ, n)
...     for k in range(Integer(1), n):
...         a = ZSn.semi_rsw_element(k)
...         b = ZSn.binary_unshuffle_sum(k)
...         c = ZSn.left_action_product(a, ZSn.antipode(b))
...         d = ZSn.left_action_product(b, ZSn.antipode(a))
...         e = ZSn.rsw_shuffling_element(k)
...         if c != e or d != e:
...             return False
...     return True
>>> test_rsw(Integer(3))
True
>>> test_rsw(Integer(4))  # long time
True
>>> test_rsw(Integer(5))  # long time
True
```

Let us also check the statement about the complete non-commutative symmetric function:

```
sage: def test_rsw_ncsf(n):
....:     ZSn = SymmetricGroupAlgebra(ZZ, n)
....:     NSym = NonCommutativeSymmetricFunctions(ZZ)
....:     S = NSym.S()
....:     for k in range(1, n):
....:         a = S(Composition([k, n-k])).to_symmetric_group_algebra()
....:         if a != ZSn.binary_unshuffle_sum(k):
....:             return False
....:     return True
sage: test_rsw_ncsf(3)
True
sage: test_rsw_ncsf(4)
True
sage: test_rsw_ncsf(5)  # long time
True
```

```
>>> from sage.all import *
>>> def test_rsw_ncsf(n):
```

(continues on next page)

(continued from previous page)

```
...       ZSn = SymmetricGroupAlgebra(ZZ, n)
...       NSym = NonCommutativeSymmetricFunctions(ZZ)
...       S = NSym.S()
...       for k in range(Integer(1), n):
...           a = S(Composition([k, n-k])).to_symmetric_group_algebra()
...           if a != ZSn.binary_unshuffle_sum(k):
...               return False
...       return True
>>> test_rsw_ncsf(Integer(3))
True
>>> test_rsw_ncsf(Integer(4))
True
>>> test_rsw_ncsf(Integer(5))  # long time
True
```

canonical_embedding(*other*)

Return the canonical coercion of `self` into a symmetric group algebra `other`.

INPUT:

- `other` – a symmetric group algebra with order p satisfying $p \geq n$, where n is the order of `self`, over a ground ring into which the ground ring of `self` coerces.

EXAMPLES:

```
sage: QS2 = SymmetricGroupAlgebra(QQ, 2)
sage: QS4 = SymmetricGroupAlgebra(QQ, 4)
sage: phi = QS2.canonical_embedding(QS4); phi
Generic morphism:
  From: Symmetric group algebra of order 2 over Rational Field
  To:   Symmetric group algebra of order 4 over Rational Field

sage: x = QS2([2,1]) + 2 * QS2([1,2])
sage: phi(x)
2*[1, 2, 3, 4] + [2, 1, 3, 4]

sage: loads(dumps(phi))
Generic morphism:
  From: Symmetric group algebra of order 2 over Rational Field
  To:   Symmetric group algebra of order 4 over Rational Field

sage: ZS2 = SymmetricGroupAlgebra(ZZ, 2)
sage: phi = ZS2.canonical_embedding(QS4); phi
Generic morphism:
  From: Symmetric group algebra of order 2 over Integer Ring
  To:   Symmetric group algebra of order 4 over Rational Field

sage: phi = ZS2.canonical_embedding(QS2); phi
Generic morphism:
  From: Symmetric group algebra of order 2 over Integer Ring
  To:   Symmetric group algebra of order 2 over Rational Field

sage: QS4.canonical_embedding(QS2)
```

(continues on next page)

(continued from previous page)

```
Traceback (most recent call last):
...
ValueError: There is no canonical embedding from Symmetric group
 algebra of order 2 over Rational Field to Symmetric group
 algebra of order 4 over Rational Field

sage: QS4g = SymmetricGroup(4).algebra(QQ)
sage: QS4.canonical_embedding(QS4g)(QS4([1,3,2,4]))
(2,3)
sage: QS4g.canonical_embedding(QS4)(QS4g((2,3)))
[1, 3, 2, 4]
sage: ZS2.canonical_embedding(QS4g)(ZS2([2,1]))
(1,2)
sage: ZS2g = SymmetricGroup(2).algebra(ZZ)
sage: ZS2g.canonical_embedding(QS4)(ZS2g((1,2)))
[2, 1, 3, 4]
```

```
>>> from sage.all import *
>>> QS2 = SymmetricGroupAlgebra(QQ, Integer(2))
>>> QS4 = SymmetricGroupAlgebra(QQ, Integer(4))
>>> phi = QS2.canonical_embedding(QS4); phi
Generic morphism:
  From: Symmetric group algebra of order 2 over Rational Field
  To:   Symmetric group algebra of order 4 over Rational Field

>>> x = QS2([Integer(2),Integer(1)]) + Integer(2) * QS2([Integer(1),
↪Integer(2)])
>>> phi(x)
2*[1, 2, 3, 4] + [2, 1, 3, 4]

>>> loads(dumps(phi))
Generic morphism:
  From: Symmetric group algebra of order 2 over Rational Field
  To:   Symmetric group algebra of order 4 over Rational Field

>>> ZS2 = SymmetricGroupAlgebra(ZZ, Integer(2))
>>> phi = ZS2.canonical_embedding(QS4); phi
Generic morphism:
  From: Symmetric group algebra of order 2 over Integer Ring
  To:   Symmetric group algebra of order 4 over Rational Field

>>> phi = ZS2.canonical_embedding(QS2); phi
Generic morphism:
  From: Symmetric group algebra of order 2 over Integer Ring
  To:   Symmetric group algebra of order 2 over Rational Field

>>> QS4.canonical_embedding(QS2)
Traceback (most recent call last):
...
ValueError: There is no canonical embedding from Symmetric group
 algebra of order 2 over Rational Field to Symmetric group
 algebra of order 4 over Rational Field
```

(continues on next page)

(continued from previous page)

```
>>> QS4g = SymmetricGroup(Integer(4)).algebra(QQ)
>>> QS4.canonical_embedding(QS4g)(QS4([Integer(1),Integer(3),Integer(2),
↪Integer(4)]))
(2,3)
>>> QS4g.canonical_embedding(QS4)(QS4g((Integer(2),Integer(3))))
[1, 3, 2, 4]
>>> ZS2.canonical_embedding(QS4g)(ZS2([Integer(2),Integer(1)]))
(1,2)
>>> ZS2g = SymmetricGroup(Integer(2)).algebra(ZZ)
>>> ZS2g.canonical_embedding(QS4)(ZS2g((Integer(1),Integer(2))))
[2, 1, 3, 4]
```

cell_module(*la*, ***kwds*)

Return the cell module indexed by `la`.

EXAMPLES:

```
sage: S = SymmetricGroupAlgebra(QQ, 3)
sage: M = S.cell_module(Partition([2,1])); M
Cell module indexed by [2, 1] of Cellular basis of
 Symmetric group algebra of order 3 over Rational Field
```

```
>>> from sage.all import *
>>> S = SymmetricGroupAlgebra(QQ, Integer(3))
>>> M = S.cell_module(Partition([Integer(2),Integer(1)])); M
Cell module indexed by [2, 1] of Cellular basis of
 Symmetric group algebra of order 3 over Rational Field
```

We check that the input `la` is standardized:

```
sage: N = S.cell_module([2,1])
sage: M is N
True
```

```
>>> from sage.all import *
>>> N = S.cell_module([Integer(2),Integer(1)])
>>> M is N
True
```

cell_module_indices(*la*)

Return the indices of the cell module of `self` indexed by `la` .

This is the finite set $M(\lambda)$.

EXAMPLES:

```
sage: S = SymmetricGroupAlgebra(QQ, 4)
sage: S.cell_module_indices([3,1])
Standard tableaux of shape [3, 1]
```

```
>>> from sage.all import *
>>> S = SymmetricGroupAlgebra(QQ, Integer(4))
```

(continues on next page)

(continued from previous page)

```
>>> S.cell_module_indices([Integer(3),Integer(1)])
Standard tableaux of shape [3, 1]
```

cell_poset()

Return the cell poset of `self`.

EXAMPLES:

```
sage: S = SymmetricGroupAlgebra(QQ, 4)
sage: S.cell_poset()
Finite poset containing 5 elements
```

```
>>> from sage.all import *
>>> S = SymmetricGroupAlgebra(QQ, Integer(4))
>>> S.cell_poset()
Finite poset containing 5 elements
```

central_orthogonal_idempotent(*la*, *block=True*)

Return the central idempotent for the symmetric group of order n corresponding to the indecomposable block to which the partition `la` is associated.

If `self.base_ring()` contains $\mathbf{Q}$, this corresponds to the classical central idempotent corresponding to the irreducible representation indexed by `la`.

Alternatively, if `self.base_ring()` has characteristic $p > 0$, then Theorem 2.8 in [Mur1983] provides that `la` is associated to an idempotent f_μ, where μ is the p-core of `la`. This f_μ is a sum of classical idempotents,

$$f_\mu = \sum_{c(\lambda)=\mu} e_\lambda,$$

where the sum ranges over the partitions λ of n with p-core equal to μ.

INPUT:

- `la` – a partition of `self.n` or a `self.base_ring().characteristic()`-core of such a partition
- `block` – boolean (default: `True`); when `False`, this returns the classical idempotent associated to `la` (defined over $\mathbf{Q}$)

OUTPUT:

If `block=False` and the corresponding coefficients are not defined over `self.base_ring()`, then return `None`. Otherwise return an element of `self`.

EXAMPLES:

Asking for block idempotents in any characteristic, by passing a partition of `self.n`:

```
sage: S0 = SymmetricGroup(4).algebra(QQ)
sage: S2 = SymmetricGroup(4).algebra(GF(2))
sage: S3 = SymmetricGroup(4).algebra(GF(3))
sage: S0.central_orthogonal_idempotent([2,1,1])
3/8*() - 1/8*(3,4) - 1/8*(2,3) - 1/8*(2,4) - 1/8*(1,2)
 - 1/8*(1,2)(3,4) + 1/8*(1,2,3,4) + 1/8*(1,2,4,3)
 + 1/8*(1,3,4,2) - 1/8*(1,3) - 1/8*(1,3)(2,4)
 + 1/8*(1,3,2,4) + 1/8*(1,4,3,2) - 1/8*(1,4)
 + 1/8*(1,4,2,3) - 1/8*(1,4)(2,3)
```

(continues on next page)

(continued from previous page)

```
sage: S2.central_orthogonal_idempotent([2,1,1])
()
sage: idem = S3.central_orthogonal_idempotent([4]); idem
 () + (1,2)(3,4) + (1,3)(2,4) + (1,4)(2,3)
sage: idem == S3.central_orthogonal_idempotent([1,1,1,1])
True
sage: S3.central_orthogonal_idempotent([2,2])
() + (1,2)(3,4) + (1,3)(2,4) + (1,4)(2,3)
```

```
>>> from sage.all import *
>>> S0 = SymmetricGroup(Integer(4)).algebra(QQ)
>>> S2 = SymmetricGroup(Integer(4)).algebra(GF(Integer(2)))
>>> S3 = SymmetricGroup(Integer(4)).algebra(GF(Integer(3)))
>>> S0.central_orthogonal_idempotent([Integer(2),Integer(1),Integer(1)])
3/8*() - 1/8*(3,4) - 1/8*(2,3) - 1/8*(2,4) - 1/8*(1,2)
 - 1/8*(1,2)(3,4) + 1/8*(1,2,3,4) + 1/8*(1,2,4,3)
 + 1/8*(1,3,4,2) - 1/8*(1,3) - 1/8*(1,3)(2,4)
 + 1/8*(1,3,2,4) + 1/8*(1,4,3,2) - 1/8*(1,4)
 + 1/8*(1,4,2,3) - 1/8*(1,4)(2,3)
>>> S2.central_orthogonal_idempotent([Integer(2),Integer(1),Integer(1)])
()
>>> idem = S3.central_orthogonal_idempotent([Integer(4)]); idem
 () + (1,2)(3,4) + (1,3)(2,4) + (1,4)(2,3)
>>> idem == S3.central_orthogonal_idempotent([Integer(1),Integer(1),
↪Integer(1),Integer(1)])
True
>>> S3.central_orthogonal_idempotent([Integer(2),Integer(2)])
() + (1,2)(3,4) + (1,3)(2,4) + (1,4)(2,3)
```

Asking for block idempotents in any characteristic, by passing p-cores:

```
sage: S0.central_orthogonal_idempotent([1,1])
Traceback (most recent call last):
...
ValueError: [1, 1] is not a partition of integer 4
sage: S2.central_orthogonal_idempotent([])
()
sage: S2.central_orthogonal_idempotent([1])
Traceback (most recent call last):
...
ValueError: the 2-core of [1] is not a 2-core of a partition of 4
sage: S3.central_orthogonal_idempotent([1])
() + (1,2)(3,4) + (1,3)(2,4) + (1,4)(2,3)
sage: S3.central_orthogonal_idempotent([7])
() + (1,2)(3,4) + (1,3)(2,4) + (1,4)(2,3)
```

```
>>> from sage.all import *
>>> S0.central_orthogonal_idempotent([Integer(1),Integer(1)])
Traceback (most recent call last):
...
ValueError: [1, 1] is not a partition of integer 4
>>> S2.central_orthogonal_idempotent([])
```

(continues on next page)

(continued from previous page)

```
()
>>> S2.central_orthogonal_idempotent([Integer(1)])
Traceback (most recent call last):
...
ValueError: the 2-core of [1] is not a 2-core of a partition of 4
>>> S3.central_orthogonal_idempotent([Integer(1)])
() + (1,2)(3,4) + (1,3)(2,4) + (1,4)(2,3)
>>> S3.central_orthogonal_idempotent([Integer(7)])
() + (1,2)(3,4) + (1,3)(2,4) + (1,4)(2,3)
```

Asking for classical idempotents:

```
sage: S3.central_orthogonal_idempotent([2,2], block=False) is None
True
sage: S3.central_orthogonal_idempotent([2,1,1], block=False)
(3,4) + (2,3) + (2,4) + (1,2) + (1,2)(3,4) + 2*(1,2,3,4)
 + 2*(1,2,4,3) + 2*(1,3,4,2) + (1,3) + (1,3)(2,4)
 + 2*(1,3,2,4) + 2*(1,4,3,2) + (1,4) + 2*(1,4,2,3)
 + (1,4)(2,3)
```

```
>>> from sage.all import *
>>> S3.central_orthogonal_idempotent([Integer(2),Integer(2)], block=False) is␣
↪None
True
>>> S3.central_orthogonal_idempotent([Integer(2),Integer(1),Integer(1)],␣
↪block=False)
(3,4) + (2,3) + (2,4) + (1,2) + (1,2)(3,4) + 2*(1,2,3,4)
 + 2*(1,2,4,3) + 2*(1,3,4,2) + (1,3) + (1,3)(2,4)
 + 2*(1,3,2,4) + 2*(1,4,3,2) + (1,4) + 2*(1,4,2,3)
 + (1,4)(2,3)
```

- *sage.combinat.partition.Partition.core()*

central_orthogonal_idempotents()

Return a maximal list of central orthogonal idempotents for `self`.

This method does not require that `self` be semisimple, relying on Nakayama's Conjecture whenever `self.base_ring()` has positive characteristic.

EXAMPLES:

```
sage: QS3 = SymmetricGroupAlgebra(QQ,3)
sage: a = QS3.central_orthogonal_idempotents()
sage: a[0]  # [3]
1/6*[1, 2, 3] + 1/6*[1, 3, 2] + 1/6*[2, 1, 3] + 1/6*[2, 3, 1]
 + 1/6*[3, 1, 2] + 1/6*[3, 2, 1]
sage: a[1]  # [2, 1]
2/3*[1, 2, 3] - 1/3*[2, 3, 1] - 1/3*[3, 1, 2]
```

```
>>> from sage.all import *
>>> QS3 = SymmetricGroupAlgebra(QQ,Integer(3))
>>> a = QS3.central_orthogonal_idempotents()
>>> a[Integer(0)]  # [3]
1/6*[1, 2, 3] + 1/6*[1, 3, 2] + 1/6*[2, 1, 3] + 1/6*[2, 3, 1]
 + 1/6*[3, 1, 2] + 1/6*[3, 2, 1]
>>> a[Integer(1)]  # [2, 1]
2/3*[1, 2, 3] - 1/3*[2, 3, 1] - 1/3*[3, 1, 2]
```

See also

- *central_orthogonal_idempotent()*

dft (*form=None*, *mult='l2r'*)

Return the discrete Fourier transform for `self`.

See [Mur1983] for the construction of central primitive orthogonal idempotents. For each idempotent e_i we have a homomorphic projection $v \mapsto ve_i$. Choose a basis for each submodule spanned by $\{\sigma e_i | \sigma \in S_n\}$. The change-of-basis from the standard basis $\{\sigma\}_\sigma$ is returned.

INPUT:

- `mult` – string (default: $l2r$); if set to $r2l$, this causes the method to use the antipodes (*antipode()*) of the seminormal basis instead of the seminormal basis.
- `form` – string (default: `"modular"` if $p|n!$ else `"seminormal"`); one of the following:
  - `"seminormal"` – use the seminormal basis
  - `"modular"` – use the modular DFT, which uses the Peirce decomposition of the group algebra into blocks with central orthogonal idempotents
  - `"unitary"` – use the unitary DFT, which computes the extended Cholesky decomposition of an S_n-invariant symmetric bilinear form as a change-of-basis matrix (for positive characteristics, it must be a finite field of square order)

EXAMPLES:

The default is the seminormal DFT when the characteristic does not divide the group order:

```
sage: QQ_S3 = SymmetricGroupAlgebra(QQ, 3)
sage: QQ_S3.dft()
[   1    1    1    1    1    1]
[   1  1/2   -1 -1/2 -1/2  1/2]
[   0  3/4    0  3/4 -3/4 -3/4]
[   0    1    0   -1    1   -1]
[   1 -1/2    1 -1/2 -1/2 -1/2]
[   1   -1   -1    1    1   -1]
```

```
>>> from sage.all import *
>>> QQ_S3 = SymmetricGroupAlgebra(QQ, Integer(3))
>>> QQ_S3.dft()
[   1    1    1    1    1    1]
[   1  1/2   -1 -1/2 -1/2  1/2]
[   0  3/4    0  3/4 -3/4 -3/4]
```

(continues on next page)

(continued from previous page)

```
[   0    1    0   -1    1   -1]
[   1 -1/2    1 -1/2 -1/2 -1/2]
[   1   -1   -1    1    1   -1]
```

The unitary form works in characteristic zero:

```
sage: U = QQ_S3.dft(form='unitary'); U
[-1/6*sqrt3*sqrt2 -1/6*sqrt3*sqrt2 -1/6*sqrt3*sqrt2 -1/6*sqrt3*sqrt2 -1/
↪6*sqrt3*sqrt2 -1/6*sqrt3*sqrt2]
[       1/3*sqrt3        1/6*sqrt3       -1/3*sqrt3       -1/6*sqrt3       -1/
↪6*sqrt3        1/6*sqrt3]
[               0              1/2                0              1/2         ␣
↪   -1/2             -1/2]
[               0              1/2                0             -1/2         ␣
↪    1/2             -1/2]
[       1/3*sqrt3       -1/6*sqrt3        1/3*sqrt3       -1/6*sqrt3       -1/
↪6*sqrt3       -1/6*sqrt3]
[-1/6*sqrt3*sqrt2  1/6*sqrt3*sqrt2  1/6*sqrt3*sqrt2 -1/6*sqrt3*sqrt2 -1/
↪6*sqrt3*sqrt2  1/6*sqrt3*sqrt2]
sage: U*U.H == 1
True
```

```
>>> from sage.all import *
>>> U = QQ_S3.dft(form='unitary'); U
[-1/6*sqrt3*sqrt2 -1/6*sqrt3*sqrt2 -1/6*sqrt3*sqrt2 -1/6*sqrt3*sqrt2 -1/
↪6*sqrt3*sqrt2 -1/6*sqrt3*sqrt2]
[       1/3*sqrt3        1/6*sqrt3       -1/3*sqrt3       -1/6*sqrt3       -1/
↪6*sqrt3        1/6*sqrt3]
[               0              1/2                0              1/2         ␣
↪   -1/2             -1/2]
[               0              1/2                0             -1/2         ␣
↪    1/2             -1/2]
[       1/3*sqrt3       -1/6*sqrt3        1/3*sqrt3       -1/6*sqrt3       -1/
↪6*sqrt3       -1/6*sqrt3]
[-1/6*sqrt3*sqrt2  1/6*sqrt3*sqrt2  1/6*sqrt3*sqrt2 -1/6*sqrt3*sqrt2 -1/
↪6*sqrt3*sqrt2  1/6*sqrt3*sqrt2]
>>> U*U.H == Integer(1)
True
```

Over finite fields of square order with characteristic $p > n$, we can perform the unitary DFT:

```
sage: GF25_S3 = SymmetricGroupAlgebra(GF(5**2), 3)
sage: U = GF25_S3.dft(form='unitary'); U
[       1        1        1        1        1        1]
[2*z2 + 4   z2 + 2 3*z2 + 1 4*z2 + 3 4*z2 + 3   z2 + 2]
[       0        2        0        2        3        3]
[       0   z2 + 1        0 4*z2 + 4   z2 + 1 4*z2 + 4]
[2*z2 + 4 4*z2 + 3 2*z2 + 4 4*z2 + 3 4*z2 + 3 4*z2 + 3]
[       1        4        4        1        1        4]
sage: U*U.H == 1
True
```

```
>>> from sage.all import *
>>> GF25_S3 = SymmetricGroupAlgebra(GF(Integer(5)**Integer(2)), Integer(3))
>>> U = GF25_S3.dft(form='unitary'); U
[       1        1        1        1        1        1]
[2*z2 + 4   z2 + 2 3*z2 + 1 4*z2 + 3 4*z2 + 3   z2 + 2]
[       0        2        0        2        3        3]
[       0   z2 + 1        0 4*z2 + 4   z2 + 1 4*z2 + 4]
[2*z2 + 4 4*z2 + 3 2*z2 + 4 4*z2 + 3 4*z2 + 3 4*z2 + 3]
[       1        4        4        1        1        4]
>>> U*U.H == Integer(1)
True
```

Over fields of characteristic $p > 0$ such that $p|n!$, we use the modular Fourier transform (Issue #37751):

```
sage: GF2_S3 = SymmetricGroupAlgebra(GF(2), 3)
sage: GF2_S3.dft()
[1 0 0 0 1 0]
[0 1 0 0 0 1]
[0 0 1 0 0 1]
[0 0 0 1 1 0]
[1 0 0 1 1 0]
[0 1 1 0 0 1]
```

```
>>> from sage.all import *
>>> GF2_S3 = SymmetricGroupAlgebra(GF(Integer(2)), Integer(3))
>>> GF2_S3.dft()
[1 0 0 0 1 0]
[0 1 0 0 0 1]
[0 0 1 0 0 1]
[0 0 0 1 1 0]
[1 0 0 1 1 0]
[0 1 1 0 0 1]
```

epsilon_ik(*itab*, *ktab*, *star=0*, *mult='l2r'*)

Return the seminormal basis element of `self` corresponding to the pair of tableaux `itab` and `ktab` (or restrictions of these tableaux, if the optional variable `star` is set).

INPUT:

- `itab`, `ktab` – two standard tableaux of size n
- `star` – integer (default: 0)
- `mult` – string (default: $l2r$); if set to $r2l$, this causes the method to return the antipode (*antipode()*) of $\epsilon(I, K)$ instead of $\epsilon(I, K)$ itself.

OUTPUT:

The element $\epsilon(I, K)$, where I and K are the tableaux obtained by removing all entries higher than $n -$ star from `itab` and `ktab`, respectively. Here, we are using the notations from *seminormal_basis()*.

EXAMPLES:

```
sage: QS3 = SymmetricGroupAlgebra(QQ, 3)
sage: a = QS3.epsilon_ik([[1,2,3]], [[1,2,3]]); a
1/6*[1, 2, 3] + 1/6*[1, 3, 2] + 1/6*[2, 1, 3] + 1/6*[2, 3, 1] + 1/6*[3, 1, 2]␣
```

(continues on next page)

(continued from previous page)

```
↪+ 1/6*[3, 2, 1]
sage: QS3.dft()*vector(a)
(1, 0, 0, 0, 0, 0)
sage: a = QS3.epsilon_ik([[1,2],[3]], [[1,2],[3]]); a
1/3*[1, 2, 3] - 1/6*[1, 3, 2] + 1/3*[2, 1, 3] - 1/6*[2, 3, 1] - 1/6*[3, 1, 2]␣
↪- 1/6*[3, 2, 1]
sage: QS3.dft()*vector(a)
(0, 0, 0, 0, 1, 0)
```

```
>>> from sage.all import *
>>> QS3 = SymmetricGroupAlgebra(QQ, Integer(3))
>>> a = QS3.epsilon_ik([[Integer(1),Integer(2),Integer(3)]], [[Integer(1),
↪Integer(2),Integer(3)]]); a
1/6*[1, 2, 3] + 1/6*[1, 3, 2] + 1/6*[2, 1, 3] + 1/6*[2, 3, 1] + 1/6*[3, 1, 2]␣
↪+ 1/6*[3, 2, 1]
>>> QS3.dft()*vector(a)
(1, 0, 0, 0, 0, 0)
>>> a = QS3.epsilon_ik([[Integer(1),Integer(2)],[Integer(3)]], [[Integer(1),
↪Integer(2)],[Integer(3)]]); a
1/3*[1, 2, 3] - 1/6*[1, 3, 2] + 1/3*[2, 1, 3] - 1/6*[2, 3, 1] - 1/6*[3, 1, 2]␣
↪- 1/6*[3, 2, 1]
>>> QS3.dft()*vector(a)
(0, 0, 0, 0, 1, 0)
```

Let us take some properties of the seminormal basis listed in the docstring of *seminormal_basis()*, and verify them on the situation of S_3.

First, check the formula

$$\epsilon(T) = \frac{1}{\kappa_{\mathrm{sh}(T)}} \epsilon(\overline{T}) e(T) \epsilon(\overline{T}).$$

In fact:

```
sage: from sage.combinat.symmetric_group_algebra import e
sage: def test_sn1(n):
....:     QSn = SymmetricGroupAlgebra(QQ, n)
....:     QSn1 = SymmetricGroupAlgebra(QQ, n - 1)
....:     for T in StandardTableaux(n):
....:         TT = T.restrict(n-1)
....:         eTT = QSn1.epsilon_ik(TT, TT)
....:         eT = QSn.epsilon_ik(T, T)
....:         kT = prod(T.shape().hooks())
....:         if kT * eT != eTT * e(T) * eTT:
....:             return False
....:     return True
sage: test_sn1(3)
True
sage: test_sn1(4)   # long time
True
```

```
>>> from sage.all import *
>>> from sage.combinat.symmetric_group_algebra import e
```

(continues on next page)

(continued from previous page)

```
>>> def test_sn1(n):
...     QSn = SymmetricGroupAlgebra(QQ, n)
...     QSn1 = SymmetricGroupAlgebra(QQ, n - Integer(1))
...     for T in StandardTableaux(n):
...         TT = T.restrict(n-Integer(1))
...         eTT = QSn1.epsilon_ik(TT, TT)
...         eT = QSn.epsilon_ik(T, T)
...         kT = prod(T.shape().hooks())
...         if kT * eT != eTT * e(T) * eTT:
...             return False
...     return True
>>> test_sn1(Integer(3))
True
>>> test_sn1(Integer(4))    # long time
True
```

Next, we check the identity

$$\epsilon(T,S) = \frac{1}{\kappa_{\mathrm{sh}(T)}} \epsilon(\overline{S}) \pi_{T,S} e(T) \epsilon(\overline{T})$$

which we used to define $\epsilon(T,S)$. In fact:

```
sage: from sage.combinat.symmetric_group_algebra import e
sage: def test_sn2(n):
....:     QSn = SymmetricGroupAlgebra(QQ, n)
....:     mul = QSn.left_action_product
....:     QSn1 = SymmetricGroupAlgebra(QQ, n - 1)
....:     for lam in Partitions(n):
....:         k = prod(lam.hooks())
....:         for T in StandardTableaux(lam):
....:             for S in StandardTableaux(lam):
....:                 TT = T.restrict(n-1)
....:                 SS = S.restrict(n-1)
....:                 eTT = QSn1.epsilon_ik(TT, TT)
....:                 eSS = QSn1.epsilon_ik(SS, SS)
....:                 eTS = QSn.epsilon_ik(T, S)
....:                 piTS = [0] * n
....:                 for (i, j) in T.cells():
....:                     piTS[T[i][j] - 1] = S[i][j]
....:                 piTS = QSn(Permutation(piTS))
....:                 if k * eTS != mul(mul(eSS, piTS), mul(e(T), eTT)):
....:                     return False
....:     return True
sage: test_sn2(3)
True
sage: test_sn2(4)    # long time
True
```

```
>>> from sage.all import *
>>> from sage.combinat.symmetric_group_algebra import e
>>> def test_sn2(n):
...     QSn = SymmetricGroupAlgebra(QQ, n)
```

(continues on next page)

(continued from previous page)

```
...       mul = QSn.left_action_product
...       QSn1 = SymmetricGroupAlgebra(QQ, n - Integer(1))
...       for lam in Partitions(n):
...           k = prod(lam.hooks())
...           for T in StandardTableaux(lam):
...               for S in StandardTableaux(lam):
...                   TT = T.restrict(n-Integer(1))
...                   SS = S.restrict(n-Integer(1))
...                   eTT = QSn1.epsilon_ik(TT, TT)
...                   eSS = QSn1.epsilon_ik(SS, SS)
...                   eTS = QSn.epsilon_ik(T, S)
...                   piTS = [Integer(0)] * n
...                   for (i, j) in T.cells():
...                       piTS[T[i][j] - Integer(1)] = S[i][j]
...                   piTS = QSn(Permutation(piTS))
...                   if k * eTS != mul(mul(eSS, piTS), mul(e(T), eTT)):
...                       return False
...       return True
>>> test_sn2(Integer(3))
True
>>> test_sn2(Integer(4))    # long time
True
```

Let us finally check the identity

$$\epsilon(T,S)\epsilon(U,V) = \delta_{T,V}\epsilon(U,S)$$

In fact:

```
sage: def test_sn3(lam):
....:     n = lam.size()
....:     QSn = SymmetricGroupAlgebra(QQ, n)
....:     mul = QSn.left_action_product
....:     for T in StandardTableaux(lam):
....:         for S in StandardTableaux(lam):
....:             for U in StandardTableaux(lam):
....:                 for V in StandardTableaux(lam):
....:                     lhs = mul(QSn.epsilon_ik(T, S), QSn.epsilon_ik(U,␣
↪V))
....:                     if T == V:
....:                         rhs = QSn.epsilon_ik(U, S)
....:                     else:
....:                         rhs = QSn.zero()
....:                     if rhs != lhs:
....:                         return False
....:     return True
sage: all( test_sn3(lam) for lam in Partitions(3) )
True
sage: all( test_sn3(lam) for lam in Partitions(4) )    # long time
True
```

```
>>> from sage.all import *
>>> def test_sn3(lam):
```

(continues on next page)

(continued from previous page)

```
...      n = lam.size()
...      QSn = SymmetricGroupAlgebra(QQ, n)
...      mul = QSn.left_action_product
...      for T in StandardTableaux(lam):
...          for S in StandardTableaux(lam):
...              for U in StandardTableaux(lam):
...                  for V in StandardTableaux(lam):
...                      lhs = mul(QSn.epsilon_ik(T, S), QSn.epsilon_ik(U, V))
...                      if T == V:
...                          rhs = QSn.epsilon_ik(U, S)
...                      else:
...                          rhs = QSn.zero()
...                      if rhs != lhs:
...                          return False
...      return True
>>> all( test_sn3(lam) for lam in Partitions(Integer(3)) )
True
>>> all( test_sn3(lam) for lam in Partitions(Integer(4)) )    # long time
True
```

garsia_procesi_module(*la*)

Return the *Garsia-Procesi module* of `self` indexed by `la`.

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(GF(2), 6)
sage: SGA.garsia_procesi_module(Partition([2,2,1,1]))
Garsia-Procesi module of shape [2, 2, 1, 1] over Finite Field of size 2
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(GF(Integer(2)), Integer(6))
>>> SGA.garsia_procesi_module(Partition([Integer(2),Integer(2),Integer(1),
↪Integer(1)]))
Garsia-Procesi module of shape [2, 2, 1, 1] over Finite Field of size 2
```

jucys_murphy(*k*)

Return the Jucys-Murphy element J_k (also known as a Young-Jucys-Murphy element) for the symmetric group algebra `self`.

The Jucys-Murphy element J_k in the symmetric group algebra RS_n is defined for every $k \in \{1, 2, \ldots, n\}$ by

$$J_k = (1,k) + (2,k) + \cdots + (k-1,k) \in RS_n,$$

where the addends are transpositions in S_n (regarded as elements of RS_n). We note that there is not a dependence on n, so it is often suppressed in the notation.

EXAMPLES:

```
sage: QS3 = SymmetricGroupAlgebra(QQ, 3)
sage: QS3.jucys_murphy(1)
0
sage: QS3.jucys_murphy(2)
```

(continues on next page)

(continued from previous page)

```
[2, 1, 3]
sage: QS3.jucys_murphy(3)
[1, 3, 2] + [3, 2, 1]

sage: QS4 = SymmetricGroupAlgebra(QQ, 4)
sage: j3 = QS4.jucys_murphy(3); j3
[1, 3, 2, 4] + [3, 2, 1, 4]
sage: j4 = QS4.jucys_murphy(4); j4
[1, 2, 4, 3] + [1, 4, 3, 2] + [4, 2, 3, 1]
sage: j3*j4 == j4*j3
True

sage: QS5 = SymmetricGroupAlgebra(QQ, 5)
sage: QS5.jucys_murphy(4)
[1, 2, 4, 3, 5] + [1, 4, 3, 2, 5] + [4, 2, 3, 1, 5]
```

```
>>> from sage.all import *
>>> QS3 = SymmetricGroupAlgebra(QQ, Integer(3))
>>> QS3.jucys_murphy(Integer(1))
0
>>> QS3.jucys_murphy(Integer(2))
[2, 1, 3]
>>> QS3.jucys_murphy(Integer(3))
[1, 3, 2] + [3, 2, 1]

>>> QS4 = SymmetricGroupAlgebra(QQ, Integer(4))
>>> j3 = QS4.jucys_murphy(Integer(3)); j3
[1, 3, 2, 4] + [3, 2, 1, 4]
>>> j4 = QS4.jucys_murphy(Integer(4)); j4
[1, 2, 4, 3] + [1, 4, 3, 2] + [4, 2, 3, 1]
>>> j3*j4 == j4*j3
True

>>> QS5 = SymmetricGroupAlgebra(QQ, Integer(5))
>>> QS5.jucys_murphy(Integer(4))
[1, 2, 4, 3, 5] + [1, 4, 3, 2, 5] + [4, 2, 3, 1, 5]
```

kazhdan_lusztig_basis_element(*w*)

Return the Kazhdan-Lusztig C'_w basis element at $q = 1$.

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(QQ, 3)
sage: for w in SGA.group():
....:     print(w, SGA.kazhdan_lusztig_basis_element(w))
[1, 2, 3] [1, 2, 3]
[1, 3, 2] [1, 2, 3] + [1, 3, 2]
[2, 1, 3] [1, 2, 3] + [2, 1, 3]
[2, 3, 1] [1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1]
[3, 1, 2] [1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [3, 1, 2]
[3, 2, 1] [1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1] + [3, 1, 2] + [3, 2,␣
↪1]
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(QQ, Integer(3))
>>> for w in SGA.group():
...     print(w, SGA.kazhdan_lusztig_basis_element(w))
[1, 2, 3] [1, 2, 3]
[1, 3, 2] [1, 2, 3] + [1, 3, 2]
[2, 1, 3] [1, 2, 3] + [2, 1, 3]
[2, 3, 1] [1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1]
[3, 1, 2] [1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [3, 1, 2]
[3, 2, 1] [1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1] + [3, 1, 2] + [3, 2,␣
↪1]
```

kazhdan_lusztig_cellular_basis()

Return the Kazhdan-Lusztig basis (at $q = 1$) of `self` as a cellular basis.

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(QQ, 3)
sage: KL = SGA.kazhdan_lusztig_cellular_basis()
sage: KL(SGA.an_element())
C([2, 1], [[1, 2], [3]], [[1, 2], [3]])
 + C([2, 1], [[1, 3], [2]], [[1, 2], [3]])
 + 2*C([2, 1], [[1, 3], [2]], [[1, 3], [2]])
 - 3*C([3], [[1, 2, 3]], [[1, 2, 3]])
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(QQ, Integer(3))
>>> KL = SGA.kazhdan_lusztig_cellular_basis()
>>> KL(SGA.an_element())
C([2, 1], [[1, 2], [3]], [[1, 2], [3]])
 + C([2, 1], [[1, 3], [2]], [[1, 2], [3]])
 + 2*C([2, 1], [[1, 3], [2]], [[1, 3], [2]])
 - 3*C([3], [[1, 2, 3]], [[1, 2, 3]])
```

ladder_idempotent(*la*)

Return the ladder idempotent of `self`.

Let F be a field of characteristic p. The *ladder idempotent* of shape λ is the idempotent of $F[S_n]$ defined as follows. Let T be the *ladder tableau* of shape λ. Let $[T]$ be the set of standard tableaux whose residue sequence is the same as for T. Let α be the sizes of the ladders of λ. Then the ladder idempotent is constructed as

$$\widetilde{e}_\lambda := \frac{1}{\alpha!} \left(\sum_{\sigma \in S_\alpha} \sigma \right) \left(\overline{\sum_{U \in [T]} E_U} \right),$$

where E_{UU} is the *seminormal_basis()* element over $\mathbf{Q}$ and we project the sum to F, S_α is the Young subgroup corresponding to α, and $\alpha! = \alpha_1! \cdots \alpha_k!$.

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(GF(3), 4)
sage: for la in Partitions(SGA.n):
....:     idem = SGA.ladder_idempotent(la)
....:     print(la)
```

(continues on next page)

(continued from previous page)

```
....:     print(idem)
....:     assert idem^2 == idem
[4]
2*[1, 2, 3, 4] + 2*[1, 2, 4, 3] + 2*[2, 1, 3, 4] + 2*[2, 1, 4, 3]
 + 2*[3, 4, 1, 2] + 2*[3, 4, 2, 1] + 2*[4, 3, 1, 2] + 2*[4, 3, 2, 1]
[3, 1]

left_action_product(*left*, *right*)

Return the product of two elements `left` and `right` of `self`, where multiplication is defined in such a way that for two permutations p and q, the product pq is the permutation obtained by first applying q and then applying p. This definition of multiplication is tailored to make multiplication of permutations associative with their action on numbers if permutations are to act on numbers from the left.

EXAMPLES:

```
sage: QS3 = SymmetricGroupAlgebra(QQ, 3)
sage: p1 = Permutation([2, 1, 3])
sage: p2 = Permutation([3, 1, 2])
sage: QS3.left_action_product(QS3(p1), QS3(p2))
[3, 2, 1]
sage: x = QS3([1, 2, 3]) - 2*QS3([1, 3, 2])
sage: y = 1/2 * QS3([3, 1, 2]) + 3*QS3([1, 2, 3])
sage: QS3.left_action_product(x, y)
3*[1, 2, 3] - 6*[1, 3, 2] - [2, 1, 3] + 1/2*[3, 1, 2]
sage: QS3.left_action_product(0, x)
```

(continues on next page)

(continued from previous page)

```
0
```

```
>>> from sage.all import *
>>> QS3 = SymmetricGroupAlgebra(QQ, Integer(3))
>>> p1 = Permutation([Integer(2), Integer(1), Integer(3)])
>>> p2 = Permutation([Integer(3), Integer(1), Integer(2)])
>>> QS3.left_action_product(QS3(p1), QS3(p2))
[3, 2, 1]
>>> x = QS3([Integer(1), Integer(2), Integer(3)]) -␣
↪Integer(2)*QS3([Integer(1), Integer(3), Integer(2)])
>>> y = Integer(1)/Integer(2) * QS3([Integer(3), Integer(1), Integer(2)]) +␣
↪Integer(3)*QS3([Integer(1), Integer(2), Integer(3)])
>>> QS3.left_action_product(x, y)
3*[1, 2, 3] - 6*[1, 3, 2] - [2, 1, 3] + 1/2*[3, 1, 2]
>>> QS3.left_action_product(Integer(0), x)
0
```

The method coerces its input into the algebra `self`:

```
sage: QS4 = SymmetricGroupAlgebra(QQ, 4)
sage: QS4.left_action_product(QS3([1, 2, 3]), QS3([2, 1, 3]))
[2, 1, 3, 4]
sage: QS4.left_action_product(1, Permutation([4, 1, 2, 3]))
[4, 1, 2, 3]
```

```
>>> from sage.all import *
>>> QS4 = SymmetricGroupAlgebra(QQ, Integer(4))
>>> QS4.left_action_product(QS3([Integer(1), Integer(2), Integer(3)]),␣
↪QS3([Integer(2), Integer(1), Integer(3)]))
[2, 1, 3, 4]
>>> QS4.left_action_product(Integer(1), Permutation([Integer(4), Integer(1),␣
↪Integer(2), Integer(3)]))
[4, 1, 2, 3]
```

Warning

Note that coercion presently works from permutations of `n` into the `n`-th symmetric group algebra, and also from all smaller symmetric group algebras into the `n`-th symmetric group algebra, but not from permutations of integers smaller than `n` into the `n`-th symmetric group algebra.

monomial_from_smaller_permutation(*permutation*)

Convert `permutation` into a permutation, possibly extending it to the appropriate size, and return the corresponding basis element of `self`.

EXAMPLES:

```
sage: QS5 = SymmetricGroupAlgebra(QQ, 5)
sage: QS5.monomial_from_smaller_permutation([])
[1, 2, 3, 4, 5]
sage: QS5.monomial_from_smaller_permutation(Permutation([3,1,2]))
```

(continues on next page)

(continued from previous page)

```
[3, 1, 2, 4, 5]
sage: QS5.monomial_from_smaller_permutation([5,3,4,1,2])
[5, 3, 4, 1, 2]
sage: QS5.monomial_from_smaller_permutation(SymmetricGroup(2)((1,2)))
[2, 1, 3, 4, 5]

sage: QS5g = SymmetricGroup(5).algebra(QQ)
sage: QS5g.monomial_from_smaller_permutation([2,1])
(1,2)
```

```
>>> from sage.all import *
>>> QS5 = SymmetricGroupAlgebra(QQ, Integer(5))
>>> QS5.monomial_from_smaller_permutation([])
[1, 2, 3, 4, 5]
>>> QS5.monomial_from_smaller_permutation(Permutation([Integer(3),Integer(1),
↪Integer(2)]))
[3, 1, 2, 4, 5]
>>> QS5.monomial_from_smaller_permutation([Integer(5),Integer(3),Integer(4),
↪Integer(1),Integer(2)])
[5, 3, 4, 1, 2]
>>> QS5.monomial_from_smaller_
↪permutation(SymmetricGroup(Integer(2))((Integer(1),Integer(2))))
[2, 1, 3, 4, 5]

>>> QS5g = SymmetricGroup(Integer(5)).algebra(QQ)
>>> QS5g.monomial_from_smaller_permutation([Integer(2),Integer(1)])
(1,2)
```

murphy_basis()

Return the *Murphy basis* of `self`.

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(QQ, 3)
sage: M = SGA.murphy_basis()
sage: M(SGA.an_element())
-C([1, 1, 1], [[1], [2], [3]], [[1], [2], [3]])
 + C([2, 1], [[1, 2], [3]], [[1, 2], [3]])
 + C([2, 1], [[1, 2], [3]], [[1, 3], [2]])
 + 2*C([2, 1], [[1, 3], [2]], [[1, 2], [3]])
 + 4*C([2, 1], [[1, 3], [2]], [[1, 3], [2]])
 - 3*C([3], [[1, 2, 3]], [[1, 2, 3]])
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(QQ, Integer(3))
>>> M = SGA.murphy_basis()
>>> M(SGA.an_element())
-C([1, 1, 1], [[1], [2], [3]], [[1], [2], [3]])
 + C([2, 1], [[1, 2], [3]], [[1, 2], [3]])
 + C([2, 1], [[1, 2], [3]], [[1, 3], [2]])
 + 2*C([2, 1], [[1, 3], [2]], [[1, 2], [3]])
 + 4*C([2, 1], [[1, 3], [2]], [[1, 3], [2]])
```

(continues on next page)

(continued from previous page)

```
- 3*C([3], [[1, 2, 3]], [[1, 2, 3]])
```

murphy_basis_element(S, T)

Return the Murphy basis element indexed by `S` and `T`.

See also

MurphyBasis

EXAMPLES:

```
sage: import itertools
sage: SGA = SymmetricGroupAlgebra(QQ, 3)
sage: for S, T in itertools.product(StandardTableaux([2,1]), repeat=2):
....:     print(S, T, SGA.murphy_basis_element(S, T))
[[1, 3], [2]] [[1, 3], [2]] [1, 2, 3] + [2, 1, 3]
[[1, 3], [2]] [[1, 2], [3]] [1, 3, 2] + [3, 1, 2]
[[1, 2], [3]] [[1, 3], [2]] [1, 3, 2] + [2, 3, 1]
[[1, 2], [3]] [[1, 2], [3]] [1, 2, 3] + [3, 2, 1]
```

```
>>> from sage.all import *
>>> import itertools
>>> SGA = SymmetricGroupAlgebra(QQ, Integer(3))
>>> for S, T in itertools.product(StandardTableaux([Integer(2),Integer(1)]),␣
↪repeat=Integer(2)):
...     print(S, T, SGA.murphy_basis_element(S, T))
[[1, 3], [2]] [[1, 3], [2]] [1, 2, 3] + [2, 1, 3]
[[1, 3], [2]] [[1, 2], [3]] [1, 3, 2] + [3, 1, 2]
[[1, 2], [3]] [[1, 3], [2]] [1, 3, 2] + [2, 3, 1]
[[1, 2], [3]] [[1, 2], [3]] [1, 2, 3] + [3, 2, 1]
```

retract_direct_product(f, m)

Return the direct-product retract of the element $f \in RS_n$ to RS_m, where $m \leq n$ (and where RS_n is `self`).

If m is a nonnegative integer less or equal to n, then the direct-product retract from S_n to S_m is defined as an R-linear map $S_n \to S_m$ which sends every permutation $p \in S_n$ to

$$\begin{cases} \operatorname{dret}(p) & \text{if } \operatorname{dret}(p) \text{ is defined;} \\ 0 & \text{otherwise} \end{cases}.$$

Here $\operatorname{dret}(p)$ denotes the direct-product retract of the permutation p to S_m, which is defined in *retract_direct_product()*.

EXAMPLES:

```
sage: SGA3 = SymmetricGroupAlgebra(QQ, 3)
sage: SGA3.retract_direct_product(2*SGA3([1,2,3]) - 4*SGA3([2,1,3]) +␣
↪7*SGA3([1,3,2]), 2)
2*[1, 2] - 4*[2, 1]
sage: SGA3.retract_direct_product(2*SGA3([1,3,2]) - 5*SGA3([2,3,1]), 2)
0
```

(continues on next page)

(continued from previous page)

```
sage: SGA5 = SymmetricGroupAlgebra(QQ, 5)

retract_plain(), *retract_okounkov_vershik()*

retract_okounkov_vershik(f, m)

Return the Okounkov-Vershik retract of the element $f \in RS_n$ to RS_m, where $m \leq n$ (and where RS_n is `self`).

If m is a nonnegative integer less or equal to n, then the Okounkov-Vershik retract from S_n to S_m is defined as an R-linear map $S_n \to S_m$ which sends every permutation $p \in S_n$ to the Okounkov-Vershik retract of the permutation p to S_m, which is defined in *retract_okounkov_vershik()*.

EXAMPLES:

```
sage: SGA3 = SymmetricGroupAlgebra(QQ, 3)
sage: SGA3.retract_okounkov_vershik(2*SGA3([1,2,3]) - 4*SGA3([2,1,3]) +␣

retract_plain(), *retract_direct_product()*

retract_plain(f, m)

Return the plain retract of the element $f \in RS_n$ to RS_m, where $m \leq n$ (and where RS_n is `self`).

If m is a nonnegative integer less or equal to n, then the plain retract from S_n to S_m is defined as an R-linear map $S_n \to S_m$ which sends every permutation $p \in S_n$ to

$$\begin{cases} \mathrm{pret}(p) & \text{if } \mathrm{pret}(p) \text{ is defined;} \\ 0 & \text{otherwise} \end{cases}.$$

Here $\mathrm{pret}(p)$ denotes the plain retract of the permutation p to S_m, which is defined in *retract_plain()*.

EXAMPLES:

```
sage: SGA3 = SymmetricGroupAlgebra(QQ, 3)
sage: SGA3.retract_plain(2*SGA3([1,2,3]) - 4*SGA3([2,1,3]) + 7*SGA3([1,3,2]),␣
↪2)
2*[1, 2] - 4*[2, 1]
sage: SGA3.retract_plain(2*SGA3([1,3,2]) - 5*SGA3([2,3,1]), 2)
0

sage: SGA5 = SymmetricGroupAlgebra(QQ, 5)
sage: SGA5.retract_plain(8*SGA5([1,4,2,5,3]) - 6*SGA5([1,3,2,5,4]) +␣
↪11*SGA5([3,2,1,4,5]), 4)

↪Integer(4),Integer(5)]) - Integer(6)*SGA5([Integer(1),Integer(3),Integer(2),
↪Integer(4),Integer(5)]), Integer(0))
8*[]
```

See also

retract_direct_product(), *retract_okounkov_vershik()*

right_action_product(*left*, *right*)

Return the product of two elements `left` and `right` of `self`, where multiplication is defined in such a way that for two permutations p and q, the product pq is the permutation obtained by first applying p and then applying q. This definition of multiplication is tailored to make multiplication of permutations associative

with their action on numbers if permutations are to act on numbers from the right.

EXAMPLES:

```
sage: QS3 = SymmetricGroupAlgebra(QQ, 3)
sage: p1 = Permutation([2, 1, 3])
sage: p2 = Permutation([3, 1, 2])
sage: QS3.right_action_product(QS3(p1), QS3(p2))
[1, 3, 2]
sage: x = QS3([1, 2, 3]) - 2*QS3([1, 3, 2])
sage: y = 1/2 * QS3([3, 1, 2]) + 3*QS3([1, 2, 3])
sage: QS3.right_action_product(x, y)
3*[1, 2, 3] - 6*[1, 3, 2] + 1/2*[3, 1, 2] - [3, 2, 1]
sage: QS3.right_action_product(0, x)
0
```

```
>>> from sage.all import *
>>> QS3 = SymmetricGroupAlgebra(QQ, Integer(3))
>>> p1 = Permutation([Integer(2), Integer(1), Integer(3)])
>>> p2 = Permutation([Integer(3), Integer(1), Integer(2)])
>>> QS3.right_action_product(QS3(p1), QS3(p2))
[1, 3, 2]
>>> x = QS3([Integer(1), Integer(2), Integer(3)]) -␣
↪Integer(2)*QS3([Integer(1), Integer(3), Integer(2)])
>>> y = Integer(1)/Integer(2) * QS3([Integer(3), Integer(1), Integer(2)]) +␣
↪Integer(3)*QS3([Integer(1), Integer(2), Integer(3)])
>>> QS3.right_action_product(x, y)
3*[1, 2, 3] - 6*[1, 3, 2] + 1/2*[3, 1, 2] - [3, 2, 1]
>>> QS3.right_action_product(Integer(0), x)
0
```

The method coerces its input into the algebra `self`:

```
sage: QS4 = SymmetricGroupAlgebra(QQ, 4)
sage: QS4.right_action_product(QS3([1, 2, 3]), QS3([2, 1, 3]))
[2, 1, 3, 4]
sage: QS4.right_action_product(1, Permutation([4, 1, 2, 3]))
[4, 1, 2, 3]
```

```
>>> from sage.all import *
>>> QS4 = SymmetricGroupAlgebra(QQ, Integer(4))
>>> QS4.right_action_product(QS3([Integer(1), Integer(2), Integer(3)]),␣
↪QS3([Integer(2), Integer(1), Integer(3)]))
[2, 1, 3, 4]
>>> QS4.right_action_product(Integer(1), Permutation([Integer(4), Integer(1),␣
↪Integer(2), Integer(3)]))
[4, 1, 2, 3]
```

Warning

Note that coercion presently works from permutations of `n` into the `n`-th symmetric group algebra, and also from all smaller symmetric group algebras into the `n`-th symmetric group algebra, but not from permutations of integers smaller than `n` into the `n`-th symmetric group algebra.

rsw_shuffling_element(k)

Return the k-th Reiner-Saliola-Welker shuffling element in the group algebra `self`.

The k-th Reiner-Saliola-Welker shuffling element in the symmetric group algebra RS_n over a ring R is defined as the sum $\sum_{\sigma \in S_n} \mathrm{noninv}_k(\sigma) \cdot \sigma$, where for every permutation σ, the number $\mathrm{noninv}_k(\sigma)$ is the number of all k-noninversions of σ (that is, the number of all k-element subsets of $\{1, 2, \ldots, n\}$ on which σ restricts to a strictly increasing map). See *sage.combinat.permutation.Permutation.number_of_noninversions()* for the noninv map.

This element is more or less the operator $\nu_{k,1^{n-k}}$ introduced in [RSW2011]; more precisely, $\nu_{k,1^{n-k}}$ is the left multiplication by this element.

It is a nontrivial theorem (Theorem 1.1 in [RSW2011]) that the operators $\nu_{k,1^{n-k}}$ (for fixed n and varying k) pairwise commute. It is a conjecture (Conjecture 1.2 in [RSW2011]) that all their eigenvalues are integers (which, in light of their commutativity and easily established symmetry, yields that they can be simultaneously diagonalized over $\mathbf{Q}$ with only integer eigenvalues).

EXAMPLES:

The Reiner-Saliola-Welker shuffling elements on $\mathbf{Q}S_3$:

```
sage: QS3 = SymmetricGroupAlgebra(QQ, 3)
sage: QS3.rsw_shuffling_element(0)
[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1] + [3, 1, 2] + [3, 2, 1]
sage: QS3.rsw_shuffling_element(1)
3*[1, 2, 3] + 3*[1, 3, 2] + 3*[2, 1, 3] + 3*[2, 3, 1] + 3*[3, 1, 2] + 3*[3, 2,
↪ 1]
sage: QS3.rsw_shuffling_element(2)
3*[1, 2, 3] + 2*[1, 3, 2] + 2*[2, 1, 3] + [2, 3, 1] + [3, 1, 2]
sage: QS3.rsw_shuffling_element(3)
[1, 2, 3]
sage: QS3.rsw_shuffling_element(4)
0
```

```
>>> from sage.all import *
>>> QS3 = SymmetricGroupAlgebra(QQ, Integer(3))
>>> QS3.rsw_shuffling_element(Integer(0))
[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1] + [3, 1, 2] + [3, 2, 1]
>>> QS3.rsw_shuffling_element(Integer(1))
3*[1, 2, 3] + 3*[1, 3, 2] + 3*[2, 1, 3] + 3*[2, 3, 1] + 3*[3, 1, 2] + 3*[3, 2,
↪ 1]
>>> QS3.rsw_shuffling_element(Integer(2))
3*[1, 2, 3] + 2*[1, 3, 2] + 2*[2, 1, 3] + [2, 3, 1] + [3, 1, 2]
>>> QS3.rsw_shuffling_element(Integer(3))
[1, 2, 3]
>>> QS3.rsw_shuffling_element(Integer(4))
0
```

Checking the commutativity of Reiner-Saliola-Welker shuffling elements (we leave out the ones for which it is trivial):

```
sage: def test_rsw_comm(n):
....:     QSn = SymmetricGroupAlgebra(QQ, n)
....:     rsws = [QSn.rsw_shuffling_element(k) for k in range(2, n)]
....:     return all(ri * rsws[j] == rsws[j] * ri
....:                for i, ri in enumerate(rsws) for j in range(i))
```

(continues on next page)

(continued from previous page)

```
sage: test_rsw_comm(3)
True
sage: test_rsw_comm(4)    # long time
True
sage: test_rsw_comm(5)    # not tested
True
```

```
>>> from sage.all import *
>>> def test_rsw_comm(n):
...     QSn = SymmetricGroupAlgebra(QQ, n)
...     rsws = [QSn.rsw_shuffling_element(k) for k in range(Integer(2), n)]
...     return all(ri * rsws[j] == rsws[j] * ri
...                for i, ri in enumerate(rsws) for j in range(i))
>>> test_rsw_comm(Integer(3))
True
>>> test_rsw_comm(Integer(4))    # long time
True
>>> test_rsw_comm(Integer(5))    # not tested
True
```

Note

For large `k` (relative to `n`), it might be faster to call `QSn.left_action_product(QSn.semi_rsw_element(k), QSn.antipode(binary_unshuffle_sum(k)))` than `QSn.rsw_shuffling_element(n)`.

See also

semi_rsw_element(), binary_unshuffle_sum()

semi_rsw_element(k)

Return the k-th semi-RSW element in the group algebra `self`.

The k-th semi-RSW element in the symmetric group algebra RS_n over a ring R is defined as the sum of all permutations $\sigma \in S_n$ satisfying $\sigma(1) < \sigma(2) < \cdots < \sigma(k)$.

This element has the property that, if it is denoted by s_k, then $s_k S(s_k)$ is $(n-k)!$ times the k-th Reiner-Saliola-Welker shuffling element of RS_n (see *rsw_shuffling_element()*). Here, S denotes the antipode of the group algebra RS_n.

The k-th semi-RSW element is the image of the complete non-commutative symmetric function $S^{(k,1^{n-k})}$ in the ring of non-commutative symmetric functions under the canonical projection on the symmetric group algebra (through the descent algebra).

EXAMPLES:

The semi-RSW elements on $\mathbf{Q}S_3$:

```
sage: QS3 = SymmetricGroupAlgebra(QQ, 3)
sage: QS3.semi_rsw_element(0)
[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1] + [3, 1, 2] + [3, 2, 1]
```

(continues on next page)

(continued from previous page)

```
sage: QS3.semi_rsw_element(1)
[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1] + [3, 1, 2] + [3, 2, 1]
sage: QS3.semi_rsw_element(2)
[1, 2, 3] + [1, 3, 2] + [2, 3, 1]
sage: QS3.semi_rsw_element(3)
[1, 2, 3]
sage: QS3.semi_rsw_element(4)
0
```

```
>>> from sage.all import *
>>> QS3 = SymmetricGroupAlgebra(QQ, Integer(3))
>>> QS3.semi_rsw_element(Integer(0))
[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1] + [3, 1, 2] + [3, 2, 1]
>>> QS3.semi_rsw_element(Integer(1))
[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1] + [3, 1, 2] + [3, 2, 1]
>>> QS3.semi_rsw_element(Integer(2))
[1, 2, 3] + [1, 3, 2] + [2, 3, 1]
>>> QS3.semi_rsw_element(Integer(3))
[1, 2, 3]
>>> QS3.semi_rsw_element(Integer(4))
0
```

Let us check the relation with the k-th Reiner-Saliola-Welker shuffling element stated in the docstring:

```
sage: def test_rsw(n):
....:     ZSn = SymmetricGroupAlgebra(ZZ, n)
....:     for k in range(1, n):
....:         a = ZSn.semi_rsw_element(k)
....:         b = ZSn.left_action_product(a, ZSn.antipode(a))
....:         if factorial(n-k) * ZSn.rsw_shuffling_element(k) != b:
....:             return False
....:     return True
sage: test_rsw(3)
True
sage: test_rsw(4)
True
sage: test_rsw(5)  # long time
True
```

```
>>> from sage.all import *
>>> def test_rsw(n):
...     ZSn = SymmetricGroupAlgebra(ZZ, n)
...     for k in range(Integer(1), n):
...         a = ZSn.semi_rsw_element(k)
...         b = ZSn.left_action_product(a, ZSn.antipode(a))
...         if factorial(n-k) * ZSn.rsw_shuffling_element(k) != b:
...             return False
...     return True
>>> test_rsw(Integer(3))
True
>>> test_rsw(Integer(4))
True
```

(continues on next page)

(continued from previous page)

```
>>> test_rsw(Integer(5))  # long time
True
```

Let us also check the statement about the complete non-commutative symmetric function:

```
sage: def test_rsw_ncsf(n):
....:     ZSn = SymmetricGroupAlgebra(ZZ, n)
....:     NSym = NonCommutativeSymmetricFunctions(ZZ)
....:     S = NSym.S()
....:     for k in range(1, n):
....:         a = S(Composition([k] + [1]*(n-k))).to_symmetric_group_algebra()
....:         if a != ZSn.semi_rsw_element(k):
....:             return False
....:     return True
sage: test_rsw_ncsf(3)
True
sage: test_rsw_ncsf(4)
True
sage: test_rsw_ncsf(5)  # long time
True
```

```
>>> from sage.all import *
>>> def test_rsw_ncsf(n):
...     ZSn = SymmetricGroupAlgebra(ZZ, n)
...     NSym = NonCommutativeSymmetricFunctions(ZZ)
...     S = NSym.S()
...     for k in range(Integer(1), n):
...         a = S(Composition([k] + [Integer(1)]*(n-k))).to_symmetric_group_
↪algebra()
...         if a != ZSn.semi_rsw_element(k):
...             return False
...     return True
>>> test_rsw_ncsf(Integer(3))
True
>>> test_rsw_ncsf(Integer(4))
True
>>> test_rsw_ncsf(Integer(5))  # long time
True
```

seminormal_basis(*mult='l2r'*)

Return a list of the seminormal basis elements of `self`.

The seminormal basis of a symmetric group algebra is defined as follows:

Let n be a nonnegative integer. Let R be a $\mathbf{Q}$-algebra. In the following, we will use the "left action" convention for multiplying permutations. This means that for all permutations p and q in S_n, the product pq is defined in such a way that $(pq)(i) = p(q(i))$ for each $i \in \{1, 2, \ldots, n\}$ (this is the same convention as in *left_action_product()*, but not the default semantics of the $*$ operator on permutations in Sage). Thus, for instance, $s_2 s_1$ is the permutation obtained by first transposing 1 with 2 and then transposing 2 with 3 (where $s_i = (i, i+1)$).

For every partition λ of n, let

$$\kappa_\lambda = \frac{n!}{f^\lambda}$$

where f^λ is the number of standard Young tableaux of shape λ. Note that κ_λ is an integer, namely the product of all hook lengths of λ (by the hook length formula). In Sage, this integer can be computed by using `sage.combinat.symmetric_group_algebra.kappa()`.

Let T be a standard tableau of size n.

Let $a(T)$ denote the formal sum (in RS_n) of all permutations in S_n which stabilize the rows of T (as sets), i. e., which map each entry i of T to an entry in the same row as i. (See `sage.combinat.symmetric_group_algebra.a()` for an implementation of this.)

Let $b(T)$ denote the signed formal sum (in RS_n) of all permutations in S_n which stabilize the columns of T (as sets). Here, "signed" means that each permutation is multiplied with its sign. (This is implemented in `sage.combinat.symmetric_group_algebra.b()`.)

Define an element $e(T)$ of RS_n to be $a(T)b(T)$. (This is implemented in `sage.combinat.symmetric_group_algebra.e()` for $R = \mathbf{Q}$.)

Let $\mathrm{sh}(T)$ denote the shape of T. (See `shape()`.)

Let $\overline{T}$ denote the standard tableau of size $n-1$ obtained by removing the letter n (along with its cell) from T (if $n \geq 1$).

Now, we define an element $\epsilon(T)$ of RS_n. We define it by induction on the size n of T, so we set $\epsilon(\emptyset) = 1$ and only need to define $\epsilon(T)$ for $n \geq 1$, assuming that $\epsilon(\overline{T})$ is already defined. We do this by setting

$$\epsilon(T) = \frac{1}{\kappa_{\mathrm{sh}(T)}} \epsilon(\overline{T}) e(T) \epsilon(\overline{T}).$$

This element $\epsilon(T)$ is implemented as `sage.combinat.symmetric_group_algebra.epsilon()` for $R = \mathbf{Q}$, but it is also a particular case of the elements $\epsilon(T, S)$ defined below.

Now let S be a further tableau of the same shape as T (possibly equal to T). Let $\pi_{T,S}$ denote the permutation in S_n such that applying this permutation to the entries of T yields the tableau S. Define an element $\epsilon(T, S)$ of RS_n by

$$\epsilon(T, S) = \frac{1}{\kappa_{\mathrm{sh}(T)}} \epsilon(\overline{S}) \pi_{T,S} e(T) \epsilon(\overline{T}) = \frac{1}{\kappa_{\mathrm{sh}(T)}} \epsilon(\overline{S}) a(S) \pi_{T,S} b(T) \epsilon(\overline{T}).$$

This element $\epsilon(T, S)$ is called *Young's seminormal unit corresponding to the bitableau `(T, S)`*, and is the return value of `epsilon_ik()` applied to `T` and `S`. Note that $\epsilon(T, T) = \epsilon(T)$.

If we let λ run through all partitions of n, and (T, S) run through all pairs of tableaux of shape λ, then the elements $\epsilon(T, S)$ form a basis of RS_n. This basis is called *Young's seminormal basis* and has the properties that

$$\epsilon(T, S) \epsilon(U, V) = \delta_{T,V} \epsilon(U, S)$$

(where δ stands for the Kronecker delta).

Warning

Because of our convention, we are multiplying our elements in reverse of those given in some papers, for example [Ram1997]. Using the other convention of multiplying permutations, we would instead have $\epsilon(U, V)\epsilon(T, S) = \delta_{T,V}\epsilon(U, S)$.

In other words, Young's seminormal basis consists of the matrix units in a (particular) Artin-Wedderburn decomposition of RS_n into a direct product of matrix algebras over $\mathbf{Q}$.

The output of `seminormal_basis()` is a list of all elements of the seminormal basis of `self`.

INPUT:

- `mult` – string (default: `'l2r'`); if set to `'r2l'`, this causes the method to return the list of the antipodes (*antipode()*) of all $\epsilon(T, S)$ instead of the $\epsilon(T, S)$ themselves.

EXAMPLES:

```
sage: QS3 = SymmetricGroupAlgebra(QQ,3)
sage: QS3.seminormal_basis()
[1/6*[1, 2, 3] + 1/6*[1, 3, 2] + 1/6*[2, 1, 3] + 1/6*[2, 3, 1] + 1/6*[3, 1,␣
↪2] + 1/6*[3, 2, 1],
1/3*[1, 2, 3] + 1/6*[1, 3, 2] - 1/3*[2, 1, 3] - 1/6*[2, 3, 1] - 1/6*[3, 1, 2]␣
↪+ 1/6*[3, 2, 1],
1/3*[1, 3, 2] + 1/3*[2, 3, 1] - 1/3*[3, 1, 2] - 1/3*[3, 2, 1],
1/4*[1, 3, 2] - 1/4*[2, 3, 1] + 1/4*[3, 1, 2] - 1/4*[3, 2, 1],
1/3*[1, 2, 3] - 1/6*[1, 3, 2] + 1/3*[2, 1, 3] - 1/6*[2, 3, 1] - 1/6*[3, 1, 2]␣
↪- 1/6*[3, 2, 1],
1/6*[1, 2, 3] - 1/6*[1, 3, 2] - 1/6*[2, 1, 3] + 1/6*[2, 3, 1] + 1/6*[3, 1, 2]␣
↪- 1/6*[3, 2, 1]]
```

```
>>> from sage.all import *
>>> QS3 = SymmetricGroupAlgebra(QQ,Integer(3))
>>> QS3.seminormal_basis()
[1/6*[1, 2, 3] + 1/6*[1, 3, 2] + 1/6*[2, 1, 3] + 1/6*[2, 3, 1] + 1/6*[3, 1,␣
↪2] + 1/6*[3, 2, 1],
1/3*[1, 2, 3] + 1/6*[1, 3, 2] - 1/3*[2, 1, 3] - 1/6*[2, 3, 1] - 1/6*[3, 1, 2]␣
↪+ 1/6*[3, 2, 1],
1/3*[1, 3, 2] + 1/3*[2, 3, 1] - 1/3*[3, 1, 2] - 1/3*[3, 2, 1],
1/4*[1, 3, 2] - 1/4*[2, 3, 1] + 1/4*[3, 1, 2] - 1/4*[3, 2, 1],
1/3*[1, 2, 3] - 1/6*[1, 3, 2] + 1/3*[2, 1, 3] - 1/6*[2, 3, 1] - 1/6*[3, 1, 2]␣
↪- 1/6*[3, 2, 1],
1/6*[1, 2, 3] - 1/6*[1, 3, 2] - 1/6*[2, 1, 3] + 1/6*[2, 3, 1] + 1/6*[3, 1, 2]␣
↪- 1/6*[3, 2, 1]]
```

simple_module(*la*)

Return the simple module of `self` indexed by the partition `la`.

Over a field of characteristic 0, this simply returns the Specht module.

See also

sage.combinat.specht_module.SimpleModule

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(GF(3), 5)
sage: D = SGA.simple_module(Partition([3,1,1]))
sage: D
Simple module of [3, 1, 1] over Finite Field of size 3
sage: D.brauer_character()
(6, 0, -2, 0, 1)
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(GF(Integer(3)), Integer(5))
>>> D = SGA.simple_module(Partition([Integer(3),Integer(1),Integer(1)]))
```

(continues on next page)

(continued from previous page)

```
>>> D
Simple module of [3, 1, 1] over Finite Field of size 3
>>> D.brauer_character()
(6, 0, -2, 0, 1)
```

simple_module_dimension(*la*)

Return the dimension of the simple module of `self` indexed by the partition `la`.

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(GF(5), 6)
sage: SGA.simple_module_dimension(Partition([4,1,1]))
10
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(GF(Integer(5)), Integer(6))
>>> SGA.simple_module_dimension(Partition([Integer(4),Integer(1),Integer(1)]))
10
```

simple_module_parameterization()

Return a parameterization of the simple modules of `self`.

The symmetric group algebra of S_n over a field of characteristic p has its simple modules indexed by all p-regular partitions of n.

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(QQ, 6)
sage: SGA.simple_module_parameterization()
Partitions of the integer 6

sage: SGA = SymmetricGroupAlgebra(GF(2), 6)
sage: SGA.simple_module_parameterization()
2-Regular Partitions of the integer 6
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(QQ, Integer(6))
>>> SGA.simple_module_parameterization()
Partitions of the integer 6

>>> SGA = SymmetricGroupAlgebra(GF(Integer(2)), Integer(6))
>>> SGA.simple_module_parameterization()
2-Regular Partitions of the integer 6
```

specht_module(*D*)

Return the Specht module of `self` indexed by the diagram `D`.

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(QQ, 5)
sage: SM = SGA.specht_module(Partition([3,1,1]))
sage: SM
Specht module of [3, 1, 1] over Rational Field
```

(continues on next page)

(continued from previous page)

```
sage: SM.frobenius_image()
s[3, 1, 1]

sage: SM = SGA.specht_module([(1,1),(1,3),(2,2),(3,1),(3,2)])
sage: SM
Specht module of [(1, 1), (1, 3), (2, 2), (3, 1), (3, 2)] over Rational Field
sage: SM.frobenius_image()
s[2, 2, 1] + s[3, 1, 1] + s[3, 2]
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(QQ, Integer(5))
>>> SM = SGA.specht_module(Partition([Integer(3),Integer(1),Integer(1)]))
>>> SM
Specht module of [3, 1, 1] over Rational Field
>>> SM.frobenius_image()
s[3, 1, 1]

>>> SM = SGA.specht_module([(Integer(1),Integer(1)),(Integer(1),Integer(3)),
↪(Integer(2),Integer(2)),(Integer(3),Integer(1)),(Integer(3),Integer(2))])
>>> SM
Specht module of [(1, 1), (1, 3), (2, 2), (3, 1), (3, 2)] over Rational Field
>>> SM.frobenius_image()
s[2, 2, 1] + s[3, 1, 1] + s[3, 2]
```

specht_module_dimension(*D*)

Return the dimension of the Specht module of `self` indexed by `D`.

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(QQ, 5)
sage: SGA.specht_module_dimension(Partition([3,1,1]))
6
sage: SGA.specht_module_dimension([(1,1),(1,3),(2,2),(3,1),(3,2)])
16
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(QQ, Integer(5))
>>> SGA.specht_module_dimension(Partition([Integer(3),Integer(1),Integer(1)]))
6
>>> SGA.specht_module_dimension([(Integer(1),Integer(1)),(Integer(1),
↪Integer(3)),(Integer(2),Integer(2)),(Integer(3),Integer(1)),(Integer(3),
↪Integer(2))])
16
```

tabloid_module(*D*)

Return the module of tabloids with the natural action of `self`.

See also

TabloidModule

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(QQ, 5)
sage: TM = SGA.tabloid_module(Partition([3,1,1]))
sage: TM
Tabloid module of [3, 1, 1] over Rational Field
sage: s = SymmetricFunctions(QQ).s()
sage: s(TM.frobenius_image())
s[3, 1, 1] + s[3, 2] + 2*s[4, 1] + s[5]
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(QQ, Integer(5))
>>> TM = SGA.tabloid_module(Partition([Integer(3),Integer(1),Integer(1)]))
>>> TM
Tabloid module of [3, 1, 1] over Rational Field
>>> s = SymmetricFunctions(QQ).s()
>>> s(TM.frobenius_image())
s[3, 1, 1] + s[3, 2] + 2*s[4, 1] + s[5]
```

young_symmetrizer(*la*)

Return the Young symmetrizer of shape `la` of `self`.

EXAMPLES:

```
sage: SGA = SymmetricGroupAlgebra(QQ, SymmetricGroup(3))
sage: SGA.young_symmetrizer([2,1])
() + (1,2) - (1,3,2) - (1,3)
sage: SGA = SymmetricGroupAlgebra(QQ, 4)
sage: SGA.young_symmetrizer([2,1,1])
[1, 2, 3, 4] - [1, 2, 4, 3] + [2, 1, 3, 4] - [2, 1, 4, 3]
 - [3, 1, 2, 4] + [3, 1, 4, 2] - [3, 2, 1, 4] + [3, 2, 4, 1]
 + [4, 1, 2, 3] - [4, 1, 3, 2] + [4, 2, 1, 3] - [4, 2, 3, 1]
sage: SGA.young_symmetrizer([5,1,1])
Traceback (most recent call last):
...
ValueError: the partition [5, 1, 1] is not of size 4
```

```
>>> from sage.all import *
>>> SGA = SymmetricGroupAlgebra(QQ, SymmetricGroup(Integer(3)))
>>> SGA.young_symmetrizer([Integer(2),Integer(1)])
() + (1,2) - (1,3,2) - (1,3)
>>> SGA = SymmetricGroupAlgebra(QQ, Integer(4))
>>> SGA.young_symmetrizer([Integer(2),Integer(1),Integer(1)])
[1, 2, 3, 4] - [1, 2, 4, 3] + [2, 1, 3, 4] - [2, 1, 4, 3]
 - [3, 1, 2, 4] + [3, 1, 4, 2] - [3, 2, 1, 4] + [3, 2, 4, 1]
 + [4, 1, 2, 3] - [4, 1, 3, 2] + [4, 2, 1, 3] - [4, 2, 3, 1]
>>> SGA.young_symmetrizer([Integer(5),Integer(1),Integer(1)])
Traceback (most recent call last):
...
ValueError: the partition [5, 1, 1] is not of size 4
```

sage.combinat.symmetric_group_algebra.**a**(*tableau*, *star=0*, *base_ring=Rational Field*)

The row projection operator corresponding to the Young tableau `tableau` (which is supposed to contain every integer from 1 to its size precisely once, but may and may not be standard).

This is the sum (in the group algebra of the relevant symmetric group over $\mathbf{Q}$) of all the permutations which preserve

the rows of `tableau`. It is called a_{tableau} in [EGHLSVY], Section 4.2.

INPUT:

- `tableau` – Young tableau which contains every integer from 1 to its size precisely once
- `star` – nonnegative integer (default: 0); when this optional variable is set, the method computes not the row projection operator of `tableau`, but the row projection operator of the restriction of `tableau` to the entries `1, 2, ..., tableau.size() - star` instead.
- `base_ring` – commutative ring (default: `QQ`); when this optional variable is set, the row projection operator is computed over a user-determined base ring instead of **Q**. (Note that symmetric group algebras currently don't preserve coercion, so e. g. a symmetric group algebra over **Z** does not coerce into the corresponding one over **Q**; so convert manually or choose your base rings wisely!)

EXAMPLES:

```
sage: from sage.combinat.symmetric_group_algebra import a
sage: a([[1,2]])
[1, 2] + [2, 1]
sage: a([[1],[2]])
[1, 2]
sage: a([])
[]
sage: a([[1, 5], [2, 3], [4]])
[1, 2, 3, 4, 5] + [1, 3, 2, 4, 5] + [5, 2, 3, 4, 1] + [5, 3, 2, 4, 1]
sage: a([[1,4], [2,3]], base_ring=ZZ)
[1, 2, 3, 4] + [1, 3, 2, 4] + [4, 2, 3, 1] + [4, 3, 2, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.symmetric_group_algebra import a
>>> a([[Integer(1),Integer(2)]])
[1, 2] + [2, 1]
>>> a([[Integer(1)],[Integer(2)]])
[1, 2]
>>> a([])
[]
>>> a([[Integer(1), Integer(5)], [Integer(2), Integer(3)], [Integer(4)]])
[1, 2, 3, 4, 5] + [1, 3, 2, 4, 5] + [5, 2, 3, 4, 1] + [5, 3, 2, 4, 1]
>>> a([[Integer(1),Integer(4)], [Integer(2),Integer(3)]], base_ring=ZZ)
[1, 2, 3, 4] + [1, 3, 2, 4] + [4, 2, 3, 1] + [4, 3, 2, 1]
```

The same with a skew tableau:

```
sage: a([[None,1,4], [2,3]], base_ring=ZZ)
[1, 2, 3, 4] + [1, 3, 2, 4] + [4, 2, 3, 1] + [4, 3, 2, 1]
```

```
>>> from sage.all import *
>>> a([[None,Integer(1),Integer(4)], [Integer(2),Integer(3)]], base_ring=ZZ)
[1, 2, 3, 4] + [1, 3, 2, 4] + [4, 2, 3, 1] + [4, 3, 2, 1]
```

`sage.combinat.symmetric_group_algebra.b`(*tableau*, *star=0*, *base_ring=Rational Field*)

The column projection operator corresponding to the Young tableau `tableau` (which is supposed to contain every integer from 1 to its size precisely once, but may and may not be standard).

This is the signed sum (in the group algebra of the relevant symmetric group over **Q**) of all the permutations which preserve the column of `tableau` (where the signs are the usual signs of the permutations). It is called b_{tableau} in

[EGHLSVY], Section 4.2.

INPUT:

- `tableau` – Young tableau which contains every integer from 1 to its size precisely once
- `star` – nonnegative integer (default: 0). When this optional variable is set, the method computes not the column projection operator of `tableau`, but the column projection operator of the restriction of `tableau` to the entries `1, 2, ..., tableau.size() - star` instead.
- `base_ring` – commutative ring (default: `QQ`). When this optional variable is set, the column projection operator is computed over a user-determined base ring instead of **Q**. (Note that symmetric group algebras currently don't preserve coercion, so e. g. a symmetric group algebra over **Z** does not coerce into the corresponding one over **Q**; so convert manually or choose your base rings wisely!)

EXAMPLES:

```
sage: from sage.combinat.symmetric_group_algebra import b
sage: b([[1,2]])
[1, 2]
sage: b([[1],[2]])
[1, 2] - [2, 1]
sage: b([])
[]
sage: b([[1, 2, 4], [5, 3]])
[1, 2, 3, 4, 5] - [1, 3, 2, 4, 5] - [5, 2, 3, 4, 1] + [5, 3, 2, 4, 1]
sage: b([[1, 4], [2, 3]], base_ring=ZZ)
[1, 2, 3, 4] - [1, 2, 4, 3] - [2, 1, 3, 4] + [2, 1, 4, 3]
sage: b([[1, 4], [2, 3]], base_ring=Integers(5))
[1, 2, 3, 4] + 4*[1, 2, 4, 3] + 4*[2, 1, 3, 4] + [2, 1, 4, 3]
```

```
>>> from sage.all import *
>>> from sage.combinat.symmetric_group_algebra import b
>>> b([[Integer(1),Integer(2)]])
[1, 2]
>>> b([[Integer(1)],[Integer(2)]])
[1, 2] - [2, 1]
>>> b([])
[]
>>> b([[Integer(1), Integer(2), Integer(4)], [Integer(5), Integer(3)]])
[1, 2, 3, 4, 5] - [1, 3, 2, 4, 5] - [5, 2, 3, 4, 1] + [5, 3, 2, 4, 1]
>>> b([[Integer(1), Integer(4)], [Integer(2), Integer(3)]], base_ring=ZZ)
[1, 2, 3, 4] - [1, 2, 4, 3] - [2, 1, 3, 4] + [2, 1, 4, 3]
>>> b([[Integer(1), Integer(4)], [Integer(2), Integer(3)]], base_
↪ring=Integers(Integer(5)))
[1, 2, 3, 4] + 4*[1, 2, 4, 3] + 4*[2, 1, 3, 4] + [2, 1, 4, 3]
```

The same with a skew tableau:

```
sage: b([[None, 2, 4], [1, 3], [5]])
[1, 2, 3, 4, 5] - [1, 3, 2, 4, 5] - [5, 2, 3, 4, 1] + [5, 3, 2, 4, 1]
```

```
>>> from sage.all import *
>>> b([[None, Integer(2), Integer(4)], [Integer(1), Integer(3)], [Integer(5)]])
[1, 2, 3, 4, 5] - [1, 3, 2, 4, 5] - [5, 2, 3, 4, 1] + [5, 3, 2, 4, 1]
```

With the `l2r` setting for multiplication, the unnormalized Young symmetrizer `e(tableau)` should be the product `b(tableau) * a(tableau)` for every `tableau`. Let us check this on the standard tableaux of size 5:

```
sage: from sage.combinat.symmetric_group_algebra import a, b, e
sage: all( e(t) == b(t) * a(t) for t in StandardTableaux(5) )
True
```

```
>>> from sage.all import *
>>> from sage.combinat.symmetric_group_algebra import a, b, e
>>> all( e(t) == b(t) * a(t) for t in StandardTableaux(Integer(5)) )
True
```

sage.combinat.symmetric_group_algebra.**e**(*tableau*, *star=0*)

The unnormalized Young projection operator corresponding to the Young tableau `tableau` (which is supposed to contain every integer from 1 to its size precisely once, but may and may not be standard).

If n is a nonnegative integer, and T is a Young tableau containing every integer from 1 to n exactly once, then the unnormalized Young projection operator $e(T)$ is defined by

$$e(T) = a(T)b(T) \in \mathbf{Q}S_n,$$

where $a(T) \in \mathbf{Q}S_n$ is the sum of all permutations in S_n which fix the rows of T (as sets), and $b(T) \in \mathbf{Q}S_n$ is the signed sum of all permutations in S_n which fix the columns of T (as sets). Here, "signed" means that each permutation is multiplied with its sign; and the product on the group S_n is defined in such a way that $(pq)(i) = p(q(i))$ for any permutations p and q and any $1 \leq i \leq n$.

Note that the definition of $e(T)$ is not uniform across literature. Others define it as $b(T)a(T)$ instead, or include certain scalar factors (we do not, whence "unnormalized").

EXAMPLES:

```
sage: from sage.combinat.symmetric_group_algebra import e
sage: e([[1,2]])
[1, 2] + [2, 1]
sage: e([[1],[2]])
[1, 2] - [2, 1]
sage: e([])
[]
```

```
>>> from sage.all import *
>>> from sage.combinat.symmetric_group_algebra import e
>>> e([[Integer(1),Integer(2)]])
[1, 2] + [2, 1]
>>> e([[Integer(1)],[Integer(2)]])
[1, 2] - [2, 1]
>>> e([])
[]
```

There are differing conventions for the order of the symmetrizers and antisymmetrizers. This example illustrates our conventions:

```
sage: e([[1,2],[3]])
[1, 2, 3] + [2, 1, 3] - [3, 1, 2] - [3, 2, 1]
```

```
>>> from sage.all import *
>>> e([[Integer(1),Integer(2)],[Integer(3)]])
[1, 2, 3] + [2, 1, 3] - [3, 1, 2] - [3, 2, 1]
```

To obtain the product $b(T)a(T)$, one has to take the antipode of this:

```
sage: QS3 = parent(e([[1,2],[3]]))
sage: QS3.antipode(e([[1,2],[3]]))
[1, 2, 3] + [2, 1, 3] - [2, 3, 1] - [3, 2, 1]
```

```
>>> from sage.all import *
>>> QS3 = parent(e([[Integer(1),Integer(2)],[Integer(3)]]))
>>> QS3.antipode(e([[Integer(1),Integer(2)],[Integer(3)]]))
[1, 2, 3] + [2, 1, 3] - [2, 3, 1] - [3, 2, 1]
```

And here is an example for a skew tableau:

```
sage: e([[None, 2, 1], [4, 3]])
[1, 2, 3, 4] + [1, 2, 4, 3] - [1, 3, 2, 4] - [1, 4, 2, 3]
 + [2, 1, 3, 4] + [2, 1, 4, 3] - [2, 3, 1, 4] - [2, 4, 1, 3]
```

```
>>> from sage.all import *
>>> e([[None, Integer(2), Integer(1)], [Integer(4), Integer(3)]])
[1, 2, 3, 4] + [1, 2, 4, 3] - [1, 3, 2, 4] - [1, 4, 2, 3]
 + [2, 1, 3, 4] + [2, 1, 4, 3] - [2, 3, 1, 4] - [2, 4, 1, 3]
```

e_hat()

sage.combinat.symmetric_group_algebra.**e_hat**(*tab*, *star=0*)

The Young projection operator corresponding to the Young tableau `tab` (which is supposed to contain every integer from 1 to its size precisely once, but may and may not be standard). This is an idempotent in the rational group algebra.

If n is a nonnegative integer, and T is a Young tableau containing every integer from 1 to n exactly once, then the Young projection operator $\widehat{e}(T)$ is defined by

$$\widehat{e}(T) = \frac{1}{\kappa_\lambda} a(T) b(T) \in \mathbf{Q}S_n,$$

where λ is the shape of T, where κ_λ is $n!$ divided by the number of standard tableaux of shape λ, where $a(T) \in \mathbf{Q}S_n$ is the sum of all permutations in S_n which fix the rows of T (as sets), and where $b(T) \in \mathbf{Q}S_n$ is the signed sum of all permutations in S_n which fix the columns of T (as sets). Here, "signed" means that each permutation is multiplied with its sign; and the product on the group S_n is defined in such a way that $(pq)(i) = p(q(i))$ for any permutations p and q and any $1 \leq i \leq n$.

Note that the definition of $\widehat{e}(T)$ is not uniform across literature. Others define it as $\frac{1}{\kappa_\lambda} b(T)a(T)$ instead.

EXAMPLES:

```
sage: from sage.combinat.symmetric_group_algebra import e_hat
sage: e_hat([[1,2,3]])
```

(continues on next page)

(continued from previous page)

```
1/6*[1, 2, 3] + 1/6*[1, 3, 2] + 1/6*[2, 1, 3] + 1/6*[2, 3, 1] + 1/6*[3, 1, 2] + 1/
↪6*[3, 2, 1]
sage: e_hat([[1],[2]])
1/2*[1, 2] - 1/2*[2, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.symmetric_group_algebra import e_hat
>>> e_hat([[Integer(1),Integer(2),Integer(3)]])
1/6*[1, 2, 3] + 1/6*[1, 3, 2] + 1/6*[2, 1, 3] + 1/6*[2, 3, 1] + 1/6*[3, 1, 2] + 1/
↪6*[3, 2, 1]
>>> e_hat([[Integer(1)],[Integer(2)]])
1/2*[1, 2] - 1/2*[2, 1]
```

There are differing conventions for the order of the symmetrizers and antisymmetrizers. This example illustrates our conventions:

```
sage: e_hat([[1,2],[3]])
1/3*[1, 2, 3] + 1/3*[2, 1, 3] - 1/3*[3, 1, 2] - 1/3*[3, 2, 1]
```

```
>>> from sage.all import *
>>> e_hat([[Integer(1),Integer(2)],[Integer(3)]])
1/3*[1, 2, 3] + 1/3*[2, 1, 3] - 1/3*[3, 1, 2] - 1/3*[3, 2, 1]
```

e()

sage.combinat.symmetric_group_algebra.**e_ik**(*itab*, *ktab*, *star=0*)

EXAMPLES:

```
sage: from sage.combinat.symmetric_group_algebra import e_ik
sage: e_ik([[1,2,3]], [[1,2,3]])
[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1] + [3, 1, 2] + [3, 2, 1]
sage: e_ik([[1,2,3]], [[1,2,3]], star=1)
[1, 2] + [2, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.symmetric_group_algebra import e_ik
>>> e_ik([[Integer(1),Integer(2),Integer(3)]], [[Integer(1),Integer(2),
↪Integer(3)]])
[1, 2, 3] + [1, 3, 2] + [2, 1, 3] + [2, 3, 1] + [3, 1, 2] + [3, 2, 1]
>>> e_ik([[Integer(1),Integer(2),Integer(3)]], [[Integer(1),Integer(2),
↪Integer(3)]], star=Integer(1))
[1, 2] + [2, 1]
```

sage.combinat.symmetric_group_algebra.**epsilon**(*tab*, *star=0*)

The (T, T)-th element of the seminormal basis of the group algebra $\mathbf{Q}[S_n]$, where T is the tableau `tab` (with its `star` highest entries removed if the optional variable `star` is set).

See the docstring of *seminormal_basis()* for the notation used herein.

EXAMPLES:

```
sage: from sage.combinat.symmetric_group_algebra import epsilon
sage: epsilon([[1,2]])
1/2*[1, 2] + 1/2*[2, 1]
sage: epsilon([[1],[2]])
1/2*[1, 2] - 1/2*[2, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.symmetric_group_algebra import epsilon
>>> epsilon([[Integer(1),Integer(2)]])
1/2*[1, 2] + 1/2*[2, 1]
>>> epsilon([[Integer(1)],[Integer(2)]])
1/2*[1, 2] - 1/2*[2, 1]
```

sage.combinat.symmetric_group_algebra.**epsilon_ik**(*itab*, *ktab*, *star=0*)

Return the seminormal basis element of the symmetric group algebra $\mathbf{Q}S_n$ corresponding to the pair of tableaux `itab` and `ktab` (or restrictions of these tableaux, if the optional variable `star` is set).

INPUT:

- `itab`, `ktab` – two standard tableaux of same size
- `star` – integer (default: 0)

OUTPUT:

The element $\epsilon(I, K) \in \mathbf{Q}S_n$, where I and K are the tableaux obtained by removing all entries higher than $n -$ star from `itab` and `ktab`, respectively (where n is the size of `itab` and `ktab`). Here, we are using the notations from *seminormal_basis()*.

EXAMPLES:

```
sage: from sage.combinat.symmetric_group_algebra import epsilon_ik
sage: epsilon_ik([[1,2],[3]], [[1,3],[2]])
1/4*[1, 3, 2] - 1/4*[2, 3, 1] + 1/4*[3, 1, 2] - 1/4*[3, 2, 1]
sage: epsilon_ik([[1,2],[3]], [[1,3],[2]], star=1)
Traceback (most recent call last):
...
ValueError: the two tableaux must be of the same shape
```

```
>>> from sage.all import *
>>> from sage.combinat.symmetric_group_algebra import epsilon_ik
>>> epsilon_ik([[Integer(1),Integer(2)],[Integer(3)]], [[Integer(1),Integer(3)],
↪[Integer(2)]])
1/4*[1, 3, 2] - 1/4*[2, 3, 1] + 1/4*[3, 1, 2] - 1/4*[3, 2, 1]
>>> epsilon_ik([[Integer(1),Integer(2)],[Integer(3)]], [[Integer(1),Integer(3)],
↪[Integer(2)]], star=Integer(1))
Traceback (most recent call last):
...
ValueError: the two tableaux must be of the same shape
```

sage.combinat.symmetric_group_algebra.**kappa**(*alpha*)

Return κ_α, which is $n!$ divided by the number of standard tableaux of shape α (where α is a partition of n).

INPUT:

- `alpha` – integer partition (can be encoded as a list)

OUTPUT:

The factorial of the size of `alpha`, divided by the number of standard tableaux of shape `alpha`. Equivalently, the product of all hook lengths of `alpha`.

EXAMPLES:

```
sage: from sage.combinat.symmetric_group_algebra import kappa
sage: kappa(Partition([2,1]))
3
sage: kappa([2,1])
3
```

```
>>> from sage.all import *
>>> from sage.combinat.symmetric_group_algebra import kappa
>>> kappa(Partition([Integer(2),Integer(1)]))
3
>>> kappa([Integer(2),Integer(1)])
3
```

sage.combinat.symmetric_group_algebra.**pi_ik**(*itab*, *ktab*)

Return the permutation p which sends every entry of the tableau `itab` to the respective entry of the tableau `ktab`, as an element of the corresponding symmetric group algebra.

This assumes that `itab` and `ktab` are tableaux (possibly given just as lists of lists) of the same shape. Both tableaux are allowed to be skew.

EXAMPLES:

```
sage: from sage.combinat.symmetric_group_algebra import pi_ik
sage: pi_ik([[1,3],[2]], [[1,2],[3]])
[1, 3, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.symmetric_group_algebra import pi_ik
>>> pi_ik([[Integer(1),Integer(3)],[Integer(2)]], [[Integer(1),Integer(2)],
↪[Integer(3)]])
[1, 3, 2]
```

The same with skew tableaux:

```
sage: from sage.combinat.symmetric_group_algebra import pi_ik
sage: pi_ik([[None,1,3],[2]], [[None,1,2],[3]])
[1, 3, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.symmetric_group_algebra import pi_ik
>>> pi_ik([[None,Integer(1),Integer(3)],[Integer(2)]], [[None,Integer(1),
↪Integer(2)],[Integer(3)]])
[1, 3, 2]
```

sage.combinat.symmetric_group_algebra.**seminormal_test**(*n*)

Run a variety of tests to verify that the construction of the seminormal basis works as desired. The numbers appearing are results in James and Kerber's 'Representation Theory of the Symmetric Group' [JK1981].

EXAMPLES:

```
sage: from sage.combinat.symmetric_group_algebra import seminormal_test
sage: seminormal_test(3)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.symmetric_group_algebra import seminormal_test
>>> seminormal_test(Integer(3))
True
```

T-sequences

T-sequences are tuples of four (-1, 0, 1) sequences of length t where for every i exactly one sequence has a nonzero entry at index i and for which the nonperiodic autocorrelation function is equal to zero (i.e. they are complementary). See Definition 7.5 of [Seb2017].

These can be constructed from Turyn sequences. In particular, if Turyn sequences of length l exists, there will be T-sequences of length $4l - 1$ and $2l - 1$.

Turyn sequences are tuples of four (-1, +1) sequences X, U, Y, V of length $l, l, l-1, l-1$ with nonperiodic autocorrelation equal to zero and the additional constraints that:

- the first element of X is 1
- the last element of X is -1
- the last element of U is 1

The nonperiodic autocorrelation of a family of sequences $X = \{A_1, A_2, ..., A_n\}$ is defined as (see Definition 7.2 of [Seb2017]):

$$N_X(j) = \sum_{i=1}^{n-j}(a_{1,i}a_{1,i+j} + a_{2,i}a_{2,i+j} + ... + a_{n,i}a_{n,i+j})$$

AUTHORS:

- Matteo Cati (2022-11-16): initial version

sage.combinat.t_sequences.**T_sequences_construction_from_base_sequences**(*base_sequences*, *check=True*)

Construct T-sequences of length $2n + p$ from base sequences of length $n + p, n + p, n, n$.

Given base sequences A, B, C, D, the T-sequences are constructed as described in [KTR2005]:

$$T_1 = \frac{1}{2}(A + B); 0_n$$
$$T_2 = \frac{1}{2}(A - B); 0_n$$
$$T_3 = 0_{n+p} + \frac{1}{2}(C + D)$$
$$T_4 = 0_{n+p} + \frac{1}{2}(C - D)$$

INPUT:

- `base_sequences` – the base sequences that should be used to construct the T-sequences
- `check` – boolean (default: `True`); check that the sequences created are T-sequences before returning them

EXAMPLES:

```
sage: from sage.combinat.t_sequences import turyn_sequences_smallcases, T_
↪sequences_construction_from_base_sequences
sage: seqs = turyn_sequences_smallcases(4)
sage: T_sequences_construction_from_base_sequences(seqs)
[[1, 1, -1, 0, 0, 0, 0],
[0, 0, 0, -1, 0, 0, 0],
[0, 0, 0, 0, 1, 0, 1],
[0, 0, 0, 0, 0, 1, 0]]
```

```
>>> from sage.all import *
>>> from sage.combinat.t_sequences import turyn_sequences_smallcases, T_sequences_
↪construction_from_base_sequences
>>> seqs = turyn_sequences_smallcases(Integer(4))
>>> T_sequences_construction_from_base_sequences(seqs)
[[1, 1, -1, 0, 0, 0, 0],
[0, 0, 0, -1, 0, 0, 0],
[0, 0, 0, 0, 1, 0, 1],
[0, 0, 0, 0, 0, 1, 0]]
```

sage.combinat.t_sequences.**T_sequences_construction_from_turyn_sequences**(*turyn_sequences*, *check=True*)

Construct T-sequences of length $4l-1$ from Turyn sequences of length l.

Given Turyn sequences X, U, Y, V, the T-sequences are constructed as described in theorem 7.7 of [Seb2017]:

$$T_1 = 1; 0_{4l-2}$$
$$T_2 = 0; X/Y; 0_{2l-1}$$
$$T_3 = 0_{2l}; U/0_{l-2}$$
$$T_4 = 0_{2l} + 0_l/V$$

INPUT:

- `turyn_sequences` – the Turyn sequences that should be used to construct the T-sequences
- `check` – boolean (default: `True`); check that the sequences created are T-sequences before returning them

EXAMPLES:

```
sage: from sage.combinat.t_sequences import turyn_sequences_smallcases, T_
↪sequences_construction_from_turyn_sequences, is_T_sequences_set
sage: seqs = turyn_sequences_smallcases(4)
sage: T_sequences_construction_from_turyn_sequences(seqs)
[[1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0],
[0, 1, 1, 1, 1, -1, 1, -1, 0, 0, 0, 0, 0, 0, 0],
[0, 0, 0, 0, 0, 0, 0, 0, 1, 0, 1, 0, -1, 0, 1],
[0, 0, 0, 0, 0, 0, 0, 0, 0, 1, 0, -1, 0, 1, 0]]
```

```
>>> from sage.all import *
>>> from sage.combinat.t_sequences import turyn_sequences_smallcases, T_sequences_
↪construction_from_turyn_sequences, is_T_sequences_set
>>> seqs = turyn_sequences_smallcases(Integer(4))
>>> T_sequences_construction_from_turyn_sequences(seqs)
[[1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0],
[0, 1, 1, 1, 1, -1, 1, -1, 0, 0, 0, 0, 0, 0, 0],
```

(continues on next page)

(continued from previous page)

```
[0, 0, 0, 0, 0, 0, 0, 0, 1, 0, 1, 0, -1, 0, 1],
[0, 0, 0, 0, 0, 0, 0, 0, 0, 1, 0, -1, 0, 1, 0]]
```

sage.combinat.t_sequences.**T_sequences_smallcases**(*t*, *existence=False*, *check=True*)

Construct T-sequences for some small values of t.

This method will try to use the constructions defined in *T_sequences_construction_from_base_sequences()* and *T_sequences_construction_from_turyn_sequences()* together with the Turyn sequences stored in *turyn_sequences_smallcases()*, or base sequences created by *base_sequences_smallcases()*.

This function contains also some T-sequences taken directly from [CRSKKY1989].

INPUT:

- `t` – integer; the length of the T-sequences to construct
- `existence` – boolean (default: `False`); if `True`, this method only returns whether a T-sequences of the given size can be constructed
- `check` – boolean (default: `True`); check that the sequences are T-sequences before returning them

EXAMPLES:

By default, this method returns the four T-sequences

```
sage: from sage.combinat.t_sequences import T_sequences_smallcases, is_T_
↪sequences_set
sage: T_sequences_smallcases(9)
[[1, 1, 0, 1, 0, 0, 0, 0, 0],
[0, 0, -1, 0, 1, 0, 0, 0, 0],
[0, 0, 0, 0, 0, 1, 0, 0, -1],
[0, 0, 0, 0, 0, 0, 1, -1, 0]]
```

```
>>> from sage.all import *
>>> from sage.combinat.t_sequences import T_sequences_smallcases, is_T_sequences_
↪set
>>> T_sequences_smallcases(Integer(9))
[[1, 1, 0, 1, 0, 0, 0, 0, 0],
[0, 0, -1, 0, 1, 0, 0, 0, 0],
[0, 0, 0, 0, 0, 1, 0, 0, -1],
[0, 0, 0, 0, 0, 0, 1, -1, 0]]
```

If the existence flag is passed, the method returns a boolean

```
sage: T_sequences_smallcases(9, existence=True)
True
```

```
>>> from sage.all import *
>>> T_sequences_smallcases(Integer(9), existence=True)
True
```

sage.combinat.t_sequences.**base_sequences_construction**(*turyn_type_seqs*, *check=True*)

Construct base sequences of length $2n-1, 2n-1, n, n$ from Turyn type sequences of length $n, n, n, n-1$.

Given Turyn type sequences X, Y, Z, W of length $n, n, n, n-1$, Theorem 1 of [KTR2005] shows that the following are base sequences of length $2n-1, 2n-1, n, n$:

$$A = Z; W$$
$$B = Z; -W$$
$$C = X$$
$$D = Y$$

INPUT:

- `turyn_type_seqs` – the list of 4 Turyn type sequences that should be used to construct the base sequences
- `check` – boolean (default: `True`); check that the resulting sequences are base sequences before returning them

OUTPUT: list containing the four base sequences

EXAMPLES:

```
sage: from sage.combinat.t_sequences import base_sequences_construction
sage: X = [1,1,-1,1,-1,1,-1,1]
sage: Y = [1,-1,-1,-1,-1,-1,-1,1]
sage: Z = [1,-1,-1,1,1,1,1,-1]
sage: W = [1,1,1,-1,1,1,-1]
sage: base_sequences_construction([X, Y, Z, W])
[[1, -1, -1, 1, 1, 1, 1, -1, 1, 1, 1, -1, 1, 1, -1],
[1, -1, -1, 1, 1, 1, 1, -1, -1, -1, -1, 1, -1, -1, 1],
[1, 1, -1, 1, -1, 1, -1, 1],
[1, -1, -1, -1, -1, -1, -1, 1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.t_sequences import base_sequences_construction
>>> X = [Integer(1),Integer(1),-Integer(1),Integer(1),-Integer(1),Integer(1),-
↪Integer(1),Integer(1)]
>>> Y = [Integer(1),-Integer(1),-Integer(1),-Integer(1),-Integer(1),-Integer(1),-
↪Integer(1),Integer(1)]

is_base_sequences_tuple()

`sage.combinat.t_sequences.`**`base_sequences_smallcases`**(*n*, *p*, *existence=False*, *check=True*)

Construct base sequences of length $n+p, n+p, n, n$ from available data.

The function uses the construction *base_sequences_construction()*, together with Turyn type sequences from *turyn_type_sequences_smallcases()* to construct base sequences with $p = n - 1$.

Furthermore, this function uses also Turyn sequences (i.e. base sequences with $p = 1$) from *turyn_sequences_smallcases()*.

INPUT:

- `n` – integer; the length of the last two base sequences
- `p` – integer; $n + p$ will be the length of the first two base sequences
- `existence` – boolean (default: `False`); if `True`, the function will only check whether the base sequences can be constructed
- `check` – boolean (default: `True`); check that the resulting sequences are base sequences before returning them

OUTPUT:

If `existence` is `False`, the function returns a list containing the four base sequences, or raises an error if the base sequences cannot be constructed. If `existence` is `True`, the function returns a boolean, which is `True` if the base sequences can be constructed and `False` otherwise.

EXAMPLES:

```
sage: from sage.combinat.t_sequences import base_sequences_smallcases
sage: base_sequences_smallcases(8, 7)
[[1, -1, -1, 1, 1, 1, 1, -1, 1, 1, 1, -1, 1, 1, -1],
[1, -1, -1, 1, 1, 1, 1, -1, -1, -1, -1, 1, -1, -1, 1],
[1, 1, -1, 1, -1, 1, -1, 1],
[1, -1, -1, -1, -1, -1, -1, 1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.t_sequences import base_sequences_smallcases
>>> base_sequences_smallcases(Integer(8), Integer(7))
[[1, -1, -1, 1, 1, 1, 1, -1, 1, 1, 1, -1, 1, 1, -1],
[1, -1, -1, 1, 1, 1, 1, -1, -1, -1, -1, 1, -1, -1, 1],
[1, 1, -1, 1, -1, 1, -1, 1],
[1, -1, -1, -1, -1, -1, -1, 1]]
```

If `existence` is `True`, the function returns a boolean

```
sage: base_sequences_smallcases(8, 7, existence=True)
True
sage: base_sequences_smallcases(7, 5, existence=True)
False
```

```
>>> from sage.all import *
>>> base_sequences_smallcases(Integer(8), Integer(7), existence=True)
True
>>> base_sequences_smallcases(Integer(7), Integer(5), existence=True)
False
```

`sage.combinat.t_sequences.`**`is_T_sequences_set`**(*sequences*, *verbose=False*)

Check if a family of sequences is composed of T-sequences.

Given 4 (-1, 0, +1) sequences, they will be T-sequences if (Definition 7.4 of [Seb2017]):

- they have all the same length t
- for each index i, exactly one sequence is nonzero at i

- the nonperiodic autocorrelation is equal to 0

INPUT:

- `sequences` – list of four sequences
- `verbose` – boolean (default: `False`); if `True` the function will be verbose when the sequences do not satisfy the constraints

EXAMPLES:

```
sage: from sage.combinat.t_sequences import is_T_sequences_set
sage: seqs = [[1, 1, 0, 0, 0], [0, 0, 1, 0, 0], [0, 0, 0, 1, -1], [0, 0, 0, 0, 0]]
sage: is_T_sequences_set(seqs)
True
sage: seqs = [[1, 1, 0, 1, 0], [0, 0, 1, 0, 0], [0, 0, 0, 1, -1], [0, 0, 0, 0, 0]]
sage: is_T_sequences_set(seqs, verbose=True)
There should be exactly a nonzero element at every index, found 2 such
 elements at index 3
False
```

```
>>> from sage.all import *
>>> from sage.combinat.t_sequences import is_T_sequences_set
>>> seqs = [[Integer(1), Integer(1), Integer(0), Integer(0), Integer(0)],␣
↪[Integer(0), Integer(0), Integer(1), Integer(0), Integer(0)], [Integer(0),␣
↪Integer(0), Integer(0), Integer(1), -Integer(1)], [Integer(0), Integer(0),␣
↪Integer(0), Integer(0), Integer(0)]]
>>> is_T_sequences_set(seqs)
True
>>> seqs = [[Integer(1), Integer(1), Integer(0), Integer(1), Integer(0)],␣
↪[Integer(0), Integer(0), Integer(1), Integer(0), Integer(0)], [Integer(0),␣
↪Integer(0), Integer(0), Integer(1), -Integer(1)], [Integer(0), Integer(0),␣
↪Integer(0), Integer(0), Integer(0)]]
>>> is_T_sequences_set(seqs, verbose=True)
There should be exactly a nonzero element at every index, found 2 such
 elements at index 3
False
```

`sage.combinat.t_sequences.`**`is_base_sequences_tuple`**(*base_sequences*, *verbose=False*)

Check if the given sequences are base sequences.

Four (-1, +1) sequences A, B, C, D of length $n+p, n+p, n, n$ are called base sequences if for all $j \geq 1$:

$$N_A(j) + N_B(j) + N_C(j) + N_D(j) = 0$$

where $N_X(j)$ is the nonperiodic autocorrelation (See definition in [KTR2005]).

INPUT:

- `base_sequences` – the list of 4 sequences that should be checked
- `verbose` – boolean (default: `False`); if `True` the function will be verbose when the sequences do not satisfy the constraints

EXAMPLES:

```
sage: from sage.combinat.t_sequences import is_base_sequences_tuple
sage: seqs = [[1, -1, -1, 1, 1, 1, 1, -1, 1, 1, 1, -1, 1, 1, -1],[1, -1, -1, 1, 1,
```

(continues on next page)

(continued from previous page)

```
↪ 1, 1, -1, -1, -1, -1, 1, -1, -1, 1],[1, 1, -1, 1, -1, 1, -1, 1],[1, -1, -1, -1,
↪ -1, -1, -1, 1]]
sage: is_base_sequences_tuple(seqs)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.t_sequences import is_base_sequences_tuple
>>> seqs = [[Integer(1), -Integer(1), -Integer(1), Integer(1), Integer(1),␣
↪Integer(1), Integer(1), -Integer(1), Integer(1), Integer(1), Integer(1), -
↪Integer(1), Integer(1), Integer(1), -Integer(1)],[Integer(1), -Integer(1), -
↪Integer(1), Integer(1), Integer(1), Integer(1), Integer(1), -Integer(1), -
↪Integer(1), -Integer(1), -Integer(1), Integer(1), -Integer(1), -Integer(1),␣
↪Integer(1)],[Integer(1), Integer(1), -Integer(1), Integer(1), -Integer(1),␣
↪Integer(1), -Integer(1), Integer(1)],[Integer(1), -Integer(1), -Integer(1), -
↪Integer(1), -Integer(1), -Integer(1), Integer(1)]]
>>> is_base_sequences_tuple(seqs)
True
```

If verbose is true, the function will be verbose

```
sage: seqs = [[1, -1], [1, 1], [-1], [2]]
sage: is_base_sequences_tuple(seqs, verbose=True)
Base sequences should only contain -1, +1, found 2
False
```

```
>>> from sage.all import *
>>> seqs = [[Integer(1), -Integer(1)], [Integer(1), Integer(1)], [-Integer(1)],␣
↪[Integer(2)]]
>>> is_base_sequences_tuple(seqs, verbose=True)
Base sequences should only contain -1, +1, found 2
False
```

See also

base_sequences_construction()

sage.combinat.t_sequences.**is_skew**(*seq*, *verbose=False*)

Check if the given sequence is skew.

A sequence $X = \{x_1, x_2, ..., x_n\}$ is defined skew (according to Definition 7.4 of [Seb2017]) if n is even and $x_i = -x_{n-i+1}$.

INPUT:

- `seq` – the sequence that should be checked
- `verbose` – boolean (default: `False`); if `True` the function will be verbose when the sequences do not satisfy the constraints

EXAMPLES:

```
sage: from sage.combinat.t_sequences import is_skew
sage: is_skew([1, -1, 1, -1, 1, -1])
```

(continues on next page)

(continued from previous page)

```
True
sage: is_skew([1, -1, -1, -1], verbose=True)
Constraint not satisfied at index 1
False
```

```
>>> from sage.all import *
>>> from sage.combinat.t_sequences import is_skew
>>> is_skew([Integer(1), -Integer(1), Integer(1), -Integer(1), Integer(1), -
↪Integer(1)])
True
>>> is_skew([Integer(1), -Integer(1), -Integer(1), -Integer(1)], verbose=True)
Constraint not satisfied at index 1
False
```

sage.combinat.t_sequences.**is_symmetric**(*seq*, *verbose=False*)

Check if the given sequence is symmetric.

A sequence $X = \{x_1, x_2, ..., x_n\}$ is defined symmetric (according to Definition 7.4 of [Seb2017]) if n is odd and $x_i = x_{n-i+1}$.

INPUT:

- `seq` – the sequence that should be checked
- `verbose` – boolean (default: `False`); if `True` the function will be verbose when the sequences do not satisfy the constraints

EXAMPLES:

```
sage: from sage.combinat.t_sequences import is_symmetric
sage: is_symmetric([1, -1, 1, -1, 1])
True
sage: is_symmetric([1, -1, 1, 1, 1], verbose=True)
Constraint not satisfied at index 1
False
```

```
>>> from sage.all import *
>>> from sage.combinat.t_sequences import is_symmetric
>>> is_symmetric([Integer(1), -Integer(1), Integer(1), -Integer(1), Integer(1)])
True
>>> is_symmetric([Integer(1), -Integer(1), Integer(1), Integer(1), Integer(1)],␣
↪verbose=True)
Constraint not satisfied at index 1
False
```

sage.combinat.t_sequences.**turyn_sequences_smallcases**(*l*, *existence=False*)

Construction of Turyn sequences for small values of l.

The data is taken from [Seb2017] and [CRSKKY1989].

INPUT:

- `l` – integer; the length of the Turyn sequences
- `existence` – boolean (default: `False`); if `True`, only return whether the Turyn sequences are available for the given length

EXAMPLES:

By default, this method returns the four Turyn sequences

```
sage: from sage.combinat.t_sequences import turyn_sequences_smallcases
sage: turyn_sequences_smallcases(4)
[[1, 1, -1, -1], [1, 1, -1, 1], [1, 1, 1], [1, -1, 1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.t_sequences import turyn_sequences_smallcases
>>> turyn_sequences_smallcases(Integer(4))
[[1, 1, -1, -1], [1, 1, -1, 1], [1, 1, 1], [1, -1, 1]]
```

If we pass the `existence` flag, the method will return a boolean

```
sage: turyn_sequences_smallcases(4, existence=True)
True
```

```
>>> from sage.all import *
>>> turyn_sequences_smallcases(Integer(4), existence=True)
True
```

sage.combinat.t_sequences.**turyn_type_sequences_smallcases**(*n*, *existence=False*)

Construction of Turyn type sequences for small values of n.

The data is taken from [KTR2005] for $n = 36$, and from [BDKR2013] for $n \leq 32$.

INPUT:

- `n` – integer; the length of the Turyn type sequences
- `existence` – boolean (default: `False`); if `True`, only return whether the Turyn type sequences are available for the given length

EXAMPLES:

By default, this method returns the four Turyn type sequences

```
sage: from sage.combinat.t_sequences import turyn_type_sequences_smallcases
sage: turyn_type_sequences_smallcases(4)
[[1, 1, 1, 1], [1, 1, -1, 1], [1, 1, -1, -1], [1, -1, 1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.t_sequences import turyn_type_sequences_smallcases
>>> turyn_type_sequences_smallcases(Integer(4))
[[1, 1, 1, 1], [1, 1, -1, 1], [1, 1, -1, -1], [1, -1, 1]]
```

If we pass the `existence` flag, the method will return a boolean

```
sage: turyn_type_sequences_smallcases(4, existence=True)
True
```

```
>>> from sage.all import *
>>> turyn_type_sequences_smallcases(Integer(4), existence=True)
True
```

ALGORITHM:

The Turyn type sequences are stored in hexadecimal format. Given n hexadecimal digits $h_1, h_2, ..., h_n$, it is possible to get the Turyn type sequences by converting each h_i ($1 \leq i \leq n-1$) into a four digits binary number. Then, the j-th binary digit is 0 if the i-th number in the j-th sequence is 1, and it is 1 if the number in the sequence is -1.

For the n-th digit, it should be converted to a 3 digits binary number, and then the same mapping as before can be used (see also [BDKR2013]).

TableauTuples

A *TableauTuple* is a tuple of tableaux. These objects arise naturally in representation theory of the wreath products of cyclic groups and the symmetric groups where the standard tableau tuples index bases for the ordinary irreducible representations. This generalises the well-known fact the ordinary irreducible representations of the symmetric groups have bases indexed by the standard tableaux of a given shape. More generally, *TableauTuples*, or multitableaux, appear in the representation theory of the degenerate and non-degenerate cyclotomic Hecke algebras and in the crystal theory of the integral highest weight representations of the affine special linear groups.

A *TableauTuple* is an ordered tuple $(t^{(1)}, t^{(2)}, \ldots, t^{(l)})$ of tableaux. The length of the tuple is its *level* and the tableaux $t^{(1)}, t^{(2)}, \ldots, t^{(l)}$ are the components of the *TableauTuple*.

A tableau can be thought of as the labelled diagram of a partition. Analogously, a *TableauTuple* is the labelled diagram of a *PartitionTuple*. That is, a *TableauTuple* is a tableau of *PartitionTuple* shape. As much as possible, *TableauTuples* behave in exactly the same way as *Tableaux*. There are obvious differences in that the cells of a partition are ordered pairs (r, c), where r is a row index and c a column index, whereas the cells of a *PartitionTuple* are ordered triples (k, r, c), with r and c as before and k indexes the component.

Frequently, we will call a *TableauTuple* a tableau, or a tableau of *PartitionTuple* shape. If the shape of the tableau is known this should not cause any confusion.

Warning

In sage the convention is that the (k, r, c)-th entry of a tableau tuple t is the entry in row r, column c and component k of the tableau. This is because it makes much more sense to let `t[k]` be component of the tableau. In particular, we want `t(k,r,c) == t[k][r][c]`. In the literature, the cells of a tableau tuple are usually written in the form (r, c, k), where r is the row index, c is the column index, and k is the component index.

The same convention applies to the cells of *PartitionTuples*.

Note

As with partitions and tableaux, the cells are 0-based. For example, the (lexicographically) first cell in any non-empty tableau tuple is `[0,0,0]`.

EXAMPLES:

```
sage: TableauTuple([[1,2,3],[4,5]])
[[1, 2, 3], [4, 5]]
sage: t = TableauTuple([ [[6,7],[8,9]],[[1,2,3],[4,5]] ]); t
([[6, 7], [8, 9]], [[1, 2, 3], [4, 5]])
sage: t.pp()
  6  7     1  2  3
  8  9     4  5
sage: t(0,0,1)
```

(continues on next page)

(continued from previous page)

```
7
sage: t(1,0,1)
2
sage: t.shape()
([2, 2], [3, 2])
sage: t.size()
9
sage: t.level()
2
sage: t.components()
[[[6, 7], [8, 9]], [[1, 2, 3], [4, 5]]]
sage: t.entries()
[6, 7, 8, 9, 1, 2, 3, 4, 5]
sage: t.parent()
Tableau tuples
sage: t.category()
Category of elements of Tableau tuples
```

```
>>> from sage.all import *
>>> TableauTuple([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]])
[[1, 2, 3], [4, 5]]
>>> t = TableauTuple([ [[Integer(6),Integer(7)],[Integer(8),Integer(9)]],[[Integer(1),
↪Integer(2),Integer(3)],[Integer(4),Integer(5)]] ]); t
([[6, 7], [8, 9]], [[1, 2, 3], [4, 5]])
>>> t.pp()
  6  7     1  2  3
  8  9     4  5
>>> t(Integer(0),Integer(0),Integer(1))
7
>>> t(Integer(1),Integer(0),Integer(1))
2
>>> t.shape()
([2, 2], [3, 2])
>>> t.size()
9
>>> t.level()
2
>>> t.components()
[[[6, 7], [8, 9]], [[1, 2, 3], [4, 5]]]
>>> t.entries()
[6, 7, 8, 9, 1, 2, 3, 4, 5]
>>> t.parent()
Tableau tuples
>>> t.category()
Category of elements of Tableau tuples
```

One reason for implementing *TableauTuples* is to be able to consider *StandardTableauTuples*. These objects arise in many areas of algebraic combinatorics. In particular, they index bases for the Specht modules of the cyclotomic Hecke algebras of type $G(r, 1, n)$. A *StandardTableauTuple* of tableau whose entries are increasing along rows and down columns in each component and which contain the numbers $1, 2, \ldots, n$, where the shape of the *StandardTableauTuple* is a *PartitionTuple* of n.

```
sage: s = StandardTableauTuple([ [[1,2],[3]],[[4,5]]])
sage: s.category()
Category of elements of Standard tableau tuples
sage: t = TableauTuple([ [[1,2],[3]],[[4,5]]])
sage: t.is_standard(), t.is_column_strict(), t.is_row_strict()
(True, True, True)
sage: t.category()
Category of elements of Tableau tuples
sage: s == t
True
sage: s is t
False
sage: s == StandardTableauTuple(t)
True
sage: StandardTableauTuples([ [2,1],[1] ])[:]
[([[1, 2], [3]], [[4]]),
 ([[1, 3], [2]], [[4]]),
 ([[1, 2], [4]], [[3]]),
 ([[1, 3], [4]], [[2]]),
 ([[2, 3], [4]], [[1]]),
 ([[1, 4], [2]], [[3]]),
 ([[1, 4], [3]], [[2]]),
 ([[2, 4], [3]], [[1]])]
```

```
>>> from sage.all import *
>>> s = StandardTableauTuple([ [[Integer(1),Integer(2)],[Integer(3)]],[[Integer(4),
↪Integer(5)]]])
>>> s.category()
Category of elements of Standard tableau tuples
>>> t = TableauTuple([ [[Integer(1),Integer(2)],[Integer(3)]],[[Integer(4),
↪Integer(5)]]])
>>> t.is_standard(), t.is_column_strict(), t.is_row_strict()
(True, True, True)
>>> t.category()
Category of elements of Tableau tuples
>>> s == t
True
>>> s is t
False
>>> s == StandardTableauTuple(t)
True
>>> StandardTableauTuples([ [Integer(2),Integer(1)],[Integer(1)] ])[:]
[([[1, 2], [3]], [[4]]),
 ([[1, 3], [2]], [[4]]),
 ([[1, 2], [4]], [[3]]),
 ([[1, 3], [4]], [[2]]),
 ([[2, 3], [4]], [[1]]),
 ([[1, 4], [2]], [[3]]),
 ([[1, 4], [3]], [[2]]),
 ([[2, 4], [3]], [[1]])]
```

As tableaux (of partition shape) are in natural bijection with 1-tuples of tableaux all of the *TableauTuple* classes return an ordinary *Tableau* when given *TableauTuple* of level 1.

```
sage: TableauTuples( level=1 ) is Tableaux()
True
sage: TableauTuple([[1,2,3],[4,5]])
[[1, 2, 3], [4, 5]]
sage: TableauTuple([ [[1,2,3],[4,5]] ])
[[1, 2, 3], [4, 5]]
sage: TableauTuple([[1,2,3],[4,5]]) == Tableau([[1,2,3],[4,5]])
True
```

```
>>> from sage.all import *
>>> TableauTuples( level=Integer(1) ) is Tableaux()
True
>>> TableauTuple([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]])
[[1, 2, 3], [4, 5]]
>>> TableauTuple([ [[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]] ])
[[1, 2, 3], [4, 5]]
>>> TableauTuple([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]]) ==␣
↪Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]])
True
```

There is one situation where a 1-tuple of tableau is not actually a *Tableau*; tableaux generated by the *StandardTableauTuples()* iterators must have the correct parents, so in this one case 1-tuples of tableaux are different from *Tableaux*:

```
sage: StandardTableauTuples()[:10]                                              #␣
↪needs sage.libs.flint
[(),
 ([[1]]),
 ([], []),
 ([[1, 2]]),
 ([[1], [2]]),
 ([[1]], []),
 ([], [[1]]),
 ([], [], []),
 ([[1, 2, 3]]),
 ([[1, 3], [2]])]
```

```
>>> from sage.all import *
>>> StandardTableauTuples()[:Integer(10)]                                       ␣
↪     # needs sage.libs.flint
[(),
 ([[1]]),
 ([], []),
 ([[1, 2]]),
 ([[1], [2]]),
 ([[1]], []),
 ([], [[1]]),
 ([], [], []),
 ([[1, 2, 3]]),
 ([[1, 3], [2]])]
```

Todo

Implement semistandard tableau tuples as defined in [DJM1998].

Much of the combinatorics implemented here is motivated by this and subsequent papers on the representation theory of these algebras.

class sage.combinat.tableau_tuple.**RowStandardTableauTuple**(*parent*, *t*, *check=True*)

Bases: *TableauTuple*

A class for row standard tableau tuples of shape a partition tuple.

A row standard tableau tuple of size n is an ordered tuple of row standard tableaux (see *RowStandardTableau*), with entries $1, 2, \ldots, n$ such that, in each component, the entries are in increasing order along each row. If the tableau in component k has shape $\lambda^{(k)}$ then $\lambda = (\lambda^{(1)}, \ldots, \lambda^{(l)}$ is a *PartitionTuple*.

Note

The tableaux appearing in a *RowStandardTableauTuple* are row strict, but individually they are not standard tableaux because the entries in any single component of a *RowStandardTableauTuple* will typically not be in bijection with $\{1, 2, \ldots, n\}$.

INPUT:

- `t` – a tableau, a list of (standard) tableau or an equivalent list

OUTPUT: a *RowStandardTableauTuple* object constructed from `t`

Note

Sage uses the English convention for (tuples of) partitions and tableaux: the longer rows are displayed on top. As with *PartitionTuple*, in sage the cells, or nodes, of partition tuples are 0-based. For example, the (lexicographically) first cell in any non-empty partition tuple is $[0, 0, 0]$. Further, the coordinates `[k,r,c]` in a *TableauTuple* refer to the component, row and column indices, respectively.

EXAMPLES:

```
sage: t = RowStandardTableauTuple([[[4,7],[3]],[[2,6,8],[1,5]],[[9]]]); t
([[4, 7], [3]], [[2, 6, 8], [1, 5]], [[9]])
sage: t.pp()
  4  7     2  6  8     9
  3        1  5
sage: t.shape()
([2, 1], [3, 2], [1])
sage: t[0].pp()  # pretty printing
  4  7
  3
sage: t.is_row_strict()
```

(continues on next page)

(continued from previous page)

```
True
sage: t[0].is_standard()
False
sage: RowStandardTableauTuple([[],[],[]]) # An empty tableau tuple
([], [], [])
sage: RowStandardTableauTuple([[[4,5],[6]],[[1,2,3]]]) in StandardTableauTuples()
True
sage: RowStandardTableauTuple([[[5,6],[4]],[[1,2,3]]]) in StandardTableauTuples()
False
```

```
>>> from sage.all import *
>>> t = RowStandardTableauTuple([[[Integer(4),Integer(7)],[Integer(3)]],
↪[[Integer(2),Integer(6),Integer(8)],[Integer(1),Integer(5)]],[[Integer(9)]]]); t
([[4, 7], [3]], [[2, 6, 8], [1, 5]], [[9]])
>>> t.pp()
  4  7     2  6  8     9
  3        1  5
>>> t.shape()
([2, 1], [3, 2], [1])
>>> t[Integer(0)].pp()  # pretty printing
  4  7
  3
>>> t.is_row_strict()
True
>>> t[Integer(0)].is_standard()
False
>>> RowStandardTableauTuple([[],[],[]]) # An empty tableau tuple
([], [], [])
>>> RowStandardTableauTuple([[[Integer(4),Integer(5)],[Integer(6)]],[[Integer(1),
↪Integer(2),Integer(3)]]]) in StandardTableauTuples()
True
>>> RowStandardTableauTuple([[[Integer(5),Integer(6)],[Integer(4)]],[[Integer(1),
↪Integer(2),Integer(3)]]]) in StandardTableauTuples()
False
```

When using code that will generate a lot of tableaux, it is slightly more efficient to construct a *RowStandardTableauTuple* from the appropriate parent object:

```
sage: RST = RowStandardTableauTuples()
sage: RST([[[4,5],[7]],[[1,2,3],[6,8]],[[9]]])
([[4, 5], [7]], [[1, 2, 3], [6, 8]], [[9]])
```

```
>>> from sage.all import *
>>> RST = RowStandardTableauTuples()
>>> RST([[[Integer(4),Integer(5)],[Integer(7)]],[[Integer(1),Integer(2),
↪Integer(3)],[Integer(6),Integer(8)]],[[Integer(9)]]])
([[4, 5], [7]], [[1, 2, 3], [6, 8]], [[9]])
```

codegree(*e*, *multicharge*)

Return the Brundan-Kleshchev-Wang [BKW2011] codegree of `self`.

The *codegree* of a tableau is an integer that is defined recursively by successively stripping off the number k, for $k = n, n-1, \ldots, 1$ and at stage adding the number of addable cell of the same residue minus the number of removable cells of the same residue as k and which are above k in the diagram.

The codegree of the tableau `self` gives the degree of "dual" homogeneous basis element of the graded Specht module which is indexed by `self`.

INPUT:

- `e` – the *quantum characteristic*
- `multicharge` – the multicharge

OUTPUT: the codegree of the tableau `self`, which is an integer

EXAMPLES:

```
sage: StandardTableauTuple([[[1]], [], []]).codegree(0,(0,0,0))
0
sage: StandardTableauTuple([[],[[1]], []]).codegree(0,(0,0,0))
1
sage: StandardTableauTuple([[], [], [[1]]]).codegree(0,(0,0,0))
2
sage: StandardTableauTuple([[[1]],[[2]], []]).codegree(0,(0,0,0))
-1
sage: StandardTableauTuple([[[1]], [], [[2]]]).codegree(0,(0,0,0))
0
sage: StandardTableauTuple([[],[[1]], [[2]]]).codegree(0,(0,0,0))
1
sage: StandardTableauTuple([[[2]],[[1]], []]).codegree(0,(0,0,0))
1
sage: StandardTableauTuple([[[2]], [], [[1]]]).codegree(0,(0,0,0))
2
sage: StandardTableauTuple([[],[[2]], [[1]]]).codegree(0,(0,0,0))
3
```

```
>>> from sage.all import *
>>> StandardTableauTuple([[[Integer(1)]], [], []]).codegree(Integer(0),
↪(Integer(0),Integer(0),Integer(0)))
0
>>> StandardTableauTuple([[],[[Integer(1)]], []]).codegree(Integer(0),
↪(Integer(0),Integer(0),Integer(0)))
1
```

(continues on next page)

(continued from previous page)

```
>>> StandardTableauTuple([[], [], [[Integer(1)]]]).codegree(Integer(0),
↪(Integer(0),Integer(0),Integer(0)))
2
>>> StandardTableauTuple([[[Integer(1)]],[[Integer(2)]], []]).
↪codegree(Integer(0),(Integer(0),Integer(0),Integer(0)))
-1
>>> StandardTableauTuple([[[Integer(1)]], [], [[Integer(2)]]]).
↪codegree(Integer(0),(Integer(0),Integer(0),Integer(0)))
0
>>> StandardTableauTuple([[],[[Integer(1)]], [[Integer(2)]]]).
↪codegree(Integer(0),(Integer(0),Integer(0),Integer(0)))
1
>>> StandardTableauTuple([[[Integer(2)]],[[Integer(1)]], []]).
↪codegree(Integer(0),(Integer(0),Integer(0),Integer(0)))
1
>>> StandardTableauTuple([[[Integer(2)]], [], [[Integer(1)]]]).
↪codegree(Integer(0),(Integer(0),Integer(0),Integer(0)))
2
>>> StandardTableauTuple([[],[[Integer(2)]], [[Integer(1)]]]).
↪codegree(Integer(0),(Integer(0),Integer(0),Integer(0)))
3
```

degree(*e*, *multicharge*)

Return the Brundan-Kleshchev-Wang [BKW2011] degree of `self`.

The *degree* of a tableau is an integer that is defined recursively by successively stripping off the number k, for $k = n, n-1, \ldots, 1$, and at stage adding the count of the number of addable cell of the same residue minus the number of removable cells of them same residue as k and that are below k in the diagram.

Note that even though this degree function was defined by Brundan-Kleshchev-Wang [BKW2011] the underlying combinatorics is much older, going back at least to Misra and Miwa.

The degrees of the tableau T gives the degree of the homogeneous basis element of the graded Specht module which is indexed by T.

INPUT:

- `e` – the *quantum characteristic* `e`
- `multicharge` – (default: `[0]`) the multicharge

OUTPUT: the degree of the tableau `self`, which is an integer

EXAMPLES:

```
sage: StandardTableauTuple([[[1]], [], []]).degree(0,(0,0,0))
2
sage: StandardTableauTuple([[],[[1]], []]).degree(0,(0,0,0))
1
sage: StandardTableauTuple([[], [], [[1]]]).degree(0,(0,0,0))
0
sage: StandardTableauTuple([[[1]],[[2]], []]).degree(0,(0,0,0))
3
sage: StandardTableauTuple([[[1]], [], [[2]]]).degree(0,(0,0,0))
2
sage: StandardTableauTuple([[],[[1]], [[2]]]).degree(0,(0,0,0))
```

(continues on next page)

(continued from previous page)

```
1
sage: StandardTableauTuple([[[2]],[[1]], []]).degree(0,(0,0,0))
1
sage: StandardTableauTuple([[[2]], [], [[1]]]).degree(0,(0,0,0))
0
sage: StandardTableauTuple([[],[[2]], [[1]]]).degree(0,(0,0,0))
-1
```

```
>>> from sage.all import *
>>> StandardTableauTuple([[[Integer(1)]], [], []]).degree(Integer(0),
↪(Integer(0),Integer(0),Integer(0)))
2
>>> StandardTableauTuple([[],[[Integer(1)]], []]).degree(Integer(0),
↪(Integer(0),Integer(0),Integer(0)))
1
>>> StandardTableauTuple([[], [], [[Integer(1)]]]).degree(Integer(0),
↪(Integer(0),Integer(0),Integer(0)))
0
>>> StandardTableauTuple([[[Integer(1)]],[[Integer(2)]], []]).
↪degree(Integer(0),(Integer(0),Integer(0),Integer(0)))
3
>>> StandardTableauTuple([[[Integer(1)]], [], [[Integer(2)]]]).
↪degree(Integer(0),(Integer(0),Integer(0),Integer(0)))
2
>>> StandardTableauTuple([[],[[Integer(1)]], [[Integer(2)]]]).
↪degree(Integer(0),(Integer(0),Integer(0),Integer(0)))
1
>>> StandardTableauTuple([[[Integer(2)]],[[Integer(1)]], []]).
↪degree(Integer(0),(Integer(0),Integer(0),Integer(0)))
1
>>> StandardTableauTuple([[[Integer(2)]], [], [[Integer(1)]]]).
↪degree(Integer(0),(Integer(0),Integer(0),Integer(0)))
0
>>> StandardTableauTuple([[],[[Integer(2)]], [[Integer(1)]]]).
↪degree(Integer(0),(Integer(0),Integer(0),Integer(0)))
-1
```

inverse(*k*)

Return the cell containing `k` in the tableau tuple `self`.

EXAMPLES:

```
sage: RowStandardTableauTuple([[[3,4],[1,2]],[[5,6,7],[8]],[[9,10],[11],
↪[12]]]).inverse(1)
(0, 1, 0)
sage: RowStandardTableauTuple([[[3,4],[1,2]],[[5,6,7],[8]],[[9,10],[11],
↪[12]]]).inverse(2)
(0, 1, 1)
sage: RowStandardTableauTuple([[[3,4],[1,2]],[[5,6,7],[8]],[[9,10],[11],
↪[12]]]).inverse(3)
(0, 0, 0)
sage: RowStandardTableauTuple([[[3,4],[1,2]],[[5,6,7],[8]],[[9,10],[11],
```

(continues on next page)

(continued from previous page)

```
↪[12]]]).inverse(4)
(0, 0, 1)
sage: StandardTableauTuple([[[1,2],[3,4]],[[5,6,7],[8]],[[9,10],[11],[12]]]).
↪inverse(1)
(0, 0, 0)
sage: StandardTableauTuple([[[1,2],[3,4]],[[5,6,7],[8]],[[9,10],[11],[12]]]).
↪inverse(2)
(0, 0, 1)
sage: StandardTableauTuple([[[1,2],[3,4]],[[5,6,7],[8]],[[9,10],[11],[12]]]).
↪inverse(3)
(0, 1, 0)
sage: StandardTableauTuple([[[1,2],[3,4]],[[5,6,7],[8]],[[9,10],[11],[12]]]).
↪inverse(12)
(2, 2, 0)
```

```
>>> from sage.all import *
>>> RowStandardTableauTuple([[[Integer(3),Integer(4)],[Integer(1),
↪Integer(2)]],[[Integer(5),Integer(6),Integer(7)],[Integer(8)]],[[Integer(9),
↪Integer(10)],[Integer(11)],[Integer(12)]]]).inverse(Integer(1))
(0, 1, 0)
>>> RowStandardTableauTuple([[[Integer(3),Integer(4)],[Integer(1),
↪Integer(2)]],[[Integer(5),Integer(6),Integer(7)],[Integer(8)]],[[Integer(9),
↪Integer(10)],[Integer(11)],[Integer(12)]]]).inverse(Integer(2))
(0, 1, 1)
>>> RowStandardTableauTuple([[[Integer(3),Integer(4)],[Integer(1),
↪Integer(2)]],[[Integer(5),Integer(6),Integer(7)],[Integer(8)]],[[Integer(9),
↪Integer(10)],[Integer(11)],[Integer(12)]]]).inverse(Integer(3))
(0, 0, 0)
>>> RowStandardTableauTuple([[[Integer(3),Integer(4)],[Integer(1),
↪Integer(2)]],[[Integer(5),Integer(6),Integer(7)],[Integer(8)]],[[Integer(9),
↪Integer(10)],[Integer(11)],[Integer(12)]]]).inverse(Integer(4))
(0, 0, 1)
>>> StandardTableauTuple([[[Integer(1),Integer(2)],[Integer(3),Integer(4)]],
↪[[Integer(5),Integer(6),Integer(7)],[Integer(8)]],[[Integer(9),Integer(10)],
↪[Integer(11)],[Integer(12)]]]).inverse(Integer(1))
(0, 0, 0)
>>> StandardTableauTuple([[[Integer(1),Integer(2)],[Integer(3),Integer(4)]],
↪[[Integer(5),Integer(6),Integer(7)],[Integer(8)]],[[Integer(9),Integer(10)],
↪[Integer(11)],[Integer(12)]]]).inverse(Integer(2))
(0, 0, 1)
>>> StandardTableauTuple([[[Integer(1),Integer(2)],[Integer(3),Integer(4)]],
↪[[Integer(5),Integer(6),Integer(7)],[Integer(8)]],[[Integer(9),Integer(10)],
↪[Integer(11)],[Integer(12)]]]).inverse(Integer(3))
(0, 1, 0)
>>> StandardTableauTuple([[[Integer(1),Integer(2)],[Integer(3),Integer(4)]],
↪[[Integer(5),Integer(6),Integer(7)],[Integer(8)]],[[Integer(9),Integer(10)],
↪[Integer(11)],[Integer(12)]]]).inverse(Integer(12))
(2, 2, 0)
```

residue_sequence(*e*, *multicharge*)

Return the *sage.combinat.tableau_residues.ResidueSequence* of `self`.

INPUT:

- `e` – integer in $\{0, 2, 3, 4, 5, \ldots\}$
- `multicharge` – a sequence of integers of length equal to the level/length of `self`

OUTPUT:

The *residue sequence* of the tableau.

EXAMPLES:

```
sage: RowStandardTableauTuple([[[5]],[[3,4],[1,2]]]).residue_sequence(3,[0,0])
3-residue sequence (2,0,0,1,0) with multicharge (0,0)
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).residue_sequence(3,[0,1])
3-residue sequence (1,2,0,1,0) with multicharge (0,1)
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).residue_sequence(3,[0,2])
3-residue sequence (2,0,1,2,0) with multicharge (0,2)
```

```
>>> from sage.all import *
>>> RowStandardTableauTuple([[[Integer(5)]],[[Integer(3),Integer(4)],
↪[Integer(1),Integer(2)]]]).residue_sequence(Integer(3),[Integer(0),
↪Integer(0)])
3-residue sequence (2,0,0,1,0) with multicharge (0,0)
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).residue_sequence(Integer(3),[Integer(0),Integer(1)])
3-residue sequence (1,2,0,1,0) with multicharge (0,1)
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).residue_sequence(Integer(3),[Integer(0),Integer(2)])
3-residue sequence (2,0,1,2,0) with multicharge (0,2)
```

class sage.combinat.tableau_tuple.**RowStandardTableauTuples**

Bases: *TableauTuples*

A factory class for the various classes of tuples of row standard tableau.

INPUT:

There are three optional arguments:

- `level` – the *level()* of the tuples of tableaux
- `size` – the *size()* of the tuples of tableaux
- `shape` – list or a partition tuple specifying the *shape()* of the row standard tableau tuples

It is not necessary to use the keywords. If they are not used then the first integer argument specifies the *level()* and the second the *size()* of the tableau tuples.

OUTPUT: the appropriate subclass of *RowStandardTableauTuples*

A tuple of row standard tableau is a tableau whose entries are positive integers which increase from left to right along the rows in each component. The entries do NOT need to increase from left to right along the components.

Note

Sage uses the English convention for (tuples of) partitions and tableaux: the longer rows are displayed on top. As with *PartitionTuple*, in sage the cells, or nodes, of partition tuples are 0-based. For example, the (lexicographically) first cell in any non-empty partition tuple is $[0, 0, 0]$.

EXAMPLES:

```
sage: tabs = RowStandardTableauTuples([[2],[1,1]]); tabs
Row standard tableau tuples of shape ([2], [1, 1])
sage: tabs.cardinality()
12
sage: tabs[:]                                                                 #␣
↪needs sage.graphs sage.rings.finite_rings
[([[3, 4]], [[2], [1]]),
 ([[2, 4]], [[3], [1]]),
 ([[1, 4]], [[3], [2]]),
 ([[1, 2]], [[4], [3]]),
 ([[1, 3]], [[4], [2]]),
 ([[2, 3]], [[4], [1]]),
 ([[1, 4]], [[2], [3]]),
 ([[1, 3]], [[2], [4]]),
 ([[1, 2]], [[3], [4]]),
 ([[2, 3]], [[1], [4]]),
 ([[2, 4]], [[1], [3]]),
 ([[3, 4]], [[1], [2]])]

sage: tabs = RowStandardTableauTuples(level=3); tabs
Row standard tableau tuples of level 3
sage: tabs[100]                                                               #␣
↪needs sage.libs.flint
([], [], [[2, 3], [1]])

sage: RowStandardTableauTuples()[0]                                           #␣
↪needs sage.libs.flint
([])
```

```
>>> from sage.all import *
>>> tabs = RowStandardTableauTuples([[Integer(2)],[Integer(1),Integer(1)]]); tabs
Row standard tableau tuples of shape ([2], [1, 1])
>>> tabs.cardinality()
12
>>> tabs[:]                                                                   #␣
↪needs sage.graphs sage.rings.finite_rings
[([[3, 4]], [[2], [1]]),
 ([[2, 4]], [[3], [1]]),
 ([[1, 4]], [[3], [2]]),
 ([[1, 2]], [[4], [3]]),
 ([[1, 3]], [[4], [2]]),
 ([[2, 3]], [[4], [1]]),
 ([[1, 4]], [[2], [3]]),
 ([[1, 3]], [[2], [4]]),
 ([[1, 2]], [[3], [4]]),
 ([[2, 3]], [[1], [4]]),
 ([[2, 4]], [[1], [3]]),
 ([[3, 4]], [[1], [2]])]

>>> tabs = RowStandardTableauTuples(level=Integer(3)); tabs
Row standard tableau tuples of level 3
>>> tabs[Integer(100)]                                                        ␣
```

(continues on next page)

(continued from previous page)

```
↪      # needs sage.libs.flint
([], [], [[2, 3], [1]])

>>> RowStandardTableauTuples()[Integer(0)]                                    ␣
↪      # needs sage.libs.flint
([])
```

Element

alias of *RowStandardTableauTuple*

level_one_parent_class

alias of *RowStandardTableaux_all*

shape()

Return the shape of the set of *RowStandardTableauTuples*, or `None` if it is not defined.

EXAMPLES:

```
sage: tabs=RowStandardTableauTuples(shape=[[5,2],[3,2],[],[1,1,1],[3]]); tabs
Row standard tableau tuples of shape ([5, 2], [3, 2], [], [1, 1, 1], [3])
sage: tabs.shape()
([5, 2], [3, 2], [], [1, 1, 1], [3])
sage: RowStandardTableauTuples().shape() is None
True
```

```
>>> from sage.all import *
>>> tabs=RowStandardTableauTuples(shape=[[Integer(5),Integer(2)],[Integer(3),
↪Integer(2)],[],[Integer(1),Integer(1),Integer(1)],[Integer(3)]]); tabs
Row standard tableau tuples of shape ([5, 2], [3, 2], [], [1, 1, 1], [3])
>>> tabs.shape()
([5, 2], [3, 2], [], [1, 1, 1], [3])
>>> RowStandardTableauTuples().shape() is None
True
```

class sage.combinat.tableau_tuple.**RowStandardTableauTuples_all**

Bases: *RowStandardTableauTuples*, DisjointUnionEnumeratedSets

Default class of all *RowStandardTableauTuples* with an arbitrary *level()* and *size()*.

an_element()

Return a particular element of the class.

EXAMPLES:

```
sage: RowStandardTableauTuples().an_element()
([[4, 5, 6, 7]], [[2, 3]], [[1]])
```

```
>>> from sage.all import *
>>> RowStandardTableauTuples().an_element()
([[4, 5, 6, 7]], [[2, 3]], [[1]])
```

class sage.combinat.tableau_tuple.**RowStandardTableauTuples_level**(*level*)

Bases: *RowStandardTableauTuples*, DisjointUnionEnumeratedSets

Class of all *RowStandardTableauTuples* with a fixed `level` and arbitrary `size`.

an_element()

Return a particular element of the class.

EXAMPLES:

```
sage: RowStandardTableauTuples(2).an_element()
([[1]], [[2, 3]])
sage: RowStandardTableauTuples(3).an_element()
([[1]], [[2, 3]], [[4, 5, 6, 7]])
```

```
>>> from sage.all import *
>>> RowStandardTableauTuples(Integer(2)).an_element()
([[1]], [[2, 3]])
>>> RowStandardTableauTuples(Integer(3)).an_element()
([[1]], [[2, 3]], [[4, 5, 6, 7]])
```

class sage.combinat.tableau_tuple.**RowStandardTableauTuples_level_size**(*level*, *size*)

Bases: *RowStandardTableauTuples*, DisjointUnionEnumeratedSets

Class of all *RowStandardTableauTuples* with a fixed `level` and a fixed `size`.

an_element()

Return a particular element of `self`.

EXAMPLES:

```
sage: RowStandardTableauTuples(5, size=2).an_element()                  #␣
↪needs sage.libs.flint
([], [], [], [], [[1], [2]])
sage: RowStandardTableauTuples(2, size=4).an_element()                  #␣
↪needs sage.libs.flint
([[1]], [[2, 3], [4]])
```

```
>>> from sage.all import *
>>> RowStandardTableauTuples(Integer(5), size=Integer(2)).an_element()       ␣
↪              # needs sage.libs.flint
([], [], [], [], [[1], [2]])
>>> RowStandardTableauTuples(Integer(2), size=Integer(4)).an_element()       ␣
↪              # needs sage.libs.flint
([[1]], [[2, 3], [4]])
```

class sage.combinat.tableau_tuple.**RowStandardTableauTuples_residue**(*residue*)

Bases: *RowStandardTableauTuples*

Class of all row standard tableau tuples with a fixed residue sequence.

Implicitly, this also specifies the quantum characteristic, multicharge and hence the level and size of the tableaux.

Note

This class is not intended to be called directly, but rather, it is accessed through the row standard tableaux.

EXAMPLES:

```
sage: RowStandardTableau([[3,4,5],[1,2]]).residue_sequence(2).row_standard_
↪tableaux()
Row standard tableaux with 2-residue sequence (1,0,0,1,0) and multicharge (0)
sage: RowStandardTableau([[3,4,5],[1,2]]).residue_sequence(3).row_standard_
↪tableaux()
Row standard tableaux with 3-residue sequence (2,0,0,1,2) and multicharge (0)
sage: RowStandardTableauTuple([[[5,6],[7]],[[1,2,3],[4]]]).residue_sequence(2,(0,
↪0)).row_standard_tableaux()
Row standard tableaux with 2-residue sequence (0,1,0,1,0,1,1) and multicharge (0,
↪0)
sage: RowStandardTableauTuple([[[5,6],[7]],[[1,2,3],[4]]]).residue_sequence(3,(0,
↪1)).row_standard_tableaux()
Row standard tableaux with 3-residue sequence (1,2,0,0,0,1,2) and multicharge (0,
↪1)
```

```
>>> from sage.all import *
>>> RowStandardTableau([[Integer(3),Integer(4),Integer(5)],[Integer(1),
↪Integer(2)]]).residue_sequence(Integer(2)).row_standard_tableaux()
Row standard tableaux with 2-residue sequence (1,0,0,1,0) and multicharge (0)
>>> RowStandardTableau([[Integer(3),Integer(4),Integer(5)],[Integer(1),
↪Integer(2)]]).residue_sequence(Integer(3)).row_standard_tableaux()
Row standard tableaux with 3-residue sequence (2,0,0,1,2) and multicharge (0)
>>> RowStandardTableauTuple([[[Integer(5),Integer(6)],[Integer(7)]],[[Integer(1),
↪Integer(2),Integer(3)],[Integer(4)]]]).residue_sequence(Integer(2),(Integer(0),
↪Integer(0))).row_standard_tableaux()
Row standard tableaux with 2-residue sequence (0,1,0,1,0,1,1) and multicharge (0,
↪0)
>>> RowStandardTableauTuple([[[Integer(5),Integer(6)],[Integer(7)]],[[Integer(1),
↪Integer(2),Integer(3)],[Integer(4)]]]).residue_sequence(Integer(3),(Integer(0),
↪Integer(1))).row_standard_tableaux()
Row standard tableaux with 3-residue sequence (1,2,0,0,0,1,2) and multicharge (0,
↪1)
```

an_element()

Return a particular element of `self`.

EXAMPLES:

```
sage: RowStandardTableau([[2,3],[1]]).residue_sequence(3).row_standard_
↪tableaux().an_element()
```

(continues on next page)

(continued from previous page)

```
[[2, 3], [1]]
sage: StandardTableau([[1,3],[2]]).residue_sequence(3).row_standard_
↪tableaux().an_element()
[[1, 3], [2]]
sage: RowStandardTableauTuple([[[4]],[[2,3],[1]]]).residue_sequence(3,(0,1)).
↪row_standard_tableaux().an_element()                                    #␣
↪needs sage.libs.flint
sage: StandardTableauTuple([[[4]],[[1,3],[2]]]).residue_sequence(3,(0,1)).row_
↪standard_tableaux().an_element()                                        #␣
↪needs sage.libs.flint
([[4], [3], [1], [2]], [])
```

```
>>> from sage.all import *
>>> RowStandardTableau([[Integer(2),Integer(3)],[Integer(1)]]).residue_
↪sequence(Integer(3)).row_standard_tableaux().an_element()
[[2, 3], [1]]
>>> StandardTableau([[Integer(1),Integer(3)],[Integer(2)]]).residue_
↪sequence(Integer(3)).row_standard_tableaux().an_element()
[[1, 3], [2]]
>>> RowStandardTableauTuple([[[Integer(4)]],[[Integer(2),Integer(3)],
↪[Integer(1)]]]).residue_sequence(Integer(3),(Integer(0),Integer(1))).row_
↪standard_tableaux().an_element()                                  # needs␣
↪sage.libs.flint
>>> StandardTableauTuple([[[Integer(4)]],[[Integer(1),Integer(3)],
↪[Integer(2)]]]).residue_sequence(Integer(3),(Integer(0),Integer(1))).row_
↪standard_tableaux().an_element()                                      #␣
↪needs sage.libs.flint
([[4], [3], [1], [2]], [])
```

level()

Return the level of `self`.

EXAMPLES:

```
sage: RowStandardTableau([[2,3],[1]]).residue_sequence(3,(0,1)).row_standard_
↪tableaux().level()
2
sage: StandardTableau([[1,2],[3]]).residue_sequence(3,(0,1)).row_standard_
↪tableaux().level()
2
sage: RowStandardTableauTuple([[[4]],[[2,3],[1]]]).residue_sequence(3,(0,1)).
↪row_standard_tableaux().level()
2
sage: StandardTableauTuple([[[4]],[[1,3],[2]]]).residue_sequence(3,(0,1)).row_
↪standard_tableaux().level()
2
```

```
>>> from sage.all import *
>>> RowStandardTableau([[Integer(2),Integer(3)],[Integer(1)]]).residue_
↪sequence(Integer(3),(Integer(0),Integer(1))).row_standard_tableaux().level()
2
>>> StandardTableau([[Integer(1),Integer(2)],[Integer(3)]]).residue_
```

(continues on next page)

(continued from previous page)

```
↪sequence(Integer(3),(Integer(0),Integer(1))).row_standard_tableaux().level()
2
>>> RowStandardTableauTuple([[[Integer(4)]],[[Integer(2),Integer(3)],
↪[Integer(1)]]]).residue_sequence(Integer(3),(Integer(0),Integer(1))).row_
↪standard_tableaux().level()
2
>>> StandardTableauTuple([[[Integer(4)]],[[Integer(1),Integer(3)],
↪[Integer(2)]]]).residue_sequence(Integer(3),(Integer(0),Integer(1))).row_
↪standard_tableaux().level()
2
```

multicharge()

Return the multicharge of `self`.

EXAMPLES:

```
sage: RowStandardTableau([[2,3],[1]]).residue_sequence(3,(0,1)).row_standard_
↪tableaux().multicharge()
(0, 1)
sage: StandardTableau([[1,2],[3]]).residue_sequence(3,(0,1)).row_standard_
↪tableaux().multicharge()
(0, 1)
sage: RowStandardTableauTuple([[[4]],[[2,3],[1]]]).residue_sequence(3,(0,1)).
↪row_standard_tableaux().multicharge()
(0, 1)
sage: StandardTableauTuple([[[4]],[[1,3],[2]]]).residue_sequence(3,(0,1)).row_
↪standard_tableaux().multicharge()
(0, 1)
```

```
>>> from sage.all import *
>>> RowStandardTableau([[Integer(2),Integer(3)],[Integer(1)]]).residue_
↪sequence(Integer(3),(Integer(0),Integer(1))).row_standard_tableaux().
↪multicharge()
(0, 1)
>>> StandardTableau([[Integer(1),Integer(2)],[Integer(3)]]).residue_
↪sequence(Integer(3),(Integer(0),Integer(1))).row_standard_tableaux().
↪multicharge()
(0, 1)
>>> RowStandardTableauTuple([[[Integer(4)]],[[Integer(2),Integer(3)],
↪[Integer(1)]]]).residue_sequence(Integer(3),(Integer(0),Integer(1))).row_
↪standard_tableaux().multicharge()
(0, 1)
>>> StandardTableauTuple([[[Integer(4)]],[[Integer(1),Integer(3)],
↪[Integer(2)]]]).residue_sequence(Integer(3),(Integer(0),Integer(1))).row_
↪standard_tableaux().multicharge()
(0, 1)
```

quantum_characteristic()

Return the quantum characteristic of `self`.

EXAMPLES:

```
sage: RowStandardTableau([[2,3],[1]]).residue_sequence(3,(0,1)).row_standard_
↪tableaux().quantum_characteristic()
3
sage: StandardTableau([[1,2],[3]]).residue_sequence(3,(0,1)).row_standard_
↪tableaux().quantum_characteristic()
3
sage: RowStandardTableauTuple([[[4]],[[2,3],[1]]]).residue_sequence(3,(0,1)).
↪row_standard_tableaux().quantum_characteristic()
3
sage: StandardTableauTuple([[[4]],[[1,3],[2]]]).residue_sequence(3,(0,1)).row_
↪standard_tableaux().quantum_characteristic()
3
```

```
>>> from sage.all import *
>>> RowStandardTableau([[Integer(2),Integer(3)],[Integer(1)]]).residue_
↪sequence(Integer(3),(Integer(0),Integer(1))).row_standard_tableaux().
↪quantum_characteristic()
3
>>> StandardTableau([[Integer(1),Integer(2)],[Integer(3)]]).residue_
↪sequence(Integer(3),(Integer(0),Integer(1))).row_standard_tableaux().
↪quantum_characteristic()
3
>>> RowStandardTableauTuple([[[Integer(4)]],[[Integer(2),Integer(3)],
↪[Integer(1)]]]).residue_sequence(Integer(3),(Integer(0),Integer(1))).row_
↪standard_tableaux().quantum_characteristic()
3
>>> StandardTableauTuple([[[Integer(4)]],[[Integer(1),Integer(3)],
↪[Integer(2)]]]).residue_sequence(Integer(3),(Integer(0),Integer(1))).row_
↪standard_tableaux().quantum_characteristic()
3
```

residue_sequence()

Return the residue sequence of `self`.

EXAMPLES:

```
sage: RowStandardTableau([[2,3],[1]]).residue_sequence(3,(0,1)).row_standard_
↪tableaux().residue_sequence()
3-residue sequence (2,0,1) with multicharge (0,1)
sage: StandardTableau([[1,2],[3]]).residue_sequence(3,(0,1)).row_standard_
↪tableaux().residue_sequence()
3-residue sequence (0,1,2) with multicharge (0,1)
sage: RowStandardTableauTuple([[[4]],[[2,3],[1]]]).residue_sequence(3,(0,1)).
↪row_standard_tableaux().residue_sequence()
3-residue sequence (0,1,2,0) with multicharge (0,1)
sage: StandardTableauTuple([[[4]],[[1,3],[2]]]).residue_sequence(3,(0,1)).row_
↪standard_tableaux().residue_sequence()
3-residue sequence (1,0,2,0) with multicharge (0,1)
```

```
>>> from sage.all import *
>>> RowStandardTableau([[Integer(2),Integer(3)],[Integer(1)]]).residue_
↪sequence(Integer(3),(Integer(0),Integer(1))).row_standard_tableaux().
↪residue_sequence()
```

(continues on next page)

(continued from previous page)

```
3-residue sequence (2,0,1) with multicharge (0,1)
>>> StandardTableau([[Integer(1),Integer(2)],[Integer(3)]]).residue_
↪sequence(Integer(3),(Integer(0),Integer(1))).row_standard_tableaux().
↪residue_sequence()
3-residue sequence (0,1,2) with multicharge (0,1)
>>> RowStandardTableauTuple([[[Integer(4)]],[[Integer(2),Integer(3)],
↪[Integer(1)]]]).residue_sequence(Integer(3),(Integer(0),Integer(1))).row_
↪standard_tableaux().residue_sequence()
3-residue sequence (0,1,2,0) with multicharge (0,1)
>>> StandardTableauTuple([[[Integer(4)]],[[Integer(1),Integer(3)],
↪[Integer(2)]]]).residue_sequence(Integer(3),(Integer(0),Integer(1))).row_
↪standard_tableaux().residue_sequence()
3-residue sequence (1,0,2,0) with multicharge (0,1)
```

size()

Return the size of `self`.

EXAMPLES:

```
sage: RowStandardTableau([[2,3],[1]]).residue_sequence(3,(0,1)).row_standard_
↪tableaux().size()
3
sage: StandardTableau([[1,2],[3]]).residue_sequence(3,(0,1)).row_standard_
↪tableaux().size()
3
sage: RowStandardTableauTuple([[[4]],[[2,3],[1]]]).residue_sequence(3,(0,1)).
↪row_standard_tableaux().size()
4
sage: StandardTableauTuple([[[4]],[[1,3],[2]]]).residue_sequence(3,(0,1)).row_
↪standard_tableaux().size()
4
```

```
>>> from sage.all import *
>>> RowStandardTableau([[Integer(2),Integer(3)],[Integer(1)]]).residue_
↪sequence(Integer(3),(Integer(0),Integer(1))).row_standard_tableaux().size()
3
>>> StandardTableau([[Integer(1),Integer(2)],[Integer(3)]]).residue_
↪sequence(Integer(3),(Integer(0),Integer(1))).row_standard_tableaux().size()
3
>>> RowStandardTableauTuple([[[Integer(4)]],[[Integer(2),Integer(3)],
↪[Integer(1)]]]).residue_sequence(Integer(3),(Integer(0),Integer(1))).row_
↪standard_tableaux().size()
4
>>> StandardTableauTuple([[[Integer(4)]],[[Integer(1),Integer(3)],
↪[Integer(2)]]]).residue_sequence(Integer(3),(Integer(0),Integer(1))).row_
↪standard_tableaux().size()
4
```

class sage.combinat.tableau_tuple.**RowStandardTableauTuples_residue_shape**(*residue*, *shape*)

Bases: *RowStandardTableauTuples_residue*

All row standard tableau tuples with a fixed residue and shape.

INPUT:

- `shape` – the shape of the partitions or partition tuples
- `residue` – the residue sequence of the label

EXAMPLES:

```
sage: res = RowStandardTableauTuple([[[3,6],[1]],[[5,7],[4],[2]]]).residue_
↪sequence(3,(0,0))
sage: tabs = res.row_standard_tableaux([[2,1],[2,1,1]]); tabs
Row standard (2,1|2,1^2)-tableaux with 3-residue sequence (2,1,0,2,0,1,1) and␣
↪multicharge (0,0)
sage: tabs.shape()
([2, 1], [2, 1, 1])
sage: tabs.level()
2
sage: tabs[:6]
[([[5, 7], [4]], [[3, 6], [1], [2]]),
 ([[5, 7], [1]], [[3, 6], [4], [2]]),
 ([[3, 7], [4]], [[5, 6], [1], [2]]),
 ([[3, 7], [1]], [[5, 6], [4], [2]]),
 ([[5, 6], [4]], [[3, 7], [1], [2]]),
 ([[5, 6], [1]], [[3, 7], [4], [2]])]
```

```
>>> from sage.all import *
>>> res = RowStandardTableauTuple([[[Integer(3),Integer(6)],[Integer(1)]],
↪[[Integer(5),Integer(7)],[Integer(4)],[Integer(2)]]]).residue_
↪sequence(Integer(3),(Integer(0),Integer(0)))
>>> tabs = res.row_standard_tableaux([[Integer(2),Integer(1)],[Integer(2),
↪Integer(1),Integer(1)]]); tabs
Row standard (2,1|2,1^2)-tableaux with 3-residue sequence (2,1,0,2,0,1,1) and␣
↪multicharge (0,0)
>>> tabs.shape()
([2, 1], [2, 1, 1])
>>> tabs.level()
2
>>> tabs[:Integer(6)]
[([[5, 7], [4]], [[3, 6], [1], [2]]),
 ([[5, 7], [1]], [[3, 6], [4], [2]]),
 ([[3, 7], [4]], [[5, 6], [1], [2]]),
 ([[3, 7], [1]], [[5, 6], [4], [2]]),
 ([[5, 6], [4]], [[3, 7], [1], [2]]),
 ([[5, 6], [1]], [[3, 7], [4], [2]])]
```

class sage.combinat.tableau_tuple.**RowStandardTableauTuples_shape**(*shape*)

Bases: *RowStandardTableauTuples*

Class of all *RowStandardTableauTuples* of a fixed shape.

an_element()

Return a particular element of `self`.

EXAMPLES:

```
sage: RowStandardTableauTuples([[2],[2,1]]).an_element()                    #␣
↪needs sage.graphs
```

(continues on next page)

(continued from previous page)

```
([[4, 5]], [[1, 3], [2]])
sage: RowStandardTableauTuples([[10],[],[]]).an_element()                    #␣
↪needs sage.graphs
([[1, 2, 3, 4, 5, 6, 7, 8, 9, 10]], [], [])
```

```
>>> from sage.all import *
>>> RowStandardTableauTuples([[Integer(2)],[Integer(2),Integer(1)]]).an_
↪element()                      # needs sage.graphs
([[4, 5]], [[1, 3], [2]])
>>> RowStandardTableauTuples([[Integer(10)],[],[]]).an_element()              ␣
↪     # needs sage.graphs
([[1, 2, 3, 4, 5, 6, 7, 8, 9, 10]], [], [])
```

cardinality()

Return the number of row standard tableau tuples of with the same shape as the partition tuple `self`.

This is just the index of the corresponding Young subgroup in the full symmetric group.

EXAMPLES:

```
sage: RowStandardTableauTuples([[3,2,1],[]]).cardinality()
60
sage: RowStandardTableauTuples([[1],[1],[1]]).cardinality()
6
sage: RowStandardTableauTuples([[2,1],[1],[1]]).cardinality()
60
```

```
>>> from sage.all import *
>>> RowStandardTableauTuples([[Integer(3),Integer(2),Integer(1)],[]]).
↪cardinality()
60
>>> RowStandardTableauTuples([[Integer(1)],[Integer(1)],[Integer(1)]]).
↪cardinality()
6
>>> RowStandardTableauTuples([[Integer(2),Integer(1)],[Integer(1)],
↪[Integer(1)]]).cardinality()
60
```

class sage.combinat.tableau_tuple.**RowStandardTableauTuples_size**(*size*)

Bases: *RowStandardTableauTuples*, DisjointUnionEnumeratedSets

Class of all *RowStandardTableauTuples* with an arbitrary `level` and a fixed `size`.

an_element()

Return a particular element of the class.

EXAMPLES:

```
sage: RowStandardTableauTuples(size=2).an_element()
([[1]], [[2]], [], [])
sage: RowStandardTableauTuples(size=4).an_element()
([[1]], [[2, 3, 4]], [], [])
```

```
>>> from sage.all import *
>>> RowStandardTableauTuples(size=Integer(2)).an_element()
([[1]], [[2]], [], [])
>>> RowStandardTableauTuples(size=Integer(4)).an_element()
([[1]], [[2, 3, 4]], [], [])
```

class sage.combinat.tableau_tuple.**StandardTableauTuple**(*parent*, *t*, *check=True*)

Bases: *RowStandardTableauTuple*

A class to model a standard tableau of shape a partition tuple. This is a tuple of standard tableau with entries $1, 2, \ldots, n$, where n is the size of the underlying partition tuple, such that the entries increase along rows and down columns in each component of the tuple.

sage: s = StandardTableauTuple([[1,2,3],[4,5]]) sage: t = StandardTableauTuple([[1,2],[3,5],[4]]) sage: s.dominates(t) True sage: t.dominates(s) False sage: StandardTableauTuple([[1,2,3],[4,5]]) in RowStandardTableauTuples() True

The tableaux appearing in a *StandardTableauTuple* are both row and column strict, but individually they are not standard tableaux because the entries in any single component of a *StandardTableauTuple* will typically not be in bijection with $\{1, 2, \ldots, n\}$.

INPUT:

- `t` – a tableau, a list of (standard) tableau or an equivalent list

OUTPUT: a *StandardTableauTuple* object constructed from `t`

Note

Sage uses the English convention for (tuples of) partitions and tableaux: the longer rows are displayed on top. As with *PartitionTuple*, in sage the cells, or nodes, of partition tuples are 0-based. For example, the (lexicographically) first cell in any non-empty partition tuple is $[0, 0, 0]$. Further, the coordinates `[k,r,c]` in a *TableauTuple* refer to the component, row and column indices, respectively.

EXAMPLES:

```
sage: t = TableauTuple([ [[1,3,4],[7,9]], [[2,8,11],[6]], [[5,10]] ])
sage: t
([[1, 3, 4], [7, 9]], [[2, 8, 11], [6]], [[5, 10]])
sage: t[0][0][0]
1
sage: t[1][1][0]
6
sage: t[2][0][0]
5
sage: t[2][0][1]
10

sage: t = StandardTableauTuple([[[4,5],[7]],[[1,2,3],[6,8]],[[9]]]); t
([[4, 5], [7]], [[1, 2, 3], [6, 8]], [[9]])
sage: t.pp()
  4  5     1  2  3     9
  7        6  8
sage: t.shape()
([2, 1], [3, 2], [1])
```

(continues on next page)

(continued from previous page)

```
sage: t[0].pp()  # pretty printing
  4  5
  7
sage: t.is_standard()
True
sage: t[0].is_standard()
False
sage: StandardTableauTuple([[],[],[]]) # An empty tableau tuple
([], [], [])
```

```
>>> from sage.all import *
>>> t = TableauTuple([ [[Integer(1),Integer(3),Integer(4)],[Integer(7),
↪Integer(9)]], [[Integer(2),Integer(8),Integer(11)],[Integer(6)]], [[Integer(5),
↪Integer(10)]] ])
>>> t
([[1, 3, 4], [7, 9]], [[2, 8, 11], [6]], [[5, 10]])
>>> t[Integer(0)][Integer(0)][Integer(0)]
1
>>> t[Integer(1)][Integer(1)][Integer(0)]
6
>>> t[Integer(2)][Integer(0)][Integer(0)]
5
>>> t[Integer(2)][Integer(0)][Integer(1)]
10

>>> t = StandardTableauTuple([[[Integer(4),Integer(5)],[Integer(7)]],[[Integer(1),
↪Integer(2),Integer(3)],[Integer(6),Integer(8)]],[[Integer(9)]]]); t
([[4, 5], [7]], [[1, 2, 3], [6, 8]], [[9]])
>>> t.pp()
  4  5     1  2  3     9
  7        6  8
>>> t.shape()
([2, 1], [3, 2], [1])
>>> t[Integer(0)].pp()  # pretty printing
  4  5
  7
>>> t.is_standard()
True
>>> t[Integer(0)].is_standard()
False
>>> StandardTableauTuple([[],[],[]]) # An empty tableau tuple
([], [], [])
```

When using code that will generate a lot of tableaux, it is slightly more efficient to construct a *StandardTableauTuple* from the appropriate parent object:

```
sage: STT = StandardTableauTuples()
sage: STT([[[4,5],[7]],[[1,2,3],[6,8]],[[9]]])
([[4, 5], [7]], [[1, 2, 3], [6, 8]], [[9]])
```

```
>>> from sage.all import *
>>> STT = StandardTableauTuples()
```

(continues on next page)

(continued from previous page)

```
>>> STT([[[Integer(4),Integer(5)],[Integer(7)]],[[Integer(1),Integer(2),
↪Integer(3)],[Integer(6),Integer(8)]],[[Integer(9)]]])
([[4, 5], [7]], [[1, 2, 3], [6, 8]], [[9]])
```

See also

- *Tableau*
- *Tableaux*
- *TableauTuples*
- *TableauTuple*
- *StandardTableauTuples*

dominates(*t*)

Return `True` if the tableau (tuple) `self` dominates the tableau `t`. The two tableaux do not need to be of the same shape.

EXAMPLES:

```
sage: s = StandardTableauTuple([[1,2,3],[4,5]])
sage: t = StandardTableauTuple([[1,2],[3,5],[4]])
sage: s.dominates(t)
True
sage: t.dominates(s)
False
```

```
>>> from sage.all import *
>>> s = StandardTableauTuple([[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(5)]])
>>> t = StandardTableauTuple([[Integer(1),Integer(2)],[Integer(3),Integer(5)],
↪[Integer(4)]])
>>> s.dominates(t)
True
>>> t.dominates(s)
False
```

restrict(*m=None*)

Return the restriction of the standard tableau `self` to `m`, which defaults to one less than the current *size()*.

EXAMPLES:

```
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).restrict(6)
([[5]], [[1, 2], [3, 4]])
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).restrict(5)
([[5]], [[1, 2], [3, 4]])
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).restrict(4)
([], [[1, 2], [3, 4]])
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).restrict(3)
([], [[1, 2], [3]])
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).restrict(2)
```

(continues on next page)

(continued from previous page)

```
([], [[1, 2]])
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).restrict(1)
([], [[1]])
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).restrict(0)
([], [])
```

```
>>> from sage.all import *
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(6))
([[5]], [[1, 2], [3, 4]])
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(5))
([[5]], [[1, 2], [3, 4]])
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(4))
([], [[1, 2], [3, 4]])
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(3))
([], [[1, 2], [3]])
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(2))
([], [[1, 2]])
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(1))
([], [[1]])
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(0))
([], [])
```

Where possible the restricted tableau belongs to the same category as the tableau `self`:

```
sage: TableauTuple([[[5]],[[1,2],[3,4]]]).restrict(3).category()
Category of elements of Tableau tuples
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).restrict(3).category()
Category of elements of Standard tableau tuples
sage: StandardTableauTuples([[1],[2,2]])([[[5]],[[1,2],[3,4]]]).restrict(3).
↪category()
Category of elements of Standard tableau tuples
sage: StandardTableauTuples(level=2)([[[5]],[[1,2],[3,4]]]).restrict(3).
↪category()
Category of elements of Standard tableau tuples of level 2
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(3)).category()
Category of elements of Tableau tuples
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(3)).category()
Category of elements of Standard tableau tuples
>>> StandardTableauTuples([[Integer(1)],[Integer(2),
↪Integer(2)]])([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(3)).category()
```

(continues on next page)

(continued from previous page)

```
Category of elements of Standard tableau tuples
>>> StandardTableauTuples(level=Integer(2))([[[Integer(5)]],[[Integer(1),
↪Integer(2)],[Integer(3),Integer(4)]]]).restrict(Integer(3)).category()
Category of elements of Standard tableau tuples of level 2
```

to_chain()

Return the chain of partitions corresponding to the standard tableau tuple `self`.

EXAMPLES:

```
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).to_chain()
[([], []),
  ([], [1]),
  ([], [2]),
  ([], [2, 1]),
  ([], [2, 2]),
  ([1], [2, 2])]
```

```
>>> from sage.all import *
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).to_chain()
[([], []),
  ([], [1]),
  ([], [2]),
  ([], [2, 1]),
  ([], [2, 2]),
  ([1], [2, 2])]
```

class sage.combinat.tableau_tuple.**StandardTableauTuples**

Bases: *RowStandardTableauTuples*

A factory class for the various classes of tuples of standard tableau.

INPUT:

There are three optional arguments:

- `level` – the *level()* of the tuples of tableaux
- `size` – the *size()* of the tuples of tableaux
- `shape` – list or a partition tuple specifying the *shape()* of the standard tableau tuples

It is not necessary to use the keywords. If they are not used then the first integer argument specifies the *level()* and the second the *size()* of the tableau tuples.

OUTPUT: the appropriate subclass of *StandardTableauTuples*

A tuple of standard tableau is a tableau whose entries are positive integers which increase from left to right along the rows, and from top to bottom down the columns, in each component. The entries do NOT need to increase from left to right along the components.

Note

Sage uses the English convention for (tuples of) partitions and tableaux: the longer rows are displayed on top. As with *PartitionTuple*, in sage the cells, or nodes, of partition tuples are 0-based. For example, the

(lexicographically) first cell in any non-empty partition tuple is $[0, 0, 0]$.

EXAMPLES:

```
sage: tabs=StandardTableauTuples([[3],[2,2]]); tabs
Standard tableau tuples of shape ([3], [2, 2])
sage: tabs.cardinality()
70
sage: tabs[10:16]
[([[1, 2, 3]], [[4, 6], [5, 7]]),
 ([[1, 2, 4]], [[3, 6], [5, 7]]),
 ([[1, 3, 4]], [[2, 6], [5, 7]]),
 ([[2, 3, 4]], [[1, 6], [5, 7]]),
 ([[1, 2, 5]], [[3, 6], [4, 7]]),
 ([[1, 3, 5]], [[2, 6], [4, 7]])]

sage: tabs=StandardTableauTuples(level=3); tabs
Standard tableau tuples of level 3
sage: tabs[100]                                                             #␣
↪needs sage.libs.flint
([[1, 2], [3]], [], [[4]])

sage: StandardTableauTuples()[0]                                            #␣
↪needs sage.libs.flint
()
```

```
>>> from sage.all import *
>>> tabs=StandardTableauTuples([[Integer(3)],[Integer(2),Integer(2)]]); tabs
Standard tableau tuples of shape ([3], [2, 2])
>>> tabs.cardinality()
70
>>> tabs[Integer(10):Integer(16)]
[([[1, 2, 3]], [[4, 6], [5, 7]]),
 ([[1, 2, 4]], [[3, 6], [5, 7]]),
 ([[1, 3, 4]], [[2, 6], [5, 7]]),
 ([[2, 3, 4]], [[1, 6], [5, 7]]),
 ([[1, 2, 5]], [[3, 6], [4, 7]]),
 ([[1, 3, 5]], [[2, 6], [4, 7]])]

>>> tabs=StandardTableauTuples(level=Integer(3)); tabs
Standard tableau tuples of level 3
>>> tabs[Integer(100)]                                                      ␣
↪     # needs sage.libs.flint
([[1, 2], [3]], [], [[4]])

>>> StandardTableauTuples()[Integer(0)]                                     ␣
↪     # needs sage.libs.flint
()
```

Element

alias of *StandardTableauTuple*

level_one_parent_class

alias of *StandardTableaux_all*

shape()

Return the shape of the set of *StandardTableauTuples*, or `None` if it is not defined.

EXAMPLES:

```
sage: tabs=StandardTableauTuples(shape=[[5,2],[3,2],[],[1,1,1],[3]]); tabs
Standard tableau tuples of shape ([5, 2], [3, 2], [], [1, 1, 1], [3])
sage: tabs.shape()
([5, 2], [3, 2], [], [1, 1, 1], [3])
sage: StandardTableauTuples().shape() is None
True
```

```
>>> from sage.all import *
>>> tabs=StandardTableauTuples(shape=[[Integer(5),Integer(2)],[Integer(3),
↪Integer(2)],[],[Integer(1),Integer(1),Integer(1)],[Integer(3)]]); tabs
Standard tableau tuples of shape ([5, 2], [3, 2], [], [1, 1, 1], [3])
>>> tabs.shape()
([5, 2], [3, 2], [], [1, 1, 1], [3])
>>> StandardTableauTuples().shape() is None
True
```

class sage.combinat.tableau_tuple.**StandardTableauTuples_all**

Bases: *StandardTableauTuples*, DisjointUnionEnumeratedSets

Default class of all *StandardTableauTuples* with an arbitrary *level()* and *size()*.

class sage.combinat.tableau_tuple.**StandardTableauTuples_level**(*level*)

Bases: *StandardTableauTuples*, DisjointUnionEnumeratedSets

Class of all *StandardTableauTuples* with a fixed `level` and arbitrary `size`.

an_element()

Return a particular element of the class.

EXAMPLES:

```
sage: StandardTableauTuples(size=2).an_element()
([[1]], [[2]], [], [])
sage: StandardTableauTuples(size=4).an_element()
([[1]], [[2, 3, 4]], [], [])
```

```
>>> from sage.all import *
>>> StandardTableauTuples(size=Integer(2)).an_element()
([[1]], [[2]], [], [])
>>> StandardTableauTuples(size=Integer(4)).an_element()
([[1]], [[2, 3, 4]], [], [])
```

class sage.combinat.tableau_tuple.**StandardTableauTuples_level_size**(*level*, *size*)

Bases: *StandardTableauTuples*, DisjointUnionEnumeratedSets

Class of all *StandardTableauTuples* with a fixed `level` and a fixed `size`.

an_element()

Return a particular element of the class.

EXAMPLES:

```
sage: StandardTableauTuples(5, size=2).an_element()                    #␣
↪needs sage.libs.flint
([], [], [], [], [[1], [2]])
sage: StandardTableauTuples(2, size=4).an_element()                    #␣
↪needs sage.libs.flint
([[1]], [[2, 3], [4]])
```

```
>>> from sage.all import *
>>> StandardTableauTuples(Integer(5), size=Integer(2)).an_element()          ␣
↪              # needs sage.libs.flint
([], [], [], [], [[1], [2]])
>>> StandardTableauTuples(Integer(2), size=Integer(4)).an_element()          ␣
↪              # needs sage.libs.flint
([[1]], [[2, 3], [4]])
```

cardinality()

Return the number of elements in this set of tableaux.

EXAMPLES:

```
sage: StandardTableauTuples(3,2).cardinality()                         #␣
↪needs sage.libs.flint
12
sage: StandardTableauTuples(4,6).cardinality()                         #␣
↪needs sage.libs.flint
31936
```

```
>>> from sage.all import *
>>> StandardTableauTuples(Integer(3),Integer(2)).cardinality()               ␣
↪              # needs sage.libs.flint
12
>>> StandardTableauTuples(Integer(4),Integer(6)).cardinality()               ␣
↪              # needs sage.libs.flint
31936
```

class sage.combinat.tableau_tuple.**StandardTableauTuples_shape**(*shape*)

Bases: *StandardTableauTuples*

Class of all *StandardTableauTuples* of a fixed shape.

an_element()

Return a particular element of the class.

EXAMPLES:

```
sage: StandardTableauTuples([[2],[2,1]]).an_element()
([[2, 4]], [[1, 3], [5]])
sage: StandardTableauTuples([[10],[],[]]).an_element()
([[1, 2, 3, 4, 5, 6, 7, 8, 9, 10]], [], [])
```

```
>>> from sage.all import *
>>> StandardTableauTuples([[Integer(2)],[Integer(2),Integer(1)]]).an_element()
([[2, 4]], [[1, 3], [5]])
>>> StandardTableauTuples([[Integer(10)],[],[]]).an_element()
([[1, 2, 3, 4, 5, 6, 7, 8, 9, 10]], [], [])
```

cardinality()

Return the number of standard Young tableau tuples of with the same shape as the partition tuple `self`.

Let $\mu = (\mu^{(1)}, \ldots, \mu^{(l)})$ be the `shape` of the tableaux in `self` and let $m_k = |\mu^{(k)}|$, for $1 \leq k \leq l$. Multiplying by a (unique) coset representative of the Young subgroup $S_{m_1} \times \cdots \times S_{m_l}$ inside the symmetric group S_n, we can assume that t is standard and the numbers $1, 2..., n$ are entered in order from to right along the components of the tableau. Therefore, there are

$$\binom{n}{m_1, \ldots, m_l} \prod_{k=1}^{l} |\mathrm{Std}(\mu^{(k)})|$$

standard tableau tuples of this shape, where $|\mathrm{Std}(\mu^{(k)})|$ is the number of standard tableau of shape $\mu^{(k)}$, for $1 \leq k \leq l$. This is given by the hook length formula.

EXAMPLES:

```
sage: StandardTableauTuples([[3,2,1],[]]).cardinality()
16
sage: StandardTableauTuples([[1],[1],[1]]).cardinality()
6
sage: StandardTableauTuples([[2,1],[1],[1]]).cardinality()
40
sage: StandardTableauTuples([[3,2,1],[3,2]]).cardinality()
36960
```

```
>>> from sage.all import *
>>> StandardTableauTuples([[Integer(3),Integer(2),Integer(1)],[]]).
↪cardinality()
16
>>> StandardTableauTuples([[Integer(1)],[Integer(1)],[Integer(1)]]).
↪cardinality()
6
>>> StandardTableauTuples([[Integer(2),Integer(1)],[Integer(1)],
↪[Integer(1)]]).cardinality()
40
>>> StandardTableauTuples([[Integer(3),Integer(2),Integer(1)],[Integer(3),
↪Integer(2)]]).cardinality()
36960
```

last()

Return the last standard tableau tuple in `self`, with respect to the order that they are generated by the iterator.

This is just the standard tableau tuple with the numbers $1, 2, \ldots, n$, where n is *size()*, entered in order down the columns form right to left along the components.

EXAMPLES:

```
sage: StandardTableauTuples([[2],[2,2]]).last().pp()
  5  6     1  3
           2  4
```

```
>>> from sage.all import *
>>> StandardTableauTuples([[Integer(2)],[Integer(2),Integer(2)]]).last().pp()
  5  6     1  3
           2  4
```

random_element()

Return a random standard tableau in `self`.

We do this by randomly selecting addable nodes to place $1, 2, \ldots, n$. Of course we could do this recursively, but it is more efficient to keep track of the (changing) list of addable nodes as we go.

EXAMPLES:

```
sage: StandardTableauTuples([[2],[2,1]]).random_element()  # random
([[1, 2]], [[3, 4], [5]])
```

```
>>> from sage.all import *
>>> StandardTableauTuples([[Integer(2)],[Integer(2),Integer(1)]]).random_
↪element()  # random
([[1, 2]], [[3, 4], [5]])
```

class sage.combinat.tableau_tuple.**StandardTableauTuples_size**(*size*)

Bases: *StandardTableauTuples*, DisjointUnionEnumeratedSets

Class of all *StandardTableauTuples* with an arbitrary `level` and a fixed `size`.

an_element()

Return a particular element of the class.

EXAMPLES:

```
sage: StandardTableauTuples(size=2).an_element()
([[1]], [[2]], [], [])
sage: StandardTableauTuples(size=4).an_element()
([[1]], [[2, 3, 4]], [], [])
```

```
>>> from sage.all import *
>>> StandardTableauTuples(size=Integer(2)).an_element()
([[1]], [[2]], [], [])
>>> StandardTableauTuples(size=Integer(4)).an_element()
([[1]], [[2, 3, 4]], [], [])
```

class sage.combinat.tableau_tuple.**StandardTableaux_residue**(*residue*)

Bases: *StandardTableauTuples*

Class of all standard tableau tuples with a fixed residue sequence.

Implicitly, this also specifies the quantum characteristic, multicharge and hence the level and size of the tableaux.

Note

This class is not intended to be called directly, but rather, it is accessed through the standard tableaux.

EXAMPLES:

```
sage: StandardTableau([[1,2,3],[4,5]]).residue_sequence(2).standard_tableaux()
Standard tableaux with 2-residue sequence (0,1,0,1,0) and multicharge (0)
sage: StandardTableau([[1,2,3],[4,5]]).residue_sequence(3).standard_tableaux()
Standard tableaux with 3-residue sequence (0,1,2,2,0) and multicharge (0)
sage: StandardTableauTuple([[[5,6],[7]],[[1,2,3],[4]]]).residue_sequence(2,(0,0)).
↪standard_tableaux()
Standard tableaux with 2-residue sequence (0,1,0,1,0,1,1) and multicharge (0,0)
sage: StandardTableauTuple([[[5,6],[7]],[[1,2,3],[4]]]).residue_sequence(3,(0,1)).
↪standard_tableaux()
Standard tableaux with 3-residue sequence (1,2,0,0,0,1,2) and multicharge (0,1)
```

```
>>> from sage.all import *
>>> StandardTableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]]).
↪residue_sequence(Integer(2)).standard_tableaux()
Standard tableaux with 2-residue sequence (0,1,0,1,0) and multicharge (0)
>>> StandardTableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]]).
↪residue_sequence(Integer(3)).standard_tableaux()
Standard tableaux with 3-residue sequence (0,1,2,2,0) and multicharge (0)
>>> StandardTableauTuple([[[Integer(5),Integer(6)],[Integer(7)]],[[Integer(1),
↪Integer(2),Integer(3)],[Integer(4)]]]).residue_sequence(Integer(2),(Integer(0),
↪Integer(0))).standard_tableaux()
Standard tableaux with 2-residue sequence (0,1,0,1,0,1,1) and multicharge (0,0)
>>> StandardTableauTuple([[[Integer(5),Integer(6)],[Integer(7)]],[[Integer(1),
↪Integer(2),Integer(3)],[Integer(4)]]]).residue_sequence(Integer(3),(Integer(0),
↪Integer(1))).standard_tableaux()
Standard tableaux with 3-residue sequence (1,2,0,0,0,1,2) and multicharge (0,1)
```

class sage.combinat.tableau_tuple.**StandardTableaux_residue_shape**(*residue*, *shape*)

Bases: *StandardTableaux_residue*

All standard tableau tuples with a fixed residue and shape.

INPUT:

- `shape` – the shape of the partitions or partition tuples
- `residue` – the residue sequence of the label

EXAMPLES:

```
sage: res = StandardTableauTuple([[[1,3],[6]],[[2,7],[4],[5]]]).residue_
↪sequence(3,(0,0))
```

(continues on next page)

(continued from previous page)

```
sage: tabs = res.standard_tableaux([[2,1],[2,1,1]]); tabs
Standard (2,1|2,1^2)-tableaux with 3-residue sequence (0,0,1,2,1,2,1) and␣
↪multicharge (0,0)
sage: tabs.shape()
([2, 1], [2, 1, 1])
sage: tabs.level()
2
sage: tabs[:6]
[([[2, 7], [6]], [[1, 3], [4], [5]]),
 ([[1, 7], [6]], [[2, 3], [4], [5]]),
 ([[2, 3], [6]], [[1, 7], [4], [5]]),
 ([[1, 3], [6]], [[2, 7], [4], [5]]),
 ([[2, 5], [6]], [[1, 3], [4], [7]]),
 ([[1, 5], [6]], [[2, 3], [4], [7]])]
```

```
>>> from sage.all import *
>>> res = StandardTableauTuple([[[Integer(1),Integer(3)],[Integer(6)]],
↪[[Integer(2),Integer(7)],[Integer(4)],[Integer(5)]]]).residue_
↪sequence(Integer(3),(Integer(0),Integer(0)))
>>> tabs = res.standard_tableaux([[Integer(2),Integer(1)],[Integer(2),Integer(1),
↪Integer(1)]]); tabs
Standard (2,1|2,1^2)-tableaux with 3-residue sequence (0,0,1,2,1,2,1) and␣
↪multicharge (0,0)
>>> tabs.shape()
([2, 1], [2, 1, 1])
>>> tabs.level()
2
>>> tabs[:Integer(6)]
[([[2, 7], [6]], [[1, 3], [4], [5]]),
 ([[1, 7], [6]], [[2, 3], [4], [5]]),
 ([[2, 3], [6]], [[1, 7], [4], [5]]),
 ([[1, 3], [6]], [[2, 7], [4], [5]]),
 ([[2, 5], [6]], [[1, 3], [4], [7]]),
 ([[1, 5], [6]], [[2, 3], [4], [7]])]
```

an_element()

Return a particular element of `self`.

EXAMPLES:

```
sage: T = StandardTableau([[1,3],[2]]).residue_sequence(3).standard_
↪tableaux([2,1])
sage: T.an_element()
[[1, 3], [2]]
```

```
>>> from sage.all import *
>>> T = StandardTableau([[Integer(1),Integer(3)],[Integer(2)]]).residue_
↪sequence(Integer(3)).standard_tableaux([Integer(2),Integer(1)])
>>> T.an_element()
[[1, 3], [2]]
```

class sage.combinat.tableau_tuple.**TableauTuple**(*parent*, *t*, *check=True*)

Bases: *CombinatorialElement*

A class to model a tuple of tableaux.

INPUT:

- `t` – list or tuple of *Tableau*, a list or tuple of lists of lists

OUTPUT: the Tableau tuple object constructed from `t`

A *TableauTuple* is a tuple of tableau of shape a *PartitionTuple*. These combinatorial objects are useful is several areas of algebraic combinatorics. In particular, they are important in:

- the representation theory of the complex reflection groups of type $G(l, 1, n)$ and the representation theory of the associated (degenerate and non-degenerate) Hecke algebras. See, for example, [DJM1998]
- the crystal theory of (quantum) affine special linear groups and its integral highest weight modules and their canonical bases. See, for example, [BK2009].

These apparently different and unrelated contexts are, in fact, intimately related as in characteristic zero the cyclotomic Hecke algebras categorify the canonical bases of the integral highest weight modules of the quantum affine special linear groups.

The *level()* of a tableau tuple is the length of the tuples. This corresponds to the level of the corresponding highest weight module.

In sage a *TableauTuple* looks and behaves like a real tuple of (level 1) *Tableaux*. Many of the operations which are defined on *Tableau* extend to *TableauTuples*. Tableau tuples of level 1 are just ordinary *Tableau*.

In sage, the entries of *Tableaux* can be very general, including arbitrarily nested lists, so some lists can be interpreted either as a tuple of tableaux or simply as tableaux. If it is possible to interpret the input to *TableauTuple* as a tuple of tableaux then *TableauTuple* returns the corresponding tuple. Given a 1-tuple of tableaux the tableau itself is returned.

EXAMPLES:

```
sage: t = TableauTuple([ [[6,9,10],[11]], [[1,2,3],[4,5]], [[7],[8]] ]); t
([[6, 9, 10], [11]], [[1, 2, 3], [4, 5]], [[7], [8]])
sage: t.level()
3
sage: t.size()
11
sage: t.shape()
([3, 1], [3, 2], [1, 1])
sage: t.is_standard()
True
sage: t.pp() # pretty printing
 6  9 10     1  2  3     7
11           4  5        8
sage: t.category()
Category of elements of Tableau tuples
sage: t.parent()
Tableau tuples

sage: s = TableauTuple([ [['a','c','b'],['d','e']],[[(2,1)]]]); s
([['a', 'c', 'b'], ['d', 'e']], [[(2, 1)]])
sage: s.shape()
([3, 2], [1])
sage: s.size()
6
```

(continues on next page)

(continued from previous page)

```
sage: TableauTuple([[],[],[]])  # The empty 3-tuple of tableaux
([], [], [])

sage: TableauTuple([[1,2,3],[4,5]])
[[1, 2, 3], [4, 5]]
sage: TableauTuple([[1,2,3],[4,5]]) == Tableau([[1,2,3],[4,5]])
True
```

```
>>> from sage.all import *
>>> t = TableauTuple([ [[Integer(6),Integer(9),Integer(10)],[Integer(11)]],␣
↪[[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]], [[Integer(7)],
↪[Integer(8)]] ]); t
([[6, 9, 10], [11]], [[1, 2, 3], [4, 5]], [[7], [8]])
>>> t.level()
3
>>> t.size()
11
>>> t.shape()
([3, 1], [3, 2], [1, 1])

```

cells_containing(*m*)

Return the list of cells in which the letter `m` appears in the tableau `self`.

The list is ordered with cells appearing from left to right.

EXAMPLES:

```
sage: t = TableauTuple([[[4,5]],[[1,1,2,4],[2,4,4],[4]],[[1,3,4],[3,4]]])
sage: t.cells_containing(4)
[(0, 0, 0),
  (1, 2, 0),
  (1, 1, 1),
  (1, 1, 2),
  (1, 0, 3),
  (2, 1, 1),
  (2, 0, 2)]
sage: t.cells_containing(6)
[]
```

```
>>> from sage.all import *
>>> t = TableauTuple([[[Integer(4),Integer(5)]],[[Integer(1),Integer(1),
↪Integer(2),Integer(4)],[Integer(2),Integer(4),Integer(4)],[Integer(4)]],
```

(continues on next page)

(continued from previous page)

```
↪[[Integer(1),Integer(3),Integer(4)],[Integer(3),Integer(4)]]])
>>> t.cells_containing(Integer(4))
[(0, 0, 0),
  (1, 2, 0),
  (1, 1, 1),
  (1, 1, 2),
  (1, 0, 3),
  (2, 1, 1),
  (2, 0, 2)]
>>> t.cells_containing(Integer(6))
[]
```

charge()

Return the charge of the reading word of `self`.

See *charge()* for more information.

EXAMPLES:

```
sage: TableauTuple([[[4,5]],[[1,1,2,4],[2,4,4],[4]],[[1,3,4],[3,4]]]).charge()
4
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(4),Integer(5)]],[[Integer(1),Integer(1),
↪Integer(2),Integer(4)],[Integer(2),Integer(4),Integer(4)],[Integer(4)]],
↪[[Integer(1),Integer(3),Integer(4)],[Integer(3),Integer(4)]]]).charge()
4
```

cocharge()

Return the cocharge of the reading word of `self`.

See *cocharge()* for more information.

EXAMPLES:

```
sage: TableauTuple([[[4,5]],[[1,1,2,4],[2,4,4],[4]],[[1,3,4],[3,4]]]).charge()
4
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(4),Integer(5)]],[[Integer(1),Integer(1),
↪Integer(2),Integer(4)],[Integer(2),Integer(4),Integer(4)],[Integer(4)]],
↪[[Integer(1),Integer(3),Integer(4)],[Integer(3),Integer(4)]]]).charge()
4
```

column_stabilizer()

Return the *sage.groups.perm_gps.permgroup.PermutationGroup()* corresponding to `self`. That is, return subgroup of the symmetric group of degree *size()* which is the column stabilizer of `self`.

EXAMPLES:

```
sage: # needs sage.groups
sage: t = TableauTuple([[[1,2,3],[4,5]],[[6,7]],[[8],[9]]])
sage: cs = t.column_stabilizer()
sage: cs.order()
```

(continues on next page)

(continued from previous page)

```
8
sage: PermutationGroupElement([(1,3,2),(4,5)]) in cs
False
sage: PermutationGroupElement([(1,4)]) in cs
True
```

```
>>> from sage.all import *
>>> # needs sage.groups
>>> t = TableauTuple([[[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(5)]],[[Integer(6),Integer(7)]],[[Integer(8)],[Integer(9)]]])
>>> cs = t.column_stabilizer()
>>> cs.order()
8
>>> PermutationGroupElement([(Integer(1),Integer(3),Integer(2)),(Integer(4),
↪Integer(5))]) in cs
False
>>> PermutationGroupElement([(Integer(1),Integer(4))]) in cs
True
```

components()

Return a list of the components of tableau tuple `self`.

The *components* are the individual *Tableau* which are contained in the tuple `self`.

For compatibility with *TableauTuples* of *level()* 1, *components()* should be used to iterate over the components of *TableauTuples*.

EXAMPLES:

```
sage: for t in TableauTuple([[1,2,3],[4,5]]).components(): t.pp()
  1  2  3
  4  5
sage: for t in TableauTuple([ [[1,2,3],[4,5]], [[6,7],[8,9]] ]).components():␣
↪t.pp()
  1  2  3
  4  5

  6  7
  8  9
```

```
>>> from sage.all import *
>>> for t in TableauTuple([[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(5)]]).components(): t.pp()
  1  2  3
  4  5
>>> for t in TableauTuple([ [[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(5)]], [[Integer(6),Integer(7)],[Integer(8),Integer(9)]] ]).
↪components(): t.pp()
  1  2  3
  4  5

  6  7
  8  9
```

conjugate()

Return the conjugate of the tableau tuple `self`.

The conjugate tableau tuple T' is the *TableauTuple* obtained from T by reversing the order of the components and conjugating each component – that is, swapping the rows and columns of the all of *Tableau* in T (see *sage.combinat.tableau.Tableau.conjugate()*).

EXAMPLES:

```
sage: TableauTuple([[[1,2],[3,4]],[[5,6,7],[8]],[[9,10],[11],[12]]]).
↪conjugate()
([[9, 11, 12], [10]], [[5, 8], [6], [7]], [[1, 3], [2, 4]])
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(1),Integer(2)],[Integer(3),Integer(4)]],
↪[[Integer(5),Integer(6),Integer(7)],[Integer(8)]],[[Integer(9),Integer(10)],
↪[Integer(11)],[Integer(12)]]]).conjugate()
([[9, 11, 12], [10]], [[5, 8], [6], [7]], [[1, 3], [2, 4]])
```

content(*k*, *multicharge*)

Return the content `k` in `self`.

The content of k in a standard tableau. That is, if k appears in row r and column c of the tableau, then we return $c - r + a_k$, where the multicharge is $(a_1, a_2, \ldots, a_l)$ and l is the level of the tableau.

The multicharge determines the dominant weight

$$\Lambda = \sum_{i=1}^{l} \Lambda_{a_i}$$

of the affine special linear group. In the combinatorics, the multicharge simply offsets the contents in each component so that the cell (k, r, c) has content $a_k + c - r$.

INPUT:

- `k` – integer in $\{1, 2, \ldots, n\}$
- `multicharge` – a sequence of integers of length l

Here l is the *level()* and n is the *size()* of `self`.

EXAMPLES:

```
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).content(3,[0,0])
-1
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).content(3,[0,1])
0
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).content(3,[0,2])
1
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).content(6,[0,2])
Traceback (most recent call last):
...
ValueError: 6 must be contained in the tableaux
```

```
>>> from sage.all import *
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).content(Integer(3),[Integer(0),Integer(0)])
-1
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).content(Integer(3),[Integer(0),Integer(1)])
```

(continues on next page)

(continued from previous page)

```
0
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).content(Integer(3),[Integer(0),Integer(2)])
1
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).content(Integer(6),[Integer(0),Integer(2)])
Traceback (most recent call last):
...
ValueError: 6 must be contained in the tableaux
```

entries()

Return a sorted list of all entries of `self`, in the order obtained by reading across the rows.

EXAMPLES:

```
sage: TableauTuple([[[1,2],[3,4]],[[5,6,7],[8]],[[9,10],[11],[12]]]).entries()
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12]
sage: TableauTuple([[[1,2],[3,4]],[[9,10],[11],[12]],[[5,6,7],[8]]]).entries()
[1, 2, 3, 4, 9, 10, 11, 12, 5, 6, 7, 8]
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(1),Integer(2)],[Integer(3),Integer(4)]],
↪[[Integer(5),Integer(6),Integer(7)],[Integer(8)]],[[Integer(9),Integer(10)],
↪[Integer(11)],[Integer(12)]]]).entries()
[1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12]
>>> TableauTuple([[[Integer(1),Integer(2)],[Integer(3),Integer(4)]],
↪[[Integer(9),Integer(10)],[Integer(11)],[Integer(12)]],[[Integer(5),
↪Integer(6),Integer(7)],[Integer(8)]]]).entries()
[1, 2, 3, 4, 9, 10, 11, 12, 5, 6, 7, 8]
```

entry(l, r, c)

Return the entry of the cell `(l, r, c)` in `self`.

A cell is a tuple `(l, r, c)` of coordinates, where `l` is the component index, `r` is the row index, and `c` is the column index.

EXAMPLES:

```
sage: t = TableauTuple([[[1,2],[3,4]],[[5,6,7],[8]],[[9,10],[11],[12]]])
sage: t.entry(1, 0, 0)
5
sage: t.entry(1, 1, 1)
Traceback (most recent call last):
...
IndexError: tuple index out of range
```

```
>>> from sage.all import *
>>> t = TableauTuple([[[Integer(1),Integer(2)],[Integer(3),Integer(4)]],
↪[[Integer(5),Integer(6),Integer(7)],[Integer(8)]],[[Integer(9),Integer(10)],
↪[Integer(11)],[Integer(12)]]])
>>> t.entry(Integer(1), Integer(0), Integer(0))
5
>>> t.entry(Integer(1), Integer(1), Integer(1))
```

(continues on next page)

(continued from previous page)

```
Traceback (most recent call last):
...
IndexError: tuple index out of range
```

first_column_descent()

Return the first cell of `self` is not column standard.

Cells are ordered left to right along the rows and then top to bottom. That is, return the cell (k, r, c) with (k, r, c) minimal such that the entry in position (k, r, c) is bigger than the entry in position $(k, r, c+1)$. If there is no such cell then `None` is returned - in this case the tableau is column strict.

OUTPUT:

The cell corresponding to the first column descent or `None` if the tableau is column strict.

EXAMPLES:

```
sage: TableauTuple([[[3,5,6],[2,4,5]],[[1,4,5],[2,3]]]).first_column_descent()
(0, 0, 0)
sage: Tableau([[[1,2,3],[4]],[[5,6,7],[8,9]]]).first_column_descent() is None
True
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(3),Integer(5),Integer(6)],[Integer(2),Integer(4),
↪Integer(5)]],[[Integer(1),Integer(4),Integer(5)],[Integer(2),Integer(3)]]]).
↪first_column_descent()
(0, 0, 0)
>>> Tableau([[[Integer(1),Integer(2),Integer(3)],[Integer(4)]],[[Integer(5),
↪Integer(6),Integer(7)],[Integer(8),Integer(9)]]]).first_column_descent() is␣
↪None
True
```

first_row_descent()

Return the first cell of `self` that is not row standard.

Cells are ordered left to right along the rows and then top to bottom. That is, the cell minimal (k, r, c) such that the entry in position (k, r, c) is bigger than the entry in position $(k, r, c+1)$. If there is no such cell then `None` is returned - in this case the tableau is row strict.

OUTPUT:

The cell corresponding to the first row descent or `None` if the tableau is row strict.

EXAMPLES:

```
sage: TableauTuple([[[5,6,7],[1,2]],[[1,3,2],[4]]]).first_row_descent()
(1, 0, 1)
sage: TableauTuple([[[1,2,3],[4]],[[6,7,8],[1,2,3]],[[1,11]]]).first_row_
↪descent() is None
True
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(5),Integer(6),Integer(7)],[Integer(1),
↪Integer(2)]],[[Integer(1),Integer(3),Integer(2)],[Integer(4)]]]).first_row_
↪descent()
```

(continues on next page)

(continued from previous page)

```
(1, 0, 1)
>>> TableauTuple([[[Integer(1),Integer(2),Integer(3)],[Integer(4)]],
↪[[Integer(6),Integer(7),Integer(8)],[Integer(1),Integer(2),Integer(3)]],
↪[[Integer(1),Integer(11)]]]).first_row_descent() is None
True
```

is_column_strict()

Return `True` if the tableau `self` is column strict and `False` otherwise.

A tableau tuple is *column strict* if the entries in each column of each component are in increasing order, when read from top to bottom.

EXAMPLES:

```
sage: TableauTuple([[[5,7],[8]],[[1, 3], [2, 4]],[[6]]]).is_column_strict()
True
sage: TableauTuple([[[1, 2], [2, 4]],[[4,5,6],[7,8]]]).is_column_strict()
True
sage: TableauTuple([[[1]],[[2, 3], [2, 4]]]).is_column_strict()
False
sage: TableauTuple([[[1]],[[2, 2], [4,5]]]).is_column_strict()
True
sage: TableauTuple([[[1,2],[6,7]],[[4,8], [6, 9]],[]]).is_column_strict()
True
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(5),Integer(7)],[Integer(8)]],[[Integer(1),␣
↪Integer(3)], [Integer(2), Integer(4)]],[[Integer(6)]]]).is_column_strict()
True
>>> TableauTuple([[[Integer(1), Integer(2)], [Integer(2), Integer(4)]],
↪[[Integer(4),Integer(5),Integer(6)],[Integer(7),Integer(8)]]]).is_column_
↪strict()
True
>>> TableauTuple([[[Integer(1)]],[[Integer(2), Integer(3)], [Integer(2),␣
↪Integer(4)]]]).is_column_strict()
False
>>> TableauTuple([[[Integer(1)]],[[Integer(2), Integer(2)], [Integer(4),
↪Integer(5)]]]).is_column_strict()
True
>>> TableauTuple([[[Integer(1),Integer(2)],[Integer(6),Integer(7)]],
↪[[Integer(4),Integer(8)], [Integer(6), Integer(9)]],[]]).is_column_strict()
True
```

is_row_strict()

Return `True` if the tableau `self` is row strict and `False` otherwise.

A tableau tuple is *row strict* if the entries in each row of each component are in increasing order, when read from left to right.

EXAMPLES:

```
sage: TableauTuple([[[5,7],[8]],[[1, 3], [2, 4]],[[6]]]).is_row_strict()
True
sage: TableauTuple([[[1, 2], [2, 4]],[[4,5,6],[7,8]]]).is_row_strict()
```

(continues on next page)

(continued from previous page)

```
True
sage: TableauTuple([[[1]],[[2, 3], [2, 4]]]).is_row_strict()
True
sage: TableauTuple([[[1]],[[2, 2], [4,5]]]).is_row_strict()
False
sage: TableauTuple([[[1,2],[6,7]],[[4,8], [6, 9]],[]]).is_row_strict()
True
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(5),Integer(7)],[Integer(8)]],[[Integer(1),␣
↪Integer(3)], [Integer(2), Integer(4)]],[[Integer(6)]]]).is_row_strict()
True
>>> TableauTuple([[[Integer(1), Integer(2)], [Integer(2), Integer(4)]],
↪[[Integer(4),Integer(5),Integer(6)],[Integer(7),Integer(8)]]]).is_row_
↪strict()
True
>>> TableauTuple([[[Integer(1)]],[[Integer(2), Integer(3)], [Integer(2),␣
↪Integer(4)]]]).is_row_strict()
True
>>> TableauTuple([[[Integer(1)]],[[Integer(2), Integer(2)], [Integer(4),
↪Integer(5)]]]).is_row_strict()
False
>>> TableauTuple([[[Integer(1),Integer(2)],[Integer(6),Integer(7)]],
↪[[Integer(4),Integer(8)], [Integer(6), Integer(9)]],[]]).is_row_strict()
True
```

is_standard()

Return `True` if the tableau `self` is a standard tableau and `False` otherwise.

A tableau tuple is *standard* if it is row standard, column standard and the entries in the tableaux are $1, 2, \ldots, n$, where n is the *size()* of the underlying partition tuple of `self`.

EXAMPLES:

```
sage: TableauTuple([[[5,7],[8]],[[1, 3], [2, 4]],[[6]]]).is_standard()
True
sage: TableauTuple([[[1, 2], [2, 4]],[[4,5,6],[7,8]]]).is_standard()
False
sage: TableauTuple([[[1]],[[2, 3], [2, 4]]]).is_standard()
False
sage: TableauTuple([[[1]],[[2, 2], [4,5]]]).is_row_strict()
False
sage: TableauTuple([[[1,2],[6,7]],[[4,8], [6, 9]],[]]).is_standard()
False
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(5),Integer(7)],[Integer(8)]],[[Integer(1),␣
↪Integer(3)], [Integer(2), Integer(4)]],[[Integer(6)]]]).is_standard()
True
>>> TableauTuple([[[Integer(1), Integer(2)], [Integer(2), Integer(4)]],
↪[[Integer(4),Integer(5),Integer(6)],[Integer(7),Integer(8)]]]).is_standard()
False
```

(continues on next page)

(continued from previous page)

```
>>> TableauTuple([[[Integer(1)]],[[Integer(2), Integer(3)], [Integer(2),␣
↪Integer(4)]]]).is_standard()
False
>>> TableauTuple([[[Integer(1)]],[[Integer(2), Integer(2)], [Integer(4),
↪Integer(5)]]]).is_row_strict()
False
>>> TableauTuple([[[Integer(1),Integer(2)],[Integer(6),Integer(7)]],
↪[[Integer(4),Integer(8)], [Integer(6), Integer(9)]],[]]).is_standard()
False
```

level()

Return the level of the tableau `self`.

This is just the number of components in the tableau tuple `self`.

EXAMPLES:

```
sage: TableauTuple([[[7,8,9]],[],[[1,2,3],[4,5],[6]]]).level()
3
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(7),Integer(8),Integer(9)]],[],[[Integer(1),
↪Integer(2),Integer(3)],[Integer(4),Integer(5)],[Integer(6)]]]).level()
3
```

pp()

Pretty printing for the tableau tuple `self`.

EXAMPLES:

```
sage: TableauTuple([ [[1,2,3],[4,5]], [[1,2,3],[4,5]] ]).pp()
  1  2  3     1  2  3
  4  5        4  5
sage: TableauTuple([ [[1,2],[3],[4]],[],[[6,7,8],[10,11],[12],[13]]]).pp()
  1  2     -     6  7  8
  3             10 11
  4             12
                13
sage: t = TableauTuple([ [[1,2,3],[4,5],[6],[9]], [[1,2,3],[4,5,8]], [[11,12,
↪13],[14]] ])
sage: t.pp()
  1  2  3     1  2  3    11 12 13
  4  5        4  5  8    14
  6
  9
sage: TableauTuples.options(convention='french')
sage: t.pp()
  9
  6
  4  5        4  5  8    14
  1  2  3     1  2  3    11 12 13
sage: TableauTuples.options._reset()
```

```
>>> from sage.all import *
>>> TableauTuple([ [[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(5)]], [[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]]␣
↪]).pp()
  1  2  3     1  2  3
  4  5        4  5
>>> TableauTuple([ [[Integer(1),Integer(2)],[Integer(3)],[Integer(4)]],[],
↪[[Integer(6),Integer(7),Integer(8)],[Integer(10),Integer(11)],[Integer(12)],
↪[Integer(13)]]]).pp()
  1  2     -     6  7  8
  3             10 11
  4             12
                13
>>> t = TableauTuple([ [[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(5)],[Integer(6)],[Integer(9)]], [[Integer(1),Integer(2),Integer(3)],
↪[Integer(4),Integer(5),Integer(8)]], [[Integer(11),Integer(12),Integer(13)],
↪[Integer(14)]] ])
>>> t.pp()
  1  2  3     1  2  3    11 12 13
  4  5        4  5  8    14
  6
  9
>>> TableauTuples.options(convention='french')
>>> t.pp()
  9
  6
  4  5        4  5  8    14
  1  2  3     1  2  3    11 12 13
>>> TableauTuples.options._reset()
```

reduced_column_word()

Return the lexicographically minimal reduced expression for the permutation that maps the *initial_column_tableau()* to `self`.

This reduced expression is a minimal length coset representative for the corresponding Young subgroup. In one line notation, the permutation is obtained by concatenating the rows of the tableau from top to bottom in each component, and then left to right along the components.

EXAMPLES:

```
sage: StandardTableauTuple([[[7,9],[8]],[[1,4,6],[2,5],[3]]]).reduced_column_
↪word()
[]
sage: StandardTableauTuple([[[7,9],[8]],[[1,3,6],[2,5],[4]]]).reduced_column_
↪word()
[3]
sage: StandardTableauTuple([[[6,9],[8]],[[1,3,7],[2,5],[4]]]).reduced_column_
↪word()
[3, 6]
sage: StandardTableauTuple([[[6,8],[9]],[[1,3,7],[2,5],[4]]]).reduced_column_
↪word()
[3, 6, 8]
sage: StandardTableauTuple([[[5,8],[9]],[[1,3,7],[2,6],[4]]]).reduced_column_
↪word()
```

(continues on next page)

(continued from previous page)

```
[3, 6, 5, 8]
```

```
>>> from sage.all import *
>>> StandardTableauTuple([[[Integer(7),Integer(9)],[Integer(8)]],[[Integer(1),
↪Integer(4),Integer(6)],[Integer(2),Integer(5)],[Integer(3)]]]).reduced_
↪column_word()
[]
>>> StandardTableauTuple([[[Integer(7),Integer(9)],[Integer(8)]],[[Integer(1),
↪Integer(3),Integer(6)],[Integer(2),Integer(5)],[Integer(4)]]]).reduced_
↪column_word()
[3]
>>> StandardTableauTuple([[[Integer(6),Integer(9)],[Integer(8)]],[[Integer(1),
↪Integer(3),Integer(7)],[Integer(2),Integer(5)],[Integer(4)]]]).reduced_
↪column_word()
[3, 6]
>>> StandardTableauTuple([[[Integer(6),Integer(8)],[Integer(9)]],[[Integer(1),
↪Integer(3),Integer(7)],[Integer(2),Integer(5)],[Integer(4)]]]).reduced_
↪column_word()
[3, 6, 8]
>>> StandardTableauTuple([[[Integer(5),Integer(8)],[Integer(9)]],[[Integer(1),
↪Integer(3),Integer(7)],[Integer(2),Integer(6)],[Integer(4)]]]).reduced_
↪column_word()
[3, 6, 5, 8]
```

reduced_row_word()

Return the lexicographically minimal reduced expression for the permutation that maps the *initial_tableau()* to `self`.

This reduced expression is a minimal length coset representative for the corresponding Young subgroup. In one line notation, the permutation is obtained by concatenating the rows of the tableau from top to bottom in each component, and then left to right along the components.

EXAMPLES:

```
sage: StandardTableauTuple([[[1,2],[3]],[[4,5,6],[7,8],[9]]]).reduced_row_
↪word()
[]
sage: StandardTableauTuple([[[1,2],[3]],[[4,5,6],[7,9],[8]]]).reduced_row_
↪word()
[8]
sage: StandardTableauTuple([[[1,2],[3]],[[4,5,7],[6,9],[8]]]).reduced_row_
↪word()
[6, 8]
sage: StandardTableauTuple([[[1,2],[3]],[[4,5,8],[6,9],[7]]]).reduced_row_
↪word()
[6, 8, 7]
sage: StandardTableauTuple([[[1,2],[3]],[[4,5,9],[6,8],[7]]]).reduced_row_
↪word()
[6, 7, 8, 7]
sage: StandardTableauTuple([[[7,9],[8]],[[1,3,5],[2,6],[4]]]).reduced_row_
↪word()
[2, 3, 2, 1, 4, 3, 2, 5, 4, 3, 6, 5, 4, 3, 2, 7, 6, 5, 8, 7, 6, 5, 4]
```

```
>>> from sage.all import *
>>> StandardTableauTuple([[[Integer(1),Integer(2)],[Integer(3)]],[[Integer(4),
↪Integer(5),Integer(6)],[Integer(7),Integer(8)],[Integer(9)]]]).reduced_row_
↪word()
[]
>>> StandardTableauTuple([[[Integer(1),Integer(2)],[Integer(3)]],[[Integer(4),
↪Integer(5),Integer(6)],[Integer(7),Integer(9)],[Integer(8)]]]).reduced_row_
↪word()
[8]
>>> StandardTableauTuple([[[Integer(1),Integer(2)],[Integer(3)]],[[Integer(4),
↪Integer(5),Integer(7)],[Integer(6),Integer(9)],[Integer(8)]]]).reduced_row_
↪word()
[6, 8]
>>> StandardTableauTuple([[[Integer(1),Integer(2)],[Integer(3)]],[[Integer(4),
↪Integer(5),Integer(8)],[Integer(6),Integer(9)],[Integer(7)]]]).reduced_row_
↪word()
[6, 8, 7]
>>> StandardTableauTuple([[[Integer(1),Integer(2)],[Integer(3)]],[[Integer(4),
↪Integer(5),Integer(9)],[Integer(6),Integer(8)],[Integer(7)]]]).reduced_row_
↪word()
[6, 7, 8, 7]
>>> StandardTableauTuple([[[Integer(7),Integer(9)],[Integer(8)]],[[Integer(1),
↪Integer(3),Integer(5)],[Integer(2),Integer(6)],[Integer(4)]]]).reduced_row_
↪word()
[2, 3, 2, 1, 4, 3, 2, 5, 4, 3, 6, 5, 4, 3, 2, 7, 6, 5, 8, 7, 6, 5, 4]
```

residue(*k*, *e*, *multicharge*)

Return the *residue* of the integer `k` in the tableau `self`.

The *residue* of k is $c - r + a_k$ in $\mathbf{Z}/e\mathbf{Z}$, where k appears in row r and column c of the tableau and the multicharge is $(a_1, a_2, \ldots, a_l)$.

The multicharge determines the dominant weight

$$\sum_{i=1}^{l} \Lambda_{a_i}$$

for the affine special linear group. In the combinatorics, it simply offsets the contents in each component so that the cell $(k, 0, 0)$ has content a_k.

INPUT:

- `k` – integer in $\{1, 2, \ldots, n\}$
- `e` – integer in $\{0, 2, 3, 4, 5, \ldots\}$
- `multicharge` – list of integers of length l

Here l is the *level()* and n is the *size()* of `self`.

OUTPUT: the residue of `k` in a standard tableau. That is,

EXAMPLES:

```
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).residue(1, 3,[0,0])
0
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).residue(1, 3,[0,1])
```

(continues on next page)

(continued from previous page)

```
1
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).residue(1, 3,[0,2])
2
sage: StandardTableauTuple([[[5]],[[1,2],[3,4]]]).residue(6, 3,[0,2])
Traceback (most recent call last):
...
ValueError: 6 must be contained in the tableaux
```

```
>>> from sage.all import *
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).residue(Integer(1), Integer(3),[Integer(0),Integer(0)])
0
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).residue(Integer(1), Integer(3),[Integer(0),Integer(1)])
1
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).residue(Integer(1), Integer(3),[Integer(0),Integer(2)])
2
>>> StandardTableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).residue(Integer(6), Integer(3),[Integer(0),Integer(2)])
Traceback (most recent call last):
...
ValueError: 6 must be contained in the tableaux
```

restrict(*m=None*)

Return the restriction of the standard tableau `self` to `m`.

The restriction is the subtableau of `self` whose entries are less than or equal to `m`.

By default, `m` is one less than the current size.

EXAMPLES:

```
sage: TableauTuple([[[5]],[[1,2],[3,4]]]).restrict()
([], [[1, 2], [3, 4]])
sage: TableauTuple([[[5]],[[1,2],[3,4]]]).restrict(6)
([[5]], [[1, 2], [3, 4]])
sage: TableauTuple([[[5]],[[1,2],[3,4]]]).restrict(5)
([[5]], [[1, 2], [3, 4]])
sage: TableauTuple([[[5]],[[1,2],[3,4]]]).restrict(4)
([], [[1, 2], [3, 4]])
sage: TableauTuple([[[5]],[[1,2],[3,4]]]).restrict(3)
([], [[1, 2], [3]])
sage: TableauTuple([[[5]],[[1,2],[3,4]]]).restrict(2)
([], [[1, 2]])
sage: TableauTuple([[[5]],[[1,2],[3,4]]]).restrict(1)
([], [[1]])
sage: TableauTuple([[[5]],[[1,2],[3,4]]]).restrict(0)
([], [])
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict()
```

(continues on next page)

(continued from previous page)

```
([], [[1, 2], [3, 4]])
>>> TableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(6))
([[5]], [[1, 2], [3, 4]])
>>> TableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(5))
([[5]], [[1, 2], [3, 4]])
>>> TableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(4))
([], [[1, 2], [3, 4]])
>>> TableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(3))
([], [[1, 2], [3]])
>>> TableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(2))
([], [[1, 2]])
>>> TableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(1))
([], [[1]])
>>> TableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(0))
([], [])
```

Where possible the restricted tableau belongs to the same category as the original tableaux:

```
sage: TableauTuple([[[5]],[[1,2],[3,4]]]).restrict(3).category()
Category of elements of Tableau tuples
sage: TableauTuple([[[5]],[[1,2],[3,4]]]).restrict(3).category()
Category of elements of Tableau tuples
sage: TableauTuples(level=2)([[[5]],[[1,2],[3,4]]]).restrict(3).category()
Category of elements of Tableau tuples of level 2
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(3)).category()
Category of elements of Tableau tuples
>>> TableauTuple([[[Integer(5)]],[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]]]).restrict(Integer(3)).category()
Category of elements of Tableau tuples
>>> TableauTuples(level=Integer(2))([[[Integer(5)]],[[Integer(1),Integer(2)],
↪[Integer(3),Integer(4)]]]).restrict(Integer(3)).category()
Category of elements of Tableau tuples of level 2
```

row_stabilizer()

Return the sage.groups.perm_gps.permgroup.PermutationGroup() corresponding to self. That is, return subgroup of the symmetric group of degree *size()* which is the row stabilizer of self.

EXAMPLES:

```
sage: # needs sage.groups
sage: t = TableauTuple([[[1,2,3],[4,5]],[[6,7]],[[8],[9]]])
sage: rs = t.row_stabilizer()
```

(continues on next page)

(continued from previous page)

```
sage: rs.order()
24
sage: PermutationGroupElement([(1,3,2),(4,5)]) in rs
True
sage: PermutationGroupElement([(1,4)]) in rs
False
sage: rs.one().domain()
[1, 2, 3, 4, 5, 6, 7, 8, 9]
```

```
>>> from sage.all import *
>>> # needs sage.groups
>>> t = TableauTuple([[[Integer(1),Integer(2),Integer(3)],[Integer(4),
...Integer(5)]],[[Integer(6),Integer(7)]],[[Integer(8)],[Integer(9)]]])
>>> rs = t.row_stabilizer()
>>> rs.order()
24
>>> PermutationGroupElement([(Integer(1),Integer(3),Integer(2)),(Integer(4),
...Integer(5))]) in rs
True
>>> PermutationGroupElement([(Integer(1),Integer(4))]) in rs
False
>>> rs.one().domain()
[1, 2, 3, 4, 5, 6, 7, 8, 9]
```

shape()

Return the *PartitionTuple* which is the shape of the tableau tuple `self`.

EXAMPLES:

```
sage: TableauTuple([[[7,8,9]],[],[[1,2,3],[4,5],[6]]]).shape()
([3], [], [3, 2, 1])
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(7),Integer(8),Integer(9)]],[],[[Integer(1),
...Integer(2),Integer(3)],[Integer(4),Integer(5)],[Integer(6)]]]).shape()
([3], [], [3, 2, 1])
```

size()

Return the size of the tableau tuple `self`.

This is just the number of boxes, or the size, of the underlying *PartitionTuple*.

EXAMPLES:

```
sage: TableauTuple([[[7,8,9]],[],[[1,2,3],[4,5],[6]]]).size()
9
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(7),Integer(8),Integer(9)]],[],[[Integer(1),
...Integer(2),Integer(3)],[Integer(4),Integer(5)],[Integer(6)]]]).size()
9
```

symmetric_group_action_on_entries(*w*)

Return the action of a permutation `w` on `self`.

Consider a standard tableau tuple $T = (t^{(1)}, t^{(2)}, \dots t^{(l)})$ of size n, then the action of $w \in S_n$ is defined by permuting the entries of T (recall they are $1, 2, \dots, n$). In particular, suppose the entry at cell (k, i, j) is a, then the entry becomes $w(a)$. In general, the resulting tableau tuple wT may *not* be standard.

INPUT:

- `w` – a permutation

EXAMPLES:

```
sage: TableauTuple([[[1,2],[4]],[[3,5]]]).symmetric_group_action_on_entries(␣
↪Permutation(((4,5))) )
([[1, 2], [5]], [[3, 4]])
sage: TableauTuple([[[1,2],[4]],[[3,5]]]).symmetric_group_action_on_entries(␣
↪Permutation(((1,2))) )
([[2, 1], [4]], [[3, 5]])
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(1),Integer(2)],[Integer(4)]],[[Integer(3),
↪Integer(5)]]]).symmetric_group_action_on_entries( Permutation(((Integer(4),
↪Integer(5)))) )
([[1, 2], [5]], [[3, 4]])
>>> TableauTuple([[[Integer(1),Integer(2)],[Integer(4)]],[[Integer(3),
↪Integer(5)]]]).symmetric_group_action_on_entries( Permutation(((Integer(1),
↪Integer(2)))) )
([[2, 1], [4]], [[3, 5]])
```

to_list()

Return the list representation of the tableaux tuple `self`.

EXAMPLES:

```
sage: TableauTuple([ [[1,2,3],[4,5]], [[6,7],[8,9]] ]).to_list()
[[[1, 2, 3], [4, 5]], [[6, 7], [8, 9]]]
```

```
>>> from sage.all import *
>>> TableauTuple([ [[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(5)]], [[Integer(6),Integer(7)],[Integer(8),Integer(9)]] ]).to_list()
[[[1, 2, 3], [4, 5]], [[6, 7], [8, 9]]]
```

to_permutation()

Return a permutation with the entries in the tableau tuple `self`.

The permutation is obtained from `self` by reading the entries of the tableau tuple in order from left to right along the rows, and then top to bottom, in each component and then left to right along the components.

EXAMPLES:

```
sage: TableauTuple([[[1,2],[3,4]],[[5,6,7],[8]],[[9,10],[11],[12]]]).to_
↪permutation()
[12, 11, 9, 10, 8, 5, 6, 7, 3, 4, 1, 2]
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(1),Integer(2)],[Integer(3),Integer(4)]],
↪[[Integer(5),Integer(6),Integer(7)],[Integer(8)]],[[Integer(9),Integer(10)],
↪[Integer(11)],[Integer(12)]]]).to_permutation()
[12, 11, 9, 10, 8, 5, 6, 7, 3, 4, 1, 2]
```

to_word()

alias of *to_word_by_row()*.

to_word_by_column()

Return the word obtained from a column reading of the tableau tuple `self`.

EXAMPLES:

```
sage: TableauTuple([[[1,2],[3,4]],[[5,6,7],[8]],[[9,10],[11],[12]]]).to_word_
↪by_column()
word: 12,11,9,10,8,5,6,7,3,1,4,2
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(1),Integer(2)],[Integer(3),Integer(4)]],
↪[[Integer(5),Integer(6),Integer(7)],[Integer(8)]],[[Integer(9),Integer(10)],
↪[Integer(11)],[Integer(12)]]]).to_word_by_column()
word: 12,11,9,10,8,5,6,7,3,1,4,2
```

to_word_by_row()

Return a word obtained from a row reading of the tableau tuple `self`.

EXAMPLES:

```
sage: TableauTuple([[[1,2],[3,4]],[[5,6,7],[8]],[[9,10],[11],[12]]]).to_word_
↪by_row()
word: 12,11,9,10,8,5,6,7,3,4,1,2
```

```
>>> from sage.all import *
>>> TableauTuple([[[Integer(1),Integer(2)],[Integer(3),Integer(4)]],
↪[[Integer(5),Integer(6),Integer(7)],[Integer(8)]],[[Integer(9),Integer(10)],
↪[Integer(11)],[Integer(12)]]]).to_word_by_row()
word: 12,11,9,10,8,5,6,7,3,4,1,2
```

up(*n=None*)

An iterator for all the *TableauTuple* that can be obtained from `self` by adding a cell with the label `n`. If `n` is not specified then a cell with label `n` will be added to the tableau tuple, where `n-1` is the size of the tableau tuple before any cells are added.

EXAMPLES:

```
sage: list(TableauTuple([[[1,2]],[[3]]]).up())
[([[1, 2, 4]], [[3]]),
 ([[1, 2], [4]], [[3]]),
 ([[1, 2]], [[3, 4]]),
 ([[1, 2]], [[3], [4]])]
```

```
>>> from sage.all import *
>>> list(TableauTuple([[[Integer(1),Integer(2)]],[[Integer(3)]]]).up())
[([[1, 2, 4]], [[3]]),
 ([[1, 2], [4]], [[3]]),
 ([[1, 2]], [[3, 4]]),
 ([[1, 2]], [[3], [4]])]
```

class sage.combinat.tableau_tuple.**TableauTuples**

Bases: UniqueRepresentation, Parent

A factory class for the various classes of tableau tuples.

INPUT:

There are three optional arguments:

- `shape` – determines a *PartitionTuple* which gives the shape of the *TableauTuples*
- `level` – the level of the tableau tuples (positive integer)
- `size` – the size of the tableau tuples (nonnegative integer)

It is not necessary to use the keywords. If they are not specified then the first integer argument specifies the `level` and the second the `size` of the tableaux.

OUTPUT: the corresponding class of tableau tuples

The entries of a tableau can be any sage object. Because of this, no enumeration of the set of *TableauTuples* is possible.

EXAMPLES:

```
sage: T3 = TableauTuples(3); T3
Tableau tuples of level 3
sage: [['a','b']] in TableauTuples()
True
sage: [['a','b']] in TableauTuples(level=3)
False
sage: t = TableauTuples(level=3)([[],[[1,1,1]],[]]); t
([], [[1, 1, 1]], [])
sage: t in T3
True
sage: t in TableauTuples()
True
sage: t in TableauTuples(size=3)
True
sage: t in TableauTuples(size=4)
False
sage: t in StandardTableauTuples()
False
sage: t.parent()
Tableau tuples of level 3
sage: t.category()
Category of elements of Tableau tuples of level 3
```

```
>>> from sage.all import *
>>> T3 = TableauTuples(Integer(3)); T3
```

(continues on next page)

(continued from previous page)

```
Tableau tuples of level 3
>>> [['a','b']] in TableauTuples()
True
>>> [['a','b']] in TableauTuples(level=Integer(3))
False
>>> t = TableauTuples(level=Integer(3))([[],[[Integer(1),Integer(1),Integer(1)]],
↪[]]); t
([], [[1, 1, 1]], [])
>>> t in T3
True
>>> t in TableauTuples()
True
>>> t in TableauTuples(size=Integer(3))
True
>>> t in TableauTuples(size=Integer(4))
False
>>> t in StandardTableauTuples()
False
>>> t.parent()
Tableau tuples of level 3
>>> t.category()
Category of elements of Tableau tuples of level 3
```

See also

- *Tableau*
- *StandardTableau*
- *StandardTableauTuples*

Element

alias of *TableauTuple*

level()

Return the `level` of a tableau tuple in `self`, or `None` if different tableau tuples in `self` can have different sizes. The `level` of a tableau tuple is just the level of the underlying *PartitionTuple*.

EXAMPLES:

```
sage: TableauTuples().level() is None
True
sage: TableauTuples(7).level()
7
```

```
>>> from sage.all import *
>>> TableauTuples().level() is None
True
>>> TableauTuples(Integer(7)).level()
7
```

level_one_parent_class

alias of *Tableaux_all*

list()

If the set of tableau tuples `self` is finite then this function returns the list of these tableau tuples. If the class is infinite an error is returned.

EXAMPLES:

```
sage: StandardTableauTuples([[2,1],[2]]).list()
[([[1, 2], [3]], [[4, 5]]),
 ([[1, 3], [2]], [[4, 5]]),
 ([[1, 2], [4]], [[3, 5]]),
 ([[1, 3], [4]], [[2, 5]]),
 ([[2, 3], [4]], [[1, 5]]),
 ([[1, 4], [2]], [[3, 5]]),
 ([[1, 4], [3]], [[2, 5]]),
 ([[2, 4], [3]], [[1, 5]]),
 ([[1, 2], [5]], [[3, 4]]),
 ([[1, 3], [5]], [[2, 4]]),
 ([[2, 3], [5]], [[1, 4]]),
 ([[1, 4], [5]], [[2, 3]]),
 ([[2, 4], [5]], [[1, 3]]),
 ([[3, 4], [5]], [[1, 2]]),
 ([[1, 5], [2]], [[3, 4]]),
 ([[1, 5], [3]], [[2, 4]]),
 ([[2, 5], [3]], [[1, 4]]),
 ([[1, 5], [4]], [[2, 3]]),
 ([[2, 5], [4]], [[1, 3]]),
 ([[3, 5], [4]], [[1, 2]])]
```

```
>>> from sage.all import *
>>> StandardTableauTuples([[Integer(2),Integer(1)],[Integer(2)]]).list()
[([[1, 2], [3]], [[4, 5]]),
 ([[1, 3], [2]], [[4, 5]]),
 ([[1, 2], [4]], [[3, 5]]),
 ([[1, 3], [4]], [[2, 5]]),
 ([[2, 3], [4]], [[1, 5]]),
 ([[1, 4], [2]], [[3, 5]]),
 ([[1, 4], [3]], [[2, 5]]),
 ([[2, 4], [3]], [[1, 5]]),
 ([[1, 2], [5]], [[3, 4]]),
 ([[1, 3], [5]], [[2, 4]]),
 ([[2, 3], [5]], [[1, 4]]),
 ([[1, 4], [5]], [[2, 3]]),
 ([[2, 4], [5]], [[1, 3]]),
 ([[3, 4], [5]], [[1, 2]]),
 ([[1, 5], [2]], [[3, 4]]),
 ([[1, 5], [3]], [[2, 4]]),
 ([[2, 5], [3]], [[1, 4]]),
 ([[1, 5], [4]], [[2, 3]]),
 ([[2, 5], [4]], [[1, 3]]),
 ([[3, 5], [4]], [[1, 2]])]
```

options = Current options for Tableaux - ascii_art: repr - convention: English - display: list - latex: diagram

size()

Return the `size` of a tableau tuple in `self`, or `None` if different tableau tuples in `self` can have different sizes. The `size` of a tableau tuple is just the size of the underlying *PartitionTuple*.

EXAMPLES:

```
sage: TableauTuples(size=14).size()
14
```

```
>>> from sage.all import *
>>> TableauTuples(size=Integer(14)).size()
14
```

class sage.combinat.tableau_tuple.**TableauTuples_all**

Bases: *TableauTuples*

The parent class of all *TableauTuples*, with arbitrary `level` and `size`.

an_element()

Return a particular element of the class.

EXAMPLES:

```
sage: TableauTuples().an_element()
([[1]], [[2]], [[3]], [[4]], [[5]], [[6]], [[7]])
```

```
>>> from sage.all import *
>>> TableauTuples().an_element()
([[1]], [[2]], [[3]], [[4]], [[5]], [[6]], [[7]])
```

class sage.combinat.tableau_tuple.**TableauTuples_level**(*level*)

Bases: *TableauTuples*

Class of all *TableauTuples* with a fixed `level` and arbitrary `size`.

an_element()

Return a particular element of the class.

EXAMPLES:

```
sage: TableauTuples(3).an_element()
([], [], [])
sage: TableauTuples(5).an_element()
([], [], [], [], [])
sage: T = TableauTuples(0)
Traceback (most recent call last):
...
ValueError: the level must be a positive integer
```

```
>>> from sage.all import *
>>> TableauTuples(Integer(3)).an_element()
([], [], [])
```

(continues on next page)

(continued from previous page)

```
>>> TableauTuples(Integer(5)).an_element()
([], [], [], [], [])
>>> T = TableauTuples(Integer(0))
Traceback (most recent call last):
...
ValueError: the level must be a positive integer
```

class sage.combinat.tableau_tuple.**TableauTuples_level_size**(*level*, *size*)

Bases: *TableauTuples*

Class of all *TableauTuples* with a fixed `level` and a fixed `size`.

an_element()

Return a particular element of the class.

EXAMPLES:

```
sage: TableauTuples(3,0).an_element()
([], [], [])
sage: TableauTuples(3,1).an_element()
([[1]], [], [])
sage: TableauTuples(3,2).an_element()
([[1, 2]], [], [])
```

```
>>> from sage.all import *
>>> TableauTuples(Integer(3),Integer(0)).an_element()
([], [], [])
>>> TableauTuples(Integer(3),Integer(1)).an_element()
([[1]], [], [])
>>> TableauTuples(Integer(3),Integer(2)).an_element()
([[1, 2]], [], [])
```

class sage.combinat.tableau_tuple.**TableauTuples_size**(*size*)

Bases: *TableauTuples*

Class of all *TableauTuples* with a arbitrary `level` and fixed `size`.

an_element()

Return a particular element of the class.

EXAMPLES:

```
sage: TableauTuples(size=3).an_element()
([], [[1, 2, 3]], [])
sage: TableauTuples(size=0).an_element()
([], [], [])
```

```
>>> from sage.all import *
>>> TableauTuples(size=Integer(3)).an_element()
([], [[1, 2, 3]], [])

Tableaux

AUTHORS:

- Mike Hansen (2007): initial version
- Jason Bandlow (2011): updated to use Parent/Element model, and many minor fixes
- Andrew Mathas (2012-13): completed the transition to the parent/element model begun by Jason Bandlow
- Travis Scrimshaw (11-22-2012): Added tuple options, changed `*katabolism*` to `*catabolism*`. Cleaned up documentation.
- Andrew Mathas (2016-08-11): Row standard tableaux added
- Oliver Pechenik (2018): Added increasing tableaux.

This file consists of the following major classes:

Element classes:

- *Tableau*
- *SemistandardTableau*
- *StandardTableau*
- *RowStandardTableau*
- *IncreasingTableau*

Factory classes:

- *Tableaux*
- *SemistandardTableaux*
- *StandardTableaux*
- *RowStandardTableaux*
- *IncreasingTableaux*

Parent classes:

- *Tableaux_all*
- *Tableaux_size*
- *SemistandardTableaux_all* (facade class)
- *SemistandardTableaux_size*
- *SemistandardTableaux_size_inf*
- *SemistandardTableaux_size_weight*
- *SemistandardTableaux_shape*
- *SemistandardTableaux_shape_inf*
- *SemistandardTableaux_shape_weight*
- *StandardTableaux_all* (facade class)
- *StandardTableaux_size*
- *StandardTableaux_shape*
- *IncreasingTableaux_all* (facade class)

- *IncreasingTableaux_size*
- *IncreasingTableaux_size_inf*
- *IncreasingTableaux_size_weight*
- *IncreasingTableaux_shape*
- *IncreasingTableaux_shape_inf*
- *IncreasingTableaux_shape_weight*
- *RowStandardTableaux_all* (facade class)
- *RowStandardTableaux_size*
- *RowStandardTableaux_shape*

For display options, see *Tableaux.options()*.

Todo

- Move methods that only apply to semistandard tableaux from tableau to semistandard tableau
- Copy/move functionality to skew tableaux
- Add a class for tableaux of a given shape (eg Tableaux_shape)

class sage.combinat.tableau.**IncreasingTableau**(*parent*, *t*, *check=True*)

Bases: *Tableau*

A class to model an increasing tableau.

INPUT:

- `t` – a tableau, a list of iterables, or an empty list

An *increasing tableau* is a tableau whose entries are positive integers that are strictly increasing across rows and strictly increasing down columns.

EXAMPLES:

```
sage: t = IncreasingTableau([[1,2,3],[2,3]]); t
[[1, 2, 3], [2, 3]]
sage: t.shape()
[3, 2]
sage: t.pp() # pretty printing
1 2 3
2 3
sage: t = Tableau([[1,2],[2]])
sage: s = IncreasingTableau(t); s
[[1, 2], [2]]
sage: IncreasingTableau([]) # The empty tableau
[]
```

```
>>> from sage.all import *
>>> t = IncreasingTableau([[Integer(1),Integer(2),Integer(3)],[Integer(2),
↪Integer(3)]]); t
[[1, 2, 3], [2, 3]]
>>> t.shape()
```

(continues on next page)

(continued from previous page)

```
[3, 2]
>>> t.pp() # pretty printing
1 2 3
2 3
>>> t = Tableau([[Integer(1),Integer(2)],[Integer(2)]])
>>> s = IncreasingTableau(t); s
[[1, 2], [2]]
>>> IncreasingTableau([]) # The empty tableau
[]
```

You can also construct an *IncreasingTableau* from the appropriate Parent object:

```
sage: IT = IncreasingTableaux()
sage: IT([[1, 2, 3], [4, 5]])
[[1, 2, 3], [4, 5]]
```

```
>>> from sage.all import *
>>> IT = IncreasingTableaux()
>>> IT([[Integer(1), Integer(2), Integer(3)], [Integer(4), Integer(5)]])
[[1, 2, 3], [4, 5]]
```

- *StandardTableau*
- *IncreasingTableaux*

K_bender_knuth(i)

Return the i-th K-Bender-Knuth operator (as defined in [DPS2017]) applied to self.

The i-th K-Bender-Knuth operator swaps the letters i and $i+1$ everywhere where doing so would not break increasingness.

EXAMPLES:

```
sage: T = IncreasingTableau([[1,3,4],[2,4,5]])
sage: T.K_bender_knuth(2)
[[1, 2, 4], [3, 4, 5]]
sage: T.K_bender_knuth(3)
[[1, 3, 4], [2, 4, 5]]
```

```
>>> from sage.all import *
>>> T = IncreasingTableau([[Integer(1),Integer(3),Integer(4)],[Integer(2),
↪Integer(4),Integer(5)]])
```

(continues on next page)

(continued from previous page)

```
>>> T.K_bender_knuth(Integer(2))
[[1, 2, 4], [3, 4, 5]]
>>> T.K_bender_knuth(Integer(3))
[[1, 3, 4], [2, 4, 5]]
```

K_evacuation(*ceiling=None*)

Return the K-evacuation involution from [TY2009] to `self`.

EXAMPLES:

```
sage: T = IncreasingTableau([[1,3,4],[2,4,5]])
sage: T.K_evacuation()
[[1, 2, 4], [2, 3, 5]]
sage: T.K_evacuation(6)
[[2, 3, 5], [3, 4, 6]]
sage: U = IncreasingTableau([[1,3,4],[3,4,5],[5]])
sage: U.K_evacuation()
[[1, 2, 3], [2, 3, 5], [3]]
```

```
>>> from sage.all import *
>>> T = IncreasingTableau([[Integer(1),Integer(3),Integer(4)],[Integer(2),
↪Integer(4),Integer(5)]])
>>> T.K_evacuation()
[[1, 2, 4], [2, 3, 5]]
>>> T.K_evacuation(Integer(6))
[[2, 3, 5], [3, 4, 6]]
>>> U = IncreasingTableau([[Integer(1),Integer(3),Integer(4)],[Integer(3),
↪Integer(4),Integer(5)],[Integer(5)]])
>>> U.K_evacuation()
[[1, 2, 3], [2, 3, 5], [3]]
```

K_promotion(*ceiling=None*)

Return the K-promotion operator from [Pec2014] applied to `self`.

EXAMPLES:

```
sage: T = IncreasingTableau([[1,3,4],[2,4,5]])
sage: T.K_promotion()
[[1, 2, 3], [3, 4, 5]]
sage: T.K_promotion(6)
[[1, 2, 3], [3, 4, 6]]
sage: U = IncreasingTableau([[1,3,4],[3,4,5],[5]])
sage: U.K_promotion()
[[2, 3, 4], [3, 4, 5], [4]]
```

```
>>> from sage.all import *
>>> T = IncreasingTableau([[Integer(1),Integer(3),Integer(4)],[Integer(2),
↪Integer(4),Integer(5)]])
>>> T.K_promotion()
[[1, 2, 3], [3, 4, 5]]
>>> T.K_promotion(Integer(6))
[[1, 2, 3], [3, 4, 6]]
```

(continues on next page)

(continued from previous page)

```
>>> U = IncreasingTableau([[Integer(1),Integer(3),Integer(4)],[Integer(3),
↪Integer(4),Integer(5)],[Integer(5)]])
>>> U.K_promotion()
[[2, 3, 4], [3, 4, 5], [4]]
```

K_promotion_inverse(*ceiling=None*)

Return the inverse of K-promotion operator applied to `self`.

EXAMPLES:

```
sage: T = IncreasingTableau([[1,3,4],[2,4,5]])
sage: T.K_promotion_inverse()
[[1, 2, 4], [3, 4, 5]]
sage: T.K_promotion_inverse(6)
[[2, 4, 5], [3, 5, 6]]
sage: U = IncreasingTableau([[1,3,4],[3,4,5],[5]])
sage: U.K_promotion_inverse()
[[1, 2, 4], [2, 4, 5], [4]]
```

```
>>> from sage.all import *
>>> T = IncreasingTableau([[Integer(1),Integer(3),Integer(4)],[Integer(2),
↪Integer(4),Integer(5)]])
>>> T.K_promotion_inverse()
[[1, 2, 4], [3, 4, 5]]
>>> T.K_promotion_inverse(Integer(6))
[[2, 4, 5], [3, 5, 6]]
>>> U = IncreasingTableau([[Integer(1),Integer(3),Integer(4)],[Integer(3),
↪Integer(4),Integer(5)],[Integer(5)]])
>>> U.K_promotion_inverse()
[[1, 2, 4], [2, 4, 5], [4]]
```

check()

Check that `self` is a valid increasing tableau.

descent_set()

Compute the descents of the increasing tableau `self` as defined in [DPS2017].

The number i is a *descent* of an increasing tableau if some instance of $i+1$ appears in a lower row than some instance of i.

Note

This notion is close to the notion of descent for a standard tableau but is unrelated to the notion for semistandard tableaux.

EXAMPLES:

```
sage: T = IncreasingTableau([[1,2,4],[3,5,6]])
sage: T.descent_set()
[2, 4]
sage: U = IncreasingTableau([[1,3,4],[2,4,5]])
sage: U.descent_set()
```

(continues on next page)

(continued from previous page)

```
[1, 3, 4]
sage: V = IncreasingTableau([[1,3,4],[3,4,5],[4,5]])
sage: V.descent_set()
[3, 4]
```

```
>>> from sage.all import *
>>> T = IncreasingTableau([[Integer(1),Integer(2),Integer(4)],[Integer(3),
↪Integer(5),Integer(6)]])
>>> T.descent_set()
[2, 4]
>>> U = IncreasingTableau([[Integer(1),Integer(3),Integer(4)],[Integer(2),
↪Integer(4),Integer(5)]])
>>> U.descent_set()
[1, 3, 4]
>>> V = IncreasingTableau([[Integer(1),Integer(3),Integer(4)],[Integer(3),
↪Integer(4),Integer(5)],[Integer(4),Integer(5)]])
>>> V.descent_set()
[3, 4]
```

dual_K_evacuation(*ceiling=None*)

Return the dual K-evacuation involution applied to `self`.

EXAMPLES:

```
sage: T = IncreasingTableau([[1,3,4],[2,4,5]])
sage: T.dual_K_evacuation()
[[1, 2, 4], [2, 3, 5]]
sage: T.dual_K_evacuation(6)
[[2, 3, 5], [3, 4, 6]]
sage: U = IncreasingTableau([[1,3,4],[3,4,5],[5]])
sage: U.dual_K_evacuation()
[[1, 2, 3], [2, 3, 5], [3]]
```

```
>>> from sage.all import *
>>> T = IncreasingTableau([[Integer(1),Integer(3),Integer(4)],[Integer(2),
↪Integer(4),Integer(5)]])
>>> T.dual_K_evacuation()
[[1, 2, 4], [2, 3, 5]]
>>> T.dual_K_evacuation(Integer(6))
[[2, 3, 5], [3, 4, 6]]
>>> U = IncreasingTableau([[Integer(1),Integer(3),Integer(4)],[Integer(3),
↪Integer(4),Integer(5)],[Integer(5)]])
>>> U.dual_K_evacuation()
[[1, 2, 3], [2, 3, 5], [3]]
```

class sage.combinat.tableau.**IncreasingTableaux**(***kwds*)

Bases: *Tableaux*

A factory class for the various classes of increasing tableaux.

An *increasing tableau* is a tableau whose entries are positive integers that are strictly increasing across rows and strictly increasing down columns. Note that Sage uses the English convention for partitions and tableaux; the longer rows are displayed on top.

INPUT:

Keyword arguments:

- `size` – the size of the tableaux
- `shape` – the shape of the tableaux
- `eval` – the weight (also called binary content) of the tableaux, where values can be either 0 or 1 with position i being 1 if and only if i can appear in the tableaux
- `max_entry` – positive integer or infinity (`oo`); the maximum entry for the tableaux; if `size` or `shape` are specified, `max_entry` defaults to be `size` or the size of `shape`

Positional arguments:

- the first argument is interpreted as either `size` or `shape` according to whether it is an integer or a partition
- the second keyword argument will always be interpreted as `eval`

Warning

The `eval` is not the usual notion of `eval` or `weight`, where the i-th entry counts how many i's appear in the tableau.

EXAMPLES:

```
sage: IT = IncreasingTableaux([2,1]); IT
Increasing tableaux of shape [2, 1] and maximum entry 3
sage: IT.list()
[[[1, 3], [2]], [[1, 2], [3]], [[1, 2], [2]], [[1, 3], [3]], [[2, 3], [3]]]

sage: IT = IncreasingTableaux(3); IT
Increasing tableaux of size 3 and maximum entry 3
sage: IT.list()
[[[1, 2, 3]],
 [[1, 3], [2]],
 [[1, 2], [3]],
 [[1, 2], [2]],
 [[1, 3], [3]],
 [[2, 3], [3]],
 [[1], [2], [3]]]

sage: IT = IncreasingTableaux(3, max_entry=2); IT
Increasing tableaux of size 3 and maximum entry 2
sage: IT.list()
[[[1, 2], [2]]]

sage: IT = IncreasingTableaux(3, max_entry=4); IT
Increasing tableaux of size 3 and maximum entry 4
sage: IT.list()
[[[1, 2, 3]],
 [[1, 2, 4]],
 [[1, 3, 4]],
 [[2, 3, 4]],
 [[1, 3], [2]],
```

(continues on next page)

Element

alias of *IncreasingTableau*

class sage.combinat.tableau.**IncreasingTableaux_all**(*max_entry=None*)

Bases: *IncreasingTableaux*, DisjointUnionEnumeratedSets

All increasing tableaux.

EXAMPLES:

```
sage: T = IncreasingTableaux()
sage: T.cardinality()
+Infinity

sage: T = IncreasingTableaux(max_entry=3)
sage: list(T)
[[],
 [[1]],
 [[2]],
 [[3]],
 [[1, 2]],
 [[1, 3]],
 [[2, 3]],
 [[1], [2]],
 [[1], [3]],
 [[2], [3]],
 [[1, 2, 3]],
 [[1, 3], [2]],
 [[1, 2], [3]],
 [[1, 2], [2]],
 [[1, 3], [3]],
 [[2, 3], [3]],
 [[1], [2], [3]]]
```

```
>>> from sage.all import *
>>> T = IncreasingTableaux()
>>> T.cardinality()
+Infinity

>>> T = IncreasingTableaux(max_entry=Integer(3))
>>> list(T)
[[],
 [[1]],
 [[2]],
 [[3]],
 [[1, 2]],
 [[1, 3]],
 [[2, 3]],
 [[1], [2]],
 [[1], [3]],
```

(continues on next page)

(continued from previous page)

```
[[2], [3]],
[[1, 2, 3]],
[[1, 3], [2]],
[[1, 2], [3]],
[[1, 2], [2]],
[[1, 3], [3]],
[[2, 3], [3]],
[[1], [2], [3]]]
```

class sage.combinat.tableau.**IncreasingTableaux_shape**(*p*, *max_entry=None*)

Bases: *IncreasingTableaux*

Increasing tableaux of fixed shape p with a given max entry.

An increasing tableau with max entry i is required to have all its entries less or equal to i. It is not required to actually contain an entry i.

INPUT:

- `p` – a partition
- `max_entry` – the max entry; defaults to the size of `p`

class sage.combinat.tableau.**IncreasingTableaux_shape_inf**(*p*)

Bases: *IncreasingTableaux*

Increasing tableaux of fixed shape p and no maximum entry.

class sage.combinat.tableau.**IncreasingTableaux_shape_weight**(*p*, *wt*)

Bases: *IncreasingTableaux_shape*

Increasing tableaux of fixed shape p and binary weight wt.

class sage.combinat.tableau.**IncreasingTableaux_size**(*n*, *max_entry=None*)

Bases: *IncreasingTableaux*

Increasing tableaux of fixed size n.

class sage.combinat.tableau.**IncreasingTableaux_size_inf**(*n*)

Bases: *IncreasingTableaux*

Increasing tableaux of fixed size n with no maximum entry.

class sage.combinat.tableau.**IncreasingTableaux_size_weight**(*n*, *wt*)

Bases: *IncreasingTableaux*

Increasing tableaux of fixed size n and weight wt.

class sage.combinat.tableau.**RowStandardTableau**(*parent*, *t*, *check=True*)

Bases: *Tableau*

A class to model a row standard tableau.

A row standard tableau is a tableau whose entries are positive integers from 1 to m that increase along rows.

INPUT:

- `t` – a Tableau, a list of iterables, or an empty list

EXAMPLES:

```
sage: t = RowStandardTableau([[3,4,5],[1,2]]); t
[[3, 4, 5], [1, 2]]
sage: t.shape()
[3, 2]
sage: t.pp() # pretty printing
3  4  5
1  2
sage: t.is_standard()
False
sage: RowStandardTableau([]) # The empty tableau
[]
sage: RowStandardTableau([[3,4,5],[1,2]]) in StandardTableaux()
False
sage: RowStandardTableau([[1,2,5],[3,4]]) in StandardTableaux()
True
```

```
>>> from sage.all import *
>>> t = RowStandardTableau([[Integer(3),Integer(4),Integer(5)],[Integer(1),
↪Integer(2)]]); t
[[3, 4, 5], [1, 2]]
>>> t.shape()
[3, 2]
>>> t.pp() # pretty printing
3  4  5
1  2
>>> t.is_standard()
False
>>> RowStandardTableau([]) # The empty tableau
[]
>>> RowStandardTableau([[Integer(3),Integer(4),Integer(5)],[Integer(1),
↪Integer(2)]]) in StandardTableaux()
False
>>> RowStandardTableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(4)]]) in StandardTableaux()
True
```

When using code that will generate a lot of tableaux, it is more efficient to construct a *RowStandardTableau* from the appropriate `Parent` object:

```
sage: ST = RowStandardTableaux()
sage: ST([[3, 4, 5], [1, 2]])
[[3, 4, 5], [1, 2]]
```

```
>>> from sage.all import *
>>> ST = RowStandardTableaux()
>>> ST([[Integer(3), Integer(4), Integer(5)], [Integer(1), Integer(2)]])
[[3, 4, 5], [1, 2]]
```

See also

- *Tableau*

- *StandardTableau*
- *SemistandardTableau*
- *Tableaux*
- *StandardTableaux*
- *RowStandardTableaux*
- *SemistandardTableaux*

check()

Check that `self` is a valid row standard tableau.

class sage.combinat.tableau.**RowStandardTableaux**

Bases: *Tableaux*

A factory for the various classes of row standard tableaux.

INPUT:

- either a nonnegative integer (possibly specified with the keyword `n`) or a partition

OUTPUT: with no argument, the class of all standard tableaux

- with a nonnegative integer argument, `n`, the class of all standard tableaux of size `n`
- with a partition argument, the class of all standard tableaux of that shape

A row standard tableau is a tableau that contains each of the entries from 1 to n exactly once and is increasing along rows.

All classes of row standard tableaux are iterable.

EXAMPLES:

```
sage: ST = RowStandardTableaux(3); ST
Row standard tableaux of size 3
sage: ST.first()                                                    #␣
↪needs sage.graphs
[[1, 2, 3]]
sage: ST.last()                                                     #␣
↪needs sage.graphs sage.modules
[[3], [1], [2]]
sage: ST.cardinality()                                              #␣
↪needs sage.graphs sage.modules
10
sage: ST.list()                                                     #␣
↪needs sage.graphs sage.modules
[[[1, 2, 3]],
 [[2, 3], [1]],
 [[1, 2], [3]],
 [[1, 3], [2]],
 [[3], [2], [1]],
 [[2], [3], [1]],
 [[1], [3], [2]],
 [[1], [2], [3]],
 [[2], [1], [3]],
 [[3], [1], [2]]]
```

```
>>> from sage.all import *
>>> ST = RowStandardTableaux(Integer(3)); ST
Row standard tableaux of size 3
>>> ST.first()                                                          #␣
↪needs sage.graphs
[[1, 2, 3]]
>>> ST.last()                                                           #␣
↪needs sage.graphs sage.modules
[[3], [1], [2]]
>>> ST.cardinality()                                                    #␣
↪needs sage.graphs sage.modules
10
>>> ST.list()                                                           #␣
↪needs sage.graphs sage.modules
[[[1, 2, 3]],
 [[2, 3], [1]],
 [[1, 2], [3]],
 [[1, 3], [2]],
 [[3], [2], [1]],
 [[2], [3], [1]],
 [[1], [3], [2]],
 [[1], [2], [3]],
 [[2], [1], [3]],
 [[3], [1], [2]]]
```

See also

- *Tableaux*
- *Tableau*
- *SemistandardTableaux*
- *SemistandardTableau*
- *RowStandardTableau*
- *StandardSkewTableaux*

Element

alias of *RowStandardTableau*

class sage.combinat.tableau.**RowStandardTableaux_all**

Bases: *RowStandardTableaux*, DisjointUnionEnumeratedSets

All row standard tableaux.

class sage.combinat.tableau.**RowStandardTableaux_shape**(*p*)

Bases: *RowStandardTableaux*

Row Standard tableaux of a fixed shape p.

cardinality()

Return the number of row standard tableaux of this shape.

This is just the index of the corresponding Young subgroup in the full symmetric group.

EXAMPLES:

```
sage: RowStandardTableaux([3,2,1]).cardinality()
60

class sage.combinat.tableau.**RowStandardTableaux_size**(*n*)

Bases: *RowStandardTableaux*, DisjointUnionEnumeratedSets

Row standard tableaux of fixed size n.

EXAMPLES:

```
sage: [t for t in RowStandardTableaux(1)]                                    #␣
↪needs sage.graphs
[[[1]]]
sage: [t for t in RowStandardTableaux(2)]                                    #␣
↪needs sage.graphs
[[[1, 2]], [[2], [1]], [[1], [2]]]
sage: list(RowStandardTableaux(3))                                           #␣

 [[3], [1], [2]]]
```

class sage.combinat.tableau.**SemistandardTableau**(*parent*, *t*, *check=True*)

Bases: *Tableau*

A class to model a semistandard tableau.

INPUT:

- `t` – a tableau, a list of iterables, or an empty list

OUTPUT: a SemistandardTableau object constructed from `t`

A semistandard tableau is a tableau whose entries are positive integers, which are weakly increasing in rows and strictly increasing down columns.

EXAMPLES:

```
sage: t = SemistandardTableau([[1,2,3],[2,3]]); t
[[1, 2, 3], [2, 3]]
sage: t.shape()
[3, 2]
sage: t.pp() # pretty printing
1 2 3
2 3
sage: t = Tableau([[1,2],[2]])
sage: s = SemistandardTableau(t); s
[[1, 2], [2]]
sage: SemistandardTableau([]) # The empty tableau
[]
```

```
>>> from sage.all import *
>>> t = SemistandardTableau([[Integer(1),Integer(2),Integer(3)],[Integer(2),
↪Integer(3)]]); t
[[1, 2, 3], [2, 3]]
>>> t.shape()
[3, 2]
>>> t.pp() # pretty printing
1 2 3
```

(continues on next page)

(continued from previous page)

```
2 3
>>> t = Tableau([[Integer(1),Integer(2)],[Integer(2)]])
>>> s = SemistandardTableau(t); s
[[1, 2], [2]]
>>> SemistandardTableau([]) # The empty tableau
[]
```

When using code that will generate a lot of tableaux, it is slightly more efficient to construct a SemistandardTableau from the appropriate `Parent` object:

```
sage: SST = SemistandardTableaux()
sage: SST([[1, 2, 3], [4, 5]])
[[1, 2, 3], [4, 5]]
```

```
>>> from sage.all import *
>>> SST = SemistandardTableaux()
>>> SST([[Integer(1), Integer(2), Integer(3)], [Integer(4), Integer(5)]])
[[1, 2, 3], [4, 5]]
```

check()

Check that `self` is a valid semistandard tableau.

class sage.combinat.tableau.**SemistandardTableaux**(***kwds*)

Bases: *Tableaux*

A factory class for the various classes of semistandard tableaux.

INPUT:

Keyword arguments:

- `size` – the size of the tableaux
- `shape` – the shape of the tableaux
- `eval` – the weight (also called content or evaluation) of the tableaux
- `max_entry` – a maximum entry for the tableaux. This can be a positive integer or infinity (`oo`). If `size` or `shape` are specified, `max_entry` defaults to be `size` or the size of `shape`.

Positional arguments:

- The first argument is interpreted as either `size` or `shape` according to whether it is an integer or a partition
- The second keyword argument will always be interpreted as `eval`

OUTPUT:

- The appropriate class, after checking basic consistency tests. (For example, specifying `eval` implies a value for `max_entry`).

A semistandard tableau is a tableau whose entries are positive integers, which are weakly increasing in rows and strictly increasing down columns. Note that Sage uses the English convention for partitions and tableaux; the longer rows are displayed on top.

Classes of semistandard tableaux can be iterated over if and only if there is some restriction.

EXAMPLES:

```
sage: SST = SemistandardTableaux([2,1]); SST
Semistandard tableaux of shape [2, 1] and maximum entry 3
sage: SST.list()                                                              #␣

- *StandardTableau*

Element

alias of *SemistandardTableau*

class sage.combinat.tableau.**SemistandardTableaux_all**(*max_entry=None*)

Bases: *SemistandardTableaux*, DisjointUnionEnumeratedSets

All semistandard tableaux.

list()

class sage.combinat.tableau.**SemistandardTableaux_shape**(*p*, *max_entry=None*)

Bases: *SemistandardTableaux*

Semistandard tableaux of fixed shape p with a given max entry.

A semistandard tableau with max entry i is required to have all its entries less or equal to i. It is not required to actually contain an entry i.

INPUT:

- `p` – a partition
- `max_entry` – the max entry; defaults to the size of p

cardinality(*algorithm='hook'*)

Return the cardinality of `self`.

INPUT:

- `algorithm` – (default: `'hook'`) any one of the following:
  - `'hook'` – use Stanley's hook length formula
  - `'sum'` – sum over the compositions of `max_entry` the number of semistandard tableau with `shape` and given weight vector

This is computed using *Stanley's hook length formula*:

$$f_\lambda = \prod_{u \in \lambda} \frac{n + c(u)}{h(u)}.$$

where n is the `max_entry`, $c(u)$ is the content of u, and $h(u)$ is the hook length of u. See [Sta-EC2] Corollary 7.21.4.

↪needs sage.modules
...     for sst in ssts)
True
```

random_element()

Return a uniformly distributed random tableau of the given `shape` and `max_entry`.

Uses the algorithm from [Kra1999] based on the Novelli-Pak-Stoyanovskii bijection
http://www.sciencedirect.com/science/article/pii/0012365X9290368P

EXAMPLES:

```
sage: S = SemistandardTableaux([2, 2, 1, 1])
sage: S.random_element() in S
True
sage: S = SemistandardTableaux([2, 2, 1, 1], max_entry=7)
sage: S.random_element() in S
True
```

```
>>> from sage.all import *
>>> S = SemistandardTableaux([Integer(2), Integer(2), Integer(1), Integer(1)])
>>> S.random_element() in S
True
>>> S = SemistandardTableaux([Integer(2), Integer(2), Integer(1), Integer(1)],
↪ max_entry=Integer(7))
>>> S.random_element() in S
True
```

class sage.combinat.tableau.**SemistandardTableaux_shape_inf**(*p*)

Bases: *SemistandardTableaux*

Semistandard tableaux of fixed shape p and no maximum entry.

class sage.combinat.tableau.**SemistandardTableaux_shape_weight**(*p*, *mu*)

Bases: *SemistandardTableaux_shape*

Semistandard tableaux of fixed shape p and weight μ.

cardinality()

Return the number of semistandard tableaux of the given shape and weight, as computed by `kostka_number` function of `symmetrica`.

EXAMPLES:

```
sage: # needs sage.modules
sage: SemistandardTableaux([2,2], [2, 1, 1]).cardinality()
1
sage: SemistandardTableaux([2,2,2], [2, 2, 1,1]).cardinality()
1
sage: SemistandardTableaux([2,2,2], [2, 2, 2]).cardinality()
1
sage: SemistandardTableaux([3,2,1], [2, 2, 2]).cardinality()
2
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> SemistandardTableaux([Integer(2),Integer(2)], [Integer(2), Integer(1),␣
↪Integer(1)]).cardinality()
1
>>> SemistandardTableaux([Integer(2),Integer(2),Integer(2)], [Integer(2),␣
↪Integer(2), Integer(1),Integer(1)]).cardinality()
1
>>> SemistandardTableaux([Integer(2),Integer(2),Integer(2)], [Integer(2),␣
↪Integer(2), Integer(2)]).cardinality()
1
>>> SemistandardTableaux([Integer(3),Integer(2),Integer(1)], [Integer(2),␣
↪Integer(2), Integer(2)]).cardinality()
2
```

list()

Return a list of all semistandard tableaux in `self` generated by symmetrica.

EXAMPLES:

```
sage: # needs sage.modules
sage: SemistandardTableaux([2,2], [2, 1, 1]).list()
[[[1, 1], [2, 3]]]
sage: SemistandardTableaux([2,2,2], [2, 2, 1,1]).list()
[[[1, 1], [2, 2], [3, 4]]]
sage: SemistandardTableaux([2,2,2], [2, 2, 2]).list()
[[[1, 1], [2, 2], [3, 3]]]
sage: SemistandardTableaux([3,2,1], [2, 2, 2]).list()
[[[1, 1, 2], [2, 3], [3]], [[1, 1, 3], [2, 2], [3]]]
```

```
>>> from sage.all import *
>>> # needs sage.modules
>>> SemistandardTableaux([Integer(2),Integer(2)], [Integer(2), Integer(1),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(1)]).list()
[[[1, 1], [2, 3]]]
>>> SemistandardTableaux([Integer(2),Integer(2),Integer(2)], [Integer(2),␣
↪Integer(2), Integer(1),Integer(1)]).list()
[[[1, 1], [2, 2], [3, 4]]]
>>> SemistandardTableaux([Integer(2),Integer(2),Integer(2)], [Integer(2),␣
↪Integer(2), Integer(2)]).list()
[[[1, 1], [2, 2], [3, 3]]]
>>> SemistandardTableaux([Integer(3),Integer(2),Integer(1)], [Integer(2),␣
↪Integer(2), Integer(2)]).list()
[[[1, 1, 2], [2, 3], [3]], [[1, 1, 3], [2, 2], [3]]]
```

random_element()

A random element in `self`.

`self.random_element()` returns a random element in `self` with uniform probability.

This is the default implementation from the category `EnumeratedSet()` which uses the method `unrank`.

EXAMPLES:

```
sage: C = FiniteEnumeratedSets().example()
sage: n = C.random_element()
sage: n in C
True

sage: n = C._random_element_from_unrank()
sage: n in C
True
```

```
>>> from sage.all import *
>>> C = FiniteEnumeratedSets().example()
>>> n = C.random_element()
>>> n in C
True

>>> n = C._random_element_from_unrank()
>>> n in C
True
```

class sage.combinat.tableau.**SemistandardTableaux_size**(*n*, *max_entry=None*)

Bases: *SemistandardTableaux*

Semistandard tableaux of fixed size n.

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: SemistandardTableaux(3).cardinality()
19
sage: SemistandardTableaux(4).cardinality()
116
```

(continues on next page)

(continued from previous page)

```
sage: SemistandardTableaux(4, max_entry=2).cardinality()
9
sage: SemistandardTableaux(4, max_entry=10).cardinality()
4225
sage: ns = list(range(1, 6))
sage: ssts = [SemistandardTableaux(n) for n in ns]
sage: all(sst.cardinality() == len(sst.list()) for sst in ssts)
True
```

```
>>> from sage.all import *
>>> SemistandardTableaux(Integer(3)).cardinality()
19
>>> SemistandardTableaux(Integer(4)).cardinality()
116
>>> SemistandardTableaux(Integer(4), max_entry=Integer(2)).cardinality()
9
>>> SemistandardTableaux(Integer(4), max_entry=Integer(10)).cardinality()
4225
>>> ns = list(range(Integer(1), Integer(6)))
>>> ssts = [SemistandardTableaux(n) for n in ns]
>>> all(sst.cardinality() == len(sst.list()) for sst in ssts)
True
```

random_element()

Generate a random *SemistandardTableau* with uniform probability.

The RSK algorithm gives a bijection between symmetric $k \times k$ matrices of nonnegative integers that sum to n and semistandard tableaux with size n and maximum entry k.

The number of $k \times k$ symmetric matrices of nonnegative integers having sum of elements on the diagonal i and sum of elements above the diagonal j is $\binom{k+i-1}{k-1}\binom{\binom{k}{2}+j-1}{\binom{k}{2}-1}$. We first choose the sum of the elements on the diagonal randomly weighted by the number of matrices having that trace. We then create random integer vectors of length k having that sum and use them to generate a $k \times k$ diagonal matrix. Then we take a random integer vector of length $\binom{k}{2}$ summing to half the remainder and distribute it symmetrically to the remainder of the matrix.

Applying RSK to the random symmetric matrix gives us a pair of identical *SemistandardTableau* of which we choose the first.

EXAMPLES:

```
sage: SemistandardTableaux(6).random_element()  # random                    #␣
↪needs sage.modules
[[1, 1, 2], [3, 5, 5]]
sage: SemistandardTableaux(6, max_entry=7).random_element()  # random       #␣
↪needs sage.modules
[[2, 4, 4, 6, 6, 6]]
```

```
>>> from sage.all import *
>>> SemistandardTableaux(Integer(6)).random_element()  # random              ␣
↪     # needs sage.modules
[[1, 1, 2], [3, 5, 5]]
>>> SemistandardTableaux(Integer(6), max_entry=Integer(7)).random_element()
```

(continues on next page)

(continued from previous page)

```
↪# random        # needs sage.modules
[[2, 4, 4, 6, 6, 6]]
```

class sage.combinat.tableau.**SemistandardTableaux_size_inf**(*n*)

Bases: *SemistandardTableaux*

Semistandard tableaux of fixed size n with no maximum entry.

list()

class sage.combinat.tableau.**SemistandardTableaux_size_weight**(*n*, *mu*)

Bases: *SemistandardTableaux*

Semistandard tableaux of fixed size n and weight μ.

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: SemistandardTableaux(3, [2,1]).cardinality()                    #␣
↪needs sage.modules
2
sage: SemistandardTableaux(4, [2,2]).cardinality()                    #␣
↪needs sage.modules
3
```

```
>>> from sage.all import *
>>> SemistandardTableaux(Integer(3), [Integer(2),Integer(1)]).cardinality()  ␣
↪                      # needs sage.modules
2
>>> SemistandardTableaux(Integer(4), [Integer(2),Integer(2)]).cardinality()  ␣
↪                      # needs sage.modules
3
```

class sage.combinat.tableau.**StandardTableau**(*parent*, *t*, *check=True*)

Bases: *SemistandardTableau*

A class to model a standard tableau.

INPUT:

- `t` – a Tableau, a list of iterables, or an empty list

A standard tableau is a semistandard tableau whose entries are exactly the positive integers from 1 to n, where n is the size of the tableau.

EXAMPLES:

```
sage: t = StandardTableau([[1,2,3],[4,5]]); t
[[1, 2, 3], [4, 5]]
sage: t.shape()
[3, 2]
sage: t.pp() # pretty printing
1 2 3
4 5
```

(continues on next page)

(continued from previous page)

```
sage: t.is_standard()
True
sage: StandardTableau([]) # The empty tableau
[]
sage: StandardTableau([[1,2,3],[4,5]]) in RowStandardTableaux()
True
```

```
>>> from sage.all import *
>>> t = StandardTableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(5)]]); t
[[1, 2, 3], [4, 5]]
>>> t.shape()
[3, 2]
>>> t.pp() # pretty printing
1 2 3
4 5
>>> t.is_standard()
True
>>> StandardTableau([]) # The empty tableau
[]
>>> StandardTableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]])␣
↪in RowStandardTableaux()
True
```

When using code that will generate a lot of tableaux, it is more efficient to construct a StandardTableau from the appropriate `Parent` object:

```
sage: ST = StandardTableaux()
sage: ST([[1, 2, 3], [4, 5]])
[[1, 2, 3], [4, 5]]
```

```
>>> from sage.all import *
>>> ST = StandardTableaux()
>>> ST([[Integer(1), Integer(2), Integer(3)], [Integer(4), Integer(5)]])
[[1, 2, 3], [4, 5]]
```

See also

- *SemistandardTableaux*
- *SemistandardTableau*
- *StandardTableaux*

check()

Check that `self` is a standard tableau.

dominates(*t*)

Return `True` if `self` dominates the tableau `t`.

That is, if the shape of the tableau restricted to k dominates the shape of `t` restricted to k, for $k = 1, 2, \ldots, n$.

When the two tableaux have the same shape, then this ordering coincides with the Bruhat ordering for the corresponding permutations.

INPUT:

- `t` – a tableau

EXAMPLES:

```
sage: s = StandardTableau([[1,2,3],[4,5]])
sage: t = StandardTableau([[1,2],[3,5],[4]])
sage: s.dominates(t)
True
sage: t.dominates(s)
False
sage: all(StandardTableau(s).dominates(t) for t in StandardTableaux([3,2]))
True
sage: s.dominates([[1,2,3,4,5]])
False
```

```
>>> from sage.all import *
>>> s = StandardTableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(5)]])
>>> t = StandardTableau([[Integer(1),Integer(2)],[Integer(3),Integer(5)],
↪[Integer(4)]])
>>> s.dominates(t)
True
>>> t.dominates(s)
False
>>> all(StandardTableau(s).dominates(t) for t in StandardTableaux([Integer(3),
↪Integer(2)]))
True
>>> s.dominates([[Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]])
False
```

down()

An iterator for all the standard tableaux that can be obtained from `self` by removing a cell. Note that this iterates just over a single tableau (or nothing if `self` is empty).

EXAMPLES:

```
sage: t = StandardTableau([[1,2],[3]])
sage: [x for x in t.down()]
[[[1, 2]]]
sage: t = StandardTableau([])
sage: [x for x in t.down()]
[]
```

```
>>> from sage.all import *
>>> t = StandardTableau([[Integer(1),Integer(2)],[Integer(3)]])
>>> [x for x in t.down()]
[[[1, 2]]]
>>> t = StandardTableau([])
```

(continues on next page)

(continued from previous page)

```
>>> [x for x in t.down()]
[]
```

down_list()

Return a list of all the standard tableaux that can be obtained from `self` by removing a cell. Note that this is just a singleton list if `self` is nonempty, and an empty list otherwise.

EXAMPLES:

```
sage: t = StandardTableau([[1,2],[3]])
sage: t.down_list()
[[[1, 2]]]
sage: t = StandardTableau([])
sage: t.down_list()
[]
```

```
>>> from sage.all import *
>>> t = StandardTableau([[Integer(1),Integer(2)],[Integer(3)]])
>>> t.down_list()
[[[1, 2]]]
>>> t = StandardTableau([])
>>> t.down_list()
[]
```

is_standard()

Return `True` since `self` is a standard tableau.

EXAMPLES:

```
sage: StandardTableau([[1, 3], [2, 4]]).is_standard()
True
```

```
>>> from sage.all import *
>>> StandardTableau([[Integer(1), Integer(3)], [Integer(2), Integer(4)]]).is_
↪standard()
True
```

promotion(*n=None*)

Return the image of `self` under the promotion operator.

The promotion operator, applied to a standard tableau t, does the following:

Remove the letter n from t, thus leaving a hole where it used to be. Apply jeu de taquin to move this hole southwest (in French notation) until it reaches the inner boundary of t. Fill 0 into the hole once jeu de taquin has completed. Finally, add 1 to each letter in the tableau. The resulting standard tableau is the image of t under the promotion operator.

This definition of promotion is precisely the one given in [Hai1992] (p. 90). It is the inverse of the maps called "promotion" in [Sag2011] (p. 23) and in [Stan2009].

See the *promotion()* method for a more general operator.

EXAMPLES:

```
sage: ST = StandardTableaux(7)
sage: all( st.promotion().promotion_inverse() == st for st in ST ) # long time
True
sage: all( st.promotion_inverse().promotion() == st for st in ST ) # long time
True
sage: st = StandardTableau([[1,2,5],[3,4]])
sage: parent(st.promotion())
Standard tableaux
```

```
>>> from sage.all import *
>>> ST = StandardTableaux(Integer(7))
>>> all( st.promotion().promotion_inverse() == st for st in ST ) # long time
True
>>> all( st.promotion_inverse().promotion() == st for st in ST ) # long time
True
>>> st = StandardTableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(4)]])
>>> parent(st.promotion())
Standard tableaux
```

promotion_inverse(*n=None*)

Return the image of `self` under the inverse promotion operator. The optional variable m should be set to the size of `self` minus 1 for a minimal speedup; otherwise, it defaults to this number.

The inverse promotion operator, applied to a standard tableau t, does the following:

Remove the letter 1 from t, thus leaving a hole where it used to be. Apply jeu de taquin to move this hole northeast (in French notation) until it reaches the outer boundary of t. Fill $n + 1$ into this hole, where n is the size of t. Finally, subtract 1 from each letter in the tableau. This yields a new standard tableau.

This definition of inverse promotion is the map called "promotion" in [Sag2011] (p. 23) and in [Stan2009], and is the inverse of the map called "promotion" in [Hai1992] (p. 90).

See the *promotion_inverse()* method for a more general operator.

EXAMPLES:

```
sage: t = StandardTableau([[1,3],[2,4]])
sage: t.promotion_inverse()
[[1, 2], [3, 4]]
```

```
>>> from sage.all import *
>>> t = StandardTableau([[Integer(1),Integer(3)],[Integer(2),Integer(4)]])
>>> t.promotion_inverse()
[[1, 2], [3, 4]]
```

We check the equivalence of two definitions of inverse promotion on standard tableaux:

```
sage: ST = StandardTableaux(7)
sage: def bk_promotion_inverse7(st):
....:     st2 = st
....:     for i in range(1, 7):
....:         st2 = st2.bender_knuth_involution(i, check=False)
....:     return st2
sage: all( bk_promotion_inverse7(st) == st.promotion_inverse() for st in ST )
```

(continues on next page)

(continued from previous page)

```
↪# long time
True
```

```
>>> from sage.all import *
>>> ST = StandardTableaux(Integer(7))
>>> def bk_promotion_inverse7(st):
...     st2 = st
...     for i in range(Integer(1), Integer(7)):
...         st2 = st2.bender_knuth_involution(i, check=False)
...     return st2
>>> all( bk_promotion_inverse7(st) == st.promotion_inverse() for st in ST ) #␣
↪long time
True
```

standard_descents()

Return a list of the integers i such that i appears strictly further north than $i+1$ in `self` (this is not to say that i and $i+1$ must be in the same column). The list is sorted in increasing order.

EXAMPLES:

```
sage: StandardTableau( [[1,3,4],[2,5]] ).standard_descents()
[1, 4]
sage: StandardTableau( [[1,2],[3,4]] ).standard_descents()
[2]
sage: StandardTableau( [[1,2,5],[3,4],[6,7],[8],[9]] ).standard_descents()
[2, 5, 7, 8]
sage: StandardTableau( [] ).standard_descents()
[]
```

```
>>> from sage.all import *
>>> StandardTableau( [[Integer(1),Integer(3),Integer(4)],[Integer(2),
↪Integer(5)]] ).standard_descents()
[1, 4]
>>> StandardTableau( [[Integer(1),Integer(2)],[Integer(3),Integer(4)]] ).
↪standard_descents()
[2]
>>> StandardTableau( [[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(4)],[Integer(6),Integer(7)],[Integer(8)],[Integer(9)]] ).standard_
↪descents()
[2, 5, 7, 8]
>>> StandardTableau( [] ).standard_descents()
[]
```

standard_major_index()

Return the major index of the standard tableau `self` in the standard meaning of the word. The major index is defined to be the sum of the descents of `self` (see *standard_descents()* for their definition).

EXAMPLES:

```
sage: StandardTableau( [[1,4,5],[2,6],[3]] ).standard_major_index()
8
sage: StandardTableau( [[1,2],[3,4]] ).standard_major_index()
```

(continues on next page)

(continued from previous page)

```
2
sage: StandardTableau( [[1,2,3],[4,5]] ).standard_major_index()
3
```

```
>>> from sage.all import *
>>> StandardTableau( [[Integer(1),Integer(4),Integer(5)],[Integer(2),
↪Integer(6)],[Integer(3)]] ).standard_major_index()
8
>>> StandardTableau( [[Integer(1),Integer(2)],[Integer(3),Integer(4)]] ).
↪standard_major_index()
2
>>> StandardTableau( [[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(5)]] ).standard_major_index()
3
```

standard_number_of_descents()

Return the number of all integers i such that i appears strictly further north than $i+1$ in `self` (this is not to say that i and $i+1$ must be in the same column). A list of these integers can be obtained using the *standard_descents()* method.

EXAMPLES:

```
sage: StandardTableau( [[1,2],[3,4],[5]] ).standard_number_of_descents()
2
sage: StandardTableau( [] ).standard_number_of_descents()
0
sage: tabs = StandardTableaux(5)
sage: all( t.standard_number_of_descents() == t.schuetzenberger_involution().
↪standard_number_of_descents() for t in tabs )
True
```

```
>>> from sage.all import *
>>> StandardTableau( [[Integer(1),Integer(2)],[Integer(3),Integer(4)],
↪[Integer(5)]] ).standard_number_of_descents()
2
>>> StandardTableau( [] ).standard_number_of_descents()
0
>>> tabs = StandardTableaux(Integer(5))
>>> all( t.standard_number_of_descents() == t.schuetzenberger_involution().
↪standard_number_of_descents() for t in tabs )
True
```

up()

An iterator for all the standard tableaux that can be obtained from `self` by adding a cell.

EXAMPLES:

```
sage: t = StandardTableau([[1,2]])
sage: [x for x in t.up()]
[[[1, 2, 3]], [[1, 2], [3]]]
```

```
>>> from sage.all import *
>>> t = StandardTableau([[Integer(1),Integer(2)]])
>>> [x for x in t.up()]
[[[1, 2, 3]], [[1, 2], [3]]]
```

up_list()

Return a list of all the standard tableaux that can be obtained from `self` by adding a cell.

EXAMPLES:

```
sage: t = StandardTableau([[1,2]])
sage: t.up_list()
[[[1, 2, 3]], [[1, 2], [3]]]
```

```
>>> from sage.all import *
>>> t = StandardTableau([[Integer(1),Integer(2)]])
>>> t.up_list()
[[[1, 2, 3]], [[1, 2], [3]]]
```

class sage.combinat.tableau.**StandardTableaux**(***kwds*)

Bases: *SemistandardTableaux*

A factory for the various classes of standard tableaux.

INPUT:

- Either a nonnegative integer (possibly specified with the keyword `n`) or a partition.

OUTPUT: with no argument, the class of all standard tableaux

- With a nonnegative integer argument, `n`, the class of all standard tableaux of size `n`
- With a partition argument, the class of all standard tableaux of that shape.

A standard tableau is a semistandard tableaux which contains each of the entries from 1 to `n` exactly once.

All classes of standard tableaux are iterable.

EXAMPLES:

```
sage: ST = StandardTableaux(3); ST
Standard tableaux of size 3
sage: ST.first()
[[1, 2, 3]]
sage: ST.last()
[[1], [2], [3]]
sage: ST.cardinality()
4
sage: ST.list()
[[[1, 2, 3]], [[1, 3], [2]], [[1, 2], [3]], [[1], [2], [3]]]
```

```
>>> from sage.all import *
>>> ST = StandardTableaux(Integer(3)); ST
Standard tableaux of size 3
>>> ST.first()
[[1, 2, 3]]
>>> ST.last()
```

(continues on next page)

(continued from previous page)

```
[[1], [2], [3]]
>>> ST.cardinality()
4
>>> ST.list()
[[[1, 2, 3]], [[1, 3], [2]], [[1, 2], [3]], [[1], [2], [3]]]
```

Element

alias of *StandardTableau*

class sage.combinat.tableau.**StandardTableaux_all**

Bases: *StandardTableaux*, DisjointUnionEnumeratedSets

All standard tableaux.

class sage.combinat.tableau.**StandardTableaux_shape**(*p*)

Bases: *StandardTableaux*

Semistandard tableaux of a fixed shape p.

cardinality()

Return the number of standard Young tableaux of this shape.

This method uses the so-called *hook length formula*, a formula for the number of Young tableaux associated with a given partition. The formula says the following: Let λ be a partition. For each cell c of the Young diagram of λ, let the *hook length* of c be defined as 1 plus the number of cells horizontally to the right of c plus the number of cells vertically below c. The number of standard Young tableaux of shape λ is then $n!$ divided by the product of the hook lengths of the shape of λ, where $n = |\lambda|$.

For example, consider the partition `[3,2,1]` of `6` with Ferrers diagram:

```
# # #
# #
#
```

When we fill in the cells with their respective hook lengths, we obtain:

```
5 3 1
3 1
1
```

The hook length formula returns

$$\frac{6!}{5 \cdot 3 \cdot 1 \cdot 3 \cdot 1 \cdot 1} = 16.$$

EXAMPLES:

```
sage: StandardTableaux([3,2,1]).cardinality()
16
sage: StandardTableaux([2,2]).cardinality()
2
sage: StandardTableaux([5]).cardinality()
1
sage: StandardTableaux([6,5,5,3]).cardinality()
6651216
sage: StandardTableaux([]).cardinality()
1
```

```
>>> from sage.all import *
>>> StandardTableaux([Integer(3),Integer(2),Integer(1)]).cardinality()
16
>>> StandardTableaux([Integer(2),Integer(2)]).cardinality()
2
>>> StandardTableaux([Integer(5)]).cardinality()
1
>>> StandardTableaux([Integer(6),Integer(5),Integer(5),Integer(3)]).
↪cardinality()
6651216
>>> StandardTableaux([]).cardinality()
1
```

REFERENCES:

- http://mathworld.wolfram.com/HookLengthFormula.html

list()

Return a list of the standard Young tableaux of the specified shape.

EXAMPLES:

```
sage: StandardTableaux([2,2]).list()
[[[1, 3], [2, 4]], [[1, 2], [3, 4]]]
sage: StandardTableaux([5]).list()
[[[1, 2, 3, 4, 5]]]
sage: StandardTableaux([3,2,1]).list()
[[[1, 4, 6], [2, 5], [3]],
 [[1, 3, 6], [2, 5], [4]],
 [[1, 2, 6], [3, 5], [4]],
 [[1, 3, 6], [2, 4], [5]],
 [[1, 2, 6], [3, 4], [5]],
 [[1, 4, 5], [2, 6], [3]],
 [[1, 3, 5], [2, 6], [4]],
 [[1, 2, 5], [3, 6], [4]],
 [[1, 3, 4], [2, 6], [5]],
 [[1, 2, 4], [3, 6], [5]],
 [[1, 2, 3], [4, 6], [5]],
 [[1, 3, 5], [2, 4], [6]],
 [[1, 2, 5], [3, 4], [6]],
 [[1, 3, 4], [2, 5], [6]],
```

(continues on next page)

(continued from previous page)

 [[1, 2, 4], [3, 5], [6]],
 [[1, 2, 3], [4, 5], [6]]]
```

random_element()

Return a random standard tableau of the given shape using the Greene-Nijenhuis-Wilf Algorithm.

EXAMPLES:

```
sage: t = StandardTableaux([2,2]).random_element()
sage: t.shape()
[2, 2]
sage: StandardTableaux([]).random_element()
[]
```

```
>>> from sage.all import *
>>> t = StandardTableaux([Integer(2),Integer(2)]).random_element()
>>> t.shape()
[2, 2]
>>> StandardTableaux([]).random_element()
[]
```

class sage.combinat.tableau.**StandardTableaux_size**(n)

Bases: *StandardTableaux*, DisjointUnionEnumeratedSets

Standard tableaux of fixed size n.

EXAMPLES:

```
sage: [ t for t in StandardTableaux(1) ]
[[[1]]]
```

(continues on next page)

(continued from previous page)

```
sage: [ t for t in StandardTableaux(2) ]
[[[1, 2]], [[1], [2]]]
sage: [ t for t in StandardTableaux(3) ]
[[[1, 2, 3]], [[1, 3], [2]], [[1, 2], [3]], [[1], [2], [3]]]
sage: StandardTableaux(4)[:]
[[[1, 2, 3, 4]],
 [[1, 3, 4], [2]],
 [[1, 2, 4], [3]],
 [[1, 2, 3], [4]],
 [[1, 3], [2, 4]],
 [[1, 2], [3, 4]],
 [[1, 4], [2], [3]],
 [[1, 3], [2], [4]],
 [[1, 2], [3], [4]],
 [[1], [2], [3], [4]]]
```

```
>>> from sage.all import *
>>> [ t for t in StandardTableaux(Integer(1)) ]
[[[1]]]
>>> [ t for t in StandardTableaux(Integer(2)) ]
[[[1, 2]], [[1], [2]]]
>>> [ t for t in StandardTableaux(Integer(3)) ]
[[[1, 2, 3]], [[1, 3], [2]], [[1, 2], [3]], [[1], [2], [3]]]
>>> StandardTableaux(Integer(4))[:]
[[[1, 2, 3, 4]],
 [[1, 3, 4], [2]],
 [[1, 2, 4], [3]],
 [[1, 2, 3], [4]],
 [[1, 3], [2, 4]],
 [[1, 2], [3, 4]],
 [[1, 4], [2], [3]],
 [[1, 3], [2], [4]],
 [[1, 2], [3], [4]],
 [[1], [2], [3], [4]]]
```

cardinality()

Return the number of all standard tableaux of size `n`.

The number of standard tableaux of size n is equal to the number of involutions in the symmetric group S_n. This is a consequence of the symmetry of the RSK correspondence, that if $\sigma \mapsto (P, Q)$, then $\sigma^{-1} \mapsto (Q, P)$. For more information, see Wikipedia article Robinson-Schensted-Knuth_correspondence#Symmetry.

ALGORITHM:

The algorithm uses the fact that standard tableaux of size `n` are in bijection with the involutions of size `n`, (see page 41 in section 4.1 of [Ful1997]). For each number of fixed points, you count the number of ways to choose those fixed points multiplied by the number of perfect matchings on the remaining values.

EXAMPLES:

```
sage: StandardTableaux(3).cardinality()
4
sage: ns = [1,2,3,4,5,6]
sage: sts = [StandardTableaux(n) for n in ns]
```

(continues on next page)

(continued from previous page)

```
sage: all(st.cardinality() == len(st.list()) for st in sts)
True
```

```
>>> from sage.all import *
>>> StandardTableaux(Integer(3)).cardinality()
4
>>> ns = [Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),Integer(6)]
>>> sts = [StandardTableaux(n) for n in ns]
>>> all(st.cardinality() == len(st.list()) for st in sts)
True
```

The cardinality can be computed without constructing all elements in this set, so this computation is fast (see also Issue #28273):

```
sage: StandardTableaux(500).cardinality()
42310756530860854995155175369O...22128599923665744392793725337 6
```

```
>>> from sage.all import *
>>> StandardTableaux(Integer(500)).cardinality()
42310756530860854995155175369O...22128599923665744392793725337 6
```

random_element()

Return a random `StandardTableau` with uniform probability.

This algorithm uses the fact that the Robinson-Schensted correspondence returns a pair of identical standard Young tableaux (SYTs) if and only if the permutation was an involution. Thus, generating a random SYT is equivalent to generating a random involution.

To generate an involution, we first need to choose its number of fixed points k (if the size of the involution is even, the number of fixed points will be even, and if the size is odd, the number of fixed points will be odd). To do this, we choose a random integer r between 0 and the number N of all involutions of size n. We then decompose the interval $\{1, 2, \ldots, N\}$ into subintervals whose lengths are the numbers of involutions of size n with respectively $0, 1, \ldots, \lfloor N/2 \rfloor$ fixed points. The interval in which our random integer r lies then decides how many fixed points our random involution will have. We then place those fixed points randomly and then compute a perfect matching (an involution without fixed points) on the remaining values.

EXAMPLES:

```
sage: StandardTableaux(10).random_element() # random
[[1, 3, 6], [2, 5, 7], [4, 8], [9], [10]]
sage: StandardTableaux(0).random_element()
[]
sage: StandardTableaux(1).random_element()
[[1]]
```

```
>>> from sage.all import *
>>> StandardTableaux(Integer(10)).random_element() # random
[[1, 3, 6], [2, 5, 7], [4, 8], [9], [10]]
>>> StandardTableaux(Integer(0)).random_element()
[]
>>> StandardTableaux(Integer(1)).random_element()
[[1]]
```

class sage.combinat.tableau.**Tableau**(*parent*, *t*, *check=True*)

Bases: ClonableList

A class to model a tableau.

INPUT:

- t – a Tableau, a list of iterables, or an empty list

OUTPUT: a Tableau object constructed from t

A tableau is abstractly a mapping from the cells in a partition to arbitrary objects (called entries). It is often represented as a finite list of nonempty lists (or, more generally an iterator of iterables) of weakly decreasing lengths. This list, in particular, can be empty, representing the empty tableau.

Note that Sage uses the English convention for partitions and tableaux; the longer rows are displayed on top.

EXAMPLES:

```
sage: t = Tableau([[1,2,3],[4,5]]); t
[[1, 2, 3], [4, 5]]
sage: t.shape()
[3, 2]
sage: t.pp() # pretty printing
1 2 3
4 5
sage: t.is_standard()
True

sage: Tableau([['a','c','b'],[],(2,1)]])
[['a', 'c', 'b'], [], (2, 1)]]
sage: Tableau([]) # The empty tableau
[]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]]); t
[[1, 2, 3], [4, 5]]
>>> t.shape()
[3, 2]
>>> t.pp() # pretty printing
1 2 3
4 5
>>> t.is_standard()
True

>>> Tableau([['a','c','b'],[],(Integer(2),Integer(1))]])
[['a', 'c', 'b'], [], (2, 1)]]
>>> Tableau([]) # The empty tableau
[]
```

When using code that will generate a lot of tableaux, it is slightly more efficient to construct a Tableau from the appropriate Parent object:

```
sage: T = Tableaux()
sage: T([[1, 2, 3], [4, 5]])
[[1, 2, 3], [4, 5]]
```

```
>>> from sage.all import *
>>> T = Tableaux()
>>> T([[Integer(1), Integer(2), Integer(3)], [Integer(4), Integer(5)]])
[[1, 2, 3], [4, 5]]
```

add_entry(*cell*, *m*)

Return the result of setting the entry in cell `cell` equal to `m` in the tableau `self`.

This tableau has larger size than `self` if `cell` does not belong to the shape of `self`; otherwise, the tableau has the same shape as `self` and has the appropriate entry replaced.

INPUT:

- `cell` – a pair of nonnegative integers

OUTPUT:

The tableau `self` with the entry in cell `cell` set to `m`. This entry overwrites an existing entry if `cell` already belongs to `self`, or is added to the tableau if `cell` is a cocorner of the shape `self`. (Either way, the input is not modified.)

Note

Both coordinates of `cell` are interpreted as starting at 0. So, `cell == (0, 0)` corresponds to the northwesternmost cell.

EXAMPLES:

```
sage: s = StandardTableau([[1,2,5],[3,4]]); s.pp()
  1  2  5
  3  4
sage: t = s.add_entry( (1,2), 6); t.pp()
  1  2  5
  3  4  6
sage: t.category()
Category of elements of Standard tableaux
sage: s.add_entry( (2,0), 6).pp()
  1  2  5
  3  4
  6
sage: u = s.add_entry( (1,2), 3); u.pp()
  1  2  5
  3  4  3
```

(continues on next page)

(continued from previous page)

```
sage: u.category()
Category of elements of Tableaux
sage: s.add_entry( (2,2),3)
Traceback (most recent call last):
...
IndexError: (2, 2) is not an addable cell of the tableau
```

```
>>> from sage.all import *
>>> s = StandardTableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(4)]]); s.pp()
  1  2  5
  3  4
>>> t = s.add_entry( (Integer(1),Integer(2)), Integer(6)); t.pp()
  1  2  5
  3  4  6
>>> t.category()
Category of elements of Standard tableaux
>>> s.add_entry( (Integer(2),Integer(0)), Integer(6)).pp()
  1  2  5
  3  4
  6
>>> u = s.add_entry( (Integer(1),Integer(2)), Integer(3)); u.pp()
  1  2  5
  3  4  3
>>> u.category()
Category of elements of Tableaux
>>> s.add_entry( (Integer(2),Integer(2)),Integer(3))
Traceback (most recent call last):
...
IndexError: (2, 2) is not an addable cell of the tableau
```

anti_restrict(n)

Return the skew tableau formed by removing all of the cells from `self` that are filled with a number at most n.

EXAMPLES:

```
sage: t = Tableau([[1,2,3],[4,5]]); t
[[1, 2, 3], [4, 5]]
sage: t.anti_restrict(1)
[[None, 2, 3], [4, 5]]
sage: t.anti_restrict(2)
[[None, None, 3], [4, 5]]
sage: t.anti_restrict(3)
[[None, None, None], [4, 5]]
sage: t.anti_restrict(4)
[[None, None, None], [None, 5]]
sage: t.anti_restrict(5)
[[None, None, None], [None, None]]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]]);
```

(continues on next page)

(continued from previous page)

```
↪ t
[[1, 2, 3], [4, 5]]
>>> t.anti_restrict(Integer(1))
[[None, 2, 3], [4, 5]]
>>> t.anti_restrict(Integer(2))
[[None, None, 3], [4, 5]]
>>> t.anti_restrict(Integer(3))
[[None, None, None], [4, 5]]
>>> t.anti_restrict(Integer(4))
[[None, None, None], [None, 5]]
>>> t.anti_restrict(Integer(5))
[[None, None, None], [None, None]]
```

atom()

EXAMPLES:

```
sage: Tableau([[1,2],[3,4]]).atom()
[2, 2]
sage: Tableau([[1,2,3],[4,5],[6]]).atom()
[3, 2, 1]
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).atom()
[2, 2]
>>> Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)],
↪[Integer(6)]]).atom()
[3, 2, 1]
```

bender_knuth_involution(*k*, *rows=None*, *check=True*)

Return the image of `self` under the k-th Bender–Knuth involution, assuming `self` is a semistandard tableau.

Let T be a tableau, then a *lower free `k` in `T`* means a cell of T which is filled with the integer k and whose direct lower neighbor is not filled with the integer $k+1$ (in particular, this lower neighbor might not exist at all). Let an *upper free `k + 1` in `T`* mean a cell of T which is filled with the integer $k+1$ and whose direct upper neighbor is not filled with the integer k (in particular, this neighbor might not exist at all). It is clear that for any row r of T, the lower free k's and the upper free $k+1$'s in r together form a contiguous interval or r.

The *`k`-th Bender–Knuth switch at row `i`* changes the entries of the cells in this interval in such a way that if it used to have a entries of k and b entries of $k+1$, it will now have b entries of k and a entries of $k+1$. For fixed k, the k-th Bender–Knuth switches for different i commute. The composition of the k-th Bender–Knuth switches for all rows is called the *`k`-th Bender-Knuth involution*. This is used to show that the Schur functions defined by semistandard tableaux are symmetric functions.

INPUT:

- `k` – integer
- `rows` – (default: `None`) when set to `None`, the method computes the k-th Bender–Knuth involution as defined above. When an iterable, this computes the composition of the k-th Bender–Knuth switches at row i over all i in `rows`. When set to an integer i, the method computes the k-th Bender–Knuth switch at row i. Note the indexing of the rows starts with 1.
- `check` – (default: `True`) check to make sure `self` is semistandard; Set to `False` to avoid this check

OUTPUT:

The image of `self` under either the k-th Bender–Knuth involution, the k-th Bender–Knuth switch at a certain row, or the composition of such switches, as detailed in the INPUT section.

EXAMPLES:

```
sage: t = Tableau([[1,1,3,4,4,5,6,7],[2,2,4,6,7,7,7],[3,4,5,8,8,9],[6,6,7,10],
↪[7,8,8,11],[8]])
sage: t.bender_knuth_involution(1) == t
True
sage: t.bender_knuth_involution(2)
[[1, 1, 2, 4, 4, 5, 6, 7], [2, 3, 4, 6, 7, 7, 7], [3, 4, 5, 8, 8, 9], [6, 6,␣
↪7, 10], [7, 8, 8, 11], [8]]
sage: t.bender_knuth_involution(3)
[[1, 1, 3, 3, 3, 5, 6, 7], [2, 2, 4, 6, 7, 7, 7], [3, 4, 5, 8, 8, 9], [6, 6,␣
↪7, 10], [7, 8, 8, 11], [8]]
sage: t.bender_knuth_involution(4)
[[1, 1, 3, 4, 5, 5, 6, 7], [2, 2, 4, 6, 7, 7, 7], [3, 5, 5, 8, 8, 9], [6, 6,␣
↪7, 10], [7, 8, 8, 11], [8]]
sage: t.bender_knuth_involution(5)
[[1, 1, 3, 4, 4, 5, 6, 7], [2, 2, 4, 5, 7, 7, 7], [3, 4, 6, 8, 8, 9], [5, 5,␣
↪7, 10], [7, 8, 8, 11], [8]]
sage: t.bender_knuth_involution(666) == t
True
sage: t.bender_knuth_involution(4, 2) == t
True
sage: t.bender_knuth_involution(4, 3)
[[1, 1, 3, 4, 4, 5, 6, 7], [2, 2, 4, 6, 7, 7, 7], [3, 5, 5, 8, 8, 9], [6, 6,␣
↪7, 10], [7, 8, 8, 11], [8]]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(1),Integer(3),Integer(4),Integer(4),
↪Integer(5),Integer(6),Integer(7)],[Integer(2),Integer(2),Integer(4),
↪Integer(6),Integer(7),Integer(7),Integer(7)],[Integer(3),Integer(4),
↪Integer(5),Integer(8),Integer(8),Integer(9)],[Integer(6),Integer(6),
↪Integer(7),Integer(10)],[Integer(7),Integer(8),Integer(8),Integer(11)],
↪[Integer(8)]])
>>> t.bender_knuth_involution(Integer(1)) == t
True
>>> t.bender_knuth_involution(Integer(2))
[[1, 1, 2, 4, 4, 5, 6, 7], [2, 3, 4, 6, 7, 7, 7], [3, 4, 5, 8, 8, 9], [6, 6,␣
↪7, 10], [7, 8, 8, 11], [8]]
>>> t.bender_knuth_involution(Integer(3))
[[1, 1, 3, 3, 3, 5, 6, 7], [2, 2, 4, 6, 7, 7, 7], [3, 4, 5, 8, 8, 9], [6, 6,␣
↪7, 10], [7, 8, 8, 11], [8]]
>>> t.bender_knuth_involution(Integer(4))
[[1, 1, 3, 4, 5, 5, 6, 7], [2, 2, 4, 6, 7, 7, 7], [3, 5, 5, 8, 8, 9], [6, 6,␣
↪7, 10], [7, 8, 8, 11], [8]]
>>> t.bender_knuth_involution(Integer(5))
[[1, 1, 3, 4, 4, 5, 6, 7], [2, 2, 4, 5, 7, 7, 7], [3, 4, 6, 8, 8, 9], [5, 5,␣
↪7, 10], [7, 8, 8, 11], [8]]
>>> t.bender_knuth_involution(Integer(666)) == t
True
>>> t.bender_knuth_involution(Integer(4), Integer(2)) == t
True
```

(continues on next page)

(continued from previous page)

```
>>> t.bender_knuth_involution(Integer(4), Integer(3))
[[1, 1, 3, 4, 4, 5, 6, 7], [2, 2, 4, 6, 7, 7, 7], [3, 5, 5, 8, 8, 9], [6, 6,␣
↪7, 10], [7, 8, 8, 11], [8]]
```

The `rows` keyword can be an iterator:

```
sage: t.bender_knuth_involution(6, iter([1,2])) == t
False
sage: t.bender_knuth_involution(6, iter([3,4])) == t
True
```

```
>>> from sage.all import *
>>> t.bender_knuth_involution(Integer(6), iter([Integer(1),Integer(2)])) == t
False
>>> t.bender_knuth_involution(Integer(6), iter([Integer(3),Integer(4)])) == t
True
```

The Bender–Knuth involution is an involution:

```
sage: T = SemistandardTableaux(shape=[3,1,1], max_entry=4)
sage: all(t.bender_knuth_involution(k).bender_knuth_involution(k) == t       #␣
↪needs sage.modules
....:     for k in range(1, 5) for t in T)
True
```

```
>>> from sage.all import *
>>> T = SemistandardTableaux(shape=[Integer(3),Integer(1),Integer(1)], max_
↪entry=Integer(4))
>>> all(t.bender_knuth_involution(k).bender_knuth_involution(k) == t       #␣
↪needs sage.modules
...     for k in range(Integer(1), Integer(5)) for t in T)
True
```

The same holds for the single switches:

```
sage: all(t.bender_knuth_involution(k, j).bender_knuth_involution(k, j) == t ␣
↪          # needs sage.modules
....:     for k in range(1, 5) for j in range(1, 5) for t in T)
True
```

```
>>> from sage.all import *
>>> all(t.bender_knuth_involution(k, j).bender_knuth_involution(k, j) == t    ␣
↪        # needs sage.modules
...     for k in range(Integer(1), Integer(5)) for j in range(Integer(1),␣
↪Integer(5)) for t in T)
True
```

Locality of the Bender–Knuth involutions:

```
sage: all(t.bender_knuth_involution(k).bender_knuth_involution(l)           #␣
↪needs sage.modules
....:       == t.bender_knuth_involution(l).bender_knuth_involution(k)
```

(continues on next page)

(continued from previous page)

```
....:     for k in range(1, 5) for l in range(1, 5) if abs(k - l) > 1
....:     for t in T)
True
```

```
>>> from sage.all import *
>>> all(t.bender_knuth_involution(k).bender_knuth_involution(l)           #␣
↪needs sage.modules
...       == t.bender_knuth_involution(l).bender_knuth_involution(k)
...     for k in range(Integer(1), Integer(5)) for l in range(Integer(1),␣
↪Integer(5)) if abs(k - l) > Integer(1)
...     for t in T)
True
```

Berenstein and Kirillov [KB1995] have shown that $(s_1 s_2)^6 = id$ (for tableaux of straight shape):

```
sage: p = lambda t, k: t.bender_knuth_involution(k).bender_knuth_involution(k␣
↪+ 1)
sage: all(p(p(p(p(p(p(t,1),1),1),1),1),1) == t for t in T)                  #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> p = lambda t, k: t.bender_knuth_involution(k).bender_knuth_involution(k +␣
↪Integer(1))
>>> all(p(p(p(p(p(p(t,Integer(1)),Integer(1)),Integer(1)),Integer(1)),
↪Integer(1)),Integer(1)) == t for t in T)                  # needs sage.
↪modules
True
```

However, $(s_2 s_3)^6 = id$ is false:

```
sage: p = lambda t, k: t.bender_knuth_involution(k).bender_knuth_involution(k␣
↪+ 1)
sage: t = Tableau([[1,2,2],[3,4]])
sage: x = t
sage: for i in range(6): x = p(x, 2)
sage: x
[[1, 2, 3], [2, 4]]
sage: x == t
False
```

```
>>> from sage.all import *
>>> p = lambda t, k: t.bender_knuth_involution(k).bender_knuth_involution(k +␣
↪Integer(1))
>>> t = Tableau([[Integer(1),Integer(2),Integer(2)],[Integer(3),Integer(4)]])
>>> x = t
>>> for i in range(Integer(6)): x = p(x, Integer(2))
>>> x
[[1, 2, 3], [2, 4]]
>>> x == t
False
```

bump(*x*)

Insert `x` into `self` using Schensted's row-bumping (or row-insertion) algorithm.

EXAMPLES:

```
sage: t = Tableau([[1,2],[3]])
sage: t.bump(1)
[[1, 1], [2], [3]]
sage: t
[[1, 2], [3]]
sage: t.bump(2)
[[1, 2, 2], [3]]
sage: t.bump(3)
[[1, 2, 3], [3]]
sage: t
[[1, 2], [3]]
sage: t = Tableau([[1,2,2,3],[2,3,5,5],[4,4,6],[5,6]])
sage: t.bump(2)
[[1, 2, 2, 2], [2, 3, 3, 5], [4, 4, 5], [5, 6, 6]]
sage: t.bump(1)
[[1, 1, 2, 3], [2, 2, 5, 5], [3, 4, 6], [4, 6], [5]]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2)],[Integer(3)]])
>>> t.bump(Integer(1))
[[1, 1], [2], [3]]
>>> t
[[1, 2], [3]]
>>> t.bump(Integer(2))
[[1, 2, 2], [3]]
>>> t.bump(Integer(3))
[[1, 2, 3], [3]]
>>> t
[[1, 2], [3]]
>>> t = Tableau([[Integer(1),Integer(2),Integer(2),Integer(3)],[Integer(2),
↪Integer(3),Integer(5),Integer(5)],[Integer(4),Integer(4),Integer(6)],
↪[Integer(5),Integer(6)]])
>>> t.bump(Integer(2))
[[1, 2, 2, 2], [2, 3, 3, 5], [4, 4, 5], [5, 6, 6]]
>>> t.bump(Integer(1))
[[1, 1, 2, 3], [2, 2, 5, 5], [3, 4, 6], [4, 6], [5]]
```

bump_multiply(*other*)

Multiply two tableaux using Schensted's bump.

This product makes the set of semistandard tableaux into an associative monoid. The empty tableau is the unit in this monoid. See pp. 11-12 of [Ful1997].

The same product operation is implemented in a different way in *slide_multiply()*.

EXAMPLES:

```
sage: t = Tableau([[1,2,2,3],[2,3,5,5],[4,4,6],[5,6]])
sage: t2 = Tableau([[1,2],[3]])
```

(continues on next page)

(continued from previous page)

```
sage: t.bump_multiply(t2)
[[1, 1, 2, 2, 3], [2, 2, 3, 5], [3, 4, 5], [4, 6, 6], [5]]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2),Integer(2),Integer(3)],[Integer(2),
↪Integer(3),Integer(5),Integer(5)],[Integer(4),Integer(4),Integer(6)],
↪[Integer(5),Integer(6)]])
>>> t2 = Tableau([[Integer(1),Integer(2)],[Integer(3)]])
>>> t.bump_multiply(t2)
[[1, 1, 2, 2, 3], [2, 2, 3, 5], [3, 4, 5], [4, 6, 6], [5]]
```

catabolism()

Remove the top row of `self` and insert it back in using column Schensted insertion (starting with the largest letter).

EXAMPLES:

```
sage: Tableau([]).catabolism()
[]
sage: Tableau([[1,2,3,4,5]]).catabolism()
[[1, 2, 3, 4, 5]]
sage: Tableau([[1,1,3,3],[2,3],[3]]).catabolism()
[[1, 1, 2, 3, 3, 3], [3]]
sage: Tableau([[1, 1, 2, 3, 3, 3], [3]]).catabolism()
[[1, 1, 2, 3, 3, 3, 3]]
```

```
>>> from sage.all import *
>>> Tableau([]).catabolism()
[]
>>> Tableau([[Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]]).
↪catabolism()
[[1, 2, 3, 4, 5]]
>>> Tableau([[Integer(1),Integer(1),Integer(3),Integer(3)],[Integer(2),
↪Integer(3)],[Integer(3)]]).catabolism()
[[1, 1, 2, 3, 3, 3], [3]]
>>> Tableau([[Integer(1), Integer(1), Integer(2), Integer(3), Integer(3),␣
↪Integer(3)], [Integer(3)]]).catabolism()
[[1, 1, 2, 3, 3, 3, 3]]
```

catabolism_projector(*parts*)

EXAMPLES:

```
sage: t = Tableau([[1,1,3,3],[2,3],[3]])
sage: t.catabolism_projector([[4,2,1]])
[[1, 1, 3, 3], [2, 3], [3]]
sage: t.catabolism_projector([[1]])
[]
sage: t.catabolism_projector([[2,1],[1]])
[]
sage: t.catabolism_projector([[1,1],[4,1]])
[[1, 1, 3, 3], [2, 3], [3]]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(1),Integer(3),Integer(3)],[Integer(2),
↪Integer(3)],[Integer(3)]])
>>> t.catabolism_projector([[Integer(4),Integer(2),Integer(1)]])
[[1, 1, 3, 3], [2, 3], [3]]
>>> t.catabolism_projector([[Integer(1)]])
[]
>>> t.catabolism_projector([[Integer(2),Integer(1)],[Integer(1)]])
[]
>>> t.catabolism_projector([[Integer(1),Integer(1)],[Integer(4),Integer(1)]])
[[1, 1, 3, 3], [2, 3], [3]]
```

catabolism_sequence()

Perform *catabolism()* on `self` until it returns a tableau consisting of a single row.

EXAMPLES:

```
sage: t = Tableau([[1,2,3,4,5,6,8],[7,9]])
sage: t.catabolism_sequence()
[[[1, 2, 3, 4, 5, 6, 8], [7, 9]],
 [[1, 2, 3, 4, 5, 6, 7, 9], [8]],
 [[1, 2, 3, 4, 5, 6, 7, 8], [9]],
 [[1, 2, 3, 4, 5, 6, 7, 8, 9]]]
sage: Tableau([]).catabolism_sequence()
[[]]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2),Integer(3),Integer(4),Integer(5),
↪Integer(6),Integer(8)],[Integer(7),Integer(9)]])
>>> t.catabolism_sequence()
[[[1, 2, 3, 4, 5, 6, 8], [7, 9]],
 [[1, 2, 3, 4, 5, 6, 7, 9], [8]],
 [[1, 2, 3, 4, 5, 6, 7, 8], [9]],
 [[1, 2, 3, 4, 5, 6, 7, 8, 9]]]
>>> Tableau([]).catabolism_sequence()
[[]]
```

cells()

Return a list of the coordinates of the cells of `self`.

Coordinates start at 0, so the northwesternmost cell (in English notation) has coordinates $(0, 0)$.

EXAMPLES:

```
sage: Tableau([[1,2],[3,4]]).cells()
[(0, 0), (0, 1), (1, 0), (1, 1)]
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).cells()
[(0, 0), (0, 1), (1, 0), (1, 1)]
```

cells_containing(i)

Return the list of cells in which the letter i appears in the tableau `self`. The list is ordered with cells appearing from left to right.

Cells are given as pairs of coordinates (a, b), where both rows and columns are counted from 0 (so $a = 0$ means the cell lies in the leftmost column of the tableau, etc.).

EXAMPLES:

```
sage: t = Tableau([[1,1,3],[2,3,5],[4,5]])
sage: t.cells_containing(5)
[(2, 1), (1, 2)]
sage: t.cells_containing(4)
[(2, 0)]
sage: t.cells_containing(6)
[]

sage: t = Tableau([[1,1,2,4],[2,4,4],[4]])
sage: t.cells_containing(4)
[(2, 0), (1, 1), (1, 2), (0, 3)]

sage: t = Tableau([[1,1,2,8,9],[2,5,6,11],[3,7,7,13],[4,8,9],[5],[13],[14]])
sage: t.cells_containing(8)
[(3, 1), (0, 3)]

sage: Tableau([]).cells_containing(3)
[]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(1),Integer(3)],[Integer(2),Integer(3),
↪Integer(5)],[Integer(4),Integer(5)]])
>>> t.cells_containing(Integer(5))
[(2, 1), (1, 2)]
>>> t.cells_containing(Integer(4))
[(2, 0)]
>>> t.cells_containing(Integer(6))
[]

>>> t = Tableau([[Integer(1),Integer(1),Integer(2),Integer(4)],[Integer(2),
↪Integer(4),Integer(4)],[Integer(4)]])
>>> t.cells_containing(Integer(4))
[(2, 0), (1, 1), (1, 2), (0, 3)]

>>> t = Tableau([[Integer(1),Integer(1),Integer(2),Integer(8),Integer(9)],
↪[Integer(2),Integer(5),Integer(6),Integer(11)],[Integer(3),Integer(7),
↪Integer(7),Integer(13)],[Integer(4),Integer(8),Integer(9)],[Integer(5)],
↪[Integer(13)],[Integer(14)]])
>>> t.cells_containing(Integer(8))
[(3, 1), (0, 3)]

>>> Tableau([]).cells_containing(Integer(3))
[]
```

charge()

Return the charge of the reading word of `self`. See *charge()* for more information.

EXAMPLES:

```
sage: Tableau([[1,1],[2,2],[3]]).charge()
0
sage: Tableau([[1,1,3],[2,2]]).charge()
1
sage: Tableau([[1,1,2],[2],[3]]).charge()
1
sage: Tableau([[1,1,2],[2,3]]).charge()
2
sage: Tableau([[1,1,2,3],[2]]).charge()
2
sage: Tableau([[1,1,2,2],[3]]).charge()
3
sage: Tableau([[1,1,2,2,3]]).charge()
4
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(1)],[Integer(2),Integer(2)],[Integer(3)]]).
↪charge()
0
>>> Tableau([[Integer(1),Integer(1),Integer(3)],[Integer(2),Integer(2)]]).
↪charge()
1
>>> Tableau([[Integer(1),Integer(1),Integer(2)],[Integer(2)],[Integer(3)]]).
↪charge()
1
>>> Tableau([[Integer(1),Integer(1),Integer(2)],[Integer(2),Integer(3)]]).
↪charge()
2
>>> Tableau([[Integer(1),Integer(1),Integer(2),Integer(3)],[Integer(2)]]).
↪charge()
2
>>> Tableau([[Integer(1),Integer(1),Integer(2),Integer(2)],[Integer(3)]]).
↪charge()
3
>>> Tableau([[Integer(1),Integer(1),Integer(2),Integer(2),Integer(3)]]).
↪charge()
4
```

check()

Check that `self` is a valid straight-shape tableau.

EXAMPLES:

```
sage: t = Tableau([[1,1],[2]])
sage: t.check()

sage: t = Tableau([[None, None, 1], [2, 4], [3, 4, 5]])  # indirect doctest
Traceback (most recent call last):
...
ValueError: a tableau must be a list of iterables of weakly decreasing length
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(1)],[Integer(2)]])
```

(continues on next page)

(continued from previous page)

```
>>> t.check()

>>> t = Tableau([[None, None, Integer(1)], [Integer(2), Integer(4)],␣
↪[Integer(3), Integer(4), Integer(5)]])  # indirect doctest
Traceback (most recent call last):
...
ValueError: a tableau must be a list of iterables of weakly decreasing length
```

cocharge()

Return the cocharge of the reading word of `self`. See *cocharge()* for more information.

EXAMPLES:

```
sage: Tableau([[1,1],[2,2],[3]]).cocharge()
4
sage: Tableau([[1,1,3],[2,2]]).cocharge()
3
sage: Tableau([[1,1,2],[2],[3]]).cocharge()
3
sage: Tableau([[1,1,2],[2,3]]).cocharge()
2
sage: Tableau([[1,1,2,3],[2]]).cocharge()
2
sage: Tableau([[1,1,2,2],[3]]).cocharge()
1
sage: Tableau([[1,1,2,2,3]]).cocharge()
0
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(1)],[Integer(2),Integer(2)],[Integer(3)]]).
↪cocharge()
4
>>> Tableau([[Integer(1),Integer(1),Integer(3)],[Integer(2),Integer(2)]]).
↪cocharge()
3
>>> Tableau([[Integer(1),Integer(1),Integer(2)],[Integer(2)],[Integer(3)]]).
↪cocharge()
3
>>> Tableau([[Integer(1),Integer(1),Integer(2)],[Integer(2),Integer(3)]]).
↪cocharge()
2
>>> Tableau([[Integer(1),Integer(1),Integer(2),Integer(3)],[Integer(2)]]).
↪cocharge()
2
>>> Tableau([[Integer(1),Integer(1),Integer(2),Integer(2)],[Integer(3)]]).
↪cocharge()
1
>>> Tableau([[Integer(1),Integer(1),Integer(2),Integer(2),Integer(3)]]).
↪cocharge()
0
```

codegree(*e*, *multicharge=(0,)*)

Return the Brundan-Kleshchev-Wang [BKW2011] codegree of the standard tableau `self`.

The *codegree* of a tableau is an integer that is defined recursively by successively stripping off the number k, for $k = n, n-1, \ldots, 1$ and at stage adding the number of addable cell of the same residue minus the number of removable cells of the same residue as k and are above k in the diagram.

The codegree of the tableau T gives the degree of "dual" homogeneous basis element of the Graded Specht module that is indexed by T.

INPUT:

- `e` – the *quantum characteristic*
- `multicharge` – (default: `[0]`) the multicharge

OUTPUT: the codegree of the tableau `self`, which is an integer

EXAMPLES:

```
sage: StandardTableau([[1,3,5],[2,4]]).codegree(3)                          #␣
↪needs sage.groups
0
sage: StandardTableau([[1,2,5],[3,4]]).codegree(3)                          #␣
↪needs sage.groups
1
sage: StandardTableau([[1,2,5],[3,4]]).codegree(4)                          #␣
↪needs sage.groups
0
```

```
>>> from sage.all import *
>>> StandardTableau([[Integer(1),Integer(3),Integer(5)],[Integer(2),
↪Integer(4)]]).codegree(Integer(3))                          # needs sage.
↪groups
0
>>> StandardTableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(4)]]).codegree(Integer(3))                          # needs sage.
↪groups
1
>>> StandardTableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(4)]]).codegree(Integer(4))                          # needs sage.
↪groups
0
```

column_stabilizer()

Return the PermutationGroup corresponding to the column stabilizer of `self`.

This assumes that every integer from 1 to the size of `self` appears exactly once in `self`.

EXAMPLES:

```
sage: # needs sage.groups
sage: cs = Tableau([[1,2,3],[4,5]]).column_stabilizer()
sage: cs.order() == factorial(2)*factorial(2)
True
sage: PermutationGroupElement([(1,3,2),(4,5)]) in cs
False
sage: PermutationGroupElement([(1,4)]) in cs
True
```

```
>>> from sage.all import *
>>> # needs sage.groups
>>> cs = Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(5)]]).column_stabilizer()
>>> cs.order() == factorial(Integer(2))*factorial(Integer(2))
True
>>> PermutationGroupElement([(Integer(1),Integer(3),Integer(2)),(Integer(4),
↪Integer(5))]) in cs
False
>>> PermutationGroupElement([(Integer(1),Integer(4))]) in cs
True
```

components()

This function returns a list containing itself. It exists mainly for compatibility with *TableauTuple* as it allows constructions like the example below.

EXAMPLES:

```
sage: t = Tableau([[1,2,3],[4,5]])
sage: for s in t.components(): print(s.to_list())
[[1, 2, 3], [4, 5]]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]])
>>> for s in t.components(): print(s.to_list())
[[1, 2, 3], [4, 5]]
```

conjugate()

Return the conjugate of `self`.

EXAMPLES:

```
sage: Tableau([[1,2],[3,4]]).conjugate()
[[1, 3], [2, 4]]
sage: c = StandardTableau([[1,2],[3,4]]).conjugate()
sage: c.parent()
Standard tableaux
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).conjugate()
[[1, 3], [2, 4]]
>>> c = StandardTableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).
↪conjugate()
>>> c.parent()
Standard tableaux
```

content(*k*, *multicharge=[0]*)

Return the content of `k` in the standard tableau `self`.

The content of k is $c - r$ if k appears in row r and column c of the tableau.

The `multicharge` is a list of length 1 which gives an offset for all of the contents. It is included mainly for compatibility with *sage.combinat.tableau_tuple.TableauTuple()*.

EXAMPLES:

```
sage: StandardTableau([[1,2],[3,4]]).content(3)
-1

sage: StandardTableau([[1,2],[3,4]]).content(6)
Traceback (most recent call last):
...
ValueError: 6 does not appear in tableau
```

```
>>> from sage.all import *
>>> StandardTableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).
↪content(Integer(3))
-1

>>> StandardTableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).
↪content(Integer(6))
Traceback (most recent call last):
...
ValueError: 6 does not appear in tableau
```

corners()

Return the corners of the tableau `self`.

EXAMPLES:

```
sage: Tableau([[1, 4, 6], [2, 5], [3]]).corners()
[(0, 2), (1, 1), (2, 0)]
sage: Tableau([[1, 3], [2, 4]]).corners()
[(1, 1)]
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1), Integer(4), Integer(6)], [Integer(2), Integer(5)],␣
↪[Integer(3)]]).corners()
[(0, 2), (1, 1), (2, 0)]
>>> Tableau([[Integer(1), Integer(3)], [Integer(2), Integer(4)]]).corners()
[(1, 1)]
```

degree(*e*, *multicharge=(0,)*)

Return the Brundan-Kleshchev-Wang [BKW2011] degree of `self`.

The *degree* is an integer that is defined recursively by successively stripping off the number k, for $k = n, n-1, \ldots, 1$ and at stage adding the number of addable cell of the same residue minus the number of removable cells of the same residue as k and which are below k in the diagram.

The degrees of the tableau T gives the degree of the homogeneous basis element of the graded Specht module that is indexed by T.

INPUT:

- `e` – the *quantum characteristic*
- `multicharge` – (default: `[0]`) the multicharge

OUTPUT: the degree of the tableau `self`, which is an integer

EXAMPLES:

```
sage: StandardTableau([[1,2,5],[3,4]]).degree(3)                              #␣
↪needs sage.groups
0
sage: StandardTableau([[1,2,5],[3,4]]).degree(4)                              #␣
↪needs sage.groups
1
```

```
>>> from sage.all import *
>>> StandardTableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(4)]]).degree(Integer(3))                                  # needs sage.
↪groups
0
>>> StandardTableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(4)]]).degree(Integer(4))                                  # needs sage.
↪groups
1
```

descents()

Return a list of the cells `(i,j)` such that `self[i][j] > self[i-1][j]`.

> **Warning**
>
> This is not to be confused with the descents of a standard tableau.

EXAMPLES:

```
sage: Tableau( [[1,4],[2,3]] ).descents()
[(1, 0)]
sage: Tableau( [[1,2],[3,4]] ).descents()
[(1, 0), (1, 1)]
sage: Tableau( [[1,2,3],[4,5]] ).descents()
[(1, 0), (1, 1)]
```

```
>>> from sage.all import *
>>> Tableau( [[Integer(1),Integer(4)],[Integer(2),Integer(3)]] ).descents()
[(1, 0)]
>>> Tableau( [[Integer(1),Integer(2)],[Integer(3),Integer(4)]] ).descents()
[(1, 0), (1, 1)]
>>> Tableau( [[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]] ).
↪descents()
[(1, 0), (1, 1)]
```

entries()

Return the tuple of all entries of `self`, in the order obtained by reading across the rows from top to bottom (in English notation).

EXAMPLES:

```
sage: t = Tableau([[1,3], [2]])
sage: t.entries()
(1, 3, 2)
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(3)], [Integer(2)]])
>>> t.entries()
(1, 3, 2)
```

entry(*cell*)

Return the entry of cell `cell` in the tableau `self`. Here, `cell` should be given as a tuple (i, j) of zero-based coordinates (so the northwesternmost cell in English notation is $(0, 0)$).

EXAMPLES:

```
sage: t = Tableau([[1,2],[3,4]])
sage: t.entry( (0,0) )
1
sage: t.entry( (1,1) )
4
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]])
>>> t.entry( (Integer(0),Integer(0)) )
1
>>> t.entry( (Integer(1),Integer(1)) )
4
```

evacuation(*n=None*, *check=True*)

Return the evacuation of the tableau `self`.

This is an alias for *schuetzenberger_involution()*.

This method relies on the analogous method on words, which reverts the word and then complements all letters within the underlying ordered alphabet. If n is specified, the underlying alphabet is assumed to be $[1, 2, \ldots, n]$. If no alphabet is specified, n is the maximal letter appearing in `self`.

INPUT:

- `n` – integer specifying the maximal letter in the alphabet (optional)
- `check` – boolean (default: `True`); check to make sure `self` is semistandard

OUTPUT: a tableau, the evacuation of `self`

EXAMPLES:

```
sage: t = Tableau([[1,1,1],[2,2]])
sage: t.evacuation(3)
[[2, 2, 3], [3, 3]]

sage: t = Tableau([[1,2,3],[4,5]])
sage: t.evacuation()
[[1, 2, 5], [3, 4]]

sage: t = Tableau([[1,3,5,7],[2,4,6],[8,9]])
sage: t.evacuation()
[[1, 2, 6, 8], [3, 4, 9], [5, 7]]

sage: t = Tableau([])
```

(continues on next page)

(continued from previous page)

```
sage: t.evacuation()
[]

sage: t = StandardTableau([[1,2,3],[4,5]])
sage: s = t.evacuation()
sage: s.parent()
Standard tableaux
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(1),Integer(1)],[Integer(2),Integer(2)]])
>>> t.evacuation(Integer(3))
[[2, 2, 3], [3, 3]]

>>> t = Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]])
>>> t.evacuation()
[[1, 2, 5], [3, 4]]

>>> t = Tableau([[Integer(1),Integer(3),Integer(5),Integer(7)],[Integer(2),
↪Integer(4),Integer(6)],[Integer(8),Integer(9)]])
>>> t.evacuation()
[[1, 2, 6, 8], [3, 4, 9], [5, 7]]

>>> t = Tableau([])
>>> t.evacuation()
[]

>>> t = StandardTableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(5)]])
>>> s = t.evacuation()
>>> s.parent()
Standard tableaux
```

evaluation()

alias of *weight()*.

first_column_descent()

Return the first cell where `self` is not column standard.

Cells are ordered left to right along the rows and then top to bottom. That is, the cell (r, c) with r and c minimal such that the entry in position (r, c) is bigger than the entry in position $(r, c+1)$. If there is no such cell then `None` is returned - in this case the tableau is column strict.

OUTPUT:

The first cell which there is a descent or `None` if no such cell exists.

EXAMPLES:

```
sage: Tableau([[1,4,5],[2,3]]).first_column_descent()
(0, 1)
sage: Tableau([[1,2,3],[4]]).first_column_descent() is None
True
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(4),Integer(5)],[Integer(2),Integer(3)]]).
↪first_column_descent()
(0, 1)
>>> Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(4)]]).first_column_
↪descent() is None
True
```

first_row_descent()

Return the first cell where the tableau `self` is not row standard.

Cells are ordered left to right along the rows and then top to bottom. That is, the cell (r, c) with r and c minimal such that the entry in position (r, c) is bigger than the entry in position $(r, c+1)$. If there is no such cell then `None` is returned - in this case the tableau is row strict.

OUTPUT:

The first cell which there is a descent or `None` if no such cell exists.

EXAMPLES:

```
sage: t = Tableau([[1,3,2],[4]]); t.first_row_descent()
(0, 1)
sage: Tableau([[1,2,3],[4]]).first_row_descent() is  None
True
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(3),Integer(2)],[Integer(4)]]); t.first_
↪row_descent()
(0, 1)
>>> Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(4)]]).first_row_
↪descent() is  None
True
```

flush()

Return the number of flush segments in `self`, as in [Sal2014].

Let $1 \leq i < k \leq r+1$ and suppose ℓ is the smallest integer greater than k such that there exists an ℓ-segment in the $(i+1)$-st row of T. A k-segment in the i-th row of T is called *flush* if the leftmost box in the k-segment and the leftmost box of the ℓ-segment are in the same column of T. If, however, no such ℓ exists, then this k-segment is said to be *flush* if the number of boxes in the k-segment is equal to θ_i, where $\theta_i = \lambda_i - \lambda_{i+1}$ and the shape of T is $\lambda = (\lambda_1 > \lambda_2 > \cdots > \lambda_r)$. Denote the number of flush k-segments in T by $\mathrm{flush}(T)$.

EXAMPLES:

```
sage: t = Tableau([[1,1,2,3,5],[2,3,5,5],[3,4]])
sage: t.flush()
3

sage: B = crystals.Tableaux("A4", shape=[4,3,2,1])                    #␣
↪needs sage.modules
sage: t = B[32].to_tableau()                                          #␣
↪needs sage.modules
sage: t.flush()                                                       #␣
↪needs sage.modules
4
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(1),Integer(2),Integer(3),Integer(5)],
↪[Integer(2),Integer(3),Integer(5),Integer(5)],[Integer(3),Integer(4)]])
>>> t.flush()
3

>>> B = crystals.Tableaux("A4", shape=[Integer(4),Integer(3),Integer(2),
↪Integer(1)])                              # needs sage.modules
>>> t = B[Integer(32)].to_tableau()                                          ␣
↪     # needs sage.modules
>>> t.flush()                                                              #␣
↪needs sage.modules
4
```

height()

Return the height of `self`.

EXAMPLES:

```
sage: Tableau([[1,2,3],[4,5]]).height()
2
sage: Tableau([[1,2,3]]).height()
1
sage: Tableau([]).height()
0
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]]).
↪height()
2
>>> Tableau([[Integer(1),Integer(2),Integer(3)]]).height()
1
>>> Tableau([]).height()
0
```

hillman_grassl()

Return the image of the λ-array `self` under the Hillman-Grassl correspondence (as a *WeakReverse-PlanePartition*).

This relies on interpreting `self` as a λ-array in the sense of *hillman_grassl*.

Fix a partition λ (see *Partition()*). We draw all partitions and tableaux in English notation.

A *λ-array* will mean a tableau of shape λ whose entries are nonnegative integers. (No conditions on the order of these entries are made. Note that 0 is allowed.)

A *weak reverse plane partition of shape λ* (short: *λ-rpp*) will mean a λ-array whose entries weakly increase along each row and weakly increase along each column.

The Hillman-Grassl correspondence H is the map that sends a λ-array M to a λ-rpp $H(M)$ defined recursively as follows:

- If all entries of M are 0, then $H(M) = M$.
- Otherwise, let s be the index of the leftmost column of M containing a nonzero entry. Let r be the index of the bottommost nonzero entry in the s-th column of M. Let M' be the λ-array obtained from M

by subtracting 1 from the (r, s)-th entry of M. Let $Q = (q_{i,j})$ be the image $H(M')$ (which is already defined by recursion).

- Define a sequence $((i_1, j_1), (i_2, j_2), \ldots, (i_n, j_n))$ of boxes in the diagram of λ (actually a lattice path made of southward and westward steps) as follows: Set $(i_1, j_1) = (r, \lambda_r)$ (the rightmost box in the r-th row of λ). If (i_k, j_k) is defined for some $k \geq 1$, then (i_{k+1}, j_{k+1}) is constructed as follows: If q_{i_k+1, j_k} is well-defined and equals q_{i_k, j_k}, then we set $(i_{k+1}, j_{k+1}) = (i_k + 1, j_k)$. Otherwise, if $j_k = s$, then the sequence ends here. Otherwise, we set $(i_{k+1}, j_{k+1}) = (i_k, j_k - 1)$.
- Let $H(M)$ be the array obtained from Q by adding 1 to the (i_k, j_k)-th entry of Q for each $k \in \{1, 2, \ldots, n\}$.

See [Gans1981] (Section 3) for this construction.

See also

hillman_grassl() for the Hillman-Grassl correspondence as a standalone function.

hillman_grassl_inverse() for the inverse map.

EXAMPLES:

```
sage: a = Tableau([[2, 1, 1], [0, 2, 0], [1, 1]])
sage: A = a.hillman_grassl(); A
[[2, 2, 4], [2, 3, 4], [3, 5]]
sage: A.parent(), a.parent()
(Weak Reverse Plane Partitions, Tableaux)
```

```
>>> from sage.all import *
>>> a = Tableau([[Integer(2), Integer(1), Integer(1)], [Integer(0),␣
↪Integer(2), Integer(0)], [Integer(1), Integer(1)]])
>>> A = a.hillman_grassl(); A
[[2, 2, 4], [2, 3, 4], [3, 5]]
>>> A.parent(), a.parent()
(Weak Reverse Plane Partitions, Tableaux)
```

insert_word(*w*, *left=False*)

Insert the word `w` into the tableau `self` letter by letter using Schensted insertion. By default, the word `w` is being processed from left to right, and the insertion used is row insertion. If the optional keyword `left` is set to `True`, the word `w` is being processed from right to left, and column insertion is used instead.

EXAMPLES:

```
sage: t0 = Tableau([])
sage: w = [1,1,2,3,3,3,3]
sage: t0.insert_word(w)
[[1, 1, 2, 3, 3, 3, 3]]
sage: t0.insert_word(w,left=True)
[[1, 1, 2, 3, 3, 3, 3]]
sage: w.reverse()
sage: t0.insert_word(w)
[[1, 1, 3, 3], [2, 3], [3]]
sage: t0.insert_word(w,left=True)
[[1, 1, 3, 3], [2, 3], [3]]
sage: t1 = Tableau([[1,3],[2]])
```

(continues on next page)

(continued from previous page)

```
sage: t1.insert_word([4,5])
[[1, 3, 4, 5], [2]]
sage: t1.insert_word([4,5], left=True)
[[1, 3], [2, 5], [4]]
```

```
>>> from sage.all import *
>>> t0 = Tableau([])
>>> w = [Integer(1),Integer(1),Integer(2),Integer(3),Integer(3),Integer(3),
↪Integer(3)]
>>> t0.insert_word(w)
[[1, 1, 2, 3, 3, 3, 3]]
>>> t0.insert_word(w,left=True)
[[1, 1, 2, 3, 3, 3, 3]]
>>> w.reverse()
>>> t0.insert_word(w)
[[1, 1, 3, 3], [2, 3], [3]]
>>> t0.insert_word(w,left=True)
[[1, 1, 3, 3], [2, 3], [3]]
>>> t1 = Tableau([[Integer(1),Integer(3)],[Integer(2)]])
>>> t1.insert_word([Integer(4),Integer(5)])
[[1, 3, 4, 5], [2]]
>>> t1.insert_word([Integer(4),Integer(5)], left=True)
[[1, 3], [2, 5], [4]]
```

inversion_number()

Return the inversion number of `self`.

The inversion number is defined to be the number of inversions of `self` minus the sum of the arm lengths of the descents of `self` (see the *inversions()* and *descents()* methods for the relevant definitions).

Warning

This has none of the meanings in which the word "inversion" is used in the theory of standard tableaux.

EXAMPLES:

```
sage: t = Tableau([[1,2,3],[2,5]])
sage: t.inversion_number()
0
sage: t = Tableau([[1,2,4],[3,5]])
sage: t.inversion_number()
0
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(2),Integer(5)]])
>>> t.inversion_number()
0
>>> t = Tableau([[Integer(1),Integer(2),Integer(4)],[Integer(3),Integer(5)]])
>>> t.inversion_number()
0
```

inversions()

Return a list of the inversions of `self`.

Let T be a tableau. An inversion is an attacking pair (c, d) of the shape of T (see *attacking_pairs()* for a definition of this) such that the entry of c in T is greater than the entry of d.

Warning

Do not mistake this for the inversions of a standard tableau.

EXAMPLES:

```
sage: t = Tableau([[1,2,3],[2,5]])
sage: t.inversions()
[((1, 1), (0, 0))]
sage: t = Tableau([[1,4,3],[5,2],[2,6],[3]])
sage: t.inversions()
[((0, 1), (0, 2)), ((1, 0), (1, 1)), ((1, 1), (0, 0)), ((2, 1), (1, 0))]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(2),Integer(5)]])
>>> t.inversions()
[((1, 1), (0, 0))]
>>> t = Tableau([[Integer(1),Integer(4),Integer(3)],[Integer(5),Integer(2)],
...[Integer(2),Integer(6)],[Integer(3)]])
>>> t.inversions()
[((0, 1), (0, 2)), ((1, 0), (1, 1)), ((1, 1), (0, 0)), ((2, 1), (1, 0))]
```

is_column_increasing(*weak=False*)

Return `True` if the entries in each column are in increasing order, and `False` otherwise.

By default, this checks for strictly increasing columns. Set `weak` to `True` to test for weakly increasing columns.

EXAMPLES:

```
sage: T = Tableau([[1, 1, 3], [1, 2]])
sage: T.is_column_increasing(weak=True)
True
sage: T.is_column_increasing()
False
sage: Tableau([[2], [1]]).is_column_increasing(weak=True)
False
```

```
>>> from sage.all import *
>>> T = Tableau([[Integer(1), Integer(1), Integer(3)], [Integer(1),␣
...Integer(2)]])
>>> T.is_column_increasing(weak=True)
True
>>> T.is_column_increasing()
False
>>> Tableau([[Integer(2)], [Integer(1)]]).is_column_increasing(weak=True)
False
```

is_column_strict()

Return `True` if `self` is a column strict tableau and `False` otherwise.

A tableau is column strict if the entries in each column are in (strictly) increasing order.

EXAMPLES:

```
sage: Tableau([[1, 3], [2, 4]]).is_column_strict()
True
sage: Tableau([[1, 2], [2, 4]]).is_column_strict()
True
sage: Tableau([[2, 3], [2, 4]]).is_column_strict()
False
sage: Tableau([[5, 3], [2, 4]]).is_column_strict()
False
sage: Tableau([]).is_column_strict()
True
sage: Tableau([[1, 4, 2]]).is_column_strict()
True
sage: Tableau([[1, 4, 2], [2, 5]]).is_column_strict()
True
sage: Tableau([[1, 4, 2], [2, 3]]).is_column_strict()
False
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1), Integer(3)], [Integer(2), Integer(4)]]).is_column_
↪strict()
True
>>> Tableau([[Integer(1), Integer(2)], [Integer(2), Integer(4)]]).is_column_
↪strict()
True
>>> Tableau([[Integer(2), Integer(3)], [Integer(2), Integer(4)]]).is_column_
↪strict()
False
>>> Tableau([[Integer(5), Integer(3)], [Integer(2), Integer(4)]]).is_column_
↪strict()
False
>>> Tableau([]).is_column_strict()
True
>>> Tableau([[Integer(1), Integer(4), Integer(2)]]).is_column_strict()
True
>>> Tableau([[Integer(1), Integer(4), Integer(2)], [Integer(2), Integer(5)]]).
↪is_column_strict()
True
>>> Tableau([[Integer(1), Integer(4), Integer(2)], [Integer(2), Integer(3)]]).
↪is_column_strict()
False
```

is_increasing()

Return `True` if `self` is an increasing tableau and `False` otherwise.

A tableau is increasing if it is both row strict and column strict.

EXAMPLES:

```
sage: Tableau([[1, 3], [2, 4]]).is_increasing()
True
sage: Tableau([[1, 2], [2, 4]]).is_increasing()
True
sage: Tableau([[2, 3], [2, 4]]).is_increasing()
False
sage: Tableau([[5, 3], [2, 4]]).is_increasing()
False
sage: Tableau([[1, 2, 3], [2, 3], [3]]).is_increasing()
True
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1), Integer(3)], [Integer(2), Integer(4)]]).is_
↪increasing()
True
>>> Tableau([[Integer(1), Integer(2)], [Integer(2), Integer(4)]]).is_
↪increasing()
True
>>> Tableau([[Integer(2), Integer(3)], [Integer(2), Integer(4)]]).is_
↪increasing()
False
>>> Tableau([[Integer(5), Integer(3)], [Integer(2), Integer(4)]]).is_
↪increasing()
False
>>> Tableau([[Integer(1), Integer(2), Integer(3)], [Integer(2), Integer(3)],␣
↪[Integer(3)]]).is_increasing()
True
```

is_k_tableau(k)

Check whether `self` is a valid weak k-tableau.

EXAMPLES:

```
sage: t = Tableau([[1,2,3],[2,3],[3]])
sage: t.is_k_tableau(3)
True
sage: t = Tableau([[1,1,3],[2,2],[3]])
sage: t.is_k_tableau(3)
False
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(2),Integer(3)],
↪[Integer(3)]])
>>> t.is_k_tableau(Integer(3))
True
>>> t = Tableau([[Integer(1),Integer(1),Integer(3)],[Integer(2),Integer(2)],
↪[Integer(3)]])
>>> t.is_k_tableau(Integer(3))
False
```

is_key_tableau()

Return `True` if `self` is a key tableau or `False` otherwise.

A tableau is a *key tableau* if the set of entries in the j-th column is a subset of the set of entries in the $(j-1)$-st

column.

REFERENCES:

- [LS1990]
- [Wil2010]

EXAMPLES:

```
sage: t = Tableau([[1,1,1],[2,3],[3]])
sage: t.is_key_tableau()
True

sage: t = Tableau([[1,1,2],[2,3],[3]])
sage: t.is_key_tableau()
False
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(1),Integer(1)],[Integer(2),Integer(3)],
↪[Integer(3)]])
>>> t.is_key_tableau()
True

>>> t = Tableau([[Integer(1),Integer(1),Integer(2)],[Integer(2),Integer(3)],
↪[Integer(3)]])
>>> t.is_key_tableau()
False
```

is_rectangular()

Return `True` if the tableau `self` is rectangular and `False` otherwise.

EXAMPLES:

```
sage: Tableau([[1,2],[3,4]]).is_rectangular()
True
sage: Tableau([[1,2,3],[4,5],[6]]).is_rectangular()
False
sage: Tableau([]).is_rectangular()
True
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).is_
↪rectangular()
True
>>> Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)],
↪[Integer(6)]]).is_rectangular()
False
>>> Tableau([]).is_rectangular()
True
```

is_row_increasing(*weak=False*)

Return `True` if the entries in each row are in increasing order, and `False` otherwise.

By default, this checks for strictly increasing rows. Set `weak` to `True` to test for weakly increasing rows.

EXAMPLES:

```
sage: T = Tableau([[1, 1, 3], [1, 2]])
sage: T.is_row_increasing(weak=True)
True
sage: T.is_row_increasing()
False
sage: Tableau([[2, 1]]).is_row_increasing(weak=True)
False
```

```
>>> from sage.all import *
>>> T = Tableau([[Integer(1), Integer(1), Integer(3)], [Integer(1),␣
↪Integer(2)]])
>>> T.is_row_increasing(weak=True)
True
>>> T.is_row_increasing()
False
>>> Tableau([[Integer(2), Integer(1)]]).is_row_increasing(weak=True)
False
```

is_row_strict()

Return `True` if `self` is a row strict tableau and `False` otherwise.

A tableau is row strict if the entries in each row are in (strictly) increasing order.

EXAMPLES:

```
sage: Tableau([[1, 3], [2, 4]]).is_row_strict()
True
sage: Tableau([[1, 2], [2, 4]]).is_row_strict()
True
sage: Tableau([[2, 3], [2, 4]]).is_row_strict()
True
sage: Tableau([[5, 3], [2, 4]]).is_row_strict()
False
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1), Integer(3)], [Integer(2), Integer(4)]]).is_row_
↪strict()
True
>>> Tableau([[Integer(1), Integer(2)], [Integer(2), Integer(4)]]).is_row_
↪strict()
True
>>> Tableau([[Integer(2), Integer(3)], [Integer(2), Integer(4)]]).is_row_
↪strict()
True
>>> Tableau([[Integer(5), Integer(3)], [Integer(2), Integer(4)]]).is_row_
↪strict()
False
```

is_semistandard()

Return `True` if `self` is a semistandard tableau, and `False` otherwise.

A tableau is semistandard if its rows weakly increase and its columns strictly increase.

EXAMPLES:

```
sage: Tableau([[1,1],[1,2]]).is_semistandard()
False
sage: Tableau([[1,2],[1,2]]).is_semistandard()
False
sage: Tableau([[1,1],[2,2]]).is_semistandard()
True
sage: Tableau([[1,2],[2,3]]).is_semistandard()
True
sage: Tableau([[4,1],[3,2]]).is_semistandard()
False
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(1)],[Integer(1),Integer(2)]]).is_
↪semistandard()
False
>>> Tableau([[Integer(1),Integer(2)],[Integer(1),Integer(2)]]).is_
↪semistandard()
False
>>> Tableau([[Integer(1),Integer(1)],[Integer(2),Integer(2)]]).is_
↪semistandard()
True
>>> Tableau([[Integer(1),Integer(2)],[Integer(2),Integer(3)]]).is_
↪semistandard()
True
>>> Tableau([[Integer(4),Integer(1)],[Integer(3),Integer(2)]]).is_
↪semistandard()
False
```

is_standard()

Return `True` if `self` is a standard tableau and `False` otherwise.

EXAMPLES:

```
sage: Tableau([[1, 3], [2, 4]]).is_standard()
True
sage: Tableau([[1, 2], [2, 4]]).is_standard()
False
sage: Tableau([[2, 3], [2, 4]]).is_standard()
False
sage: Tableau([[5, 3], [2, 4]]).is_standard()
False
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1), Integer(3)], [Integer(2), Integer(4)]]).is_
↪standard()
True
>>> Tableau([[Integer(1), Integer(2)], [Integer(2), Integer(4)]]).is_
↪standard()
False
>>> Tableau([[Integer(2), Integer(3)], [Integer(2), Integer(4)]]).is_
↪standard()
False
>>> Tableau([[Integer(5), Integer(3)], [Integer(2), Integer(4)]]).is_
```

(continues on next page)

(continued from previous page)

```
↪standard()
False
```

k_weight(k)

Return the k-weight of `self`.

A tableau has k-weight $\alpha = (\alpha_1, ..., \alpha_n)$ if there are exactly α_i distinct residues for the cells occupied by the letter i for each i. The residue of a cell in position (a, b) is $a - b$ modulo $k + 1$.

This definition is the one used in [Ive2012] (p. 12).

EXAMPLES:

```
sage: Tableau([[1,2],[2,3]]).k_weight(1)
[1, 1, 1]
sage: Tableau([[1,2],[2,3]]).k_weight(2)
[1, 2, 1]
sage: t = Tableau([[1,1,1,2,5],[2,3,6],[3],[4]])
sage: t.k_weight(1)
[2, 1, 1, 1, 1, 1]
sage: t.k_weight(2)
[3, 2, 2, 1, 1, 1]
sage: t.k_weight(3)
[3, 1, 2, 1, 1, 1]
sage: t.k_weight(4)
[3, 2, 2, 1, 1, 1]
sage: t.k_weight(5)
[3, 2, 2, 1, 1, 1]
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2)],[Integer(2),Integer(3)]]).k_
↪weight(Integer(1))
[1, 1, 1]
>>> Tableau([[Integer(1),Integer(2)],[Integer(2),Integer(3)]]).k_
↪weight(Integer(2))
[1, 2, 1]
>>> t = Tableau([[Integer(1),Integer(1),Integer(1),Integer(2),Integer(5)],
↪[Integer(2),Integer(3),Integer(6)],[Integer(3)],[Integer(4)]])
>>> t.k_weight(Integer(1))
[2, 1, 1, 1, 1, 1]
>>> t.k_weight(Integer(2))
[3, 2, 2, 1, 1, 1]
>>> t.k_weight(Integer(3))
[3, 1, 2, 1, 1, 1]
>>> t.k_weight(Integer(4))
[3, 2, 2, 1, 1, 1]
>>> t.k_weight(Integer(5))
[3, 2, 2, 1, 1, 1]
```

lambda_catabolism(*part*)

Return the `part`-catabolism of `self`, where `part` is a partition (which can be just given as an array).

For a partition λ and a tableau T, the λ-catabolism of T is defined by performing the following steps.

1. Truncate the parts of λ so that λ is contained in the shape of T. Let m be the length of this partition.

2. Let T_a be the first m rows of T, and T_b be the remaining rows.
3. Let S_a be the skew tableau T_a/λ.
4. Concatenate the reading words of S_a and T_b, and insert into a tableau.

EXAMPLES:

```
sage: Tableau([[1,1,3],[2,4,5]]).lambda_catabolism([2,1])
[[3, 5], [4]]
sage: t = Tableau([[1,1,3,3],[2,3],[3]])
sage: t.lambda_catabolism([])
[[1, 1, 3, 3], [2, 3], [3]]
sage: t.lambda_catabolism([1])
[[1, 2, 3, 3, 3], [3]]
sage: t.lambda_catabolism([1,1])
[[1, 3, 3, 3], [3]]
sage: t.lambda_catabolism([2,1])
[[3, 3, 3, 3]]
sage: t.lambda_catabolism([4,2,1])
[]
sage: t.lambda_catabolism([5,1])
[[3, 3]]
sage: t.lambda_catabolism([4,1])
[[3, 3]]
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(1),Integer(3)],[Integer(2),Integer(4),
↪Integer(5)]]).lambda_catabolism([Integer(2),Integer(1)])
[[3, 5], [4]]
>>> t = Tableau([[Integer(1),Integer(1),Integer(3),Integer(3)],[Integer(2),
↪Integer(3)],[Integer(3)]])
>>> t.lambda_catabolism([])
[[1, 1, 3, 3], [2, 3], [3]]
>>> t.lambda_catabolism([Integer(1)])
[[1, 2, 3, 3, 3], [3]]
>>> t.lambda_catabolism([Integer(1),Integer(1)])
[[1, 3, 3, 3], [3]]
>>> t.lambda_catabolism([Integer(2),Integer(1)])
[[3, 3, 3, 3]]
>>> t.lambda_catabolism([Integer(4),Integer(2),Integer(1)])
[]
>>> t.lambda_catabolism([Integer(5),Integer(1)])
[[3, 3]]
>>> t.lambda_catabolism([Integer(4),Integer(1)])
[[3, 3]]
```

last_letter_lequal(*tab2*)

Return `True` if `self` is less than or equal to `tab2` in the last letter ordering.

EXAMPLES:

```
sage: st = StandardTableaux([3,2])
sage: f = lambda b: 1 if b else 0
sage: matrix([[f(t1.last_letter_lequal(t2)) for t2 in st] for t1 in st])    #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.modules
[1 1 1 1 1]
[0 1 1 1 1]
[0 0 1 1 1]
[0 0 0 1 1]
[0 0 0 0 1]
```

```
>>> from sage.all import *
>>> st = StandardTableaux([Integer(3),Integer(2)])
>>> f = lambda b: Integer(1) if b else Integer(0)
>>> matrix([[f(t1.last_letter_lequal(t2)) for t2 in st] for t1 in st])     #␣
↪needs sage.modules
[1 1 1 1 1]
[0 1 1 1 1]
[0 0 1 1 1]
[0 0 0 1 1]
[0 0 0 0 1]
```

left_key_tableau()

Return the left key tableau of `self`.

The left key tableau of a tableau T is the key tableau whose entries are weakly less than the corresponding entries in T, and whose column reading word is subject to certain conditions. See [LS1990] for the full definition.

ALGORITHM:

The following algorithm follows [Wil2010]. Note that if T is a key tableau then the output of the algorithm is T.

To compute the left key tableau L of a tableau T we iterate over the columns of T. Let T_j be the j-th column of T and iterate over the entries in T_j from bottom to top. Initialize the corresponding entry k in L as the largest entry in T_j. Scan the columns to the left of T_j and with each column update k to be the lowest entry in that column which is weakly less than k. Update T_j and all columns to the left by removing all scanned entries.

See also

- *is_key_tableau()*

EXAMPLES:

```
sage: t = Tableau([[1,2],[2,3]])
sage: t.left_key_tableau()
[[1, 1], [2, 2]]
sage: t = Tableau([[1,1,2,4],[2,3,3],[4],[5]])
sage: t.left_key_tableau()
[[1, 1, 1, 2], [2, 2, 2], [4], [5]]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2)],[Integer(2),Integer(3)]])
>>> t.left_key_tableau()
```

(continues on next page)

(continued from previous page)

```
[[1, 1], [2, 2]]
>>> t = Tableau([[Integer(1),Integer(1),Integer(2),Integer(4)],[Integer(2),
↪Integer(3),Integer(3)],[Integer(4)],[Integer(5)]])
>>> t.left_key_tableau()
[[1, 1, 1, 2], [2, 2, 2], [4], [5]]
```

leq(*secondtab*)

Check whether each entry of `self` is less-or-equal to the corresponding entry of a further tableau `secondtab`.

INPUT:

- `secondtab` – a tableau of the same shape as `self`

EXAMPLES:

```
sage: T = Tableau([[1, 2], [3]])
sage: S = Tableau([[1, 3], [3]])
sage: G = Tableau([[2, 1], [4]])
sage: H = Tableau([[1, 2], [4]])
sage: T.leq(S)
True
sage: T.leq(T)
True
sage: T.leq(G)
False
sage: T.leq(H)
True
sage: S.leq(T)
False
sage: S.leq(G)
False
sage: S.leq(H)
False
sage: G.leq(H)
False
sage: H.leq(G)
False
```

```
>>> from sage.all import *
>>> T = Tableau([[Integer(1), Integer(2)], [Integer(3)]])
>>> S = Tableau([[Integer(1), Integer(3)], [Integer(3)]])
>>> G = Tableau([[Integer(2), Integer(1)], [Integer(4)]])
>>> H = Tableau([[Integer(1), Integer(2)], [Integer(4)]])
>>> T.leq(S)
True
>>> T.leq(T)
True
>>> T.leq(G)
False
>>> T.leq(H)
True
>>> S.leq(T)
False
```

(continues on next page)

(continued from previous page)

```
>>> S.leq(G)
False
>>> S.leq(H)
False
>>> G.leq(H)
False
>>> H.leq(G)
False
```

level()

Return the level of `self`, which is always 1.

This function exists mainly for compatibility with *TableauTuple*.

EXAMPLES:

```
sage: Tableau([[1,2,3],[4,5]]).level()
1
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]]).
↪level()
1
```

major_index()

Return the major index of `self`.

The major index of a tableau T is defined to be the sum of the number of descents of `T` (defined in *descents()*) with the sum of their legs' lengths.

Warning

This is not to be confused with the major index of a standard tableau.

EXAMPLES:

```
sage: Tableau( [[1,4],[2,3]] ).major_index()
1
sage: Tableau( [[1,2],[3,4]] ).major_index()
2
```

```
>>> from sage.all import *
>>> Tableau( [[Integer(1),Integer(4)],[Integer(2),Integer(3)]] ).major_index()
1
>>> Tableau( [[Integer(1),Integer(2)],[Integer(3),Integer(4)]] ).major_index()
2
```

If the major index would be defined in the sense of standard tableaux theory, then the following would give 3 for a result:

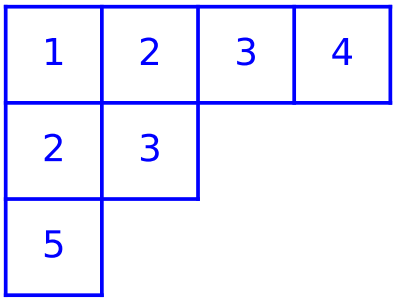
```
sage: Tableau( [[1,2,3],[4,5]] ).major_index()
2
```

```
>>> from sage.all import *
>>> Tableau( [[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]] ).
↪major_index()
2
```

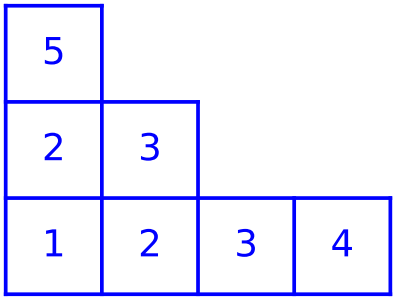
plot(*descents=False*)

Return a plot `self`.

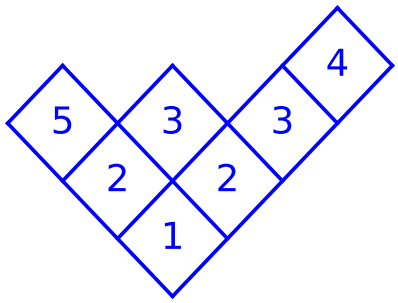
If English notation is set then the first row of the tableau is on the top:



If French notation is set, the first row of the tableau is on the bottom:



If Russian notation is set, we tilt the French notation by 45 degrees:



INPUT:

- `descents` – boolean (default: `False`); if `True`, then the descents are marked in the tableau; only valid if `self` is a standard tableau

EXAMPLES:

```
sage: t = Tableau([[1,2,4],[3]])
sage: t.plot()                                                              #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.plot
Graphics object consisting of 11 graphics primitives
sage: t.plot(descents=True)                                                 #␣
↪needs sage.plot

```

pp()

Pretty print a string of the tableau.

EXAMPLES:

```
sage: T = Tableau([[1,2,3],[3,4],[5]])
sage: T.pp()
  1  2  3
  3  4
  5
sage: Tableaux.options.convention="french"
sage: T.pp()
  5
  3  4
  1  2  3
sage: Tableaux.options.convention="russian"
sage: T.pp()
```

(continues on next page)

(continued from previous page)

```
 5    4    3
    3    2
      1
sage: Tableaux.options._reset()
```

```
>>> from sage.all import *
>>> T = Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(3),Integer(4)],
↪[Integer(5)]])
>>> T.pp()
  1  2  3
  3  4
  5
>>> Tableaux.options.convention="french"
>>> T.pp()
  5
  3  4
  1  2  3
>>> Tableaux.options.convention="russian"
>>> T.pp()
 5    4    3
    3    2
      1
>>> Tableaux.options._reset()
```

promotion(n)

Return the image of `self` under the promotion operator.

> **Warning**
>
> You might know this operator as the inverse promotion operator – literature does not agree on the name. You might also be looking for the Lapointe-Lascoux-Morse promotion operator (*promotion_operator()*).

The promotion operator, applied to a tableau t, does the following:

Iterate over all letters $n + 1$ in the tableau t, from left to right. For each of these letters, do the following:

- Remove the letter from t, thus leaving a hole where it used to be.
- Apply jeu de taquin to move this hole southwest (in French notation) until it reaches the inner boundary of t.
- Fill 0 into the hole once jeu de taquin has completed.

Once this all is done, add 1 to each letter in the tableau. This is not always well-defined. Restricted to the class of semistandard tableaux whose entries are all $\leq n + 1$, this is the usual promotion operator defined on this class.

When `self` is a standard tableau of size `n + 1`, this definition of promotion is precisely the one given in [Hai1992] (p. 90). It is the inverse of the maps called "promotion" in [Sag2011] (p. 23) and in [Stan2009].

Warning

To my (Darij's) knowledge, the fact that the above promotion operator really is the inverse of the "inverse promotion operator" *promotion_inverse()* for semistandard tableaux has never been proven in literature. Corrections are welcome.

REFERENCES:

- [Hai1992]
- [Sag2011]

EXAMPLES:

```
sage: t = Tableau([[1,2],[3,3]])
sage: t.promotion(2)
[[1, 1], [2, 3]]

sage: t = Tableau([[1,1,1],[2,2,3],[3,4,4]])
sage: t.promotion(3)
[[1, 1, 2], [2, 2, 3], [3, 4, 4]]

sage: t = Tableau([[1,2],[2]])
sage: t.promotion(3)
[[2, 3], [3]]

sage: t = Tableau([[1,1,3],[2,2]])
sage: t.promotion(2)
[[1, 2, 2], [3, 3]]

sage: t = Tableau([[1,1,3],[2,3]])
sage: t.promotion(2)
[[1, 1, 2], [2, 3]]

sage: t = Tableau([])
sage: t.promotion(2)
[]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2)],[Integer(3),Integer(3)]])
>>> t.promotion(Integer(2))
[[1, 1], [2, 3]]

>>> t = Tableau([[Integer(1),Integer(1),Integer(1)],[Integer(2),Integer(2),
↪Integer(3)],[Integer(3),Integer(4),Integer(4)]])
>>> t.promotion(Integer(3))
[[1, 1, 2], [2, 2, 3], [3, 4, 4]]

>>> t = Tableau([[Integer(1),Integer(2)],[Integer(2)]])
>>> t.promotion(Integer(3))
[[2, 3], [3]]

>>> t = Tableau([[Integer(1),Integer(1),Integer(3)],[Integer(2),Integer(2)]])
>>> t.promotion(Integer(2))
```

(continues on next page)

(continued from previous page)

```
[[1, 2, 2], [3, 3]]

>>> t = Tableau([[Integer(1),Integer(1),Integer(3)],[Integer(2),Integer(3)]])
>>> t.promotion(Integer(2))
[[1, 1, 2], [2, 3]]

>>> t = Tableau([])
>>> t.promotion(Integer(2))
[]
```

promotion_inverse(n)

Return the image of `self` under the inverse promotion operator.

> **Warning**
>
> You might know this operator as the promotion operator (without "inverse") – literature does not agree on the name.

The inverse promotion operator, applied to a tableau t, does the following:

Iterate over all letters 1 in the tableau t, from right to left. For each of these letters, do the following:

- Remove the letter from t, thus leaving a hole where it used to be.
- Apply jeu de taquin to move this hole northeast (in French notation) until it reaches the outer boundary of t.
- Fill $n + 2$ into the hole once jeu de taquin has completed.

Once this all is done, subtract 1 from each letter in the tableau. This is not always well-defined. Restricted to the class of semistandard tableaux whose entries are all $\leq n + 1$, this is the usual inverse promotion operator defined on this class.

When `self` is a standard tableau of size `n + 1`, this definition of inverse promotion is the map called "promotion" in [Sag2011] (p. 23) and in [Stan2009], and is the inverse of the map called "promotion" in [Hai1992] (p. 90).

> **Warning**
>
> To my (Darij's) knowledge, the fact that the above "inverse promotion operator" really is the inverse of the promotion operator *promotion()* for semistandard tableaux has never been proven in literature. Corrections are welcome.

EXAMPLES:

```
sage: t = Tableau([[1,2],[3,3]])
sage: t.promotion_inverse(2)
[[1, 2], [2, 3]]

sage: t = Tableau([[1,2],[2,3]])
sage: t.promotion_inverse(2)
[[1, 1], [2, 3]]
```

(continues on next page)

(continued from previous page)

```
sage: t = Tableau([[1,2,5],[3,3,6],[4,7]])
sage: t.promotion_inverse(8)
[[1, 2, 4], [2, 5, 9], [3, 6]]

sage: t = Tableau([])
sage: t.promotion_inverse(2)
[]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2)],[Integer(3),Integer(3)]])
>>> t.promotion_inverse(Integer(2))
[[1, 2], [2, 3]]

>>> t = Tableau([[Integer(1),Integer(2)],[Integer(2),Integer(3)]])
>>> t.promotion_inverse(Integer(2))
[[1, 1], [2, 3]]

>>> t = Tableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),Integer(3),
↪Integer(6)],[Integer(4),Integer(7)]])
>>> t.promotion_inverse(Integer(8))
[[1, 2, 4], [2, 5, 9], [3, 6]]

>>> t = Tableau([])
>>> t.promotion_inverse(Integer(2))
[]
```

promotion_operator(i)

Return a list of semistandard tableaux obtained by the i-th Lapointe-Lascoux-Morse promotion operator from the semistandard tableau `self`.

Warning

This is not Schuetzenberger's jeu de taquin promotion! For the latter, see *promotion()* and *promotion_inverse()*.

This operator is defined by taking the maximum entry m of T, then adding a horizontal i-strip to T in all possible ways, each time filling this strip with $m+1$'s, and finally letting the permutation $\sigma_1\sigma_2\cdots\sigma_m = (2,3,\ldots,m+1,1)$ act on each of the resulting tableaux via the Lascoux-Schuetzenberger action (*symmetric_group_action_on_values()*). This method returns the list of all resulting tableaux. See [LLM2003] for the purpose of this operator.

EXAMPLES:

```
sage: t = Tableau([[1,2],[3]])
sage: t.promotion_operator(1)
[[[1, 2, 4], [3]], [[1, 2], [3, 4]], [[1, 2], [3], [4]]]
sage: t.promotion_operator(2)
[[[1, 1, 2, 4], [3]],
 [[1, 1, 4], [2, 3]],
 [[1, 1, 2], [3], [4]],
 [[1, 1], [2, 3], [4]]]
```

(continues on next page)

(continued from previous page)

```
sage: Tableau([[1]]).promotion_operator(2)
[[[1, 1, 2]], [[1, 1], [2]]]
sage: Tableau([[1,1],[2]]).promotion_operator(3)
[[[1, 1, 1, 2, 3], [2]],
 [[1, 1, 1, 3], [2, 2]],
 [[1, 1, 1, 2], [2], [3]],
 [[1, 1, 1], [2, 2], [3]]]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2)],[Integer(3)]])
>>> t.promotion_operator(Integer(1))
[[[1, 2, 4], [3]], [[1, 2], [3, 4]], [[1, 2], [3], [4]]]
>>> t.promotion_operator(Integer(2))
[[[1, 1, 2, 4], [3]],
 [[1, 1, 4], [2, 3]],
 [[1, 1, 2], [3], [4]],
 [[1, 1], [2, 3], [4]]]
>>> Tableau([[Integer(1)]]).promotion_operator(Integer(2))
[[[1, 1, 2]], [[1, 1], [2]]]
>>> Tableau([[Integer(1),Integer(1)],[Integer(2)]]).promotion_
↪operator(Integer(3))
[[[1, 1, 1, 2, 3], [2]],
 [[1, 1, 1, 3], [2, 2]],
 [[1, 1, 1, 2], [2], [3]],
 [[1, 1, 1], [2, 2], [3]]]
```

The example from [LLM2003] p. 12:

```
sage: Tableau([[1,1],[2,2]]).promotion_operator(3)
[[[1, 1, 1, 3, 3], [2, 2]],
 [[1, 1, 1, 3], [2, 2], [3]],
 [[1, 1, 1], [2, 2], [3, 3]]]
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(1)],[Integer(2),Integer(2)]]).promotion_
↪operator(Integer(3))
[[[1, 1, 1, 3, 3], [2, 2]],
 [[1, 1, 1, 3], [2, 2], [3]],
 [[1, 1, 1], [2, 2], [3, 3]]]
```

raise_action_from_words(*f*, **args*)

EXAMPLES:

```
sage: from sage.combinat.tableau import symmetric_group_action_on_values
sage: import functools
sage: t = Tableau([[1,1,3,3],[2,3],[3]])
sage: f = functools.partial(t.raise_action_from_words, symmetric_group_action_
↪on_values)
sage: f([1,2,3])
[[1, 1, 3, 3], [2, 3], [3]]
sage: f([3,2,1])
[[1, 1, 1, 1], [2, 3], [3]]
```

(continues on next page)

(continued from previous page)

```
sage: f([1,3,2])
[[1, 1, 2, 2], [2, 2], [3]]
```

```
>>> from sage.all import *
>>> from sage.combinat.tableau import symmetric_group_action_on_values
>>> import functools
>>> t = Tableau([[Integer(1),Integer(1),Integer(3),Integer(3)],[Integer(2),
↪Integer(3)],[Integer(3)]])
>>> f = functools.partial(t.raise_action_from_words, symmetric_group_action_
↪on_values)
>>> f([Integer(1),Integer(2),Integer(3)])
[[1, 1, 3, 3], [2, 3], [3]]
>>> f([Integer(3),Integer(2),Integer(1)])
[[1, 1, 1, 1], [2, 3], [3]]
>>> f([Integer(1),Integer(3),Integer(2)])
[[1, 1, 2, 2], [2, 2], [3]]
```

reading_word_permutation()

Return the permutation obtained by reading the entries of the standardization of `self` row by row, starting with the bottommost row (in English notation).

EXAMPLES:

```
sage: StandardTableau([[1,2],[3,4]]).reading_word_permutation()
[3, 4, 1, 2]
```

```
>>> from sage.all import *
>>> StandardTableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).
↪reading_word_permutation()
[3, 4, 1, 2]
```

Check that Issue #14724 is fixed:

```
sage: SemistandardTableau([[1,1]]).reading_word_permutation()
[1, 2]
```

```
>>> from sage.all import *
>>> SemistandardTableau([[Integer(1),Integer(1)]]).reading_word_permutation()
[1, 2]
```

reduced_column_word()

Return the lexicographically minimal reduced expression for the permutation that maps the conjugate of the *initial_tableau()* to `self`.

This reduced expression is a minimal length coset representative for the corresponding Young subgroup. In one line notation, the permutation is obtained by concatenating the columns of the tableau in order from top to bottom.

EXAMPLES:

```
sage: StandardTableau([[1,4,6],[2,5],[3]]).reduced_column_word()
[]
sage: StandardTableau([[1,4,5],[2,6],[3]]).reduced_column_word()
```

(continues on next page)

(continued from previous page)

```
[5]
sage: StandardTableau([[1,3,6],[2,5],[4]]).reduced_column_word()
[3]
sage: StandardTableau([[1,3,5],[2,6],[4]]).reduced_column_word()
[3, 5]
sage: StandardTableau([[1,2,5],[3,6],[4]]).reduced_column_word()
[3, 2, 5]
```

```
>>> from sage.all import *
>>> StandardTableau([[Integer(1),Integer(4),Integer(6)],[Integer(2),
↪Integer(5)],[Integer(3)]]).reduced_column_word()
[]
>>> StandardTableau([[Integer(1),Integer(4),Integer(5)],[Integer(2),
↪Integer(6)],[Integer(3)]]).reduced_column_word()
[5]
>>> StandardTableau([[Integer(1),Integer(3),Integer(6)],[Integer(2),
↪Integer(5)],[Integer(4)]]).reduced_column_word()
[3]
>>> StandardTableau([[Integer(1),Integer(3),Integer(5)],[Integer(2),
↪Integer(6)],[Integer(4)]]).reduced_column_word()
[3, 5]
>>> StandardTableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(6)],[Integer(4)]]).reduced_column_word()
[3, 2, 5]
```

reduced_lambda_catabolism(*part*)

EXAMPLES:

```
sage: t = Tableau([[1,1,3,3],[2,3],[3]])
sage: t.reduced_lambda_catabolism([])
[[1, 1, 3, 3], [2, 3], [3]]
sage: t.reduced_lambda_catabolism([1])
[[1, 2, 3, 3, 3], [3]]
sage: t.reduced_lambda_catabolism([1,1])
[[1, 3, 3, 3], [3]]
sage: t.reduced_lambda_catabolism([2,1])
[[3, 3, 3, 3]]
sage: t.reduced_lambda_catabolism([4,2,1])
[]
sage: t.reduced_lambda_catabolism([5,1])
0
sage: t.reduced_lambda_catabolism([4,1])
0
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(1),Integer(3),Integer(3)],[Integer(2),
↪Integer(3)],[Integer(3)]])
>>> t.reduced_lambda_catabolism([])
[[1, 1, 3, 3], [2, 3], [3]]
>>> t.reduced_lambda_catabolism([Integer(1)])
[[1, 2, 3, 3, 3], [3]]
```

(continues on next page)

(continued from previous page)

```
>>> t.reduced_lambda_catabolism([Integer(1),Integer(1)])
[[1, 3, 3, 3], [3]]
>>> t.reduced_lambda_catabolism([Integer(2),Integer(1)])
[[3, 3, 3, 3]]
>>> t.reduced_lambda_catabolism([Integer(4),Integer(2),Integer(1)])
[]
>>> t.reduced_lambda_catabolism([Integer(5),Integer(1)])
0
>>> t.reduced_lambda_catabolism([Integer(4),Integer(1)])
0
```

reduced_row_word()

Return the lexicographically minimal reduced expression for the permutation that maps the *initial_tableau()* to `self`.

This reduced expression is a minimal length coset representative for the corresponding Young subgroup. In one line notation, the permutation is obtained by concatenating the rows of the tableau in order from top to bottom.

EXAMPLES:

```
sage: StandardTableau([[1,2,3],[4,5],[6]]).reduced_row_word()
[]
sage: StandardTableau([[1,2,3],[4,6],[5]]).reduced_row_word()
[5]
sage: StandardTableau([[1,2,4],[3,6],[5]]).reduced_row_word()
[3, 5]
sage: StandardTableau([[1,2,5],[3,6],[4]]).reduced_row_word()
[3, 5, 4]
sage: StandardTableau([[1,2,6],[3,5],[4]]).reduced_row_word()
[3, 4, 5, 4]
```

```
>>> from sage.all import *
>>> StandardTableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(5)],[Integer(6)]]).reduced_row_word()
[]
>>> StandardTableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(6)],[Integer(5)]]).reduced_row_word()
[5]
>>> StandardTableau([[Integer(1),Integer(2),Integer(4)],[Integer(3),
↪Integer(6)],[Integer(5)]]).reduced_row_word()
[3, 5]
>>> StandardTableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(6)],[Integer(4)]]).reduced_row_word()
[3, 5, 4]
>>> StandardTableau([[Integer(1),Integer(2),Integer(6)],[Integer(3),
↪Integer(5)],[Integer(4)]]).reduced_row_word()
[3, 4, 5, 4]
```

residue(*k*, *e*, *multicharge=(0,)*)

Return the residue of the integer `k` in the tableau `self`.

The *residue* of k in a standard tableau is $c - r + m$ in $\mathbf{Z}/e\mathbf{Z}$, where k appears in row r and column c of the tableau with multicharge m.

INPUT:

- `k` – integer in $\{1, 2, \ldots, n\}$
- `e` – integer in $\{0, 2, 3, 4, 5, \ldots\}$
- `multicharge` – (default: `[0]`) a list of length 1

Here n is its size of `self`.

The `multicharge` is a list of length 1 which gives an offset for all of the contents. It is included mainly for compatibility with *residue()*.

OUTPUT: the residue in $\mathbf{Z}/e\mathbf{Z}$

EXAMPLES:

```
sage: StandardTableau([[1,2,5],[3,4]]).residue(1,3)
0
sage: StandardTableau([[1,2,5],[3,4]]).residue(2,3)
1
sage: StandardTableau([[1,2,5],[3,4]]).residue(3,3)
2
sage: StandardTableau([[1,2,5],[3,4]]).residue(4,3)
0
sage: StandardTableau([[1,2,5],[3,4]]).residue(5,3)
2
sage: StandardTableau([[1,2,5],[3,4]]).residue(6,3)
Traceback (most recent call last):
...
ValueError: 6 does not appear in the tableau
```

```
>>> from sage.all import *
>>> StandardTableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(4)]]).residue(Integer(1),Integer(3))
0
>>> StandardTableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(4)]]).residue(Integer(2),Integer(3))
1
>>> StandardTableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(4)]]).residue(Integer(3),Integer(3))
2
>>> StandardTableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(4)]]).residue(Integer(4),Integer(3))
0
>>> StandardTableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(4)]]).residue(Integer(5),Integer(3))
2
>>> StandardTableau([[Integer(1),Integer(2),Integer(5)],[Integer(3),
↪Integer(4)]]).residue(Integer(6),Integer(3))
Traceback (most recent call last):
...
ValueError: 6 does not appear in the tableau
```

residue_sequence(*e*, *multicharge=(0,)*)

Return the *sage.combinat.tableau_residues.ResidueSequence* of the tableau `self`.

INPUT:

- `e` – integer in $\{0, 2, 3, 4, 5, \ldots\}$
- `multicharge` – (default: `[0]`) a sequence of integers of length 1

The *multicharge* is a list of length 1 which gives an offset for all of the contents. It is included mainly for compatibility with *residue()*.

OUTPUT:

The corresponding residue sequence of the tableau; see *ResidueSequence*.

EXAMPLES:

```
sage: StandardTableauTuple([[1,2],[3,4]]).residue_sequence(2)                #␣
↪needs sage.groups
2-residue sequence (0,1,1,0) with multicharge (0)
sage: StandardTableauTuple([[1,2],[3,4]]).residue_sequence(3)                #␣
↪needs sage.groups
3-residue sequence (0,1,2,0) with multicharge (0)
sage: StandardTableauTuple([[1,2],[3,4]]).residue_sequence(4)                #␣
↪needs sage.groups
4-residue sequence (0,1,3,0) with multicharge (0)
```

```
>>> from sage.all import *
>>> StandardTableauTuple([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).
↪residue_sequence(Integer(2))                # needs sage.groups
2-residue sequence (0,1,1,0) with multicharge (0)
>>> StandardTableauTuple([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).
↪residue_sequence(Integer(3))                # needs sage.groups
3-residue sequence (0,1,2,0) with multicharge (0)
>>> StandardTableauTuple([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).
↪residue_sequence(Integer(4))                # needs sage.groups
4-residue sequence (0,1,3,0) with multicharge (0)
```

restrict(*n*)

Return the restriction of the semistandard tableau `self` to `n`. If possible, the restricted tableau will have the same parent as this tableau.

If T is a semistandard tableau and n is a nonnegative integer, then the restriction of T to n is defined as the (semistandard) tableau obtained by removing all cells filled with entries greater than n from T.

Note

If only the shape of the restriction, rather than the whole restriction, is needed, then the faster method *restriction_shape()* is preferred.

EXAMPLES:

```
sage: Tableau([[1,2],[3],[4]]).restrict(3)
[[1, 2], [3]]
sage: StandardTableau([[1,2],[3],[4]]).restrict(2)
[[1, 2]]
sage: Tableau([[1,2,3],[2,4,4],[3]]).restrict(0)
[]
sage: Tableau([[1,2,3],[2,4,4],[3]]).restrict(2)
```

(continues on next page)

(continued from previous page)

```
[[1, 2], [2]]
sage: Tableau([[1,2,3],[2,4,4],[3]]).restrict(3)
[[1, 2, 3], [2], [3]]
sage: Tableau([[1,2,3],[2,4,4],[3]]).restrict(5)
[[1, 2, 3], [2, 4, 4], [3]]
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2)],[Integer(3)],[Integer(4)]]).
↪restrict(Integer(3))
[[1, 2], [3]]
>>> StandardTableau([[Integer(1),Integer(2)],[Integer(3)],[Integer(4)]]).
↪restrict(Integer(2))
[[1, 2]]
>>> Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(2),Integer(4),
↪Integer(4)],[Integer(3)]]).restrict(Integer(0))
[]
>>> Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(2),Integer(4),
↪Integer(4)],[Integer(3)]]).restrict(Integer(2))
[[1, 2], [2]]
>>> Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(2),Integer(4),
↪Integer(4)],[Integer(3)]]).restrict(Integer(3))
[[1, 2, 3], [2], [3]]
>>> Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(2),Integer(4),
↪Integer(4)],[Integer(3)]]).restrict(Integer(5))
[[1, 2, 3], [2, 4, 4], [3]]
```

If possible the restricted tableau will belong to the same category as the original tableau:

```
sage: S = StandardTableau([[1,2,4,7],[3,5],[6]]); S.category()
Category of elements of Standard tableaux
sage: S.restrict(4).category()
Category of elements of Standard tableaux

↪restrict(Integer(1))
[[1, 1]]
>>> _.category()
Category of elements of Semistandard tableaux
```

restriction_shape(n)

Return the shape of the restriction of the semistandard tableau `self` to `n`.

If T is a semistandard tableau and n is a nonnegative integer, then the restriction of T to n is defined as the (semistandard) tableau obtained by removing all cells filled with entries greater than n from T.

This method computes merely the shape of the restriction. For the restriction itself, use *restrict()*.

EXAMPLES:

```
sage: Tableau([[1,2],[2,3],[3,4]]).restriction_shape(3)
[2, 2, 1]
sage: StandardTableau([[1,2],[3],[4],[5]]).restriction_shape(2)
[2]
sage: Tableau([[1,3,3,5],[2,4,4],[17]]).restriction_shape(0)
[]
sage: Tableau([[1,3,3,5],[2,4,4],[17]]).restriction_shape(2)
[1, 1]
sage: Tableau([[1,3,3,5],[2,4,4],[17]]).restriction_shape(3)
[3, 1]
sage: Tableau([[1,3,3,5],[2,4,4],[17]]).restriction_shape(5)
[4, 3]

sage: all( T.restriction_shape(i) == T.restrict(i).shape()
....:      for T in StandardTableaux(5) for i in range(1, 5) )
True
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2)],[Integer(2),Integer(3)],[Integer(3),
↪Integer(4)]]).restriction_shape(Integer(3))
[2, 2, 1]
>>> StandardTableau([[Integer(1),Integer(2)],[Integer(3)],[Integer(4)],
↪[Integer(5)]]).restriction_shape(Integer(2))
[2]
```

(continues on next page)

(continued from previous page)

```
>>> Tableau([[Integer(1),Integer(3),Integer(3),Integer(5)],[Integer(2),
↪Integer(4),Integer(4)],[Integer(17)]]).restriction_shape(Integer(0))
[]
>>> Tableau([[Integer(1),Integer(3),Integer(3),Integer(5)],[Integer(2),
↪Integer(4),Integer(4)],[Integer(17)]]).restriction_shape(Integer(2))
[1, 1]
>>> Tableau([[Integer(1),Integer(3),Integer(3),Integer(5)],[Integer(2),
↪Integer(4),Integer(4)],[Integer(17)]]).restriction_shape(Integer(3))
[3, 1]
>>> Tableau([[Integer(1),Integer(3),Integer(3),Integer(5)],[Integer(2),
↪Integer(4),Integer(4)],[Integer(17)]]).restriction_shape(Integer(5))
[4, 3]

>>> all( T.restriction_shape(i) == T.restrict(i).shape()
...      for T in StandardTableaux(Integer(5)) for i in range(Integer(1),␣
↪Integer(5)) )
True
```

reverse_bump(*loc*)

Reverse row bump the entry of `self` at the specified location `loc` (given as a row index or a corner `(r, c)` of the tableau).

This is the reverse of Schensted's row-insertion algorithm. See Section 1.1, page 8, of Fulton's [Ful1997].

INPUT:

- `loc` – can be either of the following:
  - The coordinates `(r, c)` of the square to reverse-bump (which must be a corner of the tableau);
  - The row index `r` of this square.

  Note that both `r` and `c` are 0-based, i.e., the topmost row and the leftmost column are the 0-th row and the 0-th column.

OUTPUT: an ordered pair consisting of:

1. The resulting (smaller) tableau;
2. The entry bumped out at the end of the process.

See also

bump()

EXAMPLES:

This is the reverse of Schensted's bump:

```
sage: T = Tableau([[1, 1, 2, 2, 4], [2, 3, 3], [3, 4], [4]])
sage: T.reverse_bump(2)
([[1, 1, 2, 3, 4], [2, 3, 4], [3], [4]], 2)
sage: T == T.reverse_bump(2)[0].bump(2)
True
sage: T.reverse_bump((3, 0))
([[1, 2, 2, 2, 4], [3, 3, 3], [4, 4]], 1)
```

```
>>> from sage.all import *
>>> T = Tableau([[Integer(1), Integer(1), Integer(2), Integer(2), Integer(4)],
↪ [Integer(2), Integer(3), Integer(3)], [Integer(3), Integer(4)],␣
↪[Integer(4)]])
>>> T.reverse_bump(Integer(2))
([[1, 1, 2, 3, 4], [2, 3, 4], [3], [4]], 2)
>>> T == T.reverse_bump(Integer(2))[Integer(0)].bump(Integer(2))
True
>>> T.reverse_bump((Integer(3), Integer(0)))
([[1, 2, 2, 2, 4], [3, 3, 3], [4, 4]], 1)
```

Some errors caused by wrong input:

```
sage: T.reverse_bump((3, 1))
Traceback (most recent call last):
...
ValueError: invalid corner
sage: T.reverse_bump(4)
Traceback (most recent call last):
...
IndexError: list index out of range
sage: Tableau([[2, 2, 1], [3, 3]]).reverse_bump(0)
Traceback (most recent call last):
...
ValueError: reverse bumping is only defined for semistandard tableaux
```

```
>>> from sage.all import *
>>> T.reverse_bump((Integer(3), Integer(1)))
Traceback (most recent call last):
...
ValueError: invalid corner
>>> T.reverse_bump(Integer(4))
Traceback (most recent call last):
...
IndexError: list index out of range
>>> Tableau([[Integer(2), Integer(2), Integer(1)], [Integer(3), Integer(3)]]).
↪reverse_bump(Integer(0))
Traceback (most recent call last):
...
ValueError: reverse bumping is only defined for semistandard tableaux
```

Some edge cases:

```
sage: Tableau([[1]]).reverse_bump(0)
([], 1)
sage: Tableau([[1,1]]).reverse_bump(0)
([[1]], 1)
sage: Tableau([]).reverse_bump(0)
Traceback (most recent call last):
...
IndexError: list index out of range
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1)]]).reverse_bump(Integer(0))
([], 1)
>>> Tableau([[Integer(1),Integer(1)]]).reverse_bump(Integer(0))
([[1]], 1)
>>> Tableau([]).reverse_bump(Integer(0))
Traceback (most recent call last):
...
IndexError: list index out of range
```

Note

Reverse row bumping is only implemented for tableaux with weakly increasing and strictly increasing columns (though the tableau does not need to be an instance of class *SemistandardTableau*).

right_key_tableau()

Return the right key tableau of `self`.

The right key tableau of a tableau T is a key tableau whose entries are weakly greater than the corresponding entries in T, and whose column reading word is subject to certain conditions. See [LS1990] for the full definition.

ALGORITHM:

The following algorithm follows [Wil2010]. Note that if T is a key tableau then the output of the algorithm is T.

To compute the right key tableau R of a tableau T we iterate over the columns of T. Let T_j be the j-th column of T and iterate over the entries in T_j from bottom to top. Initialize the corresponding entry k in R to be the largest entry in T_j. Scan the bottom of each column of T to the right of T_j, updating k to be the scanned entry whenever the scanned entry is weakly greater than k. Update T_j and all columns to the right by removing all scanned entries.

See also

- *is_key_tableau()*

EXAMPLES:

```
sage: t = Tableau([[1,2],[2,3]])
sage: t.right_key_tableau()
[[2, 2], [3, 3]]
sage: t = Tableau([[1,1,2,4],[2,3,3],[4],[5]])
sage: t.right_key_tableau()
[[2, 2, 2, 4], [3, 4, 4], [4], [5]]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2)],[Integer(2),Integer(3)]])
>>> t.right_key_tableau()
[[2, 2], [3, 3]]
>>> t = Tableau([[Integer(1),Integer(1),Integer(2),Integer(4)],[Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(3),Integer(3)],[Integer(4)],[Integer(5)]])
>>> t.right_key_tableau()
[[2, 2, 2, 4], [3, 4, 4], [4], [5]]
```

rotate_180()

Return the tableau obtained by rotating `self` by 180 degrees.

This only works for rectangular tableaux.

EXAMPLES:

```
sage: Tableau([[1,2],[3,4]]).rotate_180()
[[4, 3], [2, 1]]
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).rotate_180()
[[4, 3], [2, 1]]
```

row_stabilizer()

Return the PermutationGroup corresponding to the row stabilizer of `self`.

This assumes that every integer from 1 to the size of `self` appears exactly once in `self`.

EXAMPLES:

```
sage: # needs sage.groups
sage: rs = Tableau([[1,2,3],[4,5]]).row_stabilizer()
sage: rs.order() == factorial(3)*factorial(2)
True
sage: PermutationGroupElement([(1,3,2),(4,5)]) in rs
True
sage: PermutationGroupElement([(1,4)]) in rs
False
sage: rs = Tableau([[1, 2],[3]]).row_stabilizer()
sage: PermutationGroupElement([(1,2),(3,)]) in rs
True
sage: rs.one().domain()
[1, 2, 3]
sage: rs = Tableau([[1],[2],[3]]).row_stabilizer()
sage: rs.order()
1
sage: rs = Tableau([[2,4,5],[1,3]]).row_stabilizer()
sage: rs.order()
12
sage: rs = Tableau([]).row_stabilizer()
sage: rs.order()
1
```

```
>>> from sage.all import *
>>> # needs sage.groups
>>> rs = Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(5)]]).row_stabilizer()
>>> rs.order() == factorial(Integer(3))*factorial(Integer(2))
```

(continues on next page)

(continued from previous page)

```
True
>>> PermutationGroupElement([(Integer(1),Integer(3),Integer(2)),(Integer(4),
↪Integer(5))]) in rs
True
>>> PermutationGroupElement([(Integer(1),Integer(4))]) in rs
False
>>> rs = Tableau([[Integer(1), Integer(2)],[Integer(3)]]).row_stabilizer()
>>> PermutationGroupElement([(Integer(1),Integer(2)),(Integer(3),)]) in rs
True
>>> rs.one().domain()
[1, 2, 3]
>>> rs = Tableau([[Integer(1)],[Integer(2)],[Integer(3)]]).row_stabilizer()
>>> rs.order()
1
>>> rs = Tableau([[Integer(2),Integer(4),Integer(5)],[Integer(1),
↪Integer(3)]]).row_stabilizer()
>>> rs.order()
12
>>> rs = Tableau([]).row_stabilizer()
>>> rs.order()
1
```

schensted_insert(*i*, *left=False*)

Insert `i` into `self` using Schensted's row-bumping (or row-insertion) algorithm.

INPUT:

- `i` – a number to insert
- `left` – boolean (default: `False`); if set to `True`, the insertion will be done from the left. That is, if one thinks of the algorithm as appending a letter to the reading word of `self`, we append the letter to the left instead of the right

EXAMPLES:

```
sage: t = Tableau([[3,5],[7]])
sage: t.schensted_insert(8)
[[3, 5, 8], [7]]
sage: t.schensted_insert(8, left=True)
[[3, 5], [7], [8]]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(3),Integer(5)],[Integer(7)]])
>>> t.schensted_insert(Integer(8))
[[3, 5, 8], [7]]
>>> t.schensted_insert(Integer(8), left=True)
[[3, 5], [7], [8]]
```

schuetzenberger_involution(*n=None*, *check=True*)

Return the Schuetzenberger involution of the tableau `self`.

This method relies on the analogous method on words, which reverts the word and then complements all letters within the underlying ordered alphabet. If n is specified, the underlying alphabet is assumed to be $[1, 2, \ldots, n]$. If no alphabet is specified, n is the maximal letter appearing in `self`.

INPUT:

- `n` – integer specifying the maximal letter in the alphabet (optional)
- `check` – boolean (default: `True`); check to make sure `self` is semistandard

OUTPUT: a tableau, the Schuetzenberger involution of `self`

EXAMPLES:

```
sage: t = Tableau([[1,1,1],[2,2]])
sage: t.schuetzenberger_involution(3)
[[2, 2, 3], [3, 3]]

sage: t = Tableau([[1,2,3],[4,5]])
sage: t.schuetzenberger_involution()
[[1, 2, 5], [3, 4]]

sage: t = Tableau([[1,3,5,7],[2,4,6],[8,9]])
sage: t.schuetzenberger_involution()
[[1, 2, 6, 8], [3, 4, 9], [5, 7]]

sage: t = Tableau([])
sage: t.schuetzenberger_involution()
[]

sage: t = StandardTableau([[1,2,3],[4,5]])
sage: s = t.schuetzenberger_involution()
sage: s.parent()
Standard tableaux
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(1),Integer(1)],[Integer(2),Integer(2)]])
>>> t.schuetzenberger_involution(Integer(3))
[[2, 2, 3], [3, 3]]

>>> t = Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)]])
>>> t.schuetzenberger_involution()
[[1, 2, 5], [3, 4]]

>>> t = Tableau([[Integer(1),Integer(3),Integer(5),Integer(7)],[Integer(2),
↪Integer(4),Integer(6)],[Integer(8),Integer(9)]])
>>> t.schuetzenberger_involution()
[[1, 2, 6, 8], [3, 4, 9], [5, 7]]

>>> t = Tableau([])
>>> t.schuetzenberger_involution()
[]

>>> t = StandardTableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),
↪Integer(5)]])
>>> s = t.schuetzenberger_involution()
>>> s.parent()
Standard tableaux
```

seg()

Return the total number of segments in `self`, as in [Sal2014].

Let T be a tableaux. We define a *k-segment* of T (in the i-th row) to be a maximal consecutive sequence of k-boxes in the i-th row for any $i + 1 \leq k \leq r + 1$. Denote the total number of k-segments in T by $\mathrm{seg}(T)$.

REFERENCES:

- [Sal2014]

EXAMPLES:

```
sage: t = Tableau([[1,1,2,3,5],[2,3,5,5],[3,4]])
sage: t.seg()
6

sage: B = crystals.Tableaux("A4", shape=[4,3,2,1])                    #␣
↪needs sage.modules
sage: t = B[31].to_tableau()                                          #␣
↪needs sage.modules
sage: t.seg()                                                         #␣
↪needs sage.modules
3
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(1),Integer(2),Integer(3),Integer(5)],
↪[Integer(2),Integer(3),Integer(5),Integer(5)],[Integer(3),Integer(4)]])
>>> t.seg()
6

>>> B = crystals.Tableaux("A4", shape=[Integer(4),Integer(3),Integer(2),
↪Integer(1)])                          # needs sage.modules
>>> t = B[Integer(31)].to_tableau()                                    ␣
↪     # needs sage.modules
>>> t.seg()                                                          #␣
↪needs sage.modules
3
```

shape()

Return the shape of a tableau `self`.

EXAMPLES:

```
sage: Tableau([[1,2,3],[4,5],[6]]).shape()
[3, 2, 1]
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(4),Integer(5)],
↪[Integer(6)]]).shape()
[3, 2, 1]
```

size()

Return the size of the shape of the tableau `self`.

EXAMPLES:

```
sage: Tableau([[1, 4, 6], [2, 5], [3]]).size()
6
sage: Tableau([[1, 3], [2, 4]]).size()
4
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1), Integer(4), Integer(6)], [Integer(2), Integer(5)],␣
↪[Integer(3)]]).size()
6
>>> Tableau([[Integer(1), Integer(3)], [Integer(2), Integer(4)]]).size()
4
```

slide_multiply(*other*)

Multiply two tableaux using jeu de taquin.

This product makes the set of semistandard tableaux into an associative monoid. The empty tableau is the unit in this monoid.

See pp. 15 of [Ful1997].

The same product operation is implemented in a different way in *bump_multiply()*.

EXAMPLES:

```
sage: t = Tableau([[1,2,2,3],[2,3,5,5],[4,4,6],[5,6]])
sage: t2 = Tableau([[1,2],[3]])
sage: t.slide_multiply(t2)
[[1, 1, 2, 2, 3], [2, 2, 3, 5], [3, 4, 5], [4, 6, 6], [5]]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2),Integer(2),Integer(3)],[Integer(2),
↪Integer(3),Integer(5),Integer(5)],[Integer(4),Integer(4),Integer(6)],
↪[Integer(5),Integer(6)]])
>>> t2 = Tableau([[Integer(1),Integer(2)],[Integer(3)]])
>>> t.slide_multiply(t2)
[[1, 1, 2, 2, 3], [2, 2, 3, 5], [3, 4, 5], [4, 6, 6], [5]]
```

socle()

EXAMPLES:

```
sage: Tableau([[1,2],[3,4]]).socle()
2
sage: Tableau([[1,2,3,4]]).socle()
4
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).socle()
2
>>> Tableau([[Integer(1),Integer(2),Integer(3),Integer(4)]]).socle()
4
```

standardization(*check=True*)

Return the standardization of `self`, assuming `self` is a semistandard tableau.

The standardization of a semistandard tableau T is the standard tableau $\mathrm{st}(T)$ of the same shape as T whose reversed reading word is the standardization of the reversed reading word of T.

The standardization of a word w can be formed by replacing all 1's in w by $1, 2, \ldots, k_1$ from left to right, all 2's in w by $k_1+1, k_1+2, \ldots, k_2$, and repeating for all letters which appear in w. See also *sage.combinat.words.finite_word.FiniteWord_class.standard_permutation()*.

INPUT:

- `check` – (default: `True`) check to make sure `self` is semistandard; set to `False` to avoid this check

EXAMPLES:

```
sage: t = Tableau([[1,3,3,4],[2,4,4],[5,16]])
sage: t.standardization()
[[1, 3, 4, 7], [2, 5, 6], [8, 9]]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(3),Integer(3),Integer(4)],[Integer(2),
↪Integer(4),Integer(4)],[Integer(5),Integer(16)]])
>>> t.standardization()
[[1, 3, 4, 7], [2, 5, 6], [8, 9]]
```

Standard tableaux are fixed under standardization:

```
sage: all((t == t.standardization() for t in StandardTableaux(6)))
True
sage: t = Tableau([])
sage: t.standardization()
[]
```

```
>>> from sage.all import *
>>> all((t == t.standardization() for t in StandardTableaux(Integer(6))))
True
>>> t = Tableau([])
>>> t.standardization()
[]
```

The reading word of the standardization is the standardization of the reading word:

```
sage: T = SemistandardTableaux(shape=[5,2,2,1], max_entry=4)
sage: all(t.to_word().standard_permutation() == t.standardization().reading_
↪word_permutation() for t in T) # long time
True
```

```
>>> from sage.all import *
>>> T = SemistandardTableaux(shape=[Integer(5),Integer(2),Integer(2),
↪Integer(1)], max_entry=Integer(4))
>>> all(t.to_word().standard_permutation() == t.standardization().reading_
↪word_permutation() for t in T) # long time
True
```

sulzgruber_correspondence()

Return the image of the λ-array `self` under the Sulzgruber correspondence (as a *WeakReversePlanePartition*).

This relies on interpreting `self` as a λ-array in the sense of *hillman_grassl*. See *hillman_grassl* for definitions of the objects involved.

The Sulzgruber correspondence is the map Φ_λ from [Sulzgr2017] Section 7, and is the map ξ_λ^{-1} from [Pak2002] Section 5. It is denoted by $\mathcal{RSK}$ in [Hopkins2017]. It is the inverse of the Pak correspondence (*pak_correspondence()*). The following description of the Sulzgruber correspondence follows [Hopkins2017] (which denotes it by $\mathcal{RSK}$):

Fix a partition λ (see *Partition()*). We draw all partitions and tableaux in English notation.

A *λ-array* will mean a tableau of shape λ whose entries are nonnegative integers. (No conditions on the order of these entries are made. Note that 0 is allowed.)

A *weak reverse plane partition of shape λ* (short: *λ-rpp*) will mean a λ-array whose entries weakly increase along each row and weakly increase along each column.

We shall also use the following notation: If (u, v) is a cell of λ, and if π is a λ-rpp, then:

- the *lower bound* of π at (u, v) (denoted by $\pi_{<(u,v)}$) is defined to be $\max\{\pi_{u-1,v}, \pi_{u,v-1}\}$ (where $\pi_{0,v}$ and $\pi_{u,0}$ are understood to mean 0).
- the *upper bound* of π at (u, v) (denoted by $\pi_{>(u,v)}$) is defined to be $\min\{\pi_{u+1,v}, \pi_{u,v+1}\}$ (where $\pi_{i,j}$ is understood to mean $+\infty$ if (i, j) is not in λ; thus, the upper bound at a corner cell is $+\infty$).
- *toggling* π at (u, v) means replacing the entry $\pi_{u,v}$ of π at (u, v) by $\pi_{<(u,v)} + \pi_{>(u,v)} - \pi_{u,v}$ (this is well-defined as long as (u, v) is not a corner of λ).

Note that every λ-rpp π and every cell (u, v) of λ satisfy $\pi_{<(u,v)} \leq \pi_{u,v} \leq \pi_{>(u,v)}$. Note that toggling a λ-rpp (at a cell that is not a corner) always results in a λ-rpp. Also, toggling is an involution).

The Pak correspondence ξ_λ sends a λ-rpp π to a λ-array $\xi_\lambda(\pi)$. It is defined by recursion on λ (that is, we assume that ξ_μ is already defined for every partition μ smaller than λ), and its definition proceeds as follows:

- If $\lambda = \varnothing$, then ξ_λ is the obvious bijection sending the only $\varnothing$-rpp to the only $\varnothing$-array.
- Pick any corner $c = (i, j)$ of λ, and let μ be the result of removing this corner c from the partition λ. (The exact choice of c is immaterial.)
- Let π' be what remains of π when the corner cell c is removed.
- For each positive integer k such that $(i - k, j - k)$ is a cell of λ, toggle π' at $(i - k, j - k)$. (All these togglings commute, so the order in which they are made is immaterial.)
- Let $M = \xi_\mu(\pi')$.
- Extend the μ-array M to a λ-array M' by adding the cell c and writing the number $\pi_{i,j} - \pi_{<(i,j)}$ into this cell.
- Set $\xi_\lambda(\pi) = M'$.

See also

sulzgruber_correspondence() for the Sulzgruber correspondence as a standalone function.

pak_correspondence() for the inverse map.

EXAMPLES:

```
sage: a = Tableau([[2, 1, 1], [0, 2, 0], [1, 1]])
sage: A = a.sulzgruber_correspondence(); A
[[0, 1, 4], [1, 5, 5], [3, 6]]
```

```
sage: A.parent(), a.parent()
(Weak Reverse Plane Partitions, Tableaux)

sage: a = Tableau([[1, 3], [0, 1]])
sage: a.sulzgruber_correspondence()
[[0, 4], [1, 5]]
```

```
>>> from sage.all import *
>>> a = Tableau([[Integer(2), Integer(1), Integer(1)], [Integer(0),␣
↪Integer(2), Integer(0)], [Integer(1), Integer(1)]])
>>> A = a.sulzgruber_correspondence(); A
[[0, 1, 4], [1, 5, 5], [3, 6]]
>>> A.parent(), a.parent()
(Weak Reverse Plane Partitions, Tableaux)

>>> a = Tableau([[Integer(1), Integer(3)], [Integer(0), Integer(1)]])
>>> a.sulzgruber_correspondence()
[[0, 4], [1, 5]]
```

symmetric_group_action_on_entries(*w*)

Return the tableau obtained form this tableau by acting by the permutation `w`.

Let T be a standard tableau of size n, then the action of $w \in S_n$ is defined by permuting the entries of T (recall they are $1, 2, \ldots, n$). In particular, suppose the entry at cell (i, j) is a, then the entry becomes $w(a)$. In general, the resulting tableau wT may *not* be standard.

Note

This is different than *symmetric_group_action_on_values()* which is defined on semistandard tableaux and is guaranteed to return a semistandard tableau.

INPUT:

- `w` – a permutation

EXAMPLES:

```
sage: StandardTableau([[1,2,4],[3,5]]).symmetric_group_action_on_entries(␣
↪Permutation(((4,5))) )
[[1, 2, 5], [3, 4]]
sage: _.category()
Category of elements of Standard tableaux
sage: StandardTableau([[1,2,4],[3,5]]).symmetric_group_action_on_entries(␣
↪Permutation(((1,2))) )
[[2, 1, 4], [3, 5]]
sage: _.category()
Category of elements of Tableaux
```

```
>>> from sage.all import *
>>> StandardTableau([[Integer(1),Integer(2),Integer(4)],[Integer(3),
↪Integer(5)]]).symmetric_group_action_on_entries( Permutation(((Integer(4),
↪Integer(5)))) )
```

(continues on next page)

(continued from previous page)

```
[[1, 2, 5], [3, 4]]
>>> _.category()
Category of elements of Standard tableaux
>>> StandardTableau([[Integer(1),Integer(2),Integer(4)],[Integer(3),
↪Integer(5)]]).symmetric_group_action_on_entries( Permutation(((Integer(1),
↪Integer(2)))) )
[[2, 1, 4], [3, 5]]
>>> _.category()
Category of elements of Tableaux
```

symmetric_group_action_on_values(*perm*)

Return the image of the semistandard tableau `self` under the action of the permutation `perm` using the Lascoux-Schuetzenberger action of the symmetric group S_n on the semistandard tableaux with ceiling n.

If n is a nonnegative integer, then the Lascoux-Schuetzenberger action is a group action of the symmetric group S_n on the set of semistandard Young tableaux with ceiling n (that is, with entries taken from the set $\{1, 2, \ldots, n\}$). It is defined as follows:

Let $i \in \{1, 2, \ldots, n-1\}$, and let T be a semistandard tableau with ceiling n. Let w be the reading word (*to_word()*) of T. Replace all letters i in w by closing parentheses, and all letters $i+1$ in w by opening parentheses. Whenever an opening parenthesis stands left of a closing parenthesis without there being any parentheses in between (it is allowed to have letters in-between as long as they are not parentheses), consider these two parentheses as matched with each other, and replace them back by the letters $i+1$ and i. Repeat this procedure until there are no more opening parentheses standing left of closing parentheses. Then, let a be the number of opening parentheses in the word, and b the number of closing parentheses (notice that all opening parentheses are right of all closing parentheses). Replace the first a parentheses by the letters i, and replace the remaining b parentheses by the letters $i+1$. Let w' be the resulting word. Let T' be the tableau with the same shape as T but with reading word w'. This tableau T' can be shown to be semistandard. We define the image of T under the action of the simple transposition $s_i = (i, i+1) \in S_n$ to be this tableau T'. It can be shown that these actions of the transpositions $s_1, s_2, \ldots, s_{n-1}$ satisfy the Moore-Coxeter relations of S_n, and thus this extends to a unique action of the symmetric group S_n on the set of semistandard tableaux with ceiling n. This is the Lascoux-Schuetzenberger action.

This action of the symmetric group S_n on the set of all semistandard tableaux of given shape λ with entries in $\{1, 2, \ldots, n\}$ is the one defined in [Loth02] Theorem 5.6.3. In particular, the action of s_i is denoted by σ_i in said source. (Beware of the typo in the definition of σ_i: it should say $\sigma_i(a_i^r a_{i+1}^s) = a_i^s a_{i+1}^r$, not $\sigma_i(a_i^r a_{i+1}^s) = a_i^s a_{i+1}^s$.)

EXAMPLES:

```
sage: t = Tableau([[1,1,3,3],[2,3],[3]])
sage: t.symmetric_group_action_on_values([1,2,3])
[[1, 1, 3, 3], [2, 3], [3]]
sage: t.symmetric_group_action_on_values([2,1,3])
[[1, 2, 3, 3], [2, 3], [3]]
sage: t.symmetric_group_action_on_values([3,1,2])
[[1, 2, 2, 2], [2, 3], [3]]
sage: t.symmetric_group_action_on_values([2,3,1])
[[1, 1, 1, 1], [2, 2], [3]]
sage: t.symmetric_group_action_on_values([3,2,1])
[[1, 1, 1, 1], [2, 3], [3]]
sage: t.symmetric_group_action_on_values([1,3,2])
[[1, 1, 2, 2], [2, 2], [3]]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(1),Integer(3),Integer(3)],[Integer(2),
↪Integer(3)],[Integer(3)]])
>>> t.symmetric_group_action_on_values([Integer(1),Integer(2),Integer(3)])
[[1, 1, 3, 3], [2, 3], [3]]
>>> t.symmetric_group_action_on_values([Integer(2),Integer(1),Integer(3)])
[[1, 2, 3, 3], [2, 3], [3]]
>>> t.symmetric_group_action_on_values([Integer(3),Integer(1),Integer(2)])
[[1, 2, 2, 2], [2, 3], [3]]
>>> t.symmetric_group_action_on_values([Integer(2),Integer(3),Integer(1)])
[[1, 1, 1, 1], [2, 2], [3]]
>>> t.symmetric_group_action_on_values([Integer(3),Integer(2),Integer(1)])
[[1, 1, 1, 1], [2, 3], [3]]
>>> t.symmetric_group_action_on_values([Integer(1),Integer(3),Integer(2)])
[[1, 1, 2, 2], [2, 2], [3]]
```

to_Gelfand_Tsetlin_pattern()

Return the *Gelfand-Tsetlin pattern* corresponding to `self` when semistandard.

EXAMPLES:

```
sage: T = Tableau([[1,2,3],[2,3],[3]])
sage: G = T.to_Gelfand_Tsetlin_pattern(); G
[[3, 2, 1], [2, 1], [1]]
sage: G.to_tableau() == T
True
sage: T = Tableau([[1,3],[2]])
sage: T.to_Gelfand_Tsetlin_pattern()
[[2, 1, 0], [1, 1], [1]]
```

```
>>> from sage.all import *
>>> T = Tableau([[Integer(1),Integer(2),Integer(3)],[Integer(2),Integer(3)],
↪[Integer(3)]])
>>> G = T.to_Gelfand_Tsetlin_pattern(); G
[[3, 2, 1], [2, 1], [1]]
>>> G.to_tableau() == T
True
>>> T = Tableau([[Integer(1),Integer(3)],[Integer(2)]])
>>> T.to_Gelfand_Tsetlin_pattern()
[[2, 1, 0], [1, 1], [1]]
```

to_chain(*max_entry=None*)

Return the chain of partitions corresponding to the (semi)standard tableau `self`.

The optional keyword parameter `max_entry` can be used to customize the length of the chain. Specifically, if this parameter is set to a nonnegative integer `n`, then the chain is constructed from the positions of the letters $1, 2, \ldots, n$ in the tableau.

EXAMPLES:

```
sage: Tableau([[1,2],[3],[4]]).to_chain()
[[], [1], [2], [2, 1], [2, 1, 1]]
sage: Tableau([[1,1],[2]]).to_chain()
[[], [2], [2, 1]]
```

(continues on next page)

(continued from previous page)

```
sage: Tableau([[1,1],[3]]).to_chain()
[[], [2], [2], [2, 1]]
sage: Tableau([]).to_chain()
[[]]
sage: Tableau([[1,1],[2],[3]]).to_chain(max_entry=2)
[[], [2], [2, 1]]
sage: Tableau([[1,1],[2],[3]]).to_chain(max_entry=3)
[[], [2], [2, 1], [2, 1, 1]]
sage: Tableau([[1,1],[2],[3]]).to_chain(max_entry=4)
[[], [2], [2, 1], [2, 1, 1], [2, 1, 1]]
sage: Tableau([[1,1,2],[2,3],[4,5]]).to_chain(max_entry=6)
[[], [2], [3, 1], [3, 2], [3, 2, 1], [3, 2, 2], [3, 2, 2]]
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2)],[Integer(3)],[Integer(4)]]).to_chain()
[[], [1], [2], [2, 1], [2, 1, 1]]
>>> Tableau([[Integer(1),Integer(1)],[Integer(2)]]).to_chain()
[[], [2], [2, 1]]
>>> Tableau([[Integer(1),Integer(1)],[Integer(3)]]).to_chain()
[[], [2], [2], [2, 1]]
>>> Tableau([]).to_chain()
[[]]
>>> Tableau([[Integer(1),Integer(1)],[Integer(2)],[Integer(3)]]).to_chain(max_
↪entry=Integer(2))
[[], [2], [2, 1]]
>>> Tableau([[Integer(1),Integer(1)],[Integer(2)],[Integer(3)]]).to_chain(max_
↪entry=Integer(3))
[[], [2], [2, 1], [2, 1, 1]]
>>> Tableau([[Integer(1),Integer(1)],[Integer(2)],[Integer(3)]]).to_chain(max_
↪entry=Integer(4))
[[], [2], [2, 1], [2, 1, 1], [2, 1, 1]]
>>> Tableau([[Integer(1),Integer(1),Integer(2)],[Integer(2),Integer(3)],
↪[Integer(4),Integer(5)]]).to_chain(max_entry=Integer(6))
[[], [2], [3, 1], [3, 2], [3, 2, 1], [3, 2, 2], [3, 2, 2]]
```

to_list()

Return `self` as a list of lists (not tuples!).

EXAMPLES:

```
sage: t = Tableau([[1,2],[3,4]])
sage: l = t.to_list(); l
[[1, 2], [3, 4]]
sage: l[0][0] = 2
sage: t
[[1, 2], [3, 4]]
```

```
>>> from sage.all import *
>>> t = Tableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]])
>>> l = t.to_list(); l
[[1, 2], [3, 4]]
>>> l[Integer(0)][Integer(0)] = Integer(2)
```

(continues on next page)

(continued from previous page)

```
>>> t
[[1, 2], [3, 4]]
```

to_sign_matrix(*max_entry=None*)

Return the sign matrix of `self`.

A sign matrix is an $m \times n$ matrix of 0s, 1s, and -1s such that the partial sums of each column is either 0 or 1 and the partial sums of each row is nonnegative. [Ava2007]

INPUT:

- `max_entry` – nonnegative integer; the maximum allowable number in the tableau (defaults to the largest entry in the tableau if not specified)

EXAMPLES:

```
sage: t = SemistandardTableau([[1,1,1,2,4],[3,3,4],[4,5],[6,6]])
sage: t.to_sign_matrix(6)                                                   #␣
↪needs sage.modules
[ 0  0  0  1  0  0]
[ 0  1  0 -1  0  0]
[ 1 -1  0  1  0  0]
[ 0  0  1 -1  1  1]
[ 0  0  0  1 -1  0]
sage: t = Tableau([[1,2,4],[3,5]])
sage: t.to_sign_matrix(7)                                                   #␣
↪needs sage.modules
[ 0  0  0  1  0  0  0]
[ 0  1  0 -1  1  0  0]
[ 1 -1  1  0 -1  0  0]
sage: t = Tableau([(4,5,4,3),(2,1,3)])
sage: t.to_sign_matrix(5)                                                   #␣
↪needs sage.modules
[ 0  0  1  0  0]
[ 0  0  0  1  0]
[ 1  0 -1 -1  1]
[-1  1  0  1 -1]
sage: s = Tableau([(1,0,-2,4),(3,4,5)])
sage: s.to_sign_matrix(6)
Traceback (most recent call last):
...
ValueError: the entries must be nonnegative integers
```

```
>>> from sage.all import *
>>> t = SemistandardTableau([[Integer(1),Integer(1),Integer(1),Integer(2),
↪Integer(4)],[Integer(3),Integer(3),Integer(4)],[Integer(4),Integer(5)],
↪[Integer(6),Integer(6)]])
>>> t.to_sign_matrix(Integer(6))                                            ␣
↪     # needs sage.modules

>>> t = Tableau([(Integer(4),Integer(5),Integer(4),Integer(3)),(Integer(2),
↪Integer(1),Integer(3))])
>>> t.to_sign_matrix(Integer(5))                                              ␣
↪     # needs sage.modules
[ 0  0  1  0  0]
[ 0  0  0  1  0]
[ 1  0 -1 -1  1]
[-1  1  0  1 -1]
>>> s = Tableau([(Integer(1),Integer(0),-Integer(2),Integer(4)),(Integer(3),
↪Integer(4),Integer(5))])
>>> s.to_sign_matrix(Integer(6))
Traceback (most recent call last):
...
ValueError: the entries must be nonnegative integers
```

to_word()

An alias for *to_word_by_row()*.

EXAMPLES:

```
sage: Tableau([[1,2],[3,4]]).to_word()
word: 3412
sage: Tableau([[1, 4, 6], [2, 5], [3]]).to_word()
word: 325146
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).to_word()
word: 3412
>>> Tableau([[Integer(1), Integer(4), Integer(6)], [Integer(2), Integer(5)],␣
↪[Integer(3)]]).to_word()
word: 325146
```

to_word_by_column()

Return the word obtained from a column reading of the tableau `self` (starting with the leftmost column, reading every column from bottom to top).

EXAMPLES:

```
sage: Tableau([[1,2],[3,4]]).to_word_by_column()
word: 3142
sage: Tableau([[1, 4, 6], [2, 5], [3]]).to_word_by_column()
word: 321546
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).to_word_by_
↪column()
```

(continues on next page)

(continued from previous page)

```
word: 3142
>>> Tableau([[Integer(1), Integer(4), Integer(6)], [Integer(2), Integer(5)],␣
↪[Integer(3)]]).to_word_by_column()
word: 321546
```

to_word_by_row()

Return the word obtained from a row reading of the tableau `self` (starting with the lowermost row, reading every row from left to right).

EXAMPLES:

```
sage: Tableau([[1,2],[3,4]]).to_word_by_row()
word: 3412
sage: Tableau([[1, 4, 6], [2, 5], [3]]).to_word_by_row()
word: 325146
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).to_word_by_
↪row()
word: 3412
>>> Tableau([[Integer(1), Integer(4), Integer(6)], [Integer(2), Integer(5)],␣
↪[Integer(3)]]).to_word_by_row()
word: 325146
```

vertical_flip()

Return the tableau obtained by vertically flipping the tableau `self`.

This only works for rectangular tableaux.

EXAMPLES:

```
sage: Tableau([[1,2],[3,4]]).vertical_flip()
[[3, 4], [1, 2]]
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).vertical_flip()
[[3, 4], [1, 2]]
```

weight()

Return the weight of the tableau `self`. Trailing zeroes are omitted when returning the weight.

The weight of a tableau T is the sequence $(a_1, a_2, a_3, \ldots)$, where a_k is the number of entries of T equal to k. This sequence contains only finitely many nonzero entries.

The weight of a tableau T is the same as the weight of the reading word of T, for any reading order.

EXAMPLES:

```
sage: Tableau([[1,2],[3,4]]).weight()
[1, 1, 1, 1]

sage: Tableau([]).weight()
[]
```

(continues on next page)

(continued from previous page)

```
sage: Tableau([[1,3,3,7],[4,2],[2,3]]).weight()
[1, 2, 3, 1, 0, 0, 1]
```

```
>>> from sage.all import *
>>> Tableau([[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).weight()
[1, 1, 1, 1]

>>> Tableau([]).weight()
[]

>>> Tableau([[Integer(1),Integer(3),Integer(3),Integer(7)],[Integer(4),
↪Integer(2)],[Integer(2),Integer(3)]]).weight()
[1, 2, 3, 1, 0, 0, 1]
```

class sage.combinat.tableau.**Tableaux**

Bases: UniqueRepresentation, Parent

A factory class for the various classes of tableaux.

INPUT:

- n – (optional) nonnegative integer

OUTPUT:

- If n is specified, the class of tableaux of size n. Otherwise, the class of all tableaux.

A tableau in Sage is a finite list of lists, whose lengths are weakly decreasing, or an empty list, representing the empty tableau. The entries of a tableau can be any Sage objects. Because of this, no enumeration through the set of Tableaux is possible.

EXAMPLES:

```
sage: T = Tableaux(); T
Tableaux
sage: T3 = Tableaux(3); T3
Tableaux of size 3
sage: [['a','b']] in T
True
sage: [['a','b']] in T3
False
sage: t = T3([[1,1,1]]); t
[[1, 1, 1]]
sage: t in T
True
sage: t.parent()
Tableaux of size 3
sage: T([]) # the empty tableau
[]
sage: T.category()
Category of sets
```

```
>>> from sage.all import *
>>> T = Tableaux(); T
Tableaux
```

(continues on next page)

(continued from previous page)

```
>>> T3 = Tableaux(Integer(3)); T3
Tableaux of size 3
>>> [['a','b']] in T
True
>>> [['a','b']] in T3
False
>>> t = T3([[Integer(1),Integer(1),Integer(1)]]); t
[[1, 1, 1]]
>>> t in T
True
>>> t.parent()
Tableaux of size 3
>>> T([]) # the empty tableau
[]
>>> T.category()
Category of sets
```

Element

alias of *Tableau*

options = Current options for Tableaux - ascii_art: repr - convention: English - display: list - latex: diagram

class sage.combinat.tableau.**Tableaux_all**

Bases: *Tableaux*

Initialize the class of all tableaux.

class sage.combinat.tableau.**Tableaux_size**(*n*)

Bases: *Tableaux*

Tableaux of a fixed size n.

sage.combinat.tableau.**from_chain**(*chain*)

Return a semistandard tableau from a chain of partitions.

EXAMPLES:

```
sage: from sage.combinat.tableau import from_chain
sage: from_chain([[], [2], [2, 1], [3, 2, 1]])
[[1, 1, 3], [2, 3], [3]]
```

```
>>> from sage.all import *
>>> from sage.combinat.tableau import from_chain
>>> from_chain([[], [Integer(2)], [Integer(2), Integer(1)], [Integer(3),␣
↪Integer(2), Integer(1)]])
[[1, 1, 3], [2, 3], [3]]
```

sage.combinat.tableau.**from_shape_and_word**(*shape*, *w*, *convention='French'*)

Return a tableau from a shape and word.

INPUT:

- `shape` – a partition
- `w` – a word whose length equals that of the partition
- `convention` – string (default: `'French'`); can take values `'French'` or `'English'`

OUTPUT:

A tableau, whose shape is `shape` and whose reading word is `w`. If the `convention` is specified as `'French'`, the reading word is to be read starting from the top row in French convention (= the bottom row in English convention). If the `convention` is specified as `'English'`, the reading word is to be read starting with the top row in English convention.

EXAMPLES:

```
sage: from sage.combinat.tableau import from_shape_and_word
sage: t = Tableau([[1, 3], [2], [4]])
sage: shape = t.shape(); shape
[2, 1, 1]
sage: word = t.to_word(); word
word: 4213
sage: from_shape_and_word(shape, word)
[[1, 3], [2], [4]]
sage: word = Word(flatten(t))
sage: from_shape_and_word(shape, word, convention='English')
[[1, 3], [2], [4]]
```

```
>>> from sage.all import *
>>> from sage.combinat.tableau import from_shape_and_word
>>> t = Tableau([[Integer(1), Integer(3)], [Integer(2)], [Integer(4)]])
>>> shape = t.shape(); shape
[2, 1, 1]
>>> word = t.to_word(); word
word: 4213
>>> from_shape_and_word(shape, word)
[[1, 3], [2], [4]]
>>> word = Word(flatten(t))
>>> from_shape_and_word(shape, word, convention='English')
[[1, 3], [2], [4]]
```

sage.combinat.tableau.**symmetric_group_action_on_values**(*word*, *perm*)

Return the image of the word `word` under the Lascoux-Schuetzenberger action of the permutation `perm`.

See *Tableau.symmetric_group_action_on_values()* for the definition of the Lascoux-Schuetzenberger action on semistandard tableaux. The transformation that the reading word of the tableau undergoes in said definition is precisely the Lascoux-Schuetzenberger action on words.

EXAMPLES:

```
sage: from sage.combinat.tableau import symmetric_group_action_on_values
sage: symmetric_group_action_on_values([1,1,1],[1,3,2])
[1, 1, 1]
sage: symmetric_group_action_on_values([1,1,1],[2,1,3])
[2, 2, 2]
sage: symmetric_group_action_on_values([1,2,1],[2,1,3])
[2, 2, 1]
sage: symmetric_group_action_on_values([2,2,2],[2,1,3])
[1, 1, 1]
sage: symmetric_group_action_on_values([2,1,2],[2,1,3])
[2, 1, 1]
sage: symmetric_group_action_on_values([2,2,3,1,1,2,2,3],[1,3,2])
[2, 3, 3, 1, 1, 2, 3, 3]
sage: symmetric_group_action_on_values([2,1,1],[2,1])
[2, 1, 2]
sage: symmetric_group_action_on_values([2,2,1],[2,1])
[1, 2, 1]
sage: symmetric_group_action_on_values([1,2,1],[2,1])
[2, 2, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.tableau import symmetric_group_action_on_values
>>> symmetric_group_action_on_values([Integer(1),Integer(1),Integer(1)],
↪[Integer(1),Integer(3),Integer(2)])

↪[Integer(2),Integer(1)])
[2, 2, 1]
```

sage.combinat.tableau.**unmatched_places**(*w*, *open*, *close*)

Given a word `w` and two letters `open` and `close` to be treated as opening and closing parentheses (respectively),

return a pair `(xs, ys)` that encodes the positions of the unmatched parentheses after the standard parenthesis matching procedure is applied to `w`.

More precisely, `xs` will be the list of all `i` such that `w[i]` is an unmatched closing parenthesis, while `ys` will be the list of all `i` such that `w[i]` is an unmatched opening parenthesis. Both lists returned are in increasing order.

EXAMPLES:

```
sage: from sage.combinat.tableau import unmatched_places
sage: unmatched_places([2,2,2,1,1,1],2,1)
([], [])
sage: unmatched_places([1,1,1,2,2,2],2,1)
([0, 1, 2], [3, 4, 5])
sage: unmatched_places([], 2, 1)
([], [])
sage: unmatched_places([1,2,4,6,2,1,5,3],2,1)
([0], [1])
sage: unmatched_places([2,2,1,2,4,6,2,1,5,3], 2, 1)
([], [0, 3])
sage: unmatched_places([3,1,1,1,2,1,2], 2, 1)
([1, 2, 3], [6])
```

```
>>> from sage.all import *
>>> from sage.combinat.tableau import unmatched_places
>>> unmatched_places([Integer(2),Integer(2),Integer(2),Integer(1),Integer(1),
↪Integer(1)],Integer(2),Integer(1))
([], [])
>>> unmatched_places([Integer(1),Integer(1),Integer(1),Integer(2),Integer(2),
↪Integer(2)],Integer(2),Integer(1))
([0, 1, 2], [3, 4, 5])
>>> unmatched_places([], Integer(2), Integer(1))
([], [])
>>> unmatched_places([Integer(1),Integer(2),Integer(4),Integer(6),Integer(2),
↪Integer(1),Integer(5),Integer(3)],Integer(2),Integer(1))
([0], [1])
>>> unmatched_places([Integer(2),Integer(2),Integer(1),Integer(2),Integer(4),
↪Integer(6),Integer(2),Integer(1),Integer(5),Integer(3)], Integer(2), Integer(1))
([], [0, 3])
>>> unmatched_places([Integer(3),Integer(1),Integer(1),Integer(1),Integer(2),
↪Integer(1),Integer(2)], Integer(2), Integer(1))
([1, 2, 3], [6])
```

Quasi-ribbon tableaux

AUTHORS:

- Daniel Chen, Lisa Johnston, Junbok Lee, Evuilynn Nguyen, Heather Ross, Anne Schilling, Chenchen Zhao (2026): initial version

This file implements quasi-ribbon tableaux and finite families of quasi-ribbon tableaux. A quasi-ribbon tableau is entered as a list of rows from top to bottom. The entries in each row are weakly increasing left to right, the entries in each column are strictly increasing top to bottom, and `None` entries are used to record the shifted positions in the ribbon shape.

The main functionality includes constructing quasi-ribbon tableaux, computing their associated compositions, computing column-reading words, generating finite families of fixed composition shape, and performing Krob–Thibon insertion of letters and words. For references, see [KT1997] and [Nov2000].

class sage.combinat.quasi_ribbon_tableau.**QuasiRibbonTableau**(*parent*, *rows*)

Bases: *SkewTableau*

A quasi-ribbon tableau.

A quasi-ribbon shape is obtained from a composition by drawing rows of cells whose lengths are the parts of the composition, and then shifting the rows so that each lower row starts under the last cell of the row above. For the purposes of this class, a quasi-ribbon tableau is a filling of a quasi-ribbon shape with positive integers which:

1) has at least one entry in row 1;

2) weakly increases from left to right in each row; and

3) strictly increases from top to bottom in each column.

A quasi-ribbon tableau is given by a list of the rows from top to bottom.

EXAMPLES:

```
sage: from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
sage: Q = QuasiRibbonTableau([[1, 2, 3],
....:                         [None, None, 4, 5]])
sage: Q
[[1, 2, 3], [None, None, 4, 5]]
sage: Q.pp()
1  2  3
      4  5
sage: Q.to_composition()
[3, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
>>> Q = QuasiRibbonTableau([[Integer(1), Integer(2), Integer(3)],
...                         [None, None, Integer(4), Integer(5)]])
>>> Q
[[1, 2, 3], [None, None, 4, 5]]
>>> Q.pp()
1  2  3
      4  5
>>> Q.to_composition()
[3, 2]
```

The entries labeled by `None` correspond to shifted positions before the first actual entry in a row. Using `None` is optional; the entries will be shifted accordingly:

```
sage: from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
sage: Q = QuasiRibbonTableau([[1, 2, 3], [4, 5]])
sage: Q.pp()
1  2  3
      4  5
```

```
>>> from sage.all import *
>>> from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
>>> Q = QuasiRibbonTableau([[Integer(1), Integer(2), Integer(3)], [Integer(4),␣
↪Integer(5)]])
>>> Q.pp()
```

(continues on next page)

(continued from previous page)

```
1  2  3
      4  5
```

insert_letter(*a*)

Insert one letter a into a quasi-ribbon tableau `self`.

Case 1: If no entry of `self` is less or equal to `a`, add a as a new top row.

Case 2: Otherwise, find x, the rightmost and bottommost entry of `self` that is less or equal to a. Put a immediately to the right of x. Then split off the entries that were originally to the right of x and move them below.

EXAMPLES:

```
sage: from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
sage: Q = QuasiRibbonTableau([])
sage: Q.insert_letter(3)
[[3]]

sage: Q = QuasiRibbonTableau([[4, 5]])
sage: Q.insert_letter(3)
[[3], [4, 5]]

sage: Q = QuasiRibbonTableau([[1, 2, 3], [4, 5]])
sage: Q.insert_letter(4)
[[1, 2, 3], [None, None, 4, 4], [None, None, None, 5]]
```

```
>>> from sage.all import *
>>> from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
>>> Q = QuasiRibbonTableau([])
>>> Q.insert_letter(Integer(3))
[[3]]

>>> Q = QuasiRibbonTableau([[Integer(4), Integer(5)]])
>>> Q.insert_letter(Integer(3))
[[3], [4, 5]]

>>> Q = QuasiRibbonTableau([[Integer(1), Integer(2), Integer(3)], [Integer(4),
↪ Integer(5)]])
>>> Q.insert_letter(Integer(4))
[[1, 2, 3], [None, None, 4, 4], [None, None, None, 5]]
```

insert_word(*word*)

Insert the letters of a `word` one at a time from left to right into `self`.

EXAMPLES:

```
sage: from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
sage: Q = QuasiRibbonTableau([])
sage: Q.insert_word([3])
[[3]]

sage: Q = QuasiRibbonTableau([[4, 5]])
sage: Q.insert_word([3,3,1,2])
```

(continues on next page)

(continued from previous page)

```
[[1, 2], [None, 3, 3], [None, None, 4, 5]]

sage: Q = QuasiRibbonTableau([[1], [2,3]])
sage: Q.insert_word([])
[[1], [2, 3]]
sage: Q.insert_word([4,1,2])
[[1, 1], [None, 2, 2], [None, None, 3, 4]]
```

```
>>> from sage.all import *
>>> from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
>>> Q = QuasiRibbonTableau([])
>>> Q.insert_word([Integer(3)])
[[3]]

>>> Q = QuasiRibbonTableau([[Integer(4), Integer(5)]])
>>> Q.insert_word([Integer(3),Integer(3),Integer(1),Integer(2)])
[[1, 2], [None, 3, 3], [None, None, 4, 5]]

>>> Q = QuasiRibbonTableau([[Integer(1)], [Integer(2),Integer(3)]])
>>> Q.insert_word([])
[[1], [2, 3]]
>>> Q.insert_word([Integer(4),Integer(1),Integer(2)])
[[1, 1], [None, 2, 2], [None, None, 3, 4]]
```

pp()

Return a pretty print of `self`.

EXAMPLES:

```
sage: from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
sage: Q = QuasiRibbonTableau([[1, 2, 3],
....:                         [None, None, 4, 5]])
sage: Q.pp()
1  2  3
      4  5
```

```
>>> from sage.all import *
>>> from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
>>> Q = QuasiRibbonTableau([[Integer(1), Integer(2), Integer(3)],
...                         [None, None, Integer(4), Integer(5)]])
>>> Q.pp()
1  2  3
      4  5
```

rows()

Return the quasi-ribbon rows of `self`.

This returns the user-facing row-list representation, including `None` entries.

EXAMPLES:

```
sage: from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
sage: Q = QuasiRibbonTableau([[1, 2, 3],
```

(continues on next page)

(continued from previous page)

```
....:                           [None, None, 4, 5]])
sage: Q.rows()
[[1, 2, 3], [None, None, 4, 5]]
```

```
>>> from sage.all import *
>>> from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
>>> Q = QuasiRibbonTableau([[Integer(1), Integer(2), Integer(3)],
...                         [None, None, Integer(4), Integer(5)]])
>>> Q.rows()
[[1, 2, 3], [None, None, 4, 5]]
```

split(*row_index*, *col_index*)

Return two quasi-ribbon tableaux split from `self`.

The first quasi-ribbon tableau includes all entries above or weakly left of the (`row_index`, `col_index`)-position and the second includes all entries below or strictly right of that position. `col_index` indicates the position among integers in a row, ignoring the `None` entries; both it and `row_index` count starting from 0.

When `row_index` exceeds the number of rows, the first quasi-ribbon tableau is `self` and the second is empty. When `column_index` exceeds the number of integers in `self.rows()[row_index]`, the first quasi-ribbon contains the entirety of `self.rows()[row_index]` and the second starts at the row below.

EXAMPLES:

```
sage: from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
sage: Q = QuasiRibbonTableau([[1, 2, 3], [4, 5]])
sage: Q1, Q2 = Q.split(0, 0)
sage: Q1.rows()
[[1]]
sage: Q2.rows()
[[2, 3], [None, 4, 5]]
sage: Q3, Q4 = Q.split(1, 0)
sage: Q3.rows()
[[1, 2, 3], [None, None, 4]]
sage: Q4.rows()
[[5]]
```

```
>>> from sage.all import *
>>> from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
>>> Q = QuasiRibbonTableau([[Integer(1), Integer(2), Integer(3)], [Integer(4),
↪ Integer(5)]])
>>> Q1, Q2 = Q.split(Integer(0), Integer(0))
>>> Q1.rows()
[[1]]
>>> Q2.rows()
[[2, 3], [None, 4, 5]]
>>> Q3, Q4 = Q.split(Integer(1), Integer(0))
>>> Q3.rows()
[[1, 2, 3], [None, None, 4]]
>>> Q4.rows()
[[5]]
```

to_composition()

Return the composition shape of `self`.

The shape counts the actual entries in each row, ignoring `None`.

EXAMPLES:

```
sage: from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
sage: Q = QuasiRibbonTableau([[1, 2, 3],
....:                         [None, None, 4, 5]])
sage: Q.to_composition()
[3, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
>>> Q = QuasiRibbonTableau([[Integer(1), Integer(2), Integer(3)],
...                         [None, None, Integer(4), Integer(5)]])
>>> Q.to_composition()
[3, 2]
```

to_word_by_column()

Return the reading word of `self`.

The reading convention is column by column from left to right. Within each column, read from bottom to top.

EXAMPLES:

```
sage: from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
sage: Q = QuasiRibbonTableau([[1, 2, 3],
....:                         [None, None, 4, 5]])
sage: Q.to_word_by_column()
word: 12435

sage: T = QuasiRibbonTableau([[1], [2, 2], [None, 3, 3], [None, None, 4]])
sage: T.to_word_by_column()
word: 213243
```

```
>>> from sage.all import *
>>> from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
>>> Q = QuasiRibbonTableau([[Integer(1), Integer(2), Integer(3)],
...                         [None, None, Integer(4), Integer(5)]])
>>> Q.to_word_by_column()
word: 12435

>>> T = QuasiRibbonTableau([[Integer(1)], [Integer(2), Integer(2)], [None,␣
↪Integer(3), Integer(3)], [None, None, Integer(4)]])
>>> T.to_word_by_column()
word: 213243
```

width()

Return the maximum row length of `self`, including `None` entries.

EXAMPLES:

```
sage: from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
sage: Q = QuasiRibbonTableau([[1, 2, 3],
....:                         [None, None, 4, 5]])
sage: Q.width()
4
```

```
>>> from sage.all import *
>>> from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableau
>>> Q = QuasiRibbonTableau([[Integer(1), Integer(2), Integer(3)],
...                         [None, None, Integer(4), Integer(5)]])
>>> Q.width()
4
```

class sage.combinat.quasi_ribbon_tableau.**QuasiRibbonTableaux**(*shape=None*, *max_entry=None*, *size=None*, *category=None*)

Bases: *SkewTableaux*

The set of quasi-ribbon tableaux.

INPUT:

- `shape` – (optional) the composition shape of the rows
- `max_entry` – (optional) the largest allowed entry for finite generation

EXAMPLES:

```
sage: from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableaux
sage: QRT = QuasiRibbonTableaux()
sage: QRT
Quasi-ribbon tableaux
sage: QRT = QuasiRibbonTableaux(shape=[2, 1])
sage: QRT
Quasi-ribbon tableaux of shape [2, 1]
sage: QRT = QuasiRibbonTableaux(shape=[2, 1], max_entry=3)
sage: list(QRT)
[[[1, 1], [None, 2]],
[[1, 1], [None, 3]],
[[1, 2], [None, 3]],
[[2, 2], [None, 3]]]
```

```
>>> from sage.all import *
>>> from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableaux
>>> QRT = QuasiRibbonTableaux()
>>> QRT
Quasi-ribbon tableaux
>>> QRT = QuasiRibbonTableaux(shape=[Integer(2), Integer(1)])
>>> QRT
Quasi-ribbon tableaux of shape [2, 1]
>>> QRT = QuasiRibbonTableaux(shape=[Integer(2), Integer(1)], max_
↪entry=Integer(3))
>>> list(QRT)
[[[1, 1], [None, 2]],
[[1, 1], [None, 3]],
```

(continues on next page)

(continued from previous page)

```
[[1, 2], [None, 3]],
[[2, 2], [None, 3]]]
```

Element

alias of *QuasiRibbonTableau*

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableaux
sage: QuasiRibbonTableaux().cardinality()
+Infinity
sage: QuasiRibbonTableaux(shape=[2, 1]).cardinality()
+Infinity
sage: QuasiRibbonTableaux(shape=[2, 1], max_entry=2).cardinality()
1
sage: QuasiRibbonTableaux(1, max_entry=2).cardinality()
2
```

```
>>> from sage.all import *
>>> from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableaux
>>> QuasiRibbonTableaux().cardinality()
+Infinity
>>> QuasiRibbonTableaux(shape=[Integer(2), Integer(1)]).cardinality()
+Infinity
>>> QuasiRibbonTableaux(shape=[Integer(2), Integer(1)], max_entry=Integer(2)).
↪cardinality()
1
>>> QuasiRibbonTableaux(Integer(1), max_entry=Integer(2)).cardinality()
2
```

insert_word(*word*)

Insert the letters of `word` one at a time into `self`.

EXAMPLES:

```
sage: from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableaux
sage: H = QuasiRibbonTableaux()
sage: H.insert_word([])
[]
sage: H.insert_word([3, 4])
[[3, 4]]
sage: H.insert_word([4, 3])
[[3], [4]]
sage: H.insert_word([1, 3, 2, 4, 4])
[[1, 2], [None, 3, 4, 4]]
```

```
>>> from sage.all import *
>>> from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableaux
>>> H = QuasiRibbonTableaux()
>>> H.insert_word([])
```

(continues on next page)

(continued from previous page)

```
[]
>>> H.insert_word([Integer(3), Integer(4)])
[[3, 4]]
>>> H.insert_word([Integer(4), Integer(3)])
[[3], [4]]
>>> H.insert_word([Integer(1), Integer(3), Integer(2), Integer(4),␣
↪Integer(4)])
[[1, 2], [None, 3, 4, 4]]
```

shape()

Return the fixed composition shape of `self`.

Raise an error if this family does not have a fixed shape.

EXAMPLES:

```
sage: from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableaux
sage: QRT = QuasiRibbonTableaux(shape=[3, 2])
sage: QRT.shape()
[3, 2]
sage: QRT = QuasiRibbonTableaux(3)
sage: QRT.shape()
Traceback (most recent call last):
...
ValueError: this family does not have a fixed shape
```

```
>>> from sage.all import *
>>> from sage.combinat.quasi_ribbon_tableau import QuasiRibbonTableaux
>>> QRT = QuasiRibbonTableaux(shape=[Integer(3), Integer(2)])
>>> QRT.shape()
[3, 2]
>>> QRT = QuasiRibbonTableaux(Integer(3))
>>> QRT.shape()
Traceback (most recent call last):
...
ValueError: this family does not have a fixed shape
```

Tamari blossoming trees

This module implements the blossoming trees in bijection with Tamari intervals.

These blossoming trees are trees with half-edges bicolored following some local rules, each node has two buds, and each edge has two legs. Buds are matched with legs in a planar way, leaving only two dangling buds. The coloring can be replaced by marking one of the dangling buds. The blossoming tree is represented as a plane tree, in which a bud is exactly a leaf. We take the convention that the root bud is a dangling bud with red half-edges next to it in the counter-clockwise order.

class sage.combinat.tamari_blossoming_tree.**ModernBlossomingTreeFactory**(*size: int*)

Bases: SageObject, UniqueRepresentation

This class is for uniform random generation of blossoming trees associated with modern Tamari intervals of a given size. As some precomputation is needed, it is the best practice to keep the same instance when generating multiple modern blossoming trees. For one-shot generation, we also provide a static method.

EXAMPLES:

```
sage: from sage.combinat.tamari_blossoming_tree import (
....:     ModernBlossomingTreeFactory)
sage: MBTF = ModernBlossomingTreeFactory(100)
sage: MBTF
Random generator of modern blossoming trees of size 100
sage: MBTF.random_element()
Tamari blossoming tree ... of size 100
sage: MBTF.random_element().is_modern()
True
```

```
>>> from sage.all import *
>>> from sage.combinat.tamari_blossoming_tree import (
...     ModernBlossomingTreeFactory)
>>> MBTF = ModernBlossomingTreeFactory(Integer(100))
>>> MBTF
Random generator of modern blossoming trees of size 100
>>> MBTF.random_element()
Tamari blossoming tree ... of size 100
>>> MBTF.random_element().is_modern()
True
```

random_element()

Generate a uniformly random modern blossoming tree of a given size.

OUTPUT:

A uniformly random modern blossoming tree obtained using bijection with lattice paths.

ALGORITHM:

According to Section 5.5 of [FFN2025], the generating function of modern blossoming trees can be written as $(1 + C)^2$, with:

- $C = \frac{A}{1-B}$
- $B = \frac{z(1+C)}{1-B}$
- $A = \frac{z(1+C)^2}{1-B} = B(1 + C)$

Each series counts a certain family of trees with buds.

By solving it, we know that

- $C(z)$ is the series of Dyck paths with weight 2 on every non-initial up-step
- $B(z)$ is the series of Dyck paths of C without touching the x-axis in middle
- $A(z)$ is the series of Dyck paths with weight 2 on every up-step except the first and the second one on the x-axis (there may be only one such step)

We may then generate a modern blossoming tree by generating Dyck paths with the correct weights, then interpreting such weights in the proper way to obtain a modern blossoming tree according to the recursive decomposition. Details of the bijection for each family can be found in the documentation of the corresponding sub-functions.

EXAMPLES:

```
sage: from sage.combinat.tamari_blossoming_tree import (
....:     ModernBlossomingTreeFactory)
sage: B = ModernBlossomingTreeFactory(100).random_element()
sage: B
Tamari blossoming tree ... of size 100
sage: B.is_modern()
True
```

```
>>> from sage.all import *
>>> from sage.combinat.tamari_blossoming_tree import (
...     ModernBlossomingTreeFactory)
>>> B = ModernBlossomingTreeFactory(Integer(100)).random_element()
>>> B
Tamari blossoming tree ... of size 100
>>> B.is_modern()
True
```

class sage.combinat.tamari_blossoming_tree.**SynchronizedBlossomingTreeFactory**(*size: int*)

Bases: SageObject, UniqueRepresentation

This class is for uniform random generation of synchronized blossoming trees, which are in bijection with modern Tamari intervals, of a given size. No precomputation is needed here, but we keep the same convention as *ModernBlossomingTreeFactory* for the methods.

EXAMPLES:

```
sage: from sage.combinat.tamari_blossoming_tree import (
....:     SynchronizedBlossomingTreeFactory)
sage: SBTF = SynchronizedBlossomingTreeFactory(100)
sage: SBTF
Random generator of synchronized blossoming trees of size 100
sage: SBTF.random_element()
Tamari blossoming tree ... of size 100
sage: SBTF.random_element().is_synchronized()
True
```

```
>>> from sage.all import *
>>> from sage.combinat.tamari_blossoming_tree import (
...     SynchronizedBlossomingTreeFactory)
>>> SBTF = SynchronizedBlossomingTreeFactory(Integer(100))
>>> SBTF
Random generator of synchronized blossoming trees of size 100
>>> SBTF.random_element()
Tamari blossoming tree ... of size 100
>>> SBTF.random_element().is_synchronized()
True
```

random_element()

Generate a random synchronized blossoming tree of a given size.

OUTPUT:

A uniformly random synchronized blossoming tree, obtained through random generation of lattice paths.

ALGORITHM:

According to [FFN2025], a Tamari blossoming tree is synchronized if and only if the two buds of the same node is always side by side. In such a case, we may identify them, and what we need to generate is a plane tree where each node has one extra bud. Now, root such a plane tree with buds by one of the bud, we only need to generate a sequence of plane trees with a bud at each internal node. Let A be the set of such trees. A tree in A can be decomposed at the root as two sequences of trees in A, separated by the bud.

It is clear that lattice paths with steps $(1, 2)$ and $(1, -1)$ starting and ending on the x-axis while staying weakly above it (also called 2-Dyck paths in some literature) are in bijection with such sequence of plane trees. Such a lattice path can be considered a sequence of primitive paths (touching only the x-axis at both ends), and each of them can be decomposed into two 2-Dyck paths by the last returning to the height 2 and 1. It is clear that A is in bijection with primitive paths by isomorphism of recursive decomposition.

We note that no cutting is needed here, as we simply generate one sequence instead of a pair of them. This is why precomputing is not needed here.

EXAMPLES:

```
sage: from sage.combinat.tamari_blossoming_tree import (
....:     SynchronizedBlossomingTreeFactory)
sage: B = SynchronizedBlossomingTreeFactory(100).random_element()
sage: B
Tamari blossoming tree ... of size 100
sage: B.is_synchronized()
True
```

```
>>> from sage.all import *
>>> from sage.combinat.tamari_blossoming_tree import (
...     SynchronizedBlossomingTreeFactory)
>>> B = SynchronizedBlossomingTreeFactory(Integer(100)).random_element()
>>> B
Tamari blossoming tree ... of size 100
>>> B.is_synchronized()
True
```

class sage.combinat.tamari_blossoming_tree.**TamariBlossomingTree**(*parent*, *tree:* OrderedTree)

Bases: Element, UniqueRepresentation

The class of bicolored blossoming trees, which are in bijection with intervals in the Tamari lattice.

A (bicolored) blossoming tree is a plane unrooted tree satisfying:

- Each edge consists of two half-edges, one colored red and the other blue.
- Each node has two extra unpaired uncolored half-edges called **buds**, which separate cyclically its other adjacent half-edges into two monochromatic parts. In other words, for each node, when reading color of adjacent half-edges in the cyclic order, colors change exactly twice, and the buds are placed at such position of changes.

The size of a bicolored blossoming tree is the number of edges (not counting buds). They are in bijection with intervals in the Tamari lattice formed by binary trees of the same size (the number of internal nodes).

As a convention, although a blossoming tree is unrooted, we represent it by a rooted plane tree with the root as the node with the dangling bud with red half-edges next to it in the counter-clockwise order. As a consequence, all internal nodes of the rooted plane tree have two buds, except for the root which only has one, separating blue half-edges on the left and red ones on the right.

For usage, it is the best to use conversion functions provided by this class, instead of its constructor, which has less flexibility.

Note

The metaclass `InheritComparisonClasscallMetaclass` comes from a conjoint of the metaclass `InheritComparisonMetaclass` imposed by the base class `UniqueRepresentation` and the metaclass `ClasscallMetaclass` imposed by `Element`.

EXAMPLES:

```
sage: T = [[], [[[], []], [], []]]
sage: TB = TamariBlossomingTree.from_plane_tree(T)
sage: TB
Tamari blossoming tree [[], [[], []], [[], []]] of size 2
sage: B1, B2 = TB.to_tamari()
sage: B1, B2
([[., .], .], [[., .], .])
sage: TB is TamariBlossomingTree.from_tamari(B1, B2)
True
sage: TB.is_modern()
True
sage: TB.is_synchronized()
True
```

```
>>> from sage.all import *
>>> T = [[], [[[], []], [], []]]
>>> TB = TamariBlossomingTree.from_plane_tree(T)
>>> TB
Tamari blossoming tree [[], [[], []], [[], []]] of size 2
>>> B1, B2 = TB.to_tamari()
>>> B1, B2
([[., .], .], [[., .], .])
>>> TB is TamariBlossomingTree.from_tamari(B1, B2)
True
>>> TB.is_modern()
True
>>> TB.is_synchronized()
True
```

static binary_tree_plot(*btree*)

Utility function for plotting binary trees in the "upside-down Chapoton" way, i.e., leaves are drawn on a horizontal line, but the root still on top.

INPUT:

- `btree` – a binary tree, not necessarily of type BinaryTree

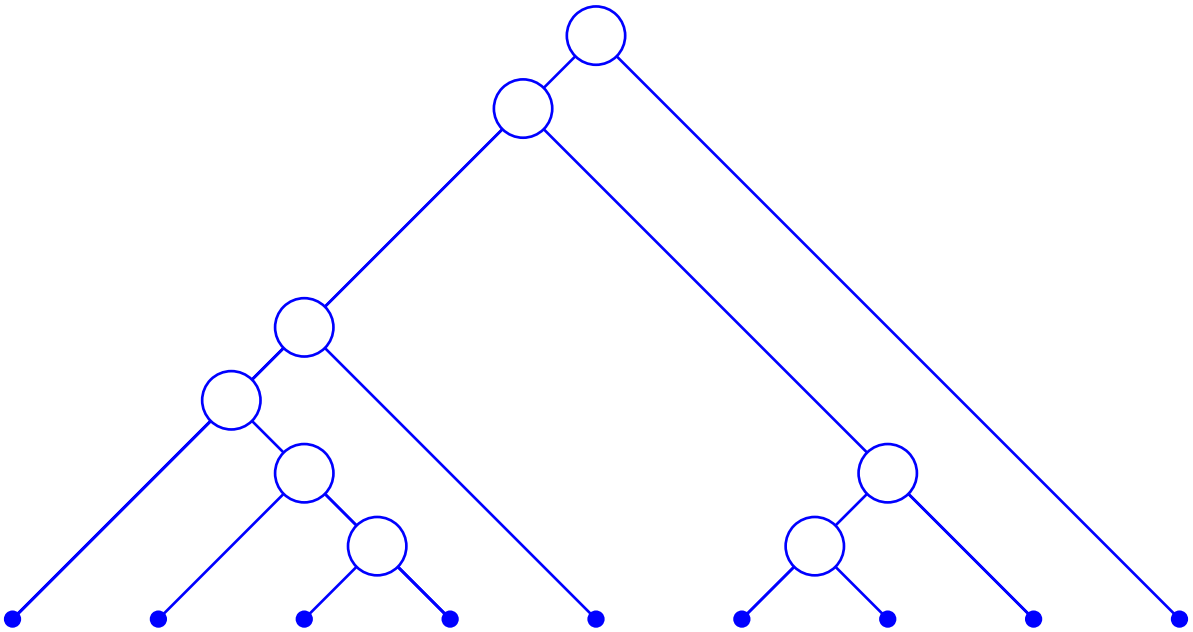
OUTPUT:

A plot of `btree`, with leaves on a horizontal line, and edges all of slope 1 or -1. Labels are ignored.

EXAMPLES:

```
sage: B3 = [[[[None, [None, []]], None], [[], None]], None]
sage: g = TamariBlossomingTree.binary_tree_plot(B3)
```

```
>>> from sage.all import *
>>> B3 = [[[[None, [None, []]], None], [[], None]], None]
>>> g = TamariBlossomingTree.binary_tree_plot(B3)
```



static binary_tree_smooth_drawing(*btree*, *color='blue'*)

Plot the smooth drawing of a binary tree, which is obtained by converting each internal node of a binary tree and its edges into an arc linking its leftmost and rightmost leaves. Such a drawing is planar. See [FFN2025] for more details.

INPUT:

- `btree` – a binary tree, not necessarily of type *BinaryTree*.
- `color` – color of the arcs. Default: `blue`.

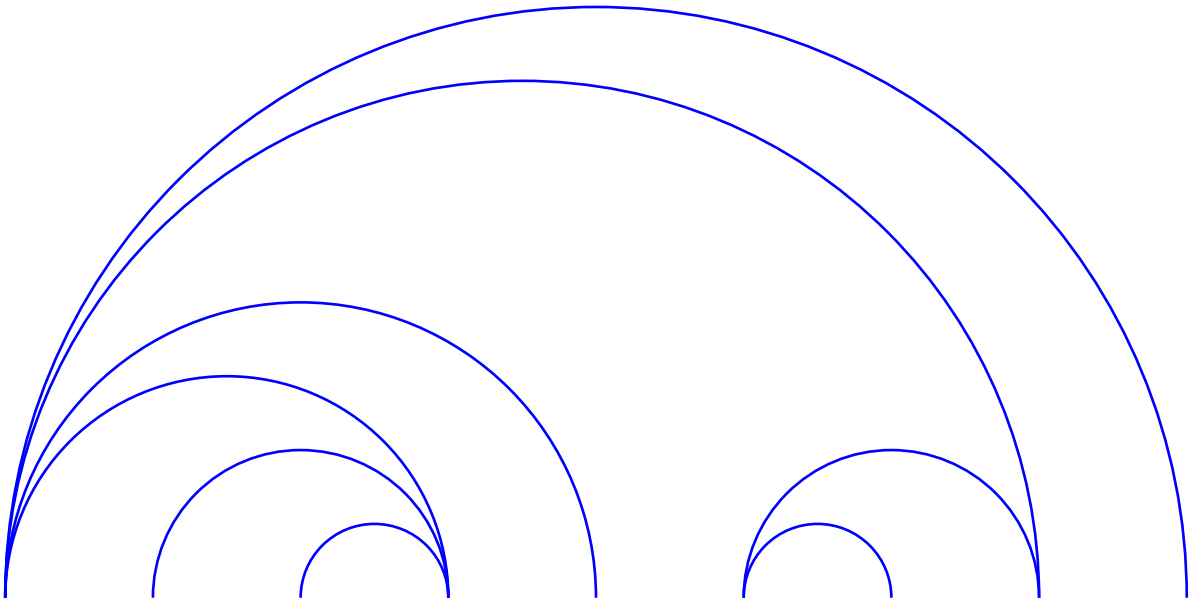
OUTPUT:

The smooth drawing of a binary tree with the given color

EXAMPLES:

```
sage: B3 = [[[[None, [None, []]], None], [[], None]], None]
sage: g = TamariBlossomingTree.binary_tree_smooth_drawing(B3)
```

```
>>> from sage.all import *
>>> B3 = [[[[None, [None, []]], None], [[], None]], None]
>>> g = TamariBlossomingTree.binary_tree_smooth_drawing(B3)
```



static from_TIP(*tip*)

Construct the blossoming tree in bijection with a given Tamari interval-poset.

INPUT:

- `tip` – a *TamariIntervalPoset* object representing a Tamari interval

EXAMPLES:

```
sage: B3 = [[[[None, [None, []]], None], [[], None]], None]
sage: B4 = [[None, [[None, []], None]], [None, [[], None]]]
sage: B3, B4 = BinaryTree(B3), BinaryTree(B4)
sage: tip = TamariIntervalPosets.from_binary_trees(B3, B4)
sage: Tl = OrderedTree([[], [[], [], [[], []], [[[], []], [], []]],
....:                  [[], [], [[[], []], [], [], [[], []], [[]]]])
sage: TlB = TamariBlossomingTree(Tl)
sage: TlB == TamariBlossomingTree.from_TIP(tip)
```

(continues on next page)

(continued from previous page)

```
True
sage: B0 = BinaryTree()
sage: tip2 = TamariIntervalPosets.from_binary_trees(B0, B0)
sage: TlB == TamariBlossomingTree.from_TIP(tip2)
False
```

```
>>> from sage.all import *
>>> B3 = [[[[None, [None, []]], None], [[], None]], None]
>>> B4 = [[None, [[None, []], None]], [None, [[], None]]]
>>> B3, B4 = BinaryTree(B3), BinaryTree(B4)
>>> tip = TamariIntervalPosets.from_binary_trees(B3, B4)
>>> Tl = OrderedTree([[], [[], [], [[], []], [[[], []], [], []]],
...                   [[], [], [[[], []], [], [[], []], [[[]]]])
>>> TlB = TamariBlossomingTree(Tl)
>>> TlB == TamariBlossomingTree.from_TIP(tip)
True
>>> B0 = BinaryTree()
>>> tip2 = TamariIntervalPosets.from_binary_trees(B0, B0)
>>> TlB == TamariBlossomingTree.from_TIP(tip2)
False
```

static from_plane_tree(*tree*)

Return the blossoming tree corresponding to the given tree.

We suppose that the root of the tree is a bud. Comparing to the constructor, we do not fail when the buds are not matching, but tries to find the correct bud.

We assume that the root, which is a bud, has red half-edges next to it in counter-clockwise order (so the left one). We then find the unpaired bud with the opposite property, to simplify the reflection operation.

Note

This function is a thin wrapper of the internal function `_from_plane_tree`, which provides two extra functionalities by which end users should not be concerned.

INPUT:

- `tree` – a plane tree with two buds on each node (one for the root).

OUTPUT:

An object of type *TamariBlossomingTree* representing the blossoming tree given by `tree`.

EXAMPLES:

```
sage: pt = [[], [[[], []], [], []]]
sage: B1, B2 = TamariBlossomingTree.from_plane_tree(pt).to_tamari()
sage: B1 == BinaryTree([[], None])
True
sage: B1 == B2
True
```

```
>>> from sage.all import *
>>> pt = [[], [[[], []], [], []]]
>>> B1, B2 = TamariBlossomingTree.from_plane_tree(pt).to_tamari()
>>> B1 == BinaryTree([[], None])
True
>>> B1 == B2
True
```

static from_tamari(*ltree*, *htree*)

Return the blossoming tree corresponding to the given Tamari interval, given as a pair of binary trees (not necessarily of type *BinaryTree*).

INPUT:

- `ltree` – the lower binary tree in the given Tamari interval.
- `htree` – the upper binary tree in the given Tamari interval.

OUTPUT:

A blossoming tree in bijection with the given Tamari interval

EXAMPLES:

```
sage: B0 = BinaryTree()
sage: TB0 = TamariBlossomingTree(OrderedTree([[]]))
sage: TamariBlossomingTree.from_tamari(B0, B0) == TB0
True
sage: Tl = OrderedTree([[], [[], [], [[], []], [[[], []], []], [], []]],
....:                  [[], [], [[[], []], [], [[], []], []]])
sage: TlB = TamariBlossomingTree(Tl)
sage: B3 = [[[[None, [None, []]], None], [[], None]], None]
sage: B4 = [[None, [[None, []], None]], [None, [[], None]]]
sage: TamariBlossomingTree.from_tamari(B3, B4) == TlB
True
sage: TamariBlossomingTree.from_tamari(B4, B3)
Traceback (most recent call last):
...
ValueError: not a Tamari interval
```

```
>>> from sage.all import *
>>> B0 = BinaryTree()
>>> TB0 = TamariBlossomingTree(OrderedTree([[]]))
>>> TamariBlossomingTree.from_tamari(B0, B0) == TB0
True
>>> Tl = OrderedTree([[], [[], [], [[], []], [[[], []], []], [], []]],
...                  [[], [], [[[], []], [], [[], []], []]])
>>> TlB = TamariBlossomingTree(Tl)
>>> B3 = [[[[None, [None, []]], None], [[], None]], None]
>>> B4 = [[None, [[None, []], None]], [None, [[], None]]]
>>> TamariBlossomingTree.from_tamari(B3, B4) == TlB
True
>>> TamariBlossomingTree.from_tamari(B4, B3)
Traceback (most recent call last):
...
ValueError: not a Tamari interval
```

is_modern()

Return whether the Tamari interval associated to the current blossoming tree is modern, using the function *is_modern()* in *TamariIntervalPoset*.

OUTPUT:

`True` if the blossoming tree is modern, and `False` otherwise.

EXAMPLES:

```
sage: T1 = [[], [[], [], [[], []]]]
sage: TamariBlossomingTree.from_plane_tree(T1).is_modern()
True
sage: T2 = [[], [[[], [], [[], []]], [], []]]
sage: TamariBlossomingTree.from_plane_tree(T2).is_modern()
False
```

```
>>> from sage.all import *
>>> T1 = [[], [[], [], [[], []]]]
>>> TamariBlossomingTree.from_plane_tree(T1).is_modern()
True
>>> T2 = [[], [[[], [], [[], []]], [], []]]
>>> TamariBlossomingTree.from_plane_tree(T2).is_modern()
False
```

is_synchronized()

Return whether the Tamari interval presented by the current blossoming tree is synchronized, i.e., two buds of the same node are adjacent.

OUTPUT:

`True` if the blossoming tree is synchronized, otherwise `False`

EXAMPLES:

```
sage: T1 = [[], [[], [], [[], []]]]
sage: TamariBlossomingTree.from_plane_tree(T1).is_synchronized()
True
sage: T2 = [[], [[], [[], []], []]]
sage: TamariBlossomingTree.from_plane_tree(T2).is_synchronized()
False
```

```
>>> from sage.all import *
>>> T1 = [[], [[], [], [[], []]]]
>>> TamariBlossomingTree.from_plane_tree(T1).is_synchronized()
True
>>> T2 = [[], [[], [[], []], []]]
>>> TamariBlossomingTree.from_plane_tree(T2).is_synchronized()
False
```

plot_blossoming(*aspect=1.0*, *layout='tree'*)

Plot the blossoming tree of `self`, using the plot of *OrderedTree*, but with buds better spaced.

INPUT:

- `aspect` – ratio of aspect, default to `1.0`
- **`layout` – the algorithm for layout, with three possible options:**

- `'tree'`: uses `layout_tree` of undirected graph in sage
- `'planar'`: uses `layout_planar` of undirected graph in sage

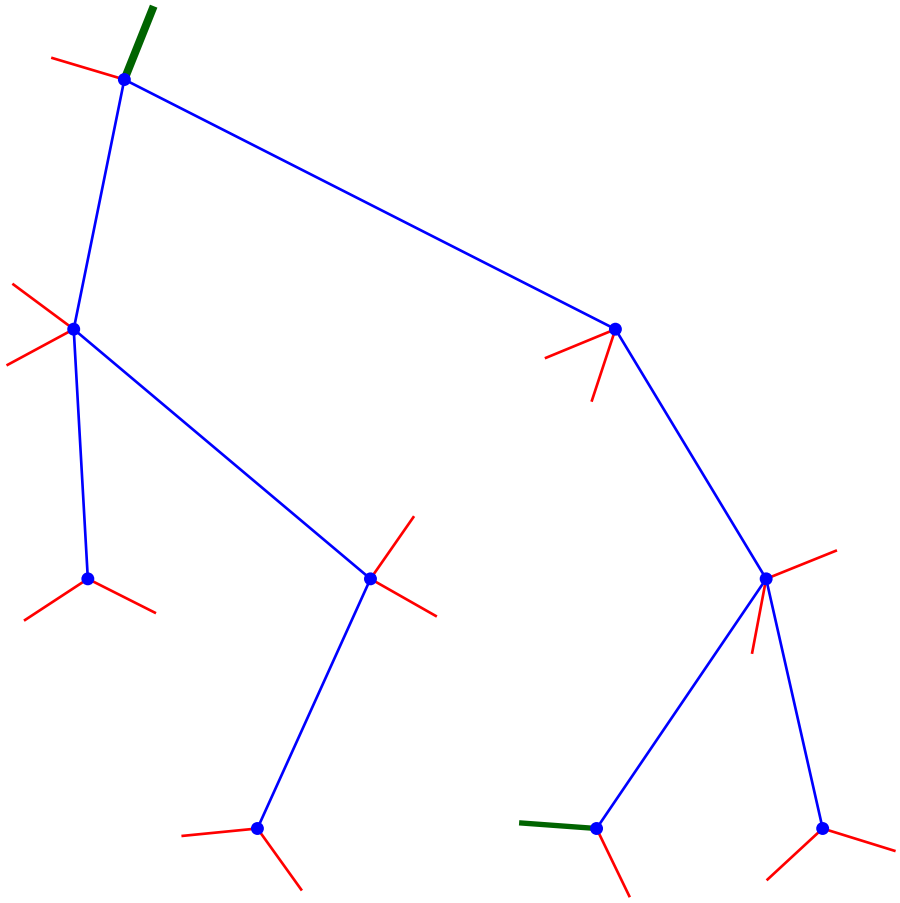
OUTPUT:

A plot of the current blossoming tree.

EXAMPLES:

```
sage: Tl = OrderedTree([[], [[], [], [[], []], [[[], []], [], [[], [], []]]],
....:                  [[], [], [[[], []], [], [[], [], []], [[]]])
sage: g = TamariBlossomingTree(Tl).plot_blossoming()
```

```
>>> from sage.all import *
>>> Tl = OrderedTree([[], [[], [], [[], []], [[[], []], [], [[], [], []]]],
...                  [[], [], [[[], []], [], [[], [], []], [[]]])
>>> g = TamariBlossomingTree(Tl).plot_blossoming()
```



plot_meandric(*semicircle=True*, *arrow=True*)

Plot the meandric tree of `self`.

The meandric tree is the blossoming tree drawn in a way such that the drawing is planar, with buds all on the same horizontal line, which separates the red half-edges above and the blue ones below. For more details, see [FFN2025].

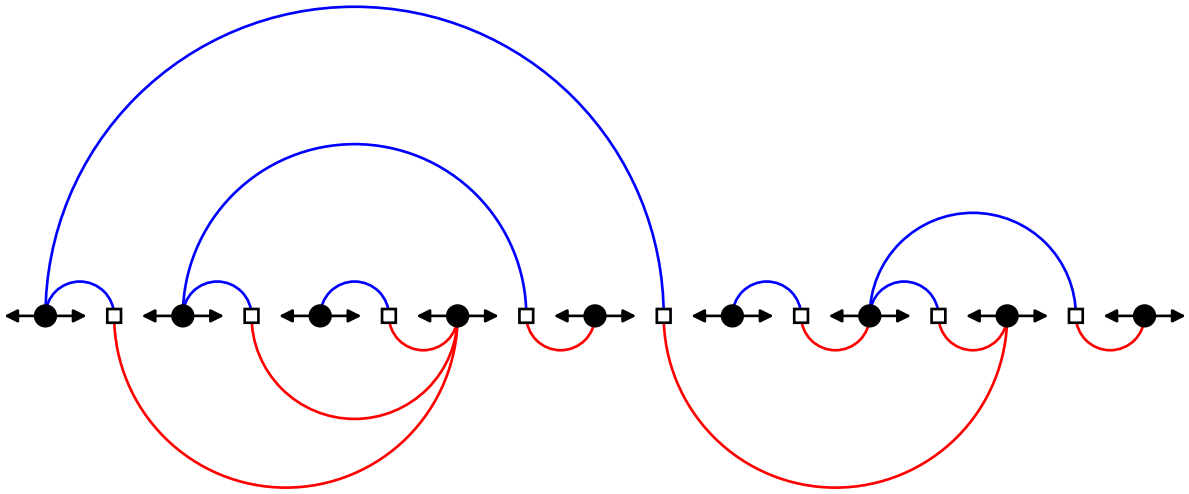
INPUT:

- `semicircle` – optional, sets whether the arcs are drawn as semicircles or a Bezier arc. Default: `True`, which draws semicircles.
- `arrow` – optional, sets whether draw horizontal arrows tips. Default: `True`.

EXAMPLES:

```
sage: Tl = OrderedTree([[], [[], [], [[], []], [[[], []], [], [[]],
....:                   [[], [], [[[], []], [], [[], []], []]])
sage: g = TamariBlossomingTree(Tl).plot_meandric()
```

```
>>> from sage.all import *
>>> Tl = OrderedTree([[], [[], [], [[], []], [[[], []], [], [[]],
...                   [[], [], [[[], []], [], [[], []], []]])
>>> g = TamariBlossomingTree(Tl).plot_meandric()
```



reflection()

Return the blossoming tree that is the mirror image of the current blossoming tree.

Note that the dangling buds change in general, so the root dangling bud will be the one with the correct color.

OUTPUT:

A blossoming tree that is the mirror image of the current one. Not to be confused with the Tamari dual computed by *tamari_dual()*.

EXAMPLES:

```
sage: pt = [[], [[[], []], [], []]]
sage: TB = TamariBlossomingTree.from_plane_tree(pt)
sage: TB == TB.reflection().reflection()
True
sage: TB.reflection().to_plane_tree()
[[], [[], []], [[], []]]
```

```
>>> from sage.all import *
>>> pt = [[], [[[], []], [], []]]
>>> TB = TamariBlossomingTree.from_plane_tree(pt)
>>> TB == TB.reflection().reflection()
True
>>> TB.reflection().to_plane_tree()
[[], [[], []], [[], []]]
```

size()

Return the size of the Tamari blossoming tree.

OUTPUT:

The size of the current blossoming tree, which is the number of edges excluding buds. This convention agrees with that of *TamariIntervalPoset*.

EXAMPLES:

```
sage: T = OrderedTree([[], [[], [], [[], []]]])
sage: T = TamariBlossomingTree(T)
sage: T.size()
2
sage: T.size() == T.to_TIP().size()
True
```

```
>>> from sage.all import *
>>> T = OrderedTree([[], [[], [], [[], []]]])
>>> T = TamariBlossomingTree(T)
>>> T.size()
2
>>> T.size() == T.to_TIP().size()
True
```

smooth_drawing()

Plot the smooth drawing of `self`.

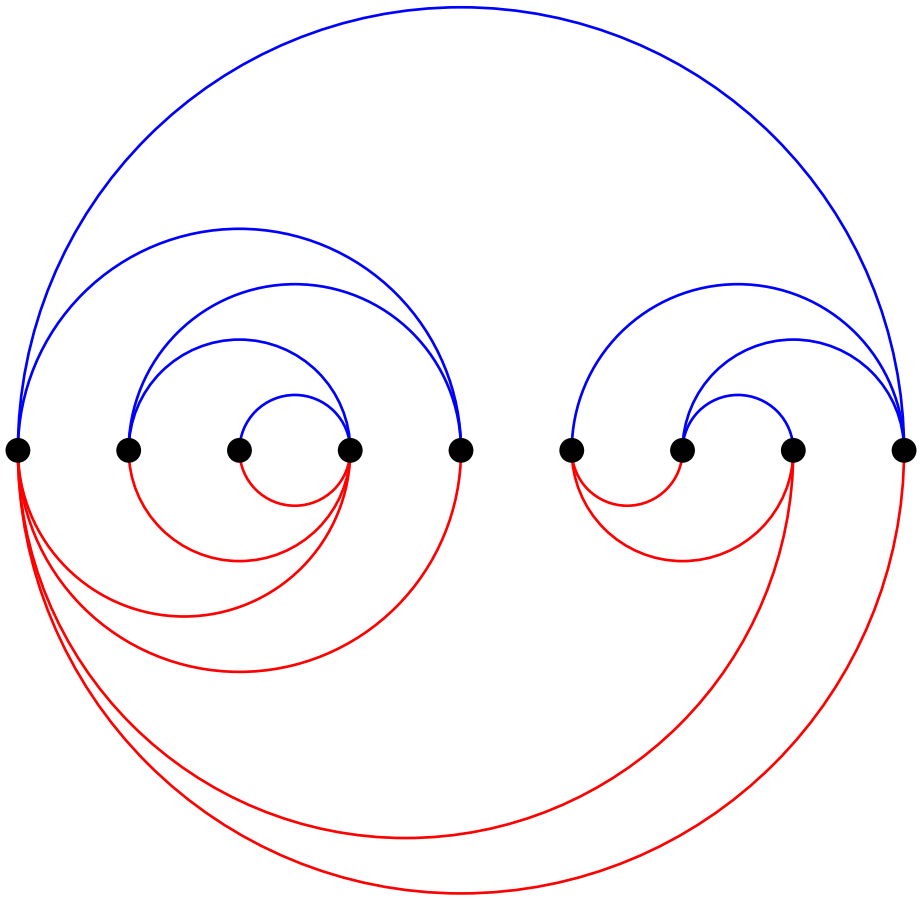
The smooth drawing of a blossoming tree is the combination of the smooth drawings of the two binary trees of the Tamari interval represented by the current blossoming tree, with that of the larger element above and that of the smaller one below, reflected by the horizontal axis.

See [FFN2025] for more details.

EXAMPLES:

```
sage: Tl = OrderedTree([[], [[], [], [[], []]], [[], []], [[]]],
....:                  [[], [], [[[], []], [], [[], []], []]])
sage: g = TamariBlossomingTree(Tl).smooth_drawing()
```

```
>>> from sage.all import *
>>> Tl = OrderedTree([[], [[], [], [[], []], [[[], []], [], [[]]],
...                   [[], [], [[[], []], []], [], [[], []], [[]]]])
>>> g = TamariBlossomingTree(Tl).smooth_drawing()
```



tamari_dual()

Return the current blossoming tree with colors exchanged.

This is equivalent to taking the dual in the Tamari lattice for the corresponding interval. **Not to be confused** with the mirror symmetric of blossoming trees, which is implemented in *reflection()*.

Note

We use a feature of *from_plane_tree()* instead of using the usual *left_right_symmetry()* in *BinaryTree* to avoid exceeding the limit on the number of recursions when tree size is large.

EXAMPLES:

```
sage: B3 = [[[[None, [None, []]], None], [[], None]], None]
sage: B4 = [[None, [[None, []], None]], [None, [[], None]]]
sage: B3, B4 = BinaryTree(B3), BinaryTree(B4)
sage: TB = TamariBlossomingTree.from_tamari(B3, B4)
```

(continues on next page)

(continued from previous page)

```
sage: B4d, B3d = TB.tamari_dual().to_tamari()
sage: B4d == B4.left_right_symmetry()
True
sage: B3d == B3.left_right_symmetry()
True
```

```
>>> from sage.all import *
>>> B3 = [[[[None, [None, []]], None], [[], None]], None]
>>> B4 = [[None, [[None, []], None]], [None, [[], None]]]
>>> B3, B4 = BinaryTree(B3), BinaryTree(B4)
>>> TB = TamariBlossomingTree.from_tamari(B3, B4)
>>> B4d, B3d = TB.tamari_dual().to_tamari()
>>> B4d == B4.left_right_symmetry()
True
>>> B3d == B3.left_right_symmetry()
True
```

to_TIP()

Return the corresponding Tamari interval-poset in bijection with the current instance of blossoming tree.

OUTPUT:

An object of type *TamariIntervalPoset* representing the corresponding Tamari interval poset

EXAMPLES:

```
sage: Tl = OrderedTree([[], [[], [], [[], [[], []], [[[], []], [], []]],
....:                   [[], [], [[[], []], [], [[], []], []]]])
sage: TlB = TamariBlossomingTree(Tl)
sage: tip = TlB.to_TIP()
sage: B3 = [[[[None, [None, []]], None], [[], None]], None]
sage: B4 = [[None, [[None, []], None]], [None, [[], None]]]
sage: tip.lower_binary_tree() == BinaryTree(B3)
True
sage: tip.upper_binary_tree() == BinaryTree(B4)
True
```

```
>>> from sage.all import *
>>> Tl = OrderedTree([[], [[], [], [[], [[], []], [[[], []], [], []]],
...                   [[], [], [[[], []], [], [[], []], []]]])
>>> TlB = TamariBlossomingTree(Tl)
>>> tip = TlB.to_TIP()
>>> B3 = [[[[None, [None, []]], None], [[], None]], None]
>>> B4 = [[None, [[None, []], None]], [None, [[], None]]]
>>> tip.lower_binary_tree() == BinaryTree(B3)
True
>>> tip.upper_binary_tree() == BinaryTree(B4)
True
```

to_plane_tree()

Return the blossoming tree as an *OrderedTree*.

The buds simply become leaves.

EXAMPLES:

```
sage: T = OrderedTree([[], [[], [], [[], []]]])
sage: T == TamariBlossomingTree(T).to_plane_tree()
True
```

```
>>> from sage.all import *
>>> T = OrderedTree([[], [[], [], [[], []]]])
>>> T == TamariBlossomingTree(T).to_plane_tree()
True
```

to_tamari()

Return the Tamari interval in bijection with `self`, under the form of a pair of binary trees.

OUTPUT:

A pair of binary trees comparable in the Tamari lattice (thus a Tamari interval)

EXAMPLES:

```
sage: B0 = BinaryTree()
sage: T0 = OrderedTree([[]])
sage: TamariBlossomingTree(T0).to_tamari() == (B0, B0)
True
sage: T = OrderedTree([[], [[], [], [[], []]]])
sage: TamariBlossomingTree(T).to_tamari()
([., [., .]], [., [., .]])
sage: Tl = OrderedTree([[], [[], [], [[], []], [[], []], [], [[]],
....:                   [[], [], [[], []], [], [[], []], [[]]])
sage: B3, B4 = TamariBlossomingTree(Tl).to_tamari()
sage: B3
[[[[., [., [., .]]], .], [[., .], .]], .]
sage: B4
[[., [[., [., .]], .]], [., [[., .], .]]]
```

```
>>> from sage.all import *
>>> B0 = BinaryTree()
>>> T0 = OrderedTree([[]])
>>> TamariBlossomingTree(T0).to_tamari() == (B0, B0)
True
>>> T = OrderedTree([[], [[], [], [[], []]]])
>>> TamariBlossomingTree(T).to_tamari()
([., [., .]], [., [., .]])
>>> Tl = OrderedTree([[], [[], [], [[], []], [[], []], [], [[]],
...                   [[], [], [[], []], [], [[], []], [[]]])
>>> B3, B4 = TamariBlossomingTree(Tl).to_tamari()
>>> B3
[[[[., [., [., .]]], .], [[., .], .]], .]
>>> B4
[[., [[., [., .]], .]], [., [[., .], .]]]
```

class sage.combinat.tamari_blossoming_tree.**TamariBlossomingTrees**

Bases: `UniqueRepresentation`, `Parent`

Factory class for Tamari blossoming trees. See *TamariBlossomingTree* for details of the elements.

INPUT:

- `size` – size of Tamari blossoming trees in the set (optional, default: None, standing for Tamari blossoming trees of all sizes)

OUTPUT:

An object representing the set of Tamari blossoming trees of the given size.

EXAMPLES:

```
sage: from sage.combinat.tamari_blossoming_tree import (
....:     TamariBlossomingTrees)
sage: TamariBlossomingTrees()
Tamari blossoming trees
sage: TamariBlossomingTrees(10)
Tamari blossoming trees of size 10
```

```
>>> from sage.all import *
>>> from sage.combinat.tamari_blossoming_tree import (
...     TamariBlossomingTrees)
>>> TamariBlossomingTrees()
Tamari blossoming trees
>>> TamariBlossomingTrees(Integer(10))
Tamari blossoming trees of size 10
```

Note

This is a factory class whose constructor returns instances of subclasses corresponding to call parameters.

class sage.combinat.tamari_blossoming_tree.**TamariBlossomingTrees_all**

Bases: `DisjointUnionEnumeratedSets`, *TamariBlossomingTrees*

The enumerated set of all Tamari blossoming trees.

Element

alias of *TamariBlossomingTree*

class sage.combinat.tamari_blossoming_tree.**TamariBlossomingTrees_size**(*size*)

Bases: *TamariBlossomingTrees*

The enumerated set of Tamari blossoming trees of a given size.

cardinality()

Return the cardinality of `self`, i.e., the number of Tamari blossoming trees of size n used to initialize the instance.

The formula, which is the same as that for Tamari intervals, is given in [Cha2008]:

$$\frac{2}{n(n+1)}\binom{4n+1}{n-1}$$

EXAMPLES:

```
sage: from sage.combinat.tamari_blossoming_tree import (
....:     TamariBlossomingTrees)
sage: [len(TamariBlossomingTrees(n)) for n in range(1, 6)]
[1, 3, 13, 68, 399]
```

```
>>> from sage.all import *
>>> from sage.combinat.tamari_blossoming_tree import (
...     TamariBlossomingTrees)
>>> [len(TamariBlossomingTrees(n)) for n in range(Integer(1), Integer(6))]
[1, 3, 13, 68, 399]
```

element_class()

Overriding the original method of the base class to make the element class uniform across all implementation of sets of Tamari blossoming trees.

random_element()

Generate a uniformly random Tamari blossoming tree of a given size.

OUTPUT:

A uniformly random Tamari blossoming tree, obtained through random generation of lattice path.

ALGORITHM:

Let A be the set of rooted plane trees such that each internal node has two buds. Then a tree in A can be decomposed at the root into three sequences of sub-trees in A, separated by the two buds of the root. A Tamari blossoming tree represented as a rooted plane tree can thus be decomposed at the root as two sequences of sub-trees separated by the only bud (the other bud hangs above the root).

It is clear that lattice paths with steps $(1, 3)$ and $(1, -1)$ returning to the x-axis while staying always weakly above it are in bijection with sequences of trees in A by separation at contacts. The parts between contacts are the same family of lattices walks with the extra condition of never touching the x-axis except at both ends. They are in bijection with trees in A by decomposition at the last returning to the height 3, 2 and 1.

We perform random generation by considering a blossoming tree as a pair of lattice paths of a given total size, and the precomputation consists of storing the relative probability of how the total size is split.

EXAMPLES:

```
sage: from sage.combinat.tamari_blossoming_tree import (
....:     TamariBlossomingTrees)
sage: TB = TamariBlossomingTrees(100).random_element()
sage: TB
Tamari blossoming tree ... of size 100
sage: TB in TamariBlossomingTrees()
True
sage: TB in TamariBlossomingTrees(100)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.tamari_blossoming_tree import (
...     TamariBlossomingTrees)
>>> TB = TamariBlossomingTrees(Integer(100)).random_element()
>>> TB
Tamari blossoming tree ... of size 100
>>> TB in TamariBlossomingTrees()
True
>>> TB in TamariBlossomingTrees(Integer(100))
True
```

random_modern_element()

Return a uniformly random modern blossoming tree in the current set of Tamari blossoming trees of a given size.

OUTPUT:

A uniformly random modern blossoming tree in the current instance.

> **Note**
>
> This is a thin wrapper of the random generation facility in *ModernBlossomingTreeFactory*, which automatically cache the instance, thus also the precomputation within.

EXAMPLES:

```
sage: B = TamariBlossomingTrees(100).random_modern_element()
sage: B
Tamari blossoming tree ... of size 100
sage: B.is_modern()
True
```

```
>>> from sage.all import *
>>> B = TamariBlossomingTrees(Integer(100)).random_modern_element()
>>> B
Tamari blossoming tree ... of size 100
>>> B.is_modern()
True
```

random_synchronized_element()

Return a uniformly random synchronized blossoming tree in the current set of Tamari blossoming trees of a given size.

OUTPUT:

A uniformly random synchronized blossoming tree in the current instance.

> **Note**
>
> This is a thin wrapper of the random generation in *SynchronizedBlossomingTreeFactory*, which automatically cache the instance.

EXAMPLES:

```
sage: B = TamariBlossomingTrees(100).random_synchronized_element()
sage: B
Tamari blossoming tree ... of size 100
sage: B.is_synchronized()
True
```

```
>>> from sage.all import *
>>> B = TamariBlossomingTrees(Integer(100)).random_synchronized_element()
>>> B
Tamari blossoming tree ... of size 100
```

(continues on next page)

(continued from previous page)

```
>>> B.is_synchronized()
True
```

Tamari Interval-posets

This module implements Tamari interval-posets: combinatorial objects which represent intervals of the Tamari order. They have been introduced in [CP2015] and allow for many combinatorial operations on Tamari intervals. In particular, they are linked to *DyckWords* and *BinaryTrees*. An introduction into Tamari interval-posets is given in Chapter 7 of [Pons2013].

The Tamari lattice can be defined as a lattice structure on either of several classes of Catalan objects, especially binary trees and Dyck paths [Tam1962] [HT1972] [Sta-EC2]. An interval can be seen as a pair of comparable elements. The number of intervals has been given in [Cha2008].

AUTHORS:

`sage.combinat.interval_posets.`**`TIP`**

alias of *TamariIntervalPoset*

class `sage.combinat.interval_posets.`**`TamariIntervalPoset`**(*parent*, *size*, *relations=None*, *check=True*)

Bases: `Element`

The class of Tamari interval-posets.

An interval-poset is a labelled poset of size n, with labels $1, 2, \ldots, n$, satisfying the following conditions:

- if $a < c$ (as integers) and a precedes c in the poset, then, for all b such that $a < b < c$, b precedes c,
- if $a < c$ (as integers) and c precedes a in the poset, then, for all b such that $a < b < c$, b precedes a.

We use the word "precedes" here to distinguish the poset order and the natural order on numbers. "Precedes" means "is smaller than with respect to the poset structure"; this does not imply a covering relation.

Interval-posets of size n are in bijection with intervals of the Tamari lattice of binary trees of size n. Specifically, if P is an interval-poset of size n, then the set of linear extensions of P (as permutations in S_n) is an interval in the right weak order (see *permutohedron_lequal()*), and is in fact the preimage of an interval in the Tamari lattice (of binary trees of size n) under the operation which sends a permutation to its right-to-left binary search tree (*binary_search_tree()* with the `left_to_right` variable set to `False`) without its labelling.

INPUT:

- `size` – integer; the size of the interval-posets (number of vertices)
- `relations` – list (or tuple) of pairs `(a,b)` (themselves lists or tuples), each representing a relation of the form 'a precedes b' in the poset
- `check` – boolean (default: `True`); whether to check the interval-poset condition or not

Warning

The `relations` input can be a list or tuple, but not an iterator (nor should its entries be iterators).

NOTATION:

Here and in the following, the signs $<$ and $>$ always refer to the natural ordering on integers, whereas the word "precedes" refers to the order of the interval-poset. "Minimal" and "maximal" refer to the natural ordering on integers.

The *increasing relations* of an interval-poset P mean the pairs (a, b) of elements of P such that $a < b$ as integers and a precedes b in P. The *initial forest* of P is the poset obtained by imposing (only) the increasing relations on the ground set of P. It is a sub-interval poset of P, and is a forest with its roots on top. This forest is usually given the structure of a planar forest by ordering brother nodes by their labels; it then has the property that if its nodes are traversed in post-order (see *post_order_traversal()*, and traverse the trees of the forest from left to right as well), then the labels encountered are $1, 2, \ldots, n$ in this order.

The *decreasing relations* of an interval-poset P mean the pairs (a, b) of elements of P such that $b < a$ as integers and a precedes b in P. The *final forest* of P is the poset obtained by imposing (only) the decreasing relations on the ground set of P. It is a sub-interval poset of P, and is a forest with its roots on top. This forest is usually given the structure of a planar forest by ordering brother nodes by their labels; it then has the property that if its nodes are traversed in pre-order (see *pre_order_traversal()*, and traverse the trees of the forest from left to right as well), then the labels encountered are $1, 2, \ldots, n$ in this order.

>>> TamariIntervalPoset(Integer(3),[(Integer(1),Integer(3))])
Traceback (most recent call last):
...
ValueError: this does not satisfy the Tamari interval-poset condition
```

It is also possible to transform a poset directly into an interval-poset:

```
sage: TIP = TamariIntervalPosets()
sage: p = Poset(([1,2,3], [(1,2)]))
sage: TIP(p)
The Tamari interval of size 3 induced by relations [(1, 2)]
sage: TIP(Poset({1: []}))
The Tamari interval of size 1 induced by relations []
sage: TIP(Poset({}))
```

(continues on next page)

(continued from previous page)

```
The Tamari interval of size 0 induced by relations []
```

```
>>> from sage.all import *
>>> TIP = TamariIntervalPosets()
>>> p = Poset(([Integer(1),Integer(2),Integer(3)], [(Integer(1),Integer(2))]))
>>> TIP(p)
The Tamari interval of size 3 induced by relations [(1, 2)]
>>> TIP(Poset({Integer(1): []}))
The Tamari interval of size 1 induced by relations []
>>> TIP(Poset({}))
The Tamari interval of size 0 induced by relations []
```

binary_trees()

Return an iterator on all the binary trees in the interval represented by `self`.

See also

interval_cardinality()

EXAMPLES:

```
sage: list(TamariIntervalPoset(4,[(2,4),(3,4),(2,1),(3,1)]).binary_trees())
[[., [[., [., .]], .]],
 [[., [., [., .]]], .],
 [., [[[., .], .], .]],
 [[., [[., .], .]], .]]
sage: set(TamariIntervalPoset(4,[]).binary_trees()) == set(BinaryTrees(4))
True
```

```
>>> from sage.all import *
>>> list(TamariIntervalPoset(Integer(4),[(Integer(2),Integer(4)),(Integer(3),
↪Integer(4)),(Integer(2),Integer(1)),(Integer(3),Integer(1))]).binary_
↪trees())
[[., [[., [., .]], .]],
 [[., [., [., .]]], .],
 [., [[[., .], .], .]],
 [[., [[., .], .]], .]]
>>> set(TamariIntervalPoset(Integer(4),[]).binary_trees()) ==␣
↪set(BinaryTrees(Integer(4)))
True
```

blossoming_tree()

Return the Tamari blossoming tree of type *TamariBlossomingTree* in bijection with the Tamari interval represented by `self`.

EXAMPLES:

```
sage: TIP = TamariIntervalPoset(6, [(3, 2), (4, 3), (5, 2), (6, 5),
....:                               (1, 2), (4, 5)])
sage: B = TIP.blossoming_tree()
sage: B
```

(continues on next page)

(continued from previous page)

```
Tamari blossoming tree ... of size 6
sage: B.to_plane_tree()
[[], [[], []], [[], [], [[], []]], [[], [], [[[], []], [], [], []]]]
sage: B.to_TIP() == TIP
True
```

```
>>> from sage.all import *
>>> TIP = TamariIntervalPoset(Integer(6), [(Integer(3), Integer(2)),␣
↪(Integer(4), Integer(3)), (Integer(5), Integer(2)), (Integer(6),␣
↪Integer(5)),
...                                 (Integer(1), Integer(2)), (Integer(4),␣
↪Integer(5))])
>>> B = TIP.blossoming_tree()
>>> B
Tamari blossoming tree ... of size 6
>>> B.to_plane_tree()
[[], [[], []], [[], [], [[], []]], [[], [], [[[], []], [], [], []]]]
>>> B.to_TIP() == TIP
True
```

complement()

Return the complement of the interval-poset `self`.

If P is a Tamari interval-poset of size n, then the *complement* of P is defined as the interval-poset Q whose base set is $[n] = \{1, 2, \ldots, n\}$ (just as for P), but whose order relation has a precede b if and only if $n+1-a$ precedes $n+1-b$ in P.

In terms of the Tamari lattice, the *complement* is the symmetric of `self`. It is formed from the left-right symmetrized of the binary trees of the interval (switching left and right subtrees, see *left_right_symmetry()*). In particular, initial intervals are sent to final intervals and vice-versa.

EXAMPLES:

```
sage: TamariIntervalPoset(3, [(2, 1), (3, 1)]).complement()
The Tamari interval of size 3 induced by relations [(1, 3), (2, 3)]
sage: TamariIntervalPoset(0, []).complement()
The Tamari interval of size 0 induced by relations []
sage: ip = TamariIntervalPoset(4, [(1, 2), (2, 4), (3, 4)])
sage: ip.complement() == TamariIntervalPoset(4, [(2, 1), (3, 1), (4, 3)])
True
sage: ip.lower_binary_tree() == ip.complement().upper_binary_tree().left_
↪right_symmetry()
True
sage: ip.upper_binary_tree() == ip.complement().lower_binary_tree().left_
↪right_symmetry()
True
sage: ip.is_initial_interval()
True
sage: ip.complement().is_final_interval()
True
```

```
>>> from sage.all import *
>>> TamariIntervalPoset(Integer(3), [(Integer(2), Integer(1)), (Integer(3),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(1))]).complement()
The Tamari interval of size 3 induced by relations [(1, 3), (2, 3)]
>>> TamariIntervalPoset(Integer(0), []).complement()
The Tamari interval of size 0 induced by relations []
>>> ip = TamariIntervalPoset(Integer(4), [(Integer(1), Integer(2)),␣
↪(Integer(2), Integer(4)), (Integer(3), Integer(4))])
>>> ip.complement() == TamariIntervalPoset(Integer(4), [(Integer(2),␣
↪Integer(1)), (Integer(3), Integer(1)), (Integer(4), Integer(3))])
True
>>> ip.lower_binary_tree() == ip.complement().upper_binary_tree().left_right_
↪symmetry()
True
>>> ip.upper_binary_tree() == ip.complement().lower_binary_tree().left_right_
↪symmetry()
True
>>> ip.is_initial_interval()
True
>>> ip.complement().is_final_interval()
True
```

contains_binary_tree(*binary_tree*)

Return whether the interval represented by `self` contains the binary tree `binary_tree`.

INPUT:

- `binary_tree` – a binary tree

See also

contains_dyck_word()

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(2,4),(3,4),(2,1),(3,1)])
sage: ip.contains_binary_tree(BinaryTree([[None,[None,[]]],None]))
True
sage: ip.contains_binary_tree(BinaryTree([None,[[],None],None]))
True
sage: ip.contains_binary_tree(BinaryTree([[],[[],None]]))
False
sage: ip.contains_binary_tree(ip.lower_binary_tree())
True
sage: ip.contains_binary_tree(ip.upper_binary_tree())
True
sage: all(ip.contains_binary_tree(bt) for bt in ip.binary_trees())
True
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(2),Integer(4)),(Integer(3),
↪Integer(4)),(Integer(2),Integer(1)),(Integer(3),Integer(1))])
>>> ip.contains_binary_tree(BinaryTree([[None,[None,[]]],None]))
True
```

(continues on next page)

(continued from previous page)

```
>>> ip.contains_binary_tree(BinaryTree([None,[[[],None],None]]))
True
>>> ip.contains_binary_tree(BinaryTree([[],[[],None]]))
False
>>> ip.contains_binary_tree(ip.lower_binary_tree())
True
>>> ip.contains_binary_tree(ip.upper_binary_tree())
True
>>> all(ip.contains_binary_tree(bt) for bt in ip.binary_trees())
True
```

contains_dyck_word(*dyck_word*)

Return whether the interval represented by `self` contains the Dyck word `dyck_word`.

INPUT:

- `dyck_word` – a Dyck word

See also

contains_binary_tree()

EXAMPLES:

```
sage: # needs sage.combinat
sage: ip = TamariIntervalPoset(4,[(2,4),(3,4),(2,1),(3,1)])
sage: ip.contains_dyck_word(DyckWord([1,1,1,0,0,0,1,0]))
True
sage: ip.contains_dyck_word(DyckWord([1,1,0,1,0,1,0,0]))
True
sage: ip.contains_dyck_word(DyckWord([1,0,1,1,0,1,0,0]))
False
sage: ip.contains_dyck_word(ip.lower_dyck_word())
True
sage: ip.contains_dyck_word(ip.upper_dyck_word())
True
sage: all(ip.contains_dyck_word(bt) for bt in ip.dyck_words())
True
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(2),Integer(4)),(Integer(3),
↪Integer(4)),(Integer(2),Integer(1)),(Integer(3),Integer(1))])
>>> ip.contains_dyck_word(DyckWord([Integer(1),Integer(1),Integer(1),
↪Integer(0),Integer(0),Integer(0),Integer(1),Integer(0)]))
True
>>> ip.contains_dyck_word(DyckWord([Integer(1),Integer(1),Integer(0),
↪Integer(1),Integer(0),Integer(1),Integer(0),Integer(0)]))
True
>>> ip.contains_dyck_word(DyckWord([Integer(1),Integer(0),Integer(1),
↪Integer(1),Integer(0),Integer(1),Integer(0),Integer(0)]))
False
```

(continues on next page)

(continued from previous page)

```
>>> ip.contains_dyck_word(ip.lower_dyck_word())
True
>>> ip.contains_dyck_word(ip.upper_dyck_word())
True
>>> all(ip.contains_dyck_word(bt) for bt in ip.dyck_words())
True
```

contains_interval(*other*)

Return whether the interval represented by `other` is contained in `self` as an interval of the Tamari lattice.

In terms of interval-posets, it means that all relations of `self` are relations of `other`.

INPUT:

- `other` – an interval-poset

EXAMPLES:

```
sage: ip1 = TamariIntervalPoset(4,[(1,2),(2,3),(4,3)])
sage: ip2 = TamariIntervalPoset(4,[(2,3)])
sage: ip2.contains_interval(ip1)
True
sage: ip3 = TamariIntervalPoset(4,[(2,1)])
sage: ip2.contains_interval(ip3)
False
sage: ip4 = TamariIntervalPoset(3,[(2,3)])
sage: ip2.contains_interval(ip4)
False
```

```
>>> from sage.all import *
>>> ip1 = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3)),(Integer(4),Integer(3))])
>>> ip2 = TamariIntervalPoset(Integer(4),[(Integer(2),Integer(3))])
>>> ip2.contains_interval(ip1)
True
>>> ip3 = TamariIntervalPoset(Integer(4),[(Integer(2),Integer(1))])
>>> ip2.contains_interval(ip3)
False
>>> ip4 = TamariIntervalPoset(Integer(3),[(Integer(2),Integer(3))])
>>> ip2.contains_interval(ip4)
False
```

cubical_coordinates()

Return the cubical coordinates of `self`.

This provides a fast and natural way to order the set of interval-posets of a given size.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(1,2),(2,3)])
sage: ip.cubical_coordinates()
(-1, -2, 0)
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3))])
>>> ip.cubical_coordinates()
(-1, -2, 0)
```

REFERENCES:

- [Com2019]

decomposition_to_triple()

Decompose an interval-poset into a triple (`left`, `right`, `r`).

For the inverse method, see *TamariIntervalPosets.recomposition_from_triple()*.

OUTPUT:

a triple (`left`, `right`, `r`) where `left` and `right` are interval-posets and `r` (an integer) is the parameter of the decomposition.

EXAMPLES:

```
sage: tip = TamariIntervalPoset(8, [(1,2), (2,4), (3,4), (6,7),
....:                               (3,2), (5,4), (6,4), (8,7)])
sage: tip.decomposition_to_triple()
(The Tamari interval of size 3 induced by relations [(1, 2), (3, 2)],
 The Tamari interval of size 4 induced by relations [(2, 3), (4, 3)],
 2)
sage: tip == TamariIntervalPosets.recomposition_from_triple(
....:            *tip.decomposition_to_triple())
True
```

```
>>> from sage.all import *
>>> tip = TamariIntervalPoset(Integer(8), [(Integer(1),Integer(2)),␣
↪(Integer(2),Integer(4)), (Integer(3),Integer(4)), (Integer(6),Integer(7)),
...                                (Integer(3),Integer(2)), (Integer(5),
↪Integer(4)), (Integer(6),Integer(4)), (Integer(8),Integer(7))])
>>> tip.decomposition_to_triple()
(The Tamari interval of size 3 induced by relations [(1, 2), (3, 2)],
 The Tamari interval of size 4 induced by relations [(2, 3), (4, 3)],
 2)
>>> tip == TamariIntervalPosets.recomposition_from_triple(
...            *tip.decomposition_to_triple())
True
```

REFERENCES:

- [CP2015]

decreasing_children(*v*)

Return the children of `v` in the final forest of `self`.

INPUT:

- `v` – integer representing a vertex of `self` (between 1 and `size`)

OUTPUT:

The list of all children of `v` in the final forest of `self`, in increasing order.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(6,[(3,2),(4,3),(5,2),(6,5),(1,2),(3,5),(4,5)]);
↪ ip
The Tamari interval of size 6 induced by relations [(1, 2), (3, 5), (4, 5),␣
↪(6, 5), (5, 2), (4, 3), (3, 2)]
sage: ip.decreasing_children(2)
[3, 5]
sage: ip.decreasing_children(3)
[4]
sage: ip.decreasing_children(1)
[]
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(6),[(Integer(3),Integer(2)),(Integer(4),
↪Integer(3)),(Integer(5),Integer(2)),(Integer(6),Integer(5)),(Integer(1),
↪Integer(2)),(Integer(3),Integer(5)),(Integer(4),Integer(5))]); ip
The Tamari interval of size 6 induced by relations [(1, 2), (3, 5), (4, 5),␣
↪(6, 5), (5, 2), (4, 3), (3, 2)]
>>> ip.decreasing_children(Integer(2))
[3, 5]
>>> ip.decreasing_children(Integer(3))
[4]
>>> ip.decreasing_children(Integer(1))
[]
```

decreasing_cover_relations()

Return the cover relations of the final forest of `self`.

This is the poset formed by keeping only the relations of the form a precedes b with $a > b$.

The final forest of `self` is a forest with its roots being on top. It is also called the decreasing poset of `self`.

Warning

This method computes the cover relations of the final forest. This is not identical with the cover relations of `self` which happen to be decreasing!

See also

final_forest()

EXAMPLES:

```
sage: TamariIntervalPoset(4,[(2,1),(3,2),(3,4),(4,2)]).decreasing_cover_
↪relations()
[(4, 2), (3, 2), (2, 1)]
sage: TamariIntervalPoset(4,[(2,1),(4,3),(2,3)]).decreasing_cover_relations()
[(4, 3), (2, 1)]
sage: TamariIntervalPoset(3,[(2,1),(3,1),(3,2)]).decreasing_cover_relations()
[(3, 2), (2, 1)]
```

```
>>> from sage.all import *
>>> TamariIntervalPoset(Integer(4),[(Integer(2),Integer(1)),(Integer(3),
↪Integer(2)),(Integer(3),Integer(4)),(Integer(4),Integer(2))]).decreasing_
↪cover_relations()
[(4, 2), (3, 2), (2, 1)]
>>> TamariIntervalPoset(Integer(4),[(Integer(2),Integer(1)),(Integer(4),
↪Integer(3)),(Integer(2),Integer(3))]).decreasing_cover_relations()
[(4, 3), (2, 1)]
>>> TamariIntervalPoset(Integer(3),[(Integer(2),Integer(1)),(Integer(3),
↪Integer(1)),(Integer(3),Integer(2))]).decreasing_cover_relations()
[(3, 2), (2, 1)]
```

decreasing_parent(*v*)

Return the vertex parent of `v` in the final forest of `self`.

This is the highest (as integer!) vertex $a < v$ such that `v` precedes `a`. If there is no such vertex (that is, v is a decreasing root), then `None` is returned.

INPUT:

- `v` – integer representing a vertex of `self` (between 1 and `size`)

EXAMPLES:

```
sage: ip = TamariIntervalPoset(6,[(3,2),(4,3),(5,2),(6,5),(1,2),(3,5),(4,5)]);
↪ ip
The Tamari interval of size 6 induced by relations [(1, 2), (3, 5), (4, 5),␣
↪(6, 5), (5, 2), (4, 3), (3, 2)]
sage: ip.decreasing_parent(4)
3
sage: ip.decreasing_parent(3)
2
sage: ip.decreasing_parent(5)
2
sage: ip.decreasing_parent(2) is None
True
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(6),[(Integer(3),Integer(2)),(Integer(4),
↪Integer(3)),(Integer(5),Integer(2)),(Integer(6),Integer(5)),(Integer(1),
↪Integer(2)),(Integer(3),Integer(5)),(Integer(4),Integer(5))]); ip
The Tamari interval of size 6 induced by relations [(1, 2), (3, 5), (4, 5),␣
↪(6, 5), (5, 2), (4, 3), (3, 2)]
>>> ip.decreasing_parent(Integer(4))
3
>>> ip.decreasing_parent(Integer(3))
2
>>> ip.decreasing_parent(Integer(5))
2
>>> ip.decreasing_parent(Integer(2)) is None
True
```

decreasing_roots()

Return the root vertices of the final forest of `self`.

These are the vertices b such that there is no $a < b$ with b preceding a.

OUTPUT:

The list of all roots of the final forest of `self`, in increasing order.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(6,[(3,2),(4,3),(5,2),(6,5),(1,2),(3,5),(4,5)]);
↪ ip
The Tamari interval of size 6 induced by relations [(1, 2), (3, 5), (4, 5),␣
↪(6, 5), (5, 2), (4, 3), (3, 2)]
sage: ip.decreasing_roots()
[1, 2]
sage: ip.final_forest().decreasing_roots()
[1, 2]
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(6),[(Integer(3),Integer(2)),(Integer(4),
↪Integer(3)),(Integer(5),Integer(2)),(Integer(6),Integer(5)),(Integer(1),
↪Integer(2)),(Integer(3),Integer(5)),(Integer(4),Integer(5))]); ip
The Tamari interval of size 6 induced by relations [(1, 2), (3, 5), (4, 5),␣
↪(6, 5), (5, 2), (4, 3), (3, 2)]
>>> ip.decreasing_roots()
[1, 2]
>>> ip.final_forest().decreasing_roots()
[1, 2]
```

dyck_words()

Return an iterator on all the Dyck words in the interval represented by `self`.

EXAMPLES:

```
sage: list(TamariIntervalPoset(4,[(2,4),(3,4),(2,1),(3,1)]).dyck_words())    #␣
↪needs sage.combinat
[[1, 1, 1, 0, 0, 1, 0, 0],
 [1, 1, 1, 0, 0, 0, 1, 0],
 [1, 1, 0, 1, 0, 1, 0, 0],
 [1, 1, 0, 1, 0, 0, 1, 0]]
sage: set(TamariIntervalPoset(4,[]).dyck_words()) == set(DyckWords(4))       #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> list(TamariIntervalPoset(Integer(4),[(Integer(2),Integer(4)),(Integer(3),
↪Integer(4)),(Integer(2),Integer(1)),(Integer(3),Integer(1))]).dyck_words())␣
↪  # needs sage.combinat
[[1, 1, 1, 0, 0, 1, 0, 0],
 [1, 1, 1, 0, 0, 0, 1, 0],
 [1, 1, 0, 1, 0, 1, 0, 0],
 [1, 1, 0, 1, 0, 0, 1, 0]]
>>> set(TamariIntervalPoset(Integer(4),[]).dyck_words()) ==␣
↪set(DyckWords(Integer(4)))       # needs sage.combinat
True
```

factor()

Return the unique decomposition as a list of connected components.

EXAMPLES:

```
sage: factor(TamariIntervalPoset(2,[]))  # indirect doctest
[The Tamari interval of size 1 induced by relations [],
 The Tamari interval of size 1 induced by relations []]
```

```
>>> from sage.all import *
>>> factor(TamariIntervalPoset(Integer(2),[]))  # indirect doctest
[The Tamari interval of size 1 induced by relations [],
 The Tamari interval of size 1 induced by relations []]
```

See also

is_connected()

final_forest()

Return the final forest of `self`, i.e., the interval-poset formed with only the decreasing relations of `self`.

See also

initial_forest()

EXAMPLES:

```
sage: TamariIntervalPoset(4,[(2,1),(3,2),(3,4),(4,2)]).final_forest()
The Tamari interval of size 4 induced by relations [(4, 2), (3, 2), (2, 1)]
sage: ip = TamariIntervalPoset(3,[(2,1),(3,1)])
sage: ip.final_forest() == ip
True
```

```
>>> from sage.all import *
>>> TamariIntervalPoset(Integer(4),[(Integer(2),Integer(1)),(Integer(3),
↪Integer(2)),(Integer(3),Integer(4)),(Integer(4),Integer(2))]).final_forest()
The Tamari interval of size 4 induced by relations [(4, 2), (3, 2), (2, 1)]
>>> ip = TamariIntervalPoset(Integer(3),[(Integer(2),Integer(1)),(Integer(3),
↪Integer(1))])
>>> ip.final_forest() == ip
True
```

ge(*e1*, *e2*)

Return whether `e2` precedes or equals `e1` in `self`.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(1,2),(2,3)])
sage: ip.ge(2,1)
True
sage: ip.ge(3,1)
```

(continues on next page)

(continued from previous page)

```
True
sage: ip.ge(3,2)
True
sage: ip.ge(4,3)
False
sage: ip.ge(1,1)
True
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3))])
>>> ip.ge(Integer(2),Integer(1))
True
>>> ip.ge(Integer(3),Integer(1))
True
>>> ip.ge(Integer(3),Integer(2))
True
>>> ip.ge(Integer(4),Integer(3))
False
>>> ip.ge(Integer(1),Integer(1))
True
```

grafting_tree()

Return the grafting tree of the interval-poset.

For the inverse method, see *TamariIntervalPosets.from_grafting_tree()*.

EXAMPLES:

```
sage: tip = TamariIntervalPoset(8, [(1,2), (2,4), (3,4), (6,7),
....:                               (3,2), (5,4), (6,4), (8,7)])
sage: tip.grafting_tree()
2[1[0[., .], 0[., .]], 0[., 1[0[., .], 0[., .]]]]
sage: tip == TamariIntervalPosets.from_grafting_tree(tip.grafting_tree())
True
```

```
>>> from sage.all import *
>>> tip = TamariIntervalPoset(Integer(8), [(Integer(1),Integer(2)),␣
↪(Integer(2),Integer(4)), (Integer(3),Integer(4)), (Integer(6),Integer(7)),
...                                (Integer(3),Integer(2)), (Integer(5),
↪Integer(4)), (Integer(6),Integer(4)), (Integer(8),Integer(7))])
>>> tip.grafting_tree()
2[1[0[., .], 0[., .]], 0[., 1[0[., .], 0[., .]]]]
>>> tip == TamariIntervalPosets.from_grafting_tree(tip.grafting_tree())
True
```

REFERENCES:

- [Pons2018]

gt(*e1*, *e2*)

Return whether `e2` strictly precedes `e1` in `self`.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(1,2),(2,3)])
sage: ip.gt(2,1)
True
sage: ip.gt(3,1)
True
sage: ip.gt(3,2)
True
sage: ip.gt(4,3)
False
sage: ip.gt(1,1)
False
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3))])
>>> ip.gt(Integer(2),Integer(1))
True
>>> ip.gt(Integer(3),Integer(1))
True
>>> ip.gt(Integer(3),Integer(2))
True
>>> ip.gt(Integer(4),Integer(3))
False
>>> ip.gt(Integer(1),Integer(1))
False
```

increasing_children(*v*)

Return the children of `v` in the initial forest of `self`.

INPUT:

- `v` – integer representing a vertex of `self` (between 1 and `size`)

OUTPUT:

The list of all children of `v` in the initial forest of `self`, in decreasing order.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(6,[(3,2),(4,3),(5,2),(6,5),(1,2),(3,5),(4,5)]);
↪ ip
The Tamari interval of size 6 induced by relations [(1, 2), (3, 5), (4, 5),␣
↪(6, 5), (5, 2), (4, 3), (3, 2)]
sage: ip.increasing_children(2)
[1]
sage: ip.increasing_children(5)
[4, 3]
sage: ip.increasing_children(1)
[]
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(6),[(Integer(3),Integer(2)),(Integer(4),
↪Integer(3)),(Integer(5),Integer(2)),(Integer(6),Integer(5)),(Integer(1),
↪Integer(2)),(Integer(3),Integer(5)),(Integer(4),Integer(5))]); ip
The Tamari interval of size 6 induced by relations [(1, 2), (3, 5), (4, 5),␣
```

(continues on next page)

(continued from previous page)

```
↪(6, 5), (5, 2), (4, 3), (3, 2)]
>>> ip.increasing_children(Integer(2))
[1]
>>> ip.increasing_children(Integer(5))
[4, 3]
>>> ip.increasing_children(Integer(1))
[]
```

increasing_cover_relations()

Return the cover relations of the initial forest of `self`.

This is the poset formed by keeping only the relations of the form a precedes b with $a < b$.

The initial forest of `self` is a forest with its roots being on top. It is also called the increasing poset of `self`.

Warning

This method computes the cover relations of the initial forest. This is not identical with the cover relations of `self` which happen to be increasing!

See also

initial_forest()

EXAMPLES:

```
sage: TamariIntervalPoset(4,[(1,2),(3,2),(2,4),(3,4)]).increasing_cover_
↪relations()
[(1, 2), (2, 4), (3, 4)]
sage: TamariIntervalPoset(3,[(1,2),(1,3),(2,3)]).increasing_cover_relations()
[(1, 2), (2, 3)]
```

```
>>> from sage.all import *
>>> TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(3),
↪Integer(2)),(Integer(2),Integer(4)),(Integer(3),Integer(4))]).increasing_
↪cover_relations()
[(1, 2), (2, 4), (3, 4)]
>>> TamariIntervalPoset(Integer(3),[(Integer(1),Integer(2)),(Integer(1),
↪Integer(3)),(Integer(2),Integer(3))]).increasing_cover_relations()
[(1, 2), (2, 3)]
```

increasing_parent(v)

Return the vertex parent of `v` in the initial forest of `self`.

This is the lowest (as integer!) vertex $b > v$ such that v precedes b. If there is no such vertex (that is, v is an increasing root), then `None` is returned.

INPUT:

- `v` – integer representing a vertex of `self` (between 1 and `size`)

EXAMPLES:

```
sage: ip = TamariIntervalPoset(6,[(3,2),(4,3),(5,2),(6,5),(1,2),(3,5),(4,5)]);
↪ ip
The Tamari interval of size 6 induced by relations [(1, 2), (3, 5), (4, 5),␣
↪(6, 5), (5, 2), (4, 3), (3, 2)]
sage: ip.increasing_parent(1)
2
sage: ip.increasing_parent(3)
5
sage: ip.increasing_parent(4)
5
sage: ip.increasing_parent(5) is None
True
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(6),[(Integer(3),Integer(2)),(Integer(4),
↪Integer(3)),(Integer(5),Integer(2)),(Integer(6),Integer(5)),(Integer(1),
↪Integer(2)),(Integer(3),Integer(5)),(Integer(4),Integer(5))]); ip
The Tamari interval of size 6 induced by relations [(1, 2), (3, 5), (4, 5),␣
↪(6, 5), (5, 2), (4, 3), (3, 2)]
>>> ip.increasing_parent(Integer(1))
2
>>> ip.increasing_parent(Integer(3))
5
>>> ip.increasing_parent(Integer(4))
5
>>> ip.increasing_parent(Integer(5)) is None
True
```

increasing_roots()

Return the root vertices of the initial forest of `self`.

These are the vertices a of `self` such that there is no $b > a$ with a precedes b.

OUTPUT:

The list of all roots of the initial forest of `self`, in decreasing order.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(6,[(3,2),(4,3),(5,2),(6,5),(1,2),(3,5),(4,5)]);
↪ ip
The Tamari interval of size 6 induced by relations [(1, 2), (3, 5), (4, 5),␣
↪(6, 5), (5, 2), (4, 3), (3, 2)]
sage: ip.increasing_roots()
[6, 5, 2]
sage: ip.initial_forest().increasing_roots()
[6, 5, 2]
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(6),[(Integer(3),Integer(2)),(Integer(4),
↪Integer(3)),(Integer(5),Integer(2)),(Integer(6),Integer(5)),(Integer(1),
↪Integer(2)),(Integer(3),Integer(5)),(Integer(4),Integer(5))]); ip
The Tamari interval of size 6 induced by relations [(1, 2), (3, 5), (4, 5),␣
↪(6, 5), (5, 2), (4, 3), (3, 2)]
```

(continues on next page)

(continued from previous page)

```
>>> ip.increasing_roots()
[6, 5, 2]
>>> ip.initial_forest().increasing_roots()
[6, 5, 2]
```

initial_forest()

Return the initial forest of `self`, i.e., the interval-poset formed from only the increasing relations of `self`.

See also

final_forest()

EXAMPLES:

```
sage: TamariIntervalPoset(4,[(1,2),(3,2),(2,4),(3,4)]).initial_forest()
The Tamari interval of size 4 induced by relations [(1, 2), (2, 4), (3, 4)]
sage: ip = TamariIntervalPoset(4,[(1,2),(2,3)])
sage: ip.initial_forest() == ip
True
```

```
>>> from sage.all import *
>>> TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(3),
↪Integer(2)),(Integer(2),Integer(4)),(Integer(3),Integer(4))]).initial_
↪forest()
The Tamari interval of size 4 induced by relations [(1, 2), (2, 4), (3, 4)]
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3))])
>>> ip.initial_forest() == ip
True
```

insertion(i)

Return the Tamari insertion of an integer i into the interval-poset `self`.

If P is a Tamari interval-poset of size n and i is an integer with $1 \leq i \leq n+1$, then the Tamari insertion of i into P is defined as the Tamari interval-poset of size $n+1$ which corresponds to the interval $[C_1, C_2]$ on the Tamari lattice, where the binary trees C_1 and C_2 are defined as follows: We write the interval-poset P as $[B_1, B_2]$ for two binary trees B_1 and B_2. We label the vertices of each of these two trees with the integers $1, 2, \ldots, i-1, i+1, i+2, \ldots, n+1$ in such a way that the trees are binary search trees (this labelling is unique). Then, we insert i into each of these trees (in the way as explained in *binary_search_insert()*). The shapes of the resulting two trees are denoted C_1 and C_2.

An alternative way to construct the insertion of i into P is by relabeling each vertex u of P satisfying $u \geq i$ (as integers) as $u+1$, and then adding a vertex i which should precede $i-1$ and $i+1$.

Todo

To study this, it would be more natural to define interval-posets on arbitrary ordered sets rather than just on $\{1, 2, \ldots, n\}$.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4, [(2, 3), (4, 3)]); ip
The Tamari interval of size 4 induced by relations [(2, 3), (4, 3)]
sage: ip.insertion(1)
The Tamari interval of size 5 induced by relations [(1, 2), (3, 4), (5, 4)]
sage: ip.insertion(2)
The Tamari interval of size 5 induced by relations [(2, 3), (3, 4), (5, 4),␣
↪(2, 1)]
sage: ip.insertion(3)
The Tamari interval of size 5 induced by relations [(2, 4), (3, 4), (5, 4),␣
↪(3, 2)]
sage: ip.insertion(4)
The Tamari interval of size 5 induced by relations [(2, 3), (4, 5), (5, 3),␣
↪(4, 3)]
sage: ip.insertion(5)
The Tamari interval of size 5 induced by relations [(2, 3), (5, 4), (4, 3)]

sage: ip = TamariIntervalPoset(0, [])
sage: ip.insertion(1)
The Tamari interval of size 1 induced by relations []

sage: ip = TamariIntervalPoset(1, [])
sage: ip.insertion(1)
The Tamari interval of size 2 induced by relations [(1, 2)]
sage: ip.insertion(2)
The Tamari interval of size 2 induced by relations [(2, 1)]
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4), [(Integer(2), Integer(3)),␣
↪(Integer(4), Integer(3))]); ip
The Tamari interval of size 4 induced by relations [(2, 3), (4, 3)]
>>> ip.insertion(Integer(1))
The Tamari interval of size 5 induced by relations [(1, 2), (3, 4), (5, 4)]
>>> ip.insertion(Integer(2))
The Tamari interval of size 5 induced by relations [(2, 3), (3, 4), (5, 4),␣
↪(2, 1)]
>>> ip.insertion(Integer(3))
The Tamari interval of size 5 induced by relations [(2, 4), (3, 4), (5, 4),␣
↪(3, 2)]
>>> ip.insertion(Integer(4))
The Tamari interval of size 5 induced by relations [(2, 3), (4, 5), (5, 3),␣
↪(4, 3)]
>>> ip.insertion(Integer(5))
The Tamari interval of size 5 induced by relations [(2, 3), (5, 4), (4, 3)]

>>> ip = TamariIntervalPoset(Integer(0), [])
>>> ip.insertion(Integer(1))
The Tamari interval of size 1 induced by relations []

>>> ip = TamariIntervalPoset(Integer(1), [])
>>> ip.insertion(Integer(1))
The Tamari interval of size 2 induced by relations [(1, 2)]
>>> ip.insertion(Integer(2))
The Tamari interval of size 2 induced by relations [(2, 1)]
```

intersection(*other*)

Return the interval-poset formed by combining the relations from both `self` and `other`. It corresponds to the intersection of the two corresponding intervals of the Tamari lattice.

INPUT:

- `other` – an interval-poset of the same size as `self`

EXAMPLES:

```
sage: ip1 = TamariIntervalPoset(4,[(1,2),(2,3)])
sage: ip2 = TamariIntervalPoset(4,[(4,3)])
sage: ip1.intersection(ip2)
The Tamari interval of size 4 induced by relations [(1, 2), (2, 3), (4, 3)]
sage: ip3 = TamariIntervalPoset(4,[(2,1)])
sage: ip1.intersection(ip3)
Traceback (most recent call last):
...
ValueError: this intersection is empty, it does not correspond to an interval-
↪poset
sage: ip4 = TamariIntervalPoset(3,[(2,3)])
sage: ip2.intersection(ip4)
Traceback (most recent call last):
...
ValueError: intersections are only possible on interval-posets of the same␣
↪size
```

```
>>> from sage.all import *
>>> ip1 = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3))])
>>> ip2 = TamariIntervalPoset(Integer(4),[(Integer(4),Integer(3))])
>>> ip1.intersection(ip2)
The Tamari interval of size 4 induced by relations [(1, 2), (2, 3), (4, 3)]
>>> ip3 = TamariIntervalPoset(Integer(4),[(Integer(2),Integer(1))])
>>> ip1.intersection(ip3)
Traceback (most recent call last):
...
ValueError: this intersection is empty, it does not correspond to an interval-
↪poset
>>> ip4 = TamariIntervalPoset(Integer(3),[(Integer(2),Integer(3))])
>>> ip2.intersection(ip4)
Traceback (most recent call last):
...
ValueError: intersections are only possible on interval-posets of the same␣
↪size
```

interval_cardinality()

Return the cardinality of the interval, i.e., the number of elements (binary trees or Dyck words) in the interval represented by `self`.

Not to be confused with *size()* which is the number of vertices.

See also

binary_trees()

EXAMPLES:

```
sage: TamariIntervalPoset(4,[(2,4),(3,4),(2,1),(3,1)]).interval_cardinality()
4
sage: TamariIntervalPoset(4,[]).interval_cardinality()
14
sage: TamariIntervalPoset(4,[(1,2),(2,3),(3,4)]).interval_cardinality()
1
```

```
>>> from sage.all import *
>>> TamariIntervalPoset(Integer(4),[(Integer(2),Integer(4)),(Integer(3),
↪Integer(4)),(Integer(2),Integer(1)),(Integer(3),Integer(1))]).interval_
↪cardinality()
4
>>> TamariIntervalPoset(Integer(4),[]).interval_cardinality()
14
>>> TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3)),(Integer(3),Integer(4))]).interval_cardinality()
1
```

is_connected()

Return whether `self` is a connected Tamari interval.

This means that the Hasse diagram is connected.

This condition is invariant under complementation.

See also

is_indecomposable(), *factor()*

EXAMPLES:

```
sage: len([T for T in TamariIntervalPosets(3) if T.is_connected()])
8
```

```
>>> from sage.all import *
>>> len([T for T in TamariIntervalPosets(Integer(3)) if T.is_connected()])
8
```

is_dexter()

Return whether `self` is a dexter Tamari interval.

This is defined by an exclusion pattern in the Hasse diagram. See the code for the exact description.

This condition is not invariant under complementation.

EXAMPLES:

```
sage: len([T for T in TamariIntervalPosets(3) if T.is_dexter()])
12
```

```
>>> from sage.all import *
>>> len([T for T in TamariIntervalPosets(Integer(3)) if T.is_dexter()])
12
```

is_exceptional()

Return whether `self` is an exceptional Tamari interval.

This is defined by exclusion of a simple pattern in the Hasse diagram, namely there is no configuration `y <-- x --> z` with $1 \leq y < x < z \leq n$.

This condition is invariant under complementation.

EXAMPLES:

```
sage: len([T for T in TamariIntervalPosets(3)
....:      if T.is_exceptional()])
12
```

```
>>> from sage.all import *
>>> len([T for T in TamariIntervalPosets(Integer(3))
...      if T.is_exceptional()])
12
```

is_final_interval()

Return if `self` corresponds to a final interval of the Tamari lattice.

This means that its upper end is the largest element of the lattice. It consists of checking that `self` does not contain any increasing relations.

See also

is_initial_interval()

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4, [(4, 3), (3, 1), (2, 1)])
sage: ip.is_final_interval()
True
sage: ip.upper_dyck_word()                                                  #␣
↪needs sage.combinat
[1, 1, 1, 1, 0, 0, 0, 0]
sage: ip = TamariIntervalPoset(4, [(4, 3), (3, 1), (2, 1), (2, 3)])
sage: ip.is_final_interval()
False
sage: ip.upper_dyck_word()                                                  #␣
↪needs sage.combinat
[1, 1, 0, 1, 1, 0, 0, 0]
sage: all(dw.tamari_interval(DyckWord([1, 1, 1, 0, 0, 0]))                  #␣
↪needs sage.combinat
....:             .is_final_interval()
```

(continues on next page)

(continued from previous page)

```
....:     for dw in DyckWords(3))
True
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4), [(Integer(4), Integer(3)),␣
↪(Integer(3), Integer(1)), (Integer(2), Integer(1))])
>>> ip.is_final_interval()
True
>>> ip.upper_dyck_word()                                                    #␣
↪needs sage.combinat
[1, 1, 1, 1, 0, 0, 0, 0]
>>> ip = TamariIntervalPoset(Integer(4), [(Integer(4), Integer(3)),␣
↪(Integer(3), Integer(1)), (Integer(2), Integer(1)), (Integer(2),␣
↪Integer(3))])
>>> ip.is_final_interval()
False
>>> ip.upper_dyck_word()                                                    #␣
↪needs sage.combinat
[1, 1, 0, 1, 1, 0, 0, 0]
>>> all(dw.tamari_interval(DyckWord([Integer(1), Integer(1), Integer(1),␣
↪Integer(0), Integer(0), Integer(0)]))                    # needs sage.combinat
...             .is_final_interval()
...     for dw in DyckWords(Integer(3)))
True
```

is_indecomposable()

Return whether `self` is an indecomposable Tamari interval.

This is the terminology of [Cha2008].

This means that the upper binary tree has an empty left subtree.

This condition is not invariant under complementation.

See also

is_connected()

EXAMPLES:

```
sage: len([T for T in TamariIntervalPosets(3)
....:      if T.is_indecomposable()])
8
```

```
>>> from sage.all import *
>>> len([T for T in TamariIntervalPosets(Integer(3))
...      if T.is_indecomposable()])
8
```

is_infinitely_modern()

Return whether `self` is an infinitely-modern Tamari interval.

This is defined by the exclusion of the configuration $i \to i+1$ and $j+1 \to j$ with $i < j$.

This condition is invariant under complementation.

See also

is_new(), *is_modern()*

EXAMPLES:

```
sage: len([T for T in TamariIntervalPosets(3)
....:      if T.is_infinitely_modern()])
12
```

```
>>> from sage.all import *
>>> len([T for T in TamariIntervalPosets(Integer(3))
...      if T.is_infinitely_modern()])
12
```

REFERENCES:

- [Rog2018]

is_initial_interval()

Return if `self` corresponds to an initial interval of the Tamari lattice.

This means that its lower end is the smallest element of the lattice. It consists of checking that `self` does not contain any decreasing relations.

See also

is_final_interval()

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4, [(1, 2), (2, 4), (3, 4)])
sage: ip.is_initial_interval()
True
sage: ip.lower_dyck_word()                                                  #␣
↪needs sage.combinat
[1, 0, 1, 0, 1, 0, 1, 0]
sage: ip = TamariIntervalPoset(4, [(1, 2), (2, 4), (3, 4), (3, 2)])
sage: ip.is_initial_interval()
False
sage: ip.lower_dyck_word()                                                  #␣
↪needs sage.combinat
[1, 0, 1, 1, 0, 0, 1, 0]
sage: all(DyckWord([1,0,1,0,1,0]).tamari_interval(dw)                       #␣
↪needs sage.combinat
....:           .is_initial_interval()
....:      for dw in DyckWords(3))
True
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4), [(Integer(1), Integer(2)),␣
```

(continues on next page)

(continued from previous page)

```
↪(Integer(2), Integer(4)), (Integer(3), Integer(4))])
>>> ip.is_initial_interval()
True
>>> ip.lower_dyck_word()                                                    #␣
↪needs sage.combinat
[1, 0, 1, 0, 1, 0, 1, 0]
>>> ip = TamariIntervalPoset(Integer(4), [(Integer(1), Integer(2)),␣
↪(Integer(2), Integer(4)), (Integer(3), Integer(4)), (Integer(3),␣
↪Integer(2))])
>>> ip.is_initial_interval()
False
>>> ip.lower_dyck_word()                                                    #␣
↪needs sage.combinat
[1, 0, 1, 1, 0, 0, 1, 0]
>>> all(DyckWord([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0)]).tamari_interval(dw)                          # needs sage.combinat
...          .is_initial_interval()
...      for dw in DyckWords(Integer(3)))
True
```

is_linear_extension(*perm*)

Return whether the permutation `perm` is a linear extension of `self`.

INPUT:

- `perm` – a permutation of the size of `self`

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(1,2),(2,3),(4,3)])
sage: ip.is_linear_extension([1,4,2,3])
True
sage: ip.is_linear_extension(Permutation([1,4,2,3]))
True
sage: ip.is_linear_extension(Permutation([1,4,3,2]))
False
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3)),(Integer(4),Integer(3))])
>>> ip.is_linear_extension([Integer(1),Integer(4),Integer(2),Integer(3)])
True
>>> ip.is_linear_extension(Permutation([Integer(1),Integer(4),Integer(2),
↪Integer(3)]))
True
>>> ip.is_linear_extension(Permutation([Integer(1),Integer(4),Integer(3),
↪Integer(2)]))
False
```

is_modern()

Return whether `self` is a modern Tamari interval.

This is defined by exclusion of a simple pattern in the Hasse diagram, namely there is no configuration $y \to x \leftarrow z$ with $1 \leq y < x < z \leq n$.

This condition is invariant under complementation.

See also

is_new(), *is_infinitely_modern()*

EXAMPLES:

```
sage: len([T for T in TamariIntervalPosets(3) if T.is_modern()])
12
```

```
>>> from sage.all import *
>>> len([T for T in TamariIntervalPosets(Integer(3)) if T.is_modern()])
12
```

REFERENCES:

- [Rog2018]

is_new()

Return whether `self` is a new Tamari interval.

Here 'new' means that the interval is not contained in any facet of the associahedron. This condition is invariant under complementation.

They have been considered in section 9 of [Cha2008].

See also

is_modern()

EXAMPLES:

```
sage: TIP4 = TamariIntervalPosets(4)
sage: len([u for u in TIP4 if u.is_new()])
12

sage: TIP3 = TamariIntervalPosets(3)
sage: len([u for u in TIP3 if u.is_new()])
3
```

```
>>> from sage.all import *
>>> TIP4 = TamariIntervalPosets(Integer(4))
>>> len([u for u in TIP4 if u.is_new()])
12

>>> TIP3 = TamariIntervalPosets(Integer(3))
>>> len([u for u in TIP3 if u.is_new()])
3
```

is_simple()

Return whether `self` is a simple Tamari interval.

Here 'simple' means that the interval contains a unique binary tree.

These intervals define the simple modules over the incidence algebras of the Tamari lattices.

See also

is_final_interval(), *is_initial_interval()*

EXAMPLES:

```
sage: TIP4 = TamariIntervalPosets(4)
sage: len([u for u in TIP4 if u.is_simple()])
14

sage: TIP3 = TamariIntervalPosets(3)
sage: len([u for u in TIP3 if u.is_simple()])
5
```

```
>>> from sage.all import *
>>> TIP4 = TamariIntervalPosets(Integer(4))
>>> len([u for u in TIP4 if u.is_simple()])
14

>>> TIP3 = TamariIntervalPosets(Integer(3))
>>> len([u for u in TIP3 if u.is_simple()])
5
```

is_synchronized()

Return whether `self` is a synchronized Tamari interval.

This means that the upper and lower binary trees have the same canopee. This condition is invariant under complementation.

This has been considered in [FPR2015]. The numbers of synchronized intervals are given by the sequence OEIS sequence A000139.

EXAMPLES:

```
sage: len([T for T in TamariIntervalPosets(3)
....:      if T.is_synchronized()])
6
```

```
>>> from sage.all import *
>>> len([T for T in TamariIntervalPosets(Integer(3))
...      if T.is_synchronized()])
6
```

latex_options()

Return the latex options for use in the `_latex_` function as a dictionary.

The default values are set using the options.

- `tikz_scale` – (default: 1) scale for use with the tikz package
- `line_width` – (default: 1) value representing the line width (additionally scaled by `tikz_scale`)
- `color_decreasing` – (default: `'red'`) the color for decreasing relations
- `color_increasing` – (default: `'blue'`) the color for increasing relations

- `hspace` – (default: 1) the difference between horizontal coordinates of adjacent vertices
- `vspace` – (default: 1) the difference between vertical coordinates of adjacent vertices

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(2,4),(3,4),(2,1),(3,1)])
sage: ip.latex_options()['color_decreasing']
'red'
sage: ip.latex_options()['hspace']
1
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(2),Integer(4)),(Integer(3),
↪Integer(4)),(Integer(2),Integer(1)),(Integer(3),Integer(1))])
>>> ip.latex_options()['color_decreasing']
'red'
>>> ip.latex_options()['hspace']
1
```

le(*e1*, *e2*)

Return whether `e1` precedes or equals `e2` in `self`.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(1,2),(2,3)])
sage: ip.le(1,2)
True
sage: ip.le(1,3)
True
sage: ip.le(2,3)
True
sage: ip.le(3,4)
False
sage: ip.le(1,1)
True
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3))])
>>> ip.le(Integer(1),Integer(2))
True
>>> ip.le(Integer(1),Integer(3))
True
>>> ip.le(Integer(2),Integer(3))
True
>>> ip.le(Integer(3),Integer(4))
False
>>> ip.le(Integer(1),Integer(1))
True
```

left_branch_involution()

Return the image of `self` by the left-branch involution.

OUTPUT: an interval-poset

See also

rise_contact_involution()

EXAMPLES:

```
sage: tip = TamariIntervalPoset(8, [(1,2), (2,4), (3,4), (6,7), (3,2), (5,4),␣
↪(6,4), (8,7)])
sage: t = tip.left_branch_involution(); t
The Tamari interval of size 8 induced by relations [(1, 6), (2, 6),
(3, 5), (4, 5), (5, 6), (6, 8), (7, 8), (7, 6), (4, 3), (3, 1),
(2, 1)]
sage: t.left_branch_involution() == tip
True
```

```
>>> from sage.all import *
>>> tip = TamariIntervalPoset(Integer(8), [(Integer(1),Integer(2)),␣
↪(Integer(2),Integer(4)), (Integer(3),Integer(4)), (Integer(6),Integer(7)),␣
↪(Integer(3),Integer(2)), (Integer(5),Integer(4)), (Integer(6),Integer(4)),␣
↪(Integer(8),Integer(7))])
>>> t = tip.left_branch_involution(); t
The Tamari interval of size 8 induced by relations [(1, 6), (2, 6),
(3, 5), (4, 5), (5, 6), (6, 8), (7, 8), (7, 6), (4, 3), (3, 1),
(2, 1)]
>>> t.left_branch_involution() == tip
True
```

REFERENCES:

- [Pons2018]

linear_extensions()

Return an iterator on the permutations which are linear extensions of `self`.

They form an interval of the right weak order (also called the right permutohedron order – see *permutohedron_lequal()* for a definition).

EXAMPLES:

```
sage: ip = TamariIntervalPoset(3, [(1,2),(3,2)])
sage: list(ip.linear_extensions())                                          #␣
↪needs sage.modules sage.rings.finite_rings
[[3, 1, 2], [1, 3, 2]]
sage: ip = TamariIntervalPoset(4, [(1,2),(2,3),(4,3)])
sage: list(ip.linear_extensions())                                          #␣
↪needs sage.modules sage.rings.finite_rings
[[4, 1, 2, 3], [1, 2, 4, 3], [1, 4, 2, 3]]
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(3), [(Integer(1),Integer(2)),(Integer(3),
↪Integer(2))])
>>> list(ip.linear_extensions())                                            #␣
↪needs sage.modules sage.rings.finite_rings
[[3, 1, 2], [1, 3, 2]]
```

(continues on next page)

(continued from previous page)

```
>>> ip = TamariIntervalPoset(Integer(4), [(Integer(1),Integer(2)),(Integer(2),
↪Integer(3)),(Integer(4),Integer(3))])
>>> list(ip.linear_extensions())                                              #␣
↪needs sage.modules sage.rings.finite_rings
[[4, 1, 2, 3], [1, 2, 4, 3], [1, 4, 2, 3]]
```

lower_binary_tree()

Return the lowest binary tree in the interval of the Tamari lattice represented by `self`.

This is a binary tree. It is the shape of the unique binary search tree whose left-branch ordered forest (i.e., the result of applying *to_ordered_tree_left_branch()* and cutting off the root) is the final forest of `self`.

See also

lower_dyck_word()

EXAMPLES:

```
sage: ip = TamariIntervalPoset(6, [(3,2),(4,3),(5,2),(6,5),(1,2),(4,5)]); ip
The Tamari interval of size 6 induced by relations
 [(1, 2), (4, 5), (6, 5), (5, 2), (4, 3), (3, 2)]
sage: ip.lower_binary_tree()
[[., .], [[., [., .]], [., .]]]
sage: ff = TamariIntervalPosets.final_forest(ip.lower_binary_tree())
sage: ff == ip.final_forest()
True
sage: ip == TamariIntervalPosets.from_binary_trees(ip.lower_binary_tree(),
....:                                              ip.upper_binary_tree())
True
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(6), [(Integer(3),Integer(2)),(Integer(4),
↪Integer(3)),(Integer(5),Integer(2)),(Integer(6),Integer(5)),(Integer(1),
↪Integer(2)),(Integer(4),Integer(5))]); ip
The Tamari interval of size 6 induced by relations
 [(1, 2), (4, 5), (6, 5), (5, 2), (4, 3), (3, 2)]
>>> ip.lower_binary_tree()
[[., .], [[., [., .]], [., .]]]
>>> ff = TamariIntervalPosets.final_forest(ip.lower_binary_tree())
>>> ff == ip.final_forest()
True
>>> ip == TamariIntervalPosets.from_binary_trees(ip.lower_binary_tree(),
...                                              ip.upper_binary_tree())
True
```

lower_contained_intervals()

If `self` represents the interval $[t_1, t_2]$ of the Tamari lattice, return an iterator on all intervals $[t_1, t]$ with $t \leq t_2$ for the Tamari lattice.

In terms of interval-posets, it corresponds to adding all possible relations of the form n precedes m with $n < m$.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4, [(2,4),(3,4),(2,1),(3,1)])
sage: list(ip.lower_contained_intervals())
[The Tamari interval of size 4 induced by relations
  [(2, 4), (3, 4), (3, 1), (2, 1)],
 The Tamari interval of size 4 induced by relations
  [(1, 4), (2, 4), (3, 4), (3, 1), (2, 1)],
 The Tamari interval of size 4 induced by relations
  [(2, 3), (3, 4), (3, 1), (2, 1)],
 The Tamari interval of size 4 induced by relations
  [(1, 4), (2, 3), (3, 4), (3, 1), (2, 1)]]
sage: ip = TamariIntervalPoset(4,[])
sage: len(list(ip.lower_contained_intervals()))
14
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4), [(Integer(2),Integer(4)),(Integer(3),
↪Integer(4)),(Integer(2),Integer(1)),(Integer(3),Integer(1))])
>>> list(ip.lower_contained_intervals())
[The Tamari interval of size 4 induced by relations
  [(2, 4), (3, 4), (3, 1), (2, 1)],
 The Tamari interval of size 4 induced by relations
  [(1, 4), (2, 4), (3, 4), (3, 1), (2, 1)],
 The Tamari interval of size 4 induced by relations
  [(2, 3), (3, 4), (3, 1), (2, 1)],
 The Tamari interval of size 4 induced by relations
  [(1, 4), (2, 3), (3, 4), (3, 1), (2, 1)]]
>>> ip = TamariIntervalPoset(Integer(4),[])
>>> len(list(ip.lower_contained_intervals()))
14
```

lower_contains_interval(*other*)

Return whether the interval represented by `other` is contained in `self` as an interval of the Tamari lattice and if they share the same lower bound.

As interval-posets, it means that `other` contains the relations of `self` plus some extra increasing relations.

INPUT:

- `other` – an interval-poset

EXAMPLES:

```
sage: ip1 = TamariIntervalPoset(4,[(1,2),(2,3),(4,3)])
sage: ip2 = TamariIntervalPoset(4,[(4,3)])
sage: ip2.lower_contains_interval(ip1)
True
sage: ip2.contains_interval(ip1) and ip2.lower_binary_tree() == ip1.lower_
↪binary_tree()
True
sage: ip3 = TamariIntervalPoset(4,[(4,3),(2,1)])
sage: ip2.contains_interval(ip3)
True
sage: ip2.lower_binary_tree() == ip3.lower_binary_tree()
```

(continues on next page)

(continued from previous page)

```
False
sage: ip2.lower_contains_interval(ip3)
False
```

```
>>> from sage.all import *
>>> ip1 = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3)),(Integer(4),Integer(3))])
>>> ip2 = TamariIntervalPoset(Integer(4),[(Integer(4),Integer(3))])
>>> ip2.lower_contains_interval(ip1)
True
>>> ip2.contains_interval(ip1) and ip2.lower_binary_tree() == ip1.lower_
↪binary_tree()
True
>>> ip3 = TamariIntervalPoset(Integer(4),[(Integer(4),Integer(3)),(Integer(2),
↪Integer(1))])
>>> ip2.contains_interval(ip3)
True
>>> ip2.lower_binary_tree() == ip3.lower_binary_tree()
False
>>> ip2.lower_contains_interval(ip3)
False
```

lower_dyck_word()

Return the lowest Dyck word in the interval of the Tamari lattice represented by `self`.

See also

lower_binary_tree()

EXAMPLES:

```
sage: # needs sage.combinat
sage: ip = TamariIntervalPoset(6, [(3,2),(4,3),(5,2),(6,5),(1,2),(4,5)]); ip
The Tamari interval of size 6 induced by relations
 [(1, 2), (4, 5), (6, 5), (5, 2), (4, 3), (3, 2)]
sage: ip.lower_dyck_word()
[1, 0, 1, 1, 1, 0, 0, 1, 1, 0, 0, 0]
sage: ldw_ff = TamariIntervalPosets.final_forest(ip.lower_dyck_word())
sage: ldw_ff == ip.final_forest()
True
sage: ip == TamariIntervalPosets.from_dyck_words(ip.lower_dyck_word(),
....:                                            ip.upper_dyck_word())
True
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> ip = TamariIntervalPoset(Integer(6), [(Integer(3),Integer(2)),(Integer(4),
↪Integer(3)),(Integer(5),Integer(2)),(Integer(6),Integer(5)),(Integer(1),
↪Integer(2)),(Integer(4),Integer(5))]); ip
The Tamari interval of size 6 induced by relations
 [(1, 2), (4, 5), (6, 5), (5, 2), (4, 3), (3, 2)]
```

(continues on next page)

(continued from previous page)

```
>>> ip.lower_dyck_word()
[1, 0, 1, 1, 1, 0, 0, 1, 1, 0, 0, 0]
>>> ldw_ff = TamariIntervalPosets.final_forest(ip.lower_dyck_word())
>>> ldw_ff == ip.final_forest()
True
>>> ip == TamariIntervalPosets.from_dyck_words(ip.lower_dyck_word(),
...                                            ip.upper_dyck_word())
True
```

lt(*e1*, *e2*)

Return whether `e1` strictly precedes `e2` in `self`.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(1,2),(2,3)])
sage: ip.lt(1,2)
True
sage: ip.lt(1,3)
True
sage: ip.lt(2,3)
True
sage: ip.lt(3,4)
False
sage: ip.lt(1,1)
False
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3))])
>>> ip.lt(Integer(1),Integer(2))
True
>>> ip.lt(Integer(1),Integer(3))
True
>>> ip.lt(Integer(2),Integer(3))
True
>>> ip.lt(Integer(3),Integer(4))
False
>>> ip.lt(Integer(1),Integer(1))
False
```

max_linear_extension()

Return the maximal permutation for the right weak order which is a linear extension of `self`.

This is also the maximal permutation in the sylvester class of `self.upper_binary_tree()` and is a 132-avoiding permutation.

The right weak order is also known as the right permutohedron order. See *permutohedron_lequal()* for its definition.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(1,2),(2,3),(4,3)])
sage: ip.max_linear_extension()
[4, 1, 2, 3]
```

(continues on next page)

(continued from previous page)

```
sage: ip = TamariIntervalPoset(6,[(3,2),(4,3),(5,2),(6,5),(1,2),(4,5)]); ip
The Tamari interval of size 6 induced by relations [(1, 2), (4, 5), (6, 5),␣
↪(5, 2), (4, 3), (3, 2)]
sage: ip.max_linear_extension()
[6, 4, 5, 3, 1, 2]
sage: ip = TamariIntervalPoset(0,[]); ip
The Tamari interval of size 0 induced by relations []
sage: ip.max_linear_extension()
[]
sage: ip = TamariIntervalPoset(5, [(1, 4), (2, 4), (3, 4), (5, 4)]); ip
The Tamari interval of size 5 induced by relations [(1, 4), (2, 4), (3, 4),␣
↪(5, 4)]
sage: ip.max_linear_extension()
[5, 3, 2, 1, 4]
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3)),(Integer(4),Integer(3))])
>>> ip.max_linear_extension()
[4, 1, 2, 3]
>>> ip = TamariIntervalPoset(Integer(6),[(Integer(3),Integer(2)),(Integer(4),
↪Integer(3)),(Integer(5),Integer(2)),(Integer(6),Integer(5)),(Integer(1),
↪Integer(2)),(Integer(4),Integer(5))]); ip
The Tamari interval of size 6 induced by relations [(1, 2), (4, 5), (6, 5),␣
↪(5, 2), (4, 3), (3, 2)]
>>> ip.max_linear_extension()
[6, 4, 5, 3, 1, 2]
>>> ip = TamariIntervalPoset(Integer(0),[]); ip
The Tamari interval of size 0 induced by relations []
>>> ip.max_linear_extension()
[]
>>> ip = TamariIntervalPoset(Integer(5), [(Integer(1), Integer(4)),␣
↪(Integer(2), Integer(4)), (Integer(3), Integer(4)), (Integer(5),␣
↪Integer(4))]); ip
The Tamari interval of size 5 induced by relations [(1, 4), (2, 4), (3, 4),␣
↪(5, 4)]
>>> ip.max_linear_extension()
[5, 3, 2, 1, 4]
```

maximal_chain_binary_trees()

Return an iterator on the binary trees forming a longest chain of `self` (regarding `self` as an interval of the Tamari lattice).

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(2,4),(3,4),(2,1),(3,1)])
sage: list(ip.maximal_chain_binary_trees())
[[[., [[., .], .]], .], [., [[[., .], .], .]], [., [[., [., .]], .]]]
sage: ip = TamariIntervalPoset(4,[])
sage: list(ip.maximal_chain_binary_trees())
[[[[[., .], .], .], .],
 [[[., [., .]], .], .],
```

(continues on next page)

(continued from previous page)

```
 [[., [[., .], .]], .],
 [., [[[., .], .], .]],
 [., [[., [., .]], .]],
 [., [., [[., .], .]]],
 [., [., [., [., .]]]]]
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(2),Integer(4)),(Integer(3),
↪Integer(4)),(Integer(2),Integer(1)),(Integer(3),Integer(1))])
>>> list(ip.maximal_chain_binary_trees())
[[[., [[., .], .]], .], [., [[[., .], .], .]], [., [[., [., .]], .]]]
>>> ip = TamariIntervalPoset(Integer(4),[])
>>> list(ip.maximal_chain_binary_trees())
[[[[[., .], .], .], .],
 [[[., [., .]], .], .],
 [[., [[., .], .]], .],
 [., [[[., .], .], .]],
 [., [[., [., .]], .]],
 [., [., [[., .], .]]],
 [., [., [., [., .]]]]]
```

maximal_chain_dyck_words()

Return an iterator on the Dyck words forming a longest chain of `self` (regarding `self` as an interval of the Tamari lattice).

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(2,4),(3,4),(2,1),(3,1)])
sage: list(ip.maximal_chain_dyck_words())                                   #␣
↪needs sage.combinat
[[1, 1, 0, 1, 0, 0, 1, 0], [1, 1, 0, 1, 0, 1, 0, 0], [1, 1, 1, 0, 0, 1, 0, 0]]
sage: ip = TamariIntervalPoset(4,[])
sage: list(ip.maximal_chain_dyck_words())                                   #␣
↪needs sage.combinat
[[1, 0, 1, 0, 1, 0, 1, 0],
 [1, 1, 0, 0, 1, 0, 1, 0],
 [1, 1, 0, 1, 0, 0, 1, 0],
 [1, 1, 0, 1, 0, 1, 0, 0],
 [1, 1, 1, 0, 0, 1, 0, 0],
 [1, 1, 1, 0, 1, 0, 0, 0],
 [1, 1, 1, 1, 0, 0, 0, 0]]
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(2),Integer(4)),(Integer(3),
↪Integer(4)),(Integer(2),Integer(1)),(Integer(3),Integer(1))])
>>> list(ip.maximal_chain_dyck_words())                                     #␣
↪needs sage.combinat
[[1, 1, 0, 1, 0, 0, 1, 0], [1, 1, 0, 1, 0, 1, 0, 0], [1, 1, 1, 0, 0, 1, 0, 0]]
>>> ip = TamariIntervalPoset(Integer(4),[])
>>> list(ip.maximal_chain_dyck_words())                                     #␣
↪needs sage.combinat
[[1, 0, 1, 0, 1, 0, 1, 0],
```

(continues on next page)

(continued from previous page)

```
 [1, 1, 0, 0, 1, 0, 1, 0],
 [1, 1, 0, 1, 0, 0, 1, 0],
 [1, 1, 0, 1, 0, 1, 0, 0],
 [1, 1, 1, 0, 0, 1, 0, 0],
 [1, 1, 1, 0, 1, 0, 0, 0],
 [1, 1, 1, 1, 0, 0, 0, 0]]
```

maximal_chain_tamari_intervals()

Return an iterator on the upper contained intervals of one longest chain of the Tamari interval represented by `self`.

If `self` represents the interval $[T_1, T_2]$ of the Tamari lattice, this returns intervals $[T', T_2]$ with T' following one longest chain between T_1 and T_2.

To obtain a longest chain, we use the Tamari inversions of `self`. The elements of the chain are obtained by adding one by one the relations (b, a) from each Tamari inversion (a, b) to `self`, where the Tamari inversions are taken in lexicographic order.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4, [(2,4),(3,4),(2,1),(3,1)])
sage: list(ip.maximal_chain_tamari_intervals())
[The Tamari interval of size 4 induced by relations
  [(2, 4), (3, 4), (3, 1), (2, 1)],
 The Tamari interval of size 4 induced by relations
  [(2, 4), (3, 4), (4, 1), (3, 1), (2, 1)],
 The Tamari interval of size 4 induced by relations
  [(2, 4), (3, 4), (4, 1), (3, 2), (2, 1)]]
sage: ip = TamariIntervalPoset(4, [])
sage: list(ip.maximal_chain_tamari_intervals())
[The Tamari interval of size 4 induced by relations [],
 The Tamari interval of size 4 induced by relations [(2, 1)],
 The Tamari interval of size 4 induced by relations [(3, 1), (2, 1)],
 The Tamari interval of size 4 induced by relations [(4, 1), (3, 1), (2, 1)],
 The Tamari interval of size 4 induced by relations [(4, 1), (3, 2), (2, 1)],
 The Tamari interval of size 4 induced by relations [(4, 2), (3, 2), (2, 1)],
 The Tamari interval of size 4 induced by relations [(4, 3), (3, 2), (2, 1)]]
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4), [(Integer(2),Integer(4)),(Integer(3),
↪Integer(4)),(Integer(2),Integer(1)),(Integer(3),Integer(1))])
>>> list(ip.maximal_chain_tamari_intervals())
[The Tamari interval of size 4 induced by relations
  [(2, 4), (3, 4), (3, 1), (2, 1)],
 The Tamari interval of size 4 induced by relations
  [(2, 4), (3, 4), (4, 1), (3, 1), (2, 1)],
 The Tamari interval of size 4 induced by relations
  [(2, 4), (3, 4), (4, 1), (3, 2), (2, 1)]]
>>> ip = TamariIntervalPoset(Integer(4), [])
>>> list(ip.maximal_chain_tamari_intervals())
[The Tamari interval of size 4 induced by relations [],
 The Tamari interval of size 4 induced by relations [(2, 1)],
 The Tamari interval of size 4 induced by relations [(3, 1), (2, 1)],
```

(continues on next page)

(continued from previous page)

```
The Tamari interval of size 4 induced by relations [(4, 1), (3, 1), (2, 1)],
The Tamari interval of size 4 induced by relations [(4, 1), (3, 2), (2, 1)],
The Tamari interval of size 4 induced by relations [(4, 2), (3, 2), (2, 1)],
The Tamari interval of size 4 induced by relations [(4, 3), (3, 2), (2, 1)]]
```

min_linear_extension()

Return the minimal permutation for the right weak order which is a linear extension of `self`.

This is also the minimal permutation in the sylvester class of `self.lower_binary_tree()` and is a 312-avoiding permutation.

The right weak order is also known as the right permutohedron order. See *permutohedron_lequal()* for its definition.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(1,2),(2,3),(4,3)])
sage: ip.min_linear_extension()
[1, 2, 4, 3]
sage: ip = TamariIntervalPoset(6,[(3,2),(4,3),(5,2),(6,5),(1,2),(4,5)])
sage: ip.min_linear_extension()
[1, 4, 3, 6, 5, 2]
sage: ip = TamariIntervalPoset(0,[])
sage: ip.min_linear_extension()
[]
sage: ip = TamariIntervalPoset(5, [(1, 4), (2, 4), (3, 4), (5, 4)]); ip
The Tamari interval of size 5 induced by relations [(1, 4), (2, 4), (3, 4),␣
↪(5, 4)]
sage: ip.min_linear_extension()
[1, 2, 3, 5, 4]
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3)),(Integer(4),Integer(3))])
>>> ip.min_linear_extension()
[1, 2, 4, 3]
>>> ip = TamariIntervalPoset(Integer(6),[(Integer(3),Integer(2)),(Integer(4),
↪Integer(3)),(Integer(5),Integer(2)),(Integer(6),Integer(5)),(Integer(1),
↪Integer(2)),(Integer(4),Integer(5))])
>>> ip.min_linear_extension()
[1, 4, 3, 6, 5, 2]
>>> ip = TamariIntervalPoset(Integer(0),[])
>>> ip.min_linear_extension()
[]
>>> ip = TamariIntervalPoset(Integer(5), [(Integer(1), Integer(4)),␣
↪(Integer(2), Integer(4)), (Integer(3), Integer(4)), (Integer(5),␣
↪Integer(4))]); ip
The Tamari interval of size 5 induced by relations [(1, 4), (2, 4), (3, 4),␣
↪(5, 4)]
>>> ip.min_linear_extension()
[1, 2, 3, 5, 4]
```

new_decomposition()

Return the decomposition of the interval-poset into new interval-posets.

Every interval-poset has a unique decomposition as a planar tree of new interval-posets, as explained in [Cha2008]. This function computes the terms of this decomposition, but not the planar tree.

For the number of terms, you can use instead the method *number_of_new_components()*.

OUTPUT: list of new interval-posets

See also

number_of_new_components(), *is_new()*

EXAMPLES:

```
sage: ex = TamariIntervalPosets(4)[11]
sage: ex.number_of_new_components()
3
sage: ex.new_decomposition()                                                #␣
↪needs sage.combinat
[The Tamari interval of size 1 induced by relations [],
 The Tamari interval of size 2 induced by relations [],
 The Tamari interval of size 1 induced by relations []]
```

```
>>> from sage.all import *
>>> ex = TamariIntervalPosets(Integer(4))[Integer(11)]
>>> ex.number_of_new_components()
3
>>> ex.new_decomposition()                                                  #␣
↪needs sage.combinat
[The Tamari interval of size 1 induced by relations [],
 The Tamari interval of size 2 induced by relations [],
 The Tamari interval of size 1 induced by relations []]
```

number_of_new_components()

Return the number of terms in the decomposition in new interval-posets.

Every interval-poset has a unique decomposition as a planar tree of new interval-posets, as explained in [Cha2008]. This function just computes the number of terms, not the planar tree nor the terms themselves.

See also

is_new(), *new_decomposition()*

EXAMPLES:

```
sage: TIP4 = TamariIntervalPosets(4)
sage: nb = [u.number_of_new_components() for u in TIP4]
sage: [nb.count(i) for i in range(1, 5)]
[12, 21, 21, 14]
```

```
>>> from sage.all import *
>>> TIP4 = TamariIntervalPosets(Integer(4))
>>> nb = [u.number_of_new_components() for u in TIP4]
```

(continues on next page)

(continued from previous page)

```
>>> [nb.count(i) for i in range(Integer(1), Integer(5))]
[12, 21, 21, 14]
```

number_of_tamari_inversions()

Return the number of Tamari inversions of `self`.

This is also the length the longest chain of the Tamari interval represented by `self`.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(2,4),(3,4),(2,1),(3,1)])
sage: ip.number_of_tamari_inversions()
2
sage: ip = TamariIntervalPoset(4,[])
sage: ip.number_of_tamari_inversions()
6
sage: ip = TamariIntervalPoset(3,[])
sage: ip.number_of_tamari_inversions()
3
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(2),Integer(4)),(Integer(3),
↪Integer(4)),(Integer(2),Integer(1)),(Integer(3),Integer(1))])
>>> ip.number_of_tamari_inversions()
2
>>> ip = TamariIntervalPoset(Integer(4),[])
>>> ip.number_of_tamari_inversions()
6
>>> ip = TamariIntervalPoset(Integer(3),[])
>>> ip.number_of_tamari_inversions()
3
```

plot(***kwds*)

Return a picture.

The picture represents the Hasse diagram, where the covers are colored in blue if they are increasing and in red if they are decreasing.

This uses the same coordinates as the latex view.

EXAMPLES:

```
sage: ti = TamariIntervalPosets(4)[2]
sage: ti.plot()                                                             #␣
↪needs sage.plot
Graphics object consisting of 6 graphics primitives
```

```
>>> from sage.all import *
>>> ti = TamariIntervalPosets(Integer(4))[Integer(2)]
>>> ti.plot()                                                               #␣
↪needs sage.plot
Graphics object consisting of 6 graphics primitives
```

poset()

Return `self` as a labelled poset.

An interval-poset is indeed constructed from a labelled poset which is stored internally. This method allows to access the poset and all the associated methods.

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(1,2),(3,2),(2,4),(3,4)])
sage: pos = ip.poset(); pos
Finite poset containing 4 elements
sage: pos.maximal_chains()
[[3, 2, 4], [1, 2, 4]]
sage: pos.maximal_elements()
[4]
sage: pos.is_lattice()
False
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(3),
↪Integer(2)),(Integer(2),Integer(4)),(Integer(3),Integer(4))])
>>> pos = ip.poset(); pos
Finite poset containing 4 elements
>>> pos.maximal_chains()
[[3, 2, 4], [1, 2, 4]]
>>> pos.maximal_elements()
[4]
>>> pos.is_lattice()
False
```

rise_contact_involution()

Return the image of `self` by the rise-contact involution.

OUTPUT: an interval-poset

This is defined by conjugating the complement involution by the left-branch involution.

See also

left_branch_involution(), complement()

EXAMPLES:

```
sage: tip = TamariIntervalPoset(8, [(1,2), (2,4), (3,4), (6,7),
....:                               (3,2), (5,4), (6,4), (8,7)])
sage: t = tip.rise_contact_involution(); t
The Tamari interval of size 8 induced by relations [(2, 8), (3, 8),
(4, 5), (5, 7), (6, 7), (7, 8), (8, 1), (7, 2), (6, 2), (5, 3),
(4, 3), (3, 2), (2, 1)]
sage: t.rise_contact_involution() == tip
True
sage: (tip.lower_dyck_word().number_of_touch_points()                    #␣
↪needs sage.combinat
....:     == t.upper_dyck_word().number_of_initial_rises())
```

(continues on next page)

(continued from previous page)

```
True
sage: tip.number_of_tamari_inversions() == t.number_of_tamari_inversions()
True
```

```
>>> from sage.all import *
>>> tip = TamariIntervalPoset(Integer(8), [(Integer(1),Integer(2)),␣
↪(Integer(2),Integer(4)), (Integer(3),Integer(4)), (Integer(6),Integer(7)),
...                                (Integer(3),Integer(2)), (Integer(5),
↪Integer(4)), (Integer(6),Integer(4)), (Integer(8),Integer(7))])
>>> t = tip.rise_contact_involution(); t
The Tamari interval of size 8 induced by relations [(2, 8), (3, 8),
(4, 5), (5, 7), (6, 7), (7, 8), (8, 1), (7, 2), (6, 2), (5, 3),
(4, 3), (3, 2), (2, 1)]
>>> t.rise_contact_involution() == tip
True
>>> (tip.lower_dyck_word().number_of_touch_points()                    #␣
↪needs sage.combinat
...     == t.upper_dyck_word().number_of_initial_rises())
True
>>> tip.number_of_tamari_inversions() == t.number_of_tamari_inversions()
True
```

REFERENCES:

- [Pons2018]

set_latex_options(*D*)

Set the latex options for use in the `_latex_` function.

The default values are set in the `__init__` function.

- `tikz_scale` – (default: 1) scale for use with the tikz package
- `line_width` – (default: 1 * `tikz_scale`) value representing the line width
- `color_decreasing` – (default: red) the color for decreasing relations
- `color_increasing` – (default: blue) the color for increasing relations
- `hspace` – (default: 1) the difference between horizontal coordinates of adjacent vertices
- `vspace` – (default: 1) the difference between vertical coordinates of adjacent vertices

INPUT:

- `D` – dictionary with a list of latex parameters to change

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(2,4),(3,4),(2,1),(3,1)])
sage: ip.latex_options()["color_decreasing"]
'red'
sage: ip.set_latex_options({"color_decreasing":'green'})
sage: ip.latex_options()["color_decreasing"]
'green'
sage: ip.set_latex_options({"color_increasing":'black'})
sage: ip.latex_options()["color_increasing"]
'black'
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(2),Integer(4)),(Integer(3),
↪Integer(4)),(Integer(2),Integer(1)),(Integer(3),Integer(1))])
>>> ip.latex_options()["color_decreasing"]
'red'
>>> ip.set_latex_options({"color_decreasing":'green'})
>>> ip.latex_options()["color_decreasing"]
'green'
>>> ip.set_latex_options({"color_increasing":'black'})
>>> ip.latex_options()["color_increasing"]
'black'
```

To change the default options for all interval-posets, use the parent's latex options:

```
sage: ip = TamariIntervalPoset(4,[(2,4),(3,4),(2,1),(3,1)])
sage: ip2 = TamariIntervalPoset(4,[(1,2),(2,3)])
sage: ip.latex_options()["color_decreasing"]
'red'
sage: ip2.latex_options()["color_decreasing"]
'red'
sage: TamariIntervalPosets.options(latex_color_decreasing='green')
sage: ip.latex_options()["color_decreasing"]
'green'
sage: ip2.latex_options()["color_decreasing"]
'green'
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(2),Integer(4)),(Integer(3),
↪Integer(4)),(Integer(2),Integer(1)),(Integer(3),Integer(1))])
>>> ip2 = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3))])
>>> ip.latex_options()["color_decreasing"]
'red'
>>> ip2.latex_options()["color_decreasing"]
'red'
>>> TamariIntervalPosets.options(latex_color_decreasing='green')
>>> ip.latex_options()["color_decreasing"]
'green'
>>> ip2.latex_options()["color_decreasing"]
'green'
```

Next we set a local latex option and show the global option does not override it:

```
sage: ip.set_latex_options({"color_decreasing": 'black'})
sage: ip.latex_options()["color_decreasing"]
'black'
sage: TamariIntervalPosets.options(latex_color_decreasing='blue')
sage: ip.latex_options()["color_decreasing"]
'black'
sage: ip2.latex_options()["color_decreasing"]
'blue'
sage: TamariIntervalPosets.options._reset()
```

```
>>> from sage.all import *
>>> ip.set_latex_options({"color_decreasing": 'black'})
>>> ip.latex_options()["color_decreasing"]
'black'
>>> TamariIntervalPosets.options(latex_color_decreasing='blue')
>>> ip.latex_options()["color_decreasing"]
'black'
>>> ip2.latex_options()["color_decreasing"]
'blue'
>>> TamariIntervalPosets.options._reset()
```

size()

Return the size (number of vertices) of the interval-poset.

EXAMPLES:

```
sage: TamariIntervalPoset(3,[(2,1),(3,1)]).size()
3
```

```
>>> from sage.all import *
>>> TamariIntervalPoset(Integer(3),[(Integer(2),Integer(1)),(Integer(3),
↪Integer(1))]).size()
3
```

sub_poset(*start*, *end*)

alias of *subposet()*.

subposet(*start*, *end*)

Return the renormalized subposet of `self` consisting solely of integers from `start` (inclusive) to `end` (not inclusive).

"Renormalized" means that these integers are relabelled $1, 2, \ldots, k$ in the obvious way (i.e., by subtracting `start - 1`).

INPUT:

- `start` – integer; the starting vertex (inclusive)
- `end` – integer; the ending vertex (not inclusive)

EXAMPLES:

```
sage: ip = TamariIntervalPoset(6, [(3,2),(4,3),(5,2),(6,5),(1,2),(3,5),(4,
↪5)]); ip
The Tamari interval of size 6 induced by relations
 [(1, 2), (3, 5), (4, 5), (6, 5), (5, 2), (4, 3), (3, 2)]
sage: ip.subposet(1,3)
The Tamari interval of size 2 induced by relations [(1, 2)]
sage: ip.subposet(1,4)
The Tamari interval of size 3 induced by relations [(1, 2), (3, 2)]
sage: ip.subposet(1,5)
The Tamari interval of size 4 induced by relations [(1, 2), (4, 3), (3, 2)]
sage: ip.subposet(1,7) == ip
True
sage: ip.subposet(1,1)
The Tamari interval of size 0 induced by relations []
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(6), [(Integer(3),Integer(2)),(Integer(4),
↪Integer(3)),(Integer(5),Integer(2)),(Integer(6),Integer(5)),(Integer(1),
↪Integer(2)),(Integer(3),Integer(5)),(Integer(4),Integer(5))]); ip
The Tamari interval of size 6 induced by relations
 [(1, 2), (3, 5), (4, 5), (6, 5), (5, 2), (4, 3), (3, 2)]
>>> ip.subposet(Integer(1),Integer(3))
The Tamari interval of size 2 induced by relations [(1, 2)]
>>> ip.subposet(Integer(1),Integer(4))
The Tamari interval of size 3 induced by relations [(1, 2), (3, 2)]
>>> ip.subposet(Integer(1),Integer(5))
The Tamari interval of size 4 induced by relations [(1, 2), (4, 3), (3, 2)]
>>> ip.subposet(Integer(1),Integer(7)) == ip
True
>>> ip.subposet(Integer(1),Integer(1))
The Tamari interval of size 0 induced by relations []
```

tamari_inversions()

Return the Tamari inversions of `self`.

A Tamari inversion is a pair of vertices (a, b) with $a < b$ such that:

- the decreasing parent of b is strictly smaller than a (or does not exist), and
- the increasing parent of a is strictly bigger than b (or does not exist).

"Smaller" and "bigger" refer to the numerical values of the elements, not to the poset order.

This method returns the list of all Tamari inversions in lexicographic order.

The number of Tamari inversions is the length of the longest chain of the Tamari interval represented by `self`.

Indeed, when an interval consists of just one binary tree, it has no inversion. One can also prove that if a Tamari interval $I' = [T'_1, T'_2]$ is a proper subset of a Tamari interval $I = [T_1, T_2]$, then the inversion number of I' is strictly lower than the inversion number of I. And finally, by adding the relation (b, a) to the interval-poset where (a, b) is the first inversion of I in lexicographic order, one reduces the inversion number by exactly 1.

See also

tamari_inversions_iter(), number_of_tamari_inversions()

EXAMPLES:

```
sage: ip = TamariIntervalPoset(3,[])
sage: ip.tamari_inversions()
[(1, 2), (1, 3), (2, 3)]
sage: ip = TamariIntervalPoset(3,[(2,1)])
sage: ip.tamari_inversions()
[(1, 3), (2, 3)]
sage: ip = TamariIntervalPoset(3,[(1,2)])
sage: ip.tamari_inversions()
[(2, 3)]
sage: ip = TamariIntervalPoset(3,[(1,2),(3,2)])
```

(continues on next page)

(continued from previous page)

```
sage: ip.tamari_inversions()
[]
sage: ip = TamariIntervalPoset(4,[(2,4),(3,4),(2,1),(3,1)])
sage: ip.tamari_inversions()
[(1, 4), (2, 3)]
sage: ip = TamariIntervalPoset(4,[])
sage: ip.tamari_inversions()
[(1, 2), (1, 3), (1, 4), (2, 3), (2, 4), (3, 4)]

True
```

tamari_inversions_iter()

Iterate over the Tamari inversions of `self`, in lexicographic order.

See *tamari_inversions()* for the definition of the terms involved.

EXAMPLES:

```
sage: T = TamariIntervalPoset(5, [[1,2],[3,4],[3,2],[5,2],[4,2]])
sage: list(T.tamari_inversions_iter())
[(4, 5)]

sage: T = TamariIntervalPoset(8, [(2, 7), (3, 7), (4, 7), (5, 7), (6, 7),
....:                             (8, 7), (6, 4), (5, 4), (4, 3), (3, 2)])
sage: list(T.tamari_inversions_iter())
[(1, 2), (1, 7), (5, 6)]

sage: T = TamariIntervalPoset(1, [])
sage: list(T.tamari_inversions_iter())
[]

sage: T = TamariIntervalPoset(0, [])
sage: list(T.tamari_inversions_iter())
[]
```

```
>>> from sage.all import *
>>> T = TamariIntervalPoset(Integer(5), [[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)],[Integer(3),Integer(2)],[Integer(5),Integer(2)],[Integer(4),
↪Integer(2)]])
>>> list(T.tamari_inversions_iter())
[(4, 5)]

>>> T = TamariIntervalPoset(Integer(8), [(Integer(2), Integer(7)),␣
↪(Integer(3), Integer(7)), (Integer(4), Integer(7)), (Integer(5),␣
↪Integer(7)), (Integer(6), Integer(7)),
...                              (Integer(8), Integer(7)), (Integer(6),␣
↪Integer(4)), (Integer(5), Integer(4)), (Integer(4), Integer(3)),␣
↪(Integer(3), Integer(2))])
>>> list(T.tamari_inversions_iter())
[(1, 2), (1, 7), (5, 6)]

>>> T = TamariIntervalPoset(Integer(1), [])
>>> list(T.tamari_inversions_iter())
[]

>>> T = TamariIntervalPoset(Integer(0), [])
>>> list(T.tamari_inversions_iter())
[]
```

upper_binary_tree()

Return the highest binary tree in the interval of the Tamari lattice represented by `self`.

This is a binary tree. It is the shape of the unique binary search tree whose right-branch ordered forest (i.e., the result of applying *to_ordered_tree_right_branch()* and cutting off the root) is the initial forest of `self`.

See also

upper_dyck_word()

EXAMPLES:

```
sage: ip = TamariIntervalPoset(6,[(3,2),(4,3),(5,2),(6,5),(1,2),(4,5)]); ip
The Tamari interval of size 6 induced by relations
 [(1, 2), (4, 5), (6, 5), (5, 2), (4, 3), (3, 2)]
sage: ip.upper_binary_tree()
[[., .], [., [[., .], [., .]]]]

sage: TamariIntervalPosets.initial_forest(ip.upper_binary_tree()) == ip.
↪initial_forest()
True
sage: ip == TamariIntervalPosets.from_binary_trees(ip.lower_binary_tree(),ip.
↪upper_binary_tree())
True
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(6),[(Integer(3),Integer(2)),(Integer(4),
↪Integer(3)),(Integer(5),Integer(2)),(Integer(6),Integer(5)),(Integer(1),
↪Integer(2)),(Integer(4),Integer(5))]); ip
The Tamari interval of size 6 induced by relations
 [(1, 2), (4, 5), (6, 5), (5, 2), (4, 3), (3, 2)]
>>> ip.upper_binary_tree()
[[., .], [., [[., .], [., .]]]]

>>> TamariIntervalPosets.initial_forest(ip.upper_binary_tree()) == ip.initial_
↪forest()
True
>>> ip == TamariIntervalPosets.from_binary_trees(ip.lower_binary_tree(),ip.
↪upper_binary_tree())
True
```

upper_contains_interval(*other*)

Return whether the interval represented by `other` is contained in `self` as an interval of the Tamari lattice and if they share the same upper bound.

As interval-posets, it means that `other` contains the relations of `self` plus some extra decreasing relations.

INPUT:

- `other` – an interval-poset

EXAMPLES:

```
sage: ip1 = TamariIntervalPoset(4,[(1,2),(2,3),(4,3)])
sage: ip2 = TamariIntervalPoset(4,[(1,2),(2,3)])
sage: ip2.upper_contains_interval(ip1)
True
sage: ip2.contains_interval(ip1) and ip2.upper_binary_tree() == ip1.upper_
↪binary_tree()
True
```

(continues on next page)

(continued from previous page)

```
sage: ip3 = TamariIntervalPoset(4,[(1,2),(2,3),(3,4)])
sage: ip2.upper_contains_interval(ip3)
False
sage: ip2.contains_interval(ip3)
True
sage: ip2.upper_binary_tree() == ip3.upper_binary_tree()
False
```

```
>>> from sage.all import *
>>> ip1 = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3)),(Integer(4),Integer(3))])
>>> ip2 = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3))])
>>> ip2.upper_contains_interval(ip1)
True
>>> ip2.contains_interval(ip1) and ip2.upper_binary_tree() == ip1.upper_
↪binary_tree()
True
>>> ip3 = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3)),(Integer(3),Integer(4))])
>>> ip2.upper_contains_interval(ip3)
False
>>> ip2.contains_interval(ip3)
True
>>> ip2.upper_binary_tree() == ip3.upper_binary_tree()
False
```

upper_dyck_word()

Return the highest Dyck word in the interval of the Tamari lattice represented by `self`.

See also

upper_binary_tree()

EXAMPLES:

```
sage: # needs sage.combinat
sage: ip = TamariIntervalPoset(6,[(3,2),(4,3),(5,2),(6,5),(1,2),(4,5)]); ip
The Tamari interval of size 6 induced by relations
 [(1, 2), (4, 5), (6, 5), (5, 2), (4, 3), (3, 2)]
sage: ip.upper_dyck_word()
[1, 0, 1, 1, 1, 0, 1, 1, 0, 0, 0, 0]
sage: udw_if = TamariIntervalPosets.initial_forest(ip.upper_dyck_word())
sage: udw_if == ip.initial_forest()
True
sage: ip == TamariIntervalPosets.from_dyck_words(ip.lower_dyck_word(),
....:                                            ip.upper_dyck_word())
True
```

```
>>> from sage.all import *
>>> # needs sage.combinat
```

(continues on next page)

(continued from previous page)

```
>>> ip = TamariIntervalPoset(Integer(6),[(Integer(3),Integer(2)),(Integer(4),
↪Integer(3)),(Integer(5),Integer(2)),(Integer(6),Integer(5)),(Integer(1),
↪Integer(2)),(Integer(4),Integer(5))]); ip
The Tamari interval of size 6 induced by relations
 [(1, 2), (4, 5), (6, 5), (5, 2), (4, 3), (3, 2)]
>>> ip.upper_dyck_word()
[1, 0, 1, 1, 1, 0, 1, 1, 0, 0, 0, 0]
>>> udw_if = TamariIntervalPosets.initial_forest(ip.upper_dyck_word())
>>> udw_if == ip.initial_forest()
True
>>> ip == TamariIntervalPosets.from_dyck_words(ip.lower_dyck_word(),
...                                            ip.upper_dyck_word())
True
```

class sage.combinat.interval_posets.**TamariIntervalPosets**

Bases: UniqueRepresentation, Parent

Factory for interval-posets.

INPUT:

- `size` – integer (optional)

OUTPUT:

- the set of all interval-posets (of the given `size` if specified)

EXAMPLES:

```
sage: TamariIntervalPosets()
Interval-posets

sage: TamariIntervalPosets(2)
Interval-posets of size 2
```

```
>>> from sage.all import *
>>> TamariIntervalPosets()
Interval-posets

>>> TamariIntervalPosets(Integer(2))
Interval-posets of size 2
```

Note

This is a factory class whose constructor returns instances of subclasses.

static check_poset(*poset*)

Check if the given poset `poset` is a interval-poset, that is, if it satisfies the following properties:

- Its labels are exactly $1, \ldots, n$ where n is its size.
- If $a < c$ (as numbers) and a precedes c, then b precedes c for all b such that $a < b < c$.
- If $a < c$ (as numbers) and c precedes a, then b precedes a for all b such that $a < b < c$.

INPUT:

- `poset` – a finite labeled poset

EXAMPLES:

```
sage: p = Poset(([1,2,3],[(1,2),(3,2)]))
sage: TamariIntervalPosets.check_poset(p)
True
sage: p = Poset(([2,3],[(3,2)]))
sage: TamariIntervalPosets.check_poset(p)
False
sage: p = Poset(([1,2,3],[(3,1)]))
sage: TamariIntervalPosets.check_poset(p)
False
sage: p = Poset(([1,2,3],[(1,3)]))
sage: TamariIntervalPosets.check_poset(p)
False
```

```
>>> from sage.all import *
>>> p = Poset(([Integer(1),Integer(2),Integer(3)],[(Integer(1),Integer(2)),
↪(Integer(3),Integer(2))]))
>>> TamariIntervalPosets.check_poset(p)
True
>>> p = Poset(([Integer(2),Integer(3)],[(Integer(3),Integer(2))]))
>>> TamariIntervalPosets.check_poset(p)
False
>>> p = Poset(([Integer(1),Integer(2),Integer(3)],[(Integer(3),Integer(1))]))
>>> TamariIntervalPosets.check_poset(p)
False
>>> p = Poset(([Integer(1),Integer(2),Integer(3)],[(Integer(1),Integer(3))]))
>>> TamariIntervalPosets.check_poset(p)
False
```

static final_forest(*element*)

Return the final forest of a binary tree, an interval-poset or a Dyck word.

A final forest is an interval-poset corresponding to a final interval of the Tamari lattice, i.e., containing only decreasing relations.

It can be constructed from a binary tree by its binary search tree labeling with the rule: b precedes a in the final forest iff b is in the right subtree of a in the binary search tree.

INPUT:

- `element` – a binary tree, a Dyck word or an interval-poset

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(1,2),(2,3),(4,3)])
sage: TamariIntervalPosets.final_forest(ip)
The Tamari interval of size 4 induced by relations [(4, 3)]
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3)),(Integer(4),Integer(3))])
>>> TamariIntervalPosets.final_forest(ip)
The Tamari interval of size 4 induced by relations [(4, 3)]
```

From binary trees:

```
sage: bt = BinaryTree(); bt
.
sage: TamariIntervalPosets.final_forest(bt)
The Tamari interval of size 0 induced by relations []
sage: bt = BinaryTree([]); bt
[., .]
sage: TamariIntervalPosets.final_forest(bt)
The Tamari interval of size 1 induced by relations []
sage: bt = BinaryTree([[],None]); bt
[[., .], .]
sage: TamariIntervalPosets.final_forest(bt)
The Tamari interval of size 2 induced by relations []
sage: bt = BinaryTree([None,[]]); bt
[., [., .]]
sage: TamariIntervalPosets.final_forest(bt)
The Tamari interval of size 2 induced by relations [(2, 1)]
sage: bt = BinaryTree([[],[]]); bt
[[., .], [., .]]
sage: TamariIntervalPosets.final_forest(bt)
The Tamari interval of size 3 induced by relations [(3, 2)]
sage: bt = BinaryTree([[None,[[],None]],[]]); bt
[[., [[., .], .]], [., .]]
sage: TamariIntervalPosets.final_forest(bt)
The Tamari interval of size 5 induced by relations [(5, 4), (3, 1), (2, 1)]
```

```
>>> from sage.all import *
>>> bt = BinaryTree(); bt
.
>>> TamariIntervalPosets.final_forest(bt)
The Tamari interval of size 0 induced by relations []
>>> bt = BinaryTree([]); bt
[., .]
>>> TamariIntervalPosets.final_forest(bt)
The Tamari interval of size 1 induced by relations []
>>> bt = BinaryTree([[],None]); bt
[[., .], .]
>>> TamariIntervalPosets.final_forest(bt)
The Tamari interval of size 2 induced by relations []
>>> bt = BinaryTree([None,[]]); bt
[., [., .]]
>>> TamariIntervalPosets.final_forest(bt)
The Tamari interval of size 2 induced by relations [(2, 1)]
>>> bt = BinaryTree([[],[]]); bt
[[., .], [., .]]
>>> TamariIntervalPosets.final_forest(bt)
The Tamari interval of size 3 induced by relations [(3, 2)]
>>> bt = BinaryTree([[None,[[],None]],[]]); bt
[[., [[., .], .]], [., .]]
>>> TamariIntervalPosets.final_forest(bt)
The Tamari interval of size 5 induced by relations [(5, 4), (3, 1), (2, 1)]
```

From Dyck words:

```
sage: # needs sage.combinat
sage: dw = DyckWord([1,0])
sage: TamariIntervalPosets.final_forest(dw)
The Tamari interval of size 1 induced by relations []
sage: dw = DyckWord([1,1,0,1,0,0,1,1,0,0])
sage: TamariIntervalPosets.final_forest(dw)
The Tamari interval of size 5 induced by relations [(5, 4), (3, 1), (2, 1)]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> dw = DyckWord([Integer(1),Integer(0)])
>>> TamariIntervalPosets.final_forest(dw)
The Tamari interval of size 1 induced by relations []
>>> dw = DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
...Integer(0),Integer(1),Integer(1),Integer(0),Integer(0)])
>>> TamariIntervalPosets.final_forest(dw)
The Tamari interval of size 5 induced by relations [(5, 4), (3, 1), (2, 1)]
```

static from_binary_trees(*tree1*, *tree2*)

Return the interval-poset corresponding to the interval [`tree1`, `tree2`] of the Tamari lattice.

Raise an exception if `tree1` is not $\leq$ `tree2` in the Tamari lattice.

INPUT:

- `tree1` – a binary tree
- `tree2` – a binary tree greater or equal than `tree1` for the Tamari lattice

EXAMPLES:

```
sage: tree1 = BinaryTree([[],None])
sage: tree2 = BinaryTree([None,[]])
sage: TamariIntervalPosets.from_binary_trees(tree1,tree2)
The Tamari interval of size 2 induced by relations []
sage: TamariIntervalPosets.from_binary_trees(tree1,tree1)
The Tamari interval of size 2 induced by relations [(1, 2)]
sage: TamariIntervalPosets.from_binary_trees(tree2,tree2)
The Tamari interval of size 2 induced by relations [(2, 1)]

sage: tree1 = BinaryTree([[],[[None,[]],[]]])
sage: tree2 = BinaryTree([None,[None,[None,[[],[]]]]])
sage: TamariIntervalPosets.from_binary_trees(tree1,tree2)
The Tamari interval of size 6 induced by relations
 [(4, 5), (6, 5), (5, 2), (4, 3), (3, 2)]

sage: tree3 = BinaryTree([None,[None,[[],[None,[]]]]])
sage: TamariIntervalPosets.from_binary_trees(tree1,tree3)
Traceback (most recent call last):
...
ValueError: the two binary trees are not comparable on the Tamari lattice
sage: TamariIntervalPosets.from_binary_trees(tree1,BinaryTree())
Traceback (most recent call last):
...
ValueError: the two binary trees are not comparable on the Tamari lattice
```

```
>>> from sage.all import *
>>> tree1 = BinaryTree([[],None])
>>> tree2 = BinaryTree([None,[]])
>>> TamariIntervalPosets.from_binary_trees(tree1,tree2)
The Tamari interval of size 2 induced by relations []
>>> TamariIntervalPosets.from_binary_trees(tree1,tree1)
The Tamari interval of size 2 induced by relations [(1, 2)]
>>> TamariIntervalPosets.from_binary_trees(tree2,tree2)
The Tamari interval of size 2 induced by relations [(2, 1)]

>>> tree1 = BinaryTree([[],[[None,[]],[]]])
>>> tree2 = BinaryTree([None,[None,[None,[[],[]]]]])
>>> TamariIntervalPosets.from_binary_trees(tree1,tree2)
The Tamari interval of size 6 induced by relations
 [(4, 5), (6, 5), (5, 2), (4, 3), (3, 2)]

>>> tree3 = BinaryTree([None,[None,[[],[None,[]]]]])
>>> TamariIntervalPosets.from_binary_trees(tree1,tree3)
Traceback (most recent call last):
...
ValueError: the two binary trees are not comparable on the Tamari lattice
>>> TamariIntervalPosets.from_binary_trees(tree1,BinaryTree())
Traceback (most recent call last):
...
ValueError: the two binary trees are not comparable on the Tamari lattice
```

static from_blossoming_tree(B)

Return the interval poset corresponding to the Tamari interval in bijection with the blossoming tree `B` of type *TamariBlossomingTree*.

INPUT:

- `B`: a blossoming tree of type *TamariBlossomingTree*, which is in bijection with an interval in the Tamari lattice. See [FFN2025] and the documentation of *TamariBlossomingTree*. for details.

EXAMPLES:

```
sage: T = OrderedTree([[], [[], [], [[], []], [[[], []], [], []]],
....:                 [[], [], [[[], []], [], [[], []], [[]]]])
sage: B = TamariBlossomingTree(T)
sage: TIP = TamariIntervalPosets.from_blossoming_tree(B)
sage: TIP
The Tamari interval of size 8 induced by relations ...
sage: TIP.increasing_cover_relations()
[(1, 5), (2, 4), (3, 4), (4, 5), (7, 8)]
sage: TIP.decreasing_cover_relations()
[(7, 5), (6, 5), (3, 2), (2, 1)]
sage: TIP.blossoming_tree() == B
True
```

```
>>> from sage.all import *
>>> T = OrderedTree([[], [[], [], [[], []], [[[], []], [], []]],
...                 [[], [], [[[], []], [], [[], []], [[]]]])
>>> B = TamariBlossomingTree(T)
```

(continues on next page)

(continued from previous page)

```
>>> TIP = TamariIntervalPosets.from_blossoming_tree(B)
>>> TIP
The Tamari interval of size 8 induced by relations ...
>>> TIP.increasing_cover_relations()
[(1, 5), (2, 4), (3, 4), (4, 5), (7, 8)]
>>> TIP.decreasing_cover_relations()
[(7, 5), (6, 5), (3, 2), (2, 1)]
>>> TIP.blossoming_tree() == B
True
```

static from_dyck_words(*dw1*, *dw2*)

Return the interval-poset corresponding to the interval [dw1, dw2] of the Tamari lattice.

Raise an exception if the two Dyck words dw1 and dw2 do not satisfy dw1 $\leq$ dw2 in the Tamari lattice.

INPUT:

- dw1 – a Dyck word
- dw2 – a Dyck word greater or equal than dw1 for the Tamari lattice

EXAMPLES:

```
sage: # needs sage.combinat
sage: dw1 = DyckWord([1,0,1,0])
sage: dw2 = DyckWord([1,1,0,0])
sage: TamariIntervalPosets.from_dyck_words(dw1, dw2)
The Tamari interval of size 2 induced by relations []
sage: TamariIntervalPosets.from_dyck_words(dw1,dw1)
The Tamari interval of size 2 induced by relations [(1, 2)]
sage: TamariIntervalPosets.from_dyck_words(dw2,dw2)
The Tamari interval of size 2 induced by relations [(2, 1)]

sage: # needs sage.combinat
sage: dw1 = DyckWord([1,0,1,1,1,0,0,1,1,0,0,0])
sage: dw2 = DyckWord([1,1,1,1,0,1,1,0,0,0,0,0])
sage: TamariIntervalPosets.from_dyck_words(dw1,dw2)
The Tamari interval of size 6 induced by relations
 [(4, 5), (6, 5), (5, 2), (4, 3), (3, 2)]
sage: dw3 = DyckWord([1,1,1,0,1,1,1,0,0,0,0,0])
sage: TamariIntervalPosets.from_dyck_words(dw1,dw3)
Traceback (most recent call last):
...
ValueError: the two Dyck words are not comparable on the Tamari lattice
sage: TamariIntervalPosets.from_dyck_words(dw1,DyckWord([1,0]))
Traceback (most recent call last):
...
ValueError: the two Dyck words are not comparable on the Tamari lattice
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> dw1 = DyckWord([Integer(1),Integer(0),Integer(1),Integer(0)])
>>> dw2 = DyckWord([Integer(1),Integer(1),Integer(0),Integer(0)])
>>> TamariIntervalPosets.from_dyck_words(dw1, dw2)
```

(continues on next page)

(continued from previous page)

```
The Tamari interval of size 2 induced by relations []
>>> TamariIntervalPosets.from_dyck_words(dw1,dw1)
The Tamari interval of size 2 induced by relations [(1, 2)]
>>> TamariIntervalPosets.from_dyck_words(dw2,dw2)
The Tamari interval of size 2 induced by relations [(2, 1)]

>>> # needs sage.combinat
>>> dw1 = DyckWord([Integer(1),Integer(0),Integer(1),Integer(1),Integer(1),
↪Integer(0),Integer(0),Integer(1),Integer(1),Integer(0),Integer(0),
↪Integer(0)])
>>> dw2 = DyckWord([Integer(1),Integer(1),Integer(1),Integer(1),Integer(0),
↪Integer(1),Integer(1),Integer(0),Integer(0),Integer(0),Integer(0),
↪Integer(0)])
>>> TamariIntervalPosets.from_dyck_words(dw1,dw2)
The Tamari interval of size 6 induced by relations
 [(4, 5), (6, 5), (5, 2), (4, 3), (3, 2)]
>>> dw3 = DyckWord([Integer(1),Integer(1),Integer(1),Integer(0),Integer(1),
↪Integer(1),Integer(1),Integer(0),Integer(0),Integer(0),Integer(0),
↪Integer(0)])
>>> TamariIntervalPosets.from_dyck_words(dw1,dw3)
Traceback (most recent call last):
...
ValueError: the two Dyck words are not comparable on the Tamari lattice
>>> TamariIntervalPosets.from_dyck_words(dw1,DyckWord([Integer(1),
↪Integer(0)]))
Traceback (most recent call last):
...
ValueError: the two Dyck words are not comparable on the Tamari lattice
```

static from_grafting_tree(*tree*)

Return an interval-poset from a grafting tree.

For the inverse method, see *TamariIntervalPoset.grafting_tree()*.

EXAMPLES:

```
sage: tip = TamariIntervalPoset(8, [(1,2), (2,4), (3,4), (6,7), (3,2), (5,4),␣
↪(6,4), (8,7)])
sage: t = tip.grafting_tree()

static from_minimal_schnyder_wood(*graph*)

Return a Tamari interval built from a minimal Schnyder wood.

This is an implementation of Bernardi and Bonichon's bijection [BeBo2009].

INPUT:

- `graph` – a minimal Schnyder wood, given as a graph with colored and oriented edges, without the three exterior unoriented edges

The three boundary vertices must be -1, -2 and -3.

One assumes moreover that the embedding around -1 is the list of neighbors of -1 and not just a cyclic permutation of that.

Beware that the embedding convention used here is the opposite of the one used by the plot method.

OUTPUT: a Tamari interval-poset

EXAMPLES:

A small example:

```
sage: TIP = TamariIntervalPosets
sage: G = DiGraph([(0,-1,0),(0,-2,1),(0,-3,2)], format='list_of_edges')
sage: G.set_embedding({-1:[0],-2:[0],-3:[0],0:[-1,-2,-3]})
sage: TIP.from_minimal_schnyder_wood(G)                                 #␣
↪needs sage.combinat
The Tamari interval of size 1 induced by relations []
```

```
>>> from sage.all import *
>>> TIP = TamariIntervalPosets
>>> G = DiGraph([(Integer(0),-Integer(1),Integer(0)),(Integer(0),-Integer(2),
↪Integer(1)),(Integer(0),-Integer(3),Integer(2))], format='list_of_edges')
>>> G.set_embedding({-Integer(1):[Integer(0)],-Integer(2):[Integer(0)],-
↪Integer(3):[Integer(0)],Integer(0):[-Integer(1),-Integer(2),-Integer(3)]})
>>> TIP.from_minimal_schnyder_wood(G)                                   #␣
↪needs sage.combinat
The Tamari interval of size 1 induced by relations []
```

An example from page 14 of [BeBo2009]:

```
sage: c0 = [(0,-1),(1,0),(2,0),(4,3),(3,-1),(5,3)]
sage: c1 = [(5,-2),(3,-2),(4,5),(1,3),(2,3),(0,3)]
sage: c2 = [(0,-3),(1,-3),(3,-3),(4,-3),(5,-3),(2,1)]
sage: ed = [(u,v,0) for u,v in c0]
sage: ed += [(u,v,1) for u,v in c1]
sage: ed += [(u,v,2) for u,v in c2]
sage: G = DiGraph(ed, format='list_of_edges')
sage: embed = {-1:[3,0],-2:[5,3],-3:[0,1,3,4,5]}
sage: data_emb = [[3,2,1,-3,-1],[2,3,-3,0],[3,1,0]]
sage: data_emb += [[-2,5,4,-3,1,2,0,-1],[5,-3,3],[-2,-3,4,3]]
sage: for k in range(6):
....:     embed[k] = data_emb[k]
sage: G.set_embedding(embed)
sage: TIP.from_minimal_schnyder_wood(G)                                 #␣
↪needs sage.combinat
```

↪needs sage.combinat
The Tamari interval of size 3 induced by relations [(2, 3), (2, 1)]
```

static initial_forest(*element*)

Return the initial forest of a binary tree, an interval-poset or a Dyck word.

An initial forest is an interval-poset corresponding to an initial interval of the Tamari lattice, i.e., containing only increasing relations.

It can be constructed from a binary tree by its binary search tree labeling with the rule: a precedes b in the initial forest iff a is in the left subtree of b in the binary search tree.

INPUT:

- `element` – a binary tree, a Dyck word or an interval-poset

EXAMPLES:

```
sage: ip = TamariIntervalPoset(4,[(1,2),(2,3),(4,3)])
sage: TamariIntervalPosets.initial_forest(ip)
The Tamari interval of size 4 induced by relations [(1, 2), (2, 3)]
```

```
>>> from sage.all import *
>>> ip = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3)),(Integer(4),Integer(3))])
>>> TamariIntervalPosets.initial_forest(ip)
The Tamari interval of size 4 induced by relations [(1, 2), (2, 3)]
```

with binary trees:

```
sage: bt = BinaryTree(); bt
.
sage: TamariIntervalPosets.initial_forest(bt)
The Tamari interval of size 0 induced by relations []
sage: bt = BinaryTree([]); bt
[., .]
```

(continues on next page)

(continued from previous page)

```
sage: TamariIntervalPosets.initial_forest(bt)
The Tamari interval of size 1 induced by relations []
sage: bt = BinaryTree([[],None]); bt

The Tamari interval of size 2 induced by relations []
>>> bt = BinaryTree([[],[]]); bt
[[., .], [., .]]
>>> TamariIntervalPosets.initial_forest(bt)
The Tamari interval of size 3 induced by relations [(1, 2)]
>>> bt = BinaryTree([[None,[[],None]],[]]); bt
[[., [[., .], .]], [., .]]
>>> TamariIntervalPosets.initial_forest(bt)
The Tamari interval of size 5 induced by relations [(1, 4), (2, 3), (3, 4)]
```

from Dyck words:

```
sage: # needs sage.combinat
sage: dw = DyckWord([1,0])
sage: TamariIntervalPosets.initial_forest(dw)
The Tamari interval of size 1 induced by relations []
sage: dw = DyckWord([1,1,0,1,0,0,1,1,0,0])
```

(continues on next page)

(continued from previous page)

```
sage: TamariIntervalPosets.initial_forest(dw)
The Tamari interval of size 5 induced by relations [(1, 4), (2, 3), (3, 4)]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> dw = DyckWord([Integer(1),Integer(0)])
>>> TamariIntervalPosets.initial_forest(dw)
The Tamari interval of size 1 induced by relations []
>>> dw = DyckWord([Integer(1),Integer(1),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1),Integer(0),Integer(0)])
>>> TamariIntervalPosets.initial_forest(dw)
The Tamari interval of size 5 induced by relations [(1, 4), (2, 3), (3, 4)]
```

le(*el1*, *el2*)

Poset structure on the set of interval-posets.

The comparison is first by size, then using the cubical coordinates.

See also

cubical_coordinates()

INPUT:

- `el1` – an interval-poset
- `el2` – an interval-poset

EXAMPLES:

```
sage: ip1 = TamariIntervalPoset(4,[(1,2),(2,3),(4,3)])
sage: ip2 = TamariIntervalPoset(4,[(1,2),(2,3)])
sage: TamariIntervalPosets().le(ip1,ip2)
False
sage: TamariIntervalPosets().le(ip2,ip1)
True
```

```
>>> from sage.all import *
>>> ip1 = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3)),(Integer(4),Integer(3))])
>>> ip2 = TamariIntervalPoset(Integer(4),[(Integer(1),Integer(2)),(Integer(2),
↪Integer(3))])
>>> TamariIntervalPosets().le(ip1,ip2)
False
>>> TamariIntervalPosets().le(ip2,ip1)
True
```

options = Current options for TamariIntervalPosets - latex_color_decreasing: red - latex_color_increasing: blue - latex_hspace: 1 - latex_line_width_scalar: 0.5 - latex_tikz_scale: 1 - latex_vspace: 1

static recomposition_from_triple(*left*, *right*, *r*)

Recompose an interval-poset from a triple (`left`, `right`, `r`).

For the inverse method, see *TamariIntervalPoset.decomposition_to_triple()*.

INPUT:

- `left` – an interval-poset
- `right` – an interval-poset
- `r` – the parameter of the decomposition, an integer

OUTPUT: an interval-poset

EXAMPLES:

```
sage: T1 = TamariIntervalPoset(3, [(1, 2), (3, 2)])
sage: T2 = TamariIntervalPoset(4, [(2, 3), (4, 3)])
sage: TamariIntervalPosets.recomposition_from_triple(T1, T2, 2)
The Tamari interval of size 8 induced by relations [(1, 2), (2, 4),
(3, 4), (6, 7), (8, 7), (6, 4), (5, 4), (3, 2)]
```

```
>>> from sage.all import *
>>> T1 = TamariIntervalPoset(Integer(3), [(Integer(1), Integer(2)),␣
↪(Integer(3), Integer(2))])
>>> T2 = TamariIntervalPoset(Integer(4), [(Integer(2), Integer(3)),␣
↪(Integer(4), Integer(3))])
>>> TamariIntervalPosets.recomposition_from_triple(T1, T2, Integer(2))
The Tamari interval of size 8 induced by relations [(1, 2), (2, 4),
(3, 4), (6, 7), (8, 7), (6, 4), (5, 4), (3, 2)]
```

REFERENCES:

- [Pons2018]

class sage.combinat.interval_posets.**TamariIntervalPosets_all**

Bases: `DisjointUnionEnumeratedSets`, *TamariIntervalPosets*

The enumerated set of all Tamari interval-posets.

Element

alias of *TamariIntervalPoset*

one()

Return the unit of the monoid.

This is the empty interval poset, of size 0.

EXAMPLES:

```
sage: TamariIntervalPosets().one()
The Tamari interval of size 0 induced by relations []
```

```
>>> from sage.all import *
>>> TamariIntervalPosets().one()
The Tamari interval of size 0 induced by relations []
```

class sage.combinat.interval_posets.**TamariIntervalPosets_size**(*size*)

Bases: *TamariIntervalPosets*

The enumerated set of interval-posets of a given size.

cardinality()

The cardinality of `self`. That is, the number of interval-posets of size n.

The formula was given in [Cha2008]:

$$\frac{2(4n+1)!}{(n+1)!(3n+2)!} = \frac{2}{n(n+1)}\binom{4n+1}{n-1}.$$

EXAMPLES:

```
sage: [TamariIntervalPosets(i).cardinality() for i in range(6)]
[1, 1, 3, 13, 68, 399]
```

```
>>> from sage.all import *
>>> [TamariIntervalPosets(i).cardinality() for i in range(Integer(6))]
[1, 1, 3, 13, 68, 399]
```

element_class()

random_element()

Return a random Tamari interval poset of fixed size.

This is obtained using the class *TamariBlossomingTrees*, which generates blossoming trees uniformly at random. A bijection is then performed to obtain a Tamari interval poset.

EXAMPLES:

```
sage: # needs sage.combinat
sage: T = TamariIntervalPosets(4).random_element()
sage: T.parent()
Interval-posets
sage: u = T.lower_dyck_word(); u   # random
[1, 1, 0, 1, 0, 0, 1, 0]
sage: v = T.lower_dyck_word(); v   # random
[1, 1, 0, 1, 0, 0, 1, 0]
sage: len(u)
8
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> T = TamariIntervalPosets(Integer(4)).random_element()
>>> T.parent()
Interval-posets
>>> u = T.lower_dyck_word(); u   # random
[1, 1, 0, 1, 0, 0, 1, 0]
>>> v = T.lower_dyck_word(); v   # random
[1, 1, 0, 1, 0, 0, 1, 0]
>>> len(u)
8
```

The Hillman-Grassl correspondence

This module implements weak reverse plane partitions and four correspondences on them: the Hillman-Grassl correspondence and its inverse, as well as the Sulzgruber correspondence and its inverse (the Pak correspondence).

Fix a partition λ (see *Partition()*). We draw all partitions and tableaux in English notation.

A λ-*array* will mean a tableau of shape λ whose entries are nonnegative integers. (No conditions on the order of these entries are made. Note that 0 is allowed.)

A *weak reverse plane partition of shape* λ (short: λ-*rpp*) will mean a λ-array whose entries weakly increase along each row and weakly increase along each column. (The name "weak reverse plane partition" comes from Stanley in [EnumComb2] Section 7.22; other authors – such as Pak [Sulzgr2017], or Hillman and Grassl in [HilGra1976] – just call it a reverse plane partition.)

The Hillman-Grassl correspondence is a bijection from the set of λ-arrays to the set of λ-rpps. For its definition, see *hillman_grassl()*; for its inverse, see *hillman_grassl_inverse()*.

The Sulzgruber correspondence Φ_λ and the Pak correspondence ξ_λ are two further mutually inverse bijections between the set of λ-arrays and the set of λ-rpps. They appear (sometimes with different definitions, but defining the same maps) in [Pak2002], [Hopkins2017] and [Sulzgr2017]. For their definitions, see *sulzgruber_correspondence()* and *pak_correspondence()*.

EXAMPLES:

We construct a λ-rpp for $\lambda = (3, 3, 1)$ (note that λ needs not be specified explicitly):

```
sage: p = WeakReversePlanePartition([[0, 1, 3], [2, 4, 4], [3]])
sage: p.parent()
Weak Reverse Plane Partitions
```

```
>>> from sage.all import *
>>> p = WeakReversePlanePartition([[Integer(0), Integer(1), Integer(3)], [Integer(2),␣
↪Integer(4), Integer(4)], [Integer(3)]])
>>> p.parent()
Weak Reverse Plane Partitions
```

(This is the example in Section 7.22 of [EnumComb2].)

Next, we apply the inverse of the Hillman-Grassl correspondence to it:

```
sage: HGp = p.hillman_grassl_inverse(); HGp
[[1, 2, 0], [1, 0, 1], [1]]
sage: HGp.parent()
Tableaux
```

```
>>> from sage.all import *
>>> HGp = p.hillman_grassl_inverse(); HGp
[[1, 2, 0], [1, 0, 1], [1]]
>>> HGp.parent()
Tableaux
```

This is a λ-array, encoded as a tableau. We can recover our original λ-rpp from it using the Hillman-Grassl correspondence:

```
sage: HGp.hillman_grassl() == p
True
```

```
>>> from sage.all import *
>>> HGp.hillman_grassl() == p
True
```

We can also apply the Pak correspondence to our rpp:

```
sage: Pp = p.pak_correspondence(); Pp
[[2, 0, 1], [0, 2, 0], [1]]
sage: Pp.parent()
Tableaux
```

```
>>> from sage.all import *
>>> Pp = p.pak_correspondence(); Pp
[[2, 0, 1], [0, 2, 0], [1]]
>>> Pp.parent()
Tableaux
```

This is undone by the Sulzgruber correspondence:

```
sage: Pp.sulzgruber_correspondence() == p
True
```

```
>>> from sage.all import *
>>> Pp.sulzgruber_correspondence() == p
True
```

These four correspondences can also be accessed as standalone functions (*hillman_grassl_inverse()*, *hillman_grassl()*, *pak_correspondence()* and *sulzgruber_correspondence()*) that transform lists of lists into lists of lists; this may be more efficient. For example, the above computation of `HGp` can also be obtained as follows:

```
sage: from sage.combinat.hillman_grassl import hillman_grassl_inverse
sage: HGp_bare = hillman_grassl_inverse([[0, 1, 3], [2, 4, 4], [3]])
sage: HGp_bare
[[1, 2, 0], [1, 0, 1], [1]]
sage: isinstance(HGp_bare, list)

AUTHORS:

- Darij Grinberg and Tom Roby (2018): Initial implementation

class sage.combinat.hillman_grassl.**WeakReversePlanePartition**(*parent*, *t*)

Bases: *Tableau*

A weak reverse plane partition (short: rpp).

A weak reverse plane partition is a tableau with nonnegative entries that are weakly increasing in each row and weakly increasing in each column.

EXAMPLES:

```
sage: x = WeakReversePlanePartition([[0, 1, 1], [0, 1, 3], [1, 2, 2], [1, 2, 3],␣
↪[2]]); x
[[0, 1, 1], [0, 1, 3], [1, 2, 2], [1, 2, 3], [2]]
sage: x.pp()
  0  1  1
  0  1  3
  1  2  2
  1  2  3
  2
sage: x.shape()
[3, 3, 3, 3, 1]
```

```
>>> from sage.all import *
>>> x = WeakReversePlanePartition([[Integer(0), Integer(1), Integer(1)],␣
↪[Integer(0), Integer(1), Integer(3)], [Integer(1), Integer(2), Integer(2)],␣
↪[Integer(1), Integer(2), Integer(3)], [Integer(2)]]); x
[[0, 1, 1], [0, 1, 3], [1, 2, 2], [1, 2, 3], [2]]
>>> x.pp()
  0  1  1
  0  1  3
  1  2  2
  1  2  3
  2
>>> x.shape()
[3, 3, 3, 3, 1]
```

conjugate()

Return the conjugate of `self`.

EXAMPLES:

```
sage: c = WeakReversePlanePartition([[1,1],[1,3],[2]]).conjugate(); c
[[1, 1, 2], [1, 3]]
sage: c.parent()
Weak Reverse Plane Partitions
```

```
>>> from sage.all import *
>>> c = WeakReversePlanePartition([[Integer(1),Integer(1)],[Integer(1),
↪Integer(3)],[Integer(2)]]).conjugate(); c
[[1, 1, 2], [1, 3]]
>>> c.parent()
Weak Reverse Plane Partitions
```

hillman_grassl_inverse()

Return the image of the λ-rpp `self` under the inverse of the Hillman-Grassl correspondence (as a *Tableau*).

Fix a partition λ (see `Partition()`). We draw all partitions and tableaux in English notation.

A *λ-array* will mean a tableau of shape λ whose entries are nonnegative integers. (No conditions on the order of these entries are made. Note that 0 is allowed.)

A *weak reverse plane partition of shape λ* (short: *λ-rpp*) will mean a λ-array whose entries weakly increase along each row and weakly increase along each column.

The inverse H^{-1} of the Hillman-Grassl correspondence (see `hillman_grassl()` for the latter) sends a λ-rpp π to a λ-array $H^{-1}(\pi)$ constructed recursively as follows:

- If all entries of π are 0, then $H^{-1}(\pi) = \pi$.
- Otherwise, let s be the index of the leftmost column of π containing a nonzero entry. Write the λ-array M as $(m_{i,j})$.
- Define a sequence $((i_1, j_1), (i_2, j_2), \ldots, (i_n, j_n))$ of boxes in the diagram of λ (actually a lattice path made of northward and eastward steps) as follows: Let (i_1, j_1) be the bottommost box in the s-th column of π. If (i_k, j_k) is defined for some $k \geq 1$, then (i_{k+1}, j_{k+1}) is constructed as follows: If q_{i_k-1,j_k} is well-defined and equals q_{i_k,j_k}, then we set $(i_{k+1}, j_{k+1}) = (i_k - 1, j_k)$. Otherwise, we set $(i_{k+1}, j_{k+1}) = (i_k, j_k + 1)$ if this is still a box of λ. Otherwise, the sequence ends here.
- Let π' be the λ-rpp obtained from π by subtracting 1 from the (i_k, j_k)-th entry of π for each $k \in \{1, 2, \ldots, n\}$.
- Let N' be the image $H^{-1}(\pi')$ (which is already constructed by recursion). Then, $H^{-1}(\pi)$ is obtained from N' by adding 1 to the (i_n, s)-th entry of N'.

This construction appears in [HilGra1976] Section 6 (where λ-arrays are re-encoded as sequences of "hook number multiplicities") and [EnumComb2] Section 7.22.

`hillman_grassl_inverse()` for the inverse of the Hillman-Grassl correspondence as a standalone function.

`hillman_grassl()` for the inverse map.

EXAMPLES:

```
sage: a = WeakReversePlanePartition([[2, 2, 4], [2, 3, 4], [3, 5]])
sage: a.hillman_grassl_inverse()
[[2, 1, 1], [0, 2, 0], [1, 1]]
sage: b = WeakReversePlanePartition([[1, 1, 2, 2], [1, 1, 2, 2], [2, 2, 3, 3],
↪ [2, 2, 3, 3]])
sage: B = b.hillman_grassl_inverse(); B
[[1, 0, 1, 0], [0, 1, 0, 1], [1, 0, 1, 0], [0, 1, 0, 1]]
sage: b.parent(), B.parent()
(Weak Reverse Plane Partitions, Tableaux)
```

```
>>> from sage.all import *
>>> a = WeakReversePlanePartition([[Integer(2), Integer(2), Integer(4)],␣
↪[Integer(2), Integer(3), Integer(4)], [Integer(3), Integer(5)]])
>>> a.hillman_grassl_inverse()
[[2, 1, 1], [0, 2, 0], [1, 1]]
>>> b = WeakReversePlanePartition([[Integer(1), Integer(1), Integer(2),␣
↪Integer(2)], [Integer(1), Integer(1), Integer(2), Integer(2)], [Integer(2),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(2), Integer(3), Integer(3)], [Integer(2), Integer(2), Integer(3),␣
↪Integer(3)]])
>>> B = b.hillman_grassl_inverse(); B
[[1, 0, 1, 0], [0, 1, 0, 1], [1, 0, 1, 0], [0, 1, 0, 1]]
>>> b.parent(), B.parent()
(Weak Reverse Plane Partitions, Tableaux)
```

Applying the inverse of the Hillman-Grassl correspondence to the transpose of a λ-rpp M yields the same result as applying it to M and then transposing the result ([Gans1981] Corollary 3.4):

```
sage: a = WeakReversePlanePartition([[1,3,5],[2,4]])
sage: aic = a.hillman_grassl_inverse().conjugate()
sage: aic == a.conjugate().hillman_grassl_inverse()
True
```

```
>>> from sage.all import *
>>> a = WeakReversePlanePartition([[Integer(1),Integer(3),Integer(5)],
↪[Integer(2),Integer(4)]])
>>> aic = a.hillman_grassl_inverse().conjugate()
>>> aic == a.conjugate().hillman_grassl_inverse()
True
```

pak_correspondence()

Return the image of the λ-rpp `self` under the Pak correspondence (as a *Tableau*).

See *hillman_grassl*.

The Pak correspondence is the map ξ_λ from [Sulzgr2017] Section 7, and is the map ξ_λ from [Pak2002] Section 4. It is the inverse of the Sulzgruber correspondence (*sulzgruber_correspondence()*). The following description of the Pak correspondence follows [Hopkins2017] (which denotes it by $\mathcal{RSK}^{-1}$):

Fix a partition λ (see *Partition()*). We draw all partitions and tableaux in English notation.

A *λ-array* will mean a tableau of shape λ whose entries are nonnegative integers. (No conditions on the order of these entries are made. Note that 0 is allowed.)

A *weak reverse plane partition of shape λ* (short: *λ-rpp*) will mean a λ-array whose entries weakly increase along each row and weakly increase along each column.

We shall also use the following notation: If (u, v) is a cell of λ, and if π is a λ-rpp, then:

- the *lower bound* of π at (u, v) (denoted by $\pi_{<(u,v)}$) is defined to be $\max\{\pi_{u-1,v}, \pi_{u,v-1}\}$ (where $\pi_{0,v}$ and $\pi_{u,0}$ are understood to mean 0).
- the *upper bound* of π at (u, v) (denoted by $\pi_{>(u,v)}$) is defined to be $\min\{\pi_{u+1,v}, \pi_{u,v+1}\}$ (where $\pi_{i,j}$ is understood to mean $+\infty$ if (i, j) is not in λ; thus, the upper bound at a corner cell is $+\infty$).
- *toggling* π at (u, v) means replacing the entry $\pi_{u,v}$ of π at (u, v) by $\pi_{<(u,v)} + \pi_{>(u,v)} - \pi_{u,v}$ (this is well-defined as long as (u, v) is not a corner of λ).

Note that every λ-rpp π and every cell (u, v) of λ satisfy $\pi_{<(u,v)} \leq \pi_{u,v} \leq \pi_{>(u,v)}$. Note that toggling a λ-rpp (at a cell that is not a corner) always results in a λ-rpp. Also, toggling is an involution).

Note also that the lower bound of π at (u, v) is defined (and finite) even when (u, v) is not a cell of λ, as long as both $(u - 1, v)$ and $(u, v - 1)$ are cells of λ.

The Pak correspondence Φ_λ sends a λ-array $M = (m_{i,j})$ to a λ-rpp $\Phi_\lambda(M)$. It is defined by recursion on λ (that is, we assume that Φ_μ is already defined for every partition μ smaller than λ), and its definition proceeds as follows:

- If $\lambda = \varnothing$, then Φ_λ is the obvious bijection sending the only $\varnothing$-array to the only $\varnothing$-rpp.
- Pick any corner $c = (i, j)$ of λ, and let μ be the result of removing this corner c from the partition λ. (The exact choice of c is immaterial.)
- Let M' be what remains of M when the corner cell c is removed.
- Let $\pi' = \Phi_\mu(M')$.
- For each positive integer k such that $(i-k, j-k)$ is a cell of λ, toggle π' at $(i-k, j-k)$. (All these togglings commute, so the order in which they are made is immaterial.)
- Extend the μ-rpp π' to a λ-rpp π by adding the cell c and writing the number $m_{i,j} - \pi'_{<(i,j)}$ into this cell.
- Set $\Phi_\lambda(M) = \pi$.

See also

pak_correspondence() for the Pak correspondence as a standalone function.

sulzgruber_correspondence() for the inverse map.

EXAMPLES:

```
sage: a = WeakReversePlanePartition([[1, 2, 3], [1, 2, 3], [2, 4, 4]])
sage: A = a.pak_correspondence(); A
[[1, 0, 2], [0, 2, 0], [1, 1, 0]]
sage: a.parent(), A.parent()
(Weak Reverse Plane Partitions, Tableaux)
```

```
>>> from sage.all import *
>>> a = WeakReversePlanePartition([[Integer(1), Integer(2), Integer(3)],␣
↪[Integer(1), Integer(2), Integer(3)], [Integer(2), Integer(4), Integer(4)]])
>>> A = a.pak_correspondence(); A
[[1, 0, 2], [0, 2, 0], [1, 1, 0]]
>>> a.parent(), A.parent()
(Weak Reverse Plane Partitions, Tableaux)
```

Applying the Pak correspondence to the transpose of a λ-rpp M yields the same result as applying it to M and then transposing the result:

```
sage: a = WeakReversePlanePartition([[1,3,5],[2,4]])
sage: acc = a.pak_correspondence().conjugate()
sage: acc == a.conjugate().pak_correspondence()
True
```

```
>>> from sage.all import *
>>> a = WeakReversePlanePartition([[Integer(1),Integer(3),Integer(5)],
↪[Integer(2),Integer(4)]])
>>> acc = a.pak_correspondence().conjugate()
>>> acc == a.conjugate().pak_correspondence()
True
```

class sage.combinat.hillman_grassl.**WeakReversePlanePartitions**

Bases: *Tableaux*

The set of all weak reverse plane partitions.

Element

alias of *WeakReversePlanePartition*

sage.combinat.hillman_grassl.**hillman_grassl**(*M*)

Return the image of the λ-array `M` under the Hillman-Grassl correspondence.

The Hillman-Grassl correspondence is a bijection between the tableaux with nonnegative entries (otherwise arbitrary) and the weak reverse plane partitions with nonnegative entries. This bijection preserves the shape of the tableau. See *hillman_grassl*.

See *hillman_grassl()* for a description of this map.

↪ Integer(1)], [Integer(1)]])
[[1, 2, 4], [3, 5, 5], [4]]
>>> hillman_grassl([[Integer(1), Integer(1), Integer(1), Integer(1)]]*Integer(3))
[[1, 2, 3, 4], [2, 3, 4, 5], [3, 4, 5, 6]]
```

sage.combinat.hillman_grassl.**hillman_grassl_inverse**(*M*)

Return the image of the λ-rpp `M` under the inverse of the Hillman-Grassl correspondence.

See *hillman_grassl*.

See *hillman_grassl_inverse()* for a description of this map.

See also

hillman_grassl()

EXAMPLES:

```
sage: from sage.combinat.hillman_grassl import hillman_grassl_inverse
sage: hillman_grassl_inverse([[2, 2, 4], [2, 3, 4], [3, 5]])
[[2, 1, 1], [0, 2, 0], [1, 1]]
sage: hillman_grassl_inverse([[0, 1, 3], [2, 4, 4], [3]])
[[1, 2, 0], [1, 0, 1], [1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.hillman_grassl import hillman_grassl_inverse
>>> hillman_grassl_inverse([[Integer(2), Integer(2), Integer(4)], [Integer(2),␣
↪Integer(3), Integer(4)], [Integer(3), Integer(5)]])
[[2, 1, 1], [0, 2, 0], [1, 1]]
>>> hillman_grassl_inverse([[Integer(0), Integer(1), Integer(3)], [Integer(2),␣
↪Integer(4), Integer(4)], [Integer(3)]])
[[1, 2, 0], [1, 0, 1], [1]]
```

Applying the inverse of the Hillman-Grassl correspondence to the transpose of a λ-rpp M yields the same result as applying it to M and then transposing the result ([Gans1981] Corollary 3.4):

```
sage: hillman_grassl_inverse([[1,3,5],[2,4]])
[[1, 2, 2], [1, 1]]
sage: hillman_grassl_inverse([[1,2],[3,4],[5]])
[[1, 1], [2, 1], [2]]
sage: hillman_grassl_inverse([[1, 2, 3], [1, 2, 3], [2, 4, 4]])
[[1, 2, 0], [0, 1, 1], [1, 0, 1]]
sage: hillman_grassl_inverse([[1, 2, 3, 4], [2, 3, 4, 5], [3, 4, 5, 6]])
[[1, 1, 1, 1], [1, 1, 1, 1], [1, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> hillman_grassl_inverse([[Integer(1),Integer(3),Integer(5)],[Integer(2),
↪Integer(4)]])
[[1, 2, 2], [1, 1]]
>>> hillman_grassl_inverse([[Integer(1),Integer(2)],[Integer(3),Integer(4)],
↪[Integer(5)]])
[[1, 1], [2, 1], [2]]
>>> hillman_grassl_inverse([[Integer(1), Integer(2), Integer(3)], [Integer(1),␣
↪Integer(2), Integer(3)], [Integer(2), Integer(4), Integer(4)]])
[[1, 2, 0], [0, 1, 1], [1, 0, 1]]
>>> hillman_grassl_inverse([[Integer(1), Integer(2), Integer(3), Integer(4)],␣
↪[Integer(2), Integer(3), Integer(4), Integer(5)], [Integer(3), Integer(4),␣
↪Integer(5), Integer(6)]])
[[1, 1, 1, 1], [1, 1, 1, 1], [1, 1, 1, 1]]
```

sage.combinat.hillman_grassl.**pak_correspondence**(*M*, *copy=True*)

Return the image of a λ-rpp `M` under the Pak correspondence.

The Pak correspondence is the map ξ_λ from [Sulzgr2017] Section 7, and is the map ξ_λ from [Pak2002] Section 4. It is the inverse of the Sulzgruber correspondence (*sulzgruber_correspondence()*).

See *pak_correspondence()* for a description of this map.

INPUT:

- `copy` – boolean (default: `True`); if set to `False`, the algorithm will mutate the input (but be more efficient)

EXAMPLES:

```
sage: from sage.combinat.hillman_grassl import pak_correspondence
sage: pak_correspondence([[1, 2, 3], [1, 2, 3], [2, 4, 4]])
[[1, 0, 2], [0, 2, 0], [1, 1, 0]]
sage: pak_correspondence([[1, 1, 4], [2, 3, 4], [4, 4, 4]])
[[1, 1, 2], [0, 1, 0], [3, 0, 0]]
sage: pak_correspondence([[0, 2, 3], [1, 3, 3], [2, 4]])
[[1, 0, 2], [0, 2, 0], [1, 1]]
sage: pak_correspondence([[1, 2, 4], [1, 3], [3]])
[[0, 2, 2], [1, 1], [2]]
sage: pak_correspondence([[1, 2, 3, 4], [2, 3, 4, 5], [3, 4, 5, 6]])
[[1, 1, 1, 1], [1, 1, 1, 1], [1, 1, 1, 1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.hillman_grassl import pak_correspondence
>>> pak_correspondence([[Integer(1), Integer(2), Integer(3)], [Integer(1),␣
↪Integer(2), Integer(3)], [Integer(2), Integer(4), Integer(4)]])
[[1, 0, 2], [0, 2, 0], [1, 1, 0]]
>>> pak_correspondence([[Integer(1), Integer(1), Integer(4)], [Integer(2),␣
↪Integer(3), Integer(4)], [Integer(4), Integer(4), Integer(4)]])
[[1, 1, 2], [0, 1, 0], [3, 0, 0]]
>>> pak_correspondence([[Integer(0), Integer(2), Integer(3)], [Integer(1),␣
↪Integer(3), Integer(3)], [Integer(2), Integer(4)]])
[[1, 0, 2], [0, 2, 0], [1, 1]]
>>> pak_correspondence([[Integer(1), Integer(2), Integer(4)], [Integer(1),␣
↪Integer(3)], [Integer(3)]])
[[0, 2, 2], [1, 1], [2]]
>>> pak_correspondence([[Integer(1), Integer(2), Integer(3), Integer(4)],␣
↪[Integer(2), Integer(3), Integer(4), Integer(5)], [Integer(3), Integer(4),␣
↪Integer(5), Integer(6)]])
[[1, 1, 1, 1], [1, 1, 1, 1], [1, 1, 1, 1]]
```

The Pak correspondence can actually be extended (by the same definition) to "rpps" of nonnegative reals rather than nonnegative integers. This implementation supports this:

```
sage: pak_correspondence([[0, 1, 3/2], [1/2, 3/2, 3/2], [1, 2]])
[[1/2, 0, 1], [0, 1, 0], [1/2, 1/2]]
```

```
>>> from sage.all import *
>>> pak_correspondence([[Integer(0), Integer(1), Integer(3)/Integer(2)],␣
↪[Integer(1)/Integer(2), Integer(3)/Integer(2), Integer(3)/Integer(2)],␣
↪[Integer(1), Integer(2)]])
[[1/2, 0, 1], [0, 1, 0], [1/2, 1/2]]
```

sage.combinat.hillman_grassl.**sulzgruber_correspondence**(*M*)

Return the image of a λ-array `M` under the Sulzgruber correspondence.

The Sulzgruber correspondence is the map Φ_λ from [Sulzgr2017] Section 7, and is the map ξ_λ^{-1} from [Pak2002] Section 5. It is denoted by $\mathcal{RSK}$ in [Hopkins2017]. It is the inverse of the Pak correspondence (*pak_correspondence()*).

See *sulzgruber_correspondence()* for a description of this map.

EXAMPLES:

```
sage: from sage.combinat.hillman_grassl import sulzgruber_correspondence
sage: sulzgruber_correspondence([[1, 0, 2], [0, 2, 0], [1, 1, 0]])
[[1, 2, 3], [1, 2, 3], [2, 4, 4]]
sage: sulzgruber_correspondence([[1, 1, 2], [0, 1, 0], [3, 0, 0]])
[[1, 1, 4], [2, 3, 4], [4, 4, 4]]
sage: sulzgruber_correspondence([[1, 0, 2], [0, 2, 0], [1, 1]])
[[0, 2, 3], [1, 3, 3], [2, 4]]
sage: sulzgruber_correspondence([[0, 2, 2], [1, 1], [2]])
[[1, 2, 4], [1, 3], [3]]
sage: sulzgruber_correspondence([[1, 1, 1, 1]]*3)
[[1, 2, 3, 4], [2, 3, 4, 5], [3, 4, 5, 6]]
```

```
>>> from sage.all import *
>>> from sage.combinat.hillman_grassl import sulzgruber_correspondence
>>> sulzgruber_correspondence([[Integer(1), Integer(0), Integer(2)], [Integer(0),␣
↪Integer(2), Integer(0)], [Integer(1), Integer(1), Integer(0)]])
[[1, 2, 3], [1, 2, 3], [2, 4, 4]]
>>> sulzgruber_correspondence([[Integer(1), Integer(1), Integer(2)], [Integer(0),␣
↪Integer(1), Integer(0)], [Integer(3), Integer(0), Integer(0)]])
[[1, 1, 4], [2, 3, 4], [4, 4, 4]]
>>> sulzgruber_correspondence([[Integer(1), Integer(0), Integer(2)], [Integer(0),␣
↪Integer(2), Integer(0)], [Integer(1), Integer(1)]])
[[0, 2, 3], [1, 3, 3], [2, 4]]
>>> sulzgruber_correspondence([[Integer(0), Integer(2), Integer(2)], [Integer(1),␣
↪Integer(1)], [Integer(2)]])
[[1, 2, 4], [1, 3], [3]]
>>> sulzgruber_correspondence([[Integer(1), Integer(1), Integer(1),␣
↪Integer(1)]]*Integer(3))
[[1, 2, 3, 4], [2, 3, 4, 5], [3, 4, 5, 6]]
```

The Sulzgruber correspondence can actually be extended (by the same definition) to arrays of nonnegative reals rather than nonnegative integers. This implementation supports this:

```
sage: sulzgruber_correspondence([[1/2, 0, 1], [0, 1, 0], [1/2, 1/2]])
[[0, 1, 3/2], [1/2, 3/2, 3/2], [1, 2]]
```

```
>>> from sage.all import *
>>> sulzgruber_correspondence([[Integer(1)/Integer(2), Integer(0), Integer(1)],␣
↪[Integer(0), Integer(1), Integer(0)], [Integer(1)/Integer(2), Integer(1)/
↪Integer(2)]])
[[0, 1, 3/2], [1/2, 3/2, 3/2], [1, 2]]
```

sage.combinat.hillman_grassl.**transpose**(*M*)

Return the transpose of a λ-array.

The transpose of a λ-array $(m_{i,j})$ is the λ^t-array $(m_{j,i})$ (where λ^t is the conjugate of the partition λ).

EXAMPLES:

```
sage: from sage.combinat.hillman_grassl import transpose
sage: transpose([[1, 2, 3], [4, 5]])
[[1, 4], [2, 5], [3]]
sage: transpose([[5, 0, 3], [4, 1, 0], [7]])
[[5, 4, 7], [0, 1], [3, 0]]
```

```
>>> from sage.all import *
>>> from sage.combinat.hillman_grassl import transpose

[[5, 4, 7], [0, 1], [3, 0]]
```

Tiling solver

Tiling a n-dimensional polyomino with n-dimensional polyominoes.

This module defines two classes:

- *sage.combinat.tiling.Polyomino* class, to represent polyominoes in arbitrary dimension. The goal of this class is to return all the rotated, reflected and/or translated copies of a polyomino that are contained in a certain box.
- *sage.combinat.tiling.TilingSolver* class, to solve the problem of tiling a n-dimensional polyomino with a set of n-dimensional polyominoes. One can specify if rotations and reflections are allowed or not and if pieces can be reused or not. This class convert the tiling data into rows of a matrix that are passed to the DLX solver. It also allows to compute the number of solutions.

This uses dancing links code which is in Sage. Dancing links were originally introduced by Donald Knuth in 2000 [Knuth1]. Knuth used dancing links to solve tilings of a region by 2d pentaminoes. Here we extend the method to any dimension.

In particular, the `sage.games.quantumino` module is based on the Tiling Solver and allows to solve the 3d Quantumino puzzle.

AUTHOR:

- Sébastien Labbé, June 2011, initial version
- Sébastien Labbé, July 2015, count solutions up to rotations
- Sébastien Labbé, April 2017, tiling a polyomino, not only a rectangular box

EXAMPLES:

2d Easy Example

Here is a 2d example. Let us try to fill the 3×2 rectangle with a 1×2 rectangle and a 2×2 square. Obviously, there are two solutions:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0), (0,1)])
sage: q = Polyomino([(0,0), (0,1), (1,0), (1,1)])
```

(continues on next page)

(continued from previous page)

```
sage: T = TilingSolver([p,q], box=[3,2])
sage: it = T.solve()
sage: next(it)
[Polyomino: [(0, 0), (0, 1), (1, 0), (1, 1)], Color: gray,
 Polyomino: [(2, 0), (2, 1)], Color: gray]
sage: next(it)
[Polyomino: [(1, 0), (1, 1), (2, 0), (2, 1)], Color: gray,
 Polyomino: [(0, 0), (0, 1)], Color: gray]
sage: next(it)
Traceback (most recent call last):
...
StopIteration
sage: T.number_of_solutions()
2
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1))])
>>> q = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1)), (Integer(1),
↪Integer(0)), (Integer(1),Integer(1))])
>>> T = TilingSolver([p,q], box=[Integer(3),Integer(2)])
>>> it = T.solve()
>>> next(it)
[Polyomino: [(0, 0), (0, 1), (1, 0), (1, 1)], Color: gray,
 Polyomino: [(2, 0), (2, 1)], Color: gray]
>>> next(it)
[Polyomino: [(1, 0), (1, 1), (2, 0), (2, 1)], Color: gray,
 Polyomino: [(0, 0), (0, 1)], Color: gray]
>>> next(it)
Traceback (most recent call last):
...
StopIteration
>>> T.number_of_solutions()
2
```

Scott's pentamino problem

As mentioned in the introduction of [Knuth1], Scott's pentamino problem consists in tiling a chessboard leaving the center four squares vacant with the 12 distinct pentaminoes.

The 12 pentaminoes:

```
sage: from sage.combinat.tiling import Polyomino
sage: I = Polyomino([(0,0),(1,0),(2,0),(3,0),(4,0)], color='brown')
sage: N = Polyomino([(1,0),(1,1),(1,2),(0,2),(0,3)], color='yellow')
sage: L = Polyomino([(0,0),(1,0),(0,1),(0,2),(0,3)], color='magenta')
sage: U = Polyomino([(0,0),(1,0),(0,1),(0,2),(1,2)], color='violet')
sage: X = Polyomino([(1,0),(0,1),(1,1),(1,2),(2,1)], color='pink')
sage: W = Polyomino([(2,0),(2,1),(1,1),(1,2),(0,2)], color='green')
sage: P = Polyomino([(1,0),(2,0),(0,1),(1,1),(2,1)], color='orange')
sage: F = Polyomino([(1,0),(1,1),(0,1),(2,1),(2,2)], color='gray')
sage: Z = Polyomino([(0,0),(1,0),(1,1),(1,2),(2,2)], color='yellow')
```

(continues on next page)

(continued from previous page)

```
sage: T = Polyomino([(0,0),(0,1),(1,1),(2,1),(0,2)], color='red')
sage: Y = Polyomino([(0,0),(1,0),(2,0),(3,0),(2,1)], color='green')
sage: V = Polyomino([(0,0),(0,1),(0,2),(1,0),(2,0)], color='blue')
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> I = Polyomino([(Integer(0),Integer(0)),(Integer(1),Integer(0)),(Integer(2),
↪Integer(0)),(Integer(3),Integer(0)),(Integer(4),Integer(0))], color='brown')
>>> N = Polyomino([(Integer(1),Integer(0)),(Integer(1),Integer(1)),(Integer(1),
↪Integer(2)),(Integer(0),Integer(2)),(Integer(0),Integer(3))], color='yellow')
>>> L = Polyomino([(Integer(0),Integer(0)),(Integer(1),Integer(0)),(Integer(0),
↪Integer(1)),(Integer(0),Integer(2)),(Integer(0),Integer(3))], color='magenta')
>>> U = Polyomino([(Integer(0),Integer(0)),(Integer(1),Integer(0)),(Integer(0),
↪Integer(1)),(Integer(0),Integer(2)),(Integer(1),Integer(2))], color='violet')
>>> X = Polyomino([(Integer(1),Integer(0)),(Integer(0),Integer(1)),(Integer(1),
↪Integer(1)),(Integer(1),Integer(2)),(Integer(2),Integer(1))], color='pink')
>>> W = Polyomino([(Integer(2),Integer(0)),(Integer(2),Integer(1)),(Integer(1),
↪Integer(1)),(Integer(1),Integer(2)),(Integer(0),Integer(2))], color='green')
>>> P = Polyomino([(Integer(1),Integer(0)),(Integer(2),Integer(0)),(Integer(0),
↪Integer(1)),(Integer(1),Integer(1)),(Integer(2),Integer(1))], color='orange')
>>> F = Polyomino([(Integer(1),Integer(0)),(Integer(1),Integer(1)),(Integer(0),
↪Integer(1)),(Integer(2),Integer(1)),(Integer(2),Integer(2))], color='gray')
>>> Z = Polyomino([(Integer(0),Integer(0)),(Integer(1),Integer(0)),(Integer(1),
↪Integer(1)),(Integer(1),Integer(2)),(Integer(2),Integer(2))], color='yellow')
>>> T = Polyomino([(Integer(0),Integer(0)),(Integer(0),Integer(1)),(Integer(1),
↪Integer(1)),(Integer(2),Integer(1)),(Integer(0),Integer(2))], color='red')
>>> Y = Polyomino([(Integer(0),Integer(0)),(Integer(1),Integer(0)),(Integer(2),
↪Integer(0)),(Integer(3),Integer(0)),(Integer(2),Integer(1))], color='green')
>>> V = Polyomino([(Integer(0),Integer(0)),(Integer(0),Integer(1)),(Integer(0),
↪Integer(2)),(Integer(1),Integer(0)),(Integer(2),Integer(0))], color='blue')
```

A 8×8 chessboard leaving the center four squares vacant:

```
sage: import itertools
sage: s = set(itertools.product(range(8), repeat=2))
sage: s.difference_update([(3,3), (3,4), (4,3), (4,4)])
sage: chessboard = Polyomino(s)
sage: len(chessboard)
60
```

```
>>> from sage.all import *
>>> import itertools
>>> s = set(itertools.product(range(Integer(8)), repeat=Integer(2)))
>>> s.difference_update([(Integer(3),Integer(3)), (Integer(3),Integer(4)),␣
↪(Integer(4),Integer(3)), (Integer(4),Integer(4))])
>>> chessboard = Polyomino(s)
>>> len(chessboard)
60
```

This problem is represented by a matrix made of 1568 rows and 72 columns. It has 65 different solutions up to isometries:

```
sage: from sage.combinat.tiling import TilingSolver
sage: T = TilingSolver([I,N,L,U,X,W,P,F,Z,T,Y,V], box=chessboard, reflection=True)
sage: T
Tiling solver of 12 pieces into a box of size 60
Rotation allowed: True
Reflection allowed: True
Reusing pieces allowed: False
sage: len(T.rows())                # long time
1568
sage: T.number_of_solutions()      # long time
520
sage: 520 / 8
65
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver
>>> T = TilingSolver([I,N,L,U,X,W,P,F,Z,T,Y,V], box=chessboard, reflection=True)
>>> T
Tiling solver of 12 pieces into a box of size 60
Rotation allowed: True
Reflection allowed: True
Reusing pieces allowed: False
>>> len(T.rows())                # long time
1568
>>> T.number_of_solutions()      # long time
520
>>> Integer(520) / Integer(8)
65
```

Showing one solution:

```
sage: solution = next(T.solve())                                    # long time
sage: G = sum([piece.show2d() for piece in solution], Graphics())   # long time,␣
↪needs sage.plot
sage: G.show(aspect_ratio=1, axes=False)                            # long time,␣
↪needs sage.plot
```

```
>>> from sage.all import *
>>> solution = next(T.solve())                                    # long time
>>> G = sum([piece.show2d() for piece in solution], Graphics())   # long time, needs␣
↪sage.plot
>>> G.show(aspect_ratio=Integer(1), axes=False)                            # long␣
↪time, needs sage.plot
```

1d Easy Example

Here is an easy one dimensional example where we try to tile a stick of length 6 with three sticks of length 1, 2 and 3. There are six solutions:

```
sage: p = Polyomino([[0]])
sage: q = Polyomino([[0],[1]])
sage: r = Polyomino([[0],[1],[2]])
```

(continues on next page)

(continued from previous page)

```
sage: T = TilingSolver([p,q,r], box=[6])
sage: len(T.rows())
15
sage: it = T.solve()
sage: next(it)
[Polyomino: [(0)], Color: gray,
 Polyomino: [(1), (2)], Color: gray,
 Polyomino: [(3), (4), (5)], Color: gray]
sage: next(it)
[Polyomino: [(0)], Color: gray,
 Polyomino: [(1), (2), (3)], Color: gray,
 Polyomino: [(4), (5)], Color: gray]
sage: T.number_of_solutions()
6
```

```
>>> from sage.all import *
>>> p = Polyomino([[Integer(0)]])
>>> q = Polyomino([[Integer(0)],[Integer(1)]])
>>> r = Polyomino([[Integer(0)],[Integer(1)],[Integer(2)]])
>>> T = TilingSolver([p,q,r], box=[Integer(6)])
>>> len(T.rows())
15
>>> it = T.solve()
>>> next(it)
[Polyomino: [(0)], Color: gray,
 Polyomino: [(1), (2)], Color: gray,
 Polyomino: [(3), (4), (5)], Color: gray]
>>> next(it)
[Polyomino: [(0)], Color: gray,
 Polyomino: [(1), (2), (3)], Color: gray,
 Polyomino: [(4), (5)], Color: gray]
>>> T.number_of_solutions()
6
```

2d Puzzle allowing reflections

The following is a puzzle owned by Florent Hivert:

```
sage: from sage.combinat.tiling import Polyomino, TilingSolver
sage: L = []
sage: L.append(Polyomino([(0,0),(0,1),(0,2),(0,3),(1,0),(1,1),(1,2),(1,3)], 'yellow'))
sage: L.append(Polyomino([(0,0),(0,1),(0,2),(0,3),(1,0),(1,1),(1,2)], "black"))
sage: L.append(Polyomino([(0,0),(0,1),(0,2),(0,3),(1,0),(1,1),(1,3)], "gray"))
sage: L.append(Polyomino([(0,0),(0,1),(0,2),(0,3),(1,0),(1,3)],"cyan"))
sage: L.append(Polyomino([(0,0),(0,1),(0,2),(0,3),(1,0),(1,1)],"red"))
sage: L.append(Polyomino([(0,0),(0,1),(0,2),(0,3),(1,1),(1,2)],"blue"))
sage: L.append(Polyomino([(0,0),(0,1),(0,2),(0,3),(1,1),(1,3)],"green"))
sage: L.append(Polyomino([(0,1),(0,2),(0,3),(1,0),(1,1),(1,3)],"magenta"))
sage: L.append(Polyomino([(0,1),(0,2),(0,3),(1,0),(1,1),(1,2)],"orange"))
sage: L.append(Polyomino([(0,0),(0,1),(0,2),(1,0),(1,1),(1,2)],"pink"))
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino, TilingSolver
>>> L = []
>>> L.append(Polyomino([(Integer(0),Integer(0)),(Integer(0),Integer(1)),(Integer(0),
↪Integer(2)),(Integer(0),Integer(3)),(Integer(1),Integer(0)),(Integer(1),Integer(1)),
↪(Integer(1),Integer(2)),(Integer(1),Integer(3))], 'yellow'))
>>> L.append(Polyomino([(Integer(0),Integer(0)),(Integer(0),Integer(1)),(Integer(0),
↪Integer(2)),(Integer(0),Integer(3)),(Integer(1),Integer(0)),(Integer(1),Integer(1)),
↪(Integer(1),Integer(2))], "black"))
>>> L.append(Polyomino([(Integer(0),Integer(0)),(Integer(0),Integer(1)),(Integer(0),
↪Integer(2)),(Integer(0),Integer(3)),(Integer(1),Integer(0)),(Integer(1),Integer(1)),
↪(Integer(1),Integer(3))], "gray"))
>>> L.append(Polyomino([(Integer(0),Integer(0)),(Integer(0),Integer(1)),(Integer(0),
↪Integer(2)),(Integer(0),Integer(3)),(Integer(1),Integer(0)),(Integer(1),
↪Integer(3))],"cyan"))
>>> L.append(Polyomino([(Integer(0),Integer(0)),(Integer(0),Integer(1)),(Integer(0),
↪Integer(2)),(Integer(0),Integer(3)),(Integer(1),Integer(0)),(Integer(1),
↪Integer(1))],"red"))
>>> L.append(Polyomino([(Integer(0),Integer(0)),(Integer(0),Integer(1)),(Integer(0),
↪Integer(2)),(Integer(0),Integer(3)),(Integer(1),Integer(1)),(Integer(1),
↪Integer(2))],"blue"))
>>> L.append(Polyomino([(Integer(0),Integer(0)),(Integer(0),Integer(1)),(Integer(0),
↪Integer(2)),(Integer(0),Integer(3)),(Integer(1),Integer(1)),(Integer(1),
↪Integer(3))],"green"))
>>> L.append(Polyomino([(Integer(0),Integer(1)),(Integer(0),Integer(2)),(Integer(0),
↪Integer(3)),(Integer(1),Integer(0)),(Integer(1),Integer(1)),(Integer(1),
↪Integer(3))],"magenta"))
>>> L.append(Polyomino([(Integer(0),Integer(1)),(Integer(0),Integer(2)),(Integer(0),
↪Integer(3)),(Integer(1),Integer(0)),(Integer(1),Integer(1)),(Integer(1),
↪Integer(2))],"orange"))
>>> L.append(Polyomino([(Integer(0),Integer(0)),(Integer(0),Integer(1)),(Integer(0),
↪Integer(2)),(Integer(1),Integer(0)),(Integer(1),Integer(1)),(Integer(1),
↪Integer(2))],"pink"))
```

By default, rotations are allowed and reflections are not. In this case, there are no solutions for tiling a 8×8 rectangular box:

```
sage: T = TilingSolver(L, box=(8,8))
sage: T.number_of_solutions()                                    # long time (2.5s)
0
```

```
>>> from sage.all import *
>>> T = TilingSolver(L, box=(Integer(8),Integer(8)))
>>> T.number_of_solutions()                                      # long time (2.5s)
0
```

If reflections are allowed, there are solutions. Solve the puzzle and show one solution:

```
sage: T = TilingSolver(L, box=(8,8), reflection=True)
sage: solution = next(T.solve())                                 # long time (7s)
sage: G = sum([piece.show2d() for piece in solution], Graphics())  # long time (<1s),
↪ needs sage.plot
sage: G.show(aspect_ratio=1, axes=False)                         # long time (2s),␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.plot
```

```
>>> from sage.all import *
>>> T = TilingSolver(L, box=(Integer(8),Integer(8)), reflection=True)
>>> solution = next(T.solve())                                    # long time (7s)
>>> G = sum([piece.show2d() for piece in solution], Graphics())   # long time (<1s),␣
↪needs sage.plot
>>> G.show(aspect_ratio=Integer(1), axes=False)                              # long␣
↪time (2s), needs sage.plot
```

Compute the number of solutions:

```
sage: T.number_of_solutions()                                    # long time (2.6s)
328
```

```
>>> from sage.all import *
>>> T.number_of_solutions()                                    # long time (2.6s)
328
```

Create a animation of all the solutions:

```
sage: a = T.animate()                                # not tested
sage: a                                              # not tested
Animation with 328 frames
```

```
>>> from sage.all import *
>>> a = T.animate()                                # not tested
>>> a                                              # not tested
Animation with 328 frames
```

3d Puzzle

The same thing done in 3d *without* allowing reflections this time:

```
sage: from sage.combinat.tiling import Polyomino, TilingSolver
sage: L = []
sage: L.append(Polyomino([(0,0,0),(0,1,0),(0,2,0),(0,3,0),(1,0,0),(1,1,0),(1,2,0),(1,
↪3,0)]))
sage: L.append(Polyomino([(0,0,0),(0,1,0),(0,2,0),(0,3,0),(1,0,0),(1,1,0),(1,2,0)]))
sage: L.append(Polyomino([(0,0,0),(0,1,0),(0,2,0),(0,3,0),(1,0,0),(1,1,0),(1,3,0)]))
sage: L.append(Polyomino([(0,0,0),(0,1,0),(0,2,0),(0,3,0),(1,0,0),(1,3,0)]))
sage: L.append(Polyomino([(0,0,0),(0,1,0),(0,2,0),(0,3,0),(1,0,0),(1,1,0)]))
sage: L.append(Polyomino([(0,0,0),(0,1,0),(0,2,0),(0,3,0),(1,1,0),(1,2,0)]))
sage: L.append(Polyomino([(0,0,0),(0,1,0),(0,2,0),(0,3,0),(1,1,0),(1,3,0)]))
sage: L.append(Polyomino([(0,1,0),(0,2,0),(0,3,0),(1,0,0),(1,1,0),(1,3,0)]))
sage: L.append(Polyomino([(0,1,0),(0,2,0),(0,3,0),(1,0,0),(1,1,0),(1,2,0)]))
sage: L.append(Polyomino([(0,0,0),(0,1,0),(0,2,0),(1,0,0),(1,1,0),(1,2,0)]))
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino, TilingSolver
>>> L = []
```

(continues on next page)

(continued from previous page)

```
>>> L.append(Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(1),
↪Integer(0)),(Integer(0),Integer(2),Integer(0)),(Integer(0),Integer(3),Integer(0)),
↪(Integer(1),Integer(0),Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),
↪Integer(2),Integer(0)),(Integer(1),Integer(3),Integer(0))]))
>>> L.append(Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(1),
↪Integer(0)),(Integer(0),Integer(2),Integer(0)),(Integer(0),Integer(3),Integer(0)),
↪(Integer(1),Integer(0),Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),
↪Integer(2),Integer(0))]))
>>> L.append(Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(1),
↪Integer(0)),(Integer(0),Integer(2),Integer(0)),(Integer(0),Integer(3),Integer(0)),
↪(Integer(1),Integer(0),Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),
↪Integer(3),Integer(0))]))
>>> L.append(Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(1),
↪Integer(0)),(Integer(0),Integer(2),Integer(0)),(Integer(0),Integer(3),Integer(0)),
↪(Integer(1),Integer(0),Integer(0)),(Integer(1),Integer(3),Integer(0))]))
>>> L.append(Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(1),
↪Integer(0)),(Integer(0),Integer(2),Integer(0)),(Integer(0),Integer(3),Integer(0)),
↪(Integer(1),Integer(0),Integer(0)),(Integer(1),Integer(1),Integer(0))]))
>>> L.append(Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(1),
↪Integer(0)),(Integer(0),Integer(2),Integer(0)),(Integer(0),Integer(3),Integer(0)),
↪(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(2),Integer(0))]))
>>> L.append(Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(1),
↪Integer(0)),(Integer(0),Integer(2),Integer(0)),(Integer(0),Integer(3),Integer(0)),
↪(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(3),Integer(0))]))
>>> L.append(Polyomino([(Integer(0),Integer(1),Integer(0)),(Integer(0),Integer(2),
↪Integer(0)),(Integer(0),Integer(3),Integer(0)),(Integer(1),Integer(0),Integer(0)),
↪(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(3),Integer(0))]))
>>> L.append(Polyomino([(Integer(0),Integer(1),Integer(0)),(Integer(0),Integer(2),
↪Integer(0)),(Integer(0),Integer(3),Integer(0)),(Integer(1),Integer(0),Integer(0)),
↪(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(2),Integer(0))]))
>>> L.append(Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(1),
↪Integer(0)),(Integer(0),Integer(2),Integer(0)),(Integer(1),Integer(0),Integer(0)),
↪(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(2),Integer(0))]))
```

Solve the puzzle and show one solution:

```
sage: T = TilingSolver(L, box=(8,8,1))
sage: solution = next(T.solve())                                    # long time (8s)
sage: G = sum([p.show3d(size=0.85) for p in solution], Graphics())  # long time (<1s),
↪ needs sage.plot
sage: G.show(aspect_ratio=1, viewer='tachyon')                      # long time (2s),␣
↪needs sage.plot
```

```
>>> from sage.all import *
>>> T = TilingSolver(L, box=(Integer(8),Integer(8),Integer(1)))
>>> solution = next(T.solve())                                    # long time (8s)
>>> G = sum([p.show3d(size=RealNumber('0.85')) for p in solution], Graphics())  #␣
↪long time (<1s), needs sage.plot
>>> G.show(aspect_ratio=Integer(1), viewer='tachyon')                      # long␣
↪time (2s), needs sage.plot
```

Let us compute the number of solutions:

```
sage: T.number_of_solutions()                                          # long time (3s)
328
```

```
>>> from sage.all import *
>>> T.number_of_solutions()                                          # long time (3s)
328
```

Donald Knuth example : the Y pentamino

Donald Knuth [Knuth1] considered the problem of packing 45 Y pentaminoes into a 15×15 square:

```
sage: from sage.combinat.tiling import Polyomino, TilingSolver
sage: y = Polyomino([(0,0),(1,0),(2,0),(3,0),(2,1)])
sage: T = TilingSolver([y], box=(5,10), reusable=True, reflection=True)
sage: T.number_of_solutions()
10
sage: solution = next(T.solve())
sage: G = sum([p.show2d() for p in solution], Graphics())                          #␣
↪needs sage.plot
sage: G.show(aspect_ratio=1)                                          # long time (2s),␣
↪needs sage.plot
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino, TilingSolver
>>> y = Polyomino([(Integer(0),Integer(0)),(Integer(1),Integer(0)),(Integer(2),
↪Integer(0)),(Integer(3),Integer(0)),(Integer(2),Integer(1))])
>>> T = TilingSolver([y], box=(Integer(5),Integer(10)), reusable=True,␣
↪reflection=True)
>>> T.number_of_solutions()
10
>>> solution = next(T.solve())
>>> G = sum([p.show2d() for p in solution], Graphics())                            #␣
↪needs sage.plot
>>> G.show(aspect_ratio=Integer(1))                                          # long␣
↪time (2s), needs sage.plot
```

```
sage: T = TilingSolver([y], box=(15,15), reusable=True, reflection=True)
sage: T.number_of_solutions()                       # not tested
1696
```

```
>>> from sage.all import *
>>> T = TilingSolver([y], box=(Integer(15),Integer(15)), reusable=True,␣
↪reflection=True)
>>> T.number_of_solutions()                       # not tested
1696
```

Up to the symmetries of the square, there are 212 distinct solutions:

```
sage: 1696 // 8
212
```

```
>>> from sage.all import *
>>> Integer(1696) // Integer(8)
212
```

Animation of Donald Knuth's dancing links

Animation of the solutions:

```
sage: from sage.combinat.tiling import Polyomino, TilingSolver
sage: Y = Polyomino([(0,0),(1,0),(2,0),(3,0),(2,1)], color='yellow')
sage: T = TilingSolver([Y], box=(15,15), reusable=True, reflection=True)
sage: a = T.animate(stop=40); a                    # long time, optional -␣
↪imagemagick, needs sage.plot
Animation with 40 frames
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino, TilingSolver
>>> Y = Polyomino([(Integer(0),Integer(0)),(Integer(1),Integer(0)),(Integer(2),
↪Integer(0)),(Integer(3),Integer(0)),(Integer(2),Integer(1))], color='yellow')
>>> T = TilingSolver([Y], box=(Integer(15),Integer(15)), reusable=True,␣
↪reflection=True)
>>> a = T.animate(stop=Integer(40)); a                    # long time, optional -␣
↪imagemagick, needs sage.plot
Animation with 40 frames
```

Incremental animation of the solutions (one piece is removed/added at a time):

```
sage: a = T.animate('incremental', stop=40); a      # long time, optional -␣
↪imagemagick, needs sage.plot
Animation with 40 frames
sage: a.show(delay=50, iterations=1)                # long time, optional -␣
↪imagemagick, needs sage.plot
```

```
>>> from sage.all import *
>>> a = T.animate('incremental', stop=Integer(40)); a      # long time, optional -␣
↪imagemagick, needs sage.plot
Animation with 40 frames
>>> a.show(delay=Integer(50), iterations=Integer(1))                # long time,␣
↪optional - imagemagick, needs sage.plot
```

5d Easy Example

Here is a 5d example. Let us try to fill the $2 \times 2 \times 2 \times 2 \times 2$ rectangle with reusable $1 \times 1 \times 1 \times 1 \times 1$ rectangles. Obviously, there is one solution:

```
sage: from sage.combinat.tiling import Polyomino, TilingSolver
sage: p = Polyomino([(0,0,0,0,0)])
sage: T = TilingSolver([p], box=(2,2,2,2,2), reusable=True)
sage: rows = T.rows()                               # long time (3s)
sage: rows                                          # long time (fast)
[[0], [1], [2], [3], [4], [5], [6], [7], [8], [9], [10], [11], [12],
 [13], [14], [15], [16], [17], [18], [19], [20], [21], [22], [23], [24],
```

(continues on next page)

(continued from previous page)

```
 [25], [26], [27], [28], [29], [30], [31]]
sage: T.number_of_solutions()                          # long time (fast)
1
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino, TilingSolver
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0),Integer(0),Integer(0))])
>>> T = TilingSolver([p], box=(Integer(2),Integer(2),Integer(2),Integer(2),
↪Integer(2)), reusable=True)
>>> rows = T.rows()                                    # long time (3s)
>>> rows                                               # long time (fast)
[[0], [1], [2], [3], [4], [5], [6], [7], [8], [9], [10], [11], [12],
 [13], [14], [15], [16], [17], [18], [19], [20], [21], [22], [23], [24],
 [25], [26], [27], [28], [29], [30], [31]]
>>> T.number_of_solutions()                            # long time (fast)
1
```

class sage.combinat.tiling.**Polyomino**(*coords*, *color='gray'*, *dimension=None*)

Bases: SageObject

A polyomino in $\mathbf{Z}^d$.

The polyomino is the union of the unit square (or cube, or n-cube) centered at those coordinates. Such an object should be connected, but the code does not make this assumption.

INPUT:

- `coords` – iterable of integer coordinates in $\mathbf{Z}^d$
- `color` – string (default: `'gray'`); color for display
- `dimension` – integer (default: `None`); dimension of the space, if `None`, it is guessed from the `coords` if `coords` is non empty

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: Polyomino([(0,0,0), (0,1,0), (1,1,0), (1,1,1)], color='blue')
Polyomino: [(0, 0, 0), (0, 1, 0), (1, 1, 0), (1, 1, 1)], Color: blue
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(1),
↪Integer(0)), (Integer(1),Integer(1),Integer(0)), (Integer(1),Integer(1),
↪Integer(1))], color='blue')
Polyomino: [(0, 0, 0), (0, 1, 0), (1, 1, 0), (1, 1, 1)], Color: blue
```

boundary()

Return the boundary of a 2d polyomino.

INPUT:

- `self` – a 2d polyomino

OUTPUT:

- list of edges (an edge is a pair of adjacent 2d coordinates)

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0), (1,0), (0,1), (1,1)])
sage: sorted(p.boundary())
[((-0.5, -0.5), (-0.5, 0.5)), ((-0.5, -0.5), (0.5, -0.5)),
 ((-0.5, 0.5), (-0.5, 1.5)), ((-0.5, 1.5), (0.5, 1.5)),
 ((0.5, -0.5), (1.5, -0.5)), ((0.5, 1.5), (1.5, 1.5)),
 ((1.5, -0.5), (1.5, 0.5)), ((1.5, 0.5), (1.5, 1.5))]
sage: len(_)
8
sage: p = Polyomino([(5,5)])
sage: sorted(p.boundary())
[((4.5, 4.5), (4.5, 5.5)), ((4.5, 4.5), (5.5, 4.5)),
 ((4.5, 5.5), (5.5, 5.5)), ((5.5, 4.5), (5.5, 5.5))]
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0)), (Integer(1),Integer(0)),␣
↪(Integer(0),Integer(1)), (Integer(1),Integer(1))])
>>> sorted(p.boundary())
[((-0.5, -0.5), (-0.5, 0.5)), ((-0.5, -0.5), (0.5, -0.5)),
 ((-0.5, 0.5), (-0.5, 1.5)), ((-0.5, 1.5), (0.5, 1.5)),
 ((0.5, -0.5), (1.5, -0.5)), ((0.5, 1.5), (1.5, 1.5)),
 ((1.5, -0.5), (1.5, 0.5)), ((1.5, 0.5), (1.5, 1.5))]
>>> len(_)
8
>>> p = Polyomino([(Integer(5),Integer(5))])
>>> sorted(p.boundary())
[((4.5, 4.5), (4.5, 5.5)), ((4.5, 4.5), (5.5, 4.5)),
 ((4.5, 5.5), (5.5, 5.5)), ((5.5, 4.5), (5.5, 5.5))]
```

bounding_box()

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0),(1,0,0),(1,1,0),(1,1,1),(1,2,0)], color='deeppink
↪')
sage: p.bounding_box()
[[0, 0, 0], [1, 2, 1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(1),Integer(0),
↪Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(1),
↪Integer(1)),(Integer(1),Integer(2),Integer(0))], color='deeppink')
>>> p.bounding_box()
[[0, 0, 0], [1, 2, 1]]
```

canonical()

Return the translated copy of `self` having minimal and nonnegative coordinates

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0),(1,0,0),(1,1,0),(1,1,1),(1,2,0)], color='deeppink
↪')
sage: p
Polyomino: [(0, 0, 0), (1, 0, 0), (1, 1, 0), (1, 1, 1), (1, 2, 0)], Color:␣
↪deeppink
sage: p.canonical()
Polyomino: [(0, 0, 0), (1, 0, 0), (1, 1, 0), (1, 1, 1), (1, 2, 0)], Color:␣
↪deeppink
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(1),Integer(0),
↪Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(1),
↪Integer(1)),(Integer(1),Integer(2),Integer(0))], color='deeppink')
>>> p
Polyomino: [(0, 0, 0), (1, 0, 0), (1, 1, 0), (1, 1, 1), (1, 2, 0)], Color:␣
↪deeppink
>>> p.canonical()
Polyomino: [(0, 0, 0), (1, 0, 0), (1, 1, 0), (1, 1, 1), (1, 2, 0)], Color:␣
↪deeppink
```

canonical_isometric_copies(*orientation_preserving=True*, *mod_box_isometries=False*)

Return the list of image of `self` under isometries of the n-cube where the coordinates are all nonnegative and minimal.

INPUT:

- `orientation_preserving` – boolean (default: `True`); if `True`, the group of isometries of the n-cube is restricted to those that preserve the orientation, i.e. of determinant 1.
- `mod_box_isometries` – boolean (default: `False`); whether to quotient the group of isometries of the n-cube by the subgroup of isometries of the $a_1 \times a_2 \cdots \times a_n$ rectangular box where are the a_i are assumed to be distinct.

OUTPUT: set of Polyomino

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0), (0,1,0), (1,1,0), (1,1,1)], color='blue')
sage: s = p.canonical_isometric_copies()
sage: len(s)
12
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(1),
↪Integer(0)), (Integer(1),Integer(1),Integer(0)), (Integer(1),Integer(1),
↪Integer(1))], color='blue')
>>> s = p.canonical_isometric_copies()
>>> len(s)
12
```

With the non orientation-preserving:

```
sage: s = p.canonical_isometric_copies(orientation_preserving=False)
sage: len(s)
24
```

```
>>> from sage.all import *
>>> s = p.canonical_isometric_copies(orientation_preserving=False)
>>> len(s)
24
```

Modulo rotation by angle 180 degrees:

```
sage: s = p.canonical_isometric_copies(mod_box_isometries=True)
sage: len(s)
3
```

```
>>> from sage.all import *
>>> s = p.canonical_isometric_copies(mod_box_isometries=True)
>>> len(s)
3
```

center()

Return the center of the polyomino.

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0),(0,0,1)])
sage: p.center()
(0, 0, 1/2)
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(0),
↪Integer(1))])
>>> p.center()
(0, 0, 1/2)
```

In 3d:

```
sage: p = Polyomino([(0,0,0),(1,0,0),(1,1,0),(1,1,1),(1,2,0)], color='deeppink
↪')
sage: p.center()
(4/5, 4/5, 1/5)
```

```
>>> from sage.all import *
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(1),Integer(0),
↪Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(1),
↪Integer(1)),(Integer(1),Integer(2),Integer(0))], color='deeppink')
>>> p.center()
(4/5, 4/5, 1/5)
```

In 2d:

```
sage: p = Polyomino([(0,0),(1,0),(1,1),(1,2)])
sage: p.center()
(3/4, 3/4)
```

```
>>> from sage.all import *
>>> p = Polyomino([(Integer(0),Integer(0)),(Integer(1),Integer(0)),
↪(Integer(1),Integer(1)),(Integer(1),Integer(2))])
>>> p.center()
(3/4, 3/4)
```

color(*color=None*)

Return or change the color of the polyomino.

INPUT:

- `color` – string, RBG tuple or `None` (default: `None`), if `None`, it returns the current color

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0), (0,1,0), (1,1,0), (1,1,1)], color='blue')
sage: p.color()
'blue'
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(1),
↪Integer(0)), (Integer(1),Integer(1),Integer(0)), (Integer(1),Integer(1),
↪Integer(1))], color='blue')
>>> p.color()
'blue'
```

frozenset()

Return the elements of $\mathbf{Z}^d$ in the polyomino as a frozenset.

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0), (0,1,0), (1,1,0), (1,1,1)], color='red')
sage: p.frozenset()
frozenset({(0, 0, 0), (0, 1, 0), (1, 1, 0), (1, 1, 1)})
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(1),
↪Integer(0)), (Integer(1),Integer(1),Integer(0)), (Integer(1),Integer(1),
↪Integer(1))], color='red')
>>> p.frozenset()
frozenset({(0, 0, 0), (0, 1, 0), (1, 1, 0), (1, 1, 1)})
```

intersection(*other*)

Return the intersection of `self` and `other`.

INPUT:

- `other` – a polyomino

OUTPUT: polyomino

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: a = Polyomino([(0,0)])
sage: b = Polyomino([(0,0), (0,1), (1,1), (2,1)])
sage: a.intersection(b)
Polyomino: [(0, 0)], Color: gray
sage: a.intersection(b+(1,1))
Polyomino: [], Color: gray
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> a = Polyomino([(Integer(0),Integer(0))])
>>> b = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1)),␣
↪(Integer(1),Integer(1)), (Integer(2),Integer(1))])
>>> a.intersection(b)
Polyomino: [(0, 0)], Color: gray
>>> a.intersection(b+(Integer(1),Integer(1)))
Polyomino: [], Color: gray
```

isometric_copies(*box*, *orientation_preserving=True*, *mod_box_isometries=False*)

Return the translated and isometric images of `self` that lies in the box.

INPUT:

- `box` – polyomino or tuple of integers (size of a box)
- `orientation_preserving` – boolean (default: `True`); if `True`, the group of isometries of the n-cube is restricted to those that preserve the orientation, i.e. of determinant 1.
- `mod_box_isometries` – boolean (default: `False`); whether to quotient the group of isometries of the n-cube by the subgroup of isometries of the $a_1 \times a_2 \cdots \times a_n$ rectangular box where are the a_i are assumed to be distinct.

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0),(1,0,0),(1,1,0),(1,1,1),(1,2,0)], color='deeppink
↪')
sage: L = list(p.isometric_copies(box=(5,8,2)))
sage: len(L)
360
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(1),Integer(0),
↪Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(1),
↪Integer(1)),(Integer(1),Integer(2),Integer(0))], color='deeppink')
>>> L = list(p.isometric_copies(box=(Integer(5),Integer(8),Integer(2))))
>>> len(L)
360
```

```
sage: p = Polyomino([(0,0,0),(1,0,0),(1,1,0),(1,2,0),(1,2,1)], color='orange')
sage: L = list(p.isometric_copies(box=(5,8,2)))
sage: len(L)
180
sage: L = list(p.isometric_copies((5,8,2), False))
sage: len(L)
360
sage: L = list(p.isometric_copies((5,8,2), mod_box_isometries=True))
sage: len(L)
45
```

```
>>> from sage.all import *
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(1),Integer(0),
↪Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(2),
↪Integer(0)),(Integer(1),Integer(2),Integer(1))], color='orange')
>>> L = list(p.isometric_copies(box=(Integer(5),Integer(8),Integer(2))))
>>> len(L)
180
>>> L = list(p.isometric_copies((Integer(5),Integer(8),Integer(2)), False))
>>> len(L)
360
>>> L = list(p.isometric_copies((Integer(5),Integer(8),Integer(2)), mod_box_
↪isometries=True))
>>> len(L)
45
```

```
sage: p = Polyomino([(0,0), (1,0), (0,1)])
sage: b = Polyomino([(0,0), (1,0), (2,0), (0,1), (1,1), (0,2)])
sage: sorted(p.isometric_copies(b), key=lambda p: p.sorted_list())
[Polyomino: [(0, 0), (0, 1), (1, 0)], Color: gray,
 Polyomino: [(0, 0), (0, 1), (1, 1)], Color: gray,
 Polyomino: [(0, 0), (1, 0), (1, 1)], Color: gray,
 Polyomino: [(0, 1), (0, 2), (1, 1)], Color: gray,
 Polyomino: [(0, 1), (1, 0), (1, 1)], Color: gray,
 Polyomino: [(1, 0), (1, 1), (2, 0)], Color: gray]
```

```
>>> from sage.all import *
>>> p = Polyomino([(Integer(0),Integer(0)), (Integer(1),Integer(0)),␣
↪(Integer(0),Integer(1))])
>>> b = Polyomino([(Integer(0),Integer(0)), (Integer(1),Integer(0)),␣
↪(Integer(2),Integer(0)), (Integer(0),Integer(1)), (Integer(1),Integer(1)),␣
↪(Integer(0),Integer(2))])
>>> sorted(p.isometric_copies(b), key=lambda p: p.sorted_list())
[Polyomino: [(0, 0), (0, 1), (1, 0)], Color: gray,
 Polyomino: [(0, 0), (0, 1), (1, 1)], Color: gray,
 Polyomino: [(0, 0), (1, 0), (1, 1)], Color: gray,
 Polyomino: [(0, 1), (0, 2), (1, 1)], Color: gray,
 Polyomino: [(0, 1), (1, 0), (1, 1)], Color: gray,
 Polyomino: [(1, 0), (1, 1), (2, 0)], Color: gray]
```

isometric_copies_intersection(*box*, *orientation_preserving=True*)

Return the set of non empty intersections of isometric images of `self` with a polyomino.

INPUT:

- `box` – polyomino or tuple of integers (size of a box)
- `orientation_preserving` – boolean (default: `True`); if `True`, the group of isometries of the n-cube is restricted to those that preserve the orientation, i.e. of determinant 1.

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0),(1,0)], color='deeppink')
sage: sorted(sorted(a.frozenset()) for a in p.isometric_copies_
↪intersection(box=(2,3)))
[[(0, 0)],
 [(0, 0), (0, 1)],
 [(0, 0), (1, 0)],
 [(0, 1)],
 [(0, 1), (0, 2)],
 [(0, 1), (1, 1)],
 [(0, 2)],
 [(0, 2), (1, 2)],
 [(1, 0)],
 [(1, 0), (1, 1)],
 [(1, 1)],
 [(1, 1), (1, 2)],
 [(1, 2)]]
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0)),(Integer(1),Integer(0))], color=
↪'deeppink')
>>> sorted(sorted(a.frozenset()) for a in p.isometric_copies_
↪intersection(box=(Integer(2),Integer(3))))
[[(0, 0)],
 [(0, 0), (0, 1)],
 [(0, 0), (1, 0)],
 [(0, 1)],
 [(0, 1), (0, 2)],
 [(0, 1), (1, 1)],
 [(0, 2)],
 [(0, 2), (1, 2)],
 [(1, 0)],
 [(1, 0), (1, 1)],
 [(1, 1)],
 [(1, 1), (1, 2)],
 [(1, 2)]]
```

neighbor_edges()

Return an iterator over the pairs of neighbor coordinates inside of the polyomino.

Two points P and Q in the polyomino are neighbor if $P - Q$ has one coordinate equal to $+1$ or -1 and zero everywhere else.

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0),(0,0,1)])
sage: [sorted(edge) for edge in p.neighbor_edges()]
[[(0, 0, 0), (0, 0, 1)]]
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(0),Integer(0),
↪Integer(1))])
>>> [sorted(edge) for edge in p.neighbor_edges()]
[[(0, 0, 0), (0, 0, 1)]]
```

In 3d:

```
sage: p = Polyomino([(0,0,0),(1,0,0),(1,1,0),(1,1,1),(1,2,0)], color='deeppink
↪')
sage: L = sorted(sorted(edge) for edge in p.neighbor_edges())
sage: for a in L: a
[(0, 0, 0), (1, 0, 0)]
[(1, 0, 0), (1, 1, 0)]
[(1, 1, 0), (1, 1, 1)]
[(1, 1, 0), (1, 2, 0)]
```

```
>>> from sage.all import *
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)),(Integer(1),Integer(0),
↪Integer(0)),(Integer(1),Integer(1),Integer(0)),(Integer(1),Integer(1),
↪Integer(1)),(Integer(1),Integer(2),Integer(0))], color='deeppink')
>>> L = sorted(sorted(edge) for edge in p.neighbor_edges())
>>> for a in L: a
[(0, 0, 0), (1, 0, 0)]
[(1, 0, 0), (1, 1, 0)]
[(1, 1, 0), (1, 1, 1)]
[(1, 1, 0), (1, 2, 0)]
```

In 2d:

```
sage: p = Polyomino([(0,0),(1,0),(1,1),(1,2)])
sage: L = sorted(sorted(edge) for edge in p.neighbor_edges())
sage: for a in L: a
[(0, 0), (1, 0)]
[(1, 0), (1, 1)]
[(1, 1), (1, 2)]
```

```
>>> from sage.all import *
>>> p = Polyomino([(Integer(0),Integer(0)),(Integer(1),Integer(0)),
↪(Integer(1),Integer(1)),(Integer(1),Integer(2))])
>>> L = sorted(sorted(edge) for edge in p.neighbor_edges())
>>> for a in L: a
[(0, 0), (1, 0)]
[(1, 0), (1, 1)]
[(1, 1), (1, 2)]
```

self_surrounding(*radius*, *remove_incomplete_copies=True*, *ncpus=None*)

Return a list of isometric copies of `self` surrounding it with an annulus of given radius.

INPUT:

- `self` – a polyomino of dimension 2
- `radius` – integer
- `remove_incomplete_copies` – boolean (default: `True`); whether to keep only complete copies of `self` in the output
- `ncpus` – integer (default: `None`); maximal number of subprocesses to use at the same time. If `None`, it detects the number of effective CPUs in the system using `sage.parallel.ncpus.ncpus()`. If `ncpus=1`, the first solution is searched serially.

OUTPUT: list of polyominoes

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: H = Polyomino([(-1, 1), (-1, 4), (-1, 7), (0, 0), (0, 1), (0, 2),
....: (0, 3), (0, 4), (0, 5), (0, 6), (0, 7), (0, 8), (1, 1), (1, 2),
....: (1, 3), (1, 4), (1, 5), (1, 6), (1, 7), (1, 8), (2, 0), (2, 2),
....: (2, 3), (2, 5), (2, 6), (2, 8)])
sage: solution = H.self_surrounding(8)
sage: G = sum([p.show2d() for p in solution], Graphics())                    #␣
↪needs sage.plot
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> H = Polyomino([(-Integer(1), Integer(1)), (-Integer(1), Integer(4)), (-
↪Integer(1), Integer(7)), (Integer(0), Integer(0)), (Integer(0), Integer(1)),
↪ (Integer(0), Integer(2)),
... (Integer(0), Integer(3)), (Integer(0), Integer(4)), (Integer(0),␣
↪Integer(5)), (Integer(0), Integer(6)), (Integer(0), Integer(7)),␣
↪(Integer(0), Integer(8)), (Integer(1), Integer(1)), (Integer(1),␣
↪Integer(2)),
... (Integer(1), Integer(3)), (Integer(1), Integer(4)), (Integer(1),␣
↪Integer(5)), (Integer(1), Integer(6)), (Integer(1), Integer(7)),␣
↪(Integer(1), Integer(8)), (Integer(2), Integer(0)), (Integer(2),␣
↪Integer(2)),
... (Integer(2), Integer(3)), (Integer(2), Integer(5)), (Integer(2),␣
↪Integer(6)), (Integer(2), Integer(8))])
>>> solution = H.self_surrounding(Integer(8))
>>> G = sum([p.show2d() for p in solution], Graphics())                      #␣
↪needs sage.plot
```

```
sage: # long time
sage: solution = H.self_surrounding(8, remove_incomplete_copies=False)
sage: G = sum([p.show2d() for p in solution], Graphics())                    #␣
↪needs sage.plot
```

```
>>> from sage.all import *
>>> # long time
>>> solution = H.self_surrounding(Integer(8), remove_incomplete_copies=False)
```

(continues on next page)

(continued from previous page)

```
>>> G = sum([p.show2d() for p in solution], Graphics())                    #␣
↪needs sage.plot
```

show2d(*size=0.7*, *color='black'*, *thickness=1*)

Return a 2d Graphic object representing the polyomino.

INPUT:

- `self` – a polyomino of dimension 2
- `size` – number (default: `0.7`); the size of each square
- `color` – color (default: `'black'`); color of the boundary line
- `thickness` – number (default: `1`); how thick the boundary line is

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0),(1,0),(1,1),(1,2)], color='deeppink')
sage: p.show2d()                    # long time (0.5s)                    #␣
↪needs sage.plot
Graphics object consisting of 17 graphics primitives
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0)),(Integer(1),Integer(0)),
↪(Integer(1),Integer(1)),(Integer(1),Integer(2))], color='deeppink')
>>> p.show2d()                    # long time (0.5s)                    #␣
↪needs sage.plot
Graphics object consisting of 17 graphics primitives
```

show3d(*size=1*)

Return a 3d Graphic object representing the polyomino.

INPUT:

- `self` – a polyomino of dimension 3
- `size` – number (default: `1`); the size of each `1 \times 1 \times 1` cube. This does a homothety with respect to the center of the polyomino.

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0), (0,1,0), (1,1,0), (1,1,1)], color='blue')
sage: p.show3d()                    # long time (2s)                      #␣
↪needs sage.plot
Graphics3d Object
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(1),
↪Integer(0)), (Integer(1),Integer(1),Integer(0)), (Integer(1),Integer(1),
↪Integer(1))], color='blue')
>>> p.show3d()                    # long time (2s)                      #␣
```

(continues on next page)

(continued from previous page)

```
↪needs sage.plot
Graphics3d Object
```

sorted_list()

Return the color of the polyomino.

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0), (0,1,0), (1,1,0), (1,1,1)], color='blue')
sage: p.sorted_list()
[(0, 0, 0), (0, 1, 0), (1, 1, 0), (1, 1, 1)]
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(1),
↪Integer(0)), (Integer(1),Integer(1),Integer(0)), (Integer(1),Integer(1),
↪Integer(1))], color='blue')
>>> p.sorted_list()
[(0, 0, 0), (0, 1, 0), (1, 1, 0), (1, 1, 1)]
```

translated_copies(*box*)

Return an iterator over the translated images of `self` inside a polyomino.

INPUT:

- `box` – polyomino or tuple of integers (size of a box)

OUTPUT: iterator of 3d polyominoes

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0,0),(1,0,0),(1,1,0),(1,1,1),(1,2,0)], color='deeppink
↪')
sage: for t in p.translated_copies(box=(5,8,2)): t
Polyomino: [(0, 0, 0), (1, 0, 0), (1, 1, 0), (1, 1, 1), (1, 2, 0)], Color:␣
↪deeppink
Polyomino: [(0, 1, 0), (1, 1, 0), (1, 2, 0), (1, 2, 1), (1, 3, 0)], Color:␣
↪deeppink
Polyomino: [(0, 2, 0), (1, 2, 0), (1, 3, 0), (1, 3, 1), (1, 4, 0)], Color:␣
↪deeppink
Polyomino: [(0, 3, 0), (1, 3, 0), (1, 4, 0), (1, 4, 1), (1, 5, 0)], Color:␣
↪deeppink
Polyomino: [(0, 4, 0), (1, 4, 0), (1, 5, 0), (1, 5, 1), (1, 6, 0)], Color:␣
↪deeppink
Polyomino: [(0, 5, 0), (1, 5, 0), (1, 6, 0), (1, 6, 1), (1, 7, 0)], Color:␣
↪deeppink
Polyomino: [(1, 0, 0), (2, 0, 0), (2, 1, 0), (2, 1, 1), (2, 2, 0)], Color:␣
↪deeppink
Polyomino: [(1, 1, 0), (2, 1, 0), (2, 2, 0), (2, 2, 1), (2, 3, 0)], Color:␣
↪deeppink
Polyomino: [(1, 2, 0), (2, 2, 0), (2, 3, 0), (2, 3, 1), (2, 4, 0)], Color:␣
↪deeppink
```

(continues on next page)

(continued from previous page)

Polyomino: [(3, 5, 0), (4, 5, 0), (4, 6, 0), (4, 6, 1), (4, 7, 0)], Color:␣
↪deeppink
```

This method is independent of the translation of the polyomino:

```
sage: q = Polyomino([(0,0,0), (1,0,0)])
sage: list(q.translated_copies((2,2,1)))
[Polyomino: [(0, 0, 0), (1, 0, 0)], Color: gray,
 Polyomino: [(0, 1, 0), (1, 1, 0)], Color: gray]
sage: q = Polyomino([(34,7,-9), (35,7,-9)])
sage: list(q.translated_copies((2,2,1)))
[Polyomino: [(0, 0, 0), (1, 0, 0)], Color: gray,
 Polyomino: [(0, 1, 0), (1, 1, 0)], Color: gray]
```

```
>>> from sage.all import *
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(1),Integer(0),
↪Integer(0))])
>>> list(q.translated_copies((Integer(2),Integer(2),Integer(1))))
[Polyomino: [(0, 0, 0), (1, 0, 0)], Color: gray,
 Polyomino: [(0, 1, 0), (1, 1, 0)], Color: gray]
>>> q = Polyomino([(Integer(34),Integer(7),-Integer(9)), (Integer(35),
```

(continues on next page)

(continued from previous page)

```
↪Integer(7),-Integer(9))])
>>> list(q.translated_copies((Integer(2),Integer(2),Integer(1))))
[Polyomino: [(0, 0, 0), (1, 0, 0)], Color: gray,
 Polyomino: [(0, 1, 0), (1, 1, 0)], Color: gray]
```

Inside smaller boxes:

```
sage: list(p.translated_copies(box=(2,2,3)))
[]
sage: list(p.translated_copies(box=(2,3,2)))
[Polyomino: [(0, 0, 0), (1, 0, 0), (1, 1, 0), (1, 1, 1), (1, 2, 0)], Color:␣
↪deeppink]
sage: list(p.translated_copies(box=(3,2,2)))
[]
sage: list(p.translated_copies(box=(1,1,1)))
[]
```

```
>>> from sage.all import *
>>> list(p.translated_copies(box=(Integer(2),Integer(2),Integer(3))))
[]
>>> list(p.translated_copies(box=(Integer(2),Integer(3),Integer(2))))
[Polyomino: [(0, 0, 0), (1, 0, 0), (1, 1, 0), (1, 1, 1), (1, 2, 0)], Color:␣
↪deeppink]
>>> list(p.translated_copies(box=(Integer(3),Integer(2),Integer(2))))
[]
>>> list(p.translated_copies(box=(Integer(1),Integer(1),Integer(1))))
[]
```

Using a Polyomino as input:

```
sage: b = Polyomino([(0,0), (0,1), (0,2), (1,0), (1,1), (1,2)])
sage: p = Polyomino([(0,0)])
sage: list(p.translated_copies(b))
[Polyomino: [(0, 0)], Color: gray,
 Polyomino: [(0, 1)], Color: gray,
 Polyomino: [(0, 2)], Color: gray,
 Polyomino: [(1, 0)], Color: gray,
 Polyomino: [(1, 1)], Color: gray,
 Polyomino: [(1, 2)], Color: gray]
```

```
>>> from sage.all import *
>>> b = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1)),␣
↪(Integer(0),Integer(2)), (Integer(1),Integer(0)), (Integer(1),Integer(1)),␣
↪(Integer(1),Integer(2))])
>>> p = Polyomino([(Integer(0),Integer(0))])
>>> list(p.translated_copies(b))
[Polyomino: [(0, 0)], Color: gray,
 Polyomino: [(0, 1)], Color: gray,
 Polyomino: [(0, 2)], Color: gray,
 Polyomino: [(1, 0)], Color: gray,
 Polyomino: [(1, 1)], Color: gray,
 Polyomino: [(1, 2)], Color: gray]
```

```
sage: p = Polyomino([(0,0), (1,0), (0,1)])
sage: b = Polyomino([(0,0), (1,0), (2,0), (0,1), (1,1), (0,2)])
sage: list(p.translated_copies(b))
[Polyomino: [(0, 0), (0, 1), (1, 0)], Color: gray,
 Polyomino: [(0, 1), (0, 2), (1, 1)], Color: gray,
 Polyomino: [(1, 0), (1, 1), (2, 0)], Color: gray]
```

```
>>> from sage.all import *
>>> p = Polyomino([(Integer(0),Integer(0)), (Integer(1),Integer(0)),␣
↪(Integer(0),Integer(1))])
>>> b = Polyomino([(Integer(0),Integer(0)), (Integer(1),Integer(0)),␣
↪(Integer(2),Integer(0)), (Integer(0),Integer(1)), (Integer(1),Integer(1)),␣
↪(Integer(0),Integer(2))])
>>> list(p.translated_copies(b))
[Polyomino: [(0, 0), (0, 1), (1, 0)], Color: gray,
 Polyomino: [(0, 1), (0, 2), (1, 1)], Color: gray,
 Polyomino: [(1, 0), (1, 1), (2, 0)], Color: gray]
```

translated_copies_intersection(*box*)

Return the set of non empty intersections of translated images of `self` with a polyomino.

INPUT:

- `box` – polyomino or tuple of integers (size of a box)

OUTPUT: set of 3d polyominoes

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino
sage: p = Polyomino([(0,0),(1,0)], color='deeppink')
sage: sorted(sorted(a.frozenset())
....:         for a in p.translated_copies_intersection(box=(2,3)))
[[(0, 0)],
 [(0, 0), (1, 0)],
 [(0, 1)],
 [(0, 1), (1, 1)],
 [(0, 2)],
 [(0, 2), (1, 2)],
 [(1, 0)],
 [(1, 1)],
 [(1, 2)]]
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino
>>> p = Polyomino([(Integer(0),Integer(0)),(Integer(1),Integer(0))], color=
↪'deeppink')
>>> sorted(sorted(a.frozenset())
...         for a in p.translated_copies_intersection(box=(Integer(2),
↪Integer(3))))
[[(0, 0)],
 [(0, 0), (1, 0)],
 [(0, 1)],
 [(0, 1), (1, 1)],
```

(continues on next page)

(continued from previous page)

```
 [(0, 2)],
 [(0, 2), (1, 2)],
 [(1, 0)],
 [(1, 1)],
 [(1, 2)]]
```

Using a Polyomino as input:

```
sage: b = Polyomino([(0,0), (0,1), (0,2), (1,0), (2,0)])
sage: p = Polyomino([(0,0), (1,0)])
sage: sorted(sorted(a.frozenset())
....:        for a in p.translated_copies_intersection(b))
[[(0, 0)], [(0, 0), (1, 0)], [(0, 1)], [(0, 2)], [(1, 0), (2, 0)], [(2, 0)]]
```

```
>>> from sage.all import *
>>> b = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1)),␣
↪(Integer(0),Integer(2)), (Integer(1),Integer(0)), (Integer(2),Integer(0))])
>>> p = Polyomino([(Integer(0),Integer(0)), (Integer(1),Integer(0))])
>>> sorted(sorted(a.frozenset())
...        for a in p.translated_copies_intersection(b))
[[(0, 0)], [(0, 0), (1, 0)], [(0, 1)], [(0, 2)], [(1, 0), (2, 0)], [(2, 0)]]
```

class sage.combinat.tiling.**TilingSolver**(*pieces*, *box*, *rotation=True*, *reflection=False*, *reusable=False*, *outside=False*)

Bases: SageObject

Tiling solver.

Solve the problem of tiling a polyomino with a certain number of polyominoes.

INPUT:

- `pieces` – iterable of Polyominoes
- `box` – polyomino or tuple of integers (size of a box)
- `rotation` – boolean (default: `True`); whether to allow rotations
- `reflection` – boolean (default: `False`); whether to allow reflections
- `reusable` – boolean (default: `False`); whether to allow the pieces to be reused
- `outside` – boolean (default: `False`); whether to allow pieces to partially go outside of the box (all non-empty intersection of the pieces with the box are considered)

EXAMPLES:

By default, rotations are allowed and reflections are not allowed:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
sage: q = Polyomino([(0,0,0), (0,0,1)])
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: T
Tiling solver of 3 pieces into a box of size 6
Rotation allowed: True
```

(continues on next page)

(continued from previous page)

```
Reflection allowed: False
Reusing pieces allowed: False
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))])
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1))])
>>> r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1)), (Integer(0),Integer(0),Integer(2))])
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)))
>>> T
Tiling solver of 3 pieces into a box of size 6
Rotation allowed: True
Reflection allowed: False
Reusing pieces allowed: False
```

Solutions are given by an iterator:

```
sage: it = T.solve()
sage: for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2)], Color: gray
Polyomino: [(0, 0, 3), (0, 0, 4), (0, 0, 5)], Color: gray
```

```
>>> from sage.all import *
>>> it = T.solve()
>>> for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2)], Color: gray
Polyomino: [(0, 0, 3), (0, 0, 4), (0, 0, 5)], Color: gray
```

Another solution:

```
sage: for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2), (0, 0, 3)], Color: gray
Polyomino: [(0, 0, 4), (0, 0, 5)], Color: gray
```

```
>>> from sage.all import *
>>> for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2), (0, 0, 3)], Color: gray
Polyomino: [(0, 0, 4), (0, 0, 5)], Color: gray
```

Tiling of a polyomino by polyominoes:

```
sage: b = Polyomino([(0,0), (1,0), (1,1), (2,1), (1,2), (2,2), (0,3), (1,3)])
sage: p = Polyomino([(0,0), (1,0)])
sage: T = TilingSolver([p], box=b, reusable=True)
sage: T.number_of_solutions()
2
```

```
>>> from sage.all import *
>>> b = Polyomino([(Integer(0),Integer(0)), (Integer(1),Integer(0)), (Integer(1),
↪Integer(1)), (Integer(2),Integer(1)), (Integer(1),Integer(2)), (Integer(2),
↪Integer(2)), (Integer(0),Integer(3)), (Integer(1),Integer(3))])
>>> p = Polyomino([(Integer(0),Integer(0)), (Integer(1),Integer(0))])
>>> T = TilingSolver([p], box=b, reusable=True)
>>> T.number_of_solutions()
2
```

animate(*partial=None*, *stop=None*, *size=0.75*, *axes=False*)

Return an animation of evolving solutions.

INPUT:

- `partial` – string (default: `None`); whether to include partial (incomplete) solutions. It can be one of the following:
  - `None` – include only complete solutions
  - `'common_prefix'` – common prefix between two consecutive solutions
  - `'incremental'` – one piece change at a time
- `stop` – integer (default: `None`); number of frames
- `size` – number (default: `0.75`); the size of each `1 \times 1` square. This does a homothety with respect to the center of each polyomino.
- `axes` – boolean (default: `False`); whether the x and y axes are shown

EXAMPLES:

```
sage: from sage.combinat.tiling import Polyomino, TilingSolver
sage: y = Polyomino([(0,0),(1,0),(2,0),(3,0),(2,1)], color='cyan')
sage: T = TilingSolver([y], box=(5,10), reusable=True, reflection=True)
sage: a = T.animate()                                                    #␣
↪needs sage.plot
sage: a                              # long time, optional - imagemagick,␣
↪needs sage.plot
Animation with 10 frames
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino, TilingSolver
>>> y = Polyomino([(Integer(0),Integer(0)),(Integer(1),Integer(0)),
↪(Integer(2),Integer(0)),(Integer(3),Integer(0)),(Integer(2),Integer(1))],␣
↪color='cyan')
>>> T = TilingSolver([y], box=(Integer(5),Integer(10)), reusable=True,␣
↪reflection=True)
>>> a = T.animate()                                                      #␣
↪needs sage.plot
>>> a                               # long time, optional - imagemagick, needs␣
↪sage.plot
Animation with 10 frames
```

Include partial solutions (common prefix between two consecutive solutions):

```
sage: a = T.animate('common_prefix')                                          #␣
↪needs sage.plot
sage: a                               # long time, optional - imagemagick,␣
↪needs sage.plot
Animation with 19 frames
```

```
>>> from sage.all import *
>>> a = T.animate('common_prefix')                                            #␣
↪needs sage.plot
>>> a                                 # long time, optional - imagemagick, needs␣
↪sage.plot
Animation with 19 frames
```

Incremental solutions (one piece removed or added at a time):

```
sage: a = T.animate('incremental')  # long time (2s)                          #␣
↪needs sage.plot
sage: a                               # long time (2s), optional - imagemagick,␣
↪needs sage.plot
Animation with 123 frames
```

```
>>> from sage.all import *
>>> a = T.animate('incremental')  # long time (2s)                            #␣
↪needs sage.plot
>>> a                                 # long time (2s), optional - imagemagick,␣
↪needs sage.plot
Animation with 123 frames
```

```
sage: a.show()                        # long time, optional - imagemagick,␣
↪needs sage.plot
```

```
>>> from sage.all import *
>>> a.show()                          # long time, optional - imagemagick, needs␣
↪sage.plot
```

The `show` function takes arguments to specify the delay between frames (measured in hundredths of a second, default value 20) and the number of iterations (default: 0, which means to iterate forever). To iterate 4 times with half a second between each frame:

```
sage: a.show(delay=50, iterations=4)        # long time, optional -␣
↪imagemagick, needs sage.plot
```

```
>>> from sage.all import *
>>> a.show(delay=Integer(50), iterations=Integer(4))        # long time,␣
↪optional - imagemagick, needs sage.plot
```

Limit the number of frames:

```
sage: a = T.animate('incremental', stop=13); a      # not tested              #␣
↪needs sage.plot
Animation with 13 frames
```

```
>>> from sage.all import *
>>> a = T.animate('incremental', stop=Integer(13)); a      # not tested
↪     # needs sage.plot
Animation with 13 frames
```

coord_to_int_dict()

Return a dictionary mapping coordinates to integers.

OUTPUT: dictionary

EXAMPLES:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
sage: q = Polyomino([(0,0,0), (0,0,1)])
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: A = T.coord_to_int_dict()
sage: sorted(A.items())
[((0, 0, 0), 3), ((0, 0, 1), 4), ((0, 0, 2), 5),
 ((0, 0, 3), 6), ((0, 0, 4), 7), ((0, 0, 5), 8)]
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))])
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1))])
>>> r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1)), (Integer(0),Integer(0),Integer(2))])
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)))
>>> A = T.coord_to_int_dict()
>>> sorted(A.items())
[((0, 0, 0), 3), ((0, 0, 1), 4), ((0, 0, 2), 5),
 ((0, 0, 3), 6), ((0, 0, 4), 7), ((0, 0, 5), 8)]
```

Reusable pieces:

```
sage: p = Polyomino([(0,0), (0,1)])
sage: q = Polyomino([(0,0), (0,1), (1,0), (1,1)])
sage: T = TilingSolver([p,q], box=[3,2], reusable=True)
sage: B = T.coord_to_int_dict()
sage: sorted(B.items())
[((0, 0), 0), ((0, 1), 1), ((1, 0), 2), ((1, 1), 3),
 ((2, 0), 4), ((2, 1), 5)]
```

```
>>> from sage.all import *
>>> p = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1))])
>>> q = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1)),
↪(Integer(1),Integer(0)), (Integer(1),Integer(1))])
>>> T = TilingSolver([p,q], box=[Integer(3),Integer(2)], reusable=True)
>>> B = T.coord_to_int_dict()
>>> sorted(B.items())
[((0, 0), 0), ((0, 1), 1), ((1, 0), 2), ((1, 1), 3),
 ((2, 0), 4), ((2, 1), 5)]
```

dlx_solver()

Return the sage DLX solver of that tiling problem.

OUTPUT: dLX Solver

EXAMPLES:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
sage: q = Polyomino([(0,0,0), (0,0,1)])
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: T.dlx_solver()
Dancing links solver for 9 columns and 15 rows
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))])
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1))])
>>> r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1)), (Integer(0),Integer(0),Integer(2))])
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)))
>>> T.dlx_solver()
Dancing links solver for 9 columns and 15 rows
```

int_to_coord_dict()

Return a dictionary mapping integers to coordinates.

EXAMPLES:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
sage: q = Polyomino([(0,0,0), (0,0,1)])
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: B = T.int_to_coord_dict()
sage: sorted(B.items())
[(3, (0, 0, 0)), (4, (0, 0, 1)), (5, (0, 0, 2)),
 (6, (0, 0, 3)), (7, (0, 0, 4)), (8, (0, 0, 5))]
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))])
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1))])
>>> r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1)), (Integer(0),Integer(0),Integer(2))])
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)))
>>> B = T.int_to_coord_dict()
>>> sorted(B.items())
[(3, (0, 0, 0)), (4, (0, 0, 1)), (5, (0, 0, 2)),
 (6, (0, 0, 3)), (7, (0, 0, 4)), (8, (0, 0, 5))]
```

Reusable pieces:

```
sage: from sage.combinat.tiling import Polyomino, TilingSolver
sage: p = Polyomino([(0,0), (0,1)])
sage: q = Polyomino([(0,0), (0,1), (1,0), (1,1)])
sage: T = TilingSolver([p,q], box=[3,2], reusable=True)
sage: B = T.int_to_coord_dict()
sage: sorted(B.items())
[(0, (0, 0)), (1, (0, 1)), (2, (1, 0)),
 (3, (1, 1)), (4, (2, 0)), (5, (2, 1))]
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import Polyomino, TilingSolver
>>> p = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1))])
>>> q = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1)),␣
↪(Integer(1),Integer(0)), (Integer(1),Integer(1))])
>>> T = TilingSolver([p,q], box=[Integer(3),Integer(2)], reusable=True)
>>> B = T.int_to_coord_dict()
>>> sorted(B.items())
[(0, (0, 0)), (1, (0, 1)), (2, (1, 0)),
 (3, (1, 1)), (4, (2, 0)), (5, (2, 1))]
```

is_suitable()

Return whether the volume of the box is equal to sum of the volume of the polyominoes and the number of rows sent to the DLX solver is larger than zero.

If these conditions are not verified, then the problem is not suitable in the sense that there are no solution.

EXAMPLES:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
sage: q = Polyomino([(0,0,0), (0,0,1)])
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: T.is_suitable()
True
sage: T = TilingSolver([p,q,r], box=(1,1,7))
sage: T.is_suitable()
False
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))])
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1))])
>>> r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1)), (Integer(0),Integer(0),Integer(2))])
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)))
>>> T.is_suitable()
True
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(7)))
>>> T.is_suitable()
False
```

nrows_per_piece()

Return the number of rows necessary by each piece.

OUTPUT: list

EXAMPLES:

```
sage: from sage.games.quantumino import QuantuminoSolver
sage: q = QuantuminoSolver(0)
sage: T = q.tiling_solver()
sage: T.nrows_per_piece()              # long time (10s)
[360, 360, 360, 360, 360, 180, 180, 672, 672, 360, 360, 180, 180, 360, 360,␣
↪180]
```

```
>>> from sage.all import *
>>> from sage.games.quantumino import QuantuminoSolver
>>> q = QuantuminoSolver(Integer(0))
>>> T = q.tiling_solver()
>>> T.nrows_per_piece()              # long time (10s)
[360, 360, 360, 360, 360, 180, 180, 672, 672, 360, 360, 180, 180, 360, 360,␣
↪180]
```

number_of_solutions()

Return the number of distinct solutions.

OUTPUT: integer

EXAMPLES:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0)])
sage: q = Polyomino([(0,0), (0,1)])
sage: r = Polyomino([(0,0), (0,1), (0,2)])
sage: T = TilingSolver([p,q,r], box=(1,6))
sage: T.number_of_solutions()
6
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0))])
>>> q = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1))])
>>> r = Polyomino([(Integer(0),Integer(0)), (Integer(0),Integer(1)),␣
↪(Integer(0),Integer(2))])
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(6)))
>>> T.number_of_solutions()
6
```

```
sage: T = TilingSolver([p,q,r], box=(1,7))
sage: T.number_of_solutions()
0
```

```
>>> from sage.all import *
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(7)))
>>> T.number_of_solutions()
0
```

pieces()

Return the list of pieces.

OUTPUT: list of 3d polyominoes

EXAMPLES:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
sage: q = Polyomino([(0,0,0), (0,0,1)])
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: for p in T._pieces: p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 0), (0, 0, 1)], Color: gray
Polyomino: [(0, 0, 0), (0, 0, 1), (0, 0, 2)], Color: gray
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))])
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1))])
>>> r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1)), (Integer(0),Integer(0),Integer(2))])
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)))
>>> for p in T._pieces: p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 0), (0, 0, 1)], Color: gray
Polyomino: [(0, 0, 0), (0, 0, 1), (0, 0, 2)], Color: gray
```

row_to_polyomino(*row_number*)

Return a polyomino associated to a row.

INPUT:

- `row_number` – integer; the i-th row

OUTPUT: polyomino

EXAMPLES:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: a = Polyomino([(0,0,0), (0,0,1), (1,0,0)], color='blue')
sage: b = Polyomino([(0,0,0), (1,0,0), (0,1,0)], color='red')
sage: T = TilingSolver([a,b], box=(2,1,3))
sage: len(T.rows())
16
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> a = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1)), (Integer(1),Integer(0),Integer(0))], color='blue')
>>> b = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(1),Integer(0),
↪Integer(0)), (Integer(0),Integer(1),Integer(0))], color='red')
>>> T = TilingSolver([a,b], box=(Integer(2),Integer(1),Integer(3)))
```

(continues on next page)

(continued from previous page)

```
>>> len(T.rows())
16
```

```
sage: T.row_to_polyomino(7)
Polyomino: [(0, 0, 2), (1, 0, 1), (1, 0, 2)], Color: blue
```

```
>>> from sage.all import *
>>> T.row_to_polyomino(Integer(7))
Polyomino: [(0, 0, 2), (1, 0, 1), (1, 0, 2)], Color: blue
```

```
sage: T.row_to_polyomino(13)
Polyomino: [(0, 0, 1), (1, 0, 1), (1, 0, 2)], Color: red
```

```
>>> from sage.all import *
>>> T.row_to_polyomino(Integer(13))
Polyomino: [(0, 0, 1), (1, 0, 1), (1, 0, 2)], Color: red
```

rows()

Creation of the rows.

EXAMPLES:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
sage: q = Polyomino([(0,0,0), (0,0,1)])
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: rows = T.rows()
sage: for row in rows: row
[0, 3]
[0, 4]
[0, 5]
[0, 6]
[0, 7]
[0, 8]
[1, 3, 4]
[1, 4, 5]
[1, 5, 6]
[1, 6, 7]
[1, 7, 8]
[2, 3, 4, 5]
[2, 4, 5, 6]
[2, 5, 6, 7]
[2, 6, 7, 8]
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))])
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1))])
>>> r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
```

(continues on next page)

(continued from previous page)

```
↪Integer(1)), (Integer(0),Integer(0),Integer(2))])
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)))
>>> rows = T.rows()
>>> for row in rows: row
[0, 3]
[0, 4]
[0, 5]
[0, 6]
[0, 7]
[0, 8]
[1, 3, 4]
[1, 4, 5]
[1, 5, 6]
[1, 6, 7]
[1, 7, 8]
[2, 3, 4, 5]
[2, 4, 5, 6]
[2, 5, 6, 7]
[2, 6, 7, 8]
```

rows_for_piece(*i*, *mod_box_isometries=False*)

Return the rows for the i-th piece.

INPUT:

- `i` – integer; the i-th piece
- `mod_box_isometries` – boolean (default: `False`); whether to consider only rows for positions up to the action of the quotient the group of isometries of the n-cube by the subgroup of isometries of the $a_1 \times a_2 \cdots \times a_n$ rectangular box where are the a_i are assumed to be distinct.

EXAMPLES:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
sage: q = Polyomino([(0,0,0), (0,0,1)])
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: T.rows_for_piece(0)
[[0, 3], [0, 4], [0, 5], [0, 6], [0, 7], [0, 8]]
sage: T.rows_for_piece(1)
[[1, 3, 4], [1, 4, 5], [1, 5, 6], [1, 6, 7], [1, 7, 8]]
sage: T.rows_for_piece(2)
[[2, 3, 4, 5], [2, 4, 5, 6], [2, 5, 6, 7], [2, 6, 7, 8]]
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))])
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1))])
>>> r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1)), (Integer(0),Integer(0),Integer(2))])
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)))
>>> T.rows_for_piece(Integer(0))
```

(continues on next page)

(continued from previous page)

```
[[0, 3], [0, 4], [0, 5], [0, 6], [0, 7], [0, 8]]
>>> T.rows_for_piece(Integer(1))
[[1, 3, 4], [1, 4, 5], [1, 5, 6], [1, 6, 7], [1, 7, 8]]
>>> T.rows_for_piece(Integer(2))
[[2, 3, 4, 5], [2, 4, 5, 6], [2, 5, 6, 7], [2, 6, 7, 8]]
```

Less rows when using `mod_box_isometries=True`:

```
sage: a = Polyomino([(0,0,0), (0,0,1), (1,0,0)])
sage: b = Polyomino([(0,0,0), (1,0,0), (0,1,0)])
sage: T = TilingSolver([a,b], box=(2,1,3))
sage: T.rows_for_piece(0)
[[0, 2, 3, 5],
 [0, 3, 4, 6],
 [0, 2, 3, 6],
 [0, 3, 4, 7],
 [0, 2, 5, 6],
 [0, 3, 6, 7],
 [0, 3, 5, 6],
 [0, 4, 6, 7]]
sage: T.rows_for_piece(0, mod_box_isometries=True)
[[0, 2, 3, 5], [0, 3, 4, 6]]
sage: T.rows_for_piece(1, mod_box_isometries=True)
[[1, 2, 3, 5], [1, 3, 4, 6]]
```

```
>>> from sage.all import *
>>> a = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1)), (Integer(1),Integer(0),Integer(0))])
>>> b = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(1),Integer(0),
↪Integer(0)), (Integer(0),Integer(1),Integer(0))])
>>> T = TilingSolver([a,b], box=(Integer(2),Integer(1),Integer(3)))
>>> T.rows_for_piece(Integer(0))
[[0, 2, 3, 5],
 [0, 3, 4, 6],
 [0, 2, 3, 6],
 [0, 3, 4, 7],
 [0, 2, 5, 6],
 [0, 3, 6, 7],
 [0, 3, 5, 6],
 [0, 4, 6, 7]]
>>> T.rows_for_piece(Integer(0), mod_box_isometries=True)
[[0, 2, 3, 5], [0, 3, 4, 6]]
>>> T.rows_for_piece(Integer(1), mod_box_isometries=True)
[[1, 2, 3, 5], [1, 3, 4, 6]]
```

solve(*partial=None*)

Return an iterator of list of polyominoes that are an exact cover of the box.

INPUT:

- `partial` – string (default: `None`); whether to include partial (incomplete) solutions. It can be one of the following:
  - `None` – include only complete solution

- `'common_prefix'` – common prefix between two consecutive solutions
- `'incremental'` – one piece change at a time

OUTPUT: iterator of list of polyominoes

EXAMPLES:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
sage: q = Polyomino([(0,0,0), (0,0,1)])
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: it = T.solve()
sage: for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2)], Color: gray
Polyomino: [(0, 0, 3), (0, 0, 4), (0, 0, 5)], Color: gray
sage: for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2), (0, 0, 3)], Color: gray
Polyomino: [(0, 0, 4), (0, 0, 5)], Color: gray
sage: for p in next(it): p
Polyomino: [(0, 0, 0), (0, 0, 1)], Color: gray
Polyomino: [(0, 0, 2), (0, 0, 3), (0, 0, 4)], Color: gray
Polyomino: [(0, 0, 5)], Color: gray
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))])
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1))])
>>> r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1)), (Integer(0),Integer(0),Integer(2))])
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)))
>>> it = T.solve()
>>> for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2)], Color: gray
Polyomino: [(0, 0, 3), (0, 0, 4), (0, 0, 5)], Color: gray
>>> for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2), (0, 0, 3)], Color: gray
Polyomino: [(0, 0, 4), (0, 0, 5)], Color: gray
>>> for p in next(it): p
Polyomino: [(0, 0, 0), (0, 0, 1)], Color: gray
Polyomino: [(0, 0, 2), (0, 0, 3), (0, 0, 4)], Color: gray
Polyomino: [(0, 0, 5)], Color: gray
```

Including the partial solutions:

```
sage: it = T.solve(partial='common_prefix')
sage: for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2)], Color: gray
```

(continues on next page)

(continued from previous page)

```
Polyomino: [(0, 0, 3), (0, 0, 4), (0, 0, 5)], Color: gray
sage: for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
sage: for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2), (0, 0, 3)], Color: gray
Polyomino: [(0, 0, 4), (0, 0, 5)], Color: gray
sage: for p in next(it): p
sage: for p in next(it): p
Polyomino: [(0, 0, 0), (0, 0, 1)], Color: gray
Polyomino: [(0, 0, 2), (0, 0, 3), (0, 0, 4)], Color: gray
Polyomino: [(0, 0, 5)], Color: gray
```

```
>>> from sage.all import *
>>> it = T.solve(partial='common_prefix')
>>> for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2)], Color: gray
Polyomino: [(0, 0, 3), (0, 0, 4), (0, 0, 5)], Color: gray
>>> for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
>>> for p in next(it): p
Polyomino: [(0, 0, 0)], Color: gray
Polyomino: [(0, 0, 1), (0, 0, 2), (0, 0, 3)], Color: gray
Polyomino: [(0, 0, 4), (0, 0, 5)], Color: gray
>>> for p in next(it): p
>>> for p in next(it): p
Polyomino: [(0, 0, 0), (0, 0, 1)], Color: gray
Polyomino: [(0, 0, 2), (0, 0, 3), (0, 0, 4)], Color: gray
Polyomino: [(0, 0, 5)], Color: gray
```

Colors are preserved when the polyomino can be reused:

```
sage: p = Polyomino([(0,0,0)], color='yellow')
sage: q = Polyomino([(0,0,0), (0,0,1)], color='yellow')
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)], color='yellow')
sage: T = TilingSolver([p,q,r], box=(1,1,6), reusable=True)
sage: it = T.solve()
sage: for p in next(it): p
Polyomino: [(0, 0, 0)], Color: yellow
Polyomino: [(0, 0, 1)], Color: yellow
Polyomino: [(0, 0, 2)], Color: yellow
Polyomino: [(0, 0, 3)], Color: yellow
Polyomino: [(0, 0, 4)], Color: yellow
Polyomino: [(0, 0, 5)], Color: yellow
```

```
>>> from sage.all import *
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))], color='yellow')
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1))], color='yellow')
>>> r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1)), (Integer(0),Integer(0),Integer(2))], color='yellow')
```

(continues on next page)

(continued from previous page)

```
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)),␣
↪reusable=True)
>>> it = T.solve()
>>> for p in next(it): p
Polyomino: [(0, 0, 0)], Color: yellow
Polyomino: [(0, 0, 1)], Color: yellow
Polyomino: [(0, 0, 2)], Color: yellow
Polyomino: [(0, 0, 3)], Color: yellow
Polyomino: [(0, 0, 4)], Color: yellow
Polyomino: [(0, 0, 5)], Color: yellow
```

space()

Return an iterator over all the nonnegative integer coordinates contained in the space to tile.

EXAMPLES:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
sage: q = Polyomino([(0,0,0), (0,0,1)])
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: list(T.space())
[(0, 0, 0), (0, 0, 1), (0, 0, 2), (0, 0, 3), (0, 0, 4), (0, 0, 5)]
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))])
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1))])
>>> r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1)), (Integer(0),Integer(0),Integer(2))])
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)))
>>> list(T.space())
[(0, 0, 0), (0, 0, 1), (0, 0, 2), (0, 0, 3), (0, 0, 4), (0, 0, 5)]
```

starting_rows()

Return the starting rows for each piece.

EXAMPLES:

```
sage: from sage.combinat.tiling import TilingSolver, Polyomino
sage: p = Polyomino([(0,0,0)])
sage: q = Polyomino([(0,0,0), (0,0,1)])
sage: r = Polyomino([(0,0,0), (0,0,1), (0,0,2)])
sage: T = TilingSolver([p,q,r], box=(1,1,6))
sage: T.starting_rows()
[0, 6, 11, 15]
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import TilingSolver, Polyomino
>>> p = Polyomino([(Integer(0),Integer(0),Integer(0))])
>>> q = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
```

(continues on next page)

(continued from previous page)

```
↪Integer(1))])
>>> r = Polyomino([(Integer(0),Integer(0),Integer(0)), (Integer(0),Integer(0),
↪Integer(1)), (Integer(0),Integer(0),Integer(2))])
>>> T = TilingSolver([p,q,r], box=(Integer(1),Integer(1),Integer(6)))
>>> T.starting_rows()
[0, 6, 11, 15]
```

sage.combinat.tiling.**ncube_isometry_group**(*n*, *orientation_preserving=True*)

Return the isometry group of the n-cube as a list of matrices.

INPUT:

- `n` – positive integer, dimension of the space
- `orientation_preserving` – boolean (default: `True`); whether the orientation is preserved

OUTPUT: list of matrices

EXAMPLES:

```
sage: from sage.combinat.tiling import ncube_isometry_group
sage: sorted(ncube_isometry_group(2))
[
[-1  0]  [ 0 -1]  [ 0  1]  [1 0]
[ 0 -1], [ 1  0], [-1  0], [0 1]
]
sage: sorted(ncube_isometry_group(2, orientation_preserving=False))
[
[-1  0]  [-1  0]  [ 0 -1]  [ 0 -1]  [ 0  1]  [0 1]  [ 1  0]  [1 0]
[ 0 -1], [ 0  1], [-1  0], [ 1  0], [-1  0], [1 0], [ 0 -1], [0 1]
]
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import ncube_isometry_group
>>> sorted(ncube_isometry_group(Integer(2)))
[
[-1  0]  [ 0 -1]  [ 0  1]  [1 0]
[ 0 -1], [ 1  0], [-1  0], [0 1]
]
>>> sorted(ncube_isometry_group(Integer(2), orientation_preserving=False))
[
[-1  0]  [-1  0]  [ 0 -1]  [ 0 -1]  [ 0  1]  [0 1]  [ 1  0]  [1 0]
[ 0 -1], [ 0  1], [-1  0], [ 1  0], [-1  0], [1 0], [ 0 -1], [0 1]
]
```

There are 24 orientation preserving isometries of the 3-cube:

```
sage: sorted(ncube_isometry_group(3))
[
[-1  0  0]  [-1  0  0]  [-1  0  0]  [-1  0  0]  [ 0 -1  0]  [ 0 -1  0]
[ 0 -1  0]  [ 0  0 -1]  [ 0  0  1]  [ 0  1  0]  [-1  0  0]  [ 0  0 -1]
[ 0  0  1], [ 0 -1  0], [ 0  1  0], [ 0  0 -1], [ 0  0 -1], [ 1  0  0],

[ 0 -1  0]  [ 0 -1  0]  [ 0  0 -1]  [ 0  0 -1]  [ 0  0 -1]  [ 0  0 -1]
```

(continues on next page)

(continued from previous page)

```
[ 0  0  1]  [ 1  0  0]  [-1  0  0]  [ 0 -1  0]  [ 0  1  0]  [ 1  0  0]
[-1  0  0], [ 0  0  1], [ 0  1  0], [-1  0  0], [ 1  0  0], [ 0 -1  0],

[ 0  0  1]  [ 0  0  1]  [ 0  0  1]  [0 0 1]  [ 0  1  0]  [ 0  1  0]
[-1  0  0]  [ 0 -1  0]  [ 0  1  0]  [1 0 0]  [-1  0  0]  [ 0  0 -1]
[ 0 -1  0], [ 1  0  0], [-1  0  0], [0 1 0], [ 0  0  1], [-1  0  0],

[0 1 0]  [ 0  1  0]  [ 1  0  0]  [ 1  0  0]  [ 1  0  0]  [1 0 0]
[0 0 1]  [ 1  0  0]  [ 0 -1  0]  [ 0  0 -1]  [ 0  0  1]  [0 1 0]
[1 0 0], [ 0  0 -1], [ 0  0 -1], [ 0  1  0], [ 0 -1  0], [0 0 1]
]
```

```
>>> from sage.all import *
>>> sorted(ncube_isometry_group(Integer(3)))
[

<BLANKLINE>
[0 1 0]  [ 0  1  0]  [ 1  0  0]  [ 1  0  0]  [ 1  0  0]  [1 0 0]
[0 0 1]  [ 1  0  0]  [ 0 -1  0]  [ 0  0 -1]  [ 0  0  1]  [0 1 0]
[1 0 0], [ 0  0 -1], [ 0  0 -1], [ 0  1  0], [ 0 -1  0], [0 0 1]
]
```

sage.combinat.tiling.**ncube_isometry_group_cosets**(*orientation_preserving=True*)

Return the quotient of the isometry group of the n-cube by the the isometry group of the rectangular parallelepiped.

INPUT:

- `n` – positive integer, dimension of the space
- `orientation_preserving` – boolean (default: `True`); whether the orientation is preserved

OUTPUT: list of cosets, each coset being a sorted list of matrices

EXAMPLES:

```
sage: from sage.combinat.tiling import ncube_isometry_group_cosets
sage: sorted(ncube_isometry_group_cosets(2))
[[
[-1  0]  [1 0]
[ 0 -1], [0 1]
], [
[ 0 -1]  [ 0  1]
[ 1  0], [-1  0]
]]
```

(continues on next page)

(continued from previous page)

```
sage: sorted(ncube_isometry_group_cosets(2, False))
[[
[-1  0]  [-1  0]  [ 1  0]  [1 0]
[ 0 -1], [ 0  1], [ 0 -1], [0 1]
], [
[ 0 -1]  [ 0 -1]  [ 0  1]  [0 1]
[-1  0], [ 1  0], [-1  0], [1 0]
]]
```

```
>>> from sage.all import *
>>> from sage.combinat.tiling import ncube_isometry_group_cosets
>>> sorted(ncube_isometry_group_cosets(Integer(2)))
[[
[-1  0]  [1 0]
[ 0 -1], [0 1]
], [
[ 0 -1]  [ 0  1]
[ 1  0], [-1  0]
]]
>>> sorted(ncube_isometry_group_cosets(Integer(2), False))
[[
[-1  0]  [-1  0]  [ 1  0]  [1 0]
[ 0 -1], [ 0  1], [ 0 -1], [0 1]
], [
[ 0 -1]  [ 0 -1]  [ 0  1]  [0 1]
[-1  0], [ 1  0], [-1  0], [1 0]
]]
```

```
sage: sorted(ncube_isometry_group_cosets(3))
[[
[-1  0  0]  [-1  0  0]  [ 1  0  0]  [1 0 0]
[ 0 -1  0]  [ 0  1  0]  [ 0 -1  0]  [0 1 0]

```

Tools for enumeration modulo the action of a permutation group

`sage.combinat.enumeration_mod_permgroup.`**`all_children`**(*v*, *max_part*)

Return all the children of an integer vector (`ClonableIntArray`) `v` in the tree of enumeration by lexicographic order. The children of an integer vector `v` whose entries have the sum n are all integer vectors of sum $n+1$ which follow `v` in the lexicographic order.

That means this function adds 1 on the last nonzero entries and the following ones. For an integer vector v such that

$$v = [\ldots, a, 0, 0] \text{ with } a \neq 0,$$

then, the list of children is

$$[[\ldots, a+1, 0, 0], [\ldots, a, 1, 0], [\ldots, a, 0, 1]].$$

EXAMPLES:

```
sage: from sage.combinat.enumeration_mod_permgroup import all_children
sage: from sage.structure.list_clone_demo import IncreasingIntArrays
```

(continues on next page)

(continued from previous page)

```
sage: v = IncreasingIntArrays()([1,2,3,4])
sage: all_children(v, -1)
[[1, 2, 3, 5]]
```

```
>>> from sage.all import *
>>> from sage.combinat.enumeration_mod_permgroup import all_children
>>> from sage.structure.list_clone_demo import IncreasingIntArrays
>>> v = IncreasingIntArrays()([Integer(1),Integer(2),Integer(3),Integer(4)])
>>> all_children(v, -Integer(1))
[[1, 2, 3, 5]]
```

sage.combinat.enumeration_mod_permgroup.**canonical_children**(*sgs*, *v*, *max_part*)

Return the canonical children of the integer vector `v`. This function computes all children of the integer vector `v` via the function *all_children()* and returns from this list only these which are canonicals identified via the function *is_canonical()*.

EXAMPLES:

```
sage: from sage.combinat.enumeration_mod_permgroup import canonical_children
sage: G = PermutationGroup([[(1,2,3,4)]])
sage: sgs = G.strong_generating_system()
sage: from sage.structure.list_clone_demo import IncreasingIntArrays
sage: IA = IncreasingIntArrays()
sage: canonical_children(sgs, IA([1,2,3,5]), -1)
[]
```

```
>>> from sage.all import *
>>> from sage.combinat.enumeration_mod_permgroup import canonical_children
>>> G = PermutationGroup([[(Integer(1),Integer(2),Integer(3),Integer(4))]])
>>> sgs = G.strong_generating_system()
>>> from sage.structure.list_clone_demo import IncreasingIntArrays
>>> IA = IncreasingIntArrays()
>>> canonical_children(sgs, IA([Integer(1),Integer(2),Integer(3),Integer(5)]), -
↪Integer(1))
[]
```

sage.combinat.enumeration_mod_permgroup.**canonical_representative_of_orbit_of**(*sgs*, *v*)

Return the maximal vector for the lexicographic order living in the orbit of v under the action of the permutation group whose strong generating system is `sgs`. The maximal vector is also called "canonical". Hence, this method returns the canonical vector inside the orbit of v. If v is already canonical, the method returns v.

Let G to be the permutation group which admits `sgs` as a strong generating system. An integer vector v is said to be canonical under the action of G if and only if:

$$v = \max_{\text{lex order}} \{g \cdot v | g \in G\}$$

EXAMPLES:

```
sage: from sage.combinat.enumeration_mod_permgroup import canonical_
↪representative_of_orbit_of
sage: G = PermutationGroup([[(1,2,3,4)]])
sage: sgs = G.strong_generating_system()
sage: from sage.structure.list_clone_demo import IncreasingIntArrays
```

(continues on next page)

(continued from previous page)

```
sage: IA = IncreasingIntArrays()
sage: canonical_representative_of_orbit_of(sgs, IA([1,2,3,5]))
[5, 1, 2, 3]
```

```
>>> from sage.all import *
>>> from sage.combinat.enumeration_mod_permgroup import canonical_representative_
↪of_orbit_of
>>> G = PermutationGroup([[(Integer(1),Integer(2),Integer(3),Integer(4))]])
>>> sgs = G.strong_generating_system()
>>> from sage.structure.list_clone_demo import IncreasingIntArrays
>>> IA = IncreasingIntArrays()
>>> canonical_representative_of_orbit_of(sgs, IA([Integer(1),Integer(2),
↪Integer(3),Integer(5)]))
[5, 1, 2, 3]
```

sage.combinat.enumeration_mod_permgroup.**is_canonical**(*sgs*, *v*)

Return `True` if the integer vector v is maximal with respect to the lexicographic order in its orbit under the action of the permutation group whose strong generating system is `sgs`. Such vectors are said to be canonical.

Let G to be the permutation group which admit `sgs` as a strong generating system. An integer vector v is said to be canonical under the action of G if and only if:

$$v = \max_{\text{lex order}} \{g \cdot v | g \in G\}$$

EXAMPLES:

```
sage: from sage.combinat.enumeration_mod_permgroup import is_canonical
sage: G = PermutationGroup([[(1,2,3,4)]])
sage: sgs = G.strong_generating_system()
sage: from sage.structure.list_clone_demo import IncreasingIntArrays
sage: IA = IncreasingIntArrays()
sage: is_canonical(sgs, IA([1,2,3,6]))
False
```

```
>>> from sage.all import *
>>> from sage.combinat.enumeration_mod_permgroup import is_canonical
>>> G = PermutationGroup([[(Integer(1),Integer(2),Integer(3),Integer(4))]])
>>> sgs = G.strong_generating_system()
>>> from sage.structure.list_clone_demo import IncreasingIntArrays
>>> IA = IncreasingIntArrays()
>>> is_canonical(sgs, IA([Integer(1),Integer(2),Integer(3),Integer(6)]))
False
```

sage.combinat.enumeration_mod_permgroup.**lex_cmp**(*v1*, *v2*)

Lexicographic comparison of `ClonableIntArray`.

INPUT:

- `v1`, `v2` – two instances of `ClonableIntArray`

OUTPUT:

`-1`, `0`, `1`, depending on whether v_1 is lexicographically smaller, equal, or greater than v_2.

EXAMPLES:

```
sage: I =  IntegerVectorsModPermutationGroup(SymmetricGroup(5),5)
sage: I =  IntegerVectorsModPermutationGroup(SymmetricGroup(5))
sage: J =  IntegerVectorsModPermutationGroup(SymmetricGroup(6))
sage: v1 = I([2,3,1,2,3], check=False)
sage: v2 = I([2,3,2,3,2], check=False)
sage: v3 = J([2,3,1,2,3,1], check=False)
sage: from sage.combinat.enumeration_mod_permgroup import lex_cmp
sage: lex_cmp(v1, v1)
0
sage: lex_cmp(v1, v2)
-1
sage: lex_cmp(v2, v1)
1
sage: lex_cmp(v1, v3)
-1
sage: lex_cmp(v3, v1)
1
```

```
>>> from sage.all import *
>>> I =  IntegerVectorsModPermutationGroup(SymmetricGroup(Integer(5)),Integer(5))
>>> I =  IntegerVectorsModPermutationGroup(SymmetricGroup(Integer(5)))
>>> J =  IntegerVectorsModPermutationGroup(SymmetricGroup(Integer(6)))
>>> v1 = I([Integer(2),Integer(3),Integer(1),Integer(2),Integer(3)], check=False)
>>> v2 = I([Integer(2),Integer(3),Integer(2),Integer(3),Integer(2)], check=False)
>>> v3 = J([Integer(2),Integer(3),Integer(1),Integer(2),Integer(3),Integer(1)],␣
↪check=False)
>>> from sage.combinat.enumeration_mod_permgroup import lex_cmp
>>> lex_cmp(v1, v1)
0
>>> lex_cmp(v1, v2)
-1
>>> lex_cmp(v2, v1)
1
>>> lex_cmp(v1, v3)
-1
>>> lex_cmp(v3, v1)
1
```

sage.combinat.enumeration_mod_permgroup.**lex_cmp_partial**(*v1*, *v2*, *step*)

Partial comparison of the two lists according the lexicographic order. It compares the `step`-th first entries.

EXAMPLES:

```
sage: from sage.combinat.enumeration_mod_permgroup import lex_cmp_partial
sage: from sage.structure.list_clone_demo import IncreasingIntArrays
sage: IA = IncreasingIntArrays()
sage: lex_cmp_partial(IA([0,1,2,3]),IA([0,1,2,4]),3)
0
sage: lex_cmp_partial(IA([0,1,2,3]),IA([0,1,2,4]),4)
-1
```

```
>>> from sage.all import *
>>> from sage.combinat.enumeration_mod_permgroup import lex_cmp_partial
```

(continues on next page)

(continued from previous page)

```
>>> from sage.structure.list_clone_demo import IncreasingIntArrays
>>> IA = IncreasingIntArrays()
>>> lex_cmp_partial(IA([Integer(0),Integer(1),Integer(2),Integer(3)]),
↪IA([Integer(0),Integer(1),Integer(2),Integer(4)]),Integer(3))
0
>>> lex_cmp_partial(IA([Integer(0),Integer(1),Integer(2),Integer(3)]),
↪IA([Integer(0),Integer(1),Integer(2),Integer(4)]),Integer(4))
-1
```

sage.combinat.enumeration_mod_permgroup.**orbit**(*sgs*, *v*)

Return the orbit of the integer vector `v` under the action of the permutation group whose strong generating system is `sgs`.

NOTE:

The returned orbit is a set. In the doctests, we convert it into a sorted list.

EXAMPLES:

```
sage: from sage.combinat.enumeration_mod_permgroup import orbit
sage: G = PermutationGroup([[(1,2,3,4)]])
sage: sgs = G.strong_generating_system()
sage: from sage.structure.list_clone_demo import IncreasingIntArrays
sage: IA = IncreasingIntArrays()
sage: sorted(orbit(sgs, IA([1,2,3,4])))
[[1, 2, 3, 4], [2, 3, 4, 1], [3, 4, 1, 2], [4, 1, 2, 3]]
```

```
>>> from sage.all import *
>>> from sage.combinat.enumeration_mod_permgroup import orbit
>>> G = PermutationGroup([[(Integer(1),Integer(2),Integer(3),Integer(4))]])
>>> sgs = G.strong_generating_system()
>>> from sage.structure.list_clone_demo import IncreasingIntArrays
>>> IA = IncreasingIntArrays()
>>> sorted(orbit(sgs, IA([Integer(1),Integer(2),Integer(3),Integer(4)])))
[[1, 2, 3, 4], [2, 3, 4, 1], [3, 4, 1, 2], [4, 1, 2, 3]]
```

Transitive ideal closure tool

sage.combinat.tools.**transitive_ideal**(f, x)

Return a list of all elements reachable from x in the abstract reduction system whose reduction relation is given by the function f.

In more elementary terms:

If S is a set, and f is a function sending every element of S to a list of elements of S, then we can define a digraph on the vertex set S by drawing an edge from s to t for every $s \in S$ and every $t \in f(s)$.

If $x \in S$, then an element $y \in S$ is said to be reachable from x if there is a path $x \to y$ in this graph.

Given f and x, this method computes the list of all elements of S reachable from x.

Note that if there are infinitely many such elements, then this method will never halt.

For more powerful versions, see *sage.combinat.backtrack*

EXAMPLES:

```
sage: f = lambda x: [x-1] if x > 0 else []
sage: sage.combinat.tools.transitive_ideal(f, 10)
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
```

```
>>> from sage.all import *
>>> f = lambda x: [x-Integer(1)] if x > Integer(0) else []
>>> sage.combinat.tools.transitive_ideal(f, Integer(10))
[0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
```

Tuples

class sage.combinat.tuple.**Tuples**(S, k)

Bases: Parent, UniqueRepresentation

Return the enumerated set of ordered tuples of S of length k.

An ordered tuple of length k of set is an ordered selection with repetition and is represented by a list of length k containing elements of set.

EXAMPLES:

```
sage: S = [1,2]
sage: Tuples(S,3).list()
[(1, 1, 1), (2, 1, 1), (1, 2, 1), (2, 2, 1), (1, 1, 2),
 (2, 1, 2), (1, 2, 2), (2, 2, 2)]
sage: mset = ["s","t","e","i","n"]
sage: Tuples(mset,2).list()
[('s', 's'), ('t', 's'), ('e', 's'), ('i', 's'), ('n', 's'),
 ('s', 't'), ('t', 't'), ('e', 't'), ('i', 't'), ('n', 't'),
 ('s', 'e'), ('t', 'e'), ('e', 'e'), ('i', 'e'), ('n', 'e'),
 ('s', 'i'), ('t', 'i'), ('e', 'i'), ('i', 'i'), ('n', 'i'),
 ('s', 'n'), ('t', 'n'), ('e', 'n'), ('i', 'n'), ('n', 'n')]
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(2)]
>>> Tuples(S,Integer(3)).list()
[(1, 1, 1), (2, 1, 1), (1, 2, 1), (2, 2, 1), (1, 1, 2),
 (2, 1, 2), (1, 2, 2), (2, 2, 2)]
>>> mset = ["s","t","e","i","n"]
>>> Tuples(mset,Integer(2)).list()
[('s', 's'), ('t', 's'), ('e', 's'), ('i', 's'), ('n', 's'),
 ('s', 't'), ('t', 't'), ('e', 't'), ('i', 't'), ('n', 't'),
 ('s', 'e'), ('t', 'e'), ('e', 'e'), ('i', 'e'), ('n', 'e'),
 ('s', 'i'), ('t', 'i'), ('e', 'i'), ('i', 'i'), ('n', 'i'),
 ('s', 'n'), ('t', 'n'), ('e', 'n'), ('i', 'n'), ('n', 'n')]
```

```
sage: K.<a> = GF(4, 'a')                                                    #␣
↪needs sage.rings.finite_rings
sage: mset = sorted((x for x in K if x != 0), key=str)                      #␣
↪needs sage.rings.finite_rings
sage: Tuples(mset, 2).list()                                                #␣
↪needs sage.rings.finite_rings
[(1, 1),      (a, 1),      (a + 1, 1),
```

(continues on next page)

(continued from previous page)

```
 (1, a),     (a, a),     (a + 1, a),
 (1, a + 1), (a, a + 1), (a + 1, a + 1)]
```

```
>>> from sage.all import *
>>> K = GF(Integer(4), 'a', names=('a',)); (a,) = K._first_ngens(1)# needs sage.
↪rings.finite_rings
>>> mset = sorted((x for x in K if x != Integer(0)), key=str)                    ␣
↪     # needs sage.rings.finite_rings
>>> Tuples(mset, Integer(2)).list()                                             ␣
↪     # needs sage.rings.finite_rings
[(1, 1),     (a, 1),     (a + 1, 1),
 (1, a),     (a, a),     (a + 1, a),
 (1, a + 1), (a, a + 1), (a + 1, a + 1)]
```

cardinality()

EXAMPLES:

```
sage: S = [1,2,3,4,5]
sage: Tuples(S,2).cardinality()
25
sage: S = [1,1,2,3,4,5]
sage: Tuples(S,2).cardinality()
25
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]
>>> Tuples(S,Integer(2)).cardinality()
25
>>> S = [Integer(1),Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]
>>> Tuples(S,Integer(2)).cardinality()
25
```

unrank(i)

Return the i-th element of the set of Tuples.

INPUT:

- `i` – integer between 0 and $n-1$, where n is the cardinality of this set

EXAMPLES:

```
sage: T = Tuples(range(7), 6)
sage: T[73451]
(0, 0, 1, 4, 2, 4)
```

```
>>> from sage.all import *
>>> T = Tuples(range(Integer(7)), Integer(6))
>>> T[Integer(73451)]
(0, 0, 1, 4, 2, 4)
```

sage.combinat.tuple.**Tuples_sk**

alias of *Tuples*

class sage.combinat.tuple.**UnorderedTuples**(S, k)

Bases: Parent, UniqueRepresentation

Return the enumerated set of unordered tuples of S of length k.

An unordered tuple of length k of set is a unordered selection with repetitions of set and is represented by a sorted list of length k containing elements from set.

EXAMPLES:

```
sage: S = [1,2]
sage: UnorderedTuples(S,3).list()
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
sage: UnorderedTuples(["a","b","c"],2).list()
[('a', 'a'), ('a', 'b'), ('a', 'c'), ('b', 'b'), ('b', 'c'),
 ('c', 'c')]
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(2)]
>>> UnorderedTuples(S,Integer(3)).list()
[(1, 1, 1), (1, 1, 2), (1, 2, 2), (2, 2, 2)]
>>> UnorderedTuples(["a","b","c"],Integer(2)).list()
[('a', 'a'), ('a', 'b'), ('a', 'c'), ('b', 'b'), ('b', 'c'),
 ('c', 'c')]
```

cardinality()

EXAMPLES:

```
sage: S = [1,2,3,4,5]
sage: UnorderedTuples(S,2).cardinality()
15
```

```
>>> from sage.all import *
>>> S = [Integer(1),Integer(2),Integer(3),Integer(4),Integer(5)]
>>> UnorderedTuples(S,Integer(2)).cardinality()
15
```

sage.combinat.tuple.**UnorderedTuples_sk**

alias of *UnorderedTuples*

Vector partitions

AUTHORS:

- Amritanshu Prasad (2013): initial version
- Shriya M (2022): added new parameters such as distinct, parts and is_repeatable

sage.combinat.vector_partition.**IntegerVectorsIterator**(*vect*, *min=None*)

Return an iterator over the list of integer vectors which are componentwise less than or equal to vect, and lexicographically greater than or equal to min.

INPUT:

- vect – list of nonnegative integers
- min – list of nonnegative integers dominated elementwise by vect

OUTPUT:

A list in lexicographic order of all integer vectors (as lists) which are dominated elementwise by `vect` and are greater than or equal to `min` in lexicographic order.

EXAMPLES:

```
sage: from sage.combinat.vector_partition import IntegerVectorsIterator
sage: list(IntegerVectorsIterator([1, 1]))
[[0, 0], [0, 1], [1, 0], [1, 1]]

sage: list(IntegerVectorsIterator([1, 1], min = [1, 0]))
[[1, 0], [1, 1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.vector_partition import IntegerVectorsIterator
>>> list(IntegerVectorsIterator([Integer(1), Integer(1)]))
[[0, 0], [0, 1], [1, 0], [1, 1]]

>>> list(IntegerVectorsIterator([Integer(1), Integer(1)], min = [Integer(1),␣
↪Integer(0)]))
[[1, 0], [1, 1]]
```

class sage.combinat.vector_partition.**VectorPartition**(*parent*, *vecpar*)

Bases: *CombinatorialElement*

A vector partition is a multiset of integer vectors.

partition_at_vertex(*i*)

Return the partition obtained by sorting the `i`-th elements of the vectors in the vector partition.

EXAMPLES:

```
sage: V = VectorPartition([[1, 2, 1], [2, 4, 1]])
sage: V.partition_at_vertex(1)
[4, 2]
```

```
>>> from sage.all import *
>>> V = VectorPartition([[Integer(1), Integer(2), Integer(1)], [Integer(2),␣
↪Integer(4), Integer(1)]])
>>> V.partition_at_vertex(Integer(1))
[4, 2]
```

sum()

Return the sum vector as a list.

EXAMPLES:

```
sage: V = VectorPartition([[3, 2, 1], [2, 2, 1]])
sage: V.sum()
[5, 4, 2]
```

```
>>> from sage.all import *
>>> V = VectorPartition([[Integer(3), Integer(2), Integer(1)], [Integer(2),␣
↪Integer(2), Integer(1)]])
```

(continues on next page)

(continued from previous page)

```
>>> V.sum()
[5, 4, 2]
```

class sage.combinat.vector_partition.**VectorPartitions**(*vec*, *min=None*, *parts=None*, *distinct=False*, *is_repeatable=None*)

Bases: UniqueRepresentation, Parent

Class of all vector partitions of `vec` with all parts greater than or equal to `min` in lexicographic order, with parts from `parts`.

A vector partition of `vec` is a list of vectors with nonnegative integer entries whose sum is `vec`.

INPUT:

- `vec` – integer vector
- `min` – integer vector dominated elementwise by `vec`
- `parts` – finite list of possible parts
- `distinct` – boolean, set to `True` if only vector partitions with distinct parts are enumerated
- `is_repeatable` – boolean function on `parts` which gives `True` in parts that can be repeated

EXAMPLES:

If `min` is not specified, then the class of all vector partitions of `vec` is created:

```
sage: VP = VectorPartitions([2, 2])
sage: for vecpar in VP:
....:     print(vecpar)
[[0, 1], [0, 1], [1, 0], [1, 0]]
[[0, 1], [0, 1], [2, 0]]
[[0, 1], [1, 0], [1, 1]]
[[0, 1], [2, 1]]
[[0, 2], [1, 0], [1, 0]]
[[0, 2], [2, 0]]
[[1, 0], [1, 2]]
[[1, 1], [1, 1]]
[[2, 2]]
```

```
>>> from sage.all import *
>>> VP = VectorPartitions([Integer(2), Integer(2)])
>>> for vecpar in VP:
...     print(vecpar)
[[0, 1], [0, 1], [1, 0], [1, 0]]
[[0, 1], [0, 1], [2, 0]]
[[0, 1], [1, 0], [1, 1]]
[[0, 1], [2, 1]]
[[0, 2], [1, 0], [1, 0]]
[[0, 2], [2, 0]]
[[1, 0], [1, 2]]
[[1, 1], [1, 1]]
[[2, 2]]
```

If `distinct` is set to be True, then distinct part partitions are created:

```
sage: VP = VectorPartitions([2,2], distinct = True)
sage: list(VP)
[[[0, 1], [1, 0], [1, 1]],
 [[0, 1], [2, 1]],
 [[0, 2], [2, 0]],
 [[1, 0], [1, 2]],
 [[2, 2]]]
```

```
>>> from sage.all import *
>>> VP = VectorPartitions([Integer(2),Integer(2)], distinct = True)
>>> list(VP)
[[[0, 1], [1, 0], [1, 1]],
 [[0, 1], [2, 1]],
 [[0, 2], [2, 0]],
 [[1, 0], [1, 2]],
 [[2, 2]]]
```

If `min` is specified, then the class consists of only those vector partitions whose parts are all greater than or equal to `min` in lexicographic order:

```
sage: VP = VectorPartitions([2, 2], min = [1, 0])
sage: for vecpar in VP:
....:     print(vecpar)
[[1, 0], [1, 2]]
[[1, 1], [1, 1]]
[[2, 2]]
sage: VP = VectorPartitions([2, 2], min = [1, 0], distinct = True)
sage: for vecpar in VP:
....:     print(vecpar)
[[1, 0], [1, 2]]
[[2, 2]]
```

```
>>> from sage.all import *
>>> VP = VectorPartitions([Integer(2), Integer(2)], min = [Integer(1),␣
↪Integer(0)])
>>> for vecpar in VP:
...     print(vecpar)
[[1, 0], [1, 2]]
[[1, 1], [1, 1]]
[[2, 2]]
>>> VP = VectorPartitions([Integer(2), Integer(2)], min = [Integer(1),␣
↪Integer(0)], distinct = True)
>>> for vecpar in VP:
...     print(vecpar)
[[1, 0], [1, 2]]
[[2, 2]]
```

If `parts` is specified, then the class consists only of those vector partitions whose parts are from `parts`:

```
sage: Vec_Par = VectorPartitions([2,2], parts=[[0,1],[1,0],[1,1]])
sage: list(Vec_Par)
[[[0, 1], [0, 1], [1, 0], [1, 0]], [[0, 1], [1, 0], [1, 1]], [[1, 1], [1, 1]]]
```

```
>>> from sage.all import *
>>> Vec_Par = VectorPartitions([Integer(2),Integer(2)], parts=[[Integer(0),
↪Integer(1)],[Integer(1),Integer(0)],[Integer(1),Integer(1)]])
>>> list(Vec_Par)
[[[0, 1], [0, 1], [1, 0], [1, 0]], [[0, 1], [1, 0], [1, 1]], [[1, 1], [1, 1]]]
```

If `is_repeatable` is specified, then the parts which satisfy the boolean function `is_repeatable` are allowed to be repeated:

```
sage: Vector_Partitions = VectorPartitions([2,2], parts=[[0,1],[1,0],[1,1]], is_
↪repeatable=lambda vec: sum(vec)%2!=0)
sage: list(Vector_Partitions)
[[[0, 1], [0, 1], [1, 0], [1, 0]], [[0, 1], [1, 0], [1, 1]]]
```

```
>>> from sage.all import *
>>> Vector_Partitions = VectorPartitions([Integer(2),Integer(2)],␣
↪parts=[[Integer(0),Integer(1)],[Integer(1),Integer(0)],[Integer(1),Integer(1)]],
↪ is_repeatable=lambda vec: sum(vec)%Integer(2)!=Integer(0))
>>> list(Vector_Partitions)
[[[0, 1], [0, 1], [1, 0], [1, 0]], [[0, 1], [1, 0], [1, 1]]]
```

Element

alias of *VectorPartition*

sage.combinat.vector_partition.**find_min**(*vect*)

Return a list of `0`'s with one `1` at the location where the list `vect` has its last entry which is not equal to `0`.

INPUT:

- `vec` – list of integers

OUTPUT:

A list of the same length with `0`'s everywhere, except for a `1` at the last position where `vec` has an entry not equal to `0`.

EXAMPLES:

```
sage: from sage.combinat.vector_partition import find_min
sage: find_min([2, 1])
[0, 1]
sage: find_min([2, 1, 0])
[0, 1, 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.vector_partition import find_min
>>> find_min([Integer(2), Integer(1)])
[0, 1]
>>> find_min([Integer(2), Integer(1), Integer(0)])
[0, 1, 0]
```

Weighted integer vectors

AUTHORS:

- Mike Hansen (2007): initial version, ported from MuPAD-Combinat
- Nicolas M. Thiery (2010-10-30): WeightedIntegerVectors(weights) + cleanup

class sage.combinat.integer_vector_weighted.**WeightedIntegerVectors**(*n*, *weight*)

Bases: Parent, UniqueRepresentation

The class of integer vectors of n weighted by `weight`, that is, the nonnegative integer vectors $(v_1, \ldots, v_\ell)$ satisfying $\sum_{i=1}^{\ell} v_i w_i = n$ where ℓ is `length(weight)` and w_i is `weight[i]`.

INPUT:

- `n` – nonnegative integer (optional)
- `weight` – tuple (or list or iterable) of positive integers

EXAMPLES:

```
sage: WeightedIntegerVectors(8, [1,1,2])
Integer vectors of 8 weighted by [1, 1, 2]
sage: WeightedIntegerVectors(8, [1,1,2]).first()
[0, 0, 4]
sage: WeightedIntegerVectors(8, [1,1,2]).last()
[8, 0, 0]
sage: WeightedIntegerVectors(8, [1,1,2]).cardinality()
25
sage: w = WeightedIntegerVectors(8, [1,1,2]).random_element()
sage: w.parent() is WeightedIntegerVectors(8, [1,1,2])
True

sage: WeightedIntegerVectors([1,1,2])
Integer vectors weighted by [1, 1, 2]
sage: WeightedIntegerVectors([1,1,2]).cardinality()
+Infinity
sage: WeightedIntegerVectors([1,1,2]).first()
[0, 0, 0]
```

```
>>> from sage.all import *
>>> WeightedIntegerVectors(Integer(8), [Integer(1),Integer(1),Integer(2)])
Integer vectors of 8 weighted by [1, 1, 2]
>>> WeightedIntegerVectors(Integer(8), [Integer(1),Integer(1),Integer(2)]).first()
[0, 0, 4]
>>> WeightedIntegerVectors(Integer(8), [Integer(1),Integer(1),Integer(2)]).last()
[8, 0, 0]
>>> WeightedIntegerVectors(Integer(8), [Integer(1),Integer(1),Integer(2)]).
↪cardinality()
25
>>> w = WeightedIntegerVectors(Integer(8), [Integer(1),Integer(1),Integer(2)]).
↪random_element()
>>> w.parent() is WeightedIntegerVectors(Integer(8), [Integer(1),Integer(1),
↪Integer(2)])
True
```

(continues on next page)

(continued from previous page)

```
>>> WeightedIntegerVectors([Integer(1),Integer(1),Integer(2)])
Integer vectors weighted by [1, 1, 2]
>>> WeightedIntegerVectors([Integer(1),Integer(1),Integer(2)]).cardinality()
+Infinity
>>> WeightedIntegerVectors([Integer(1),Integer(1),Integer(2)]).first()
[0, 0, 0]
```

Todo

Should the order of the arguments `n` and `weight` be exchanged to simplify the logic?

Element

alias of *IntegerVector*

class sage.combinat.integer_vector_weighted.**WeightedIntegerVectors_all**(*weight*)

Bases: DisjointUnionEnumeratedSets

Set of weighted integer vectors.

EXAMPLES:

```
sage: W = WeightedIntegerVectors([3,1,1,2,1]); W
Integer vectors weighted by [3, 1, 1, 2, 1]
sage: W.cardinality()
+Infinity

sage: W12 = W.graded_component(12)
sage: W12.an_element()
[4, 0, 0, 0, 0]
sage: W12.last()
[0, 12, 0, 0, 0]
sage: W12.cardinality()
441
sage: for w in W12: print(w)
[4, 0, 0, 0, 0]
[3, 0, 0, 1, 1]
[3, 0, 1, 1, 0]
...
[0, 11, 1, 0, 0]
[0, 12, 0, 0, 0]
```

```
>>> from sage.all import *
>>> W = WeightedIntegerVectors([Integer(3),Integer(1),Integer(1),Integer(2),
↪Integer(1)]); W
Integer vectors weighted by [3, 1, 1, 2, 1]
>>> W.cardinality()
+Infinity

>>> W12 = W.graded_component(Integer(12))
>>> W12.an_element()
[4, 0, 0, 0, 0]
```

(continues on next page)

(continued from previous page)

```
>>> W12.last()
[0, 12, 0, 0, 0]
>>> W12.cardinality()
441
>>> for w in W12: print(w)
[4, 0, 0, 0, 0]
[3, 0, 0, 1, 1]
[3, 0, 1, 1, 0]
...
[0, 11, 1, 0, 0]
[0, 12, 0, 0, 0]
```

grading(*x*)

EXAMPLES:

```
sage: C = WeightedIntegerVectors([2,1,3])
sage: C.grading((2,1,1))
8
```

```
>>> from sage.all import *
>>> C = WeightedIntegerVectors([Integer(2),Integer(1),Integer(3)])
>>> C.grading((Integer(2),Integer(1),Integer(1)))
8
```

subset(*size=None*)

EXAMPLES:

```
sage: C = WeightedIntegerVectors([2,1,3])
sage: C.subset(4)
Integer vectors of 4 weighted by [2, 1, 3]
```

```
>>> from sage.all import *
>>> C = WeightedIntegerVectors([Integer(2),Integer(1),Integer(3)])
>>> C.subset(Integer(4))
Integer vectors of 4 weighted by [2, 1, 3]
```

sage.combinat.integer_vector_weighted.**iterator_fast**(*n*, *l*)

Iterate over all `l` weighted integer vectors with total weight `n`.

INPUT:

- `n` – integer
- `l` – the weights in weakly decreasing order

EXAMPLES:

```
sage: from sage.combinat.integer_vector_weighted import iterator_fast
sage: list(iterator_fast(3, [2,1,1]))
[[1, 1, 0], [1, 0, 1], [0, 3, 0], [0, 2, 1], [0, 1, 2], [0, 0, 3]]
sage: list(iterator_fast(2, [2]))
[[1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.integer_vector_weighted import iterator_fast
>>> list(iterator_fast(Integer(3), [Integer(2),Integer(1),Integer(1)]))
[[1, 1, 0], [1, 0, 1], [0, 3, 0], [0, 2, 1], [0, 1, 2], [0, 0, 3]]
>>> list(iterator_fast(Integer(2), [Integer(2)]))
[[1]]
```

Test that Issue #20491 is fixed:

```
sage: type(list(iterator_fast(2, [2]))[0][0])
<class 'sage.rings.integer.Integer'>
```

```
>>> from sage.all import *
>>> type(list(iterator_fast(Integer(2), [Integer(2)]))[Integer(0)][Integer(0)])
<class 'sage.rings.integer.Integer'>
```

Yang-Baxter Graphs

class sage.combinat.yang_baxter_graph.**SwapIncreasingOperator**(*i*)

Bases: *SwapOperator*

class sage.combinat.yang_baxter_graph.**SwapOperator**(*i*)

Bases: SageObject

The operator that swaps the items in positions `i` and `i+1`.

EXAMPLES:

```
sage: from sage.combinat.yang_baxter_graph import SwapOperator
sage: s3 = SwapOperator(3)
sage: s3 == loads(dumps(s3))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapOperator
>>> s3 = SwapOperator(Integer(3))
>>> s3 == loads(dumps(s3))
True
```

position()

Return `i` where `self` is the operator that swaps positions `i` and `i+1`.

EXAMPLES:

```
sage: from sage.combinat.yang_baxter_graph import SwapOperator
sage: s3 = SwapOperator(3)
sage: s3.position()
3
```

```
>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapOperator
>>> s3 = SwapOperator(Integer(3))
>>> s3.position()
3
```

sage.combinat.yang_baxter_graph.**YangBaxterGraph**(*partition=None*, *root=None*, *operators=None*)

Construct the Yang-Baxter graph from `root` by repeated application of `operators`, or the Yang-Baxter graph associated to `partition`.

INPUT:

The user needs to provide either `partition` or both `root` and `operators`, where

- `partition` – a partition of a positive integer
- `root` – the root vertex
- `operator` – a function that maps vertices u to a list of tuples of the form (v, l) where v is a successor of u and l is the label of the edge from u to v.

OUTPUT: either:

- *YangBaxterGraph_partition* – if partition is defined
- *YangBaxterGraph_generic* – if partition is `None`

EXAMPLES:

The Yang-Baxter graph defined by a partition $[p_1, \ldots, p_k]$ is the labelled directed graph with vertex set obtained by bubble-sorting $(p_k - 1, p_k - 2, \ldots, 0, \ldots, p_1 - 1, p_1 - 2, \ldots, 0)$; there is an arrow from u to v labelled by i if v is obtained by swapping the i-th and $(i+1)$-th elements of u. For example, if the partition is $[3, 1]$, then we begin with $(0, 2, 1, 0)$ and generate all tuples obtained from it by swapping two adjacent entries if they are increasing:

```
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: bubbleswaps = [SwapIncreasingOperator(i) for i in range(3)]
sage: Y = YangBaxterGraph(root=(0,2,1,0), operators=bubbleswaps); Y
Yang-Baxter graph with root vertex (0, 2, 1, 0)
sage: Y.vertices(sort=True)
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]
```

```
>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>>> bubbleswaps = [SwapIncreasingOperator(i) for i in range(Integer(3))]
>>> Y = YangBaxterGraph(root=(Integer(0),Integer(2),Integer(1),Integer(0)),␣
↪operators=bubbleswaps); Y
Yang-Baxter graph with root vertex (0, 2, 1, 0)
>>> Y.vertices(sort=True)
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]
```

The `partition` keyword is a shorthand for the above construction:

```
sage: Y = YangBaxterGraph(partition=[3,1]); Y                                  #␣
↪needs sage.combinat
Yang-Baxter graph of [3, 1], with top vertex (0, 2, 1, 0)
sage: Y.vertices(sort=True)
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]
```

```
>>> from sage.all import *
>>> Y = YangBaxterGraph(partition=[Integer(3),Integer(1)]); Y                  ␣
↪              # needs sage.combinat
Yang-Baxter graph of [3, 1], with top vertex (0, 2, 1, 0)
>>> Y.vertices(sort=True)
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]
```

The permutahedron can be realized as a Yang-Baxter graph:

```
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: swappers = [SwapIncreasingOperator(i) for i in range(3)]
sage: Y = YangBaxterGraph(root=(1,2,3,4), operators=swappers); Y
Yang-Baxter graph with root vertex (1, 2, 3, 4)
sage: Y.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 97 graphics primitives
```

```
>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>>> swappers = [SwapIncreasingOperator(i) for i in range(Integer(3))]
>>> Y = YangBaxterGraph(root=(Integer(1),Integer(2),Integer(3),Integer(4)),␣
↪operators=swappers); Y
Yang-Baxter graph with root vertex (1, 2, 3, 4)
>>> Y.plot()                                                                #␣
↪needs sage.plot
Graphics object consisting of 97 graphics primitives
```

The Cayley graph of a finite group can be realized as a Yang-Baxter graph:

```
sage: # needs sage.groups
sage: def left_multiplication_by(g):
....:     return lambda h: h*g
sage: G = CyclicPermutationGroup(4)
sage: operators = [ left_multiplication_by(gen) for gen in G.gens() ]
sage: Y = YangBaxterGraph(root=G.identity(), operators=operators); Y
Yang-Baxter graph with root vertex ()
sage: Y.plot(edge_labels=False)                                             #␣
↪needs sage.plot
Graphics object consisting of 9 graphics primitives

sage: # needs sage.groups
sage: G = SymmetricGroup(4)
sage: operators = [left_multiplication_by(gen) for gen in G.gens()]
sage: Y = YangBaxterGraph(root=G.identity(), operators=operators); Y
Yang-Baxter graph with root vertex ()
sage: Y.plot(edge_labels=False)                                             #␣
↪needs sage.plot
Graphics object consisting of 96 graphics primitives
```

```
>>> from sage.all import *
>>> # needs sage.groups
>>> def left_multiplication_by(g):
...     return lambda h: h*g
>>> G = CyclicPermutationGroup(Integer(4))
>>> operators = [ left_multiplication_by(gen) for gen in G.gens() ]
>>> Y = YangBaxterGraph(root=G.identity(), operators=operators); Y
Yang-Baxter graph with root vertex ()
>>> Y.plot(edge_labels=False)                                               #␣
↪needs sage.plot
Graphics object consisting of 9 graphics primitives
```

(continues on next page)

(continued from previous page)

```
>>> # needs sage.groups
>>> G = SymmetricGroup(Integer(4))
>>> operators = [left_multiplication_by(gen) for gen in G.gens()]
>>> Y = YangBaxterGraph(root=G.identity(), operators=operators); Y
Yang-Baxter graph with root vertex ()
>>> Y.plot(edge_labels=False)                                                  #␣
↪needs sage.plot
Graphics object consisting of 96 graphics primitives
```

AUTHORS:

- Franco Saliola (2009-04-23)

class sage.combinat.yang_baxter_graph.**YangBaxterGraph_generic**(*root*, *operators*)

Bases: SageObject

A class to model the Yang-Baxter graph defined by `root` and `operators`.

INPUT:

- `root` – the root vertex of the graph
- `operators` – list of callables that map vertices to (new) vertices

Note

This is a lazy implementation: the digraph is only computed when it is needed.

EXAMPLES:

```
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(4)]
sage: Y = YangBaxterGraph(root=(1,0,2,1,0), operators=ops); Y
Yang-Baxter graph with root vertex (1, 0, 2, 1, 0)
sage: loads(dumps(Y)) == Y
True
```

```
>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>>> ops = [SwapIncreasingOperator(i) for i in range(Integer(4))]
>>> Y = YangBaxterGraph(root=(Integer(1),Integer(0),Integer(2),Integer(1),
↪Integer(0)), operators=ops); Y
Yang-Baxter graph with root vertex (1, 0, 2, 1, 0)
>>> loads(dumps(Y)) == Y
True
```

AUTHORS:

- Franco Saliola (2009-04-23)

edges()

Return the (labelled) edges of `self`.

EXAMPLES:

```
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(3)]
sage: Y = YangBaxterGraph(root=(0,2,1,0), operators=ops)
sage: Y.edges()
[((0, 2, 1, 0), (2, 0, 1, 0), Swap-if-increasing at position 0), ((2, 0, 1,␣
↪0), (2, 1, 0, 0), Swap-if-increasing at position 1)]
```

```
>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>>> ops = [SwapIncreasingOperator(i) for i in range(Integer(3))]
>>> Y = YangBaxterGraph(root=(Integer(0),Integer(2),Integer(1),Integer(0)),␣
↪operators=ops)
>>> Y.edges()
[((0, 2, 1, 0), (2, 0, 1, 0), Swap-if-increasing at position 0), ((2, 0, 1,␣
↪0), (2, 1, 0, 0), Swap-if-increasing at position 1)]
```

plot(**args*, ***kwds*)

Plot `self` as a digraph.

EXAMPLES:

```
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(4)]
sage: Y = YangBaxterGraph(root=(1,0,2,1,0), operators=ops)
sage: Y.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 16 graphics primitives
sage: Y.plot(edge_labels=False)                                             #␣
↪needs sage.plot
Graphics object consisting of 11 graphics primitives
```

```
>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>>> ops = [SwapIncreasingOperator(i) for i in range(Integer(4))]
>>> Y = YangBaxterGraph(root=(Integer(1),Integer(0),Integer(2),Integer(1),
↪Integer(0)), operators=ops)
>>> Y.plot()                                                                #␣
↪needs sage.plot
Graphics object consisting of 16 graphics primitives
>>> Y.plot(edge_labels=False)                                               #␣
↪needs sage.plot
Graphics object consisting of 11 graphics primitives
```

relabel_edges(*edge_dict*, *inplace=True*)

Relabel the edges of `self`.

INPUT:

- `edge_dict` – dictionary keyed by the (unlabelled) edges

EXAMPLES:

```
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(3)]
```

(continues on next page)

(continued from previous page)

```
sage: Y = YangBaxterGraph(root=(0,2,1,0), operators=ops)
sage: def relabel_op(op, u):
....:     i = op.position()
....:     return u[:i] + u[i:i+2][::-1] + u[i+2:]
sage: Y.edges()
[((0, 2, 1, 0), (2, 0, 1, 0), Swap-if-increasing at position 0), ((2, 0, 1,␣
↪0), (2, 1, 0, 0), Swap-if-increasing at position 1)]
sage: d = {((0,2,1,0),(2,0,1,0)):17, ((2,0,1,0),(2,1,0,0)):27}
sage: Y.relabel_edges(d, inplace=False).edges()

```

relabel_vertices(*v*, *relabel_operator*, *inplace=True*)

Relabel the vertices `u` of `self` by the object obtained from `u` by applying the `relabel_operator` to `v` along a path from `self.root()` to `u`.

Note that the `self.root()` is paired with `v`.

INPUT:

- `v` – tuple, Permutation, etc.
- `inplace` – if `True`, modifies `self`; otherwise returns a modified copy of `self`

EXAMPLES:

```
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(3)]
sage: Y = YangBaxterGraph(root=(0,2,1,0), operators=ops)
sage: def relabel_op(op, u):
....:     i = op.position()
....:     return u[:i] + u[i:i+2][::-1] + u[i+2:]
sage: d = Y.relabel_vertices((1,2,3,4), relabel_op, inplace=False); d
Yang-Baxter graph with root vertex (1, 2, 3, 4)
sage: Y.vertices(sort=True)
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]
sage: e = Y.relabel_vertices((1,2,3,4), relabel_op); e
sage: Y.vertices(sort=True)
[(1, 2, 3, 4), (2, 1, 3, 4), (2, 3, 1, 4)]
```

```
>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>>> ops = [SwapIncreasingOperator(i) for i in range(Integer(3))]
>>> Y = YangBaxterGraph(root=(Integer(0),Integer(2),Integer(1),Integer(0)),␣
↪operators=ops)
>>> def relabel_op(op, u):
...     i = op.position()
...     return u[:i] + u[i:i+Integer(2)][::-Integer(1)] + u[i+Integer(2):]
>>> d = Y.relabel_vertices((Integer(1),Integer(2),Integer(3),Integer(4)),␣
↪relabel_op, inplace=False); d
Yang-Baxter graph with root vertex (1, 2, 3, 4)
>>> Y.vertices(sort=True)
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]
>>> e = Y.relabel_vertices((Integer(1),Integer(2),Integer(3),Integer(4)),␣
↪relabel_op); e
>>> Y.vertices(sort=True)
[(1, 2, 3, 4), (2, 1, 3, 4), (2, 3, 1, 4)]
```

root()

Return the root vertex of `self`.

If `self` is the Yang-Baxter graph of the partition $[p_1, p_2, \ldots, p_k]$, then this is the vertex $(p_k - 1, p_k - 2, \ldots, 0, \ldots, p_1 - 1, p_1 - 2, \ldots, 0)$.

EXAMPLES:

```
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(4)]
sage: Y = YangBaxterGraph(root=(1,0,2,1,0), operators=ops)
sage: Y.root()
(1, 0, 2, 1, 0)
sage: Y = YangBaxterGraph(root=(0,1,0,2,1,0), operators=ops)
sage: Y.root()
(0, 1, 0, 2, 1, 0)
sage: Y = YangBaxterGraph(root=(1,0,3,2,1,0), operators=ops)
sage: Y.root()
(1, 0, 3, 2, 1, 0)
sage: Y = YangBaxterGraph(partition=[3,2])                                    #␣
↪needs sage.combinat
```

(continues on next page)

(continued from previous page)

```
sage: Y.root()                                                                #␣
↪needs sage.combinat
(1, 0, 2, 1, 0)
```

```
>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>>> ops = [SwapIncreasingOperator(i) for i in range(Integer(4))]
>>> Y = YangBaxterGraph(root=(Integer(1),Integer(0),Integer(2),Integer(1),
↪Integer(0)), operators=ops)
>>> Y.root()
(1, 0, 2, 1, 0)
>>> Y = YangBaxterGraph(root=(Integer(0),Integer(1),Integer(0),Integer(2),
↪Integer(1),Integer(0)), operators=ops)
>>> Y.root()
(0, 1, 0, 2, 1, 0)
>>> Y = YangBaxterGraph(root=(Integer(1),Integer(0),Integer(3),Integer(2),
↪Integer(1),Integer(0)), operators=ops)
>>> Y.root()
(1, 0, 3, 2, 1, 0)
>>> Y = YangBaxterGraph(partition=[Integer(3),Integer(2)])                    ␣
↪              # needs sage.combinat
>>> Y.root()                                                                 #␣
↪needs sage.combinat
(1, 0, 2, 1, 0)
```

successors(*v*)

Return the successors of the vertex `v`.

EXAMPLES:

```
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(4)]
sage: Y = YangBaxterGraph(root=(1,0,2,1,0), operators=ops)
sage: Y.successors(Y.root())
[(1, 2, 0, 1, 0)]
sage: sorted(Y.successors((1, 2, 0, 1, 0)))
[(1, 2, 1, 0, 0), (2, 1, 0, 1, 0)]
```

```
>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>>> ops = [SwapIncreasingOperator(i) for i in range(Integer(4))]
>>> Y = YangBaxterGraph(root=(Integer(1),Integer(0),Integer(2),Integer(1),
↪Integer(0)), operators=ops)
>>> Y.successors(Y.root())
[(1, 2, 0, 1, 0)]
>>> sorted(Y.successors((Integer(1), Integer(2), Integer(0), Integer(1),␣
↪Integer(0))))
[(1, 2, 1, 0, 0), (2, 1, 0, 1, 0)]
```

vertex_relabelling_dict(*v*, *relabel_operator*)

Return a dictionary pairing vertices `u` of `self` with the object obtained from `v` by applying the `relabel_operator` along a path from the root to `u`.

Note that the root is paired with `v`.

INPUT:

- `v` – an object
- `relabel_operator` – function mapping a vertex and a label to the image of the vertex

OUTPUT: dictionary pairing vertices with the corresponding image of `v`

EXAMPLES:

```
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(3)]
sage: Y = YangBaxterGraph(root=(0,2,1,0), operators=ops)
sage: def relabel_operator(op, u):
....:     i = op.position()
....:     return u[:i] + u[i:i+2][::-1] + u[i+2:]
sage: Y.vertex_relabelling_dict((1,2,3,4), relabel_operator)
{(0, 2, 1, 0): (1, 2, 3, 4),
 (2, 0, 1, 0): (2, 1, 3, 4),
 (2, 1, 0, 0): (2, 3, 1, 4)}
```

```
>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>>> ops = [SwapIncreasingOperator(i) for i in range(Integer(3))]
>>> Y = YangBaxterGraph(root=(Integer(0),Integer(2),Integer(1),Integer(0)),␣
↪operators=ops)
>>> def relabel_operator(op, u):
...     i = op.position()
...     return u[:i] + u[i:i+Integer(2)][::-Integer(1)] + u[i+Integer(2):]
>>> Y.vertex_relabelling_dict((Integer(1),Integer(2),Integer(3),Integer(4)),␣
↪relabel_operator)
{(0, 2, 1, 0): (1, 2, 3, 4),
 (2, 0, 1, 0): (2, 1, 3, 4),
 (2, 1, 0, 0): (2, 3, 1, 4)}
```

vertices(*sort=False*)

Return the vertices of `self`.

INPUT:

- `sort` – boolean (default: `False`); whether to sort the vertices

EXAMPLES:

```
sage: from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
sage: ops = [SwapIncreasingOperator(i) for i in range(3)]
sage: Y = YangBaxterGraph(root=(0,2,1,0), operators=ops)
sage: Y.vertices(sort=True)
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]
```

```
>>> from sage.all import *
>>> from sage.combinat.yang_baxter_graph import SwapIncreasingOperator
>>> ops = [SwapIncreasingOperator(i) for i in range(Integer(3))]
>>> Y = YangBaxterGraph(root=(Integer(0),Integer(2),Integer(1),Integer(0)),␣
↪operators=ops)
```

(continues on next page)

(continued from previous page)

```
>>> Y.vertices(sort=True)
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]
```

class sage.combinat.yang_baxter_graph.**YangBaxterGraph_partition**(*partition*)

Bases: *YangBaxterGraph_generic*

A class to model the Yang-Baxter graph of a partition.

The Yang-Baxter graph defined by a partition $[p_1, \ldots, p_k]$ is the labelled directed graph with vertex set obtained by bubble-sorting $(p_k - 1, p_k - 2, \ldots, 0, \ldots, p_1 - 1, p_1 - 2, \ldots, 0)$; there is an arrow from u to v labelled by i if v is obtained by swapping the i-th and $(i + 1)$-th elements of u.

Note

This is a lazy implementation: the digraph is only computed when it is needed.

EXAMPLES:

```
sage: Y = YangBaxterGraph(partition=[3,2,1]); Y                                #␣
↪needs sage.combinat
Yang-Baxter graph of [3, 2, 1], with top vertex (0, 1, 0, 2, 1, 0)
sage: loads(dumps(Y)) == Y                                                     #␣
↪needs sage.combinat
True
```

```
>>> from sage.all import *
>>> Y = YangBaxterGraph(partition=[Integer(3),Integer(2),Integer(1)]); Y       ␣
↪                    # needs sage.combinat
Yang-Baxter graph of [3, 2, 1], with top vertex (0, 1, 0, 2, 1, 0)
>>> loads(dumps(Y)) == Y                                                  # needs␣
↪sage.combinat
True
```

AUTHORS:

- Franco Saliola (2009-04-23)

relabel_vertices(*v*, *inplace=True*)

Relabel the vertices of `self` with the object obtained from `v` by applying the transpositions corresponding to the edge labels along some path from the root to the vertex.

INPUT:

- `v` – tuple, Permutation, etc.
- `inplace` – if `True`, modifies `self`; otherwise returns a modified copy of `self`

EXAMPLES:

```
sage: # needs sage.combinat
sage: Y = YangBaxterGraph(partition=[3,1]); Y
Yang-Baxter graph of [3, 1], with top vertex (0, 2, 1, 0)
sage: d = Y.relabel_vertices((1,2,3,4), inplace=False); d
Digraph on 3 vertices
sage: Y.vertices(sort=True)
```

(continues on next page)

(continued from previous page)

```
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]
sage: e = Y.relabel_vertices((1,2,3,4)); e
sage: Y.vertices(sort=True)
[(1, 2, 3, 4), (2, 1, 3, 4), (2, 3, 1, 4)]
```

```
>>> from sage.all import *
>>> # needs sage.combinat
>>> Y = YangBaxterGraph(partition=[Integer(3),Integer(1)]); Y
Yang-Baxter graph of [3, 1], with top vertex (0, 2, 1, 0)
>>> d = Y.relabel_vertices((Integer(1),Integer(2),Integer(3),Integer(4)),␣
↪inplace=False); d
Digraph on 3 vertices
>>> Y.vertices(sort=True)
[(0, 2, 1, 0), (2, 0, 1, 0), (2, 1, 0, 0)]
>>> e = Y.relabel_vertices((Integer(1),Integer(2),Integer(3),Integer(4))); e
>>> Y.vertices(sort=True)
[(1, 2, 3, 4), (2, 1, 3, 4), (2, 3, 1, 4)]
```

vertex_relabelling_dict(*v*)

Return a dictionary pairing vertices `u` of `self` with the object obtained from `v` by applying transpositions corresponding to the edges labels along a path from the root to `u`.

Note that the root is paired with `v`.

INPUT:

- `v` – an object

OUTPUT: dictionary pairing vertices with the corresponding image of `v`

EXAMPLES:

```
sage: Y = YangBaxterGraph(partition=[3,1])                                  #␣
↪needs sage.combinat
sage: Y.vertex_relabelling_dict((1,2,3,4))                                  #␣
↪needs sage.combinat
{(0, 2, 1, 0): (1, 2, 3, 4),
 (2, 0, 1, 0): (2, 1, 3, 4),
 (2, 1, 0, 0): (2, 3, 1, 4)}
sage: Y.vertex_relabelling_dict((4,3,2,1))                                  #␣
↪needs sage.combinat

```

ν-Dyck words

A class of the ν-Dyck word, see [PRV2017] for details.

This file is based off the class *DyckWords* written by Mike Hansen, Dan Drake, Florent Hivert, Christian Stump, Mike Zabrocki, Jean–Baptiste Priez and Travis Scrimshaw.

AUTHORS:

- Aram Dermenjian (2020-09-26)

class sage.combinat.nu_dyck_word.**NuDyckWord**(*parent*, *dw*, *latex_options=None*)

Bases: *CombinatorialElement*

A ν-Dyck word.

Given a lattice path ν in the $\mathbf{Z}^2$ grid starting at the origin $(0, 0)$ consisting of North $N = (0, 1)$ and East $E = (1, 0)$ steps, a ν-Dyck path is a lattice path in the $\mathbf{Z}^2$ grid starting at the origin $(0, 0)$ and ending at the same coordinate as ν such that it is weakly above ν. A ν-Dyck word is the representation of a ν-Dyck path where a North step is represented by a 1 and an East step is represented by a 0.

INPUT:

- `k1` – a path for the ν-Dyck word
- `k2` – a path for ν

EXAMPLES:

```
sage: dw = NuDyckWord([1,0,1,0],[1,0,0,1]); dw
[1, 0, 1, 0]
sage: print(dw)
NENE
sage: dw.height()
2

sage: dw = NuDyckWord('1010',[1,0,0,1]); dw
[1, 0, 1, 0]

sage: dw = NuDyckWord('NENE',[1,0,0,1]); dw
[1, 0, 1, 0]

sage: NuDyckWord([1,0,1,0],[1,0,0,1]).pretty_print()
   __
 _|x
| . .

sage: from sage.combinat.nu_dyck_word import update_ndw_symbols
sage: update_ndw_symbols(0,1)
sage: dw = NuDyckWord('0101001','0110010'); dw
[0, 1, 0, 1, 0, 0, 1]
sage: dw.pp()
```

(continues on next page)

(continued from previous page)

```
     __
    |x
   _|  .
 _|x   .
|  .  .  .
sage: update_ndw_symbols(1,0)
```

```
>>> from sage.all import *
>>> dw = NuDyckWord([Integer(1),Integer(0),Integer(1),Integer(0)],[Integer(1),
↪Integer(0),Integer(0),Integer(1)]); dw
[1, 0, 1, 0]
>>> print(dw)
NENE
>>> dw.height()
2

>>> dw = NuDyckWord('1010',[Integer(1),Integer(0),Integer(0),Integer(1)]); dw
[1, 0, 1, 0]

>>> dw = NuDyckWord('NENE',[Integer(1),Integer(0),Integer(0),Integer(1)]); dw
[1, 0, 1, 0]

>>> NuDyckWord([Integer(1),Integer(0),Integer(1),Integer(0)],[Integer(1),
↪Integer(0),Integer(0),Integer(1)]).pretty_print()
   __
 _|x
|  .  .

>>> from sage.combinat.nu_dyck_word import update_ndw_symbols
>>> update_ndw_symbols(Integer(0),Integer(1))
>>> dw = NuDyckWord('0101001','0110010'); dw
[0, 1, 0, 1, 0, 0, 1]
>>> dw.pp()
     __
    |x
   _|  .
 _|x   .
|  .  .  .
>>> update_ndw_symbols(Integer(1),Integer(0))
```

can_mutate(i)

Return True/False based off if mutable at height i.

Can only mutate if an east step is followed by a north step at height i.

OUTPUT: whether we can mutate at height of i

EXAMPLES:

```
sage: NDW = NuDyckWord('10010100','00000111')
sage: NDW.can_mutate(1)
False
sage: NDW.can_mutate(3)
```

(continues on next page)

(continued from previous page)

```
5
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('10010100','00000111')
>>> NDW.can_mutate(Integer(1))
False
>>> NDW.can_mutate(Integer(3))
5
```

height()

Return the height of `self`.

The height is the number of `north` steps.

EXAMPLES:

```
sage: NuDyckWord('1101110011010010001101111000110000',
....: '1010101010101010101010101010101010').height()
17
```

```
>>> from sage.all import *
>>> NuDyckWord('1101110011010010001101111000110000',
... '1010101010101010101010101010101010').height()
17
```

heights()

Return the heights of each point on `self`.

We view the Dyck word as a Dyck path from $(0, 0)$ to (x, y) in the first quadrant by letting `1`'s represent steps in the direction $(0, 1)$ and `0`'s represent steps in the direction $(1, 0)$.

The heights is the sequence of the y-coordinates of all $x + y$ lattice points along the path.

EXAMPLES:

```
sage: NuDyckWord('010','010').heights()
[0, 0, 1, 1]
sage: NuDyckWord('110100','101010').heights()
[0, 1, 2, 2, 3, 3, 3]
```

```
>>> from sage.all import *
>>> NuDyckWord('010','010').heights()
[0, 0, 1, 1]
>>> NuDyckWord('110100','101010').heights()
[0, 1, 2, 2, 3, 3, 3]
```

horizontal_distance()

Return a list of how far each point is from ν.

EXAMPLES:

```
sage: NDW = NuDyckWord('10010100','00000111')
sage: NDW.horizontal_distance()
[5, 5, 4, 3, 3, 2, 2, 1, 0]
```

(continues on next page)

(continued from previous page)

```
sage: NDW = NuDyckWord('10010100','00001011')
sage: NDW.horizontal_distance()
[4, 5, 4, 3, 3, 2, 2, 1, 0]
sage: NDW = NuDyckWord('10011001000','00100101001')
sage: NDW.horizontal_distance()
[2, 4, 3, 2, 3, 5, 4, 3, 3, 2, 1, 0]
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('10010100','00000111')
>>> NDW.horizontal_distance()
[5, 5, 4, 3, 3, 2, 2, 1, 0]
>>> NDW = NuDyckWord('10010100','00001011')
>>> NDW.horizontal_distance()
[4, 5, 4, 3, 3, 2, 2, 1, 0]
>>> NDW = NuDyckWord('10011001000','00100101001')
>>> NDW.horizontal_distance()
[2, 4, 3, 2, 3, 5, 4, 3, 3, 2, 1, 0]
```

latex_options()

Return the latex options for use in the _latex_ function as a dictionary.

The default values are set using the options.

- color – (default: black) the line color
- line width – (default: 2*``tikz_scale``) value representing the line width
- nu_options – (default: 'rounded corners=1, color=red, line width=1') string to indicate what the tikz options should be for path of ν
- points_color – (default: 'black') str to indicate color points should be drawn with
- show_grid – boolean (default: True); value to indicate if grid should be shown
- show_nu – boolean (default: True); value to indicate if ν should be shown
- show_points – boolean (default: False); value to indicate if points should be shown on path
- tikz_scale – (default: 1) scale for use with the tikz package

EXAMPLES:

```
sage: NDW = NuDyckWord('010','010')
sage: NDW.latex_options()
{'color': black,
 'line width': 2,
 'nu_options': rounded corners=1, color=red, line width=1,
 'points_color': black,
 'show_grid': True,
 'show_nu': True,
 'show_points': False,
 'tikz_scale': 1}
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('010','010')
>>> NDW.latex_options()
```

(continues on next page)

(continued from previous page)

```
{'color': black,
 'line width': 2,
 'nu_options': rounded corners=1, color=red, line width=1,
 'points_color': black,
 'show_grid': True,
 'show_nu': True,
 'show_points': False,
 'tikz_scale': 1}
```

Todo

This should probably be merged into NuDyckWord.options.

length()

Return the length of `self`.

The length is the total number of steps.

EXAMPLES:

```
sage: NDW = NuDyckWord('10011001000','00100101001')
sage: NDW.length()
11
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('10011001000','00100101001')
>>> NDW.length()
11
```

mutate(i)

Return a new ν-Dyck Word if possible.

If at height i we have an east step E meeting a north step N then we calculate all horizontal distances from this point until we find the first point that has the same horizontal distance to ν. We let

- d is everything up until EN (not including EN)
- f be everything between N and the point with the same horizontal distance (including N)
- g is everything after f

See also

can_mutate()

EXAMPLES:

```
sage: NDW = NuDyckWord('10010100','00000111')
sage: NDW.mutate(1)
sage: NDW.mutate(3)
[1, 0, 0, 1, 1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('10010100','00000111')
>>> NDW.mutate(Integer(1))
>>> NDW.mutate(Integer(3))
[1, 0, 0, 1, 1, 0, 0, 0]
```

path()

Return the underlying path object.

EXAMPLES:

```
sage: NDW = NuDyckWord('10011001000','00100101001')
sage: NDW.path()
Path: 10011001000
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('10011001000','00100101001')
>>> NDW.path()
Path: 10011001000
```

plot(***kwds*)

Plot a ν-Dyck word as a continuous path.

EXAMPLES:

```
sage: NDW = NuDyckWord('010','010')
sage: NDW.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 1 graphics primitive
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('010','010')
>>> NDW.plot()                                                                #␣
↪needs sage.plot
Graphics object consisting of 1 graphics primitive
```

points()

Return an iterator for the points on the ν-Dyck path.

EXAMPLES:

```
sage: list(NuDyckWord('1101110011010010001101111000110000',
....: '1010101010101010101010101010101010101')._path.points())

pp(*style=None*, *labelling=None*)

alias of *pretty_print()*.

pretty_print(*style=None*, *labelling=None*)

Display a NuDyckWord as a lattice path in the $\mathbf{Z}^2$ grid.

If the `style` is "N-E", then a cell below the diagonal is indicated by a period, whereas a cell below the path but above the diagonal is indicated by an x. If a list of labels is included, they are displayed along the vertical edges of the Dyck path.

INPUT:

- `style` – (default: `None`) can either be:
  - `None` to use the option default
  - "N-E" to show `self` as a path of north and east steps, or
- `labelling` – (if style is "N-E") a list of labels assigned to the up steps in `self`
- `underpath` – (if style is "N-E", default: `True`) if `True`, an `x` to show the boxes between ν and the ν-Dyck Path

EXAMPLES:

```
sage: for ND in NuDyckWords('101010'): ND.pretty_print()
     __

set_latex_options(*D*)

Set the latex options for use in the _latex_ function.

The default values are set in the __init__ function.

- `color` – (default: black) the line color
- `line width` – (default: 2× `tikz_scale`) value representing the line width
- `nu_options` – (default: `'rounded corners=1, color=red, line width=1'`) string to indicate what the tikz options should be for path of ν
- `points_color` – (default: `'black'`) str to indicate color points should be drawn with
- `show_grid` – boolean (default: `True`); value to indicate if grid should be shown
- `show_nu` – boolean (default: `True`); value to indicate if ν should be shown
- `show_points` – boolean (default: `False`); value to indicate if points should be shown on path
- `tikz_scale` – (default: 1) scale for use with the tikz package

INPUT:

- `D` – dictionary with a list of latex parameters to change

EXAMPLES:

```
sage: NDW = NuDyckWord('010','010')
sage: NDW.set_latex_options({"tikz_scale":2})
sage: NDW.set_latex_options({"color":"blue", "show_points":True})
```

```
>>> from sage.all import *
>>> NDW = NuDyckWord('010','010')
>>> NDW.set_latex_options({"tikz_scale":Integer(2)})
>>> NDW.set_latex_options({"color":"blue", "show_points":True})
```

Todo

This should probably be merged into NuDyckWord.options.

width()

Return the width of `self`.

The width is the number of `east` steps.

EXAMPLES:

```
sage: NuDyckWord('1101110011010010001101111000110000',
....: '1010101010101010101010101010101010101').width()
16
```

```
>>> from sage.all import *
>>> NuDyckWord('1101110011010010001101111000110000',
... '1010101010101010101010101010101010101').width()
16
```

widths()

Return the widths of each point on `self`.

We view the Dyck word as a Dyck path from $(0,0)$ to (x,y) in the first quadrant by letting `1`'s represent steps in the direction $(0,1)$ and `0`'s represent steps in the direction $(1,0)$.

The widths is the sequence of the x-coordinates of all $x+y$ lattice points along the path.

EXAMPLES:

```
sage: NuDyckWord('010','010').widths()
[0, 1, 1, 2]
sage: NuDyckWord('110100','101010').widths()
[0, 0, 0, 1, 1, 2, 3]
```

```
>>> from sage.all import *
>>> NuDyckWord('010','010').widths()
[0, 1, 1, 2]
>>> NuDyckWord('110100','101010').widths()
[0, 0, 0, 1, 1, 2, 3]
```

class sage.combinat.nu_dyck_word.**NuDyckWords**(*nu=()*)

Bases: `Parent`

ν-Dyck words.

Given a lattice path ν in the $\mathbf{Z}^2$ grid starting at the origin $(0,0)$ consisting of North $N=(0,1)$ and East $E=(1,0)$ steps, a ν-Dyck path is a lattice path in the`ZZ^2` grid starting at the origin $(0,0)$ and ending at the same coordinate as ν such that it is weakly above ν. A ν-Dyck word is the representation of a ν-Dyck path where a North step is represented by a 1 and an East step is represented by a 0.

INPUT:

- `nu` – the base lattice path

EXAMPLES:

```
sage: NDW = NuDyckWords('1010'); NDW
[1, 0, 1, 0] Dyck words
sage: [1,0,1,0] in NDW
True
```

(continues on next page)

(continued from previous page)

```
sage: [1,1,0,0] in NDW
True
sage: [1,0,0,1] in NDW
False
sage: [0,1,0,1] in NDW
False
sage: NDW.cardinality()
2
```

```
>>> from sage.all import *
>>> NDW = NuDyckWords('1010'); NDW
[1, 0, 1, 0] Dyck words
>>> [Integer(1),Integer(0),Integer(1),Integer(0)] in NDW
True
>>> [Integer(1),Integer(1),Integer(0),Integer(0)] in NDW
True
>>> [Integer(1),Integer(0),Integer(0),Integer(1)] in NDW
False
>>> [Integer(0),Integer(1),Integer(0),Integer(1)] in NDW
False
>>> NDW.cardinality()
2
```

Element

alias of *NuDyckWord*

cardinality()

Return the number of ν-Dyck words.

EXAMPLES:

```
sage: NDW = NuDyckWords('101010'); NDW.cardinality()
5
sage: NDW = NuDyckWords('1010010'); NDW.cardinality()
7
sage: NDW = NuDyckWords('100100100'); NDW.cardinality()
12
```

```
>>> from sage.all import *
>>> NDW = NuDyckWords('101010'); NDW.cardinality()
5
>>> NDW = NuDyckWords('1010010'); NDW.cardinality()
7
>>> NDW = NuDyckWords('100100100'); NDW.cardinality()
12
```

options = Current options for NuDyckWords - ascii_art: pretty_output - diagram_style: grid - display: list - latex_color: black - latex_line_width_scalar: 2 - latex_nu_options: rounded corners=1, color=red, line width=1 - latex_points_color: black - latex_show_grid: True - latex_show_nu: True - latex_show_points: False - latex_tikz_scale: 1

sage.combinat.nu_dyck_word.**path_weakly_above_other**(*path*, *other*)

Test if `path` is weakly above `other`.

A path P is wealy above another path Q if P and Q are the same length and if any prefix of length n of Q contains more North steps than the prefix of length n of P.

INPUT:

- `path` – the path to verify is weakly above the other path
- `other` – the other path to verify is weakly below the path

OUTPUT: boolean

EXAMPLES:

```
sage: from sage.combinat.nu_dyck_word import path_weakly_above_other
sage: path_weakly_above_other('1001','0110')
False
sage: path_weakly_above_other('1001','0101')
True
sage: path_weakly_above_other('1111','0101')
False
sage: path_weakly_above_other('111100','0101')
False
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_dyck_word import path_weakly_above_other
>>> path_weakly_above_other('1001','0110')
False
>>> path_weakly_above_other('1001','0101')
True
>>> path_weakly_above_other('1111','0101')
False
>>> path_weakly_above_other('111100','0101')
False
```

sage.combinat.nu_dyck_word.**replace_dyck_char**(*x*)

A map sending an opening character (`'1'`, `'N'`, and `'('`) to `ndw_open_symbol`, a closing character (`'0'`, `'E'`, and `')'`) to `ndw_close_symbol`, and raising an error on any input other than one of the opening or closing characters.

This is the inverse map of *replace_dyck_symbol()*.

INPUT:

- `x` – string; a `'1'`, `'0'`, `'N'`, `'E'`, `'('` or `')'`

OUTPUT:

- If `x` is an opening character, replace `x` with the constant `ndw_open_symbol`.
- If `x` is a closing character, replace `x` with the constant `ndw_close_symbol`.
- Raise a `ValueError` if `x` is neither an opening nor a closing character.

See also

replace_dyck_symbol()

EXAMPLES:

```
sage: from sage.combinat.nu_dyck_word import replace_dyck_char
sage: replace_dyck_char('(')
1
sage: replace_dyck_char(')')
0
sage: replace_dyck_char(1)
Traceback (most recent call last):
...
ValueError
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_dyck_word import replace_dyck_char
>>> replace_dyck_char('(')
1
>>> replace_dyck_char(')')
0
>>> replace_dyck_char(Integer(1))
Traceback (most recent call last):
...
ValueError
```

sage.combinat.nu_dyck_word.**replace_dyck_symbol**(*x*, *open_char='N'*, *close_char='E'*)

A map sending `ndw_open_symbol` to `open_char` and `ndw_close_symbol` to `close_char`, and raising an error on any input other than `ndw_open_symbol` and `ndw_close_symbol`. The values of the constants `ndw_open_symbol` and `ndw_close_symbol` are subject to change.

This is the inverse map of *replace_dyck_char()*.

INPUT:

- `x` – either `ndw_open_symbol` or `ndw_close_symbol`
- `open_char` – string (optional) default `'N'`
- `close_char` – string (optional) default `'E'`

OUTPUT: if `x` is `ndw_open_symbol`, replace `x` with `open_char`

- If `x` is `ndw_close_symbol`, replace `x` with `close_char`.
- If `x` is neither `ndw_open_symbol` nor `ndw_close_symbol`, a `ValueError` is raised.

See also

replace_dyck_char()

EXAMPLES:

```
sage: from sage.combinat.nu_dyck_word import replace_dyck_symbol
sage: replace_dyck_symbol(1)
'N'
sage: replace_dyck_symbol(0)
'E'
sage: replace_dyck_symbol(3)
Traceback (most recent call last):
...
ValueError
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_dyck_word import replace_dyck_symbol

```

sage.combinat.nu_dyck_word.**to_word_path**(*word*)

Convert input into a word path over an appropriate alphabet.

Helper function.

INPUT:

- `word` – word to convert to wordpath

OUTPUT: a `FiniteWordPath_north_east` object

EXAMPLES:

```
sage: from sage.combinat.nu_dyck_word import to_word_path
sage: wp = to_word_path('NEENENEN'); wp
Path: 10010101
sage: from sage.combinat.words.paths import FiniteWordPath_north_east
sage: isinstance(wp,FiniteWordPath_north_east)
True
sage: to_word_path('1001')
Path: 1001
sage: to_word_path([0,1,0,0,1,0])
Path: 010010
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_dyck_word import to_word_path
>>> wp = to_word_path('NEENENEN'); wp
Path: 10010101
>>> from sage.combinat.words.paths import FiniteWordPath_north_east
>>> isinstance(wp,FiniteWordPath_north_east)
True
>>> to_word_path('1001')
Path: 1001
>>> to_word_path([Integer(0),Integer(1),Integer(0),Integer(0),Integer(1),
```

(continues on next page)

(continued from previous page)

```
↪Integer(0)])
Path: 010010
```

sage.combinat.nu_dyck_word.**update_ndw_symbols**(*os*, *cs*)

A way to alter the open and close symbols from sage.

INPUT:

- os – the open symbol
- cs – the close symbol

EXAMPLES:

```
sage: from sage.combinat.nu_dyck_word import update_ndw_symbols
sage: update_ndw_symbols(0,1)
sage: dw = NuDyckWord('0101001','0110010'); dw
[0, 1, 0, 1, 0, 0, 1]

sage: dw = NuDyckWord('1010110','1001101'); dw
Traceback (most recent call last):
...
ValueError: invalid nu-Dyck word
sage: update_ndw_symbols(1,0)
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_dyck_word import update_ndw_symbols
>>> update_ndw_symbols(Integer(0),Integer(1))
>>> dw = NuDyckWord('0101001','0110010'); dw
[0, 1, 0, 1, 0, 0, 1]

>>> dw = NuDyckWord('1010110','1001101'); dw
Traceback (most recent call last):
...
ValueError: invalid nu-Dyck word
>>> update_ndw_symbols(Integer(1),Integer(0))
```

ν-Tamari lattice

A class of the ν-Tamari lattice, and (δ, ν)-Tamari lattice (or alt ν-Tamari lattices), see [PRV2017] and [CC2023] for details.

These lattices depend on a parameter ν where ν is a path of North and East steps. The alt ν-Tamari lattice depends on an additional parameter δ, which is an increment vector with respect to ν.

The elements are *nu-Dyck paths* which are weakly above ν.

To use the provided functionality, you should import ν-Tamari lattices by typing:

```
sage: from sage.combinat.nu_tamari_lattice import NuTamariLattice, AltNuTamariLattice
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_tamari_lattice import NuTamariLattice, AltNuTamariLattice
```

Then,

```
sage: NuTamariLattice([1,1,1,0,0,1,1,0])
Finite lattice containing 6 elements
sage: NuTamariLattice([0,0,0,1,1,0,0,1])
Finite lattice containing 40 elements
sage: AltNuTamariLattice([0,0,0,1,1,0,0,1])
Finite lattice containing 40 elements
sage: AltNuTamariLattice([0,0,0,1,1,0,0,1], [0,1,0])
Finite lattice containing 40 elements
```

```
>>> from sage.all import *
>>> NuTamariLattice([Integer(1),Integer(1),Integer(1),Integer(0),Integer(0),
↪Integer(1),Integer(1),Integer(0)])
Finite lattice containing 6 elements
>>> NuTamariLattice([Integer(0),Integer(0),Integer(0),Integer(1),Integer(1),
↪Integer(0),Integer(0),Integer(1)])
Finite lattice containing 40 elements
>>> AltNuTamariLattice([Integer(0),Integer(0),Integer(0),Integer(1),Integer(1),
↪Integer(0),Integer(0),Integer(1)])
Finite lattice containing 40 elements
>>> AltNuTamariLattice([Integer(0),Integer(0),Integer(0),Integer(1),Integer(1),
↪Integer(0),Integer(0),Integer(1)], [Integer(0),Integer(1),Integer(0)])
Finite lattice containing 40 elements
```

The classical **Tamari lattices** and the **Generalized Tamari lattices** are special cases of this construction and are also available with this poset:

```
sage: NuTamariLattice([1,0,1,0,1,0])
Finite lattice containing 5 elements

sage: NuTamariLattice([1,0,0,1,0,0,1,0,0])
Finite lattice containing 12 elements
```

```
>>> from sage.all import *
>>> NuTamariLattice([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0)])
Finite lattice containing 5 elements

>>> NuTamariLattice([Integer(1),Integer(0),Integer(0),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(0),Integer(0)])
Finite lattice containing 12 elements
```

- Clément Chenevière (2024-02-01): added the alt ν-Tamari lattices

sage.combinat.nu_tamari_lattice.**AltNuTamariLattice**(*nu*, *delta=None*)

Return the (δ, ν)-Tamari lattice (or alt ν-Tamari lattice).

For more information, see [CC2023].

The path ν is a path of North steps (represented as 1 s) and East steps (represented as 0 s).

The vector $\delta = (\delta_1, \ldots, \delta_n)$ is an increment vector with respect to the path ν, that is to say $\delta_i \leq \nu_i$, where ν_i is the number of 0 s following the i-th 1 of ν. If not provided, δ is set by default to produce the classical ν-Tamari lattice.

INPUT:

- ν – list of 0s and 1s or a string of 0s and 1s
- δ – list of nonnegative integers

OUTPUT: a finite lattice

EXAMPLES:

```
sage: from sage.combinat.nu_tamari_lattice import AltNuTamariLattice,␣
↪NuTamariLattice
sage: AltNuTamariLattice('01001', [0, 0])
Finite lattice containing 7 elements
sage: AltNuTamariLattice('01001', [1, 0])
Finite lattice containing 7 elements
sage: AltNuTamariLattice('01001') == AltNuTamariLattice('01001', [2, 0])
True
sage: nu = '00100100101'; P = AltNuTamariLattice(nu); Q = NuTamariLattice(nu); P.
↪is_isomorphic(Q)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_tamari_lattice import AltNuTamariLattice,␣
↪NuTamariLattice
>>> AltNuTamariLattice('01001', [Integer(0), Integer(0)])
Finite lattice containing 7 elements
>>> AltNuTamariLattice('01001', [Integer(1), Integer(0)])
Finite lattice containing 7 elements
>>> AltNuTamariLattice('01001') == AltNuTamariLattice('01001', [Integer(2),␣
↪Integer(0)])
True
>>> nu = '00100100101'; P = AltNuTamariLattice(nu); Q = NuTamariLattice(nu); P.is_
↪isomorphic(Q)
True
```

REFERENCES:

- [PRV2017]
- [CC2023]

sage.combinat.nu_tamari_lattice.**NuTamariLattice**(*nu*)

Return the ν-Tamari lattice.

INPUT:

- ν – list of 0s and 1s or a string of 0s and 1s

OUTPUT: a finite lattice

The elements of the lattice are *nu-Dyck paths* weakly above ν.

The usual Tamari lattice is the special case where $\nu = (NE)^h$ where h is the height.

Other special cases give the m-Tamari lattices studied in [BMFPR].

EXAMPLES:

```
sage: from sage.combinat.nu_tamari_lattice import NuTamariLattice
sage: NuTamariLattice([1,0,1,0,0,1,0])
Finite lattice containing 7 elements
sage: NuTamariLattice([1,0,1,0,1,0])
Finite lattice containing 5 elements
sage: NuTamariLattice([1,0,1,0,1,0,1,0])
Finite lattice containing 14 elements
sage: NuTamariLattice([1,0,1,0,1,0,0,0,1])
Finite lattice containing 24 elements
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_tamari_lattice import NuTamariLattice
>>> NuTamariLattice([Integer(1),Integer(0),Integer(1),Integer(0),Integer(0),
↪Integer(1),Integer(0)])
Finite lattice containing 7 elements
>>> NuTamariLattice([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0)])
Finite lattice containing 5 elements
>>> NuTamariLattice([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0),Integer(1),Integer(0)])
Finite lattice containing 14 elements
>>> NuTamariLattice([Integer(1),Integer(0),Integer(1),Integer(0),Integer(1),
↪Integer(0),Integer(0),Integer(0),Integer(1)])
Finite lattice containing 24 elements
```

sage.combinat.nu_tamari_lattice.**delta_swap**(*p*, *k*, *delta*)

Perform a covering move in the (δ, ν)-Tamari lattice (or alt ν-Tamari lattice, see [CC2023]).

The letter at position k is a North step of the ν-Dyck word p, and must be preceded by an East step.

The vector $\delta = (\delta_1, \ldots, \delta_n)$ is an increment vector with respect to the path ν, that is to say $\delta_i \leq \nu_i$, where ν_i is the number of East steps following the i-th North step of ν.

INPUT:

- `p` – a ν-Dyck word
- `k` – integer between 0 and `p.length()-1`
- `delta` – list of nonnegative integers of length `p.height()`

OUTPUT: a ν-Dyck word

EXAMPLES:

```
sage: from sage.combinat.nu_tamari_lattice import delta_swap
sage: delta_swap(NuDyckWord('0101', '0101'), 3, delta = [1, 0])
[0, 1, 1, 0]
sage: delta_swap(NuDyckWord('1001110100', '0100010111'), 3, [3, 1, 0, 0, 0])
```

(continues on next page)

(continued from previous page)

```
[1, 0, 1, 1, 1, 0, 0, 1, 0, 0]
sage: delta_swap(NuDyckWord('10100101000', '01001000110'), 2, [2, 3, 0, 1])
[1, 1, 0, 0, 1, 0, 0, 1, 0, 0, 0]
sage: delta_swap(NuDyckWord('10100101000', '01001000110'), 2, [1, 1, 0, 0])
[1, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> from sage.combinat.nu_tamari_lattice import delta_swap
>>> delta_swap(NuDyckWord('0101', '0101'), Integer(3), delta = [Integer(1),␣
↪Integer(0)])
[0, 1, 1, 0]
>>> delta_swap(NuDyckWord('1001110100', '0100010111'), Integer(3), [Integer(3),␣
↪Integer(1), Integer(0), Integer(0), Integer(0)])
[1, 0, 1, 1, 1, 0, 0, 1, 0, 0]
>>> delta_swap(NuDyckWord('10100101000', '01001000110'), Integer(2), [Integer(2),␣
↪Integer(3), Integer(0), Integer(1)])
[1, 1, 0, 0, 1, 0, 0, 1, 0, 0, 0]
>>> delta_swap(NuDyckWord('10100101000', '01001000110'), Integer(2), [Integer(1),␣
↪Integer(1), Integer(0), Integer(0)])
[1, 1, 0, 0, 0, 1, 0, 1, 0, 0, 0]
```

k-regular sequences

An introduction and formal definition of k-regular sequences can be found, for example, on the Wikipedia article k-regular_sequence or in [AS2003].

```
sage: import logging
sage: logging.basicConfig()
```

```
>>> from sage.all import *
>>> import logging
>>> logging.basicConfig()
```

Examples

Binary sum of digits

The binary sum of digits $S(n)$ of a nonnegative integer n satisfies $S(2n) = S(n)$ and $S(2n+1) = S(n)+1$. We model this by the following:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: S = Seq2((Matrix([[1, 0], [0, 1]]), Matrix([[1, 0], [1, 1]])),
....:          left=vector([0, 1]), right=vector([1, 0]))
sage: S
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
sage: all(S[n] == sum(n.digits(2)) for n in srange(10))
True
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> S = Seq2((Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
```

(continues on next page)

(continued from previous page)

```
↪Matrix([[Integer(1), Integer(0)], [Integer(1), Integer(1)]])),
...           left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),␣
↪Integer(0)]))
>>> S
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
>>> all(S[n] == sum(n.digits(Integer(2))) for n in srange(Integer(10)))
True
```

Number of odd entries in Pascal's triangle

Let us consider the number of odd entries in the first n rows of Pascals's triangle:

```
sage: @cached_function
....: def u(n):
....:     if n <= 1:
....:         return n
....:     return 2 * u(n // 2) + u((n+1) // 2)
sage: tuple(u(n) for n in srange(10))
(0, 1, 3, 5, 9, 11, 15, 19, 27, 29)
```

```
>>> from sage.all import *
>>> @cached_function
... def u(n):
...     if n <= Integer(1):
...         return n
...     return Integer(2) * u(n // Integer(2)) + u((n+Integer(1)) // Integer(2))
>>> tuple(u(n) for n in srange(Integer(10)))
(0, 1, 3, 5, 9, 11, 15, 19, 27, 29)
```

There is a 2-regular sequence describing the numbers above as well:

```
sage: U = Seq2((Matrix([[3, 0], [2, 1]]), Matrix([[2, 1], [0, 3]])),
....:          left=vector([1, 0]), right=vector([0, 1]))
sage: all(U[n] == u(n) for n in srange(30))
True
```

```
>>> from sage.all import *
>>> U = Seq2((Matrix([[Integer(3), Integer(0)], [Integer(2), Integer(1)]]),␣
↪Matrix([[Integer(2), Integer(1)], [Integer(0), Integer(3)]])),
...           left=vector([Integer(1), Integer(0)]), right=vector([Integer(0),␣
↪Integer(1)]))
>>> all(U[n] == u(n) for n in srange(Integer(30)))
True
```

Classes and Methods

exception sage.combinat.regular_sequence.**DegeneratedSequenceError**

Bases: RuntimeError

Exception raised if a degenerated sequence (see *is_degenerated()*) is detected.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: Seq2((Matrix([2]), Matrix([3])), vector([1]), vector([1]))
Traceback (most recent call last):
...
DegeneratedSequenceError: degenerated sequence: mu[0]*right != right.
Using such a sequence might lead to wrong results.
You can use 'allow_degenerated_sequence=True' followed
by a call of method .regenerated() for correcting this.
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> Seq2((Matrix([Integer(2)]), Matrix([Integer(3)])), vector([Integer(1)]),␣
↪vector([Integer(1)]))
Traceback (most recent call last):
...
DegeneratedSequenceError: degenerated sequence: mu[0]*right != right.
Using such a sequence might lead to wrong results.
You can use 'allow_degenerated_sequence=True' followed
by a call of method .regenerated() for correcting this.
```

class sage.combinat.regular_sequence.**RecurrenceParser**(*k*, *coefficient_ring*)

Bases: object

A parser for recurrence relations that allow the construction of a k-linear representation for the sequence satisfying these recurrence relations.

This is used by *RegularSequenceRing.from_recurrence()* to construct a *RegularSequence*.

ind(*M*, *m*, *ll*, *uu*)

Determine the index operator corresponding to the recursive sequence as defined in [HKL2022].

INPUT:

- `M`, `m` – parameters of the recursive sequences, see [HKL2022], Definition 3.1
- `ll`, `uu` – parameters of the resulting linear representation, see [HKL2022], Theorem A

OUTPUT:

A dictionary which maps both row numbers to subsequence parameters and vice versa, i.e.,

- `ind[i]` – a pair `(j, d)` representing the sequence $x(k^j n + d)$ in the i-th component (0-based) of the resulting linear representation
- `ind[(j, d)]` – the (0-based) row number of the sequence $x(k^j n + d)$ in the linear representation

EXAMPLES:

```
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: RP.ind(3, 1, -3, 3)
{(0, 0): 0, (1, -1): 3, (1, -2): 2, (1, -3): 1,
(1, 0): 4, (1, 1): 5, (1, 2): 6, (1, 3): 7, (2, -1): 10,
(2, -2): 9, (2, -3): 8, (2, 0): 11, (2, 1): 12, (2, 2): 13,
(2, 3): 14, (2, 4): 15, (2, 5): 16, 0: (0, 0), 1: (1, -3),
10: (2, -1), 11: (2, 0), 12: (2, 1), 13: (2, 2), 14: (2, 3),
15: (2, 4), 16: (2, 5), 2: (1, -2), 3: (1, -1), 4: (1, 0),
5: (1, 1), 6: (1, 2), 7: (1, 3), 8: (2, -3), 9: (2, -2)}
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence import RecurrenceParser
>>> RP = RecurrenceParser(Integer(2), ZZ)
>>> RP.ind(Integer(3), Integer(1), -Integer(3), Integer(3))
{(0, 0): 0, (1, -1): 3, (1, -2): 2, (1, -3): 1,
(1, 0): 4, (1, 1): 5, (1, 2): 6, (1, 3): 7, (2, -1): 10,
(2, -2): 9, (2, -3): 8, (2, 0): 11, (2, 1): 12, (2, 2): 13,
(2, 3): 14, (2, 4): 15, (2, 5): 16, 0: (0, 0), 1: (1, -3),
10: (2, -1), 11: (2, 0), 12: (2, 1), 13: (2, 2), 14: (2, 3),
15: (2, 4), 16: (2, 5), 2: (1, -2), 3: (1, -1), 4: (1, 0),
5: (1, 1), 6: (1, 2), 7: (1, 3), 8: (2, -3), 9: (2, -2)}
```

See also

RegularSequenceRing.from_recurrence()

left(*recurrence_rules*)

Construct the vector `left` of the linear representation of recursive sequences.

INPUT:

- `recurrence_rules` – a namedtuple generated by *parameters()*; it only needs to contain a field `dim` (a positive integer)

OUTPUT: a vector

EXAMPLES:

```
sage: from collections import namedtuple
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: RRD = namedtuple('recurrence_rules_dim',
....:                  ['dim', 'inhomogeneities'])
sage: recurrence_rules = RRD(dim=5, inhomogeneities={})
sage: RP.left(recurrence_rules)
(1, 0, 0, 0, 0)
```

```
>>> from sage.all import *
>>> from collections import namedtuple
>>> from sage.combinat.regular_sequence import RecurrenceParser
>>> RP = RecurrenceParser(Integer(2), ZZ)
>>> RRD = namedtuple('recurrence_rules_dim',
...                  ['dim', 'inhomogeneities'])
>>> recurrence_rules = RRD(dim=Integer(5), inhomogeneities={})
>>> RP.left(recurrence_rules)
(1, 0, 0, 0, 0)
```

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: RRD = namedtuple('recurrence_rules_dim',
....:                  ['M', 'm', 'll', 'uu', 'dim', 'inhomogeneities'])
sage: recurrence_rules = RRD(M=3, m=2, ll=0, uu=9, dim=5,
....:                        inhomogeneities={0: Seq2.one_hadamard()})
sage: RP.left(recurrence_rules)
(1, 0, 0, 0, 0, 0, 0, 0)
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> RRD = namedtuple('recurrence_rules_dim',
...                  ['M', 'm', 'll', 'uu', 'dim', 'inhomogeneities'])
>>> recurrence_rules = RRD(M=Integer(3), m=Integer(2), ll=Integer(0),␣
↪uu=Integer(9), dim=Integer(5),
...                        inhomogeneities={Integer(0): Seq2.one_hadamard()})
>>> RP.left(recurrence_rules)
(1, 0, 0, 0, 0, 0, 0, 0)
```

See also

RegularSequenceRing.from_recurrence()

matrix(*recurrence_rules*, *rem*, *correct_offset=True*)

Construct the matrix for remainder `rem` of the linear representation of the sequence represented by `recurrence_rules`.

INPUT:

- `recurrence_rules` – a namedtuple generated by *parameters()*
- `rem` – integer between 0 and $k-1$
- `correct_offset` – boolean (default: `True`); if `True`, then the resulting linear representation has no offset. See [HKL2022] for more information.

OUTPUT: a matrix

EXAMPLES:

The following example illustrates how the coefficients in the right-hand sides of the recurrence relations correspond to the entries of the matrices.

```
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
```

(continues on next page)

(continued from previous page)

```
sage: var('n')
n
sage: function('f')
f
sage: M, m, coeffs, initial_values = RP.parse_recurrence([
....:     f(8*n) == -1*f(2*n - 1) + 1*f(2*n + 1),
....:     f(8*n + 1) == -11*f(2*n - 1) + 10*f(2*n) + 11*f(2*n + 1),
....:     f(8*n + 2) == -21*f(2*n - 1) + 20*f(2*n) + 21*f(2*n + 1),
....:     f(8*n + 3) == -31*f(2*n - 1) + 30*f(2*n) + 31*f(2*n + 1),
....:     f(8*n + 4) == -41*f(2*n - 1) + 40*f(2*n) + 41*f(2*n + 1),
....:     f(8*n + 5) == -51*f(2*n - 1) + 50*f(2*n) + 51*f(2*n + 1),
....:     f(8*n + 6) == -61*f(2*n - 1) + 60*f(2*n) + 61*f(2*n + 1),
....:     f(8*n + 7) == -71*f(2*n - 1) + 70*f(2*n) + 71*f(2*n + 1),

RegularSequenceRing.from_recurrence()

parameters(*M*, *m*, *coeffs*, *initial_values*, *offset=0*, *inhomogeneities={}*)

Determine parameters from recurrence relations as admissible in *RegularSequenceRing.from_recurrence()*.

INPUT:

All parameters are explained in the high-level method *RegularSequenceRing.from_recurrence()*.

OUTPUT: a namedtuple `recurrence_rules` consisting of

- `M`, `m`, `l`, `u`, `offset` – parameters of the recursive sequences, see [HKL2022], Definition 3.1
- `ll`, `uu`, `n1`, `dim` – parameters and dimension of the resulting linear representation, see [HKL2022], Theorem A
- `coeffs` – dictionary mapping `(r, j)` to the coefficients $c_{r,j}$ as given in [HKL2022], Equation (3.1). If `coeffs[(r, j)]` is not given for some `r` and `j`, then it is assumed to be zero.
- `initial_values` – dictionary mapping integers `n` to the `n`-th value of the sequence
- `inhomogeneities` – dictionary mapping integers `r` to the inhomogeneity g_r as given in [HKL2022], Corollary D

EXAMPLES:

```
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: RP.parameters(2, 1,
....: {(0, -2): 3, (0, 0): 1, (0, 1): 2, (1, -2): 6, (1, 0): 4,
....: (1, 1): 5, (2, -2): 9, (2, 0): 7, (2, 1): 8, (3, -2): 12,
....: (3, 0): 10, (3, 1): 11}, {0: 1, 1: 2, 2: 1, 3: 4}, 0, {0: 1})
recurrence_rules(M=2, m=1, l=-2, u=1, ll=-6, uu=3, dim=14,
coeffs={(0, -2): 3, (0, 0): 1, (0, 1): 2, (1, -2): 6, (1, 0): 4,
(1, 1): 5, (2, -2): 9, (2, 0): 7, (2, 1): 8, (3, -2): 12,

RegularSequenceRing.from_recurrence()

parse_direct_arguments(*M*, *m*, *coeffs*, *initial_values*)

Check whether the direct arguments as admissible in *RegularSequenceRing.from_recurrence()* are valid.

INPUT:

All parameters are explained in the high-level method *RegularSequenceRing.from_recurrence()*.

OUTPUT: a tuple consisting of the input parameters

EXAMPLES:

```
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: RP.parse_direct_arguments(2, 1,
....:     {(0, -2): 3, (0, 0): 1, (0, 1): 2,
....:      (1, -2): 6, (1, 0): 4, (1, 1): 5,
....:      (2, -2): 9, (2, 0): 7, (2, 1): 8,
....:      (3, -2): 12, (3, 0): 10, (3, 1): 11},
....:     {0: 1, 1: 2, 2: 1})
```

(continues on next page)

RegularSequenceRing.from_recurrence()

parse_recurrence(*equations*, *function*, *var*)

Parse recurrence relations as admissible in *RegularSequenceRing.from_recurrence()*.

INPUT:

All parameters are explained in the high-level method *RegularSequenceRing.from_recurrence()*.

OUTPUT: a tuple consisting of

- M, m – see *RegularSequenceRing.from_recurrence()*
- coeffs – see *RegularSequenceRing.from_recurrence()*
- initial_values – see *RegularSequenceRing.from_recurrence()*

EXAMPLES:

```
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: var('n')
n
sage: function('f')
f
sage: RP.parse_recurrence([
....:     f(4*n) == f(2*n) + 2*f(2*n + 1) + 3*f(2*n - 2),
....:     f(4*n + 1) == 4*f(2*n) + 5*f(2*n + 1) + 6*f(2*n - 2),
....:     f(4*n + 2) == 7*f(2*n) + 8*f(2*n + 1) + 9*f(2*n - 2),
....:     f(4*n + 3) == 10*f(2*n) + 11*f(2*n + 1) + 12*f(2*n - 2),
....:     f(0) == 1, f(1) == 2, f(2) == 1], f, n)
(2, 1, {(0, -2): 3, (0, 0): 1, (0, 1): 2, (1, -2): 6, (1, 0): 4,
(1, 1): 5, (2, -2): 9, (2, 0): 7, (2, 1): 8, (3, -2): 12, (3, 0): 10,
(3, 1): 11}, {0: 1, 1: 2, 2: 1})
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence import RecurrenceParser
>>> RP = RecurrenceParser(Integer(2), ZZ)
>>> var('n')
n
>>> function('f')
f
>>> RP.parse_recurrence([
...     f(Integer(4)*n) == f(Integer(2)*n) + Integer(2)*f(Integer(2)*n +␣
↪Integer(1)) + Integer(3)*f(Integer(2)*n - Integer(2)),
...     f(Integer(4)*n + Integer(1)) == Integer(4)*f(Integer(2)*n) +␣
↪Integer(5)*f(Integer(2)*n + Integer(1)) + Integer(6)*f(Integer(2)*n -␣
↪Integer(2)),

↪f(Integer(2)) == Integer(1)], f, n)
(2, 1, {(0, -2): 3, (0, 0): 1, (0, 1): 2, (1, -2): 6, (1, 0): 4,
(1, 1): 5, (2, -2): 9, (2, 0): 7, (2, 1): 8, (3, -2): 12, (3, 0): 10,
(3, 1): 11}, {0: 1, 1: 2, 2: 1})
```

Stern–Brocot Sequence:

```
sage: RP.parse_recurrence([
....:     f(2*n) == f(n), f(2*n + 1) == f(n) + f(n + 1),
....:     f(0) == 0, f(1) == 1], f, n)
(1, 0, {(0, 0): 1, (1, 0): 1, (1, 1): 1}, {0: 0, 1: 1})
```

```
>>> from sage.all import *
>>> RP.parse_recurrence([
...     f(Integer(2)*n) == f(n), f(Integer(2)*n + Integer(1)) == f(n) + f(n +␣
↪Integer(1)),
...     f(Integer(0)) == Integer(0), f(Integer(1)) == Integer(1)], f, n)
(1, 0, {(0, 0): 1, (1, 0): 1, (1, 1): 1}, {0: 0, 1: 1})
```

See also

RegularSequenceRing.from_recurrence()

right(*recurrence_rules*)

Construct the vector `right` of the linear representation of the sequence induced by `recurrence_rules`.

INPUT:

- `recurrence_rules` – a namedtuple generated by *parameters()*

OUTPUT: a vector

See also

RegularSequenceRing.from_recurrence()

shifted_inhomogeneities(*recurrence_rules*)

Return a dictionary of all needed shifted inhomogeneities as described in the proof of Corollary D in [HKL2022].

INPUT:

- `recurrence_rules` – a namedtuple generated by *parameters()*

OUTPUT:

A dictionary mapping r to the regular sequence $\sum_i g_r(n+i)$ for g_r as given in [HKL2022], Corollary D, and i between $\lfloor \ell'/k^M \rfloor$ and $\lfloor (k^{M-1} - k^m + u')/k^M \rfloor + 1$; see [HKL2022], proof of Corollary D. The first blocks of the corresponding vector-valued sequence (obtained from its linear representation) correspond to the sequences $g_r(n+i)$ where i is as in the sum above; the remaining blocks consist of other shifts which are required for the regular sequence.

EXAMPLES:

```
sage: from collections import namedtuple
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: S = Seq2((Matrix([[1, 0], [0, 1]]), Matrix([[1, 0], [1, 1]])),
....:          left=vector([0, 1]), right=vector([1, 0]))
sage: S
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
sage: RR = namedtuple('recurrence_rules',
....:                 ['M', 'm', 'll', 'uu', 'inhomogeneities'])
sage: recurrence_rules = RR(M=3, m=0, ll=-14, uu=14,
....:                       inhomogeneities={0: S, 1: S})
```

>>> S = Seq2((Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(1), Integer(0)], [Integer(1), Integer(1)]])),
...          left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),␣
↪Integer(0)]))
>>> S
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
>>> RR = namedtuple('recurrence_rules',
...                 ['M', 'm', 'll', 'uu', 'inhomogeneities'])
>>> recurrence_rules = RR(M=Integer(3), m=Integer(0), ll=-Integer(14),␣
↪uu=Integer(14),
...                       inhomogeneities={Integer(0): S, Integer(1): S})
>>> SI = RP.shifted_inhomogeneities(recurrence_rules)
>>> SI
{0: 2-regular sequence 4, 5, 7, 9, 11, 11, 11, 12, 13, 13, ...,
 1: 2-regular sequence 4, 5, 7, 9, 11, 11, 11, 12, 13, 13, ...}
```

The first blocks of the corresponding vector-valued sequence correspond to the corresponding shifts of the inhomogeneity. In this particular case, there are no other blocks:

```
sage: lower = -2
sage: upper = 3
sage: SI[0].dimension() == S.dimension() * (upper - lower + 1)
True
sage: all(
....:     Seq2(
....:         SI[0].mu,
....:         vector((i - lower)*[0, 0] + list(S.left) + (upper - i)*[0, 0]),
....:         SI[0].right)
....:     == S.subsequence(1, i)
....:     for i in range(lower, upper+1))
True
```

```
>>> from sage.all import *
>>> lower = -Integer(2)
>>> upper = Integer(3)
>>> SI[Integer(0)].dimension() == S.dimension() * (upper - lower + Integer(1))
True
>>> all(
...     Seq2(
...         SI[Integer(0)].mu,
...         vector((i - lower)*[Integer(0), Integer(0)] + list(S.left) +␣
↪(upper - i)*[Integer(0), Integer(0)]),
```

(continues on next page)

(continued from previous page)

```
...          SI[Integer(0)].right)
...      == S.subsequence(Integer(1), i)
...      for i in range(lower, upper+Integer(1)))
True
```

See also

RegularSequenceRing.from_recurrence()

v_eval_n (*recurrence_rules*, *n*)

Return the vector $v(n)$ as given in [HKL2022], Theorem A.

INPUT:

- `recurrence_rules` – a namedtuple generated by *parameters()*
- `n` – integer

OUTPUT: a vector

EXAMPLES:

Stern–Brocot Sequence:

```
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: SB_rules = RP.parameters(
....:     1, 0, {(0, 0): 1, (1, 0): 1, (1, 1): 1},
....:     {0: 0, 1: 1, 2: 1}, 0)
sage: RP.v_eval_n(SB_rules, 0)
(0, 1, 1)
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence import RecurrenceParser
>>> RP = RecurrenceParser(Integer(2), ZZ)
>>> SB_rules = RP.parameters(
...     Integer(1), Integer(0), {(Integer(0), Integer(0)): Integer(1),␣
↪(Integer(1), Integer(0)): Integer(1), (Integer(1), Integer(1)): Integer(1)},
...     {Integer(0): Integer(0), Integer(1): Integer(1), Integer(2):␣
↪Integer(1)}, Integer(0))
>>> RP.v_eval_n(SB_rules, Integer(0))
(0, 1, 1)
```

RegularSequenceRing.from_recurrence()

values (*M*, *m*, *l*, *u*, *ll*, *coeffs*, *initial_values*, *last_value_needed*, *offset*, *inhomogeneities*)

Determine enough values of the corresponding recursive sequence by applying the recurrence relations given in *RegularSequenceRing.from_recurrence()* to the values given in `initial_values`.

INPUT:

- `M`, `m`, `l`, `u`, `offset` – parameters of the recursive sequences, see [HKL2022], Definition 3.1

- `ll` – parameter of the resulting linear representation, see [HKL2022], Theorem A
- `coeffs` – dictionary where `coeffs[(r, j)]` is the coefficient $c_{r,j}$ as given in *RegularSequenceRing.from_recurrence()*. If `coeffs[(r, j)]` is not given for some `r` and `j`, then it is assumed to be zero.
- `initial_values` – dictionary mapping integers `n` to the `n`-th value of the sequence
- `last_value_needed` – last initial value which is needed to determine the linear representation
- `inhomogeneities` – dictionary mapping integers `r` to the inhomogeneity g_r as given in [HKL2022], Corollary D

OUTPUT:

A dictionary mapping integers `n` to the `n`-th value of the sequence for all `n` up to `last_value_needed`.

EXAMPLES:

Stern–Brocot Sequence:

```
sage: from sage.combinat.regular_sequence import RecurrenceParser
sage: RP = RecurrenceParser(2, ZZ)
sage: RP.values(M=1, m=0, l=0, u=1, ll=0,
....:     coeffs={(0, 0): 1, (1, 0): 1, (1, 1): 1},
....:     initial_values={0: 0, 1: 1, 2: 1}, last_value_needed=20,
....:     offset=0, inhomogeneities={})
{0: 0, 1: 1, 2: 1, 3: 2, 4: 1, 5: 3, 6: 2, 7: 3, 8: 1, 9: 4, 10: 3,
11: 5, 12: 2, 13: 5, 14: 3, 15: 4, 16: 1, 17: 5, 18: 4, 19: 7, 20: 3}
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence import RecurrenceParser
>>> RP = RecurrenceParser(Integer(2), ZZ)
>>> RP.values(M=Integer(1), m=Integer(0), l=Integer(0), u=Integer(1),␣
↪ll=Integer(0),
...     coeffs={(Integer(0), Integer(0)): Integer(1), (Integer(1),␣
↪Integer(0)): Integer(1), (Integer(1), Integer(1)): Integer(1)},
...     initial_values={Integer(0): Integer(0), Integer(1): Integer(1),␣
↪Integer(2): Integer(1)}, last_value_needed=Integer(20),
...     offset=Integer(0), inhomogeneities={})
{0: 0, 1: 1, 2: 1, 3: 2, 4: 1, 5: 3, 6: 2, 7: 3, 8: 1, 9: 4, 10: 3,
11: 5, 12: 2, 13: 5, 14: 3, 15: 4, 16: 1, 17: 5, 18: 4, 19: 7, 20: 3}
```

See also

RegularSequenceRing.from_recurrence()

class sage.combinat.regular_sequence.**RegularSequence**(*parent*, *mu*, *left=None*, *right=None*)

Bases: *RecognizableSeries*

A k-regular sequence.

INPUT:

- `parent` – an instance of *RegularSequenceRing*
- `mu` – a family of square matrices, all of which have the same dimension. The indices of this family are $0, ..., k-1$. `mu` may be a list or tuple of cardinality k as well. See also *mu()*.

- `left` – (default: `None`) a vector. When evaluating the sequence, this vector is multiplied from the left to the matrix product. If `None`, then this multiplication is skipped.
- `right` – (default: `None`) a vector. When evaluating the sequence, this vector is multiplied from the right to the matrix product. If `None`, then this multiplication is skipped.

When created via the parent *RegularSequenceRing*, then the following option is available.

- `allow_degenerated_sequence` – boolean (default: `False`); if set, then there will be no check if the input is a degenerated sequence (see *is_degenerated()*). Otherwise the input is checked and a *DegeneratedSequenceError* is raised if such a sequence is detected.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: S = Seq2((Matrix([[3, 0], [6, 1]]), Matrix([[0, 1], [-6, 5]])),
....:          vector([1, 0]), vector([0, 1])); S
2-regular sequence 0, 1, 3, 5, 9, 11, 15, 19, 27, 29, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> S = Seq2((Matrix([[Integer(3), Integer(0)], [Integer(6), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [-Integer(6), Integer(5)]])),
...           vector([Integer(1), Integer(0)]), vector([Integer(0), Integer(1)]));␣
↪S
2-regular sequence 0, 1, 3, 5, 9, 11, 15, 19, 27, 29, ...
```

We can access the coefficients of a sequence by

```
sage: S[5]
11
```

```
>>> from sage.all import *
>>> S[Integer(5)]
11
```

or iterating over the first, say 10, by

```
sage: from itertools import islice
sage: list(islice(S, 10))
[0, 1, 3, 5, 9, 11, 15, 19, 27, 29]
```

```
>>> from sage.all import *
>>> from itertools import islice
>>> list(islice(S, Integer(10)))
[0, 1, 3, 5, 9, 11, 15, 19, 27, 29]
```

See also

k-regular sequence, *RegularSequenceRing*.

backward_differences(***kwds*)

Return the sequence of backward differences of this k-regular sequence.

INPUT:

- `minimize` – (default: `None`) a boolean or `None`. If `True`, then *`minimized()`* is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a *`RegularSequence`*

Note

The coefficient to the index -1 is 0.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: C = Seq2((Matrix([[2, 0], [2, 1]]), Matrix([[0, 1], [-2, 3]])),
....:          vector([1, 0]), vector([0, 1]))
sage: C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
sage: C.backward_differences()
2-regular sequence 0, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> C = Seq2((Matrix([[Integer(2), Integer(0)], [Integer(2), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [-Integer(2), Integer(3)]])),
...          vector([Integer(1), Integer(0)]), vector([Integer(0),␣
↪Integer(1)]))
>>> C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
>>> C.backward_differences()
2-regular sequence 0, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
```

```
sage: E = Seq2((Matrix([[0, 1], [0, 1]]), Matrix([[0, 0], [0, 1]])),
....:          vector([1, 0]), vector([1, 1]))
sage: E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
sage: E.backward_differences()
2-regular sequence 1, -1, 1, -1, 1, -1, 1, -1, 1, -1, ...
```

```
>>> from sage.all import *
>>> E = Seq2((Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(1)]])),
...          vector([Integer(1), Integer(0)]), vector([Integer(1),␣
↪Integer(1)]))
>>> E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
>>> E.backward_differences()
2-regular sequence 1, -1, 1, -1, 1, -1, 1, -1, 1, -1, ...
```

`coefficient_of_n`(*n*, ***kwds*)

Return the n-th entry of this sequence.

INPUT:

- `n` – nonnegative integer

OUTPUT: an element of the universe of the sequence

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: S = Seq2((Matrix([[1, 0], [0, 1]]), Matrix([[0, -1], [1, 2]])),
....:          left=vector([0, 1]), right=vector([1, 0]))
sage: S[7]
3
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> S = Seq2((Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), -Integer(1)], [Integer(1), Integer(2)]])),
...           left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),␣
↪Integer(0)]))
>>> S[Integer(7)]
3
```

This is equivalent to:

```
sage: S.coefficient_of_n(7)
3
```

```
>>> from sage.all import *
>>> S.coefficient_of_n(Integer(7))
3
```

convolution(**args*, ***kwds*)

Return the product of this k-regular sequence with `other`, where the multiplication is convolution of power series.

The operator $*$ is mapped to *convolution()*.

INPUT:

- `other` – a *RegularSequence*
- `minimize` – (default: `None`) a boolean or `None`. If `True`, then *minimized()* is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a *RegularSequence*

ALGORITHM:

See pdf attached to github pull request #35894 which contains a draft describing the details of the used algorithm.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: E = Seq2((Matrix([[0, 1], [0, 1]]), Matrix([[0, 0], [0, 1]])),
....:          vector([1, 0]), vector([1, 1]))
sage: E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> E = Seq2((Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(1)]])),
...           vector([Integer(1), Integer(0)]), vector([Integer(1),␣
↪Integer(1)]))
>>> E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
```

We can build the convolution (in the sense of power-series) of E by itself via:

```
sage: E.convolution(E)
2-regular sequence 1, 0, 2, 0, 3, 0, 4, 0, 5, 0, ...
```

```
>>> from sage.all import *
>>> E.convolution(E)
2-regular sequence 1, 0, 2, 0, 3, 0, 4, 0, 5, 0, ...
```

This is the same as using multiplication operator:

```
sage: E * E
2-regular sequence 1, 0, 2, 0, 3, 0, 4, 0, 5, 0, ...
```

```
>>> from sage.all import *
>>> E * E
2-regular sequence 1, 0, 2, 0, 3, 0, 4, 0, 5, 0, ...
```

Building *partial_sums()* can also be seen as a convolution:

```
sage: o = Seq2.one_hadamard()
sage: E * o
2-regular sequence 1, 1, 2, 2, 3, 3, 4, 4, 5, 5, ...
sage: E * o == E.partial_sums(include_n=True)
True
```

```
>>> from sage.all import *
>>> o = Seq2.one_hadamard()
>>> E * o
2-regular sequence 1, 1, 2, 2, 3, 3, 4, 4, 5, 5, ...
>>> E * o == E.partial_sums(include_n=True)
True
```

forward_differences(***kwds*)

Return the sequence of forward differences of this k-regular sequence.

INPUT:

- `minimize` – (default: `None`) a boolean or `None`. If `True`, then *minimized()* is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a *RegularSequence*

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: C = Seq2((Matrix([[2, 0], [2, 1]]), Matrix([[0, 1], [-2, 3]])),
....:          vector([1, 0]), vector([0, 1]))
sage: C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
sage: C.forward_differences()
2-regular sequence 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> C = Seq2((Matrix([[Integer(2), Integer(0)], [Integer(2), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [-Integer(2), Integer(3)]])),
...          vector([Integer(1), Integer(0)]), vector([Integer(0),␣
↪Integer(1)]))
>>> C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
>>> C.forward_differences()
2-regular sequence 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
```

```
sage: E = Seq2((Matrix([[0, 1], [0, 1]]), Matrix([[0, 0], [0, 1]])),
....:          vector([1, 0]), vector([1, 1]))
sage: E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
sage: E.forward_differences()
2-regular sequence -1, 1, -1, 1, -1, 1, -1, 1, -1, 1, ...
```

```
>>> from sage.all import *
>>> E = Seq2((Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(1)]])),
...          vector([Integer(1), Integer(0)]), vector([Integer(1),␣
↪Integer(1)]))
>>> E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
>>> E.forward_differences()
2-regular sequence -1, 1, -1, 1, -1, 1, -1, 1, -1, 1, ...
```

is_bounded()

Return whether this k-regular sequence is bounded.

EXAMPLES:

Thue–Morse Sequence:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: TM = Seq2([Matrix([[1, 0], [0, 1]]), Matrix([[0, 1], [1, 0]])],
....:           left=vector([1, 0]), right=vector([0, 1]))
sage: TM.is_bounded()
True
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> TM = Seq2([Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
```

(continues on next page)

(continued from previous page)

```
↪Matrix([[Integer(0), Integer(1)], [Integer(1), Integer(0)]])],
...           left=vector([Integer(1), Integer(0)]), right=vector([Integer(0),
↪ Integer(1)]))
>>> TM.is_bounded()
True
```

Binary Sum of Digits:

```
sage: SD = Seq2([Matrix([[1, 0], [0, 1]]), Matrix([[0, -1], [1, 2]])],
....:           left=vector([0, 1]), right=vector([1, 0]))
sage: SD.is_bounded()
False
```

```
>>> from sage.all import *
>>> SD = Seq2([Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), -Integer(1)], [Integer(1), Integer(2)]])],
...           left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),
↪ Integer(0)]))
>>> SD.is_bounded()
False
```

Sequence of All Natural Numbers:

```
sage: N = Seq2([Matrix([[2, 0], [2, 1]]), Matrix([[0, 1], [-2, 3]])],
....:          left=vector([1, 0]), right=vector([0, 1]))
sage: N.is_bounded()
False
```

```
>>> from sage.all import *
>>> N = Seq2([Matrix([[Integer(2), Integer(0)], [Integer(2), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [-Integer(2), Integer(3)]])],
...          left=vector([Integer(1), Integer(0)]), right=vector([Integer(0),␣
↪Integer(1)]))
>>> N.is_bounded()
False
```

Indicator Function of Even Integers:

```
sage: E = Seq2([Matrix([[0, 1], [0, 1]]), Matrix([[0, 0], [0, 1]])],
....:          left=vector([1, 0]), right=vector([1, 1]))
sage: E.is_bounded()
True
```

```
>>> from sage.all import *
>>> E = Seq2([Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(1)]])],
...           left=vector([Integer(1), Integer(0)]), right=vector([Integer(1),␣
↪Integer(1)]))
>>> E.is_bounded()
True
```

Indicator Function of Odd Integers:

```
sage: O = Seq2([Matrix([[0, 0], [0, 1]]), Matrix([[0, 1], [0, 1]])],
....:          left=vector([1, 0]), right=vector([0, 1]))
sage: O.is_bounded()
True
```

```
>>> from sage.all import *
>>> O = Seq2([Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]])],
...          left=vector([Integer(1), Integer(0)]), right=vector([Integer(0),␣
↪Integer(1)]))
>>> O.is_bounded()
True
```

Number of Odd Entries in Pascal's Triangle:

```
sage: U = Seq2([Matrix([[3, 0], [6, 1]]), Matrix([[0, 1], [-6, 5]])],
....:          left=vector([1, 0]), right=vector([0, 1]))
sage: U.is_bounded()
False
```

```
>>> from sage.all import *
>>> U = Seq2([Matrix([[Integer(3), Integer(0)], [Integer(6), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [-Integer(6), Integer(5)]])],
...          left=vector([Integer(1), Integer(0)]), right=vector([Integer(0),␣
↪Integer(1)]))
>>> U.is_bounded()
False
```

Counting '10' in the Binary Representation:

```
sage: C = Seq2([Matrix([[0, 1, 0, 0], [0, 0, 0, 1],
....:                   [-1, 0, 1, 1], [0, 0, 0, 1]]),
....:           Matrix([[0, 0, 1, 0], [0, 1, 0, 0],
....:                   [0, 0, 1, 0], [-1, 0, 1, 1]])],
....:                  left=vector([1, 0, 0, 0]),
....:                  right=vector([0, 0, 1, 0]))
sage: C.is_bounded()
False
```

```
>>> from sage.all import *
>>> C = Seq2([Matrix([[Integer(0), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(0), Integer(0), Integer(0), Integer(1)],
...                   [-Integer(1), Integer(0), Integer(1), Integer(1)],␣
↪[Integer(0), Integer(0), Integer(0), Integer(1)]]),
...           Matrix([[Integer(0), Integer(0), Integer(1), Integer(0)],␣
↪[Integer(0), Integer(1), Integer(0), Integer(0)],
...                   [Integer(0), Integer(0), Integer(1), Integer(0)], [-
↪Integer(1), Integer(0), Integer(1), Integer(1)]])],
...                  left=vector([Integer(1), Integer(0), Integer(0),␣
↪Integer(0)]),
...                  right=vector([Integer(0), Integer(0), Integer(1),␣
↪Integer(0)]))
```

(continues on next page)

(continued from previous page)

```
>>> C.is_bounded()
False
```

Numbers Starting with '10':

```
sage: D = Seq2([Matrix([[0, 1, 0, 0], [0, 0, 1, 0],
....:                   [0, -2, 3, 0], [0, -2, 2, 1]]),
....:           Matrix([[2, 0, 0, 0], [0, 0, 0, 1],
....:                   [0, 2, 0, 1], [0, -2, 0, 3]])],
....:                  left=vector([1, 0, 0, 0]),
....:                  right=vector([2, 2, 2, 5]))
sage: D.is_bounded()
False
```

```
>>> from sage.all import *
>>> D = Seq2([Matrix([[Integer(0), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(0), Integer(0), Integer(1), Integer(0)],
...                   [Integer(0), -Integer(2), Integer(3), Integer(0)],␣
↪[Integer(0), -Integer(2), Integer(2), Integer(1)]]),
...            Matrix([[Integer(2), Integer(0), Integer(0), Integer(0)],␣
↪[Integer(0), Integer(0), Integer(0), Integer(1)],
...                   [Integer(0), Integer(2), Integer(0), Integer(1)],␣
↪[Integer(0), -Integer(2), Integer(0), Integer(3)]])],
...                  left=vector([Integer(1), Integer(0), Integer(0),␣
↪Integer(0)]),
...                  right=vector([Integer(2), Integer(2), Integer(2),␣
↪Integer(5)]))
>>> D.is_bounded()
False
```

Signum Function:

```
sage: S = Seq2([Matrix([[1, 0], [0, 1]]), Matrix([[0, 1], [0, 1]])],
....:          left=vector([1, 0]), right=vector([0, 1]))
sage: S.is_bounded()
True
```

```
>>> from sage.all import *
>>> S = Seq2([Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]])],
...           left=vector([Integer(1), Integer(0)]), right=vector([Integer(0),␣
↪Integer(1)]))
>>> S.is_bounded()
True
```

Number of Digits from the Right to the First '1':

```
sage: S = Seq2([Matrix([[0, 1, 0], [-1, 2, 0], [0, 0, 1]]),
....:           Matrix([[0, 0, 1], [0, 0, 2], [0, 0, 1]])],
....:          left=vector([1, 0, 0]), right=vector([0, 0, 1]))
sage: S.is_bounded()
False
```

```
>>> from sage.all import *
>>> S = Seq2([Matrix([[Integer(0), Integer(1), Integer(0)], [-Integer(1),␣
↪Integer(2), Integer(0)], [Integer(0), Integer(0), Integer(1)]]),
...           Matrix([[Integer(0), Integer(0), Integer(1)], [Integer(0),␣
↪Integer(0), Integer(2)], [Integer(0), Integer(0), Integer(1)]])],
...          left=vector([Integer(1), Integer(0), Integer(0)]),␣
↪right=vector([Integer(0), Integer(0), Integer(1)]))
>>> S.is_bounded()
False
```

boundedness of k-regular sequences

is_degenerated()

Return whether this k-regular sequence is degenerated, i.e., whether this k-regular sequence does not satisfy $\mu[0]right = right$.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: Seq2((Matrix([2]), Matrix([3])), vector([1]), vector([1]))  # indirect␣
↪doctest
Traceback (most recent call last):
...
DegeneratedSequenceError: degenerated sequence: mu[0]*right != right.
Using such a sequence might lead to wrong results.
You can use 'allow_degenerated_sequence=True' followed
by a call of method .regenerated() for correcting this.
sage: S = Seq2((Matrix([2]), Matrix([3])), vector([1]), vector([1]),
....:          allow_degenerated_sequence=True)
sage: S
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
sage: S.is_degenerated()
True
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> Seq2((Matrix([Integer(2)]), Matrix([Integer(3)])), vector([Integer(1)]),␣
↪vector([Integer(1)]))  # indirect doctest
Traceback (most recent call last):
...
DegeneratedSequenceError: degenerated sequence: mu[0]*right != right.
Using such a sequence might lead to wrong results.
You can use 'allow_degenerated_sequence=True' followed
by a call of method .regenerated() for correcting this.
>>> S = Seq2((Matrix([Integer(2)]), Matrix([Integer(3)])),␣
↪vector([Integer(1)]), vector([Integer(1)]),
...          allow_degenerated_sequence=True)
>>> S
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
```

(continues on next page)

(continued from previous page)

```
>>> S.is_degenerated()
True
```

```
sage: C = Seq2((Matrix([[2, 0], [2, 1]]), Matrix([[0, 1], [-2, 3]])),
....:          vector([1, 0]), vector([0, 1]))
sage: C.is_degenerated()
False
```

```
>>> from sage.all import *
>>> C = Seq2((Matrix([[Integer(2), Integer(0)], [Integer(2), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [-Integer(2), Integer(3)]])),
...           vector([Integer(1), Integer(0)]), vector([Integer(0),␣
↪Integer(1)]))
>>> C.is_degenerated()
False
```

partial_sums(**args*, ***kwds*)

Return the sequence of partial sums of this k-regular sequence. That is, the n-th entry of the result is the sum of the first n entries in the original sequence.

INPUT:

- `include_n` – boolean (default: `False`); if set, then the n-th entry of the result is the sum of the entries up to index n (included)
- `minimize` – (default: `None`) a boolean or `None`. If `True`, then *`minimized()`* is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a *`RegularSequence`*

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)

sage: E = Seq2((Matrix([[0, 1], [0, 1]]), Matrix([[0, 0], [0, 1]])),
....:          vector([1, 0]), vector([1, 1]))
sage: E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
sage: E.partial_sums()
2-regular sequence 0, 1, 1, 2, 2, 3, 3, 4, 4, 5, ...
sage: E.partial_sums(include_n=True)
2-regular sequence 1, 1, 2, 2, 3, 3, 4, 4, 5, 5, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)

>>> E = Seq2((Matrix([[Integer(0), Integer(1)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(0)], [Integer(0), Integer(1)]])),
...           vector([Integer(1), Integer(0)]), vector([Integer(1),␣
↪Integer(1)]))
>>> E
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
>>> E.partial_sums()
```

(continues on next page)

(continued from previous page)

```
2-regular sequence 0, 1, 1, 2, 2, 3, 3, 4, 4, 5, ...
>>> E.partial_sums(include_n=True)
2-regular sequence 1, 1, 2, 2, 3, 3, 4, 4, 5, 5, ...
```

```
sage: C = Seq2((Matrix([[2, 0], [2, 1]]), Matrix([[0, 1], [-2, 3]])),
....:          vector([1, 0]), vector([0, 1]))
sage: C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
sage: C.partial_sums()
2-regular sequence 0, 0, 1, 3, 6, 10, 15, 21, 28, 36, ...
sage: C.partial_sums(include_n=True)
2-regular sequence 0, 1, 3, 6, 10, 15, 21, 28, 36, 45, ...
```

```
>>> from sage.all import *
>>> C = Seq2((Matrix([[Integer(2), Integer(0)], [Integer(2), Integer(1)]]),␣
↪Matrix([[Integer(0), Integer(1)], [-Integer(2), Integer(3)]])),
...          vector([Integer(1), Integer(0)]), vector([Integer(0),␣
↪Integer(1)]))
>>> C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
>>> C.partial_sums()
2-regular sequence 0, 0, 1, 3, 6, 10, 15, 21, 28, 36, ...
>>> C.partial_sums(include_n=True)
2-regular sequence 0, 1, 3, 6, 10, 15, 21, 28, 36, 45, ...
```

The following linear representation of S is chosen badly (is degenerated, see `is_degenerated()`), as $\mu(0)$ applied on *right* does not equal *right*:

```
sage: S = Seq2((Matrix([2]), Matrix([3])), vector([1]), vector([1]),
....:          allow_degenerated_sequence=True)
sage: S
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
```

```
>>> from sage.all import *
>>> S = Seq2((Matrix([Integer(2)]), Matrix([Integer(3)])),␣
↪vector([Integer(1)]), vector([Integer(1)]),
...          allow_degenerated_sequence=True)
>>> S
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
```

Therefore, building partial sums produces a wrong result:

```
sage: H = S.partial_sums(include_n=True, minimize=False)
sage: H
2-regular sequence 1, 5, 16, 25, 62, 80, 98, 125, 274, 310, ...
sage: H = S.partial_sums(minimize=False)
sage: H
2-regular sequence 0, 2, 10, 16, 50, 62, 80, 98, 250, 274, ...
```

```
>>> from sage.all import *
>>> H = S.partial_sums(include_n=True, minimize=False)
```

(continues on next page)

(continued from previous page)

```
>>> H
2-regular sequence 1, 5, 16, 25, 62, 80, 98, 125, 274, 310, ...
>>> H = S.partial_sums(minimize=False)
>>> H
2-regular sequence 0, 2, 10, 16, 50, 62, 80, 98, 250, 274, ...
```

We can *guess()* the correct representation:

```
sage: from itertools import islice
sage: L = []; ps = 0
sage: for s in islice(S, 110):
....:     ps += s
....:     L.append(ps)
sage: G = Seq2.guess(lambda n: L[n])
sage: G
2-regular sequence 1, 4, 10, 19, 31, 49, 67, 94, 118, 154, ...
sage: G.linear_representation()
((1, 0, 0, 0),
 Finite family {0: [  0   1   0   0]
                   [  0   0   0   1]
                   [ -5   5   1   0]
                   [ 10 -17   0   8],
                1: [  0   0   1   0]
                   [ -5   3   3   0]
                   [ -5   0   6   0]
                   [-30  21  10   0]},
 (1, 1, 4, 1))
sage: G.minimized().dimension() == G.dimension()
True
```

```
>>> from sage.all import *
>>> from itertools import islice
>>> L = []; ps = Integer(0)
>>> for s in islice(S, Integer(110)):
...     ps += s
...     L.append(ps)
>>> G = Seq2.guess(lambda n: L[n])
>>> G
2-regular sequence 1, 4, 10, 19, 31, 49, 67, 94, 118, 154, ...
>>> G.linear_representation()
((1, 0, 0, 0),
 Finite family {0: [  0   1   0   0]
                   [  0   0   0   1]
                   [ -5   5   1   0]
                   [ 10 -17   0   8],
                1: [  0   0   1   0]
                   [ -5   3   3   0]
                   [ -5   0   6   0]
                   [-30  21  10   0]},
 (1, 1, 4, 1))
>>> G.minimized().dimension() == G.dimension()
True
```

Or we regenerate the sequence S first:

```
sage: S.regenerated().partial_sums(include_n=True, minimize=False)
2-regular sequence 1, 4, 10, 19, 31, 49, 67, 94, 118, 154, ...
sage: S.regenerated().partial_sums(minimize=False)
2-regular sequence 0, 1, 4, 10, 19, 31, 49, 67, 94, 118, ...
```

```
>>> from sage.all import *
>>> S.regenerated().partial_sums(include_n=True, minimize=False)
2-regular sequence 1, 4, 10, 19, 31, 49, 67, 94, 118, 154, ...
>>> S.regenerated().partial_sums(minimize=False)
2-regular sequence 0, 1, 4, 10, 19, 31, 49, 67, 94, 118, ...
```

regenerated(**args*, ***kwds*)

Return a k-regular sequence that satisfies $\mu[0]right = right$ with the same values as this sequence.

INPUT:

- `minimize` – (default: `None`) a boolean or `None`. If `True`, then *minimized()* is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a *RegularSequence*

ALGORITHM:

Theorem B of [HKL2022] with $n_0 = 1$.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
```

The following linear representation of S is chosen badly (is degenerated, see *is_degenerated()*), as $\mu(0)$ applied on *right* does not equal *right*:

```
sage: S = Seq2((Matrix([2]), Matrix([3])), vector([1]), vector([1]),
....:          allow_degenerated_sequence=True)
sage: S
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
sage: S.is_degenerated()
True
```

```
>>> from sage.all import *
>>> S = Seq2((Matrix([Integer(2)]), Matrix([Integer(3)])),␣
↪vector([Integer(1)]), vector([Integer(1)]),
...           allow_degenerated_sequence=True)
>>> S
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
>>> S.is_degenerated()
True
```

However, we can regenerate the sequence S:

```
sage: H = S.regenerated()
sage: H
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
sage: H.linear_representation()
((1, 0),
 Finite family {0: [ 0  1]
                   [-2  3],
                1: [3 0]
                   [6 0]},
 (1, 1))
sage: H.is_degenerated()
False
```

```
>>> from sage.all import *
>>> H = S.regenerated()
>>> H
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
>>> H.linear_representation()
((1, 0),
 Finite family {0: [ 0  1]
                   [-2  3],
                1: [3 0]
                   [6 0]},
 (1, 1))
>>> H.is_degenerated()
False
```

shift_left(*b=1*, ***kwds*)

Return the sequence obtained by shifting this k-regular sequence b steps to the left.

INPUT:

- `b` – integer
- `minimize` – (default: `None`) a boolean or `None`. If `True`, then *`minimized()`* is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a *`RegularSequence`*

Note

If b is negative (i.e., actually a right-shift), then the coefficients when accessing negative indices are 0.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: C = Seq2((Matrix([[2, 0], [0, 1]]), Matrix([[2, 1], [0, 1]])),
....:          vector([1, 0]), vector([0, 1])); C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...

sage: C.shift_left()
2-regular sequence 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, ...
```

(continues on next page)

(continued from previous page)

```
sage: C.shift_left(3)
2-regular sequence 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, ...
sage: C.shift_left(-2)
2-regular sequence 0, 0, 0, 1, 2, 3, 4, 5, 6, 7, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> C = Seq2((Matrix([[Integer(2), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(2), Integer(1)], [Integer(0), Integer(1)]])),
...           vector([Integer(1), Integer(0)]), vector([Integer(0),␣
↪Integer(1)])); C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...

>>> C.shift_left()
2-regular sequence 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, ...
>>> C.shift_left(Integer(3))
2-regular sequence 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, ...
>>> C.shift_left(-Integer(2))
2-regular sequence 0, 0, 0, 1, 2, 3, 4, 5, 6, 7, ...
```

shift_right(*b=1*, ***kwds*)

Return the sequence obtained by shifting this k-regular sequence b steps to the right.

INPUT:

- `b` – integer
- `minimize` – (default: `None`) a boolean or `None`. If `True`, then *`minimized()`* is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a *`RegularSequence`*

Note

If b is positive (i.e., indeed a right-shift), then the coefficients when accessing negative indices are 0.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: C = Seq2((Matrix([[2, 0], [0, 1]]), Matrix([[2, 1], [0, 1]])),
....:          vector([1, 0]), vector([0, 1])); C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...

sage: C.shift_right()
2-regular sequence 0, 0, 1, 2, 3, 4, 5, 6, 7, 8, ...
sage: C.shift_right(3)
2-regular sequence 0, 0, 0, 0, 1, 2, 3, 4, 5, 6, ...
sage: C.shift_right(-2)
2-regular sequence 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> C = Seq2((Matrix([[Integer(2), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(2), Integer(1)], [Integer(0), Integer(1)]])),
...           vector([Integer(1), Integer(0)]), vector([Integer(0),␣
↪Integer(1)])); C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...

>>> C.shift_right()
2-regular sequence 0, 0, 1, 2, 3, 4, 5, 6, 7, 8, ...
>>> C.shift_right(Integer(3))
2-regular sequence 0, 0, 0, 0, 1, 2, 3, 4, 5, 6, ...
>>> C.shift_right(-Integer(2))
2-regular sequence 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, ...
```

subsequence(**args*, ***kwds*)

Return the subsequence with indices $an + b$ of this k-regular sequence.

INPUT:

- `a` – nonnegative integer
- `b` – integer

  Alternatively, this is allowed to be a dictionary $b_j \mapsto c_j$. If so and applied on $f(n)$, the result will be the sum of all $c_j \cdot f(an + b_j)$.
- `minimize` – (default: `None`) a boolean or `None`. If `True`, then *`minimized()`* is called after the operation, if `False`, then not. If this argument is `None`, then the default specified by the parent's `minimize_results` is used.

OUTPUT: a *`RegularSequence`*

Note

If b is negative (i.e., right-shift), then the coefficients when accessing negative indices are 0.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
```

We consider the sequence C with $C(n) = n$ and the following linear representation corresponding to the vector $(n, 1)$:

```
sage: C = Seq2((Matrix([[2, 0], [0, 1]]), Matrix([[2, 1], [0, 1]])),
....:          vector([1, 0]), vector([0, 1])); C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
```

```
>>> from sage.all import *
>>> C = Seq2((Matrix([[Integer(2), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(2), Integer(1)], [Integer(0), Integer(1)]])),
```

(continues on next page)

(continued from previous page)

```
...          vector([Integer(1), Integer(0)]), vector([Integer(0),␣
↪Integer(1)])); C
2-regular sequence 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ...
```

We now extract various subsequences of C:

```
sage: C.subsequence(2, 0)
2-regular sequence 0, 2, 4, 6, 8, 10, 12, 14, 16, 18, ...

sage: S31 = C.subsequence(3, 1); S31
2-regular sequence 1, 4, 7, 10, 13, 16, 19, 22, 25, 28, ...
sage: S31.linear_representation()
((1, 0),
 Finite family {0: [ 0  1]
                   [-2  3],
                1: [ 6 -2]
                   [10 -3]},
 (1, 1))

sage: C.subsequence(3, 2)
2-regular sequence 2, 5, 8, 11, 14, 17, 20, 23, 26, 29, ...
```

```
>>> from sage.all import *
>>> C.subsequence(Integer(2), Integer(0))
2-regular sequence 0, 2, 4, 6, 8, 10, 12, 14, 16, 18, ...

>>> S31 = C.subsequence(Integer(3), Integer(1)); S31
2-regular sequence 1, 4, 7, 10, 13, 16, 19, 22, 25, 28, ...
>>> S31.linear_representation()
((1, 0),
 Finite family {0: [ 0  1]
                   [-2  3],
                1: [ 6 -2]
                   [10 -3]},
 (1, 1))

>>> C.subsequence(Integer(3), Integer(2))
2-regular sequence 2, 5, 8, 11, 14, 17, 20, 23, 26, 29, ...
```

```
sage: Srs = C.subsequence(1, -1); Srs
2-regular sequence 0, 0, 1, 2, 3, 4, 5, 6, 7, 8, ...
sage: Srs.linear_representation()
((1, 0, 0),
 Finite family {0: [ 0  1  0]
                   [-2  3  0]
                   [-4  4  1],
                1: [ -2   2   0]
                   [  0   0   1]
                   [ 12 -12   5]},
 (0, 0, 1))
```

```
>>> from sage.all import *
>>> Srs = C.subsequence(Integer(1), -Integer(1)); Srs
2-regular sequence 0, 0, 1, 2, 3, 4, 5, 6, 7, 8, ...
>>> Srs.linear_representation()
((1, 0, 0),
 Finite family {0: [ 0  1  0]
                   [-2  3  0]
                   [-4  4  1],
                1: [ -2   2   0]
                   [  0   0   1]
                   [ 12 -12   5]},
 (0, 0, 1))
```

We can build *backward_differences()* manually by passing a dictionary for the parameter `b`:

```
sage: Sbd = C.subsequence(1, {0: 1, -1: -1}); Sbd
2-regular sequence 0, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
```

```
>>> from sage.all import *
>>> Sbd = C.subsequence(Integer(1), {Integer(0): Integer(1), -Integer(1): -
↪Integer(1)}); Sbd
2-regular sequence 0, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
```

transposed(*allow_degenerated_sequence=False*)

Return the transposed sequence.

INPUT:

- `allow_degenerated_sequence` – boolean (default: `False`); if set, then there will be no check if the transposed sequence is a degenerated sequence (see *is_degenerated()*). Otherwise the transposed sequence is checked and a *DegeneratedSequenceError* is raised if such a sequence is detected.

OUTPUT: a *RegularSequence*

Each of the matrices in *mu* is transposed. Additionally the vectors *left* and *right* are switched.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: U = Seq2((Matrix([[3, 2], [0, 1]]), Matrix([[2, 0], [1, 3]])),
....:          left=vector([0, 1]), right=vector([1, 0]),
....:          allow_degenerated_sequence=True)
sage: U.is_degenerated()
True
sage: Ut = U.transposed()
sage: Ut.linear_representation()
((1, 0),
 Finite family {0: [3 0]
                   [2 1],
                1: [2 1]
                   [0 3]},
 (0, 1))
sage: Ut.is_degenerated()
False
```

(continues on next page)

(continued from previous page)

```
sage: Ut.transposed()
Traceback (most recent call last):
...
DegeneratedSequenceError: degenerated sequence: mu[0]*right != right.
Using such a sequence might lead to wrong results.
You can use 'allow_degenerated_sequence=True' followed
by a call of method .regenerated() for correcting this.
sage: Utt = Ut.transposed(allow_degenerated_sequence=True)
sage: Utt.is_degenerated()
True
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> U = Seq2((Matrix([[Integer(3), Integer(2)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(2), Integer(0)], [Integer(1), Integer(3)]])),
...           left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),␣
↪Integer(0)]),
...           allow_degenerated_sequence=True)
>>> U.is_degenerated()
True
>>> Ut = U.transposed()
>>> Ut.linear_representation()
((1, 0),
 Finite family {0: [3 0]
                   [2 1],
                1: [2 1]
                   [0 3]},
 (0, 1))
>>> Ut.is_degenerated()
False

>>> Ut.transposed()
Traceback (most recent call last):
...
DegeneratedSequenceError: degenerated sequence: mu[0]*right != right.
Using such a sequence might lead to wrong results.
You can use 'allow_degenerated_sequence=True' followed
by a call of method .regenerated() for correcting this.
>>> Utt = Ut.transposed(allow_degenerated_sequence=True)
>>> Utt.is_degenerated()
True
```

RecognizableSeries.transposed

class sage.combinat.regular_sequence.**RegularSequenceRing**(*k*, **args*, ***kwds*)

Bases: *RecognizableSeriesSpace*

The space of k-regular Sequences over the given `coefficient_ring`.

INPUT:

- k – integer at least 2 specifying the base
- coefficient_ring – a (semi-)ring
- category – (default: None) the category of this space

EXAMPLES:

```
sage: RegularSequenceRing(2, ZZ)
Space of 2-regular sequences over Integer Ring
sage: RegularSequenceRing(3, ZZ)
Space of 3-regular sequences over Integer Ring
```

```
>>> from sage.all import *
>>> RegularSequenceRing(Integer(2), ZZ)
Space of 2-regular sequences over Integer Ring
>>> RegularSequenceRing(Integer(3), ZZ)
Space of 3-regular sequences over Integer Ring
```

See also

k-regular sequence, *RegularSequence*.

Element

alias of *RegularSequence*

from_recurrence(**args*, ***kwds*)

Construct the unique k-regular sequence which fulfills the given recurrence relations and initial values. The recurrence relations have to have the specific shape of k-recursive sequences as described in [HKL2022], and are either given as symbolic equations, e.g.,

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: var('n')
n
sage: function('f')
f
sage: Seq2.from_recurrence([
....:     f(2*n) == 2*f(n), f(2*n + 1) == 3*f(n) + 4*f(n - 1),
....:     f(0) == 0, f(1) == 1], f, n)
2-regular sequence 0, 0, 0, 1, 2, 3, 4, 10, 6, 17, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> var('n')
n
>>> function('f')
f
>>> Seq2.from_recurrence([
...     f(Integer(2)*n) == Integer(2)*f(n), f(Integer(2)*n + Integer(1)) ==␣
↪Integer(3)*f(n) + Integer(4)*f(n - Integer(1)),
...     f(Integer(0)) == Integer(0), f(Integer(1)) == Integer(1)], f, n)
2-regular sequence 0, 0, 0, 1, 2, 3, 4, 10, 6, 17, ...
```

or via the parameters of the k-recursive sequence as described in the input block below:

```
sage: Seq2.from_recurrence(M=1, m=0,
....:     coeffs={(0, 0): 2, (1, 0): 3, (1, -1): 4},
....:     initial_values={0: 0, 1: 1})
2-regular sequence 0, 0, 0, 1, 2, 3, 4, 10, 6, 17, ...
```

```
>>> from sage.all import *
>>> Seq2.from_recurrence(M=Integer(1), m=Integer(0),
...     coeffs={(Integer(0), Integer(0)): Integer(2), (Integer(1),␣
↪Integer(0)): Integer(3), (Integer(1), -Integer(1)): Integer(4)},
...     initial_values={Integer(0): Integer(0), Integer(1): Integer(1)})
2-regular sequence 0, 0, 0, 1, 2, 3, 4, 10, 6, 17, ...
```

INPUT:

Positional arguments:

If the recurrence relations are represented by symbolic equations, then the following arguments are required:

- `equations` – list of equations where the elements have either the form
  - $f(k^M n + r) = c_{r,l} f(k^m n + l) + c_{r,l+1} f(k^m n + l + 1) + ... + c_{r,u} f(k^m n + u)$ for some integers $0 \le r < k^M$, $M > m \ge 0$ and $l \le u$, and some coefficients $c_{r,j}$ from the (semi)ring `coefficients` of the corresponding *RegularSequenceRing*, valid for all integers $n \ge$ offset for some integer offset $\ge \max(-l/k^m, 0)$ (default: `0`), and there is an equation of this form (with the same parameters M and m) for all r

  or the form

  - `f(k) == t` for some integer `k` and some `t` from the (semi)ring `coefficient_ring`.

  The recurrence relations above uniquely determine a k-regular sequence; see [HKL2022] for further information.

- `function` – symbolic function `f` occurring in the equations
- `var` – symbolic variable (`n` in the above description of `equations`)

The following second representation of the recurrence relations is particularly useful for cases where `coefficient_ring` is not compatible with `sage.symbolic.ring.SymbolicRing`. Then the following arguments are required:

- `M` – parameter of the recursive sequences, see [HKL2022], Definition 3.1, as well as in the description of `equations` above
- `m` – parameter of the recursive sequences, see [HKL2022], Definition 3.1, as well as in the description of `equations` above
- `coeffs` – dictionary where `coeffs[(r, j)]` is the coefficient $c_{r,j}$ as given in the description of `equations` above. If `coeffs[(r, j)]` is not given for some `r` and `j`, then it is assumed to be zero.
- `initial_values` – dictionary mapping integers `n` to the `n`-th value of the sequence

Optional keyword-only argument:

- `offset` – integer (default: 0); see explanation of `equations` above
- `inhomogeneities` – (default: `{}`) a dictionary mapping integers `r` to the inhomogeneity g_r as given in [HKL2022], Corollary D. All inhomogeneities have to be regular sequences from `self` or elements of `coefficient_ring`.

OUTPUT: a *RegularSequence*

EXAMPLES:

Stern–Brocot Sequence:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: var('n')
n
sage: function('f')
f
sage: SB = Seq2.from_recurrence([
....:     f(2*n) == f(n), f(2*n + 1) == f(n) + f(n + 1),
....:     f(0) == 0, f(1) == 1], f, n)
sage: SB
2-regular sequence 0, 1, 1, 2, 1, 3, 2, 3, 1, 4, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> var('n')
n
>>> function('f')
f
>>> SB = Seq2.from_recurrence([
...     f(Integer(2)*n) == f(n), f(Integer(2)*n + Integer(1)) == f(n) + f(n +␣
↪Integer(1)),
...     f(Integer(0)) == Integer(0), f(Integer(1)) == Integer(1)], f, n)
>>> SB
2-regular sequence 0, 1, 1, 2, 1, 3, 2, 3, 1, 4, ...
```

Number of Odd Entries in Pascal's Triangle:

```
sage: Seq2.from_recurrence([
....:     f(2*n) == 3*f(n), f(2*n + 1) == 2*f(n) + f(n + 1),
....:     f(0) == 0, f(1) == 1], f, n)
2-regular sequence 0, 1, 3, 5, 9, 11, 15, 19, 27, 29, ...
```

```
>>> from sage.all import *
>>> Seq2.from_recurrence([
...     f(Integer(2)*n) == Integer(3)*f(n), f(Integer(2)*n + Integer(1)) ==␣
↪Integer(2)*f(n) + f(n + Integer(1)),
...     f(Integer(0)) == Integer(0), f(Integer(1)) == Integer(1)], f, n)
2-regular sequence 0, 1, 3, 5, 9, 11, 15, 19, 27, 29, ...
```

Number of Unbordered Factors in the Thue–Morse Sequence:

```
sage: UB = Seq2.from_recurrence([
....:     f(8*n) == 2*f(4*n),
....:     f(8*n + 1) == f(4*n + 1),
....:     f(8*n + 2) == f(4*n + 1) + f(4*n + 3),
....:     f(8*n + 3) == -f(4*n + 1) + f(4*n + 2),
....:     f(8*n + 4) == 2*f(4*n + 2),
....:     f(8*n + 5) == f(4*n + 3),
....:     f(8*n + 6) == -f(4*n + 1) + f(4*n + 2) + f(4*n + 3),
....:     f(8*n + 7) == 2*f(4*n + 1) + f(4*n + 3),
....:     f(0) == 1, f(1) == 2, f(2) == 2, f(3) == 4, f(4) == 2,
....:     f(5) == 4, f(6) == 6, f(7) == 0, f(8) == 4, f(9) == 4,
```

(continues on next page)

(continued from previous page)

```
....:     f(10) == 4, f(11) == 4, f(12) == 12, f(13) == 0, f(14) == 4,
....:     f(15) == 4, f(16) == 8, f(17) == 4, f(18) == 8, f(19) == 0,
....:     f(20) == 8, f(21) == 4, f(22) == 4, f(23) == 8], f, n, offset=3)
sage: UB
2-regular sequence 1, 2, 2, 4, 2, 4, 6, 0, 4, 4, ...
```

```
>>> from sage.all import *
>>> UB = Seq2.from_recurrence([
...     f(Integer(8)*n) == Integer(2)*f(Integer(4)*n),
...     f(Integer(8)*n + Integer(1)) == f(Integer(4)*n + Integer(1)),
...     f(Integer(8)*n + Integer(2)) == f(Integer(4)*n + Integer(1)) +␣
↪f(Integer(4)*n + Integer(3)),
...     f(Integer(8)*n + Integer(3)) == -f(Integer(4)*n + Integer(1)) +␣
↪f(Integer(4)*n + Integer(2)),
...     f(Integer(8)*n + Integer(4)) == Integer(2)*f(Integer(4)*n +␣
↪Integer(2)),
...     f(Integer(8)*n + Integer(5)) == f(Integer(4)*n + Integer(3)),
...     f(Integer(8)*n + Integer(6)) == -f(Integer(4)*n + Integer(1)) +␣
↪f(Integer(4)*n + Integer(2)) + f(Integer(4)*n + Integer(3)),
...     f(Integer(8)*n + Integer(7)) == Integer(2)*f(Integer(4)*n +␣
↪Integer(1)) + f(Integer(4)*n + Integer(3)),
...     f(Integer(0)) == Integer(1), f(Integer(1)) == Integer(2),␣
↪f(Integer(2)) == Integer(2), f(Integer(3)) == Integer(4), f(Integer(4)) ==␣
↪Integer(2),
...     f(Integer(5)) == Integer(4), f(Integer(6)) == Integer(6),␣
↪f(Integer(7)) == Integer(0), f(Integer(8)) == Integer(4), f(Integer(9)) ==␣
↪Integer(4),

↪== Integer(4),
...     f(Integer(15)) == Integer(4), f(Integer(16)) == Integer(8),␣
↪f(Integer(17)) == Integer(4), f(Integer(18)) == Integer(8), f(Integer(19))␣
↪== Integer(0),
...     f(Integer(20)) == Integer(8), f(Integer(21)) == Integer(4),␣
↪f(Integer(22)) == Integer(4), f(Integer(23)) == Integer(8)], f, n,␣
↪offset=Integer(3))
>>> UB
2-regular sequence 1, 2, 2, 4, 2, 4, 6, 0, 4, 4, ...
```

Binary sum of digits $S(n)$, characterized by the recurrence relations $S(4n) = S(2n)$, $S(4n+1) = S(2n+1)$, $S(4n+2) = S(2n+1)$ and $S(4n+3) = -S(2n) + 2S(2n+1)$:

```
sage: S = Seq2.from_recurrence([
....:     f(4*n) == f(2*n),
....:     f(4*n + 1) == f(2*n + 1),
....:     f(4*n + 2) == f(2*n + 1),
....:     f(4*n + 3) == -f(2*n) + 2*f(2*n + 1),
....:     f(0) == 0, f(1) == 1], f, n)
sage: S
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
```

```
>>> from sage.all import *
>>> S = Seq2.from_recurrence([
...     f(Integer(4)*n) == f(Integer(2)*n),
...     f(Integer(4)*n + Integer(1)) == f(Integer(2)*n + Integer(1)),
...     f(Integer(4)*n + Integer(2)) == f(Integer(2)*n + Integer(1)),
...     f(Integer(4)*n + Integer(3)) == -f(Integer(2)*n) +␣
↪Integer(2)*f(Integer(2)*n + Integer(1)),
...     f(Integer(0)) == Integer(0), f(Integer(1)) == Integer(1)], f, n)
>>> S
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
```

In order to check if this sequence is indeed the binary sum of digits, we construct it directly via its linear representation and compare it with `S`:

```
sage: S2 = Seq2(
....:     (Matrix([[1, 0], [0, 1]]), Matrix([[1, 0], [1, 1]])),
....:     left=vector([0, 1]), right=vector([1, 0]))
sage: (S - S2).is_trivial_zero()
True
```

```
>>> from sage.all import *
>>> S2 = Seq2(
...     (Matrix([[Integer(1), Integer(0)], [Integer(0), Integer(1)]]),␣
↪Matrix([[Integer(1), Integer(0)], [Integer(1), Integer(1)]])),
...     left=vector([Integer(0), Integer(1)]), right=vector([Integer(1),␣
↪Integer(0)]))
>>> (S - S2).is_trivial_zero()
True
```

Alternatively, we can also use the simpler but inhomogeneous recurrence relations $S(2n) = S(n)$ and $S(2n+1) = S(n) + 1$ via direct parameters:

```
sage: S3 = Seq2.from_recurrence(M=1, m=0,
....:     coeffs={(0, 0): 1, (1, 0): 1},
....:     initial_values={0: 0, 1: 1},
....:     inhomogeneities={1: 1})
sage: S3
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
sage: (S3 - S2).is_trivial_zero()
True
```

```
>>> from sage.all import *
>>> S3 = Seq2.from_recurrence(M=Integer(1), m=Integer(0),
...     coeffs={(Integer(0), Integer(0)): Integer(1), (Integer(1),␣
↪Integer(0)): Integer(1)},
...     initial_values={Integer(0): Integer(0), Integer(1): Integer(1)},
...     inhomogeneities={Integer(1): Integer(1)})
>>> S3
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
>>> (S3 - S2).is_trivial_zero()
True
```

Number of Non-Zero Elements in the Generalized Pascal's Triangle (see [LRS2017]):

```
sage: Seq2 = RegularSequenceRing(2, QQ)
sage: P = Seq2.from_recurrence([
....:     f(4*n) == 5/3*f(2*n) - 1/3*f(2*n + 1),
....:     f(4*n + 1) == 4/3*f(2*n) + 1/3*f(2*n + 1),
....:     f(4*n + 2) == 1/3*f(2*n) + 4/3*f(2*n + 1),
....:     f(4*n + 3) == -1/3*f(2*n) + 5/3*f(2*n + 1),
....:     f(0) == 1, f(1) == 2], f, n)
sage: P
2-regular sequence 1, 2, 3, 3, 4, 5, 5, 4, 5, 7, ...
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), QQ)
>>> P = Seq2.from_recurrence([
...     f(Integer(4)*n) == Integer(5)/Integer(3)*f(Integer(2)*n) - Integer(1)/
↪Integer(3)*f(Integer(2)*n + Integer(1)),
...     f(Integer(4)*n + Integer(1)) == Integer(4)/Integer(3)*f(Integer(2)*n)␣
↪+ Integer(1)/Integer(3)*f(Integer(2)*n + Integer(1)),
...     f(Integer(4)*n + Integer(2)) == Integer(1)/Integer(3)*f(Integer(2)*n)␣
↪+ Integer(4)/Integer(3)*f(Integer(2)*n + Integer(1)),
...     f(Integer(4)*n + Integer(3)) == -Integer(1)/
↪Integer(3)*f(Integer(2)*n) + Integer(5)/Integer(3)*f(Integer(2)*n +␣
↪Integer(1)),
...     f(Integer(0)) == Integer(1), f(Integer(1)) == Integer(2)], f, n)
>>> P
2-regular sequence 1, 2, 3, 3, 4, 5, 5, 4, 5, 7, ...
```

Finally, the same sequence can also be obtained via direct parameters without symbolic equations:

```
sage: Seq2.from_recurrence(M=2, m=1,
....:     coeffs={(0, 0): 5/3, (0, 1): -1/3,
....:             (1, 0): 4/3, (1, 1): 1/3,
....:             (2, 0): 1/3, (2, 1): 4/3,
....:             (3, 0): -1/3, (3, 1): 5/3},
....:     initial_values={0: 1, 1: 2})
2-regular sequence 1, 2, 3, 3, 4, 5, 5, 4, 5, 7, ...
```

```
>>> from sage.all import *
>>> Seq2.from_recurrence(M=Integer(2), m=Integer(1),
...     coeffs={(Integer(0), Integer(0)): Integer(5)/Integer(3), (Integer(0),␣
↪Integer(1)): -Integer(1)/Integer(3),
...             (Integer(1), Integer(0)): Integer(4)/Integer(3), (Integer(1),␣
↪Integer(1)): Integer(1)/Integer(3),

2-regular sequence 1, 2, 3, 3, 4, 5, 5, 4, 5, 7, ...
```

guess(*f*, *n_verify=100*, *max_exponent=10*, *sequence=None*)

Guess a k-regular sequence whose first terms coincide with $(f(n))_{n\geq 0}$.

INPUT:

- `f` – a function (callable) which determines the sequence. It takes nonnegative integers as an input
- `n_verify` – (default: `100`) a positive integer. The resulting k-regular sequence coincides with f on the first `n_verify` terms.
- `max_exponent` – (default: `10`) a positive integer specifying the maximum exponent of k which is tried when guessing the sequence, i.e., relations between $f(k^t n + r)$ are used for $0 \leq t \leq$ `max_exponent` and $0 \leq r < k^j$
- `sequence` – (default: `None`) a k-regular sequence used for bootstrapping the guessing by adding information of the linear representation of `sequence` to the guessed representation

OUTPUT: a *RegularSequence*

ALGORITHM:

For the purposes of this description, the right vector valued sequence associated with a regular sequence consists of the corresponding matrix product multiplied by the right vector, but without the left vector of the regular sequence.

The algorithm maintains a right vector valued sequence consisting of the right vector valued sequence of the argument `sequence` (replaced by an empty tuple if `sequence` is `None`) plus several components of the shape $m \mapsto f(k^t \cdot m + r)$ for suitable `t` and `r`.

Implicitly, the algorithm also maintains a $d \times n_{\text{verify}}$ matrix `A` (where `d` is the dimension of the right vector valued sequence) whose columns are the current right vector valued sequence evaluated at the nonnegative integers less than n_{verify} and ensures that this matrix has full row rank.

EXAMPLES:

Binary sum of digits:

```
sage: @cached_function
....: def s(n):
....:     if n == 0:
....:         return 0
....:     return s(n//2) + ZZ(is_odd(n))
sage: all(s(n) == sum(n.digits(2)) for n in srange(10))
True
sage: [s(n) for n in srange(10)]
[0, 1, 1, 2, 1, 2, 2, 3, 1, 2]
```

```
>>> from sage.all import *
>>> @cached_function
... def s(n):
...     if n == Integer(0):
...         return Integer(0)
...     return s(n//Integer(2)) + ZZ(is_odd(n))
>>> all(s(n) == sum(n.digits(Integer(2))) for n in srange(Integer(10)))
True
>>> [s(n) for n in srange(Integer(10))]
[0, 1, 1, 2, 1, 2, 2, 3, 1, 2]
```

Let us guess a 2-linear representation for $s(n)$:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: import logging
sage: logging.getLogger().setLevel(logging.INFO)
```

(continues on next page)

(continued from previous page)

```
sage: S1 = Seq2.guess(s); S1
INFO:...:including f_{1*m+0}
INFO:...:including f_{2*m+1}
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
sage: S1.linear_representation()
((1, 0),
 Finite family {0: [1 0]
                   [0 1],
                1: [ 0  1]
                   [-1  2]},
 (0, 1))
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> import logging
>>> logging.getLogger().setLevel(logging.INFO)
>>> S1 = Seq2.guess(s); S1
INFO:...:including f_{1*m+0}
INFO:...:including f_{2*m+1}
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
>>> S1.linear_representation()
((1, 0),
 Finite family {0: [1 0]
                   [0 1],
                1: [ 0  1]
                   [-1  2]},
 (0, 1))
```

The `INFO` messages mean that the right vector valued sequence is the sequence $(s(n), s(2n+1))^\top$.

We guess again, but this time, we use a constant sequence for bootstrapping the guessing process:

```
sage: C = Seq2.one_hadamard(); C
2-regular sequence 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
sage: S2 = Seq2.guess(s, sequence=C); S2
INFO:...:including 2-regular sequence 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
INFO:...:including f_{1*m+0}
2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...
sage: S2.linear_representation()
((0, 1),
 Finite family {0: [1 0]
                   [0 1],
                1: [1 0]
                   [1 1]},
 (1, 0))
sage: S1 == S2
True
```

```
>>> from sage.all import *
>>> C = Seq2.one_hadamard(); C
2-regular sequence 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...
>>> S2 = Seq2.guess(s, sequence=C); S2
```

(continues on next page)

(continued from previous page)

```
INFO:...:including 2-regular sequence 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, ...

                   [2 1],
                1: [ 0  1]
                   [-2  3]},
 (0, 1))
```

The indicator function of the even integers:

```
sage: S = Seq2.guess(lambda n: ZZ(is_even(n))); S
INFO:...:including f_{1*m+0}
INFO:...:including f_{2*m+0}
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
sage: S.linear_representation()
((1, 0),
 Finite family {0: [0 1]
                   [0 1],
                1: [0 0]
                   [0 1]},
```

(continues on next page)

(continued from previous page)

```
 (1, 1))
```

```
>>> from sage.all import *
>>> S = Seq2.guess(lambda n: ZZ(is_even(n))); S
INFO:...:including f_{1*m+0}
INFO:...:including f_{2*m+0}
2-regular sequence 1, 0, 1, 0, 1, 0, 1, 0, 1, 0, ...
>>> S.linear_representation()
((1, 0),
 Finite family {0: [0 1]
                   [0 1],
                1: [0 0]
                   [0 1]},
 (1, 1))
```

The indicator function of the odd integers:

```
sage: S = Seq2.guess(lambda n: ZZ(is_odd(n))); S
INFO:...:including f_{1*m+0}
INFO:...:including f_{2*m+1}
2-regular sequence 0, 1, 0, 1, 0, 1, 0, 1, 0, 1, ...
sage: S.linear_representation()
((1, 0),
 Finite family {0: [0 0]
                   [0 1],
                1: [0 1]
                   [0 1]},
 (0, 1))
sage: logging.getLogger().setLevel(logging.WARN)
```

```
>>> from sage.all import *
>>> S = Seq2.guess(lambda n: ZZ(is_odd(n))); S
INFO:...:including f_{1*m+0}
INFO:...:including f_{2*m+1}
2-regular sequence 0, 1, 0, 1, 0, 1, 0, 1, 0, 1, ...
>>> S.linear_representation()
((1, 0),
 Finite family {0: [0 0]
                   [0 1],
                1: [0 1]
                   [0 1]},
 (0, 1))
>>> logging.getLogger().setLevel(logging.WARN)
```

The following linear representation of S is chosen badly (is degenerated, see *is_degenerated()*), as $\mu(0)$ applied on *right* does not equal *right*:

```
sage: S = Seq2((Matrix([2]), Matrix([3])), vector([1]), vector([1]),
....:          allow_degenerated_sequence=True)
sage: S
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
sage: S.is_degenerated()
```

(continues on next page)

(continued from previous page)

```
True
```

```
>>> from sage.all import *
>>> S = Seq2((Matrix([Integer(2)]), Matrix([Integer(3)])),␣
↪vector([Integer(1)]), vector([Integer(1)]),
...           allow_degenerated_sequence=True)
>>> S
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
>>> S.is_degenerated()
True
```

However, we can *guess()* a 2-regular sequence of dimension 2:

```
sage: G = Seq2.guess(lambda n: S[n])
sage: G
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
sage: G.linear_representation()
((1, 0),
 Finite family {0: [ 0  1]
                   [-2  3],
                1: [3 0]
                   [6 0]},
 (1, 1))

sage: G == S.regenerated()
True
```

```
>>> from sage.all import *
>>> G = Seq2.guess(lambda n: S[n])
>>> G
2-regular sequence 1, 3, 6, 9, 12, 18, 18, 27, 24, 36, ...
>>> G.linear_representation()
((1, 0),
 Finite family {0: [ 0  1]
                   [-2  3],
                1: [3 0]
                   [6 0]},
 (1, 1))

>>> G == S.regenerated()
True
```

one()

Return the one element of this *RegularSequenceRing*, i.e. the unique neutral element for $*$ and also the embedding of the one of the coefficient ring into this *RegularSequenceRing*.

EXAMPLES:

```
sage: Seq2 = RegularSequenceRing(2, ZZ)
sage: O = Seq2.one(); O
2-regular sequence 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, ...
sage: O.linear_representation()
```

(continues on next page)

(continued from previous page)

```
((1), Finite family {0: [1], 1: [0]}, (1))
```

```
>>> from sage.all import *
>>> Seq2 = RegularSequenceRing(Integer(2), ZZ)
>>> O = Seq2.one(); O
2-regular sequence 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, ...
>>> O.linear_representation()
((1), Finite family {0: [1], 1: [0]}, (1))
```

some_elements()

Return some elements of this k-regular sequence.

See `TestSuite` for a typical use case.

OUTPUT: an iterator

EXAMPLES:

```
sage: tuple(RegularSequenceRing(2, ZZ).some_elements())
(2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...,
 2-regular sequence 1, 1, 0, 1, 0, 0, 0, 1, 0, 0, ...,
 2-regular sequence 1, 1, 0, 1, -1, 0, 0, 1, -2, -1, ...,
 2-regular sequence 2, -1, 0, 0, 0, -1, 0, 0, 0, 0, ...,
 2-regular sequence 1, 1, 0, 1, 5, 0, 0, 1, -33, 5, ...,
 2-regular sequence -5, 0, 0, 0, 0, 0, 0, 0, 0, 0, ...,
 2-regular sequence -59, -20, 0, -20, 0, 0, 0, -20, 0, 0, ...,
 ...
 2-regular sequence 2210, 170, 0, 0, 0, 0, 0, 0, 0, 0, ...)
```

```
>>> from sage.all import *
>>> tuple(RegularSequenceRing(Integer(2), ZZ).some_elements())
(2-regular sequence 0, 1, 1, 2, 1, 2, 2, 3, 1, 2, ...,
 2-regular sequence 1, 1, 0, 1, 0, 0, 0, 1, 0, 0, ...,
 2-regular sequence 1, 1, 0, 1, -1, 0, 0, 1, -2, -1, ...,
 2-regular sequence 2, -1, 0, 0, 0, -1, 0, 0, 0, 0, ...,
 2-regular sequence 1, 1, 0, 1, 5, 0, 0, 1, -33, 5, ...,
 2-regular sequence -5, 0, 0, 0, 0, 0, 0, 0, 0, 0, ...,
 2-regular sequence -59, -20, 0, -20, 0, 0, 0, -20, 0, 0, ...,
 ...
 2-regular sequence 2210, 170, 0, 0, 0, 0, 0, 0, 0, 0, ...)
```

sage.combinat.regular_sequence.**pad_right**(*T*, *length*, *zero=0*)

Pad `T` to the right by using `zero` to have at least the given `length`.

INPUT:

- `T` – tuple, list or other iterable
- `length` – nonnegative integer
- `zero` – (default: `0`) the elements to pad with

OUTPUT: an object of the same type as `T`

EXAMPLES:

```
sage: from sage.combinat.regular_sequence import pad_right
sage: pad_right((1, 2, 3), 10)
(1, 2, 3, 0, 0, 0, 0, 0, 0, 0)
sage: pad_right((1, 2, 3), 2)
(1, 2, 3)
sage: pad_right([(1, 2), (3, 4)], 4, (0, 0))
[(1, 2), (3, 4), (0, 0), (0, 0)]
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence import pad_right
>>> pad_right((Integer(1), Integer(2), Integer(3)), Integer(10))
(1, 2, 3, 0, 0, 0, 0, 0, 0, 0)
>>> pad_right((Integer(1), Integer(2), Integer(3)), Integer(2))
(1, 2, 3)
>>> pad_right([(Integer(1), Integer(2)), (Integer(3), Integer(4))], Integer(4),␣
↪(Integer(0), Integer(0)))
[(1, 2), (3, 4), (0, 0), (0, 0)]
```

sage.combinat.regular_sequence.**value**(*D*, *k*)

Return the value of the expansion with digits D in base k, i.e.

$$\sum_{0 \le j < \text{len } D} D[j] k^j.$$

INPUT:

- D – tuple or other iterable
- k – the base

OUTPUT:

An element in the common parent of the base k and of the entries of D

EXAMPLES:

```
sage: from sage.combinat.regular_sequence import value
sage: value(42.digits(7), 7)
42
```

```
>>> from sage.all import *
>>> from sage.combinat.regular_sequence import value
>>> value(Integer(42).digits(Integer(7)), Integer(7))
42
```

q-Bernoulli numbers and polynomials

sage.combinat.q_bernoulli.**q_bernoulli**(*p=None*)

Compute Carlitz's q-analogue of the Bernoulli numbers.

For every nonnegative integer m, the q-Bernoulli number β_m is a rational function of the indeterminate q whose value at $q = 1$ is the usual Bernoulli number B_m.

INPUT:

- m – nonnegative integer

- p – (default: None) an optional value for q

OUTPUT:

A rational function of the indeterminate q (if p is None)

Otherwise, the rational function is evaluated at p.

EXAMPLES:

```
sage: from sage.combinat.q_bernoulli import q_bernoulli
sage: q_bernoulli(0)
1
sage: q_bernoulli(1)
-1/(q + 1)
sage: q_bernoulli(2)
q/(q^3 + 2*q^2 + 2*q + 1)
sage: all(q_bernoulli(i)(q=1) == bernoulli(i) for i in range(12))                #␣
↪needs sage.libs.flint
True
```

```
>>> from sage.all import *
>>> from sage.combinat.q_bernoulli import q_bernoulli
>>> q_bernoulli(Integer(0))
1
>>> q_bernoulli(Integer(1))
-1/(q + 1)
>>> q_bernoulli(Integer(2))
q/(q^3 + 2*q^2 + 2*q + 1)
>>> all(q_bernoulli(i)(q=Integer(1)) == bernoulli(i) for i in range(Integer(12)))␣
↪              # needs sage.libs.flint
True
```

One can evaluate the rational function by giving a second argument:

```
sage: x = PolynomialRing(GF(2),'x').gen()
sage: q_bernoulli(5,x)
x/(x^6 + x^5 + x + 1)
```

```
>>> from sage.all import *
>>> x = PolynomialRing(GF(Integer(2)),'x').gen()
>>> q_bernoulli(Integer(5),x)
x/(x^6 + x^5 + x + 1)
```

The function does not accept negative arguments:

```
sage: q_bernoulli(-1)
Traceback (most recent call last):
...
ValueError: the argument must be a nonnegative integer
```

```
>>> from sage.all import *
>>> q_bernoulli(-Integer(1))
Traceback (most recent call last):
```

(continues on next page)

(continued from previous page)

```
...
ValueError: the argument must be a nonnegative integer
```

REFERENCES:

sage.combinat.q_bernoulli.**q_bernoulli_polynomial**()

Compute Carlitz's q-analogue of the Bernoulli polynomials.

For every nonnegative integer m, the q-Bernoulli polynomial is a polynomial in one variable x with coefficients in $\mathbf{Q}(q)$ whose value at $q = 1$ is the usual Bernoulli polynomial $B_m(x)$.

The original q-Bernoulli polynomials introduced by Carlitz were polynomials in q^y with coefficients in $\mathbf{Q}(q)$. This function returns these polynomials but expressed in the variable $x = (q^y - 1)/(q - 1)$. This allows to let $q = 1$ to recover the classical Bernoulli polynomials.

INPUT:

- m – nonnegative integer

OUTPUT: a polynomial in one variable x

EXAMPLES:

```
sage: from sage.combinat.q_bernoulli import q_bernoulli_polynomial, q_bernoulli
sage: q_bernoulli_polynomial(0)
1
sage: q_bernoulli_polynomial(1)
(2/(q + 1))*x - 1/(q + 1)
sage: x = q_bernoulli_polynomial(1).parent().gen()
sage: all(q_bernoulli_polynomial(i)(q=1) == bernoulli_polynomial(x,i)           #␣
↪needs sage.libs.flint
....:     for i in range(12))
True
sage: all(q_bernoulli_polynomial(i)(x=0) == q_bernoulli(i)
....:     for i in range(12))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.q_bernoulli import q_bernoulli_polynomial, q_bernoulli
>>> q_bernoulli_polynomial(Integer(0))
1
>>> q_bernoulli_polynomial(Integer(1))
(2/(q + 1))*x - 1/(q + 1)
>>> x = q_bernoulli_polynomial(Integer(1)).parent().gen()
>>> all(q_bernoulli_polynomial(i)(q=Integer(1)) == bernoulli_polynomial(x,i)     ␣
↪     # needs sage.libs.flint
...     for i in range(Integer(12)))
True
>>> all(q_bernoulli_polynomial(i)(x=Integer(0)) == q_bernoulli(i)
...     for i in range(Integer(12)))
True
```

The function does not accept negative arguments:

```
sage: q_bernoulli_polynomial(-1)
Traceback (most recent call last):
...
ValueError: the argument must be a nonnegative integer
```

```
>>> from sage.all import *
>>> q_bernoulli_polynomial(-Integer(1))
Traceback (most recent call last):
...
ValueError: the argument must be a nonnegative integer
```

q-analogues

sage.combinat.q_analogues.**gaussian_binomial**(*n*, *k*, *q=None*, *algorithm='auto'*)

This is an alias of *q_binomial()*.

See *q_binomial()* for the full documentation.

EXAMPLES:

```
sage: gaussian_binomial(4,2)
q^4 + q^3 + 2*q^2 + q + 1
```

```
>>> from sage.all import *
>>> gaussian_binomial(Integer(4),Integer(2))
q^4 + q^3 + 2*q^2 + q + 1
```

sage.combinat.q_analogues.**gaussian_multinomial**(*seq*, *q=None*, *binomial_algorithm='auto'*)

alias of *q_multinomial()*.

sage.combinat.q_analogues.**number_of_irreducible_polynomials**(*n*, *q=None*, *m=1*)

Return the number of monic irreducible polynomials of degree `n` in `m` variables over the finite field with `q` elements.

If `q` is not given, the result is returned as an integer-valued polynomial in $\mathbf{Q}[q]$.

INPUT:

- `n` – positive integer
- `q` – `None` (default) or a prime power
- `m` – positive integer (default: 1)

OUTPUT: integer or integer-valued polynomial over $\mathbf{Q}$

EXAMPLES:

```
sage: number_of_irreducible_polynomials(8, q=2)
30
sage: number_of_irreducible_polynomials(9, q=9)
43046640
sage: number_of_irreducible_polynomials(5, q=11, m=3)
207965056718405914564724636740174134515736964320705570316 8
```

```
>>> from sage.all import *
>>> number_of_irreducible_polynomials(Integer(8), q=Integer(2))
30
>>> number_of_irreducible_polynomials(Integer(9), q=Integer(9))
43046640
>>> number_of_irreducible_polynomials(Integer(5), q=Integer(11), m=Integer(3))
207965056718405914564724636740174134515736964320705570316 8
```

```
sage: poly = number_of_irreducible_polynomials(12); poly
1/12*q^12 - 1/12*q^6 - 1/12*q^4 + 1/12*q^2
sage: poly(5) == number_of_irreducible_polynomials(12, q=5)
True
sage: poly = number_of_irreducible_polynomials(5, m=3); poly
q^55 + q^54 + q^53 + q^52 + q^51 + q^50 + ... + 1/5*q^5 - 1/5*q^3 - 1/5*q^2 - 1/
↪5*q
sage: poly(11) == number_of_irreducible_polynomials(5, q=11, m=3)
True
```

```
>>> from sage.all import *
>>> poly = number_of_irreducible_polynomials(Integer(12)); poly
1/12*q^12 - 1/12*q^6 - 1/12*q^4 + 1/12*q^2
>>> poly(Integer(5)) == number_of_irreducible_polynomials(Integer(12),␣
↪q=Integer(5))
True
>>> poly = number_of_irreducible_polynomials(Integer(5), m=Integer(3)); poly
q^55 + q^54 + q^53 + q^52 + q^51 + q^50 + ... + 1/5*q^5 - 1/5*q^3 - 1/5*q^2 - 1/
↪5*q
>>> poly(Integer(11)) == number_of_irreducible_polynomials(Integer(5),␣
↪q=Integer(11), m=Integer(3))
True
```

This function is *much* faster than enumerating the polynomials:

```
sage: num = number_of_irreducible_polynomials(99, q=101)
sage: num.bit_length()
653
```

```
>>> from sage.all import *
>>> num = number_of_irreducible_polynomials(Integer(99), q=Integer(101))
>>> num.bit_length()
653
```

ALGORITHM:

In the univariate case, classical formula $\frac{1}{n}\sum_{d|n}\mu(n/d)q^d$ using the Möbius function μ; see `Moebius`.

In the multivariate case, formula from [Bodin2007], independently [Alekseyev2006].

`sage.combinat.q_analogues.`**`q_binomial`**(*n*, *k*, *q=None*, *algorithm='auto'*)

Return the q-binomial coefficient.

This is also known as the Gaussian binomial coefficient, and is defined by

$$\binom{n}{k}_q = \frac{(1-q^n)(1-q^{n-1})\cdots(1-q^{n-k+1})}{(1-q)(1-q^2)\cdots(1-q^k)}.$$

See Wikipedia article Gaussian_binomial_coefficient.

If q is unspecified, then the variable is the generator q for a univariate polynomial ring over the integers.

INPUT:

- `n`, `k` – the values n and k defined above
- `q` – (default: `None`) the variable q; if `None`, then use a default variable in $\mathbf{Z}[q]$
- `algorithm` – (default: `'auto'`) the algorithm to use and can be one of the following:
  - `'auto'` – automatically choose the algorithm; see the algorithm section below
  - `'naive'` – use the naive algorithm
  - `'cyclotomic'` – use cyclotomic algorithm

ALGORITHM:

The naive algorithm uses the product formula. The cyclotomic algorithm uses a product of cyclotomic polynomials (cf. [CH2006]).

When the algorithm is set to `'auto'`, we choose according to the following rules:

- If `q` is a polynomial:

  When `n` is small or `k` is small with respect to `n`, one uses the naive algorithm. When both `n` and `k` are big, one uses the cyclotomic algorithm.

- If `q` is in the symbolic ring (or a symbolic subring), one uses the cyclotomic algorithm.
- Otherwise one uses the naive algorithm, unless `q` is a root of unity, then one uses the cyclotomic algorithm.

EXAMPLES:

By default, the variable is the generator of $\mathbf{Z}[q]$:

```
sage: from sage.combinat.q_analogues import q_binomial
sage: g = q_binomial(5,1) ; g
q^4 + q^3 + q^2 + q + 1
sage: g.parent()
Univariate Polynomial Ring in q over Integer Ring
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_binomial
>>> g = q_binomial(Integer(5),Integer(1)) ; g
q^4 + q^3 + q^2 + q + 1
>>> g.parent()
Univariate Polynomial Ring in q over Integer Ring
```

For $n \geq 0$, the q-binomial coefficient vanishes unless $0 \leq k \leq n$:

```
sage: q_binomial(4,5)
0
sage: q_binomial(5,-1)
0
```

```
>>> from sage.all import *
>>> q_binomial(Integer(4),Integer(5))
0
```

(continues on next page)

(continued from previous page)

```
>>> q_binomial(Integer(5),-Integer(1))
0
```

For $k \geq 0$, the q-binomial coefficient is extended as a polynomial in n:

```
sage: q_binomial(-4,1)
-q^-4 - q^-3 - q^-2 - q^-1
sage: q_binomial(-2,3)
-q^-9 - q^-8 - q^-7 - q^-6
```

```
>>> from sage.all import *
>>> q_binomial(-Integer(4),Integer(1))
-q^-4 - q^-3 - q^-2 - q^-1
>>> q_binomial(-Integer(2),Integer(3))
-q^-9 - q^-8 - q^-7 - q^-6
```

Other variables can be used, given as third parameter:

```
sage: p = ZZ['p'].gen()
sage: q_binomial(4,2,p)
p^4 + p^3 + 2*p^2 + p + 1
```

```
>>> from sage.all import *
>>> p = ZZ['p'].gen()
>>> q_binomial(Integer(4),Integer(2),p)
p^4 + p^3 + 2*p^2 + p + 1
```

The third parameter can also be arbitrary values:

```
sage: q_binomial(5,1,2) == g.subs(q=2)
True
sage: q_binomial(5,1,1)
5
sage: q_binomial(4,2,-1)
2
sage: q_binomial(4,2,3.14)
152.030056160000
sage: R = GF((5, 2), 't')
sage: t = R.gen(0)
sage: q_binomial(6, 3, t)
2*t + 3
```

```
>>> from sage.all import *
>>> q_binomial(Integer(5),Integer(1),Integer(2)) == g.subs(q=Integer(2))
True
>>> q_binomial(Integer(5),Integer(1),Integer(1))
5
>>> q_binomial(Integer(4),Integer(2),-Integer(1))
2
>>> q_binomial(Integer(4),Integer(2),RealNumber('3.14'))
152.030056160000
>>> R = GF((Integer(5), Integer(2)), 't')
```

(continues on next page)

(continued from previous page)

```
>>> t = R.gen(Integer(0))
>>> q_binomial(Integer(6), Integer(3), t)
2*t + 3
```

We can also do this for more complicated objects such as matrices or symmetric functions:

```
sage: q_binomial(4,2,matrix([[2,1],[-1,3]]))
[ -6  84]
[-84  78]
sage: Sym = SymmetricFunctions(QQ)
sage: s = Sym.schur()
sage: q_binomial(4,1, s[2]+s[1])
s[] + s[1] + s[1, 1] + s[1, 1, 1] + 2*s[2] + 4*s[2, 1] + 3*s[2, 1, 1]
 + 4*s[2, 2] + 3*s[2, 2, 1] + s[2, 2, 2] + 3*s[3] + 7*s[3, 1] + 3*s[3, 1, 1]
 + 6*s[3, 2] + 2*s[3, 2, 1] + s[3, 3] + 4*s[4] + 6*s[4, 1] + s[4, 1, 1]
 + 3*s[4, 2] + 3*s[5] + 2*s[5, 1] + s[6]
```

```
>>> from sage.all import *
>>> q_binomial(Integer(4),Integer(2),matrix([[Integer(2),Integer(1)],[-Integer(1),
↪Integer(3)]]))
[ -6  84]
[-84  78]
>>> Sym = SymmetricFunctions(QQ)
>>> s = Sym.schur()
>>> q_binomial(Integer(4),Integer(1), s[Integer(2)]+s[Integer(1)])
s[] + s[1] + s[1, 1] + s[1, 1, 1] + 2*s[2] + 4*s[2, 1] + 3*s[2, 1, 1]
 + 4*s[2, 2] + 3*s[2, 2, 1] + s[2, 2, 2] + 3*s[3] + 7*s[3, 1] + 3*s[3, 1, 1]
 + 6*s[3, 2] + 2*s[3, 2, 1] + s[3, 3] + 4*s[4] + 6*s[4, 1] + s[4, 1, 1]
 + 3*s[4, 2] + 3*s[5] + 2*s[5, 1] + s[6]
```

AUTHORS:

- Frédéric Chapoton, David Joyner and William Stein

sage.combinat.q_analogues.**q_catalan_number**(*n*, *q=None*, *m=1*)

Return the q-Catalan number of index n.

INPUT:

- `q` – (optional) variable
- `m` – (optional) integer; to get instead the `m`-Fuss-Catalan numbers

If q is unspecified, then it defaults to using the generator q for a univariate polynomial ring over the integers.

There are several q-Catalan numbers. This procedure returns the one which can be written using the q-binomial coefficients.

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_catalan_number
sage: q_catalan_number(4)
q^12 + q^10 + q^9 + 2*q^8 + q^7 + 2*q^6 + q^5 + 2*q^4 + q^3 + q^2 + 1
```

(continues on next page)

(continued from previous page)

```
sage: p = ZZ['p'].0
sage: q_catalan_number(4, p)
p^12 + p^10 + p^9 + 2*p^8 + p^7 + 2*p^6 + p^5 + 2*p^4 + p^3 + p^2 + 1

sage: q_catalan_number(3, m=2)
q^12 + q^10 + q^9 + q^8 + q^7 + 2*q^6 + q^5 + q^4 + q^3 + q^2 + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_catalan_number
>>> q_catalan_number(Integer(4))
q^12 + q^10 + q^9 + 2*q^8 + q^7 + 2*q^6 + q^5 + 2*q^4 + q^3 + q^2 + 1

>>> p = ZZ['p'].gen(0)
>>> q_catalan_number(Integer(4), p)
p^12 + p^10 + p^9 + 2*p^8 + p^7 + 2*p^6 + p^5 + 2*p^4 + p^3 + p^2 + 1

>>> q_catalan_number(Integer(3), m=Integer(2))
q^12 + q^10 + q^9 + q^8 + q^7 + 2*q^6 + q^5 + q^4 + q^3 + q^2 + 1
```

sage.combinat.q_analogues.**q_factorial**(*n*, *q=None*)

Return the q-analogue of the factorial $n!$.

This is the product

$$[1]_q[2]_q \cdots [n]_q = 1 \cdot (1+q) \cdot (1+q+q^2) \cdots (1+q+q^2+\cdots+q^{n-1}).$$

If q is unspecified, then this function defaults to using the generator q for a univariate polynomial ring over the integers.

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_factorial
sage: q_factorial(3)
q^3 + 2*q^2 + 2*q + 1
sage: p = ZZ['p'].0
sage: q_factorial(3, p)
p^3 + 2*p^2 + 2*p + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_factorial
>>> q_factorial(Integer(3))
q^3 + 2*q^2 + 2*q + 1
>>> p = ZZ['p'].gen(0)
>>> q_factorial(Integer(3), p)
p^3 + 2*p^2 + 2*p + 1
```

The q-analogue of $n!$ is only defined for n a nonnegative integer (Issue #11411):

```
sage: q_factorial(-2)
Traceback (most recent call last):
...
ValueError: argument (-2) must be a nonnegative integer
```

```
>>> from sage.all import *
>>> q_factorial(-Integer(2))
Traceback (most recent call last):
...
ValueError: argument (-2) must be a nonnegative integer
```

sage.combinat.q_analogues.**q_int**(*n*, *q=None*)

Return the q-analogue of the integer n.

The q-analogue of the integer n is given by

$$[n]_q = \begin{cases} 1 + q + \cdots + q^{n-1}, & \text{if } n \geq 0, \\ -q^{-n}[-n]_q, & \text{if } n \leq 0. \end{cases}$$

Consequently, if $q = 1$ then $[n]_1 = n$ and if $q \neq 1$ then $[n]_q = (q^n - 1)/(q - 1)$.

If the argument q is not specified then it defaults to the generator q of the univariate polynomial ring over the integers.

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_int
sage: q_int(3)
q^2 + q + 1
sage: q_int(-3)
-q^-3 - q^-2 - q^-1
sage: p = ZZ['p'].0
sage: q_int(3,p)
p^2 + p + 1
sage: q_int(3/2)
Traceback (most recent call last):
...
ValueError: 3/2 must be an integer
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_int
>>> q_int(Integer(3))
q^2 + q + 1
>>> q_int(-Integer(3))
-q^-3 - q^-2 - q^-1
>>> p = ZZ['p'].gen(0)
>>> q_int(Integer(3),p)
p^2 + p + 1
>>> q_int(Integer(3)/Integer(2))
Traceback (most recent call last):
...
ValueError: 3/2 must be an integer
```

sage.combinat.q_analogues.**q_jordan**(*q=None*)

Return the q-Jordan number of t.

If q is the power of a prime number, the output is the number of complete flags in $\mathbf{F}_q^N$ (where N is the size of t) stable under a linear nilpotent endomorphism f_t whose Jordan type is given by t, i.e. such that for all i:

$$\dim(\ker f_t^i) = t[0] + \cdots + t[i-1]$$

If q is unspecified, then it defaults to using the generator q for a univariate polynomial ring over the integers.

The result is cached.

INPUT:

- `t` – integer partition, or an argument accepted by *Partition*
- `q` – (default: `None`) the variable q; if `None`, then use a default variable in $\mathbf{Z}[q]$

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_jordan
sage: [q_jordan(mu, 2) for mu in Partitions(5)]
[9765, 1029, 213, 93, 29, 9, 1]
sage: [q_jordan(mu, 2) for mu in Partitions(6)]
[615195, 40635, 5643, 2331, 1491, 515, 147, 87, 47, 11, 1]
sage: q_jordan([3,2,1])
16*q^4 + 24*q^3 + 14*q^2 + 5*q + 1
sage: q_jordan([2,1], x)                                                    #␣
↪needs sage.symbolic
2*x + 1
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_jordan
>>> [q_jordan(mu, Integer(2)) for mu in Partitions(Integer(5))]
[9765, 1029, 213, 93, 29, 9, 1]
>>> [q_jordan(mu, Integer(2)) for mu in Partitions(Integer(6))]
[615195, 40635, 5643, 2331, 1491, 515, 147, 87, 47, 11, 1]
>>> q_jordan([Integer(3),Integer(2),Integer(1)])
16*q^4 + 24*q^3 + 14*q^2 + 5*q + 1
>>> q_jordan([Integer(2),Integer(1)], x)                                    ␣
↪              # needs sage.symbolic
2*x + 1
```

If the partition is trivial (i.e. has only one part), we get the q-factorial (in this case, the nilpotent endomorphism is necessarily 0):

```
sage: from sage.combinat.q_analogues import q_factorial
sage: q_jordan([5]) == q_factorial(5)
True
sage: q_jordan([11], 5) == q_factorial(11, 5)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_factorial
>>> q_jordan([Integer(5)]) == q_factorial(Integer(5))
True
>>> q_jordan([Integer(11)], Integer(5)) == q_factorial(Integer(11), Integer(5))
True
```

AUTHOR:

- Xavier Caruso (2012-06-29)

`sage.combinat.q_analogues.`**`q_multinomial`**(*seq*, *q=None*, *binomial_algorithm='auto'*)

Return the q-multinomial coefficient.

This is also known as the Gaussian multinomial coefficient, and is defined by

$$\binom{n}{k_1, k_2, \ldots, k_m}_q = \frac{[n]_q!}{[k_1]_q![k_2]_q! \cdots [k_m]_q!}$$

where $n = k_1 + k_2 + \cdots + k_m$.

If q is unspecified, then the variable is the generator q for a univariate polynomial ring over the integers.

INPUT:

- `seq` – an iterable of the values k_1 to k_m defined above
- `q` – (default: `None`) the variable q; if `None`, then use a default variable in $\mathbf{Z}[q]$
- `binomial_algorithm` – (default: `'auto'`) the algorithm to use in *q_binomial()*; see possible values there

ALGORITHM:

We use the equivalent formula

$$\binom{k_1 + \cdots + k_m}{k_1, \ldots, k_m}_q = \prod_{i=1}^{m} \binom{\sum_{j=1}^{i} k_j}{k_i}_q.$$

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_multinomial
sage: q_multinomial([1,2,1])
q^5 + 2*q^4 + 3*q^3 + 3*q^2 + 2*q + 1
sage: q_multinomial([1,2,1], q=1) == multinomial([1,2,1])
True
sage: q_multinomial((3,2)) == q_binomial(5,3)
True
sage: q_multinomial([])
1
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_multinomial
>>> q_multinomial([Integer(1),Integer(2),Integer(1)])
q^5 + 2*q^4 + 3*q^3 + 3*q^2 + 2*q + 1
>>> q_multinomial([Integer(1),Integer(2),Integer(1)], q=Integer(1)) ==␣
↪multinomial([Integer(1),Integer(2),Integer(1)])
True
>>> q_multinomial((Integer(3),Integer(2))) == q_binomial(Integer(5),Integer(3))
True
>>> q_multinomial([])
1
```

`sage.combinat.q_analogues.`**`q_pochhammer`**(*n*, *a*, *q=None*)

Return the q-Pochhammer $(a;q)_n$.

The q-Pochhammer symbol is defined by

$$(a;q)_n = \prod_{k=0}^{n-1} (1 - aq^k)$$

with $(a;q)_0 = 1$ for all a, q and $n \in \mathbf{N}$. By using the identity

$$(a;q)_n = \frac{(a;q)_\infty}{(aq^n;q)_\infty},$$

we can extend the definition to $n < 0$ by

$$(a;q)_n = \frac{1}{(aq^n;q)_{-n}} = \prod_{k=1}^{-n} \frac{1}{1 - a/q^k}.$$

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_pochhammer
sage: q_pochhammer(3, 1/7)
6/343*q^3 - 6/49*q^2 - 6/49*q + 6/7
sage: q_pochhammer(3, 3)
-18*q^3 + 6*q^2 + 6*q - 2
sage: q_pochhammer(3, 1)
0

sage: R.<q,a> = ZZ[]
sage: q_pochhammer(4, q)
q^10 - q^9 - q^8 + 2*q^5 - q^2 - q + 1
sage: q_pochhammer(4, q^2)
q^14 - q^12 - q^11 - q^10 + q^8 + 2*q^7 + q^6 - q^4 - q^3 - q^2 + 1
sage: q_pochhammer(-3, a, q)
q^6/(q^6 - q^5*a - q^4*a + q^3*a^2 - q^3*a + q^2*a^2 + q*a^2 - a^3)
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_pochhammer
>>> q_pochhammer(Integer(3), Integer(1)/Integer(7))
6/343*q^3 - 6/49*q^2 - 6/49*q + 6/7
>>> q_pochhammer(Integer(3), Integer(3))
-18*q^3 + 6*q^2 + 6*q - 2
>>> q_pochhammer(Integer(3), Integer(1))
0

>>> R = ZZ['q, a']; (q, a,) = R._first_ngens(2)
>>> q_pochhammer(Integer(4), q)
q^10 - q^9 - q^8 + 2*q^5 - q^2 - q + 1
>>> q_pochhammer(Integer(4), q**Integer(2))
q^14 - q^12 - q^11 - q^10 + q^8 + 2*q^7 + q^6 - q^4 - q^3 - q^2 + 1
>>> q_pochhammer(-Integer(3), a, q)
q^6/(q^6 - q^5*a - q^4*a + q^3*a^2 - q^3*a + q^2*a^2 + q*a^2 - a^3)
```

sage.combinat.q_analogues.**q_stirling_number1**(*k*, *q=None*)

Return the (unsigned) q-Stirling number of the first kind.

This is a q-analogue of *sage.combinat.combinat.stirling_number1()* .

INPUT:

- n, k – integers with $1 \leq k \leq n$

- q – variable (default: q)

OUTPUT: a polynomial in the variable q

These polynomials satisfy the recurrence

$$s_{n,k} = s_{n-1,k-1} + [n-1]_q s_{n-1,k}.$$

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_stirling_number1
sage: q_stirling_number1(4,2)
q^3 + 3*q^2 + 4*q + 3

sage: all(stirling_number1(6,k) == q_stirling_number1(6,k)(1)                    #␣
↪needs sage.libs.gap
....:     for k in range(1,6))
True

sage: x = polygen(QQ['q'],'x')
sage: S = sum(q_stirling_number1(5,k)*x**k for k in range(1, 6))
sage: factor(S)                                                                  #␣
↪needs sage.libs.singular
x * (x + 1) * (x + q + 1) * (x + q^2 + q + 1) * (x + q^3 + q^2 + q + 1)
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_stirling_number1
>>> q_stirling_number1(Integer(4),Integer(2))
q^3 + 3*q^2 + 4*q + 3

>>> all(stirling_number1(Integer(6),k) == q_stirling_number1(Integer(6),
↪k)(Integer(1))                    # needs sage.libs.gap
...     for k in range(Integer(1),Integer(6)))
True

>>> x = polygen(QQ['q'],'x')
>>> S = sum(q_stirling_number1(Integer(5),k)*x**k for k in range(Integer(1),␣
↪Integer(6)))
>>> factor(S)                                                                    #␣
↪needs sage.libs.singular
x * (x + 1) * (x + q + 1) * (x + q^2 + q + 1) * (x + q^3 + q^2 + q + 1)
```

- [Ca1948]
- [Ca1954]

sage.combinat.q_analogues.**q_stirling_number2**(*k*, *q=None*)

Return the (unsigned) q-Stirling number of the second kind.

This is a q-analogue of *sage.combinat.combinat.stirling_number2()*.

INPUT:

- n, k – integers with $1 \leq k \leq n$
- q – variable (default: q)

OUTPUT: a polynomial in the variable q

These polynomials satisfy the recurrence

$$S_{n,k} = q^{k-1} S_{n-1,k-1} + [k]_q s_{n-1,k}.$$

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_stirling_number2
sage: q_stirling_number2(4,2)
q^3 + 3*q^2 + 3*q

sage: all(stirling_number2(6,k) == q_stirling_number2(6,k)(1)
....:     for k in range(7))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_stirling_number2
>>> q_stirling_number2(Integer(4),Integer(2))
q^3 + 3*q^2 + 3*q

>>> all(stirling_number2(Integer(6),k) == q_stirling_number2(Integer(6),
↪k)(Integer(1))
...     for k in range(Integer(7)))
True
```

sage.combinat.q_analogues.**q_subgroups_of_abelian_group**(*la*, *mu*, *q=None*, *algorithm='birkhoff'*)

Return the q-number of subgroups of type `mu` in a finite abelian group of type `la`.

INPUT:

- `la` – type of the ambient group as a *Partition*
- `mu` – type of the subgroup as a *Partition*
- `q` – (default: `None`) an indeterminate or a prime number; if `None`, this defaults to $q \in \mathbf{Z}[q]$
- `algorithm` – (default: `'birkhoff'`) the algorithm to use can be one of the following:
  - `'birkhoff'` – use the Birkhoff formula from [Bu87]
  - `'delsarte'` – use the formula from [Delsarte48]

OUTPUT:

The number of subgroups of type `mu` in a group of type `la` as a polynomial in `q`.

ALGORITHM:

Let q be a prime number and $\lambda = (\lambda_1, \ldots, \lambda_l)$ be a partition. A finite abelian q-group is of type λ if it is isomorphic to

$$\mathbf{Z}/q^{\lambda_1}\mathbf{Z} \times \cdots \times \mathbf{Z}/q^{\lambda_l}\mathbf{Z}.$$

The formula from [Bu87] works as follows: Let λ and μ be partitions. Let λ' and μ' denote the conjugate partitions to λ and μ, respectively. The number of subgroups of type μ in a group of type λ is given by

$$\prod_{i=1}^{\mu_1} q^{\mu'_{i+1}(\lambda'_i - \mu'_i)} \binom{\lambda'_i - \mu'_{i+1}}{\mu'_i - \mu'_{i+1}}_q$$

The formula from [Delsarte48] works as follows: Let λ and μ be partitions. Let $(s_1, s_2, \ldots, s_l)$ and $(r_1, r_2, \ldots, r_k)$ denote the parts of the partitions conjugate to λ and μ respectively. Let

$$\mathfrak{F}(\xi_1, \ldots, \xi_k) = \xi_1^{r_2} \xi_2^{r_3} \cdots \xi_{k-1}^{r_k} \prod_{i_1=r_2}^{r_1-1} (\xi_1 - q^{i_1}) \prod_{i_2=r_3}^{r_2-1} (\xi_2 - q^{i_2}) \cdots \prod_{i_k=0}^{r_k-1} (\xi_k - q^{-i_k}).$$

Then the number of subgroups of type μ in a group of type λ is given by

$$\frac{\mathfrak{F}(q^{s_1}, q^{s_2}, \ldots, q^{s_k})}{\mathfrak{F}(q^{r_1}, q^{r_2}, \ldots, q^{r_k})}.$$

EXAMPLES:

```
sage: from sage.combinat.q_analogues import q_subgroups_of_abelian_group
sage: q_subgroups_of_abelian_group([1,1], [1])
q + 1
sage: q_subgroups_of_abelian_group([3,3,2,1], [2,1])
q^6 + 2*q^5 + 3*q^4 + 2*q^3 + q^2
sage: R.<t> = QQ[]
sage: q_subgroups_of_abelian_group([5,3,1], [3,1], t)
t^4 + 2*t^3 + t^2
sage: q_subgroups_of_abelian_group([5,3,1], [3,1], 3)
144
sage: q_subgroups_of_abelian_group([1,1,1], [1]) == q_subgroups_of_abelian_
↪group([1,1,1], [1,1])
True
sage: q_subgroups_of_abelian_group([5], [3])
1
sage: q_subgroups_of_abelian_group([1], [2])
0
sage: q_subgroups_of_abelian_group([2], [1,1])
0
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import q_subgroups_of_abelian_group
>>> q_subgroups_of_abelian_group([Integer(1),Integer(1)], [Integer(1)])
q + 1
>>> q_subgroups_of_abelian_group([Integer(3),Integer(3),Integer(2),Integer(1)],␣
↪[Integer(2),Integer(1)])
q^6 + 2*q^5 + 3*q^4 + 2*q^3 + q^2
>>> R = QQ['t']; (t,) = R._first_ngens(1)
>>> q_subgroups_of_abelian_group([Integer(5),Integer(3),Integer(1)], [Integer(3),
↪Integer(1)], t)
t^4 + 2*t^3 + t^2
>>> q_subgroups_of_abelian_group([Integer(5),Integer(3),Integer(1)], [Integer(3),
↪Integer(1)], Integer(3))
144
>>> q_subgroups_of_abelian_group([Integer(1),Integer(1),Integer(1)],␣
↪[Integer(1)]) == q_subgroups_of_abelian_group([Integer(1),Integer(1),
↪Integer(1)], [Integer(1),Integer(1)])
True
>>> q_subgroups_of_abelian_group([Integer(5)], [Integer(3)])
1
>>> q_subgroups_of_abelian_group([Integer(1)], [Integer(2)])
```

(continues on next page)

(continued from previous page)

```
0
>>> q_subgroups_of_abelian_group([Integer(2)], [Integer(1),Integer(1)])
0
```

sage.combinat.q_analogues.**qt_catalan_number**(n)

Return the q, t-Catalan number of index n.

EXAMPLES:

```
sage: from sage.combinat.q_analogues import qt_catalan_number
sage: qt_catalan_number(1)
1
sage: qt_catalan_number(2)
q + t
sage: qt_catalan_number(3)
q^3 + q^2*t + q*t^2 + t^3 + q*t
sage: qt_catalan_number(4)
q^6 + q^5*t + q^4*t^2 + q^3*t^3 + q^2*t^4 + q*t^5 + t^6 + q^4*t + q^3*t^2 + q^2*t^
↪3 + q*t^4 + q^3*t + q^2*t^2 + q*t^3
```

```
>>> from sage.all import *
>>> from sage.combinat.q_analogues import qt_catalan_number
>>> qt_catalan_number(Integer(1))
1
>>> qt_catalan_number(Integer(2))
q + t
>>> qt_catalan_number(Integer(3))
q^3 + q^2*t + q*t^2 + t^3 + q*t
>>> qt_catalan_number(Integer(4))
q^6 + q^5*t + q^4*t^2 + q^3*t^3 + q^2*t^4 + q*t^5 + t^6 + q^4*t + q^3*t^2 + q^2*t^
↪3 + q*t^4 + q^3*t + q^2*t^2 + q*t^3
```

The q, t-Catalan number of index n is only defined for n a nonnegative integer (Issue #11411):

```
sage: qt_catalan_number(-2)
Traceback (most recent call last):
...
ValueError: argument (-2) must be a nonnegative integer
```

```
>>> from sage.all import *
>>> qt_catalan_number(-Integer(2))
Traceback (most recent call last):
...
ValueError: argument (-2) must be a nonnegative integer
```

sine-Gordon Y-system plotter

This class builds the triangulations associated to sine-Gordon and reduced sine-Gordon Y-systems as constructed in [NS].

AUTHORS:

- Salvatore Stella (2014-07-18): initial version

EXAMPLES:

A reduced sine-Gordon example with 3 generations:

```
sage: Y = SineGordonYsystem('A',(6,4,3)); Y
A sine-Gordon Y-system of type A with defining integer tuple (6, 4, 3)
sage: Y.plot()      #not tested
```

```
>>> from sage.all import *
>>> Y = SineGordonYsystem('A',(Integer(6),Integer(4),Integer(3))); Y
A sine-Gordon Y-system of type A with defining integer tuple (6, 4, 3)
>>> Y.plot()      #not tested
```

The same integer tuple but for the non-reduced case:

```
sage: Y = SineGordonYsystem('D',(6,4,3)); Y
A sine-Gordon Y-system of type D with defining integer tuple (6, 4, 3)
sage: Y.plot()      #not tested
```

```
>>> from sage.all import *
>>> Y = SineGordonYsystem('D',(Integer(6),Integer(4),Integer(3))); Y
A sine-Gordon Y-system of type D with defining integer tuple (6, 4, 3)
>>> Y.plot()      #not tested
```

Todo

The code for plotting is extremely slow.

class sage.combinat.sine_gordon.**SineGordonYsystem**(X, na)

Bases: SageObject

A class to model a (reduced) sine-Gordon Y-system.

Note that the generations, together with all integer tuples, in this implementation are numbered from 0 while in [NS] they are numbered from 1

INPUT:

- `X` – the type of the Y-system to construct (either 'A' or 'D')
- `na` – the tuple of positive integers defining the Y-system with `na[0] > 2`

See [NS]

EXAMPLES:

```
sage: Y = SineGordonYsystem('A',(6,4,3)); Y
A sine-Gordon Y-system of type A with defining integer tuple (6, 4, 3)
sage: Y.intervals()
```

(continues on next page)

(continued from previous page)

```
(((0, 0, 'R'),),
 ((0, 17, 'L'),
  (17, 34, 'L'),
...
  (104, 105, 'R'),
  (105, 0, 'R')))
sage: Y.triangulation()
((17, 89),
 (17, 72),
 (34, 72),
...
 (102, 105),
 (103, 105))
sage: Y.plot()      #not tested
```

```
>>> from sage.all import *
>>> Y = SineGordonYsystem('A',(Integer(6),Integer(4),Integer(3))); Y
A sine-Gordon Y-system of type A with defining integer tuple (6, 4, 3)
>>> Y.intervals()
(((0, 0, 'R'),),
 ((0, 17, 'L'),
  (17, 34, 'L'),
...
  (104, 105, 'R'),
  (105, 0, 'R')))
>>> Y.triangulation()
((17, 89),
 (17, 72),
 (34, 72),
...
 (102, 105),
 (103, 105))
>>> Y.plot()      #not tested
```

F()

Return the number of generations in `self`.

EXAMPLES:

```
sage: Y = SineGordonYsystem('A',(6,4,3))
sage: Y.F()
3
```

```
>>> from sage.all import *
>>> Y = SineGordonYsystem('A',(Integer(6),Integer(4),Integer(3)))
>>> Y.F()
3
```

intervals()

Return, divided by generation, the list of intervals used to construct the initial triangulation.

Each such interval is a triple `(p, q, X)` where `p` and `q` are the two extremal vertices of the interval and `X` is the type of the interval (one of 'L', 'R', 'NL', 'NR').

ALGORITHM:

The algorithm used here is the one described in section 5.1 of [NS]. The only difference is that we get rid of the special case of the first generation by treating the whole disk as a type 'R' interval.

EXAMPLES:

```
sage: Y = SineGordonYsystem('A',(6,4,3))
sage: Y.intervals()
(((0, 0, 'R'),),
 ((0, 17, 'L'),
  (17, 34, 'L'),
...
  (104, 105, 'R'),
  (105, 0, 'R')))
```

```
>>> from sage.all import *
>>> Y = SineGordonYsystem('A',(Integer(6),Integer(4),Integer(3)))
>>> Y.intervals()
(((0, 0, 'R'),),
 ((0, 17, 'L'),
  (17, 34, 'L'),
...
  (104, 105, 'R'),
  (105, 0, 'R')))
```

na()

Return the sequence of the integers n_a defining `self`.

EXAMPLES:

```
sage: Y = SineGordonYsystem('A',(6,4,3))
sage: Y.na()
(6, 4, 3)
```

```
>>> from sage.all import *
>>> Y = SineGordonYsystem('A',(Integer(6),Integer(4),Integer(3)))
>>> Y.na()
(6, 4, 3)
```

pa()

Return the sequence of integers `p_a`, i.e. the total number of intervals of types 'NL' and 'NR' in the `(a+1)`-th generation.

EXAMPLES:

```
sage: Y = SineGordonYsystem('A',(6,4,3))
sage: Y.pa()
(1, 6, 25)
```

```
>>> from sage.all import *
>>> Y = SineGordonYsystem('A',(Integer(6),Integer(4),Integer(3)))
>>> Y.pa()
(1, 6, 25)
```

plot(***kwds*)

Plot the initial triangulation associated to `self`.

INPUT:

- `radius` – the radius of the disk; by default the length of the circle is the number of vertices
- `points_color` – the color of the vertices; default 'black'
- `points_size` – the size of the vertices; default 7
- `triangulation_color` – the color of the arcs; default 'black'
- `triangulation_thickness` – the thickness of the arcs; default 0.5
- `shading_color` – the color of the shading used on neuter intervals; default 'lightgray'
- `reflections_color` – the color of the reflection axes; default 'blue'
- `reflections_thickness` – the thickness of the reflection axes; default 1

EXAMPLES:

```
sage: Y = SineGordonYsystem('A',(6,4,3))
sage: Y.plot()                        # long time (2s)                          #␣
↪needs sage.plot
Graphics object consisting of 219 graphics primitives
```

```
>>> from sage.all import *
>>> Y = SineGordonYsystem('A',(Integer(6),Integer(4),Integer(3)))
>>> Y.plot()                         # long time (2s)                          #␣
↪needs sage.plot
Graphics object consisting of 219 graphics primitives
```

qa()

Return the sequence of integers `q_a`, i.e. the total number of intervals of types 'L' and 'R' in the `(a+1)`-th generation.

EXAMPLES:

```
sage: Y = SineGordonYsystem('A',(6,4,3))
sage: Y.qa()
(6, 25, 81)
```

```
>>> from sage.all import *
>>> Y = SineGordonYsystem('A',(Integer(6),Integer(4),Integer(3)))
>>> Y.qa()
(6, 25, 81)
```

r()

Return the number of vertices in the polygon realizing `self`.

EXAMPLES:

```
sage: Y = SineGordonYsystem('A',(6,4,3))
sage: Y.r()
106
```

```
>>> from sage.all import *
>>> Y = SineGordonYsystem('A',(Integer(6),Integer(4),Integer(3)))
>>> Y.r()
106
```

rk()

Return the sequence of integers `r^{(k)}`, i.e. the width of an interval of type 'L' or 'R' in the `k`-th generation.

EXAMPLES:

```
sage: Y = SineGordonYsystem('A',(6,4,3))
sage: Y.rk()
(106, 17, 4)
```

```
>>> from sage.all import *
>>> Y = SineGordonYsystem('A',(Integer(6),Integer(4),Integer(3)))
>>> Y.rk()
(106, 17, 4)
```

triangulation()

Return the initial triangulation of the polygon realizing `self` as a tuple of pairs of vertices.

Warning

In type 'D' the returned triangulation does NOT contain the two radii.

ALGORITHM:

We implement the four cases described by Figure 14 in [NS].

EXAMPLES:

```
sage: Y = SineGordonYsystem('A',(6,4,3))
sage: Y.triangulation()
((17, 89),
 (17, 72),
...
 (102, 105),
 (103, 105))
```

```
>>> from sage.all import *
>>> Y = SineGordonYsystem('A',(Integer(6),Integer(4),Integer(3)))
>>> Y.triangulation()
((17, 89),
 (17, 72),
...
 (102, 105),
 (103, 105))
```

type()

Return the type of `self`.

EXAMPLES:

```
sage: Y = SineGordonYsystem('A',(6,4,3))
sage: Y.type()
'A'
```

```
>>> from sage.all import *
>>> Y = SineGordonYsystem('A',(Integer(6),Integer(4),Integer(3)))
>>> Y.type()
'A'
```

vertices()

Return the vertices of the polygon realizing `self` as the ring of integers modulo `self.r()`.

EXAMPLES:

```
sage: Y = SineGordonYsystem('A',(6,4,3))
sage: Y.vertices()
Ring of integers modulo 106
```

```
>>> from sage.all import *
>>> Y = SineGordonYsystem('A',(Integer(6),Integer(4),Integer(3)))
>>> Y.vertices()
Ring of integers modulo 106
```

Poirier-Reutenauer Hopf algebra of standard tableaux

AUTHORS:

- Franco Saliola (2012): initial implementation
- Travis Scrimshaw (2018-04-11): added missing doctests and reorganization

class sage.combinat.chas.fsym.**FSymBases**(*parent_with_realization*)

Bases: `Category_realization_of_parent`

The category of graded bases of $FSym$ and $FSym^*$ indexed by standard tableaux.

class ElementMethods

Bases: `object`

duality_pairing(*other*)

Compute the pairing between `self` and an element `other` of the dual.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: G = FSym.G()
sage: F = G.dual_basis()
sage: elt = G[[1,3],[2]] - 3*G[[1,2],[3]]
sage: elt.duality_pairing(F[[1,3],[2]])
1
sage: elt.duality_pairing(F[[1,2],[3]])
-3
sage: elt.duality_pairing(F[[1,2]])
0
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> G = FSym.G()
>>> F = G.dual_basis()
>>> elt = G[[Integer(1),Integer(3)],[Integer(2)]] -␣
↪Integer(3)*G[[Integer(1),Integer(2)],[Integer(3)]]
>>> elt.duality_pairing(F[[Integer(1),Integer(3)],[Integer(2)]])
1
>>> elt.duality_pairing(F[[Integer(1),Integer(2)],[Integer(3)]])
-3
>>> elt.duality_pairing(F[[Integer(1),Integer(2)]])
0
```

class ParentMethods

Bases: `object`

basis(*degree=None*)

The basis elements (optionally: of the specified degree).

OUTPUT: family

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: TG = FSym.G()
sage: TG.basis()
Lazy family (Term map from Standard tableaux to Hopf algebra of standard␣
↪tableaux
 over the Rational Field in the Fundamental basis(i))_{i in Standard␣
↪tableaux}
sage: TG.basis().keys()
Standard tableaux
sage: TG.basis(degree=3).keys()
Standard tableaux of size 3
sage: TG.basis(degree=3).list()
[G[123], G[13|2], G[12|3], G[1|2|3]]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> TG = FSym.G()
>>> TG.basis()
Lazy family (Term map from Standard tableaux to Hopf algebra of standard␣
↪tableaux
 over the Rational Field in the Fundamental basis(i))_{i in Standard␣
↪tableaux}
>>> TG.basis().keys()
Standard tableaux
>>> TG.basis(degree=Integer(3)).keys()
Standard tableaux of size 3
>>> TG.basis(degree=Integer(3)).list()
[G[123], G[13|2], G[12|3], G[1|2|3]]
```

degree_on_basis(*t*)

Return the degree of a standard tableau in the algebra of free symmetric functions.

This is the size of the tableau `t`.

EXAMPLES:

```
sage: G = algebras.FSym(QQ).G()
sage: t = StandardTableau([[1,3],[2]])
sage: G.degree_on_basis(t)
3
sage: u = StandardTableau([[1,3,4,5],[2]])
sage: G.degree_on_basis(u)
5
```

```
>>> from sage.all import *
>>> G = algebras.FSym(QQ).G()
>>> t = StandardTableau([[Integer(1),Integer(3)],[Integer(2)]])
>>> G.degree_on_basis(t)
3
>>> u = StandardTableau([[Integer(1),Integer(3),Integer(4),Integer(5)],
↪[Integer(2)]])
>>> G.degree_on_basis(u)
5
```

duality_pairing(*x*, *y*)

The canonical pairing between $FSym$ and $FSym^*$.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: G = FSym.G()
sage: F = G.dual_basis()
sage: t1 = StandardTableau([[1,3,5],[2,4]])
sage: t2 = StandardTableau([[1,3],[2,5],[4]])
sage: G.duality_pairing(G[t1], F[t2])
0
sage: G.duality_pairing(G[t1], F[t1])
1
```

(continues on next page)

(continued from previous page)

```
sage: G.duality_pairing(G[t2], F[t2])
1
sage: F.duality_pairing(F[t2], G[t2])
1

sage: z = G[[1,3,5],[2,4]]
sage: all(F.duality_pairing(F[p1] * F[p2], z) == c
....:     for (p1, p2), c in z.coproduct())
True
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> G = FSym.G()
>>> F = G.dual_basis()
>>> t1 = StandardTableau([[Integer(1),Integer(3),Integer(5)],[Integer(2),
↪Integer(4)]])
>>> t2 = StandardTableau([[Integer(1),Integer(3)],[Integer(2),Integer(5)],
↪[Integer(4)]])
>>> G.duality_pairing(G[t1], F[t2])
0
>>> G.duality_pairing(G[t1], F[t1])
1
>>> G.duality_pairing(G[t2], F[t2])
1
>>> F.duality_pairing(F[t2], G[t2])
1

>>> z = G[[Integer(1),Integer(3),Integer(5)],[Integer(2),Integer(4)]]
>>> all(F.duality_pairing(F[p1] * F[p2], z) == c
...     for (p1, p2), c in z.coproduct())
True
```

duality_pairing_matrix(*basis*, *degree*)

The matrix of scalar products between elements of $FSym$ and elements of $FSym^*$.

INPUT:

- `basis` – a basis of the dual Hopf algebra
- `degree` – nonnegative integer

OUTPUT:

- the matrix of scalar products between the basis `self` and the basis `basis` in the dual Hopf algebra of degree `degree`

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: G = FSym.G()
sage: G.duality_pairing_matrix(G.dual_basis(), 3)
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

```
>>> from sage.all import *
```

(continues on next page)

(continued from previous page)

```
>>> FSym = algebras.FSym(QQ)
>>> G = FSym.G()
>>> G.duality_pairing_matrix(G.dual_basis(), Integer(3))
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

one_basis()

Return the basis index corresponding to 1.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: TG = FSym.G()
sage: TG.one_basis()
[]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> TG = FSym.G()
>>> TG.one_basis()
[]
```

super_categories()

The super categories of `self`.

EXAMPLES:

```
sage: from sage.combinat.chas.fsym import FSymBases
sage: FSym = algebras.FSym(ZZ)
sage: bases = FSymBases(FSym)
sage: bases.super_categories()
[Category of realizations of Hopf algebra of standard tableaux over the␣
↪Integer Ring,
 Join of Category of realizations of Hopf algebras over Integer Ring
     and Category of graded algebras over Integer Ring
     and Category of graded coalgebras over Integer Ring,
 Category of graded connected Hopf algebras with basis over Integer Ring]
```

```
>>> from sage.all import *
>>> from sage.combinat.chas.fsym import FSymBases
>>> FSym = algebras.FSym(ZZ)
>>> bases = FSymBases(FSym)
>>> bases.super_categories()
[Category of realizations of Hopf algebra of standard tableaux over the␣
↪Integer Ring,
 Join of Category of realizations of Hopf algebras over Integer Ring
     and Category of graded algebras over Integer Ring
     and Category of graded coalgebras over Integer Ring,
 Category of graded connected Hopf algebras with basis over Integer Ring]
```

class sage.combinat.chas.fsym.**FSymBasis_abstract**(*alg*, *graded=True*)

Bases: *CombinatorialFreeModule*, BindableClass

Abstract base class for graded bases of $FSym$ and of $FSym^*$ indexed by standard tableaux.

This must define the following attributes:

- `_prefix` – the basis prefix

some_elements()

Return some elements of `self`.

EXAMPLES:

```
sage: G = algebras.FSym(QQ).G()
sage: G.some_elements()
[G[], G[1], G[12], G[1] + G[1|2], G[] + 1/2*G[1]]
```

```
>>> from sage.all import *
>>> G = algebras.FSym(QQ).G()
>>> G.some_elements()
[G[], G[1], G[12], G[1] + G[1|2], G[] + 1/2*G[1]]
```

class sage.combinat.chas.fsym.**FreeSymmetricFunctions**(*base_ring*)

Bases: UniqueRepresentation, Parent

The free symmetric functions.

The *free symmetric functions* is a combinatorial Hopf algebra defined using tableaux and denoted $FSym$.

Consider the Hopf algebra $FQSym$ (*FreeQuasisymmetricFunctions*) over a commutative ring R, and its bases (F_w) and (G_w) (where w, in both cases, ranges over all permutations in all symmetric groups $S_0, S_1, S_2, \ldots$). For each word w, let $P(w)$ be the P-tableau of w (that is, the first of the two tableaux obtained by applying the RSK algorithm to w; see *RSK()*). If t is a standard tableau of size n, then we define $\mathcal{G}_t \in FQSym$ to be the sum of the F_w with w ranging over all permutations of $\{1, 2, \ldots, n\}$ satisfying $P(w) = t$. Equivalently, $\mathcal{G}_t$ is the sum of the G_w with w ranging over all permutations of $\{1, 2, \ldots, n\}$ satisfying $Q(w) = t$ (where $Q(w)$ denotes the Q-tableau of w).

The R-linear span of the $\mathcal{G}_t$ (for t ranging over all standard tableaux) is a Hopf subalgebra of $FQSym$, denoted by $FSym$ and known as the *free symmetric functions* or the *Poirier-Reutenauer Hopf algebra of tableaux*. It has been introduced in [PoiReu95], where it was denoted by $(\mathbf{Z}T, *, \delta)$. (What we call $\mathcal{G}_t$ has just been called t in [PoiReu95].) The family $(\mathcal{G}_t)$ (with t ranging over all standard tableaux) is a basis of $FSym$, called the *Fundamental basis*.

EXAMPLES:

As explained above, $FSym$ is constructed as a Hopf subalgebra of $FQSym$:

```
sage: G = algebras.FSym(QQ).G()
sage: F = algebras.FQSym(QQ).F()
sage: G[[1,3],[2]]
G[13|2]
sage: G[[1,3],[2]].to_fqsym()
G[2, 1, 3] + G[3, 1, 2]
sage: F(G[[1,3],[2]])
F[2, 1, 3] + F[2, 3, 1]
```

```
>>> from sage.all import *
>>> G = algebras.FSym(QQ).G()
>>> F = algebras.FQSym(QQ).F()
>>> G[[Integer(1),Integer(3)],[Integer(2)]]
G[13|2]
>>> G[[Integer(1),Integer(3)],[Integer(2)]].to_fqsym()
G[2, 1, 3] + G[3, 1, 2]
>>> F(G[[Integer(1),Integer(3)],[Integer(2)]])
F[2, 1, 3] + F[2, 3, 1]
```

This embedding is a Hopf algebra morphism:

```
sage: all(F(G[t1] * G[t2]) == F(G[t1]) * F(G[t2])
....:     for t1 in StandardTableaux(2)
....:     for t2 in StandardTableaux(3))
True

sage: FF = F.tensor_square()
sage: all(FF(G[t].coproduct()) == F(G[t]).coproduct()
....:     for t in StandardTableaux(4))
True
```

```
>>> from sage.all import *
>>> all(F(G[t1] * G[t2]) == F(G[t1]) * F(G[t2])
...     for t1 in StandardTableaux(Integer(2))
...     for t2 in StandardTableaux(Integer(3)))
True

>>> FF = F.tensor_square()
>>> all(FF(G[t].coproduct()) == F(G[t]).coproduct()
...     for t in StandardTableaux(Integer(4)))
True
```

There is a Hopf algebra map from $FSym$ onto the Hopf algebra of symmetric functions, which maps a tableau t to the Schur function indexed by the shape of t:

```
sage: TG = algebras.FSym(QQ).G()
sage: t = StandardTableau([[1,3],[2,4],[5]])
sage: TG[t]
G[13|24|5]
sage: TG[t].to_symmetric_function()
s[2, 2, 1]
```

```
>>> from sage.all import *
>>> TG = algebras.FSym(QQ).G()
>>> t = StandardTableau([[Integer(1),Integer(3)],[Integer(2),Integer(4)],
↪[Integer(5)]])
>>> TG[t]
G[13|24|5]
>>> TG[t].to_symmetric_function()
s[2, 2, 1]
```

class Fundamental(*alg*, *graded=True*)

Bases: *FSymBasis_abstract*

The Hopf algebra of tableaux on the Fundamental basis.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: TG = FSym.G()
sage: TG
Hopf algebra of standard tableaux over the Rational Field
 in the Fundamental basis
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> TG = FSym.G()
>>> TG
Hopf algebra of standard tableaux over the Rational Field
 in the Fundamental basis
```

Elements of the algebra look like:

```
sage: TG.an_element()
2*G[] + 2*G[1] + 3*G[12]
```

```
>>> from sage.all import *
>>> TG.an_element()
2*G[] + 2*G[1] + 3*G[12]
```

class Element

Bases: IndexedFreeModuleElement

to_fqsym()

Return the image of `self` under the natural inclusion map to $FQSym$.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: G = FSym.G()
sage: t = StandardTableau([[1,3],[2,4],[5]])
sage: G[t].to_fqsym()
G[2, 1, 5, 4, 3] + G[3, 1, 5, 4, 2] + G[3, 2, 5, 4, 1]
 + G[4, 1, 5, 3, 2] + G[4, 2, 5, 3, 1]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> G = FSym.G()
>>> t = StandardTableau([[Integer(1),Integer(3)],[Integer(2),
↪Integer(4)],[Integer(5)]])
>>> G[t].to_fqsym()
G[2, 1, 5, 4, 3] + G[3, 1, 5, 4, 2] + G[3, 2, 5, 4, 1]
 + G[4, 1, 5, 3, 2] + G[4, 2, 5, 3, 1]
```

to_symmetric_function()

Return the image of `self` under the natural projection map to Sym.

The natural projection map $FSym \to Sym$ sends each standard tableau t to the Schur function s_λ, where λ is the shape of t. This map is a surjective Hopf algebra homomorphism.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: G = FSym.G()
sage: t = StandardTableau([[1,3],[2,4],[5]])
sage: G[t].to_symmetric_function()
s[2, 2, 1]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> G = FSym.G()
>>> t = StandardTableau([[Integer(1),Integer(3)],[Integer(2),
↪Integer(4)],[Integer(5)]])
>>> G[t].to_symmetric_function()
s[2, 2, 1]
```

coproduct_on_basis(*t*)

Return the coproduct of the basis element indexed by `t`.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: G = FSym.G()
sage: t = StandardTableau([[1,2,5], [3,4]])
sage: G.coproduct_on_basis(t)
G[] # G[125|34] + G[1] # G[12|34] + G[1] # G[124|3]
 + G[1|2] # G[13|2] + G[12] # G[12|3] + G[12] # G[123]
 + G[12|34] # G[1] + G[123] # G[12] + G[125|34] # G[]
 + G[13|2] # G[1|2] + G[13|2] # G[12] + G[134|2] # G[1]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> G = FSym.G()
>>> t = StandardTableau([[Integer(1),Integer(2),Integer(5)], [Integer(3),
↪Integer(4)]])
>>> G.coproduct_on_basis(t)
G[] # G[125|34] + G[1] # G[12|34] + G[1] # G[124|3]
 + G[1|2] # G[13|2] + G[12] # G[12|3] + G[12] # G[123]
 + G[12|34] # G[1] + G[123] # G[12] + G[125|34] # G[]
 + G[13|2] # G[1|2] + G[13|2] # G[12] + G[134|2] # G[1]
```

dual_basis()

Return the dual basis to `self`.

EXAMPLES:

```
sage: G = algebras.FSym(QQ).G()
sage: G.dual_basis()
Dual Hopf algebra of standard tableaux over the Rational Field
 in the FundamentalDual basis
```

```
>>> from sage.all import *
>>> G = algebras.FSym(QQ).G()
>>> G.dual_basis()
Dual Hopf algebra of standard tableaux over the Rational Field
 in the FundamentalDual basis
```

product_on_basis(*t1*, *t2*)

Return the product of basis elements indexed by `t1` and `t2`.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: G = FSym.G()
sage: t1 = StandardTableau([[1,2], [3]])
sage: t2 = StandardTableau([[1,2,3]])
sage: G.product_on_basis(t1, t2)
G[12456|3] + G[1256|3|4] + G[1256|34] + G[126|35|4]

sage: t1 = StandardTableau([[1],[2]])
sage: t2 = StandardTableau([[1,2]])
sage: G.product_on_basis(t1, t2)
G[134|2] + G[14|2|3]

sage: t1 = StandardTableau([[1,2],[3]])
sage: t2 = StandardTableau([[1],[2]])
sage: G.product_on_basis(t1, t2)
G[12|3|4|5] + G[12|34|5] + G[124|3|5] + G[124|35]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> G = FSym.G()
>>> t1 = StandardTableau([[Integer(1),Integer(2)], [Integer(3)]])
>>> t2 = StandardTableau([[Integer(1),Integer(2),Integer(3)]])
>>> G.product_on_basis(t1, t2)
G[12456|3] + G[1256|3|4] + G[1256|34] + G[126|35|4]

>>> t1 = StandardTableau([[Integer(1)],[Integer(2)]])
>>> t2 = StandardTableau([[Integer(1),Integer(2)]])
>>> G.product_on_basis(t1, t2)
G[134|2] + G[14|2|3]

>>> t1 = StandardTableau([[Integer(1),Integer(2)],[Integer(3)]])
>>> t2 = StandardTableau([[Integer(1)],[Integer(2)]])
>>> G.product_on_basis(t1, t2)
G[12|3|4|5] + G[12|34|5] + G[124|3|5] + G[124|35]
```

G

alias of *Fundamental*

a_realization()

Return a particular realization of `self` (the Fundamental basis).

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: FSym.a_realization()
Hopf algebra of standard tableaux over the Rational Field
 in the Fundamental basis
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> FSym.a_realization()
Hopf algebra of standard tableaux over the Rational Field
 in the Fundamental basis
```

dual()

Return the dual Hopf algebra of $FSym$.

EXAMPLES:

```
sage: algebras.FSym(QQ).dual()
Dual Hopf algebra of standard tableaux over the Rational Field
```

```
>>> from sage.all import *
>>> algebras.FSym(QQ).dual()
Dual Hopf algebra of standard tableaux over the Rational Field
```

class sage.combinat.chas.fsym.**FreeSymmetricFunctions_Dual**(*base_ring*)

Bases: UniqueRepresentation, Parent

The Hopf dual $FSym^*$ of the free symmetric functions $FSym$.

See *FreeSymmetricFunctions* for the definition of the latter.

Recall that the fundamental basis of $FSym$ consists of the elements $\mathcal{G}_t$ for t ranging over all standard tableaux. The dual basis of this is called the *dual fundamental basis* of $FSym^*$, and is denoted by $(\mathcal{G}_t^*)$. The Hopf dual $FSym^*$ is isomorphic to the Hopf algebra $(\mathbf{Z}T, *', \delta')$ from [PoiReu95]; the isomorphism sends a basis element $\mathcal{G}_t^*$ to t.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: TF = FSym.dual().F()
sage: TF[1,2] * TF[[1],[2]]
F[12|3|4] + F[123|4] + F[124|3] + F[13|2|4] + F[134|2] + F[14|2|3]
sage: TF[[1,2],[3]].coproduct()
F[] # F[12|3] + F[1] # F[1|2] + F[12] # F[1] + F[12|3] # F[]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> TF = FSym.dual().F()
>>> TF[Integer(1),Integer(2)] * TF[[Integer(1)],[Integer(2)]]
F[12|3|4] + F[123|4] + F[124|3] + F[13|2|4] + F[134|2] + F[14|2|3]
>>> TF[[Integer(1),Integer(2)],[Integer(3)]].coproduct()
F[] # F[12|3] + F[1] # F[1|2] + F[12] # F[1] + F[12|3] # F[]
```

The Hopf algebra $FSym^*$ is a Hopf quotient of $FQSym$; the canonical projection sends F_w (for a permutation w) to $\mathcal{G}^*_{Q(w)}$, where $Q(w)$ is the Q-tableau of w. This projection is implemented as a coercion:

```
sage: FQSym = algebras.FQSym(QQ)
sage: F = FQSym.F()
sage: TF(F[[1, 3, 2]])
F[12|3]
sage: TF(F[[5, 1, 4, 2, 3]])
F[135|2|4]
```

```
>>> from sage.all import *
>>> FQSym = algebras.FQSym(QQ)
>>> F = FQSym.F()
>>> TF(F[[Integer(1), Integer(3), Integer(2)]])
F[12|3]
>>> TF(F[[Integer(5), Integer(1), Integer(4), Integer(2), Integer(3)]])
F[135|2|4]
```

F

alias of *FundamentalDual*

class FundamentalDual(*alg*, *graded=True*)

Bases: *FSymBasis_abstract*

The dual to the Hopf algebra of tableaux, on the fundamental dual basis.

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: TF = FSym.dual().F()
sage: TF
Dual Hopf algebra of standard tableaux over the Rational Field
 in the FundamentalDual basis
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> TF = FSym.dual().F()
>>> TF
Dual Hopf algebra of standard tableaux over the Rational Field
 in the FundamentalDual basis
```

Elements of the algebra look like:

```
sage: TF.an_element()
2*F[] + 2*F[1] + 3*F[12]
```

```
>>> from sage.all import *
>>> TF.an_element()
2*F[] + 2*F[1] + 3*F[12]
```

class Element

Bases: IndexedFreeModuleElement

to_quasisymmetric_function()

Return the image of `self` under the canonical projection $FSym^* \to QSym$ to the ring of quasi-symmetric functions.

This projection is the adjoint of the canonical injection $NSym \to FSym$ (see `to_fsym()`). It sends each tableau t to the fundamental quasi-symmetric function F_α, where α is the descent composition of t.

EXAMPLES:

```
sage: F = algebras.FSym(QQ).dual().F()
sage: F[[1,3,5],[2,4]].to_quasisymmetric_function()
F[1, 2, 2]
```

```
>>> from sage.all import *
>>> F = algebras.FSym(QQ).dual().F()
>>> F[[Integer(1),Integer(3),Integer(5)],[Integer(2),Integer(4)]].to_
↪quasisymmetric_function()
F[1, 2, 2]
```

coproduct_on_basis(*t*)

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: TF = FSym.dual().F()
sage: t = StandardTableau([[1,2,5], [3,4]])
sage: TF.coproduct_on_basis(t)
F[] # F[125|34] + F[1] # F[134|2] + F[12] # F[123]
 + F[12|3] # F[12] + F[12|34] # F[1] + F[125|34] # F[]
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> TF = FSym.dual().F()
>>> t = StandardTableau([[Integer(1),Integer(2),Integer(5)], [Integer(3),
↪Integer(4)]])
>>> TF.coproduct_on_basis(t)
F[] # F[125|34] + F[1] # F[134|2] + F[12] # F[123]
 + F[12|3] # F[12] + F[12|34] # F[1] + F[125|34] # F[]
```

dual_basis()

Return the dual basis to `self`.

EXAMPLES:

```
sage: F = algebras.FSym(QQ).dual().F()
sage: F.dual_basis()
Hopf algebra of standard tableaux over the Rational Field
 in the Fundamental basis
```

```
>>> from sage.all import *
>>> F = algebras.FSym(QQ).dual().F()
>>> F.dual_basis()
Hopf algebra of standard tableaux over the Rational Field
 in the Fundamental basis
```

product_on_basis(*t1*, *t2*)

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ)
sage: TF = FSym.dual().F()
sage: t1 = StandardTableau([[1,2]])
sage: TF.product_on_basis(t1, t1)
F[12|34] + F[123|4] + F[1234] + F[124|3] + F[13|24] + F[134|2]
sage: t0 = StandardTableau([])
sage: TF.product_on_basis(t1, t0) == TF[t1] == TF.product_on_basis(t0, t1)
True
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ)
>>> TF = FSym.dual().F()
>>> t1 = StandardTableau([[Integer(1),Integer(2)]])
>>> TF.product_on_basis(t1, t1)
F[12|34] + F[123|4] + F[1234] + F[124|3] + F[13|24] + F[134|2]
>>> t0 = StandardTableau([])
>>> TF.product_on_basis(t1, t0) == TF[t1] == TF.product_on_basis(t0, t1)
True
```

a_realization()

Return a particular realization of `self` (the Fundamental dual basis).

EXAMPLES:

```
sage: FSym = algebras.FSym(QQ).dual()
sage: FSym.a_realization()
Dual Hopf algebra of standard tableaux over the Rational Field
 in the FundamentalDual basis
```

```
>>> from sage.all import *
>>> FSym = algebras.FSym(QQ).dual()
>>> FSym.a_realization()
Dual Hopf algebra of standard tableaux over the Rational Field
 in the FundamentalDual basis
```

dual()

Return the dual Hopf algebra of `self`, which is $FSym$.

EXAMPLES:

```
sage: D = algebras.FSym(QQ).dual()
sage: D.dual()
Hopf algebra of standard tableaux over the Rational Field
```

```
>>> from sage.all import *
>>> D = algebras.FSym(QQ).dual()
>>> D.dual()
Hopf algebra of standard tableaux over the Rational Field
```

sage.combinat.chas.fsym.**ascent_set**(t)

Return the ascent set of a standard tableau `t` (encoded as a sorted list).

The *ascent set* of a standard tableau t is defined as the set of all entries i of t such that the number $i+1$ either appears to the right of i or appears in a row above i or does not appear in t at all.

EXAMPLES:

```
sage: from sage.combinat.chas.fsym import ascent_set
sage: t = StandardTableau([[1,3,4,7],[2,5,6],[8]])
sage: ascent_set(t)
[2, 3, 5, 6, 8]
sage: ascent_set(StandardTableau([]))
[]
sage: ascent_set(StandardTableau([[1, 2, 3]]))
[1, 2, 3]
sage: ascent_set(StandardTableau([[1, 2, 4], [3]]))
[1, 3, 4]
sage: ascent_set([[1, 3, 5], [2, 4]])
[2, 4, 5]
```

```
>>> from sage.all import *
>>> from sage.combinat.chas.fsym import ascent_set
>>> t = StandardTableau([[Integer(1),Integer(3),Integer(4),Integer(7)],
↪[Integer(2),Integer(5),Integer(6)],[Integer(8)]])
>>> ascent_set(t)
[2, 3, 5, 6, 8]
>>> ascent_set(StandardTableau([]))
[]
>>> ascent_set(StandardTableau([[Integer(1), Integer(2), Integer(3)]]))
[1, 2, 3]
>>> ascent_set(StandardTableau([[Integer(1), Integer(2), Integer(4)],␣
↪[Integer(3)]]))
[1, 3, 4]
>>> ascent_set([[Integer(1), Integer(3), Integer(5)], [Integer(2), Integer(4)]])
[2, 4, 5]
```

sage.combinat.chas.fsym.**descent_composition**(*t*)

Return the descent composition of a standard tableau `t`.

This is the composition of the size of t whose partial sums are the elements of the descent set of `t` (see *descent_set()*).

EXAMPLES:

```
sage: from sage.combinat.chas.fsym import descent_composition
sage: t = StandardTableau([[1,3,4,7],[2,5,6],[8]])
sage: descent_composition(t)
[1, 3, 3, 1]
sage: descent_composition([[1, 3, 5], [2, 4]])
[1, 2, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.chas.fsym import descent_composition
>>> t = StandardTableau([[Integer(1),Integer(3),Integer(4),Integer(7)],
↪[Integer(2),Integer(5),Integer(6)],[Integer(8)]])
>>> descent_composition(t)
[1, 3, 3, 1]
>>> descent_composition([[Integer(1), Integer(3), Integer(5)], [Integer(2),␣
↪Integer(4)]])
```

(continues on next page)

(continued from previous page)

```
[1, 2, 2]
```

sage.combinat.chas.fsym.**descent_set**(*t*)

Return the descent set of a standard tableau `t` (encoded as a sorted list).

The *descent set* of a standard tableau t is defined as the set of all entries i of t such that the number $i+1$ appears in a row below i in t.

EXAMPLES:

```
sage: from sage.combinat.chas.fsym import descent_set
sage: t = StandardTableau([[1,3,4,7],[2,5,6],[8]])
sage: descent_set(t)
[1, 4, 7]
sage: descent_set(StandardTableau([]))
[]
sage: descent_set(StandardTableau([[1, 2, 3]]))
[]
sage: descent_set(StandardTableau([[1, 2, 4], [3]]))
[2]
sage: descent_set([[1, 3, 5], [2, 4]])
[1, 3]
```

```
>>> from sage.all import *
>>> from sage.combinat.chas.fsym import descent_set
>>> t = StandardTableau([[Integer(1),Integer(3),Integer(4),Integer(7)],
↪[Integer(2),Integer(5),Integer(6)],[Integer(8)]])
>>> descent_set(t)
[1, 4, 7]
>>> descent_set(StandardTableau([]))
[]
>>> descent_set(StandardTableau([[Integer(1), Integer(2), Integer(3)]]))
[]
>>> descent_set(StandardTableau([[Integer(1), Integer(2), Integer(4)],␣
↪[Integer(3)]]))
[2]
>>> descent_set([[Integer(1), Integer(3), Integer(5)], [Integer(2), Integer(4)]])
[1, 3]
```

sage.combinat.chas.fsym.**standardize**(*t*)

Return the standard tableau corresponding to a given semistandard tableau `t` with no repeated entries.

> **Note**
>
> This is an optimized version of *Tableau.standardization()* for computations in $FSym$ by using the assumption of no repeated entries in `t`.

EXAMPLES:

```
sage: from sage.combinat.chas.fsym import standardize
sage: t = Tableau([[1,3,5,7],[2,4,8],[9]])
sage: standardize(t)
```

(continues on next page)

(continued from previous page)

```
[[1, 3, 5, 6], [2, 4, 7], [8]]
sage: t = Tableau([[3,8,9,15],[5,10,12],[133]])
sage: standardize(t)
[[1, 3, 4, 7], [2, 5, 6], [8]]
```

```
>>> from sage.all import *
>>> from sage.combinat.chas.fsym import standardize
>>> t = Tableau([[Integer(1),Integer(3),Integer(5),Integer(7)],[Integer(2),
...Integer(4),Integer(8)],[Integer(9)]])
>>> standardize(t)
[[1, 3, 5, 6], [2, 4, 7], [8]]
>>> t = Tableau([[Integer(3),Integer(8),Integer(9),Integer(15)],[Integer(5),
...Integer(10),Integer(12)],[Integer(133)]])
>>> standardize(t)
[[1, 3, 4, 7], [2, 5, 6], [8]]
```

class sage.combinat.chas.wqsym.**WQSymBases**(*base*, *graded*)

Bases: Category_realization_of_parent

The category of bases of $WQSym$.

class ElementMethods

Bases: object

algebraic_complement()

Return the image of the element `self` of $WQSym$ under the algebraic complement involution.

If $u = (u_1, u_2, \ldots, u_n)$ is a packed word that contains the letters $1, 2, \ldots, k$ and no others, then the *complement* of u is defined to be the packed word $\overline{u} := (k+1-u_1, k+1-u_2, \ldots, k+1-u_n)$.

The algebraic complement involution is defined as the linear map $WQSym \to WQSym$ that sends each basis element $\mathbf{M}_u$ of the monomial basis of $WQSym$ to the basis element $\mathbf{M}_{\overline{u}}$. This is a graded algebra automorphism and a coalgebra anti-automorphism of $WQSym$. Denoting by $\overline{f}$ the image of an element $f \in WQSym$ under the algebraic complement involution, it can be shown that every packed word u satisfies

$$\overline{\mathbf{M}_u} = \mathbf{M}_{\overline{u}}, \qquad \overline{X_u} = X_{\overline{u}},$$

where standard notations for classical bases of $WQSym$ are being used (that is, $\mathbf{M}$ for the monomial basis, and X for the characteristic basis).

This can be restated in terms of ordered set partitions: For any ordered set partition $R = (R_1, R_2, \ldots, R_k)$, let R^r denote the ordered set partition $(R_k, R_{k-1}, \ldots, R_1)$; this is known as the *reversal* of R. Then,

$$\overline{\mathbf{M}_A} = \mathbf{M}_{A^r}, \qquad \overline{X_A} = X_{A^r}$$

for any ordered set partition A.

The formula describing algebraic complements on the Q basis (*WordQuasiSymmetricFunctions.StronglyCoarser*) is more complicated, and requires some definitions. We define a partial order $\leq$ on the set of all ordered set partitions as follows: $A \leq B$ if and only if A is strongly finer than B (see *is_strongly_finer()* for a definition of this). The *length* $\ell(R)$ of an ordered set partition R shall be defined as the number of parts of R. Use the notation Q for the Q basis. For any ordered set partition A of $[n]$, we have

$$\overline{Q_A} = \sum_P c_{A,P} Q_P,$$

where the sum is over all ordered set partitions P of $[n]$, and where the coefficient $c_{A,P}$ is defined as follows:

- If there exists an ordered set partition R satisfying $R \leq P$ and $A \leq R^r$, then this R is unique, and $c_{A,P} = (-1)^{\ell(R)-\ell(P)}$.
- If there exists no such R, then $c_{A,P} = 0$.

The formula describing algebraic complements on the Φ basis (*WordQuasiSymmetricFunctions.StronglyFiner*) is identical to the above formula for the Q basis, except that the $\leq$ sign has to be replaced by $\geq$ in the definition of the coefficients $c_{A,P}$. In fact, both formulas are particular cases of a general formula for involutions: Assume that V is an (additive) abelian group, and that I is a poset. For each $i \in I$, let M_i be an element of V. Also, let ω be an involution of the set I (not necessarily order-preserving or order-reversing), and let ω' be an involutive group endomorphism of V such that each $i \in I$ satisfies $\omega'(M_i) = M_{\omega(i)}$. For each $i \in I$, let $F_i = \sum_{j \geq i} M_j$, where we assume that the sum is finite. Then, each $i \in I$ satisfies

$$\omega'(F_i) = \sum_j \sum_{\substack{k \leq j; \\ \omega(k) \geq i}} \mu(k,j) F_j,$$

where μ denotes the Möbius function. This formula becomes particularly useful when the k satisfying $k \leq j$ and $\omega(k) \geq i$ is unique (if it exists). In our situation, V is $WQSym$, and I is the set of ordered set partitions equipped either with the $\leq$ partial order defined above or with its opposite order. The M_i is the $\mathbf{M}_A$, whereas the F_i is either Q_i or Φ_i.

If we denote the star involution (*star_involution()*) of the quasisymmetric functions by $f \mapsto f^*$, and if we let π be the canonical projection $WQSym \to QSym$, then each $f \in WQSym$ satisfies $\pi(\overline{f}) = (\pi(f))^*$.

coalgebraic_complement(), *star_involution()*

EXAMPLES:

Recall that the index set for the bases of $WQSym$ is given by ordered set partitions, not packed words. Translated into the language of ordered set partitions, the algebraic complement involution acts on the Monomial basis by reversing the ordered set partition. In other words, we have

$$\overline{\mathbf{M}_{(P_1,P_2,\ldots,P_k)}} = \mathbf{M}_{(P_k,P_{k-1},\ldots,P_1)}$$

for any standard ordered set partition $(P_1, P_2, \ldots, P_k)$. Let us check this in practice:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: M = WQSym.M()
sage: M[[1,3],[2]].algebraic_complement()
M[{2}, {1, 3}]
```

```

The algebraic complement involution intertwines the antipode and the inverse of the antipode:

```
sage: all( M(I).antipode().algebraic_complement().antipode()  # long time
....:      == M(I).algebraic_complement()
....:      for I in OrderedSetPartitions(4) )
True
```

```
>>> from sage.all import *
>>> all( M(I).antipode().algebraic_complement().antipode()  # long time
...      == M(I).algebraic_complement()
...      for I in OrderedSetPartitions(Integer(4)) )
True
```

Testing the $\pi(\overline{f}) = (\pi(f))^*$ relation:

```
sage: all( M[I].algebraic_complement().to_quasisymmetric_function()
....:      == M[I].to_quasisymmetric_function().star_involution()
....:      for I in OrderedSetPartitions(4) )
True
```

```
>>> from sage.all import *
>>> all( M[I].algebraic_complement().to_quasisymmetric_function()
...      == M[I].to_quasisymmetric_function().star_involution()
...      for I in OrderedSetPartitions(Integer(4)) )
True
```

Todo

Check further commutative squares.

coalgebraic_complement()

Return the image of the element `self` of $WQSym$ under the coalgebraic complement involution.

If $u = (u_1, u_2, \ldots, u_n)$ is a packed word, then the *reversal* of u is defined to be the packed word $(u_n, u_{n-1}, \ldots, u_1)$. This reversal is denoted by u^r.

The coalgebraic complement involution is defined as the linear map $WQSym \to WQSym$ that sends each basis element $\mathbf{M}_u$ of the monomial basis of $WQSym$ to the basis element $\mathbf{M}_{u^r}$. This is a graded coalgebra automorphism and an algebra anti-automorphism of $WQSym$. Denoting by f^r the image of an element $f \in WQSym$ under the coalgebraic complement involution, it can be shown that every packed word u satisfies

$$(\mathbf{M}_u)^r = \mathbf{M}_{u^r}, \qquad (X_u)^r = X_{u^r},$$

where standard notations for classical bases of $WQSym$ are being used (that is, $\mathbf{M}$ for the monomial basis, and X for the characteristic basis).

This can be restated in terms of ordered set partitions: For any ordered set partition R of $[n]$, let $\overline{R}$ denote the complement of R (defined in *complement()*). Then,

$$(\mathbf{M}_A)^r = \mathbf{M}_{\overline{A}}, \qquad (X_A)^r = X_{\overline{A}}$$

for any ordered set partition A.

Recall that $WQSym$ is a subring of the ring of all bounded-degree noncommutative power series in countably many indeterminates. The latter ring has an obvious continuous algebra anti-endomorphism which sends each letter x_i to x_i (and thus sends each monomial $x_{i_1} x_{i_2} \cdots x_{i_n}$ to $x_{i_n} x_{i_{n-1}} \cdots x_{i_1}$). This anti-endomorphism is actually an involution. The coalgebraic complement involution is simply the restriction of this involution to the subring $WQSym$.

The formula describing coalgebraic complements on the Q basis (*WordQuasiSymmetricFunctions.StronglyCoarser*) is more complicated, and requires some definitions. We define a partial order $\leq$

on the set of all ordered set partitions as follows: $A \leq B$ if and only if A is strongly finer than B (see *is_strongly_finer()* for a definition of this). The *length* $\ell(R)$ of an ordered set partition R shall be defined as the number of parts of R. Use the notation Q for the Q basis. For any ordered set partition A of $[n]$, we have

$$(Q_A)^r = \sum_P c_{A,P} Q_P,$$

where the sum is over all ordered set partitions P of $[n]$, and where the coefficient $c_{A,P}$ is defined as follows:

- If there exists an ordered set partition R satisfying $R \leq P$ and $A \leq \overline{R}$, then this R is unique, and $c_{A,P} = (-1)^{\ell(R)-\ell(P)}$.
- If there exists no such R, then $c_{A,P} = 0$.

The formula describing coalgebraic complements on the Φ basis (*WordQuasiSymmetricFunctions.StronglyFiner*) is identical to the above formula for the Q basis, except that the $\leq$ sign has to be replaced by $\geq$ in the definition of the coefficients $c_{A,P}$. In fact, both formulas are particular cases of the general formula for involutions described in the documentation of *algebraic_complement()*.

If we let π be the canonical projection $WQSym \to QSym$, then each $f \in WQSym$ satisfies $\pi(f^r) = \pi(f)$.

True
```

Todo

Check further commutative squares.

star_involution()

Return the image of the element `self` of $WQSym$ under the star involution.

The star involution is the composition of the algebraic complement involution (*algebraic_complement()*) with the coalgebraic complement involution (*coalgebraic_complement()*). The composition can be performed in either order, as the involutions commute.

The star involution is a graded Hopf algebra anti-automorphism of $WQSym$. Let f^* denote the image of an element $f \in WQSym$ under the star involution. Let $\mathbf{M}$, X, Q and Φ stand for the monomial, characteristic, Q and Phi bases of $WQSym$. For any ordered set partition A of $[n]$, we let A^* denote the complement (*complement()*) of the reversal (*reversed()*) of A. Then, for any ordered set partition A of $[n]$, we have

$$(\mathbf{M}_A)^* = \mathbf{M}_{A^*}, \qquad (X_A)^* = X_{A^*}, \qquad (Q_A)^* = Q_{A^*}, \qquad (\Phi_A)^* = \Phi_{A^*}.$$

The star involution (*star_involution()*) on the ring of noncommutative symmetric functions is a restriction of the star involution on $WQSym$.

If we denote the star involution (*star_involution()*) of the quasisymmetric functions by $f \mapsto f^*$, and if we let π be the canonical projection $WQSym \to QSym$, then each $f \in WQSym$ satisfies $\pi(f^*) = (\pi(f))^*$.

Todo

More commutative diagrams? FQSym and FSym need their own star_involution methods defined first.

algebraic_complement(), *coalgebraic_complement()*

EXAMPLES:

Keep in mind that the default input method for basis keys of $WQSym$ is by entering an ordered set partition, not a packed word. Let us check the basis formulas for the star involution:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: M = WQSym.M()
sage: M[[1,3], [2,4,5]].star_involution()
M[{1, 2, 4}, {3, 5}]
sage: M[[1,3],[2]].star_involution()
M[{2}, {1, 3}]
sage: M[[1,4],[2,5],[3,6]].star_involution()
M[{1, 4}, {2, 5}, {3, 6}]
sage: (3*M[[1]] - 4*M[[]] + 5*M[[1],[2]]).star_involution()
-4*M[] + 3*M[{1}] + 5*M[{1}, {2}]
sage: X = WQSym.X()
sage: X[[1,3],[2]].star_involution()
X[{2}, {1, 3}]
sage: C = WQSym.C()
sage: C[[1,3],[2]].star_involution()
-C[{1, 2, 3}] - C[{1, 3}, {2}] + C[{2}, {1, 3}]
sage: Q = WQSym.Q()
sage: Q[[1,3], [2,4,5]].star_involution()
Q[{1, 2, 4}, {3, 5}]
sage: Phi = WQSym.Phi()
sage: Phi[[1,3], [2,4,5]].star_involution()
Phi[{1, 2, 4}, {3, 5}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> M = WQSym.M()
>>> M[[Integer(1),Integer(3)], [Integer(2),Integer(4),Integer(5)]].star_
↪involution()
M[{1, 2, 4}, {3, 5}]
>>> M[[Integer(1),Integer(3)],[Integer(2)]].star_involution()
M[{2}, {1, 3}]
>>> M[[Integer(1),Integer(4)],[Integer(2),Integer(5)],[Integer(3),
↪Integer(6)]].star_involution()
M[{1, 4}, {2, 5}, {3, 6}]
>>> (Integer(3)*M[[Integer(1)]] - Integer(4)*M[[]] +␣
↪Integer(5)*M[[Integer(1)],[Integer(2)]]).star_involution()
-4*M[] + 3*M[{1}] + 5*M[{1}, {2}]
>>> X = WQSym.X()
>>> X[[Integer(1),Integer(3)],[Integer(2)]].star_involution()
X[{2}, {1, 3}]
>>> C = WQSym.C()
>>> C[[Integer(1),Integer(3)],[Integer(2)]].star_involution()
-C[{1, 2, 3}] - C[{1, 3}, {2}] + C[{2}, {1, 3}]
>>> Q = WQSym.Q()
>>> Q[[Integer(1),Integer(3)], [Integer(2),Integer(4),Integer(5)]].star_
↪involution()
Q[{1, 2, 4}, {3, 5}]
>>> Phi = WQSym.Phi()
>>> Phi[[Integer(1),Integer(3)], [Integer(2),Integer(4),Integer(5)]].star_
↪involution()
Phi[{1, 2, 4}, {3, 5}]
```

Testing the formulas for $(Q_A)^*$ and $(\Phi_A)^*$:

```
sage: all(Q[A].star_involution() == Q[A.complement().reversed()] for A in␣
↪OrderedSetPartitions(4))
True
sage: all(Phi[A].star_involution() == Phi[A.complement().reversed()] for␣
↪A in OrderedSetPartitions(4))
True
```

```
>>> from sage.all import *
>>> all(Q[A].star_involution() == Q[A.complement().reversed()] for A in␣
↪OrderedSetPartitions(Integer(4)))
True
>>> all(Phi[A].star_involution() == Phi[A.complement().reversed()] for A␣
↪in OrderedSetPartitions(Integer(4)))
True
```

The star involution commutes with the antipode:

```
sage: all( M(I).antipode().star_involution()  # long time
....:      == M(I).star_involution().antipode()
....:      for I in OrderedSetPartitions(4) )
True
```

```
>>> from sage.all import *
>>> all( M(I).antipode().star_involution()  # long time
...      == M(I).star_involution().antipode()
...      for I in OrderedSetPartitions(Integer(4)) )
True
```

Testing the $\pi(f^*) = (\pi(f))^*$ relation:

```
sage: all( M[I].star_involution().to_quasisymmetric_function()
....:      == M[I].to_quasisymmetric_function().star_involution()
....:      for I in OrderedSetPartitions(4) )
True
```

```
>>> from sage.all import *
>>> all( M[I].star_involution().to_quasisymmetric_function()
...      == M[I].to_quasisymmetric_function().star_involution()
...      for I in OrderedSetPartitions(Integer(4)) )
True
```

Testing the fact that the star involution on the noncommutative symmetric functions is a restriction of the star involution on $WQSym$:

```
sage: NCSF = NonCommutativeSymmetricFunctions(QQ)
sage: R = NCSF.R()
sage: all(R[I].star_involution().to_fqsym().to_wqsym()
....:     == R[I].to_fqsym().to_wqsym().star_involution()
....:     for I in Compositions(4))
True
```

```
>>> from sage.all import *
>>> NCSF = NonCommutativeSymmetricFunctions(QQ)
>>> R = NCSF.R()
>>> all(R[I].star_involution().to_fqsym().to_wqsym()
...     == R[I].to_fqsym().to_wqsym().star_involution()
...     for I in Compositions(Integer(4)))
True
```

Todo

Check further commutative squares.

to_quasisymmetric_function()

The projection of `self` to the ring $QSym$ of quasisymmetric functions.

There is a canonical projection $\pi : WQSym \to QSym$ that sends every element $\mathbf{M}_P$ of the monomial basis of $WQSym$ to the monomial quasisymmetric function M_c, where c is the composition whose parts are the sizes of the blocks of P. This π is a ring homomorphism.

OUTPUT: an element of the quasisymmetric functions in the monomial basis

EXAMPLES:

```
sage: M = algebras.WQSym(QQ).M()
sage: M[[1,3],[2]].to_quasisymmetric_function()
M[2, 1]
sage: (M[[1,3],[2]] + 3*M[[2,3],[1]] - M[[1,2,3],]).to_quasisymmetric_
↪function()
4*M[2, 1] - M[3]
sage: X, Y = M[[1,3],[2]], M[[1,2,3],]
sage: X.to_quasisymmetric_function() * Y.to_quasisymmetric_function() ==␣
↪(X*Y).to_quasisymmetric_function()
True

sage: C = algebras.WQSym(QQ).C()
sage: C[[2,3],[1,4]].to_quasisymmetric_function() == M(C[[2,3],[1,4]]).to_
↪quasisymmetric_function()
True

sage: C2 = algebras.WQSym(GF(2)).C()
sage: C2[[1,2],[3,4]].to_quasisymmetric_function()

>>> C2[[Integer(2),Integer(3)],[Integer(1),Integer(4)]].to_quasisymmetric_
↪function()
M[4]
```

class ParentMethods

Bases: object

degree_on_basis(*t*)

Return the degree of an ordered set partition in the algebra of word quasi-symmetric functions.

This is the sum of the sizes of the blocks of the ordered set partition.

EXAMPLES:

```
sage: A = algebras.WQSym(QQ).M()
sage: u = OrderedSetPartition([[2,1],])
sage: A.degree_on_basis(u)
2
sage: u = OrderedSetPartition([[2], [1]])
sage: A.degree_on_basis(u)
2
```

```
>>> from sage.all import *
>>> A = algebras.WQSym(QQ).M()
>>> u = OrderedSetPartition([[Integer(2),Integer(1)],])
>>> A.degree_on_basis(u)
2
>>> u = OrderedSetPartition([[Integer(2)], [Integer(1)]])
>>> A.degree_on_basis(u)
2
```

is_field(*proof=True*)

Return whether `self` is a field.

EXAMPLES:

```
sage: M = algebras.WQSym(QQ).M()
sage: M.is_field()
False
```

```
>>> from sage.all import *
>>> M = algebras.WQSym(QQ).M()
>>> M.is_field()
False
```

one_basis()

Return the index of the unit.

EXAMPLES:

```
sage: A = algebras.WQSym(QQ).M()
sage: A.one_basis()
[]
```

```
>>> from sage.all import *
>>> A = algebras.WQSym(QQ).M()
>>> A.one_basis()
[]
```

super_categories()

The super categories of `self`.

EXAMPLES:

```
sage: from sage.combinat.chas.wqsym import WQSymBases
sage: WQSym = algebras.WQSym(ZZ)
sage: bases = WQSymBases(WQSym, True)
sage: bases.super_categories()
[Category of realizations of Word Quasi-symmetric functions over Integer Ring,
 Join of Category of realizations of Hopf algebras over Integer Ring
     and Category of graded algebras over Integer Ring
     and Category of graded coalgebras over Integer Ring,
 Category of graded connected Hopf algebras with basis over Integer Ring]

sage: bases = WQSymBases(WQSym, False)
sage: bases.super_categories()
[Category of realizations of Word Quasi-symmetric functions over Integer Ring,
 Join of Category of realizations of Hopf algebras over Integer Ring
     and Category of graded algebras over Integer Ring
     and Category of graded coalgebras over Integer Ring,
 Join of Category of filtered connected Hopf algebras with basis over Integer␣
↪Ring
     and Category of graded algebras over Integer Ring
     and Category of graded coalgebras over Integer Ring]
```

```
>>> from sage.all import *
>>> from sage.combinat.chas.wqsym import WQSymBases
>>> WQSym = algebras.WQSym(ZZ)
>>> bases = WQSymBases(WQSym, True)
```

(continues on next page)

(continued from previous page)

```
>>> bases.super_categories()

↪Ring
     and Category of graded algebras over Integer Ring
     and Category of graded coalgebras over Integer Ring]
```

class sage.combinat.chas.wqsym.**WQSymBasis_abstract**(*alg*, *graded=True*)

Bases: *CombinatorialFreeModule*, BindableClass

Abstract base class for bases of $WQSym$.

This must define two attributes:

- `_prefix` – the basis prefix
- `_basis_name` – the name of the basis (must match one of the names that the basis can be constructed from $WQSym$)

options = Current options for WordQuasiSymmetricFunctions element - display: normal - objects: compositions

some_elements()

Return some elements of the word quasi-symmetric functions.

EXAMPLES:

```
sage: M = algebras.WQSym(QQ).M()
sage: M.some_elements()
[M[], M[{1}], M[{1, 2}],
 M[{1}] + M[{1}, {2}],
 M[] + 1/2*M[{1}]]
```

```
>>> from sage.all import *
>>> M = algebras.WQSym(QQ).M()
>>> M.some_elements()
[M[], M[{1}], M[{1, 2}],
 M[{1}] + M[{1}, {2}],
 M[] + 1/2*M[{1}]]
```

class sage.combinat.chas.wqsym.**WordQuasiSymmetricFunctions**(*R*)

Bases: UniqueRepresentation, Parent

The word quasi-symmetric functions.

The ring of word quasi-symmetric functions can be defined as a subring of the ring of all bounded-degree noncommutative power series in countably many indeterminates (i.e., elements in $R\langle\langle x_1, x_2, x_3, \ldots\rangle\rangle$ of bounded degree). Namely, consider words over the alphabet $\{1, 2, 3, \ldots\}$; every noncommutative power series is an infinite R-linear combination of these words. For each such word w, we define the *packing* of w to be the word $\mathrm{pack}(w)$ that is obtained from w by replacing the smallest letter that appears in w by 1, the second-smallest letter that appears in w by 2, etc. (for example, $\mathrm{pack}(4112774) = 3112443$). A word w is said to be *packed* if $\mathrm{pack}(w) = w$. For each packed word u, we define the noncommutative power series $\mathbf{M}_u = \sum w$, where the sum ranges over all words w satisfying $\mathrm{pack}(w) = u$. The span of these power series $\mathbf{M}_u$ is a subring of the ring of all noncommutative power series; it is called the ring of word quasi-symmetric functions, and is denoted by $WQSym$.

For each nonnegative integer n, there is a bijection between packed words of length n and ordered set partitions of $\{1, 2, \ldots, n\}$. Under this bijection, a packed word $u = (u_1, u_2, \ldots, u_n)$ of length n corresponds to the ordered set partition $P = (P_1, P_2, \ldots, P_k)$ of $\{1, 2, \ldots, n\}$ whose i-th part P_i (for each i) is the set of all $j \in \{1, 2, \ldots, n\}$ such that $u_j = i$.

The basis element $\mathbf{M}_u$ is also denoted as $\mathbf{M}_P$ in this situation. The basis $(\mathbf{M}_P)_P$ is called the *Monomial basis* and is implemented as `Monomial`.

Other bases are the cone basis (aka C basis), the characteristic basis (aka X basis), the Q basis and the Phi basis.

Bases of $WQSym$ are implemented (internally) using ordered set partitions. However, the user may access specific basis vectors using either packed words or ordered set partitions. See the examples below, noting especially the section on ambiguities.

$WQSym$ is endowed with a connected graded Hopf algebra structure (see Section 2.2 of [NoThWi08], Section 1.1 of [FoiMal14] and Section 4.3.2 of [MeNoTh11]) given by

$$\Delta(\mathbf{M}_{(P_1,\ldots,P_\ell)}) = \sum_{i=0}^{\ell} \mathbf{M}_{\mathrm{st}(P_1,\ldots,P_i)} \otimes \mathbf{M}_{\mathrm{st}(P_{i+1},\ldots,P_\ell)}.$$

Here, for any ordered set partition $(Q_1, \ldots, Q_k)$ of a finite set Z of integers, we let $\mathrm{st}(Q_1, \ldots, Q_k)$ denote the set partition obtained from Z by replacing the smallest element appearing in it by 1, the second-smallest element by 2, and so on.

A rule for multiplying elements of the monomial basis relies on the *quasi-shuffle product* of two ordered set partitions. The quasi-shuffle product $\square$ is given by `ShuffleProduct_overlapping` with the $+$ operation in the overlapping of the shuffles being the union of the sets. The product $\mathbf{M}_P\mathbf{M}_Q$ for two ordered set partitions P and Q of $[n]$ and $[m]$ is then given by

$$\mathbf{M}_P\mathbf{M}_Q = \sum_{R \in P \square Q^+} \mathbf{M}_R,$$

where Q^+ means Q with all numbers shifted upwards by n.

Sometimes, $WQSym$ is also denoted as $NCQSym$.

REFERENCES:

- [FoiMal14]
- [MeNoTh11]
- [NoThWi08]
- [BerZab05]

EXAMPLES:

Constructing the algebra and its Monomial basis:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: WQSym
Word Quasi-symmetric functions over Integer Ring
sage: M = WQSym.M()
sage: M
Word Quasi-symmetric functions over Integer Ring in the Monomial basis
sage: M[[]]
M[]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> WQSym
Word Quasi-symmetric functions over Integer Ring
>>> M = WQSym.M()
>>> M
Word Quasi-symmetric functions over Integer Ring in the Monomial basis
>>> M[[]]
M[]
```

Calling basis elements using packed words:

```
sage: x = M[1,2,1]; x
M[{1, 3}, {2}]
sage: x == M[[1,2,1]] == M[Word([1,2,1])]
True
sage: y = M[1,1,2] - M[1,2,2]; y
-M[{1}, {2, 3}] + M[{1, 2}, {3}]
```

```
>>> from sage.all import *
>>> x = M[Integer(1),Integer(2),Integer(1)]; x
M[{1, 3}, {2}]
>>> x == M[[Integer(1),Integer(2),Integer(1)]] == M[Word([Integer(1),Integer(2),
↪Integer(1)])]
True
>>> y = M[Integer(1),Integer(1),Integer(2)] - M[Integer(1),Integer(2),Integer(2)];
↪ y
-M[{1}, {2, 3}] + M[{1, 2}, {3}]
```

Calling basis elements using ordered set partitions:

```
sage: z = M[[1,2,3],]; z
M[{1, 2, 3}]
sage: z == M[[[1,2,3]]] == M[OrderedSetPartition([[1,2,3]])]
True
sage: M[[1,2],[3]]
M[{1, 2}, {3}]
```

```
>>> from sage.all import *
>>> z = M[[Integer(1),Integer(2),Integer(3)],]; z
M[{1, 2, 3}]
>>> z == M[[[Integer(1),Integer(2),Integer(3)]]] ==␣
↪M[OrderedSetPartition([[Integer(1),Integer(2),Integer(3)]])]
```

(continues on next page)

(continued from previous page)

```
True
>>> M[[Integer(1),Integer(2)],[Integer(3)]]
M[{1, 2}, {3}]
```

Note that expressions above are output in terms of ordered set partitions, even when input as packed words. Output as packed words can be achieved by modifying the global options. (See *options* for further details.):

```
sage: M.options.objects = "words"
sage: y
-M[1, 2, 2] + M[1, 1, 2]
sage: M.options.display = "compact"
sage: y
-M[122] + M[112]
sage: z
M[111]
```

```
>>> from sage.all import *
>>> M.options.objects = "words"
>>> y
-M[1, 2, 2] + M[1, 1, 2]
>>> M.options.display = "compact"
>>> y
-M[122] + M[112]
>>> z
M[111]
```

The options should be reset to display as ordered set partitions:

```
sage: M.options._reset()
sage: z
M[{1, 2, 3}]
```

```
>>> from sage.all import *
>>> M.options._reset()
>>> z
M[{1, 2, 3}]
```

Illustration of the Hopf algebra structure:

```
sage: M[[2, 3], [5], [6], [4], [1]].coproduct()
M[] # M[{2, 3}, {5}, {6}, {4}, {1}] + M[{1, 2}] # M[{3}, {4}, {2}, {1}]
 + M[{1, 2}, {3}] # M[{3}, {2}, {1}] + M[{1, 2}, {3}, {4}] # M[{2}, {1}]
 + M[{1, 2}, {4}, {5}, {3}] # M[{1}] + M[{2, 3}, {5}, {6}, {4}, {1}] # M[]
sage: _ == M[5,1,1,4,2,3].coproduct()
True
sage: M[[1,1,1]] * M[[1,1,2]]   # packed words
M[{1, 2, 3}, {4, 5}, {6}] + M[{1, 2, 3, 4, 5}, {6}]
 + M[{4, 5}, {1, 2, 3}, {6}] + M[{4, 5}, {1, 2, 3, 6}]
 + M[{4, 5}, {6}, {1, 2, 3}]
sage: M[[1,2,3],].antipode()  # ordered set partition
-M[{1, 2, 3}]
sage: M[[1], [2], [3]].antipode()
```

(continues on next page)

(continued from previous page)

```
-M[{1, 2, 3}] - M[{2, 3}, {1}] - M[{3}, {1, 2}] - M[{3}, {2}, {1}]
sage: x = M[[1],[2],[3]] + 3*M[[2],[1]]
sage: x.counit()
0
sage: x.antipode()
3*M[{1}, {2}] + 3*M[{1, 2}] - M[{1, 2, 3}] - M[{2, 3}, {1}]
 - M[{3}, {1, 2}] - M[{3}, {2}, {1}]
```

```
>>> from sage.all import *
>>> M[[Integer(2), Integer(3)], [Integer(5)], [Integer(6)], [Integer(4)],␣

M[] # M[{2, 3}, {5}, {6}, {4}, {1}] + M[{1, 2}] # M[{3}, {4}, {2}, {1}]
 + M[{1, 2}, {3}] # M[{3}, {2}, {1}] + M[{1, 2}, {3}, {4}] # M[{2}, {1}]
 + M[{1, 2}, {4}, {5}, {3}] # M[{1}] + M[{2, 3}, {5}, {6}, {4}, {1}] # M[]
>>> _ == M[Integer(5),Integer(1),Integer(1),Integer(4),Integer(2),Integer(3)].
↪coproduct()
True
>>> M[[Integer(1),Integer(1),Integer(1)]] * M[[Integer(1),Integer(1),Integer(2)]]␣
↪  # packed words
M[{1, 2, 3}, {4, 5}, {6}] + M[{1, 2, 3, 4, 5}, {6}]
 + M[{4, 5}, {1, 2, 3}, {6}] + M[{4, 5}, {1, 2, 3, 6}]
 + M[{4, 5}, {6}, {1, 2, 3}]
>>> M[[Integer(1),Integer(2),Integer(3)],].antipode()  # ordered set partition
-M[{1, 2, 3}]
>>> M[[Integer(1)], [Integer(2)], [Integer(3)]].antipode()
-M[{1, 2, 3}] - M[{2, 3}, {1}] - M[{3}, {1, 2}] - M[{3}, {2}, {1}]
>>> x = M[[Integer(1)],[Integer(2)],[Integer(3)]] + Integer(3)*M[[Integer(2)],
↪[Integer(1)]]
>>> x.counit()
0
>>> x.antipode()
3*M[{1}, {2}] + 3*M[{1, 2}] - M[{1, 2, 3}] - M[{2, 3}, {1}]
 - M[{3}, {1, 2}] - M[{3}, {2}, {1}]
```

Ambiguities

Some ambiguity arises when accessing basis vectors with the dictionary syntax, i.e., `M[...]`. A common example is when referencing an ordered set partition with one part. For example, in the expression `M[[1,2]]`, does `[[1, 2]]` refer to an ordered set partition or does `[1,2]` refer to a packed word? We choose the latter: if the received arguments do not behave like a tuple of iterables, then view them as describing a packed word. (In the running example, one argument is received, which behaves as a tuple of integers.) Here are a variety of ways to get the same basis vector:

```
sage: x = M[1,1]; x
M[{1, 2}]
sage: x == M[[1,1]]  # treated as word
True
sage: x == M[[1,2],] == M[[[1,2]]]  # treated as ordered set partitions
True

sage: M[[1,3],[2]]  # treat as ordered set partition
M[{1, 3}, {2}]
```

(continues on next page)

(continued from previous page)

```
sage: M[[1,3],[2]] == M[1,2,1]  # treat as word
True
```

```
>>> from sage.all import *
>>> x = M[Integer(1),Integer(1)]; x
M[{1, 2}]
>>> x == M[[Integer(1),Integer(1)]]  # treated as word
True
>>> x == M[[Integer(1),Integer(2)],] == M[[[Integer(1),Integer(2)]]]  # treated␣
↪as ordered set partitions
True

>>> M[[Integer(1),Integer(3)],[Integer(2)]]  # treat as ordered set partition
M[{1, 3}, {2}]
>>> M[[Integer(1),Integer(3)],[Integer(2)]] == M[Integer(1),Integer(2),
↪Integer(1)]  # treat as word
True
```

Todo

- Dendriform structure.

C

alias of *Cone*

class Characteristic(*alg*)

Bases: *WQSymBasis_abstract*

The Characteristic basis of $WQSym$.

The *Characteristic basis* is a graded basis (X_P) of $WQSym$, indexed by ordered set partitions P. It is defined by

$$X_P = (-1)^{\ell(P)} \mathbf{M}_P,$$

where $(\mathbf{M}_P)_P$ denotes the Monomial basis, and where $\ell(P)$ denotes the number of blocks in an ordered set partition P.

EXAMPLES:

```
sage: WQSym = algebras.WQSym(QQ)
sage: X = WQSym.X(); X
Word Quasi-symmetric functions over Rational Field in the Characteristic basis

sage: X[[[1,2,3]]] * X[[1,2],[3]]
X[{1, 2, 3}, {4, 5}, {6}] - X[{1, 2, 3, 4, 5}, {6}]
 + X[{4, 5}, {1, 2, 3}, {6}] - X[{4, 5}, {1, 2, 3, 6}]
 + X[{4, 5}, {6}, {1, 2, 3}]

sage: X[[1, 4], [3], [2]].coproduct()
X[] # X[{1, 4}, {3}, {2}] + X[{1, 2}] # X[{2}, {1}]
 + X[{1, 3}, {2}] # X[{1}] + X[{1, 4}, {3}, {2}] # X[]
```

(continues on next page)

(continued from previous page)

```
sage: M = WQSym.M()
sage: M(X[[1, 2, 3],])
-M[{1, 2, 3}]
sage: M(X[[1, 3], [2]])
M[{1, 3}, {2}]
sage: X(M[[1, 2, 3],])

```

class Element

Bases: IndexedFreeModuleElement

algebraic_complement()

Return the image of the element `self` of $WQSym$ under the algebraic complement involution.

See *algebraic_complement()* for a definition of the involution and for examples.

See also

coalgebraic_complement(), *star_involution()*

EXAMPLES:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: X = WQSym.X()
```

(continues on next page)

(continued from previous page)

```
sage: X[[1,2],[5,6],[3,4]].algebraic_complement()
X[{3, 4}, {5, 6}, {1, 2}]
sage: X[[3], [1, 2], [4]].algebraic_complement()
X[{4}, {1, 2}, {3}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> X = WQSym.X()
>>> X[[Integer(1),Integer(2)],[Integer(5),Integer(6)],[Integer(3),
↪Integer(4)]].algebraic_complement()
X[{3, 4}, {5, 6}, {1, 2}]
>>> X[[Integer(3)], [Integer(1), Integer(2)], [Integer(4)]].algebraic_
↪complement()
X[{4}, {1, 2}, {3}]
```

coalgebraic_complement()

Return the image of the element `self` of $WQSym$ under the coalgebraic complement involution.

See *coalgebraic_complement()* for a definition of the involution and for examples.

See also

algebraic_complement(), *star_involution()*

EXAMPLES:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: X = WQSym.X()
sage: X[[1,2],[5,6],[3,4]].coalgebraic_complement()
X[{5, 6}, {1, 2}, {3, 4}]
sage: X[[3], [1, 2], [4]].coalgebraic_complement()
X[{2}, {3, 4}, {1}]
```

```
>>> from sage.all import *

↪Integer(4)]].star_involution()
X[{3, 4}, {1, 2}, {5, 6}]
>>> X[[Integer(3)], [Integer(1), Integer(2)], [Integer(4)]].star_
↪involution()
X[{1}, {3, 4}, {2}]
```

class Cone(*alg*)

Bases: *WQSymBasis_abstract*

The Cone basis of $WQSym$.

Let $(X_P)_P$ denote the Characteristic basis of $WQSym$. Denote the quasi-shuffle of two ordered set partitions A and B by $A \square B$. For an ordered set partition $P = (P_1, \ldots, P_\ell)$, we form a list of ordered set partitions $[P] := (P'_1, \ldots, P'_k)$ as follows. Define a strictly decreasing sequence of integers $\ell + 1 = i_0 > i_1 > \cdots > i_k = 1$ recursively by requiring that $\min P_{i_j} \leq \min P_a$ for all $a < i_{j-1}$. Set $P'_j = (P_{i_j}, \ldots, P_{i_{j-1}-1})$.

The *Cone basis* $(C_P)_P$ is defined by

$$C_P = \sum_Q X_Q,$$

where the sum is over all elements Q of the quasi-shuffle product $P'_1 \square P'_2 \square \cdots \square P'_k$ with $[P] = (P'_1, \ldots, P'_k)$.

EXAMPLES:

```
sage: WQSym = algebras.WQSym(QQ)
sage: C = WQSym.C()
sage: C
Word Quasi-symmetric functions over Rational Field in the Cone basis

sage: X = WQSym.X()
sage: X(C[[2,3],[1,4]])
X[{1, 2, 3, 4}] + X[{1, 4}, {2, 3}] + X[{2, 3}, {1, 4}]
sage: X(C[[1,4],[2,3]])
X[{1, 4}, {2, 3}]
sage: X(C[[2,3],[1],[4]])
X[{1}, {2, 3}, {4}] + X[{1}, {2, 3, 4}] + X[{1}, {4}, {2, 3}]
 + X[{1, 2, 3}, {4}] + X[{2, 3}, {1}, {4}]
```

(continues on next page)

(continued from previous page)

```
sage: X(C[[3], [2, 5], [1, 4]])
X[{1, 2, 3, 4, 5}] + X[{1, 2, 4, 5}, {3}] + X[{1, 3, 4}, {2, 5}]
 + X[{1, 4}, {2, 3, 5}] + X[{1, 4}, {2, 5}, {3}]
 + X[{1, 4}, {3}, {2, 5}] + X[{2, 3, 5}, {1, 4}]

Todo

Experiments suggest that *algebraic_complement()*, *coalgebraic_complement()*, and *star_involution()* should have reasonable formulas on the C basis; at least the coefficients of the outputs on any element of the C basis seem to be always $0, 1, -1$. Is this true? What is the formula?

some_elements()

Return some elements of the word quasi-symmetric functions in the Cone basis.

EXAMPLES:

```
sage: C = algebras.WQSym(QQ).C()
sage: C.some_elements()
[C[], C[{1}], C[{1, 2}], C[] + 1/2*C[{1}]]
```

```
>>> from sage.all import *
>>> C = algebras.WQSym(QQ).C()
>>> C.some_elements()
[C[], C[{1}], C[{1, 2}], C[] + 1/2*C[{1}]]
```

M

alias of *Monomial*

class Monomial(*alg*, *graded=True*)

Bases: *WQSymBasis_abstract*

The Monomial basis of $WQSym$.

The family $(\mathbf{M}_u)$, as defined in *WordQuasiSymmetricFunctions* with u ranging over all packed words, is a basis for the free R-module $WQSym$ and called the *Monomial basis*. Here it is labelled using ordered set partitions.

EXAMPLES:

```
sage: WQSym = algebras.WQSym(QQ)
sage: M = WQSym.M(); M
Word Quasi-symmetric functions over Rational Field in the Monomial basis
sage: sorted(M.basis(2))
[M[{1}, {2}], M[{2}, {1}], M[{1, 2}]]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(QQ)
>>> M = WQSym.M(); M
Word Quasi-symmetric functions over Rational Field in the Monomial basis
>>> sorted(M.basis(Integer(2)))
[M[{1}, {2}], M[{2}, {1}], M[{1, 2}]]
```

coproduct_on_basis(*x*)

Return the coproduct of `self` on the basis element indexed by the ordered set partition `x`.

EXAMPLES:

```
sage: M = algebras.WQSym(QQ).M()

sage: M.coproduct(M.one())  # indirect doctest
M[] # M[]
sage: M.coproduct( M([[1]]) )  # indirect doctest
M[] # M[{1}] + M[{1}] # M[]
sage: M.coproduct( M([[1,2]]) )
M[] # M[{1, 2}] + M[{1, 2}] # M[]
sage: M.coproduct( M([[1], [2]]) )
M[] # M[{1}, {2}] + M[{1}] # M[{1}] + M[{1}, {2}] # M[]
```

```
>>> from sage.all import *
>>> M = algebras.WQSym(QQ).M()

>>> M.coproduct(M.one())  # indirect doctest
M[] # M[]
>>> M.coproduct( M([[Integer(1)]]) )  # indirect doctest
```

(continues on next page)

(continued from previous page)

```
M[] # M[{1}] + M[{1}] # M[]
>>> M.coproduct( M([[Integer(1),Integer(2)]]) )
M[] # M[{1, 2}] + M[{1, 2}] # M[]
>>> M.coproduct( M([[Integer(1)], [Integer(2)]]) )
M[] # M[{1}, {2}] + M[{1}] # M[{1}] + M[{1}, {2}] # M[]
```

product_on_basis(*x*, *y*)

Return the (associative) $*$ product of the basis elements of `self` indexed by the ordered set partitions x and y.

This is the shifted quasi-shuffle product of x and y.

EXAMPLES:

```
sage: A = algebras.WQSym(QQ).M()
sage: x = OrderedSetPartition([[1],[2,3]])
sage: y = OrderedSetPartition([[1,2]])
sage: z = OrderedSetPartition([[1,2],[3]])
sage: A.product_on_basis(x, y)
M[{1}, {2, 3}, {4, 5}] + M[{1}, {2, 3, 4, 5}]
 + M[{1}, {4, 5}, {2, 3}] + M[{1, 4, 5}, {2, 3}]
 + M[{4, 5}, {1}, {2, 3}]
sage: A.product_on_basis(x, z)
M[{1}, {2, 3}, {4, 5}, {6}] + M[{1}, {2, 3, 4, 5}, {6}]
 + M[{1}, {4, 5}, {2, 3}, {6}] + M[{1}, {4, 5}, {2, 3, 6}]
 + M[{1}, {4, 5}, {6}, {2, 3}] + M[{1, 4, 5}, {2, 3}, {6}]
 + M[{1, 4, 5}, {2, 3, 6}] + M[{1, 4, 5}, {6}, {2, 3}]
 + M[{4, 5}, {1}, {2, 3}, {6}] + M[{4, 5}, {1}, {2, 3, 6}]
 + M[{4, 5}, {1}, {6}, {2, 3}] + M[{4, 5}, {1, 6}, {2, 3}]
 + M[{4, 5}, {6}, {1}, {2, 3}]
sage: A.product_on_basis(y, y)
M[{1, 2}, {3, 4}] + M[{1, 2, 3, 4}] + M[{3, 4}, {1, 2}]
```

```
>>> from sage.all import *
>>> A = algebras.WQSym(QQ).M()
>>> x = OrderedSetPartition([[Integer(1)],[Integer(2),Integer(3)]])
>>> y = OrderedSetPartition([[Integer(1),Integer(2)]])
>>> z = OrderedSetPartition([[Integer(1),Integer(2)],[Integer(3)]])
>>> A.product_on_basis(x, y)
M[{1}, {2, 3}, {4, 5}] + M[{1}, {2, 3, 4, 5}]
 + M[{1}, {4, 5}, {2, 3}] + M[{1, 4, 5}, {2, 3}]
 + M[{4, 5}, {1}, {2, 3}]
>>> A.product_on_basis(x, z)
M[{1}, {2, 3}, {4, 5}, {6}] + M[{1}, {2, 3, 4, 5}, {6}]
 + M[{1}, {4, 5}, {2, 3}, {6}] + M[{1}, {4, 5}, {2, 3, 6}]
 + M[{1}, {4, 5}, {6}, {2, 3}] + M[{1, 4, 5}, {2, 3}, {6}]
 + M[{1, 4, 5}, {2, 3, 6}] + M[{1, 4, 5}, {6}, {2, 3}]
 + M[{4, 5}, {1}, {2, 3}, {6}] + M[{4, 5}, {1}, {2, 3, 6}]
 + M[{4, 5}, {1}, {6}, {2, 3}] + M[{4, 5}, {1, 6}, {2, 3}]
 + M[{4, 5}, {6}, {1}, {2, 3}]
>>> A.product_on_basis(y, y)
M[{1, 2}, {3, 4}] + M[{1, 2, 3, 4}] + M[{3, 4}, {1, 2}]
```

Phi

alias of *StronglyFiner*

Q

alias of *StronglyCoarser*

class StronglyCoarser(*alg*)

Bases: *WQSymBasis_abstract*

The Q basis of $WQSym$.

We define a partial order $\leq$ on the set of all ordered set partitions as follows: $A \leq B$ if and only if A is strongly finer than B (see *is_strongly_finer()* for a definition of this).

The *Q basis* $(Q_P)_P$ is a basis of $WQSym$ indexed by ordered set partitions, and is defined by

$$Q_P = \sum \mathbf{M}_W,$$

where the sum is over ordered set partitions W satisfying $P \leq W$.

EXAMPLES:

```
sage: WQSym = algebras.WQSym(QQ)
sage: M = WQSym.M(); Q = WQSym.Q()
sage: Q
Word Quasi-symmetric functions over Rational Field in the Q basis

sage: Q(M[[2,3],[1,4]])
Q[{2, 3}, {1, 4}]
sage: Q(M[[1,2],[3,4]])
Q[{1, 2}, {3, 4}] - Q[{1, 2, 3, 4}]
sage: M(Q[[1,2],[3,4]])
M[{1, 2}, {3, 4}] + M[{1, 2, 3, 4}]
sage: M(Q[[2,3],[1],[4]])
M[{2, 3}, {1}, {4}] + M[{2, 3}, {1, 4}]
sage: M(Q[[3], [2, 5], [1, 4]])

class Element

Bases: IndexedFreeModuleElement

algebraic_complement()

Return the image of the element `self` of $WQSym$ under the algebraic complement involution.

See *algebraic_complement()* for a definition of the involution and for examples.

See also

coalgebraic_complement(), *star_involution()*

EXAMPLES:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: Q = WQSym.Q()
sage: Q[[1,2],[5,6],[3,4]].algebraic_complement()
Q[{3, 4}, {1, 2, 5, 6}] + Q[{3, 4}, {5, 6}, {1, 2}]
 - Q[{3, 4, 5, 6}, {1, 2}]
sage: Q[[3], [1, 2], [4]].algebraic_complement()
Q[{1, 2, 4}, {3}] + Q[{4}, {1, 2}, {3}] - Q[{4}, {1, 2, 3}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> Q = WQSym.Q()
>>> Q[[Integer(1),Integer(2)],[Integer(5),Integer(6)],[Integer(3),
↪Integer(4)]].algebraic_complement()
```

(continues on next page)

(continued from previous page)

```
Q[{3, 4}, {1, 2, 5, 6}] + Q[{3, 4}, {5, 6}, {1, 2}]
 - Q[{3, 4, 5, 6}, {1, 2}]
>>> Q[[Integer(3)], [Integer(1), Integer(2)], [Integer(4)]].algebraic_
↪complement()
Q[{1, 2, 4}, {3}] + Q[{4}, {1, 2}, {3}] - Q[{4}, {1, 2, 3}]
```

coalgebraic_complement()

Return the image of the element `self` of $WQSym$ under the coalgebraic complement involution.

See *coalgebraic_complement()* for a definition of the involution and for examples.

See also

algebraic_complement(), *star_involution()*

EXAMPLES:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: Q = WQSym.Q()
sage: Q[[1,2],[5,6],[3,4]].coalgebraic_complement()
Q[{1, 2, 5, 6}, {3, 4}] + Q[{5, 6}, {1, 2}, {3, 4}] - Q[{5, 6}, {1, 2,␣
↪3, 4}]
sage: Q[[3], [1, 2], [4]].coalgebraic_complement()
Q[{2}, {1, 3, 4}] + Q[{2}, {3, 4}, {1}] - Q[{2, 3, 4}, {1}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
>>> Q = WQSym.Q()
>>> Q[[Integer(1),Integer(2)],[Integer(5),Integer(6)],[Integer(3),
↪Integer(4)]].coalgebraic_complement()
Q[{1, 2, 5, 6}, {3, 4}] + Q[{5, 6}, {1, 2}, {3, 4}] - Q[{5, 6}, {1, 2,␣
↪3, 4}]
>>> Q[[Integer(3)], [Integer(1), Integer(2)], [Integer(4)]].
↪coalgebraic_complement()
Q[{2}, {1, 3, 4}] + Q[{2}, {3, 4}, {1}] - Q[{2, 3, 4}, {1}]
```

star_involution()

Return the image of the element `self` of $WQSym$ under the star involution.

See *star_involution()* for a definition of the involution and for examples.

See also

algebraic_complement(), *coalgebraic_complement()*

EXAMPLES:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: Q = WQSym.Q()
sage: Q[[1,2],[5,6],[3,4]].star_involution()
Q[{3, 4}, {1, 2}, {5, 6}]
```

↪Integer(4)]].star_involution()
Q[{3, 4}, {1, 2}, {5, 6}]
>>> Q[[Integer(3)], [Integer(1), Integer(2)], [Integer(4)]].star_
↪involution()
Q[{1}, {3, 4}, {2}]
```

coproduct_on_basis(*x*)

Return the coproduct of `self` on the basis element indexed by the ordered set partition `x`.

EXAMPLES:

```
sage: Q = algebras.WQSym(QQ).Q()

sage: Q.coproduct(Q.one())  # indirect doctest
Q[] # Q[]
sage: Q.coproduct( Q([[1]]) )  # indirect doctest
Q[] # Q[{1}] + Q[{1}] # Q[]
sage: Q.coproduct( Q([[1,2]]) )
Q[] # Q[{1, 2}] + Q[{1, 2}] # Q[]
sage: Q.coproduct( Q([[1], [2]]) )
Q[] # Q[{1}, {2}] + Q[{1}] # Q[{1}] + Q[{1}, {2}] # Q[]
sage: Q[[1,2],[3],[4]].coproduct()
Q[] # Q[{1, 2}, {3}, {4}] + Q[{1, 2}] # Q[{1}, {2}]
 + Q[{1, 2}, {3}] # Q[{1}] + Q[{1, 2}, {3}, {4}] # Q[]
```

```
>>> from sage.all import *
>>> Q = algebras.WQSym(QQ).Q()

>>> Q.coproduct(Q.one())  # indirect doctest
Q[] # Q[]
>>> Q.coproduct( Q([[Integer(1)]]) )  # indirect doctest
Q[] # Q[{1}] + Q[{1}] # Q[]
>>> Q.coproduct( Q([[Integer(1),Integer(2)]]) )
Q[] # Q[{1, 2}] + Q[{1, 2}] # Q[]
>>> Q.coproduct( Q([[Integer(1)], [Integer(2)]]) )
Q[] # Q[{1}, {2}] + Q[{1}] # Q[{1}] + Q[{1}, {2}] # Q[]
>>> Q[[Integer(1),Integer(2)],[Integer(3)],[Integer(4)]].coproduct()
Q[] # Q[{1, 2}, {3}, {4}] + Q[{1, 2}] # Q[{1}, {2}]
 + Q[{1, 2}, {3}] # Q[{1}] + Q[{1, 2}, {3}, {4}] # Q[]
```

product_on_basis(*x*, *y*)

Return the (associative) $*$ product of the basis elements of the Q basis `self` indexed by the ordered set partitions x and y.

This is the shifted shuffle product of x and y.

EXAMPLES:

```
sage: A = algebras.WQSym(QQ).Q()
sage: x = OrderedSetPartition([[1],[2,3]])
sage: y = OrderedSetPartition([[1,2]])
sage: z = OrderedSetPartition([[1,2],[3]])
sage: A.product_on_basis(x, y)
Q[{1}, {2, 3}, {4, 5}] + Q[{1}, {4, 5}, {2, 3}]
 + Q[{4, 5}, {1}, {2, 3}]
sage: A.product_on_basis(x, z)
Q[{1}, {2, 3}, {4, 5}, {6}] + Q[{1}, {4, 5}, {2, 3}, {6}]
 + Q[{1}, {4, 5}, {6}, {2, 3}] + Q[{4, 5}, {1}, {2, 3}, {6}]
 + Q[{4, 5}, {1}, {6}, {2, 3}] + Q[{4, 5}, {6}, {1}, {2, 3}]
sage: A.product_on_basis(y, y)
Q[{1, 2}, {3, 4}] + Q[{3, 4}, {1, 2}]
```

```
>>> from sage.all import *
>>> A = algebras.WQSym(QQ).Q()
>>> x = OrderedSetPartition([[Integer(1)],[Integer(2),Integer(3)]])
>>> y = OrderedSetPartition([[Integer(1),Integer(2)]])
>>> z = OrderedSetPartition([[Integer(1),Integer(2)],[Integer(3)]])
>>> A.product_on_basis(x, y)
Q[{1}, {2, 3}, {4, 5}] + Q[{1}, {4, 5}, {2, 3}]
 + Q[{4, 5}, {1}, {2, 3}]
>>> A.product_on_basis(x, z)
Q[{1}, {2, 3}, {4, 5}, {6}] + Q[{1}, {4, 5}, {2, 3}, {6}]
 + Q[{1}, {4, 5}, {6}, {2, 3}] + Q[{4, 5}, {1}, {2, 3}, {6}]
 + Q[{4, 5}, {1}, {6}, {2, 3}] + Q[{4, 5}, {6}, {1}, {2, 3}]
>>> A.product_on_basis(y, y)
Q[{1, 2}, {3, 4}] + Q[{3, 4}, {1, 2}]
```

some_elements()

Return some elements of the word quasi-symmetric functions in the Q basis.

EXAMPLES:

```
sage: Q = algebras.WQSym(QQ).Q()
sage: Q.some_elements()
[Q[], Q[{1}], Q[{1, 2}], Q[] + 1/2*Q[{1}]]
```

```
>>> from sage.all import *
>>> Q = algebras.WQSym(QQ).Q()
>>> Q.some_elements()
[Q[], Q[{1}], Q[{1, 2}], Q[] + 1/2*Q[{1}]]
```

class StronglyFiner(*alg*)

Bases: *WQSymBasis_abstract*

The Phi basis of $WQSym$.

We define a partial order $\leq$ on the set of all ordered set partitions as follows: $A \leq B$ if and only if A is strongly finer than B (see *is_strongly_finer()* for a definition of this).

The *Phi basis* $(\Phi_P)_P$ is a basis of $WQSym$ indexed by ordered set partitions, and is defined by

$$\Phi_P = \sum \mathbf{M}_W,$$

where the sum is over ordered set partitions W satisfying $W \leq P$.

Novelli and Thibon introduced this basis in [NovThi06] Section 2.7.2, and called it the quasi-ribbon basis. It later reappeared in [MeNoTh11] Section 4.3.2.

EXAMPLES:

```
sage: WQSym = algebras.WQSym(QQ)
sage: M = WQSym.M(); Phi = WQSym.Phi()
sage: Phi
Word Quasi-symmetric functions over Rational Field in the Phi basis

sage: Phi(M[[2,3],[1,4]])
Phi[{2}, {3}, {1}, {4}] - Phi[{2}, {3}, {1, 4}]
 - Phi[{2, 3}, {1}, {4}] + Phi[{2, 3}, {1, 4}]
sage: Phi(M[[1,2],[3,4]])
Phi[{1}, {2}, {3}, {4}] - Phi[{1}, {2}, {3, 4}]
 - Phi[{1, 2}, {3}, {4}] + Phi[{1, 2}, {3, 4}]
sage: M(Phi[[1,2],[3,4]])
M[{1}, {2}, {3}, {4}] + M[{1}, {2}, {3, 4}]
 + M[{1, 2}, {3}, {4}] + M[{1, 2}, {3, 4}]
sage: M(Phi[[2,3],[1],[4]])
M[{2}, {3}, {1}, {4}] + M[{2, 3}, {1}, {4}]
sage: M(Phi[[3], [2, 5], [1, 4]])
M[{3}, {2}, {5}, {1}, {4}] + M[{3}, {2}, {5}, {1, 4}]
 + M[{3}, {2, 5}, {1}, {4}] + M[{3}, {2, 5}, {1, 4}]
sage: M(Phi[[1, 4], [2, 3], [5], [6]])
M[{1}, {4}, {2}, {3}, {5}, {6}] + M[{1}, {4}, {2, 3}, {5}, {6}]
 + M[{1, 4}, {2}, {3}, {5}, {6}] + M[{1, 4}, {2, 3}, {5}, {6}]

sage: Phi[[1],] * Phi[[1, 3], [2]]
Phi[{1, 2, 4}, {3}] + Phi[{2}, {1, 4}, {3}]
 + Phi[{2, 4}, {1, 3}] + Phi[{2, 4}, {3}, {1}]
sage: Phi[[3, 5], [1, 4], [2]].coproduct()
Phi[] # Phi[{3, 5}, {1, 4}, {2}]
 + Phi[{1}] # Phi[{4}, {1, 3}, {2}]
 + Phi[{1, 2}] # Phi[{1, 3}, {2}]
 + Phi[{2, 3}, {1}] # Phi[{2}, {1}]
 + Phi[{2, 4}, {1, 3}] # Phi[{1}]
 + Phi[{3, 5}, {1, 4}, {2}] # Phi[]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(QQ)
>>> M = WQSym.M(); Phi = WQSym.Phi()
>>> Phi

class Element

Bases: IndexedFreeModuleElement

algebraic_complement()

Return the image of the element `self` of $WQSym$ under the algebraic complement involution.

See *algebraic_complement()* for a definition of the involution and for examples.

See also

coalgebraic_complement(), *star_involution()*

EXAMPLES:

```
sage: WQSym = algebras.WQSym(ZZ)
sage: Phi = WQSym.Phi()
sage: Phi[[1],[2,4],[3]].algebraic_complement()
-Phi[{3}, {2}, {4}, {1}] + Phi[{3}, {2, 4}, {1}] + Phi[{3}, {4}, {2},
↪{1}]
sage: Phi[[1],[2,3],[4]].algebraic_complement()
-Phi[{4}, {2}, {3}, {1}] + Phi[{4}, {2, 3}, {1}] + Phi[{4}, {3}, {2},
↪{1}]
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(ZZ)
```

(continues on next page)

(continued from previous page)

```
>>> Phi = WQSym.Phi()
>>> Phi[[Integer(1)],[Integer(2),Integer(4)],[Integer(3)]].algebraic_
↪complement()

↪Integer(4)]].star_involution()
Phi[{3, 4}, {1, 2}, {5, 6}]
>>> Phi[[Integer(3)], [Integer(1), Integer(2)], [Integer(4)]].star_
↪involution()
Phi[{1}, {3, 4}, {2}]
```

coproduct_on_basis(*x*)

Return the coproduct of `self` on the basis element indexed by the ordered set partition `x`.

The coproduct of the basis element Φ_x indexed by an ordered set partition x of $[n]$ can be computed by the following formula ([NovThi06]):

$$\Delta\Phi_x = \sum \Phi_y \otimes \Phi_z,$$

where the sum ranges over all pairs (y, z) of ordered set partitions y and z such that:

- y and z are ordered set partitions of two complementary subsets of $[n]$;
- x is obtained either by concatenating y and z, or by first concatenating y and z and then merging the two "middle blocks" (i.e., the last block of y and the first block of z); in the latter case, the maximum of the last block of y has to be smaller than the minimum of the first block of z (so that when merging these blocks, their entries don't need to be sorted).

EXAMPLES:

```
sage: Phi = algebras.WQSym(QQ).Phi()

sage: Phi.coproduct(Phi.one())  # indirect doctest
Phi[] # Phi[]
sage: Phi.coproduct( Phi([[1]]) )  # indirect doctest
Phi[] # Phi[{1}] + Phi[{1}] # Phi[]
sage: Phi.coproduct( Phi([[1,2]]) )
Phi[] # Phi[{1, 2}] + Phi[{1}] # Phi[{1}] + Phi[{1, 2}] # Phi[]
sage: Phi.coproduct( Phi([[1], [2]]) )
Phi[] # Phi[{1}, {2}] + Phi[{1}] # Phi[{1}] + Phi[{1}, {2}] # Phi[]
sage: Phi[[1,2],[3],[4]].coproduct()
Phi[] # Phi[{1, 2}, {3}, {4}] + Phi[{1}] # Phi[{1}, {2}, {3}]
 + Phi[{1, 2}] # Phi[{1}, {2}] + Phi[{1, 2}, {3}] # Phi[{1}]
 + Phi[{1, 2}, {3}, {4}] # Phi[]
```

```
>>> from sage.all import *
>>> Phi = algebras.WQSym(QQ).Phi()

>>> Phi.coproduct(Phi.one())  # indirect doctest
Phi[] # Phi[]
```

(continues on next page)

(continued from previous page)

```
>>> Phi.coproduct( Phi([[Integer(1)]]) )  # indirect doctest
Phi[] # Phi[{1}] + Phi[{1}] # Phi[]
>>> Phi.coproduct( Phi([[Integer(1),Integer(2)]]) )
Phi[] # Phi[{1, 2}] + Phi[{1}] # Phi[{1}] + Phi[{1, 2}] # Phi[]
>>> Phi.coproduct( Phi([[Integer(1)], [Integer(2)]]) )
Phi[] # Phi[{1}, {2}] + Phi[{1}] # Phi[{1}] + Phi[{1}, {2}] # Phi[]
>>> Phi[[Integer(1),Integer(2)],[Integer(3)],[Integer(4)]].coproduct()
Phi[] # Phi[{1, 2}, {3}, {4}] + Phi[{1}] # Phi[{1}, {2}, {3}]
 + Phi[{1, 2}] # Phi[{1}, {2}] + Phi[{1, 2}, {3}] # Phi[{1}]
 + Phi[{1, 2}, {3}, {4}] # Phi[]
```

product_on_basis(*x*, *y*)

Return the (associative) $*$ product of the basis elements of the Phi basis `self` indexed by the ordered set partitions x and y.

This is obtained by the following algorithm (going back to [NovThi06]):

Let x be an ordered set partition of $[m]$, and y an ordered set partition of $[n]$. Transform x into a list u of all the m elements of $[m]$ by writing out each block of x (in increasing order) and putting bars between each two consecutive blocks; this is called a barred permutation. Do the same for y, but also shift each entry of the resulting barred permutation by m. Let v be the barred permutation of $[m+n] \setminus [m]$ thus obtained. Now, shuffle the two barred permutations u and v (ignoring the bars) in all the $\binom{n+m}{n}$ possible ways. For each shuffle obtained, place bars between some entries of the shuffle, according to the following rule:

- If two consecutive entries of the shuffle both come from u, then place a bar between them if the corresponding entries of u had a bar between them.
- If the first of two consecutive entries of the shuffle comes from v and the second from u, then place a bar between them.

This results in a barred permutation of $[m+n]$. Transform it into an ordered set partition of $[m+n]$, by treating the bars as dividers separating consecutive blocks.

The product $\Phi_x \Phi_y$ is the sum of Φ_p with p ranging over all ordered set partitions obtained this way.

EXAMPLES:

```
sage: A = algebras.WQSym(QQ).Phi()
sage: x = OrderedSetPartition([[1],[2,3]])
sage: y = OrderedSetPartition([[1,2]])
sage: z = OrderedSetPartition([[1,2],[3]])
sage: A.product_on_basis(x, y)
Phi[{1}, {2, 3, 4, 5}] + Phi[{1}, {2, 4}, {3, 5}]
 + Phi[{1}, {2, 4, 5}, {3}] + Phi[{1, 4}, {2, 3, 5}]
 + Phi[{1, 4}, {2, 5}, {3}] + Phi[{1, 4, 5}, {2, 3}]
 + Phi[{4}, {1}, {2, 3, 5}] + Phi[{4}, {1}, {2, 5}, {3}]
 + Phi[{4}, {1, 5}, {2, 3}] + Phi[{4, 5}, {1}, {2, 3}]
sage: A.product_on_basis(x, z)
Phi[{1}, {2, 3, 4, 5}, {6}] + Phi[{1}, {2, 4}, {3, 5}, {6}]
 + Phi[{1}, {2, 4, 5}, {3, 6}] + Phi[{1}, {2, 4, 5}, {6}, {3}]
 + Phi[{1, 4}, {2, 3, 5}, {6}] + Phi[{1, 4}, {2, 5}, {3, 6}]

 + Phi[{3, 4}, {1, 2}]
```

some_elements()

Return some elements of the word quasi-symmetric functions in the Phi basis.

EXAMPLES:

```
sage: Phi = algebras.WQSym(QQ).Phi()
sage: Phi.some_elements()
[Phi[], Phi[{1}], Phi[{1, 2}], Phi[] + 1/2*Phi[{1}]]
```

```
>>> from sage.all import *
>>> Phi = algebras.WQSym(QQ).Phi()
>>> Phi.some_elements()
[Phi[], Phi[{1}], Phi[{1, 2}], Phi[] + 1/2*Phi[{1}]]
```

x

alias of *Characteristic*

a_realization()

Return a particular realization of `self` (the M-basis).

EXAMPLES:

```
sage: WQSym = algebras.WQSym(QQ)
sage: WQSym.a_realization()
Word Quasi-symmetric functions over Rational Field in the Monomial basis
```

```
>>> from sage.all import *
>>> WQSym = algebras.WQSym(QQ)
>>> WQSym.a_realization()
Word Quasi-symmetric functions over Rational Field in the Monomial basis
```

4.1.3 sage.combinat.cluster_algebra_quiver

Cluster algebras and quivers

A compendium on the cluster algebra and quiver package in Sage [MS2011]

- *Quiver mutation types*
- *Quiver*
- *Cluster seeds*

Cluster seeds

A *cluster seed* is a pair $(B, \mathbf{x})$ with B being a *skew-symmetrizable* $(n+m) \times n$ *-matrix* and with $\mathbf{x}$ being an n-tuple of *independent elements* in the field of rational functions in n variables.

For the compendium on the cluster algebra and quiver package see [MS2011].

REFERENCES:

- [FZ2007]
- [BDP2013]

See also

For mutation types of cluster seeds, see *sage.combinat.cluster_algebra_quiver.quiver_mutation_type.QuiverMutationType()*. Cluster seeds are closely related to *sage.combinat.cluster_algebra_quiver.quiver.ClusterQuiver()*.

class sage.combinat.cluster_algebra_quiver.cluster_seed.**ClusterSeed**(*data*, *frozen=None*, *is_principal=False*, *user_labels=None*, *user_labels_prefix='x'*)

Bases: SageObject

The *cluster seed* associated to an *exchange matrix*.

INPUT:

- `data` – can be any of the following:

```
* :class:`QuiverMutationType`
```

  - `str` – string representing a *QuiverMutationType* or a common quiver type (see Examples)
  - *ClusterQuiver*
  - `Matrix()` – a skew-symmetrizable matrix
  - `DiGraph` – must be the input data for a quiver
  - List of edges – must be the edge list of a digraph for a quiver

EXAMPLES:

```
sage: S = ClusterSeed(['A',5]); S
A seed for a cluster algebra of rank 5 of type ['A', 5]

sage: S = ClusterSeed(['A',[2,5],1]); S
A seed for a cluster algebra of rank 7 of type ['A', [2, 5], 1]

sage: T = ClusterSeed(S); T
A seed for a cluster algebra of rank 7 of type ['A', [2, 5], 1]

sage: T = ClusterSeed(S._M); T
A seed for a cluster algebra of rank 7

sage: T = ClusterSeed(S.quiver()._digraph); T
A seed for a cluster algebra of rank 7

sage: T = ClusterSeed(S.quiver()._digraph.edges(sort=True)); T
A seed for a cluster algebra of rank 7

sage: S = ClusterSeed(['B',2]); S
A seed for a cluster algebra of rank 2 of type ['B', 2]

sage: S = ClusterSeed(['C',2]); S
A seed for a cluster algebra of rank 2 of type ['B', 2]

sage: S = ClusterSeed(['A', [5,0],1]); S
A seed for a cluster algebra of rank 5 of type ['D', 5]

sage: S = ClusterSeed(['GR',[3,7]]); S
A seed for a cluster algebra of rank 6 of type ['E', 6]
```

A seed for a cluster algebra of rank 4 with 1 frozen variable

>>> S = ClusterSeed(['D', Integer(4)], user_labels=[-Integer(1), Integer(0),␣
↪Integer(1), Integer(2)]); S
A seed for a cluster algebra of rank 4 of type ['D', 4]
```

LLM_gen_set(*size_limit=-1*)

Produce a list of upper cluster algebra elements corresponding to all vectors in $\{0,1\}^n$.

INPUT:

- `B` – a skew-symmetric matrix
- `size_limit` – a limit on how many vectors you want the function to return

OUTPUT: an array of elements in the upper cluster algebra

EXAMPLES:

```
sage: B = matrix([[0,1,0],[-1,0,1],[0,-1,0],[1,0,0],[0,1,0],[0,0,1]])
sage: C = ClusterSeed(B)
sage: C.LLM_gen_set()
[1,
 (x1 + x3)/x0,
 (x0*x4 + x2)/x1,
 (x0*x3*x4 + x1*x2 + x2*x3)/(x0*x1),
 (x1*x5 + 1)/x2,
 (x1^2*x5 + x1*x3*x5 + x1 + x3)/(x0*x2),
 (x0*x1*x4*x5 + x0*x4 + x2)/(x1*x2),
 (x0*x1*x3*x4*x5 + x0*x3*x4 + x1*x2 + x2*x3)/(x0*x1*x2)]
```

```
>>> from sage.all import *
>>> B = matrix([[Integer(0),Integer(1),Integer(0)],[-Integer(1),Integer(0),
↪Integer(1)],[Integer(0),-Integer(1),Integer(0)],[Integer(1),Integer(0),
↪Integer(0)],[Integer(0),Integer(1),Integer(0)],[Integer(0),Integer(0),
```

(continues on next page)

(continued from previous page)

```
↪Integer(1)]])
>>> C = ClusterSeed(B)
>>> C.LLM_gen_set()
[1,
 (x1 + x3)/x0,
 (x0*x4 + x2)/x1,
 (x0*x3*x4 + x1*x2 + x2*x3)/(x0*x1),
 (x1*x5 + 1)/x2,
 (x1^2*x5 + x1*x3*x5 + x1 + x3)/(x0*x2),
 (x0*x1*x4*x5 + x0*x4 + x2)/(x1*x2),
 (x0*x1*x3*x4*x5 + x0*x3*x4 + x1*x2 + x2*x3)/(x0*x1*x2)]
```

b_matrix()

Return the B *-matrix* of `self`.

EXAMPLES:

```
sage: ClusterSeed(['A',4]).b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

sage: ClusterSeed(['B',4]).b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -2  0]

sage: ClusterSeed(['D',4]).b_matrix()
[ 0  1  0  0]
[-1  0 -1 -1]
[ 0  1  0  0]
[ 0  1  0  0]

sage: ClusterSeed(QuiverMutationType([['A',2],['B',2]])).b_matrix()
[ 0  1  0  0]
[-1  0  0  0]
[ 0  0  0  1]

b_matrix_class(*depth=+Infinity*, *up_to_equivalence=True*)

Return all B-matrices in the mutation class of `self`.

INPUT:

- `depth` – (default: infinity) integer or infinity, only seeds with distance at most `depth` from `self` are returned
- `up_to_equivalence` – boolean (default: `True`); if `True`, only B-matrices up to equivalence are considered

EXAMPLES:

- for examples see *b_matrix_class_iter()*

b_matrix_class_iter(*depth=+Infinity*, *up_to_equivalence=True*)

Return an iterator through all B-matrices in the mutation class of `self`.

INPUT:

- `depth` – (default: infinity) integer or infinity, only seeds with distance at most `depth` from `self` are returned
- `up_to_equivalence` – boolean (default: `True`); if `True`, only B-matrices up to equivalence are considered

EXAMPLES:

A standard finite type example:

```
sage: S = ClusterSeed(['A',4])
sage: it = S.b_matrix_class_iter()
sage: for T in it: print(T)
[ 0  0  0  1]
[ 0  0  1  1]
[ 0 -1  0  0]
[-1 -1  0  0]
[ 0  0  0  1]
[ 0  0  1  0]
[ 0 -1  0  1]
[-1  0 -1  0]
[ 0  0  1  1]
```

[ 0  0  0  1]
[ 0  0  1  0]
[ 0 -1  0  1]
[-1  0 -1  0]
[ 0  0  1  1]
[ 0  0  0 -1]
[-1  0  0  0]
[-1  1  0  0]
```

Finite type example not considered up to equivalence:

```
sage: S = ClusterSeed(['A',3])
sage: it = S.b_matrix_class_iter(up_to_equivalence=False)
sage: b_matrix_class = list(it)
sage: len(b_matrix_class)
14
sage: b_matrix_class[0]
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> it = S.b_matrix_class_iter(up_to_equivalence=False)
>>> b_matrix_class = list(it)
>>> len(b_matrix_class)
14
>>> b_matrix_class[Integer(0)]
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]
```

Infinite (but finite mutation) type example:

```
sage: S = ClusterSeed(['A',[1,2],1])
sage: it = S.b_matrix_class_iter()
sage: for T in it: print(T)
[ 0  1  1]
[-1  0  1]
[-1 -1  0]
[ 0 -2  1]
[ 2  0 -1]
[-1  1  0]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',[Integer(1),Integer(2)],Integer(1)])
>>> it = S.b_matrix_class_iter()
>>> for T in it: print(T)
[ 0  1  1]
[-1  0  1]
[-1 -1  0]
[ 0 -2  1]
[ 2  0 -1]
[-1  1  0]
```

Infinite mutation type example:

```
sage: S = ClusterSeed(['E',10])
sage: it = S.b_matrix_class_iter(depth=3)
sage: len ([T for T in it])
266
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['E',Integer(10)])
>>> it = S.b_matrix_class_iter(depth=Integer(3))
>>> len ([T for T in it])
266
```

For a cluster seed from an arbitrarily labelled digraph:

```
sage: dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
sage: S = ClusterSeed(dg, frozen=['b'])
sage: S.b_matrix_class()
[
[ 0  0]  [ 0  0]  [0 0]
[ 0  0]  [ 0  0]  [0 0]
[-1  1], [-1 -1], [1 1]
]
```

```
>>> from sage.all import *
>>> dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
>>> S = ClusterSeed(dg, frozen=['b'])
>>> S.b_matrix_class()
[
[ 0  0]  [ 0  0]  [0 0]
[ 0  0]  [ 0  0]  [0 0]
```

(continues on next page)

(continued from previous page)

```
[-1  1], [-1 -1], [1 1]
]
```

c_matrix(*show_warnings=True*)

Return all *c-vectors* of `self`.

> **Warning**
>
> This method assumes the sign-coherence conjecture and that the input seed is sign-coherent (has an exchange matrix with columns of like signs). Otherwise, computational errors might arise.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: S.c_matrix()
[ 1  0  0]
[ 0  0 -1]
[ 0 -1  0]

sage: S = ClusterSeed(['A',4])
sage: S.use_g_vectors(False); S.use_fpolys(False)
sage: S.use_c_vectors(False); S.use_d_vectors(False); S.track_mutations(False)
sage: S.c_matrix()
Traceback (most recent call last):
...
ValueError: Unable to calculate c-vectors. Need to use c vectors.
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> S.c_matrix()
[ 1  0  0]
[ 0  0 -1]
[ 0 -1  0]

>>> S = ClusterSeed(['A',Integer(4)])
>>> S.use_g_vectors(False); S.use_fpolys(False)
>>> S.use_c_vectors(False); S.use_d_vectors(False); S.track_mutations(False)
>>> S.c_matrix()
Traceback (most recent call last):
...
ValueError: Unable to calculate c-vectors. Need to use c vectors.
```

c_vector(*k*)

Return the `k`-th *c-vector* of `self`. It is obtained as the `k`-th column vector of the bottom part of the `B`-matrix of `self`.

> **Warning**
>
> This method assumes the sign-coherence conjecture and that the input seed is sign-coherent (has an exchange matrix with columns of like signs). Otherwise, computational errors might arise.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: [S.c_vector(k) for k in range(3)]
[(1, 0, 0), (0, 0, -1), (0, -1, 0)]

sage: S = ClusterSeed(Matrix([[0,1],[-1,0],[1,0],[-1,1]])); S
A seed for a cluster algebra of rank 2 with 2 frozen variables
sage: S.c_vector(0)
(1, 0)

sage: S = ClusterSeed(Matrix([[0,1],[-1,0],[1,0],[-1,1]]))
sage: S.use_c_vectors(bot_is_c=True); S
A seed for a cluster algebra of rank 2 with 2 frozen variables
sage: S.c_vector(0)
(1, -1)
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> [S.c_vector(k) for k in range(Integer(3))]
[(1, 0, 0), (0, 0, -1), (0, -1, 0)]

>>> S = ClusterSeed(Matrix([[Integer(0),Integer(1)],[-Integer(1),Integer(0)],
↪[Integer(1),Integer(0)],[-Integer(1),Integer(1)]])); S
A seed for a cluster algebra of rank 2 with 2 frozen variables
>>> S.c_vector(Integer(0))
(1, 0)

>>> S = ClusterSeed(Matrix([[Integer(0),Integer(1)],[-Integer(1),Integer(0)],
↪[Integer(1),Integer(0)],[-Integer(1),Integer(1)]]))
>>> S.use_c_vectors(bot_is_c=True); S
A seed for a cluster algebra of rank 2 with 2 frozen variables
>>> S.c_vector(Integer(0))
(1, -1)
```

cluster()

Return a copy of the *cluster* of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.cluster()
[x0, x1, x2]

sage: S.mutate(1)
sage: S.cluster()
```

(continues on next page)

(continued from previous page)

```
[x0, (x0*x2 + 1)/x1, x2]

sage: S.mutate(2)
sage: S.cluster()
[x0, (x0*x2 + 1)/x1, (x0*x2 + x1 + 1)/(x1*x2)]

sage: S.mutate([2,1])
sage: S.cluster()
[x0, x1, x2]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.cluster()
[x0, x1, x2]

>>> S.mutate(Integer(1))
>>> S.cluster()
[x0, (x0*x2 + 1)/x1, x2]

>>> S.mutate(Integer(2))
>>> S.cluster()
[x0, (x0*x2 + 1)/x1, (x0*x2 + x1 + 1)/(x1*x2)]

>>> S.mutate([Integer(2),Integer(1)])
>>> S.cluster()
[x0, x1, x2]
```

cluster_class(*depth=+Infinity*, *show_depth=False*, *up_to_equivalence=True*)

Return the cluster class of `self` with respect to certain constraints.

INPUT:

- `depth` – (default: infinity) integer, only seeds with distance at most `depth` from `self` are returned
- `return_depth` – (default: `False`) if `True`, ignored if `depth` is set; returns the depth of the mutation class, i.e., the maximal distance from `self` of an element in the mutation class
- `up_to_equivalence` – (default: `True`) if `True`, only clusters up to equivalence are considered

EXAMPLES:

- for examples see *cluster_class_iter()*

cluster_class_iter(*depth=+Infinity*, *show_depth=False*, *up_to_equivalence=True*)

Return an iterator through all clusters in the mutation class of `self`.

INPUT:

- `depth` – (default: infinity) integer or infinity, only seeds with distance at most `depth` from `self` are returned
- `show_depth` – boolean (default: `False`); if `True`, ignored if `depth` is set; returns the depth of the mutation class, i.e., the maximal distance from `self` of an element in the mutation class
- `up_to_equivalence` – boolean (default: `True`); if `True`, only clusters up to equivalence are considered

EXAMPLES:

A standard finite type example:

```
sage: S = ClusterSeed(['A',3])
sage: it = S.cluster_class_iter()
sage: cluster_class = list(it)
sage: len(cluster_class)
14
sage: cluster_class[0]
[x0, x1, x2]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> it = S.cluster_class_iter()
>>> cluster_class = list(it)
>>> len(cluster_class)
14
>>> cluster_class[Integer(0)]
[x0, x1, x2]
```

A finite type example with given depth:

```
sage: it = S.cluster_class_iter(depth=1)
sage: for T in it: print(T)
[x0, x1, x2]
[x0, x1, (x1 + 1)/x2]
[x0, (x0*x2 + 1)/x1, x2]
[(x1 + 1)/x0, x1, x2]
```

```
>>> from sage.all import *
>>> it = S.cluster_class_iter(depth=Integer(1))
>>> for T in it: print(T)
[x0, x1, x2]
[x0, x1, (x1 + 1)/x2]
[x0, (x0*x2 + 1)/x1, x2]
[(x1 + 1)/x0, x1, x2]
```

A finite type example where the depth is returned while computing:

```
sage: it = S.cluster_class_iter(show_depth=True)
sage: _ = list(it)
Depth: 0     found: 1          Time: ... s
Depth: 1     found: 4          Time: ... s
Depth: 2     found: 9          Time: ... s
Depth: 3     found: 13         Time: ... s
Depth: 4     found: 14         Time: ... s
```

```
>>> from sage.all import *
>>> it = S.cluster_class_iter(show_depth=True)
>>> _ = list(it)
Depth: 0     found: 1          Time: ... s
Depth: 1     found: 4          Time: ... s
Depth: 2     found: 9          Time: ... s
Depth: 3     found: 13         Time: ... s
```

(continues on next page)

(continued from previous page)

```
Depth: 4     found: 14         Time: ... s
```

Finite type examples not considered up to equivalence:

```
sage: it = S.cluster_class_iter(up_to_equivalence=False)
sage: len([T for T in it])
84

sage: it = ClusterSeed(['A',2]).cluster_class_iter(up_to_equivalence=False)
sage: cluster_class = list(it)
sage: len(cluster_class)
10
sage: cluster_class[0]
[x0, x1]
sage: cluster_class[-1]
[x1, x0]
```

```
>>> from sage.all import *
>>> it = S.cluster_class_iter(up_to_equivalence=False)
>>> len([T for T in it])
84

>>> it = ClusterSeed(['A',Integer(2)]).cluster_class_iter(up_to_
↪equivalence=False)
>>> cluster_class = list(it)
>>> len(cluster_class)
10
>>> cluster_class[Integer(0)]
[x0, x1]
>>> cluster_class[-Integer(1)]
[x1, x0]
```

Infinite type examples:

```
sage: S = ClusterSeed(['A',[1,1],1])
sage: it = S.cluster_class_iter()
sage: next(it)
[x0, x1]
sage: next(it)
[x0, (x0^2 + 1)/x1]
sage: next(it)
[(x1^2 + 1)/x0, x1]
sage: next(it)
[(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2), (x0^2 + 1)/x1]
sage: next(it)
[(x1^2 + 1)/x0, (x1^4 + x0^2 + 2*x1^2 + 1)/(x0^2*x1)]

sage: it = S.cluster_class_iter(depth=3)
sage: for T in it: print(T)
[x0, x1]
[x0, (x0^2 + 1)/x1]
[(x1^2 + 1)/x0, x1]
```

(continues on next page)

(continued from previous page)

```
[(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2), (x0^2 + 1)/x1]
[(x1^2 + 1)/x0, (x1^4 + x0^2 + 2*x1^2 + 1)/(x0^2*x1)]
[(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2), (x0^6 + 3*x0^4 + 2*x0^2*x1^2 + x1^4 +␣
↪3*x0^2 + 2*x1^2 + 1)/(x0^2*x1^3)]
[(x1^6 + x0^4 + 2*x0^2*x1^2 + 3*x1^4 + 2*x0^2 + 3*x1^2 + 1)/(x0^3*x1^2), (x1^
↪4 + x0^2 + 2*x1^2 + 1)/(x0^2*x1)]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',[Integer(1),Integer(1)],Integer(1)])
>>> it = S.cluster_class_iter()
>>> next(it)
[x0, x1]
>>> next(it)
[x0, (x0^2 + 1)/x1]
>>> next(it)
[(x1^2 + 1)/x0, x1]
>>> next(it)
[(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2), (x0^2 + 1)/x1]
>>> next(it)
[(x1^2 + 1)/x0, (x1^4 + x0^2 + 2*x1^2 + 1)/(x0^2*x1)]

>>> it = S.cluster_class_iter(depth=Integer(3))
>>> for T in it: print(T)
[x0, x1]
[x0, (x0^2 + 1)/x1]
[(x1^2 + 1)/x0, x1]
[(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2), (x0^2 + 1)/x1]
[(x1^2 + 1)/x0, (x1^4 + x0^2 + 2*x1^2 + 1)/(x0^2*x1)]
[(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2), (x0^6 + 3*x0^4 + 2*x0^2*x1^2 + x1^4 +␣
↪3*x0^2 + 2*x1^2 + 1)/(x0^2*x1^3)]
[(x1^6 + x0^4 + 2*x0^2*x1^2 + 3*x1^4 + 2*x0^2 + 3*x1^2 + 1)/(x0^3*x1^2), (x1^
↪4 + x0^2 + 2*x1^2 + 1)/(x0^2*x1)]
```

For a cluster seed from an arbitrarily labelled digraph:

```
sage: dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
sage: S = ClusterSeed(dg, frozen=['b'])
sage: S.cluster_class()
[[a, c], [a, (b + 1)/c], [(b + 1)/a, c], [(b + 1)/a, (b + 1)/c]]

sage: S2 = ClusterSeed(dg, frozen=[])
sage: S2.cluster_class()[0]
[a, b, c]
```

```
>>> from sage.all import *
>>> dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
>>> S = ClusterSeed(dg, frozen=['b'])
>>> S.cluster_class()
[[a, c], [a, (b + 1)/c], [(b + 1)/a, c], [(b + 1)/a, (b + 1)/c]]

>>> S2 = ClusterSeed(dg, frozen=[])
>>> S2.cluster_class()[Integer(0)]
```

(continues on next page)

(continued from previous page)

```
[a, b, c]
```

cluster_index(*cluster_str*)

Return the index of a cluster if `use_fpolys` is on.

INPUT:

- `cluster_str` – the string to look for in the cluster

OUTPUT: integer or `None` if the string is not a cluster variable

EXAMPLES:

```
sage: S = ClusterSeed(['A', 4], user_labels=['x', 'y', 'z', 'w']); S.mutate('x
↪')
sage: S.cluster_index('x')
sage: S.cluster_index('(y+1)/x')
0
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A', Integer(4)], user_labels=['x', 'y', 'z', 'w']); S.
↪mutate('x')
>>> S.cluster_index('x')
>>> S.cluster_index('(y+1)/x')
0
```

cluster_variable(*k*)

Generates a cluster variable using F-polynomials.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.mutate([0,1])
sage: S.cluster_variable(0)
(x1 + 1)/x0
sage: S.cluster_variable(1)
(x0*x2 + x1 + 1)/(x0*x1)
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.mutate([Integer(0),Integer(1)])
>>> S.cluster_variable(Integer(0))
(x1 + 1)/x0
>>> S.cluster_variable(Integer(1))
(x0*x2 + x1 + 1)/(x0*x1)
```

coefficient(*k*)

Return the *coefficient* of `self` at index `k`, or vertex `k` if `k` is not an index.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: [S.coefficient(k) for k in range(3)]
[y0, 1/y2, 1/y1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> [S.coefficient(k) for k in range(Integer(3))]
[y0, 1/y2, 1/y1]
```

coefficients()

Return all *coefficients* of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: S.coefficients()
[y0, 1/y2, 1/y1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> S.coefficients()
[y0, 1/y2, 1/y1]
```

d_matrix(*show_warnings=True*)

Return the matrix of *d-vectors* of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',4]); S.d_matrix()
[-1  0  0  0]
[ 0 -1  0  0]
[ 0  0 -1  0]
[ 0  0  0 -1]
sage: S.mutate([1,2,1,0,1,3]); S.d_matrix()
[1 1 0 1]
[1 1 1 1]
[1 0 1 1]
[0 0 0 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(4)]); S.d_matrix()
[-1  0  0  0]
[ 0 -1  0  0]
[ 0  0 -1  0]
[ 0  0  0 -1]
>>> S.mutate([Integer(1),Integer(2),Integer(1),Integer(0),Integer(1),
↪Integer(3)]); S.d_matrix()
[1 1 0 1]
[1 1 1 1]
[1 0 1 1]
[0 0 0 1]
```

d_vector(*k*)

Return the `k`-th *d-vector* of `self`. This is the exponent vector of the denominator of the `k`-th cluster variable.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.mutate([2,1,2])
sage: [S.d_vector(k) for k in range(3)]
[(-1, 0, 0), (0, 1, 1), (0, 1, 0)]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> [S.d_vector(k) for k in range(Integer(3))]
[(-1, 0, 0), (0, 1, 1), (0, 1, 0)]
```

exchangeable_part()

Return the restriction to the principal part (i.e. the exchangeable variables) of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',4])
sage: T = ClusterSeed(S.quiver().digraph().edges(sort=True), frozen=[3])
sage: T.quiver().digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

sage: T.exchangeable_part().quiver().digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1))]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(4)])
>>> T = ClusterSeed(S.quiver().digraph().edges(sort=True),␣
↪frozen=[Integer(3)])
>>> T.quiver().digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

>>> T.exchangeable_part().quiver().digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1))]
```

f_polynomial(k)

Return the `k`-th *F-polynomial* of `self`. It is obtained from the `k`-th cluster variable by setting all x_i to 1.

Warning

This method assumes the sign-coherence conjecture and that the input seed is sign-coherent (has an exchange matrix with columns of like signs). Otherwise, computational errors might arise.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: [S.f_polynomial(k) for k in range(3)]
[1, y1*y2 + y2 + 1, y1 + 1]

sage: S = ClusterSeed(Matrix([[0,1],[-1,0],[1,0],[-1,1]]))
```

(continues on next page)

(continued from previous page)

```
sage: S.use_c_vectors(bot_is_c=True); S
A seed for a cluster algebra of rank 2 with 2 frozen variables
sage: T = ClusterSeed(Matrix([[0,1],[-1,0]])).principal_extension(); T
A seed for a cluster algebra of rank 2 with principal coefficients
sage: S.mutate(0)
sage: T.mutate(0)
sage: S.f_polynomials()
[y0 + y1, 1]
sage: T.f_polynomials()
[y0 + 1, 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> [S.f_polynomial(k) for k in range(Integer(3))]
[1, y1*y2 + y2 + 1, y1 + 1]

>>> S = ClusterSeed(Matrix([[Integer(0),Integer(1)],[-Integer(1),Integer(0)],
↪[Integer(1),Integer(0)],[-Integer(1),Integer(1)]]))
>>> S.use_c_vectors(bot_is_c=True); S
A seed for a cluster algebra of rank 2 with 2 frozen variables
>>> T = ClusterSeed(Matrix([[Integer(0),Integer(1)],[-Integer(1),
↪Integer(0)]])).principal_extension(); T
A seed for a cluster algebra of rank 2 with principal coefficients
>>> S.mutate(Integer(0))
>>> T.mutate(Integer(0))
>>> S.f_polynomials()
[y0 + y1, 1]
>>> T.f_polynomials()
[y0 + 1, 1]
```

f_polynomials()

Return all *F-polynomials* of `self`. These are obtained from the cluster variables by setting all x_i's to 1.

Warning

This method assumes the sign-coherence conjecture and that the input seed is sign-coherent (has an exchange matrix with columns of like signs). Otherwise, computational errors might arise.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: S.f_polynomials()
[1, y1*y2 + y2 + 1, y1 + 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> S.f_polynomials()
[1, y1*y2 + y2 + 1, y1 + 1]
```

find_upper_bound(*verbose=False*)

Return the upper bound of the given cluster algebra as a quotient ring.

The upper bound is the intersection of the Laurent polynomial rings of the initial cluster and its neighboring clusters. As such, it always contains both the cluster algebra and the upper cluster algebra. This function uses the algorithm from [MM2015].

When the initial seed is totally coprime (for example, when the unfrozen part of the exchange matrix has full rank), the upper bound is equal to the upper cluster algebra by [BFZ2005].

Warning

The computation time grows rapidly with the size of the seed and the number of steps. For most seeds larger than four vertices, the algorithm may take an infeasible amount of time. Additionally, it will run forever without terminating whenever the upper bound is infinitely-generated (such as the example in [Spe2013]).

INPUT:

- `verbose` – boolean (default: `False`); if `True`, prints output during the computation

EXAMPLES:

- finite type:

```
sage: S = ClusterSeed(['A',3])
sage: S.find_upper_bound()
Quotient of Multivariate Polynomial Ring in x0, x1, x2, x0p, x1p, x2p, z0
 over Rational Field
 by the ideal (x0*x0p - x1 - 1, x1*x1p - x0*x2 - 1, x2*x2p - x1 - 1,
               x0*z0 - x2p, x1*z0 + z0 - x0p*x2p, x2*z0 - x0p,
               x1p*z0 + z0 - x0p*x1p*x2p + x1 + 1)
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.find_upper_bound()
Quotient of Multivariate Polynomial Ring in x0, x1, x2, x0p, x1p, x2p, z0
 over Rational Field
 by the ideal (x0*x0p - x1 - 1, x1*x1p - x0*x2 - 1, x2*x2p - x1 - 1,
               x0*z0 - x2p, x1*z0 + z0 - x0p*x2p, x2*z0 - x0p,
               x1p*z0 + z0 - x0p*x1p*x2p + x1 + 1)
```

- Markov:

```
sage: B = matrix([[0,2,-2],[-2,0,2],[2,-2,0]])
sage: S = ClusterSeed(B)
sage: S.find_upper_bound()
Quotient of Multivariate Polynomial Ring in x0, x1, x2, x0p, x1p, x2p, z0
 over Rational Field
 by the ideal (x0*x0p - x2^2 - x1^2, x1*x1p - x2^2 - x0^2, x2*x2p - x1^2 -
↪ x0^2,
               x0p*x1p*x2p - x0*x1*x2p - x0*x2*x1p - x1*x2*x0p -␣
↪2*x0*x1*x2,
               x0^3*z0 - x1p*x2p + x1*x2, x0*x1*z0 - x2p - x2,
```

(continues on next page)

(continued from previous page)

```
                x1^3*z0 - x0p*x2p + x0*x2, x0*x2*z0 - x1p - x1,
                x1*x2*z0 - x0p - x0, x2^3*z0 - x0p*x1p + x0*x1)
```

```
>>> from sage.all import *
>>> B = matrix([[Integer(0),Integer(2),-Integer(2)],[-Integer(2),
↪Integer(0),Integer(2)],[Integer(2),-Integer(2),Integer(0)]])
>>> S = ClusterSeed(B)
>>> S.find_upper_bound()
Quotient of Multivariate Polynomial Ring in x0, x1, x2, x0p, x1p, x2p, z0
 over Rational Field
 by the ideal (x0*x0p - x2^2 - x1^2, x1*x1p - x2^2 - x0^2, x2*x2p - x1^2 -
↪ x0^2,
                x0p*x1p*x2p - x0*x1*x2p - x0*x2*x1p - x1*x2*x0p -␣
↪2*x0*x1*x2,
                x0^3*z0 - x1p*x2p + x1*x2, x0*x1*z0 - x2p - x2,
                x1^3*z0 - x0p*x2p + x0*x2, x0*x2*z0 - x1p - x1,
                x1*x2*z0 - x0p - x0, x2^3*z0 - x0p*x1p + x0*x1)
```

first_green_vertex()

Return the first green vertex of `self`.

A vertex is defined to be green if its c-vector has all nonpositive entries. More information on green vertices can be found at [BDP2013]

EXAMPLES:

```
sage: ClusterSeed(['A',3]).principal_extension().first_green_vertex()
0

sage: ClusterSeed(['A',[3,3],1]).principal_extension().first_green_vertex()
0
```

```
>>> from sage.all import *
>>> ClusterSeed(['A',Integer(3)]).principal_extension().first_green_vertex()
0

>>> ClusterSeed(['A',[Integer(3),Integer(3)],Integer(1)]).principal_
↪extension().first_green_vertex()
0
```

first_red_vertex()

Return the first red vertex of `self`.

A vertex is defined to be red if its c-vector has all nonnegative entries. More information on red vertices can be found at [BDP2013].

EXAMPLES:

```
sage: ClusterSeed(['A',3]).principal_extension().first_red_vertex()

sage: ClusterSeed(['A',[3,3],1]).principal_extension().first_red_vertex()

sage: Q = ClusterSeed(['A',[3,3],1]).principal_extension()
```

(continues on next page)

(continued from previous page)

```
sage: Q.mutate(1)
sage: Q.first_red_vertex()
1
```

```
>>> from sage.all import *
>>> ClusterSeed(['A',Integer(3)]).principal_extension().first_red_vertex()

>>> ClusterSeed(['A',[Integer(3),Integer(3)],Integer(1)]).principal_
↪extension().first_red_vertex()

>>> Q = ClusterSeed(['A',[Integer(3),Integer(3)],Integer(1)]).principal_
↪extension()
>>> Q.mutate(Integer(1))
>>> Q.first_red_vertex()
1
```

first_urban_renewal()

Return the first urban renewal vertex.

An urban renewal vertex is one in which there are two arrows pointing toward the vertex and two arrows pointing away.

EXAMPLES:

```
sage: G = ClusterSeed(['GR',[4,9]]); G.first_urban_renewal()
5
```

```
>>> from sage.all import *
>>> G = ClusterSeed(['GR',[Integer(4),Integer(9)]]); G.first_urban_renewal()
5
```

free_vertices()

Return the list of *exchangeable vertices* of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
....:                         frozen=['b', 'd'])
sage: S.free_vertices()
['a', 'c', 'e']

sage: S = ClusterSeed(DiGraph([[5, 'b']]))
sage: S.free_vertices()
[5, 'b']
```

```
>>> from sage.all import *
>>> S = ClusterSeed(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd']]),
...                         frozen=['b', 'd'])
>>> S.free_vertices()
['a', 'c', 'e']

>>> S = ClusterSeed(DiGraph([[Integer(5), 'b']]))
```

(continues on next page)

(continued from previous page)

```
>>> S.free_vertices()
[5, 'b']
```

frozen_vertices()

Return the list of *frozen vertices* of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
....:                         frozen=['b', 'd'])
sage: sorted(S.frozen_vertices())
['b', 'd']
```

```
>>> from sage.all import *
>>> S = ClusterSeed(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd']]),
...                         frozen=['b', 'd'])
>>> sorted(S.frozen_vertices())
['b', 'd']
```

g_matrix(*show_warnings=True*)

Return the matrix of all *g-vectors* of `self`. These are the degree vectors of the cluster variables after setting all y_i's to 0.

Warning

This method assumes the sign-coherence conjecture and that the input seed is sign-coherent (has an exchange matrix with columns of like signs). Otherwise, computational errors might arise.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: S.g_matrix()
[ 1  0  0]
[ 0  0 -1]
[ 0 -1  0]

sage: S = ClusterSeed(['A',3])
sage: S.mutate([0,1])
sage: S.g_matrix()
[-1 -1  0]
[ 1  0  0]
[ 0  0  1]

sage: S = ClusterSeed(['A',4])
sage: S.use_g_vectors(False); S.use_fpolys(False); S.g_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

(continues on next page)

(continued from previous page)

```
sage: S = ClusterSeed(['A',4])
sage: S.use_g_vectors(False); S.use_c_vectors(False); S.use_fpolys(False)
sage: S.track_mutations(False); S.g_matrix()
Traceback (most recent call last):
...
ValueError: Unable to calculate g-vectors. Need to use g vectors.
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> S.g_matrix()
[ 1  0  0]
[ 0  0 -1]
[ 0 -1  0]

>>> S = ClusterSeed(['A',Integer(3)])
>>> S.mutate([Integer(0),Integer(1)])
>>> S.g_matrix()
[-1 -1  0]
[ 1  0  0]
[ 0  0  1]

>>> S = ClusterSeed(['A',Integer(4)])
>>> S.use_g_vectors(False); S.use_fpolys(False); S.g_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]

>>> S = ClusterSeed(['A',Integer(4)])
>>> S.use_g_vectors(False); S.use_c_vectors(False); S.use_fpolys(False)
>>> S.track_mutations(False); S.g_matrix()
Traceback (most recent call last):
...
ValueError: Unable to calculate g-vectors. Need to use g vectors.
```

g_vector(*k*)

Return the k-th *g-vector* of self. This is the degree vector of the k-th cluster variable after setting all y_i's to 0.

Warning

This method assumes the sign-coherence conjecture and that the input seed is sign-coherent (has an exchange matrix with columns of like signs). Otherwise, computational errors might arise.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.mutate([2,1,2])
sage: [S.g_vector(k) for k in range(3)]
```

(continues on next page)

(continued from previous page)

```
[(1, 0, 0), (0, 0, -1), (0, -1, 0)]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.mutate([Integer(2),Integer(1),Integer(2)])
>>> [S.g_vector(k) for k in range(Integer(3))]
[(1, 0, 0), (0, 0, -1), (0, -1, 0)]
```

get_upper_cluster_algebra_element(a)

Compute an element in the upper cluster algebra of B corresponding to the vector $a \in \mathbf{Z}^n$.

See [LLM2014] for more details.

INPUT:

- `B` – a skew-symmetric matrix. Must have the same number of columns as the length of the vectors in vd
- `a` – a vector in $\mathbf{Z}^n$ where n is the number of columns in B

OUTPUT: an element in the upper cluster algebra. Depending on the input it may or may not be irreducible

EXAMPLES:

```
sage: B = matrix([[0,3,-3],[-3,0,3],[3,-3,0],[1,0,0],[0,1,0],[0,0,1]])
sage: C = ClusterSeed(B)
sage: C.get_upper_cluster_algebra_element([1,1,0])
(x0^3*x2^3*x3*x4 + x2^6*x3 + x1^3*x2^3)/(x0*x1)
sage: C.get_upper_cluster_algebra_element([1,1,1])
x0^2*x1^2*x2^2*x3*x4*x5 + x0^2*x1^2*x2^2

sage: B = matrix([[0,3,0],[-3,0,3],[0,-3,0]])
sage: C = ClusterSeed(B)
sage: C.get_upper_cluster_algebra_element([1,1,0])
(x1^3*x2^3 + x0^3 + x2^3)/(x0*x1)
sage: C.get_upper_cluster_algebra_element([1,1,1])
(x0^3*x1^3 + x1^3*x2^3 + x0^3 + x2^3)/(x0*x1*x2)

sage: B = matrix([[0,2],[-3,0],[4,-5]])
sage: C = ClusterSeed(B)
sage: C.get_upper_cluster_algebra_element([1,1])
(x2^9 + x1^3*x2^5 + x0^2*x2^4)/(x0*x1)

sage: B = matrix([[0,3,-5],[-3,0,4],[5,-4,0]])
sage: C = ClusterSeed(B)
sage: C.get_upper_cluster_algebra_element([1,1,1])
x0^4*x1^2*x2^3 + x0^2*x1^3*x2^4
```

```
>>> from sage.all import *
>>> B = matrix([[Integer(0),Integer(3),-Integer(3)],[-Integer(3),Integer(0),
↪Integer(3)],[Integer(3),-Integer(3),Integer(0)],[Integer(1),Integer(0),
↪Integer(0)],[Integer(0),Integer(1),Integer(0)],[Integer(0),Integer(0),
↪Integer(1)]])
>>> C = ClusterSeed(B)
>>> C.get_upper_cluster_algebra_element([Integer(1),Integer(1),Integer(0)])
```

(continues on next page)

(continued from previous page)

```
(x0^3*x2^3*x3*x4 + x2^6*x3 + x1^3*x2^3)/(x0*x1)
>>> C.get_upper_cluster_algebra_element([Integer(1),Integer(1),Integer(1)])
x0^2*x1^2*x2^2*x3*x4*x5 + x0^2*x1^2*x2^2

>>> B = matrix([[Integer(0),Integer(3),Integer(0)],[-Integer(3),Integer(0),
↪Integer(3)],[Integer(0),-Integer(3),Integer(0)]])
>>> C = ClusterSeed(B)
>>> C.get_upper_cluster_algebra_element([Integer(1),Integer(1),Integer(0)])
(x1^3*x2^3 + x0^3 + x2^3)/(x0*x1)
>>> C.get_upper_cluster_algebra_element([Integer(1),Integer(1),Integer(1)])
(x0^3*x1^3 + x1^3*x2^3 + x0^3 + x2^3)/(x0*x1*x2)

>>> B = matrix([[Integer(0),Integer(2)],[-Integer(3),Integer(0)],[Integer(4),-
↪Integer(5)]])
>>> C = ClusterSeed(B)
>>> C.get_upper_cluster_algebra_element([Integer(1),Integer(1)])
(x2^9 + x1^3*x2^5 + x0^2*x2^4)/(x0*x1)

>>> B = matrix([[Integer(0),Integer(3),-Integer(5)],[-Integer(3),Integer(0),
↪Integer(4)],[Integer(5),-Integer(4),Integer(0)]])
>>> C = ClusterSeed(B)
>>> C.get_upper_cluster_algebra_element([Integer(1),Integer(1),Integer(1)])
x0^4*x1^2*x2^3 + x0^2*x1^3*x2^4
```

greedy(*a1*, *a2*, *algorithm='by_recursion'*)

Return the greedy element $x[a_1, a_2]$ assuming that `self` is rank two.

The third input can be `'by_recursion'`, `'by_combinatorics'`, or `'just_numbers'` to specify if the user wants the element computed by the recurrence, combinatorial formula, or wants to set x_1 and x_2 to be one.

See [LLZ2014] for more details.

EXAMPLES:

```
sage: S = ClusterSeed(['R2', [3, 3]])
sage: S.greedy(4, 4)
(x0^12 + x1^12 + 4*x0^9 + 4*x1^9 + 6*x0^6
  + 4*x0^3*x1^3 + 6*x1^6 + 4*x0^3 + 4*x1^3 + 1)/(x0^4*x1^4)
sage: S.greedy(4, 4, 'by_combinatorics')
(x0^12 + x1^12 + 4*x0^9 + 4*x1^9 + 6*x0^6
  + 4*x0^3*x1^3 + 6*x1^6 + 4*x0^3 + 4*x1^3 + 1)/(x0^4*x1^4)
sage: S.greedy(4, 4, 'just_numbers')
35
sage: S = ClusterSeed(['R2', [2, 2]])
sage: S.greedy(1, 2)
(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2)
sage: S.greedy(1, 2, 'by_combinatorics')
(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2)
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['R2', [Integer(3), Integer(3)]])
>>> S.greedy(Integer(4), Integer(4))
```

(continues on next page)

(continued from previous page)

```
(x0^12 + x1^12 + 4*x0^9 + 4*x1^9 + 6*x0^6
  + 4*x0^3*x1^3 + 6*x1^6 + 4*x0^3 + 4*x1^3 + 1)/(x0^4*x1^4)
>>> S.greedy(Integer(4), Integer(4), 'by_combinatorics')
(x0^12 + x1^12 + 4*x0^9 + 4*x1^9 + 6*x0^6
  + 4*x0^3*x1^3 + 6*x1^6 + 4*x0^3 + 4*x1^3 + 1)/(x0^4*x1^4)
>>> S.greedy(Integer(4), Integer(4), 'just_numbers')
35
>>> S = ClusterSeed(['R2', [Integer(2), Integer(2)]])
>>> S.greedy(Integer(1), Integer(2))
(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2)
>>> S.greedy(Integer(1), Integer(2), 'by_combinatorics')
(x0^4 + 2*x0^2 + x1^2 + 1)/(x0*x1^2)
```

green_vertices()

Return the list of green vertices of `self`.

A vertex is defined to be green if its c-vector has all nonpositive entries. More information on green vertices can be found at [BDP2013]

OUTPUT: the green vertices as a list of integers

EXAMPLES:

```
sage: ClusterSeed(['A',3]).principal_extension().green_vertices()
[0, 1, 2]

sage: ClusterSeed(['A',[3,3],1]).principal_extension().green_vertices()
[0, 1, 2, 3, 4, 5]
```

```
>>> from sage.all import *
>>> ClusterSeed(['A',Integer(3)]).principal_extension().green_vertices()
[0, 1, 2]

>>> ClusterSeed(['A',[Integer(3),Integer(3)],Integer(1)]).principal_
↪extension().green_vertices()
[0, 1, 2, 3, 4, 5]
```

ground_field()

Return the *ground field* of the cluster of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.ground_field()
Multivariate Polynomial Ring in x0, x1, x2, y0, y1, y2 over Rational Field
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.ground_field()
Multivariate Polynomial Ring in x0, x1, x2, y0, y1, y2 over Rational Field
```

highest_degree_denominator(*filter=None*)

Return the vertex of the cluster polynomial with highest degree in the denominator.

INPUT:

- `filter` – list or iterable

OUTPUT: integer

EXAMPLES:

```
sage: B = matrix([[0,-1,0,-1,1,1], [1,0,1,0,-1,-1], [0,-1,0,-1,1,1],
....:             [1,0,1,0,-1,-1], [-1,1,-1,1,0,0], [-1,1,-1,1,0,0]])
sage: C = ClusterSeed(B).principal_extension(); C.mutate([0,1,2,4,3,2,5,4,3])
sage: C.highest_degree_denominator()
5
```

```
>>> from sage.all import *
>>> B = matrix([[Integer(0),-Integer(1),Integer(0),-Integer(1),Integer(1),
↪Integer(1)], [Integer(1),Integer(0),Integer(1),Integer(0),-Integer(1),-
↪Integer(1)], [Integer(0),-Integer(1),Integer(0),-Integer(1),Integer(1),
↪Integer(1)],
...              [Integer(1),Integer(0),Integer(1),Integer(0),-Integer(1),-
↪Integer(1)], [-Integer(1),Integer(1),-Integer(1),Integer(1),Integer(0),
↪Integer(0)], [-Integer(1),Integer(1),-Integer(1),Integer(1),Integer(0),
↪Integer(0)]])
>>> C = ClusterSeed(B).principal_extension(); C.mutate([Integer(0),Integer(1),
↪Integer(2),Integer(4),Integer(3),Integer(2),Integer(5),Integer(4),
↪Integer(3)])
>>> C.highest_degree_denominator()
5
```

interact(*fig_size=1*, *circular=True*)

Start an interactive window for cluster seed mutations.

Only in *Jupyter notebook mode*.

INPUT:

- `fig_size` – (default: 1) factor by which the size of the plot is multiplied
- `circular` – boolean (default: `True`); if `True`, the circular plot is chosen, otherwise >>spring<< is used

is_acyclic()

Return `True` iff `self` is acyclic (i.e., if the underlying quiver is acyclic).

EXAMPLES:

```
sage: ClusterSeed(['A',4]).is_acyclic()
True

sage: ClusterSeed(['A',[2,1],1]).is_acyclic()
True

sage: ClusterSeed([[0,1],[1,2],[2,0]]).is_acyclic()
False
```

```
>>> from sage.all import *
>>> ClusterSeed(['A',Integer(4)]).is_acyclic()
True

>>> ClusterSeed(['A',[Integer(2),Integer(1)],Integer(1)]).is_acyclic()
```

(continues on next page)

(continued from previous page)

```
True

>>> ClusterSeed([[Integer(0),Integer(1)],[Integer(1),Integer(2)],[Integer(2),
↪Integer(0)]]).is_acyclic()
False
```

is_bipartite(*return_bipartition=False*)

Return `True` iff `self` is bipartite (i.e., if the underlying quiver is bipartite).

INPUT:

- `return_bipartition` – boolean (default: `False`); if `True`, the bipartition is returned in the case of `self` being bipartite

EXAMPLES:

```
sage: ClusterSeed(['A',[3,3],1]).is_bipartite()
True

sage: ClusterSeed(['A',[4,3],1]).is_bipartite()
False
```

```
>>> from sage.all import *
>>> ClusterSeed(['A',[Integer(3),Integer(3)],Integer(1)]).is_bipartite()
True

>>> ClusterSeed(['A',[Integer(4),Integer(3)],Integer(1)]).is_bipartite()
False
```

is_finite()

Return `True` if `self` is of finite type.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.is_finite()
True

sage: S = ClusterSeed(['A',[2,2],1])
sage: S.is_finite()
False
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.is_finite()
True

>>> S = ClusterSeed(['A',[Integer(2),Integer(2)],Integer(1)])
>>> S.is_finite()
False
```

is_mutation_finite(*nr_of_checks=None*, *return_path=False*)

Return `True` if `self` is of finite mutation type.

INPUT:

- `nr_of_checks` – (default: `None`) number of mutations applied; standard is 500 times the number of vertices of `self`
- `return_path` – boolean (default: `False`); if `True`, in case of `self` not being mutation finite, a path from `self` to a quiver with an edge label $(a, -b)$ and $a * b > 4$ is returned

ALGORITHM:

- A cluster seed is mutation infinite if and only if every $b_{ij} * b_{ji} > -4$. Thus, we apply random mutations in random directions

Warning

- Uses a non-deterministic method by random mutations in various directions.
- In theory, it can return a wrong `True`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',10])
sage: S._mutation_type = None
sage: S.is_mutation_finite()
True

sage: S = ClusterSeed([(0,1),(1,2),(2,3),(3,4),(4,5),(5,6),(6,7),(7,8),(2,9)])
sage: S.is_mutation_finite()
False
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(10)])
>>> S._mutation_type = None
>>> S.is_mutation_finite()
True

>>> S = ClusterSeed([(Integer(0),Integer(1)),(Integer(1),Integer(2)),
...(Integer(2),Integer(3)),(Integer(3),Integer(4)),(Integer(4),Integer(5)),
...(Integer(5),Integer(6)),(Integer(6),Integer(7)),(Integer(7),Integer(8)),
...(Integer(2),Integer(9))])
>>> S.is_mutation_finite()
False
```

m()

Return the number of *frozen variables* of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.n()
3

sage: S.m()
0

sage: S = S.principal_extension()
```

(continues on next page)

(continued from previous page)

```
sage: S.m()
3
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.n()
3

>>> S.m()
0

>>> S = S.principal_extension()
>>> S.m()
3
```

most_decreased_denominator_after_mutation()

Return the vertex that will produce the most decrease in denominator degrees after mutation.

EXAMPLES:

```
sage: S = ClusterSeed(['A',5])
sage: S.mutate([0,2,3,1,2,3,1,2,0,2,3])
sage: S.most_decreased_denominator_after_mutation()
2
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(5)])
>>> S.mutate([Integer(0),Integer(2),Integer(3),Integer(1),Integer(2),
↪Integer(3),Integer(1),Integer(2),Integer(0),Integer(2),Integer(3)])
>>> S.most_decreased_denominator_after_mutation()
2
```

most_decreased_edge_after_mutation()

Return the vertex that will produce the least degrees after mutation.

EXAMPLES:

```
sage: S = ClusterSeed(['A',5])
sage: S.mutate([0,2,3,1,2,3,1,2,0,2,3])
sage: S.most_decreased_edge_after_mutation()
2
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(5)])
>>> S.mutate([Integer(0),Integer(2),Integer(3),Integer(1),Integer(2),
↪Integer(3),Integer(1),Integer(2),Integer(0),Integer(2),Integer(3)])
>>> S.most_decreased_edge_after_mutation()
2
```

mutate(*sequence*, *inplace=True*, *input_type=None*)

Mutate `self` at a vertex or a sequence of vertices.

INPUT:

- sequence – a vertex of self, an iterator of vertices of self, a function which takes in the *ClusterSeed* and returns a vertex or an iterator of vertices, or a string representing a type of vertices to mutate
- inplace – boolean (default: True); if False, the result is returned, otherwise self is modified
- input_type – (default: None) indicates the type of data contained in the sequence

Possible values for vertex types in sequence are:

- 'first_source' – mutates at first found source vertex
- 'sources' – mutates at all sources
- 'first_sink' – mutates at first sink
- 'sinks' – mutates at all sink vertices
- 'green' – mutates at the first green vertex
- 'red' – mutates at the first red vertex
- 'urban_renewal' or 'urban' – mutates at first urban renewal vertex
- 'all_urban_renewals' or 'all_urban' – mutates at all urban renewal vertices

For input_type, if no value is given, preference will be given to vertex names, then indices, then cluster variables. If all input is not of the same type, an error is given. Possible values for input_type are:

- 'vertices' – interprets the input sequence as vertices
- 'indices' – interprets the input sequence as indices
- 'cluster_vars' – interprets the input sequence as cluster variables. This must be selected if inputting a sequence of cluster variables.

EXAMPLES:

```
sage: S = ClusterSeed(['A',4]); S.b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

sage: S.mutate(0); S.b_matrix()
[ 0 -1  0  0]
[ 1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

sage: T = S.mutate(0, inplace=False); T
A seed for a cluster algebra of rank 4 of type ['A', 4]

sage: S.mutate(0)
sage: S == T
True

sage: S.mutate([0,1,0])
sage: S.b_matrix()
[ 0 -1  1  0]
[ 1  0  0  0]
```

```

mutation_analysis(*options=['all']*, *filter=None*)

Run an analysis of all potential mutation options. Note that this might take a long time on large seeds.

> **Note**
>
> Edges are only returned if we have a non-valued quiver. Green and red vertices are only returned if the cluster is principal.

INPUT:

- `options` – (default: `['all']`) a list of mutation options
- `filter` – (default: `None`) a vertex or interval of vertices to limit our search to

Possible options are:

- `'all'` – all options below
- `'edges'` – number of edges (works with skew-symmetric quivers)
- `'edge_diff'` – edges added/deleted (works with skew-symmetric quivers)
- `'green_vertices'` – list of green vertices (works with principals)
- `'green_vertices_diff'` – green vertices added/removed (works with principals)
- `'red_vertices'` – list of red vertices (works with principals)
- `'red_vertices_diff'` – red vertices added/removed (works with principals)
- `'urban_renewals'` – list of urban renewal vertices

- `'urban_renewals_diff'` – urban renewal vertices added/removed
- `'sources'` – list of source vertices
- `'sources_diff'` – source vertices added/removed
- `'sinks'` – list of sink vertices
- `'sinks_diff'` – sink vertices added/removed
- `'denominators'` – list of all denominators of the cluster variables

OUTPUT:

Outputs a dictionary indexed by the vertex numbers. Each vertex will itself also be a dictionary with each desired option included as a key in the dictionary. As an example you would get something similar to: `{0: {'edges': 1}, 1: {'edges': 2}}`. This represents that if you were to do a mutation at the current seed then mutating at vertex 0 would result in a quiver with 1 edge and mutating at vertex 0 would result in a quiver with 2 edges.

EXAMPLES:

```
sage: B = [[0, 4, 0, -1],[-4,0, 3, 0],[0, -3, 0, 1],[1, 0, -1, 0]]

mutation_class(*depth=+Infinity*, *show_depth=False*, *return_paths=False*, *up_to_equivalence=True*, *only_sink_source=False*)

Return the mutation class of `self` with respect to certain constraints.

Note

Vertex labels are not tracked in this method.

See also

mutation_class_iter()

INPUT:

- `depth` – (default: `infinity`) integer, only seeds with distance at most depth from `self` are returned
- `show_depth` – boolean (default: `False`); if `True`, the actual depth of the mutation is shown
- `return_paths` – boolean (default: `False`); if `True`, a shortest path of mutation sequences from self to the given quiver is returned as well
- `up_to_equivalence` – boolean (default: `True`); if `True`, only seeds up to equivalence are considered
- `sink_source` – boolean (default: `False`); if `True`, only mutations at sinks and sources are applied

EXAMPLES:

- for examples see *mutation_class_iter()*

mutation_class_iter(*depth=+Infinity*, *show_depth=False*, *return_paths=False*, *up_to_equivalence=True*, *only_sink_source=False*)

Return an iterator for the mutation class of `self` with respect to certain constraints.

INPUT:

- `depth` – (default: infinity) integer or infinity, only seeds with distance at most `depth` from `self` are returned
- `show_depth` – boolean (default: `False`); if `True`, the current depth of the mutation is shown while computing
- `return_paths` – boolean (default: `False`); if `True`, a shortest path of mutations from `self` to the given quiver is returned as well
- `up_to_equivalence` – boolean (default: `True`); if `True`, only one seed up to simultaneous permutation of rows and columns of the exchange matrix is recorded
- `sink_source` – boolean (default: `False`); if `True`, only mutations at sinks and sources are applied

EXAMPLES:

A standard finite type example:

```
sage: S = ClusterSeed(['A',3])
sage: it = S.mutation_class_iter()
sage: for T in it: print(T)
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
```

A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
```

A finite type example with given depth:

```
sage: it = S.mutation_class_iter(depth=1)
sage: for T in it: print(T)
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
```

```
>>> from sage.all import *
>>> it = S.mutation_class_iter(depth=Integer(1))
>>> for T in it: print(T)
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
A seed for a cluster algebra of rank 3 of type ['A', 3]
```

A finite type example where the depth is shown while computing:

```
sage: it = S.mutation_class_iter(show_depth=True)
sage: for T in it: pass
Depth: 0     found: 1          Time: ... s
Depth: 1     found: 4          Time: ... s
Depth: 2     found: 9          Time: ... s
Depth: 3     found: 13         Time: ... s
```

(continues on next page)

(continued from previous page)

```
Depth: 4     found: 14         Time: ... s
```

```
>>> from sage.all import *
>>> it = S.mutation_class_iter(show_depth=True)
>>> for T in it: pass
Depth: 0     found: 1          Time: ... s
Depth: 1     found: 4          Time: ... s
Depth: 2     found: 9          Time: ... s
Depth: 3     found: 13         Time: ... s
Depth: 4     found: 14         Time: ... s
```

A finite type example with shortest paths returned:

```
sage: it = S.mutation_class_iter(return_paths=True)
sage: mutation_class = list(it)
sage: len(mutation_class)
14
sage: mutation_class[0]
(A seed for a cluster algebra of rank 3 of type ['A', 3], [])
```

```
>>> from sage.all import *
>>> it = S.mutation_class_iter(return_paths=True)
>>> mutation_class = list(it)
>>> len(mutation_class)
14
>>> mutation_class[Integer(0)]
(A seed for a cluster algebra of rank 3 of type ['A', 3], [])
```

Finite type examples not considered up to equivalence:

```
sage: it = S.mutation_class_iter(up_to_equivalence=False)
sage: len([T for T in it])
84

sage: it = ClusterSeed(['A',2]).mutation_class_iter(return_paths=True,
....:                                               up_to_equivalence=False)
sage: mutation_class = list(it)
sage: len(mutation_class)
10
sage: mutation_class[0]
(A seed for a cluster algebra of rank 2 of type ['A', 2], [])
```

```
>>> from sage.all import *
>>> it = S.mutation_class_iter(up_to_equivalence=False)
>>> len([T for T in it])
84

>>> it = ClusterSeed(['A',Integer(2)]).mutation_class_iter(return_paths=True,
...                                                        up_to_equivalence=False)
>>> mutation_class = list(it)
>>> len(mutation_class)
10
```

(continues on next page)

(continued from previous page)

```
>>> mutation_class[Integer(0)]
(A seed for a cluster algebra of rank 2 of type ['A', 2], [])
```

Check that Issue #14638 is fixed:

```
sage: S = ClusterSeed(['E',6])
sage: MC = S.mutation_class(depth=6); len(MC)  # long time
388
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['E',Integer(6)])
>>> MC = S.mutation_class(depth=Integer(6)); len(MC)  # long time
388
```

Infinite type examples:

```
sage: S = ClusterSeed(['A',[1,1],1])
sage: it = S.mutation_class_iter()
sage: next(it)
A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1]
sage: next(it)
A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1]
sage: next(it)
A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1]
sage: next(it)
A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1]

sage: it = S.mutation_class_iter(depth=3, return_paths=True)
sage: for T in it: print(T)
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [1])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [0])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [1, 0])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [0, 1])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [1, 0, 1])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [0, 1, 0])
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',[Integer(1),Integer(1)],Integer(1)])
>>> it = S.mutation_class_iter()
>>> next(it)
A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1]
>>> next(it)
A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1]

(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [1])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [0])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [1, 0])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [0, 1])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [1, 0, 1])
(A seed for a cluster algebra of rank 2 of type ['A', [1, 1], 1], [0, 1, 0])
```

mutation_sequence(*sequence*, *show_sequence=False*, *fig_size=1.2*, *return_output='seed'*)

Return the seeds obtained by mutating `self` at all vertices in `sequence`.

INPUT:

- `sequence` – an iterable of vertices of self
- `show_sequence` – boolean (default: `False`); if `True`, a png containing the associated quivers is shown
- `fig_size` – (default: 1.2) factor by which the size of the plot is multiplied
- `return_output` – (default: `'seed'`) determines what output is to be returned:
  - if `'seed'`, outputs all the cluster seeds obtained by the `sequence` of mutations
  - if `'matrix'`, outputs a list of exchange matrices
  - if `'var'`, outputs a list of new cluster variables obtained at each step

EXAMPLES:

```
sage: S = ClusterSeed(['A',2])
sage: for T in S.mutation_sequence([0,1,0]):
....:     print(T.b_matrix())
[ 0 -1]
[ 1  0]
[ 0  1]
[-1  0]
[ 0 -1]
[ 1  0]

sage: S = ClusterSeed(['A',2])
sage: S.mutation_sequence([0,1,0,1], return_output='var')
[(x1 + 1)/x0, (x0 + x1 + 1)/(x0*x1), (x0 + 1)/x1, x0]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(2)])
>>> for T in S.mutation_sequence([Integer(0),Integer(1),Integer(0)]):
...     print(T.b_matrix())
[ 0 -1]
[ 1  0]
[ 0  1]
[-1  0]
[ 0 -1]
[ 1  0]

>>> S = ClusterSeed(['A',Integer(2)])
>>> S.mutation_sequence([Integer(0),Integer(1),Integer(0),Integer(1)], return_
```

(continues on next page)

(continued from previous page)

```
↪output='var')
[(x1 + 1)/x0, (x0 + x1 + 1)/(x0*x1), (x0 + 1)/x1, x0]
```

Verify that calling mutation_sequence with show_sequence set to True executes without raising an AttributeError

sage: B = Matrix([[0,1],[-1, 0]]) sage: S = ClusterSeed(B) sage: S.mutation_sequence([0,1], show_sequence=True) [A seed for a cluster algebra of rank 2, A seed for a cluster algebra of rank 2]

mutation_type()

Return the mutation type of each connected component of `self`, if it can be determined.

Otherwise, the mutation type of this component is set to be unknown.

The mutation types of the components are ordered by vertex labels.

Warning

- All finite types can be detected,
- All affine types can be detected, **except** affine type D (the algorithm is not yet implemented)
- All exceptional types can be detected.
- Might fail to work if it is used within different Sage processes simultaneously (that happened in the doctesting).

EXAMPLES:

- finite types:

```
sage: S = ClusterSeed(['A',5])
sage: S._mutation_type = S._quiver._mutation_type = None
sage: S.mutation_type()
['A', 5]

sage: S = ClusterSeed([(0,1),(1,2),(2,3),(3,4)])
sage: S.mutation_type()
['A', 5]

sage: S = ClusterSeed(DiGraph([['a','b'],['c','b'],['c','d'],['e','d']]),
....:                 frozen=['c'])
sage: S.mutation_type()
[ ['A', 2], ['A', 2] ]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(5)])
>>> S._mutation_type = S._quiver._mutation_type = None
>>> S.mutation_type()
['A', 5]

>>> S = ClusterSeed([(Integer(0),Integer(1)),(Integer(1),Integer(2)),
↪(Integer(2),Integer(3)),(Integer(3),Integer(4))])
>>> S.mutation_type()
```

(continues on next page)

(continued from previous page)

```
['A', 5]

>>> S = ClusterSeed(DiGraph([['a','b'],['c','b'],['c','d'],['e','d']]),
...                 frozen=['c'])
>>> S.mutation_type()
[ ['A', 2], ['A', 2] ]
```

- affine types:

```
sage: S = ClusterSeed(['E',8,[1,1]]); S
A seed for a cluster algebra of rank 10 of type ['E', 8, [1, 1]]
sage: S._mutation_type = S._quiver._mutation_type = None; S
A seed for a cluster algebra of rank 10
sage: S.mutation_type() # long time
['E', 8, [1, 1]]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['E',Integer(8),[Integer(1),Integer(1)]]); S
A seed for a cluster algebra of rank 10 of type ['E', 8, [1, 1]]
>>> S._mutation_type = S._quiver._mutation_type = None; S
A seed for a cluster algebra of rank 10
>>> S.mutation_type() # long time
['E', 8, [1, 1]]
```

- the not yet working affine type D:

```
sage: S = ClusterSeed(['D',4,1])
sage: S._mutation_type = S._quiver._mutation_type = None
sage: S.mutation_type() # todo: not implemented
['D', 4, 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['D',Integer(4),Integer(1)])
>>> S._mutation_type = S._quiver._mutation_type = None
>>> S.mutation_type() # todo: not implemented
['D', 4, 1]
```

- the exceptional types:

```
sage: S = ClusterSeed(['X',6])
sage: S._mutation_type = S._quiver._mutation_type = None
sage: S.mutation_type() # long time
['X', 6]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['X',Integer(6)])
>>> S._mutation_type = S._quiver._mutation_type = None
>>> S.mutation_type() # long time
['X', 6]
```

- infinite types:

```
sage: S = ClusterSeed(['GR',[4,9]])
sage: S._mutation_type = S._quiver._mutation_type = None
sage: S.mutation_type()
'undetermined infinite mutation type'
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['GR',[Integer(4),Integer(9)]])
>>> S._mutation_type = S._quiver._mutation_type = None
>>> S.mutation_type()
'undetermined infinite mutation type'
```

mutations()

Return the list of mutations `self` has undergone if they are being tracked.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.mutations()
[]

sage: S.mutate([0,1,0,2])
sage: S.mutations()
[0, 1, 0, 2]

sage: S.track_mutations(False)
sage: S.mutations()
Traceback (most recent call last):
...
ValueError: Not recording mutation sequence.  Need to track mutations.
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.mutations()
[]

>>> S.mutate([Integer(0),Integer(1),Integer(0),Integer(2)])
>>> S.mutations()
[0, 1, 0, 2]

>>> S.track_mutations(False)
>>> S.mutations()
Traceback (most recent call last):
...
ValueError: Not recording mutation sequence.  Need to track mutations.
```

n()

Return the number of *exchangeable variables* of `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A', 3])
sage: S.n()
3
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A', Integer(3)])
>>> S.n()
3
```

oriented_exchange_graph()

Return the oriented exchange graph of `self` as a directed graph.

The seed must be a cluster seed for a cluster algebra of finite type with principal coefficients (the corresponding quiver must have mutable vertices $0, 1, ..., n-1$).

EXAMPLES:

```
sage: S = ClusterSeed(['A', 2]).principal_extension()
sage: G = S.oriented_exchange_graph(); G
Digraph on 5 vertices
sage: G.out_degree_sequence()
[2, 1, 1, 1, 0]

sage: S = ClusterSeed(['B', 2]).principal_extension()
sage: G = S.oriented_exchange_graph(); G
Digraph on 6 vertices
sage: G.out_degree_sequence()
[2, 1, 1, 1, 1, 0]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A', Integer(2)]).principal_extension()
>>> G = S.oriented_exchange_graph(); G
Digraph on 5 vertices
>>> G.out_degree_sequence()
[2, 1, 1, 1, 0]

>>> S = ClusterSeed(['B', Integer(2)]).principal_extension()
>>> G = S.oriented_exchange_graph(); G
Digraph on 6 vertices
>>> G.out_degree_sequence()
[2, 1, 1, 1, 1, 0]
```

plot(*circular=False*, *mark=None*, *save_pos=False*, *force_c=False*, *with_greens=False*, *add_labels=False*)

Return the plot of the quiver of `self`.

INPUT:

- `circular` – boolean (default: `False`); if `True`, the circular plot is chosen, otherwise >>spring<< is used
- `mark` – (default: `None`) if set to i, the vertex i is highlighted
- `save_pos` – boolean (default: `False`); if `True`, the positions of the vertices are saved
- `force_c` – boolean (default: `False`); if `True`, will show the frozen vertices even if they were never initialized
- `with_greens` – boolean (default: `False`); if `True`, will display the green vertices in green
- `add_labels` – boolean (default: `False`); if `True`, will use the initial variables as labels

EXAMPLES:

```
sage: S = ClusterSeed(['A',5])
sage: S.plot()                                                              #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
sage: S.plot(circular=True)                                                 #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
sage: S.plot(circular=True, mark=1)                                         #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(5)])
>>> S.plot()                                                                #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
>>> S.plot(circular=True)                                                   #␣
↪needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
>>> S.plot(circular=True, mark=Integer(1))                                    ␣
↪     # needs sage.plot sage.symbolic
Graphics object consisting of 15 graphics primitives
```

principal_extension()

Return the principal extension of `self`, yielding a $2n \times n$ matrix.

Raises an error if the input seed has a non-square exchange matrix. In this case, the method instead adds n frozen variables to any previously frozen variables. I.e., the seed obtained by adding a frozen variable to every exchangeable variable of `self`.

EXAMPLES:

```
sage: S = ClusterSeed([[0,1],[1,2],[2,3],[2,4]]); S
A seed for a cluster algebra of rank 5

sage: T = S.principal_extension(); T
A seed for a cluster algebra of rank 5 with principal coefficients

sage: T.b_matrix()
[ 0  1  0  0  0]
[-1  0  1  0  0]
[ 0 -1  0  1  1]
[ 0  0 -1  0  0]
[ 0  0 -1  0  0]
[ 1  0  0  0  0]
[ 0  1  0  0  0]
[ 0  0  1  0  0]
[ 0  0  0  1  0]
[ 0  0  0  0  1]

sage: S = ClusterSeed(['A', 4], user_labels=['a', 'b', 'c', 'd'])
sage: T = S.principal_extension()
sage: T.cluster()
```

(continues on next page)

(continued from previous page)

```
[a, b, c, d]
sage: T.coefficients()
[y0, y1, y2, y3]
sage: S2 = ClusterSeed(['A', 4], user_labels={0:'a', 1:'b', 2:'c', 3:'d'})
sage: S2 == S
True
sage: T2 = S2.principal_extension()
sage: T2 == T
True
```

```
>>> from sage.all import *
>>> S = ClusterSeed([[Integer(0),Integer(1)],[Integer(1),Integer(2)],
↪[Integer(2),Integer(3)],[Integer(2),Integer(4)]]); S
A seed for a cluster algebra of rank 5

>>> T = S.principal_extension(); T
A seed for a cluster algebra of rank 5 with principal coefficients

>>> T.b_matrix()
[ 0  1  0  0  0]
[-1  0  1  0  0]
[ 0 -1  0  1  1]
[ 0  0 -1  0  0]
[ 0  0 -1  0  0]
[ 1  0  0  0  0]
[ 0  1  0  0  0]
[ 0  0  1  0  0]
[ 0  0  0  1  0]
[ 0  0  0  0  1]

>>> S = ClusterSeed(['A', Integer(4)], user_labels=['a', 'b', 'c', 'd'])
>>> T = S.principal_extension()
>>> T.cluster()
[a, b, c, d]
>>> T.coefficients()
[y0, y1, y2, y3]
>>> S2 = ClusterSeed(['A', Integer(4)], user_labels={Integer(0):'a',␣
↪Integer(1):'b', Integer(2):'c', Integer(3):'d'})
>>> S2 == S
True
>>> T2 = S2.principal_extension()
>>> T2 == T
True
```

quiver()

Return the *quiver* associated to `self`.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.quiver()
Quiver on 3 vertices of type ['A', 3]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.quiver()
Quiver on 3 vertices of type ['A', 3]
```

red_vertices()

Return the list of red vertices of `self`.

A vertex is defined to be red if its c-vector has all nonnegative entries. More information on red vertices can be found at [BDP2013].

OUTPUT: the red vertices as a list of integers

EXAMPLES:

```
sage: ClusterSeed(['A',3]).principal_extension().red_vertices()
[]

sage: ClusterSeed(['A',[3,3],1]).principal_extension().red_vertices()
[]

sage: Q = ClusterSeed(['A',[3,3],1]).principal_extension()
sage: Q.mutate(1)
sage: Q.red_vertices()
[1]
```

```
>>> from sage.all import *
>>> ClusterSeed(['A',Integer(3)]).principal_extension().red_vertices()
[]

>>> ClusterSeed(['A',[Integer(3),Integer(3)],Integer(1)]).principal_
↪extension().red_vertices()
[]

>>> Q = ClusterSeed(['A',[Integer(3),Integer(3)],Integer(1)]).principal_
↪extension()
>>> Q.mutate(Integer(1))
>>> Q.red_vertices()
[1]
```

reorient(*data*)

Reorients `self` with respect to the given total order, or with respect to an iterator of ordered pairs.

Warning

- This operation might change the mutation type of `self`.
- Ignores ordered pairs (i, j) for which neither (i, j) nor (j, i) is an edge of `self`.

INPUT:

- `data` – an iterator defining a total order on `self.vertices()`, or an iterator of ordered pairs in `self` defining the new orientation of these edges.

EXAMPLES:

```
sage: S = ClusterSeed(['A',[2,3],1])
sage: S.mutation_type()
['A', [2, 3], 1]

sage: S.reorient([(0,1),(2,3)])
sage: S.mutation_type()
['D', 5]

sage: S.reorient([(1,0),(2,3)])
sage: S.mutation_type()
['A', [1, 4], 1]

sage: S.reorient([0,1,2,3,4])
sage: S.mutation_type()
['A', [1, 4], 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',[Integer(2),Integer(3)],Integer(1)])
>>> S.mutation_type()
['A', [2, 3], 1]

>>> S.reorient([(Integer(0),Integer(1)),(Integer(2),Integer(3))])
>>> S.mutation_type()
['D', 5]

>>> S.reorient([(Integer(1),Integer(0)),(Integer(2),Integer(3))])
>>> S.mutation_type()
['A', [1, 4], 1]

>>> S.reorient([Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)])
>>> S.mutation_type()
['A', [1, 4], 1]
```

reset_cluster()

Reset the cluster of `self` to the initial cluster.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: S.mutate([1,2,1])
sage: S.cluster()
[x0, (x1 + 1)/x2, (x0*x2 + x1 + 1)/(x1*x2)]

sage: S.reset_cluster()
sage: S.cluster()
[x0, x1, x2]

sage: T = S.principal_extension()
sage: T.cluster()
[x0, x1, x2]
sage: T.mutate([1,2,1])
sage: T.cluster()
```

(continues on next page)

(continued from previous page)

```
[x0, (x1*y2 + x0)/x2, (x1*y1*y2 + x0*y1 + x2)/(x1*x2)]

sage: T.reset_cluster()
sage: T.cluster()
[x0, x1, x2]

sage: S = ClusterSeed(['B',3], user_labels=[[1,2],[2,3],[3,4]],
....:                 user_labels_prefix='p')
sage: S.mutate([0,1])
sage: S.cluster()
[(p_2_3 + 1)/p_1_2, (p_1_2*p_3_4^2 + p_2_3 + 1)/(p_1_2*p_2_3), p_3_4]

sage: S.reset_cluster()
sage: S.cluster()
[p_1_2, p_2_3, p_3_4]
sage: S.g_matrix()
[1 0 0]
[0 1 0]
[0 0 1]
sage: S.f_polynomials()
[1, 1, 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> S.mutate([Integer(1),Integer(2),Integer(1)])
>>> S.cluster()
[x0, (x1 + 1)/x2, (x0*x2 + x1 + 1)/(x1*x2)]

>>> S.reset_cluster()
>>> S.cluster()
[x0, x1, x2]

>>> T = S.principal_extension()
>>> T.cluster()
[x0, x1, x2]
>>> T.mutate([Integer(1),Integer(2),Integer(1)])
>>> T.cluster()
[x0, (x1*y2 + x0)/x2, (x1*y1*y2 + x0*y1 + x2)/(x1*x2)]

>>> T.reset_cluster()
>>> T.cluster()
[x0, x1, x2]

>>> S = ClusterSeed(['B',Integer(3)], user_labels=[[Integer(1),Integer(2)],
↪[Integer(2),Integer(3)],[Integer(3),Integer(4)]],
...                 user_labels_prefix='p')
>>> S.mutate([Integer(0),Integer(1)])
>>> S.cluster()
[(p_2_3 + 1)/p_1_2, (p_1_2*p_3_4^2 + p_2_3 + 1)/(p_1_2*p_2_3), p_3_4]

>>> S.reset_cluster()
>>> S.cluster()
```

(continues on next page)

(continued from previous page)

```
[p_1_2, p_2_3, p_3_4]
>>> S.g_matrix()
[1 0 0]
[0 1 0]
[0 0 1]
>>> S.f_polynomials()
[1, 1, 1]
```

reset_coefficients()

Reset the coefficients of `self` to the frozen variables but keep the current cluster.

This raises an error if the number of frozen variables is different from the number of exchangeable variables.

Warning

This command to be phased out since *use_c_vectors()* does this more effectively.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3]).principal_extension()
sage: S.b_matrix()
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]
[ 1  0  0]
[ 0  1  0]
[ 0  0  1]
sage: S.mutate([1,2,1])
sage: S.b_matrix()
[ 0  1 -1]
[-1  0  1]
[ 1 -1  0]
[ 1  0  0]
[ 0  1 -1]
[ 0  0 -1]
sage: S.reset_coefficients()
sage: S.b_matrix()
[ 0  1 -1]
[-1  0  1]
[ 1 -1  0]
[ 1  0  0]
[ 0  1  0]
[ 0  0  1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)]).principal_extension()
>>> S.b_matrix()
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]
[ 1  0  0]
```

(continues on next page)

(continued from previous page)

```
[ 0  1  0]
[ 0  0  1]
>>> S.mutate([Integer(1),Integer(2),Integer(1)])
>>> S.b_matrix()
[ 0  1 -1]
[-1  0  1]
[ 1 -1  0]
[ 1  0  0]
[ 0  1 -1]
[ 0  0 -1]
>>> S.reset_coefficients()
>>> S.b_matrix()
[ 0  1 -1]
[-1  0  1]
[ 1 -1  0]
[ 1  0  0]
[ 0  1  0]
[ 0  0  1]
```

save_image(*filename*, *circular=False*, *mark=None*, *save_pos=False*)

Save the plot of the underlying digraph of the quiver of `self`.

INPUT:

- `filename` – the filename the image is saved to
- `circular` – boolean (default: `False`); if `True`, the circular plot is chosen, otherwise >>spring<< is used
- `mark` – (default: `None`) if set to i, the vertex i is highlighted
- `save_pos` – boolean (default: `False`); if `True`, the positions of the vertices are saved

EXAMPLES:

```
sage: S = ClusterSeed(['F',4,[1,2]])
sage: import tempfile
sage: with tempfile.NamedTemporaryFile(suffix='.png') as f:                #␣
↪needs sage.plot sage.symbolic
....:     S.save_image(f.name)
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['F',Integer(4),[Integer(1),Integer(2)]])
>>> import tempfile
>>> with tempfile.NamedTemporaryFile(suffix='.png') as f:                  #␣
↪needs sage.plot sage.symbolic
...     S.save_image(f.name)
```

set_c_matrix(*data*)

Will force set the c-matrix according to a matrix, a quiver, or a seed.

INPUT:

- `data` – the matrix to set the c-matrix to; also allowed to be a quiver or cluster seed, in which case the b-matrix is used

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: X = matrix([[0,0,1],[0,1,0],[1,0,0]])
sage: S.set_c_matrix(X)
sage: S.c_matrix()
[0 0 1]
[0 1 0]
[1 0 0]

sage: Y = matrix([[-1,0,1],[0,1,0],[1,0,0]])
sage: S.set_c_matrix(Y)
C matrix does not look to be valid - there exists a column
containing positive and negative entries.
Continuing...

sage: Z = matrix([[1,0,1],[0,1,0],[2,0,2]])
sage: S.set_c_matrix(Z)
C matrix does not look to be valid - not a linearly independent set.
Continuing...
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> X = matrix([[Integer(0),Integer(0),Integer(1)],[Integer(0),Integer(1),
↪Integer(0)],[Integer(1),Integer(0),Integer(0)]])
>>> S.set_c_matrix(X)
>>> S.c_matrix()
[0 0 1]
[0 1 0]
[1 0 0]

>>> Y = matrix([[-Integer(1),Integer(0),Integer(1)],[Integer(0),Integer(1),
↪Integer(0)],[Integer(1),Integer(0),Integer(0)]])
>>> S.set_c_matrix(Y)
C matrix does not look to be valid - there exists a column
containing positive and negative entries.
Continuing...

>>> Z = matrix([[Integer(1),Integer(0),Integer(1)],[Integer(0),Integer(1),
↪Integer(0)],[Integer(2),Integer(0),Integer(2)]])
>>> S.set_c_matrix(Z)
C matrix does not look to be valid - not a linearly independent set.
Continuing...
```

set_cluster(*cluster*, *force=False*)

Set the cluster for `self` to `cluster`.

> **Warning**
>
> Initialization may lead to inconsistent data.

INPUT:

- `cluster` – an iterable defining a cluster for `self`

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: cluster = S.cluster()
sage: S.mutate([1,2,1])
sage: S.cluster()
[x0, (x1 + 1)/x2, (x0*x2 + x1 + 1)/(x1*x2)]
sage: cluster2 = S.cluster()

sage: S.set_cluster(cluster)
Warning: using set_cluster at this point could lead to inconsistent seed data.

sage: S.set_cluster(cluster, force=True)
sage: S.cluster()
[x0, x1, x2]
sage: S.set_cluster(cluster2, force=True)
sage: S.cluster()
[x0, (x1 + 1)/x2, (x0*x2 + x1 + 1)/(x1*x2)]

sage: S = ClusterSeed(['A',3]); S.use_fpolys(False)
sage: S.set_cluster([1,1,1])
Warning: clusters not being tracked so this command is ignored.
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> cluster = S.cluster()
>>> S.mutate([Integer(1),Integer(2),Integer(1)])
>>> S.cluster()
[x0, (x1 + 1)/x2, (x0*x2 + x1 + 1)/(x1*x2)]
>>> cluster2 = S.cluster()

>>> S.set_cluster(cluster)
Warning: using set_cluster at this point could lead to inconsistent seed data.

>>> S.set_cluster(cluster, force=True)
>>> S.cluster()
[x0, x1, x2]
>>> S.set_cluster(cluster2, force=True)
>>> S.cluster()
[x0, (x1 + 1)/x2, (x0*x2 + x1 + 1)/(x1*x2)]

>>> S = ClusterSeed(['A',Integer(3)]); S.use_fpolys(False)
>>> S.set_cluster([Integer(1),Integer(1),Integer(1)])
Warning: clusters not being tracked so this command is ignored.
```

show(*fig_size=1*, *circular=False*, *mark=None*, *save_pos=False*, *force_c=False*, *with_greens=False*, *add_labels=False*)

Shows the plot of the quiver of `self`.

INPUT:

- `fig_size` – (default: 1) factor by which the size of the plot is multiplied
- `circular` – boolean (default: `False`); if `True`, the circular plot is chosen, otherwise >>spring<< is used

- `mark` – (default: `None`) if set to i, the vertex i is highlighted
- `save_pos` – boolean (default: `False`); if `True`, the positions of the vertices are saved
- `force_c` – boolean (default: `False`); if `True`, will show the frozen vertices even if they were never initialized
- `with_greens` – boolean (default: `False`); if `True`, will display the green vertices in green
- `add_labels` – boolean (default: `False`); if `True`, will use the initial variables as labels

smallest_c_vector()

Return the vertex with the smallest c-vector.

OUTPUT: integer

EXAMPLES:

```
sage: B = matrix([[0,2], [-2,0]])
sage: C = ClusterSeed(B).principal_extension()
sage: C.mutate(0)
sage: C.smallest_c_vector()
0
```

```
>>> from sage.all import *
>>> B = matrix([[Integer(0),Integer(2)], [-Integer(2),Integer(0)]])
>>> C = ClusterSeed(B).principal_extension()
>>> C.mutate(Integer(0))
>>> C.smallest_c_vector()
0
```

track_mutations(*use=True*)

Begin tracking the mutation path.

Warning

May initialize all other data to ensure that all c-, d-, and g-vectors agree on the start of mutations.

INPUT:

- `use` – boolean (default: `True`); if `True`, will begin filling the mutation path

EXAMPLES:

```
sage: S = ClusterSeed(['A',4]); S.track_mutations(False)
sage: S.mutate(0)
sage: S.mutations()
Traceback (most recent call last):
...
ValueError: Not recording mutation sequence.  Need to track mutations.
sage: S.track_mutations(True)
sage: S.g_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

(continues on next page)

(continued from previous page)

```
sage: S.mutate([0,1])
sage: S.mutations()
[0, 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(4)]); S.track_mutations(False)
>>> S.mutate(Integer(0))
>>> S.mutations()
Traceback (most recent call last):
...
ValueError: Not recording mutation sequence.  Need to track mutations.
>>> S.track_mutations(True)
>>> S.g_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]

>>> S.mutate([Integer(0),Integer(1)])
>>> S.mutations()
[0, 1]
```

universal_extension()

Return the universal extension of `self`.

This is the initial seed of the associated cluster algebra with universal coefficients, as defined in section 12 of [FZ2007].

This method works only if `self` is a bipartite, finite-type seed.

Due to some limitations in the current implementation of `CartanType`, we need to construct the set of almost positive coroots by hand. As a consequence their ordering is not the standard one (the rows of the bottom part of the exchange matrix might be a shuffling of those you would expect).

EXAMPLES:

```
sage: S = ClusterSeed(['A',2])
sage: T = S.universal_extension()
sage: T.b_matrix()
[ 0  1]
[-1  0]
[-1  0]
[ 1  0]
[ 1 -1]
[ 0  1]
[ 0 -1]

sage: S = ClusterSeed(['A',3])
sage: T = S.universal_extension()
sage: T.b_matrix()
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]
```

(continues on next page)

(continued from previous page)

```

[ 1  0  0]
[ 1 -1  0]
[ 1 -1  1]
[ 0  1  0]
[ 0 -1  0]
[ 0 -1  1]
[ 0  0 -1]
[ 0  0  1]

sage: S = ClusterSeed(['B',2])
sage: T = S.universal_extension()
sage: T.b_matrix()
[ 0  1]
[-2  0]
[-1  0]
[ 1  0]
[ 1 -1]
[ 2 -1]
[ 0  1]
[ 0 -1]

sage: S = ClusterSeed(['A', 5], user_labels=[-2, -1, 0, 1 ,2])
sage: U = S.universal_extension()
sage: U.b_matrix() == ClusterSeed(['A', 5]).universal_extension().b_matrix()
True
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(2)])
>>> T = S.universal_extension()
>>> T.b_matrix()
[ 0  1]
[-1  0]
[-1  0]
[ 1  0]
[ 1 -1]
[ 0  1]
[ 0 -1]

>>> S = ClusterSeed(['A',Integer(3)])
>>> T = S.universal_extension()
>>> T.b_matrix()
[ 0  1  0]
[-1  0 -1]
[ 0  1  0]
[-1  0  0]
[ 1  0  0]
[ 1 -1  0]
[ 1 -1  1]
[ 0  1  0]
[ 0 -1  0]

[ 0  1]
[-2  0]
[-1  0]
[ 1  0]
[ 1 -1]
[ 2 -1]
[ 0  1]
[ 0 -1]

>>> S = ClusterSeed(['A', Integer(5)], user_labels=[-Integer(2), -Integer(1),␣
↪Integer(0), Integer(1) ,Integer(2)])
>>> U = S.universal_extension()
>>> U.b_matrix() == ClusterSeed(['A', Integer(5)]).universal_extension().b_
↪matrix()
True
```

urban_renewals(*return_first=False*)

Return the list of the urban renewal vertices of `self`.

An urban renewal vertex is one in which there are two arrows pointing toward the vertex and two arrows pointing away.

INPUT:

- `return_first` – boolean (default: `False`); if `True`, will return the first urban renewal

OUTPUT:

A list of vertices (as integers)

EXAMPLES:

```
sage: G = ClusterSeed(['GR',[4,9]]); G.urban_renewals()
[5, 6]
```

```
>>> from sage.all import *
>>> G = ClusterSeed(['GR',[Integer(4),Integer(9)]]); G.urban_renewals()
[5, 6]
```

use_c_vectors(*use=True*, *bot_is_c=False*, *force=False*)

Reconstruct c-vectors from other data or initialize if no usable data exists.

Warning: Initialization may lead to inconsistent data.

INPUT:

- `use` – boolean (default: `True`); if `True`, will use c-vectors
- `bot_is_c` – boolean (default: `False`); if `True` and *ClusterSeed* `self` has `self._m == self._n`, then will assume bottom half of the extended exchange matrix is the c-matrix. If `True`, lets the *ClusterSeed* know c-vectors can be calculated.

EXAMPLES:

```
sage: S = ClusterSeed(['A',4])
sage: S.use_c_vectors(False); S.use_g_vectors(False)
sage: S.use_fpolys(False); S.track_mutations(False)
sage: S.use_c_vectors(True)
Warning: Initializing c-vectors at this point
could lead to inconsistent seed data.

sage: S.use_c_vectors(True, force=True)
sage: S.c_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]

sage: S = ClusterSeed(['A',4])
sage: S.use_c_vectors(False); S.use_g_vectors(False)
sage: S.use_fpolys(False); S.track_mutations(False)
sage: S.mutate(1)
sage: S.use_c_vectors(True, force=True)
sage: S.c_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(4)])
>>> S.use_c_vectors(False); S.use_g_vectors(False)
>>> S.use_fpolys(False); S.track_mutations(False)
>>> S.use_c_vectors(True)
Warning: Initializing c-vectors at this point
could lead to inconsistent seed data.

>>> S.use_c_vectors(True, force=True)
>>> S.c_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]

>>> S = ClusterSeed(['A',Integer(4)])
>>> S.use_c_vectors(False); S.use_g_vectors(False)
>>> S.use_fpolys(False); S.track_mutations(False)
>>> S.mutate(Integer(1))
>>> S.use_c_vectors(True, force=True)
>>> S.c_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

use_d_vectors(*use=True*, *force=False*)

Reconstruct d-vectors from other data or initialize if no usable data exists.

Warning

Initialization may lead to inconsistent data.

INPUT:

- `use` – boolean (default: `True`); if `True`, will use d-vectors

EXAMPLES:

```
sage: S = ClusterSeed(['A',4])
sage: S.use_d_vectors(True)
sage: S.d_matrix()
[-1  0  0  0]
[ 0 -1  0  0]
[ 0  0 -1  0]
[ 0  0  0 -1]

sage: S = ClusterSeed(['A',4]); S.use_d_vectors(False)
sage: S.track_mutations(False); S.mutate(1); S.d_matrix()
[-1  0  0  0]
[ 0  1  0  0]
[ 0  0 -1  0]
[ 0  0  0 -1]
sage: S.use_fpolys(False)
sage: S.d_matrix()
Traceback (most recent call last):
...
ValueError: Unable to calculate d-vectors. Need to use d vectors.

sage: S = ClusterSeed(['A',4]); S.use_d_vectors(False)
sage: S.track_mutations(False); S.mutate(1); S.d_matrix()
[-1  0  0  0]
[ 0  1  0  0]
[ 0  0 -1  0]
[ 0  0  0 -1]
sage: S.use_fpolys(False)
sage: S.use_d_vectors(True)
Warning: Initializing d-vectors at this point
could lead to inconsistent seed data.

sage: S.use_d_vectors(True, force=True)
sage: S.d_matrix()
[-1  0  0  0]
[ 0 -1  0  0]
[ 0  0 -1  0]
[ 0  0  0 -1]

sage: S = ClusterSeed(['A',4]); S.mutate(1); S.d_matrix()
[-1  0  0  0]
[ 0  1  0  0]
```

(continues on next page)

(continued from previous page)

```
[ 0  0 -1  0]

[-1  0  0  0]
[ 0  1  0  0]
[ 0  0 -1  0]
```

(continues on next page)

(continued from previous page)

```
[ 0  0  0 -1]
>>> S = ClusterSeed(['A',Integer(4)])
>>> S.use_d_vectors(True); S.mutate(Integer(1)); S.d_matrix()
[-1  0  0  0]
[ 0  1  0  0]
[ 0  0 -1  0]
[ 0  0  0 -1]
```

use_fpolys(*use=True*, *user_labels=None*, *user_labels_prefix=None*)

Use F-polynomials in our Cluster Seed.

Note: This will automatically try to recompute the cluster variables if possible

INPUT:

- `use` – boolean (default: `True`); if `True`, will use F-polynomials
- `user_labels` – (default: `None`) if set, will overwrite the default cluster variable `labels`
- `user_labels_prefix` – (default: `None`) if set, will overwrite the default

EXAMPLES:

```
sage: S = ClusterSeed(['A',4]); S.use_fpolys(False); S._cluster
sage: S.use_fpolys(True)
sage: S.cluster()
[x0, x1, x2, x3]

sage: S = ClusterSeed(['A',4]); S.use_fpolys(False); S.track_mutations(False)
sage: S.mutate(1)
sage: S.use_fpolys(True)
Traceback (most recent call last):
...
ValueError: F-polynomials and Cluster Variables cannot be reconstructed
from given data.
sage: S.cluster()
Traceback (most recent call last):
...
ValueError: Clusters not being tracked
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(4)]); S.use_fpolys(False); S._cluster
>>> S.use_fpolys(True)
>>> S.cluster()
[x0, x1, x2, x3]

>>> S = ClusterSeed(['A',Integer(4)]); S.use_fpolys(False); S.track_
↪mutations(False)
>>> S.mutate(Integer(1))
>>> S.use_fpolys(True)
Traceback (most recent call last):
...
ValueError: F-polynomials and Cluster Variables cannot be reconstructed
from given data.
>>> S.cluster()
```

(continues on next page)

(continued from previous page)

```
Traceback (most recent call last):
...
ValueError: Clusters not being tracked
```

use_g_vectors(*use=True*, *force=False*)

Reconstruct g-vectors from other data or initialize if no usable data exists.

> **Warning**
>
> Initialization may lead to inconsistent data.

INPUT:

- `use` – boolean (default: `True`); if `True`, will use g-vectors

EXAMPLES:

```
sage: S = ClusterSeed(['A',4])
sage: S.use_g_vectors(False); S.use_fpolys(False)
sage: S.use_g_vectors(True)
sage: S.g_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]

sage: S = ClusterSeed(['A',4])
sage: S.use_g_vectors(False); S.use_fpolys(False)
sage: S.mutate(1)
sage: S.use_g_vectors(True)
sage: S.g_matrix()
[ 1  0  0  0]
[ 0 -1  0  0]
[ 0  0  1  0]
[ 0  0  0  1]

[ 0 -1  0  0]
[ 0  0  1  0]
[ 0  0  0  1]

>>> S = ClusterSeed(['A',Integer(4)])
>>> S.use_g_vectors(False); S.use_fpolys(False); S.track_mutations(False)
>>> S.mutate(Integer(1))
>>> S.use_c_vectors(False)
>>> S.g_matrix()
Traceback (most recent call last):
...
ValueError: Unable to calculate g-vectors. Need to use g vectors.

>>> S = ClusterSeed(['A',Integer(4)])
>>> S.use_g_vectors(False); S.use_fpolys(False); S.track_mutations(False)
>>> S.mutate(Integer(1))
>>> S.use_c_vectors(False)
>>> S.use_g_vectors(True)
Warning: Initializing g-vectors at this point
could lead to inconsistent seed data.

>>> S.use_g_vectors(True, force=True)
>>> S.g_matrix()
[1 0 0 0]
[0 1 0 0]
[0 0 1 0]
[0 0 0 1]
```

variable_class(*depth=+Infinity*, *ignore_bipartite_belt=False*)

Return all cluster variables in the mutation class of `self`.

INPUT:

- `depth` – (default: infinity) integer, only seeds with distance at most `depth` from `self` are returned
- `ignore_bipartite_belt` – boolean (default: `False`); if `True`, the algorithm does not use the bipartite belt

EXAMPLES:

- for examples see *variable_class_iter()*

variable_class_iter(*depth=+Infinity*, *ignore_bipartite_belt=False*)

Return an iterator for all cluster variables in the mutation class of `self`.

INPUT:

- `depth` – (default: infinity) integer, only seeds with distance at most `depth` from `self` are returned
- `ignore_bipartite_belt` – boolean (default: `False`); if `True`, the algorithm does not use the bipartite belt

EXAMPLES:

A standard finite type example:

```
sage: S = ClusterSeed(['A',3])
sage: it = S.variable_class_iter()
sage: for T in it: print(T)
x0
x1
x2
(x1 + 1)/x0
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2)
(x1 + 1)/x2
(x0*x2 + x1 + 1)/(x0*x1)
(x0*x2 + 1)/x1
(x0*x2 + x1 + 1)/(x1*x2)
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> it = S.variable_class_iter()
>>> for T in it: print(T)
x0
x1
x2
(x1 + 1)/x0
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2)
(x1 + 1)/x2
(x0*x2 + x1 + 1)/(x0*x1)
(x0*x2 + 1)/x1
(x0*x2 + x1 + 1)/(x1*x2)
```

Finite type examples with given depth:

```
sage: it = S.variable_class_iter(depth=1)
sage: for T in it: print(T)
Found a bipartite seed - restarting the depth counter at zero
and constructing the variable class using its bipartite belt.
x0
x1
x2
(x1 + 1)/x0
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2)
(x1 + 1)/x2
(x0*x2 + x1 + 1)/(x0*x1)
(x0*x2 + 1)/x1
(x0*x2 + x1 + 1)/(x1*x2)
```

```
>>> from sage.all import *
>>> it = S.variable_class_iter(depth=Integer(1))
>>> for T in it: print(T)
Found a bipartite seed - restarting the depth counter at zero
and constructing the variable class using its bipartite belt.
x0
x1
x2
(x1 + 1)/x0
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2)
(x1 + 1)/x2
(x0*x2 + x1 + 1)/(x0*x1)
(x0*x2 + 1)/x1
(x0*x2 + x1 + 1)/(x1*x2)
```

Note that the notion of *depth* depends on whether a bipartite seed is found or not, or if it is manually ignored:

```
sage: it = S.variable_class_iter(depth=1, ignore_bipartite_belt=True)
sage: for T in it: print(T)
x0
x1
x2
(x1 + 1)/x2
(x0*x2 + 1)/x1
(x1 + 1)/x0

sage: S.mutate([0,1])
sage: it2 = S.variable_class_iter(depth=1)
sage: for T in it2: print(T)
(x1 + 1)/x0
(x0*x2 + x1 + 1)/(x0*x1)
x2
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2)
x1
(x0*x2 + 1)/x1
```

```
>>> from sage.all import *
>>> it = S.variable_class_iter(depth=Integer(1), ignore_bipartite_belt=True)
```

(continues on next page)

(continued from previous page)

```
>>> for T in it: print(T)
x0
x1
x2
(x1 + 1)/x2
(x0*x2 + 1)/x1
(x1 + 1)/x0

>>> S.mutate([Integer(0),Integer(1)])
>>> it2 = S.variable_class_iter(depth=Integer(1))
>>> for T in it2: print(T)
(x1 + 1)/x0
(x0*x2 + x1 + 1)/(x0*x1)
x2
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2)
x1
(x0*x2 + 1)/x1
```

Infinite type examples:

```
sage: S = ClusterSeed(['A',[1,1],1])
sage: it = S.variable_class_iter(depth=2)
sage: for T in it: print(T)
Found a bipartite seed - restarting the depth counter at zero
and constructing the variable class using its bipartite belt.

```

x(*k*)

Return the *k -th initial cluster variable* for the associated cluster seed, or the cluster variable of the corresponding vertex in `self.quiver`.

EXAMPLES:

```
sage: S = ClusterSeed(['A', 3])
sage: S.mutate([2, 1])
sage: S.x(0)
x0

sage: S.x(1)
x1

sage: S.x(2)
x2

sage: dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
sage: S = ClusterSeed(dg, frozen=['c'])
sage: S.x(0)
a
sage: S.x('a')
a
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A', Integer(3)])
>>> S.mutate([Integer(2), Integer(1)])
>>> S.x(Integer(0))
x0

>>> S.x(Integer(1))
x1

>>> S.x(Integer(2))
x2

>>> dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
>>> S = ClusterSeed(dg, frozen=['c'])
>>> S.x(Integer(0))
a
>>> S.x('a')
a
```

y(*k*)

Return the *k -th initial coefficient (frozen variable)* for the associated cluster seed, or the cluster variable of the corresponding vertex in `self.quiver`.

EXAMPLES:

```
sage: S = ClusterSeed(['A', 3]).principal_extension()
sage: S.mutate([2, 1])
sage: S.y(0)
y0

sage: S.y(1)
y1

sage: S.y(2)
y2

sage: dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
sage: S = ClusterSeed(dg, frozen=['c'])
sage: S.y(0)
c
sage: S.y('c')
c
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A', Integer(3)]).principal_extension()
>>> S.mutate([Integer(2), Integer(1)])
>>> S.y(Integer(0))
y0

>>> S.y(Integer(1))
y1

>>> S.y(Integer(2))
y2

>>> dg = DiGraph([['a', 'b'], ['b', 'c']], format='list_of_edges')
>>> S = ClusterSeed(dg, frozen=['c'])
>>> S.y(Integer(0))
c
>>> S.y('c')
c
```

class sage.combinat.cluster_algebra_quiver.cluster_seed.**ClusterVariable**(*parent*, *numerator*, *denominator*, *coerce=True*, *reduce=True*, *mutation_type=None*, *variable_type=None*, *xdim=0*)

Bases: FractionFieldElement

This class is a thin wrapper for cluster variables in cluster seeds.

It provides the extra feature to store if a variable is frozen or not.

- the associated positive root:

```
sage: S = ClusterSeed(['A',3])
sage: for T in S.variable_class_iter():
....:     print("{} {}".format(T, T.almost_positive_root()))
x0 -alpha[1]
x1 -alpha[2]
x2 -alpha[3]
(x1 + 1)/x0 alpha[1]
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2) alpha[1] + alpha[2] + alpha[3]
(x1 + 1)/x2 alpha[3]
(x0*x2 + x1 + 1)/(x0*x1) alpha[1] + alpha[2]
(x0*x2 + 1)/x1 alpha[2]
(x0*x2 + x1 + 1)/(x1*x2) alpha[2] + alpha[3]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> for T in S.variable_class_iter():
...     print("{} {}".format(T, T.almost_positive_root()))
x0 -alpha[1]
x1 -alpha[2]
x2 -alpha[3]
(x1 + 1)/x0 alpha[1]
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2) alpha[1] + alpha[2] + alpha[3]
(x1 + 1)/x2 alpha[3]
(x0*x2 + x1 + 1)/(x0*x1) alpha[1] + alpha[2]
(x0*x2 + 1)/x1 alpha[2]
(x0*x2 + x1 + 1)/(x1*x2) alpha[2] + alpha[3]
```

almost_positive_root()

Return the *almost positive root* associated to `self` if `self` is of finite type.

EXAMPLES:

```
sage: S = ClusterSeed(['A',3])
sage: for T in S.variable_class_iter():
....:     print("{} {}".format(T, T.almost_positive_root()))
x0 -alpha[1]
x1 -alpha[2]
x2 -alpha[3]
(x1 + 1)/x0 alpha[1]
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2) alpha[1] + alpha[2] + alpha[3]
(x1 + 1)/x2 alpha[3]
(x0*x2 + x1 + 1)/(x0*x1) alpha[1] + alpha[2]
(x0*x2 + 1)/x1 alpha[2]
(x0*x2 + x1 + 1)/(x1*x2) alpha[2] + alpha[3]
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> for T in S.variable_class_iter():
...     print("{} {}".format(T, T.almost_positive_root()))
x0 -alpha[1]
x1 -alpha[2]
x2 -alpha[3]
(x1 + 1)/x0 alpha[1]
```

(continues on next page)

(continued from previous page)

```
(x1^2 + x0*x2 + 2*x1 + 1)/(x0*x1*x2) alpha[1] + alpha[2] + alpha[3]
(x1 + 1)/x2 alpha[3]
(x0*x2 + x1 + 1)/(x0*x1) alpha[1] + alpha[2]
(x0*x2 + 1)/x1 alpha[2]
(x0*x2 + x1 + 1)/(x1*x2) alpha[2] + alpha[3]
```

sage.combinat.cluster_algebra_quiver.cluster_seed.**PathSubset**(*n*, *m*)

Encode a *maximal* Dyck path from $(0, 0)$ to (n, m) (for $n \geq m \geq 0$) as a subset of $\{0, 1, 2, ..., 2n - 1\}$.

The encoding is given by indexing horizontal edges by odd numbers and vertical edges by evens.

The horizontal between (i, j) and $(i + 1, j)$ is indexed by the odd number $2 * i + 1$. The vertical between (i, j) and $(i, j + 1)$ is indexed by the even number $2 * j$.

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.cluster_seed import PathSubset
sage: PathSubset(4,0)
{1, 3, 5, 7}
sage: PathSubset(4,1)
{1, 3, 5, 6, 7}
sage: PathSubset(4,2)
{1, 2, 3, 5, 6, 7}
sage: PathSubset(4,3)
{1, 2, 3, 4, 5, 6, 7}
sage: PathSubset(4,4)
{0, 1, 2, 3, 4, 5, 6, 7}
```

```
>>> from sage.all import *
>>> from sage.combinat.cluster_algebra_quiver.cluster_seed import PathSubset
>>> PathSubset(Integer(4),Integer(0))
{1, 3, 5, 7}
>>> PathSubset(Integer(4),Integer(1))
{1, 3, 5, 6, 7}
>>> PathSubset(Integer(4),Integer(2))
{1, 2, 3, 5, 6, 7}
>>> PathSubset(Integer(4),Integer(3))
{1, 2, 3, 4, 5, 6, 7}
>>> PathSubset(Integer(4),Integer(4))
{0, 1, 2, 3, 4, 5, 6, 7}
```

sage.combinat.cluster_algebra_quiver.cluster_seed.**SetToPath**(*T*)

Rearrange the encoding for a *maximal* Dyck path (as a set) so that it is a list in the proper order of the edges.

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.cluster_seed import PathSubset
sage: from sage.combinat.cluster_algebra_quiver.cluster_seed import SetToPath
sage: SetToPath(PathSubset(4,0))
[1, 3, 5, 7]
sage: SetToPath(PathSubset(4,1))
[1, 3, 5, 7, 6]
sage: SetToPath(PathSubset(4,2))
[1, 3, 2, 5, 7, 6]
```

(continues on next page)

(continued from previous page)

```
sage: SetToPath(PathSubset(4,3))
[1, 3, 2, 5, 4, 7, 6]
sage: SetToPath(PathSubset(4,4))
[1, 0, 3, 2, 5, 4, 7, 6]
```

```
>>> from sage.all import *
>>> from sage.combinat.cluster_algebra_quiver.cluster_seed import PathSubset
>>> from sage.combinat.cluster_algebra_quiver.cluster_seed import SetToPath
>>> SetToPath(PathSubset(Integer(4),Integer(0)))
[1, 3, 5, 7]
>>> SetToPath(PathSubset(Integer(4),Integer(1)))
[1, 3, 5, 7, 6]
>>> SetToPath(PathSubset(Integer(4),Integer(2)))
[1, 3, 2, 5, 7, 6]
>>> SetToPath(PathSubset(Integer(4),Integer(3)))
[1, 3, 2, 5, 4, 7, 6]
>>> SetToPath(PathSubset(Integer(4),Integer(4)))
[1, 0, 3, 2, 5, 4, 7, 6]
```

sage.combinat.cluster_algebra_quiver.cluster_seed.**coeff_recurs**(p, q, $a1$, $a2$, b, c)

Coefficients in Laurent expansion of greedy element, as defined by recursion.

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.cluster_seed import coeff_recurs
sage: coeff_recurs(1, 1, 5, 5, 3, 3)
10
```

```
>>> from sage.all import *
>>> from sage.combinat.cluster_algebra_quiver.cluster_seed import coeff_recurs
>>> coeff_recurs(Integer(1), Integer(1), Integer(5), Integer(5), Integer(3),␣
↪Integer(3))
10
```

sage.combinat.cluster_algebra_quiver.cluster_seed.**get_green_vertices**(C)

Get the green vertices from a matrix.

Will go through each column and return the ones where no entry is greater than 0.

INPUT:

- `C` – the C-matrix to check

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.cluster_seed import get_green_
↪vertices
sage: S = ClusterSeed(['A',4]); S.mutate([1,2,3,2,0,1,2,0,3])
sage: get_green_vertices(S.c_matrix())
[0, 3]
```

```
>>> from sage.all import *
>>> from sage.combinat.cluster_algebra_quiver.cluster_seed import get_green_
↪vertices
```

(continues on next page)

(continued from previous page)

```
>>> S = ClusterSeed(['A',Integer(4)]); S.mutate([Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(0),Integer(1),Integer(2),Integer(0),Integer(3)])
>>> get_green_vertices(S.c_matrix())
[0, 3]
```

sage.combinat.cluster_algebra_quiver.cluster_seed.**get_red_vertices**(C)

Get the red vertices from a matrix.

Will go through each column and return the ones where no entry is less than 0.

INPUT:

- `C` – the C-matrix to check

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.cluster_seed import get_red_
↪vertices
sage: S = ClusterSeed(['A',4]); S.mutate([1,2,3,2,0,1,2,0,3])
sage: get_red_vertices(S.c_matrix())
[1, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.cluster_algebra_quiver.cluster_seed import get_red_vertices
>>> S = ClusterSeed(['A',Integer(4)]); S.mutate([Integer(1),Integer(2),Integer(3),
↪Integer(2),Integer(0),Integer(1),Integer(2),Integer(0),Integer(3)])
>>> get_red_vertices(S.c_matrix())
[1, 2]
```

sage.combinat.cluster_algebra_quiver.cluster_seed.**is_LeeLiZel_allowable**(T, n, m, b, c)

Check if the subset T contributes to the computation of the greedy element $x[m, n]$ in the rank two (b, c)-cluster algebra.

This uses the conditions of Lee-Li-Zelevinsky's paper [LLZ2014].

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.cluster_seed import is_LeeLiZel_
↪allowable
sage: is_LeeLiZel_allowable({1,3,2,5,7,6},4,2,6,6)
False
sage: is_LeeLiZel_allowable({1,2,5},3,3,1,1)
True
```

```
>>> from sage.all import *
>>> from sage.combinat.cluster_algebra_quiver.cluster_seed import is_LeeLiZel_
↪allowable
>>> is_LeeLiZel_allowable({Integer(1),Integer(3),Integer(2),Integer(5),Integer(7),
↪Integer(6)},Integer(4),Integer(2),Integer(6),Integer(6))
False
>>> is_LeeLiZel_allowable({Integer(1),Integer(2),Integer(5)},Integer(3),
↪Integer(3),Integer(1),Integer(1))
True
```

Helper functions for mutation types of quivers

This file contains helper functions for detecting the mutation type of a cluster algebra or quiver.

For the compendium on the cluster algebra and quiver package see [MS2011]

sage.combinat.cluster_algebra_quiver.mutation_type.**is_mutation_finite**(*M*, *nr_of_checks=None*)

Use a non-deterministic method by random mutations in various directions.

This can result in a wrong answer.

Warning

This method modifies the input matrix `M`!

INPUT:

- `nr_of_checks` – number of mutations applied (default: `None`); standard is 500*(number of vertices of self)

ALGORITHM:

A quiver is mutation infinite if and only if every edge label (a, -b) satisfy a*b > 4. Thus, we apply random mutations in random directions

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.mutation_type import is_mutation_
↪finite

sage: Q = ClusterQuiver(['A', 10])
↪# needs sage.modules
sage: M = Q.b_matrix()                                                          #␣
↪needs sage.modules
sage: is_mutation_finite(M)                                                     #␣
↪needs sage.modules
(True, None)

sage: # needs sage.modules
sage: Q = ClusterQuiver([(0, 1), (1, 2), (2, 3), (3, 4), (4, 5), (5, 6), (6, 7),␣
↪(7, 8), (2, 9)])
sage: M = Q.b_matrix()
sage: is_mutation_finite(M)  # random
(False, [9, 6, 9, 8, 9, 4, 0, 4, 5, 2, 1, 0, 1, 0, 7, 1, 9, 2, 5, 7, 8, 6, 3, 0,␣
↪2, 5, 4, 2, 6, 9, 2, 7, 3, 5, 3, 7, 9, 5, 9, 0, 2, 7, 9, 2, 4, 2, 1, 6, 9, 4, 3,

↪1, 7, 8, 9, 1, 5, 0, 8, 7, 4, 8, 9, 8, 0, 7, 4, 7, 1, 2, 8, 6, 1, 3, 9, 3, 9, 1,
↪ 3, 2, 4, 9, 5, 1, 2, 9, 4, 8, 5, 3, 4, 6, 8, 9, 2, 5, 9, 4, 6, 2, 1, 4, 9, 6,␣
↪0, 9, 8, 0, 4, 7, 9, 2, 1, 6])
```

Check that Issue #19495 is fixed:

```
sage: dg = DiGraph(); dg.add_vertex(0); S = ClusterSeed(dg); S                #␣
↪needs sage.modules
A seed for a cluster algebra of rank 1
sage: S.is_mutation_finite()                                                  #␣
↪needs sage.modules
True
```

```
>>> from sage.all import *
>>> dg = DiGraph(); dg.add_vertex(Integer(0)); S = ClusterSeed(dg); S        ␣
↪     # needs sage.modules
A seed for a cluster algebra of rank 1
>>> S.is_mutation_finite()                                                   #␣
↪needs sage.modules
True
```

sage.combinat.cluster_algebra_quiver.mutation_type.**load_data**(*user=True*)

Load a dict with keys being tuples representing exceptional QuiverMutationTypes, and with values being lists or sets containing all mutation equivalent quivers as dig6 data.

We check

- the data stored by the user (unless `user=False` was given)
- and the data installed by the optional package `database_mutation_class`.

INPUT:

- `user` – boolean (default: `True`); whether to look at user data. If not, only consider the optional package.

EXAMPLES:

```
sage: from sage.combinat.cluster_algebra_quiver.mutation_type import load_data
sage: load_data(2) # random - depends on the data the user has stored
{('G', 2): [('AO', (((0, 1), (1, -3)), )), ('AO', (((0, 1), (3, -1)), ))]}
```

```
>>> from sage.all import *
>>> from sage.combinat.cluster_algebra_quiver.mutation_type import load_data
>>> load_data(Integer(2)) # random - depends on the data the user has stored
{('G', 2): [('AO', (((0, 1), (1, -3)), )), ('AO', (((0, 1), (3, -1)), ))]}
```

Interactive display of quivers

sage.combinat.cluster_algebra_quiver.interact.**cluster_interact**(*self*, *fig_size=1*, *circular=True*, *kind='seed'*)

Start an interactive window for cluster seed mutations.

Only in *Jupyter notebook mode*.

Not to be called directly. Use the *interact()* and *interact()* methods instead.

INPUT:

- `fig_size` – (default: 1) factor by which the size of the plot is multiplied
- `circular` – boolean (default: `True`); if `True`, the circular plot is chosen, otherwise >>spring<< is used
- `kind` – either `'seed'` (default) or `'quiver'`

Quiver

A *quiver* is an oriented graph without loops, two-cycles, or multiple edges. The edges are labelled by pairs $(i, -j)$ (with i and j being positive integers) such that the matrix $M = (m_{ab})$ with $m_{ab} = i, m_{ba} = -j$ for an edge $(i, -j)$ between vertices a and b is skew-symmetrizable.

Warning

This is not the standard definition of a quiver. Normally, in cluster algebra theory, a quiver is defined as an oriented graph without loops and two-cycles but with multiple edges allowed; the edges are unlabelled. This notion of quivers, however, can be seen as a particular case of our notion of quivers. Namely, if we have a quiver (in the regular sense of this word) with (precisely) i edges from a to b, then we represent it by a quiver (in our sense of this word) with an edge from a to b labelled by the pair $(i, -i)$.

For the compendium on the cluster algebra and quiver package see [MS2011]

For mutation types of combinatorial quivers, see *QuiverMutationType()*. Cluster seeds are closely related to *ClusterSeed()*.

class sage.combinat.cluster_algebra_quiver.quiver.**ClusterQuiver**(*data*, *frozen=None*, *user_labels=None*)

Bases: SageObject

The *quiver* associated to an *exchange matrix*.

INPUT:

- data – can be any of the following:

```
- :class:`QuiverMutationType`
```

  - str – string representing a *QuiverMutationType* or a common quiver type (see Examples)
  - *ClusterQuiver*
  - Matrix() – a skew-symmetrizable matrix
  - DiGraph – must be the input data for a quiver
  - List of edges – must be the edge list of a digraph for a quiver

- frozen – (default: None) sets the list of frozen variables if the input type is a DiGraph, it is ignored otherwise
- user_labels – (default: None) sets the names of the labels for the vertices of the quiver if the input type is not a DiGraph; otherwise it is ignored

EXAMPLES:

From a *QuiverMutationType*:

```
sage: Q = ClusterQuiver(['A',5]); Q
Quiver on 5 vertices of type ['A', 5]

sage: Q = ClusterQuiver(['B',2]); Q
Quiver on 2 vertices of type ['B', 2]
sage: Q2 = ClusterQuiver(['C',2]); Q2
Quiver on 2 vertices of type ['B', 2]
sage: MT = Q.mutation_type(); MT.standard_quiver() == Q
True
sage: MT = Q2.mutation_type(); MT.standard_quiver() == Q2
False

sage: Q = ClusterQuiver(['A',[2,5],1]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]

sage: Q = ClusterQuiver(['A', [5,0],1]); Q
Quiver on 5 vertices of type ['D', 5]
sage: Q.is_finite()
True
sage: Q.is_acyclic()
False

sage: Q = ClusterQuiver(['F', 4, [2,1]]); Q
Quiver on 6 vertices of type ['F', 4, [1, 2]]
sage: MT = Q.mutation_type(); MT.standard_quiver() == Q
False
sage: dg = Q.digraph(); Q.mutate([2,1,4,0,5,3])
```

(continues on next page)

(continued from previous page)

```
sage: dg2 = Q.digraph(); dg2.is_isomorphic(dg,edge_labels=True)
False
sage: dg2.is_isomorphic(MT.standard_quiver().digraph(),edge_labels=True)
True

sage: Q = ClusterQuiver(['G',2, (3,1)]); Q
Quiver on 4 vertices of type ['G', 2, [1, 3]]
sage: MT = Q.mutation_type(); MT.standard_quiver() == Q
False

sage: Q = ClusterQuiver(['GR',[3,6]]); Q
Quiver on 4 vertices of type ['D', 4]
sage: MT = Q.mutation_type(); MT.standard_quiver() == Q
False

sage: Q = ClusterQuiver(['GR',[3,7]]); Q
Quiver on 6 vertices of type ['E', 6]

sage: Q = ClusterQuiver(['TR',2]); Q
Quiver on 3 vertices of type ['A', 3]
sage: MT = Q.mutation_type(); MT.standard_quiver() == Q
False
sage: Q.mutate([1,0]); MT.standard_quiver() == Q
True

sage: Q = ClusterQuiver(['TR',3]); Q
Quiver on 6 vertices of type ['D', 6]
sage: MT = Q.mutation_type(); MT.standard_quiver() == Q
False
```

>>> MT = Q.mutation_type(); MT.standard_quiver() == Q
False
```

From a *ClusterQuiver*:

```
sage: Q = ClusterQuiver(['A',[2,5],1]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
sage: T = ClusterQuiver(Q); T
Quiver on 7 vertices of type ['A', [2, 5], 1]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',[Integer(2),Integer(5)],Integer(1)]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
>>> T = ClusterQuiver(Q); T
Quiver on 7 vertices of type ['A', [2, 5], 1]
```

From a Matrix:

```
sage: Q = ClusterQuiver(['A',[2,5],1]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
sage: T = ClusterQuiver(Q._M); T
Quiver on 7 vertices

sage: Q = ClusterQuiver(matrix([[0,1,-1],[-1,0,1],[1,-1,0],[1,2,3]])); Q
Quiver on 4 vertices with 1 frozen vertex

sage: Q = ClusterQuiver(matrix([])); Q
Quiver without vertices
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',[Integer(2),Integer(5)],Integer(1)]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
>>> T = ClusterQuiver(Q._M); T
Quiver on 7 vertices

>>> Q = ClusterQuiver(matrix([[Integer(0),Integer(1),-Integer(1)],[-Integer(1),
↪Integer(0),Integer(1)],[Integer(1),-Integer(1),Integer(0)],[Integer(1),
↪Integer(2),Integer(3)]])); Q
Quiver on 4 vertices with 1 frozen vertex

>>> Q = ClusterQuiver(matrix([])); Q
Quiver without vertices
```

From a DiGraph:

```
sage: Q = ClusterQuiver(['A',[2,5],1]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
sage: T = ClusterQuiver(Q._digraph); T
Quiver on 7 vertices

sage: Q = ClusterQuiver(DiGraph([[1,2],[2,3],[3,4],[4,1]])); Q
Quiver on 4 vertices

sage: Q = ClusterQuiver(DiGraph([['a', 'b'], ['b', 'c'], ['c', 'd'], ['d', 'e']]),
....:                   frozen=['c']); Q
Quiver on 5 vertices with 1 frozen vertex
sage: Q.mutation_type()
[ ['A', 2], ['A', 2] ]
sage: Q
Quiver on 5 vertices of type [ ['A', 2], ['A', 2] ]
with 1 frozen vertex
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',[Integer(2),Integer(5)],Integer(1)]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
>>> T = ClusterQuiver(Q._digraph); T
Quiver on 7 vertices

>>> Q = ClusterQuiver(DiGraph([[Integer(1),Integer(2)],[Integer(2),Integer(3)],
↪[Integer(3),Integer(4)],[Integer(4),Integer(1)]])); Q
```

(continues on next page)

(continued from previous page)

```
Quiver on 4 vertices

>>> Q = ClusterQuiver(DiGraph([['a', 'b'], ['b', 'c'], ['c', 'd'], ['d', 'e']]),
...           frozen=['c']); Q
Quiver on 5 vertices with 1 frozen vertex
>>> Q.mutation_type()
[ ['A', 2], ['A', 2] ]
>>> Q
Quiver on 5 vertices of type [ ['A', 2], ['A', 2] ]
with 1 frozen vertex
```

From a List of edges:

```
sage: Q = ClusterQuiver(['A',[2,5],1]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
sage: T = ClusterQuiver(Q._digraph.edges(sort=True)); T
Quiver on 7 vertices

sage: Q = ClusterQuiver([[1, 2], [2, 3], [3, 4], [4, 1]]); Q
Quiver on 4 vertices
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',[Integer(2),Integer(5)],Integer(1)]); Q
Quiver on 7 vertices of type ['A', [2, 5], 1]
>>> T = ClusterQuiver(Q._digraph.edges(sort=True)); T
Quiver on 7 vertices

>>> Q = ClusterQuiver([[Integer(1), Integer(2)], [Integer(2), Integer(3)],␣
↪[Integer(3), Integer(4)], [Integer(4), Integer(1)]]); Q
Quiver on 4 vertices
```

b_matrix()

Return the b-matrix of `self`.

EXAMPLES:

```
sage: ClusterQuiver(['A',4]).b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

sage: ClusterQuiver(['B',4]).b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -2  0]

sage: ClusterQuiver(['D',4]).b_matrix()
[ 0  1  0  0]
[-1  0 -1 -1]
[ 0  1  0  0]
```

(continues on next page)

(continued from previous page)

```
[ 0  1  0  0]

sage: ClusterQuiver(QuiverMutationType([['A',2],['B',2]])).b_matrix()
[ 0  1  0  0]
[-1  0  0  0]
[ 0  0  0  1]
[ 0  0 -2  0]
```

```
>>> from sage.all import *
>>> ClusterQuiver(['A',Integer(4)]).b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

>>> ClusterQuiver(['B',Integer(4)]).b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -2  0]

>>> ClusterQuiver(['D',Integer(4)]).b_matrix()
[ 0  1  0  0]
[-1  0 -1 -1]
[ 0  1  0  0]
[ 0  1  0  0]

>>> ClusterQuiver(QuiverMutationType([['A',Integer(2)],['B',Integer(2)]])).b_
↪matrix()
[ 0  1  0  0]
[-1  0  0  0]
[ 0  0  0  1]
[ 0  0 -2  0]
```

canonical_label(*certificate=False*)

Return the canonical labelling of `self`.

See `sage.graphs.generic_graph.GenericGraph.canonical_label()`.

INPUT:

- `certificate` – boolean (default: `False`); if `True`, the dictionary from `self.vertices()` to the vertices of the returned quiver is returned as well

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',4]); Q.digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

sage: T = Q.canonical_label(); T.digraph().edges(sort=True)
[(0, 3, (1, -1)), (1, 2, (1, -1)), (1, 3, (1, -1))]

sage: T, iso = Q.canonical_label(certificate=True)
sage: T.digraph().edges(sort=True); iso
```

(continues on next page)

(continued from previous page)

```
[(0, 3, (1, -1)), (1, 2, (1, -1)), (1, 3, (1, -1))]
{0: 0, 1: 3, 2: 1, 3: 2}

sage: Q = ClusterQuiver(QuiverMutationType([['B',2],['A',1]])); Q
Quiver on 3 vertices of type [ ['B', 2], ['A', 1] ]

sage: Q.canonical_label()
Quiver on 3 vertices of type [ ['A', 1], ['B', 2] ]

sage: Q.canonical_label(certificate=True)
(Quiver on 3 vertices of type [ ['A', 1], ['B', 2] ], {0: 1, 1: 2, 2: 0})
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(4)]); Q.digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

>>> T = Q.canonical_label(); T.digraph().edges(sort=True)
[(0, 3, (1, -1)), (1, 2, (1, -1)), (1, 3, (1, -1))]

>>> T, iso = Q.canonical_label(certificate=True)
>>> T.digraph().edges(sort=True); iso
[(0, 3, (1, -1)), (1, 2, (1, -1)), (1, 3, (1, -1))]
{0: 0, 1: 3, 2: 1, 3: 2}

>>> Q = ClusterQuiver(QuiverMutationType([['B',Integer(2)],['A',
↪Integer(1)]])); Q
Quiver on 3 vertices of type [ ['B', 2], ['A', 1] ]

>>> Q.canonical_label()
Quiver on 3 vertices of type [ ['A', 1], ['B', 2] ]

>>> Q.canonical_label(certificate=True)
(Quiver on 3 vertices of type [ ['A', 1], ['B', 2] ], {0: 1, 1: 2, 2: 0})
```

d_vector_fan()

Return the d-vector fan associated with the quiver.

It is the fan whose maximal cones are generated by the d-matrices of the clusters.

This is a complete simplicial fan (and even smooth when the initial quiver is acyclic). It only makes sense for quivers of finite type.

EXAMPLES:

```
sage: Fd = ClusterQuiver([[1,2]]).d_vector_fan(); Fd
Rational polyhedral fan in 2-d lattice N
sage: Fd.ngenerating_cones()
5
sage: Fd = ClusterQuiver([[1,2],[2,3]]).d_vector_fan(); Fd
Rational polyhedral fan in 3-d lattice N
sage: Fd.ngenerating_cones()
14
sage: Fd.is_smooth()
```

(continues on next page)

(continued from previous page)

```
True
sage: Fd = ClusterQuiver([[1,2],[2,3],[3,1]]).d_vector_fan(); Fd
Rational polyhedral fan in 3-d lattice N
sage: Fd.ngenerating_cones()
14
sage: Fd.is_smooth()
False
```

```
>>> from sage.all import *
>>> Fd = ClusterQuiver([[Integer(1),Integer(2)]]).d_vector_fan(); Fd
Rational polyhedral fan in 2-d lattice N
>>> Fd.ngenerating_cones()
5
>>> Fd = ClusterQuiver([[Integer(1),Integer(2)],[Integer(2),Integer(3)]]).d_
↪vector_fan(); Fd
Rational polyhedral fan in 3-d lattice N
>>> Fd.ngenerating_cones()
14
>>> Fd.is_smooth()
True
>>> Fd = ClusterQuiver([[Integer(1),Integer(2)],[Integer(2),Integer(3)],
↪[Integer(3),Integer(1)]]).d_vector_fan(); Fd
Rational polyhedral fan in 3-d lattice N
>>> Fd.ngenerating_cones()
14
>>> Fd.is_smooth()
False
```

digraph()

Return the underlying digraph of `self`.

EXAMPLES:

```
sage: ClusterQuiver(['A',1]).digraph()
Digraph on 1 vertex
sage: list(ClusterQuiver(['A',1]).digraph())
[0]
sage: ClusterQuiver(['A',1]).digraph().edges(sort=True)
[]

sage: ClusterQuiver(['A',4]).digraph()
Digraph on 4 vertices
sage: ClusterQuiver(['A',4]).digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

sage: ClusterQuiver(['B',4]).digraph()
Digraph on 4 vertices
sage: ClusterQuiver(['A',4]).digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

sage: ClusterQuiver(QuiverMutationType([['A',2],['B',2]])).digraph()
Digraph on 4 vertices
```

(continues on next page)

(continued from previous page)

```
sage: ClusterQuiver(QuiverMutationType([['A',2],['B',2]])).digraph().
↪edges(sort=True)
[(0, 1, (1, -1)), (2, 3, (1, -2))]

sage: ClusterQuiver(['C', 4], user_labels = ['x', 'y', 'z', 'w']).digraph().
↪edges(sort=True)
[('x', 'y', (1, -1)), ('z', 'w', (2, -1)), ('z', 'y', (1, -1))]
```

```
>>> from sage.all import *
>>> ClusterQuiver(['A',Integer(1)]).digraph()
Digraph on 1 vertex
>>> list(ClusterQuiver(['A',Integer(1)]).digraph())
[0]
>>> ClusterQuiver(['A',Integer(1)]).digraph().edges(sort=True)
[]

>>> ClusterQuiver(['A',Integer(4)]).digraph()
Digraph on 4 vertices
>>> ClusterQuiver(['A',Integer(4)]).digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

>>> ClusterQuiver(['B',Integer(4)]).digraph()
Digraph on 4 vertices
>>> ClusterQuiver(['A',Integer(4)]).digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

>>> ClusterQuiver(QuiverMutationType([['A',Integer(2)],['B',Integer(2)]])).
↪digraph()
Digraph on 4 vertices

>>> ClusterQuiver(QuiverMutationType([['A',Integer(2)],['B',Integer(2)]])).
↪digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 3, (1, -2))]

>>> ClusterQuiver(['C', Integer(4)], user_labels = ['x', 'y', 'z', 'w']).
↪digraph().edges(sort=True)
[('x', 'y', (1, -1)), ('z', 'w', (2, -1)), ('z', 'y', (1, -1))]
```

exchangeable_part()

Return the restriction to the principal part (i.e. exchangeable part) of `self`, the subquiver obtained by deleting the frozen vertices of `self`.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',4])
sage: T = ClusterQuiver(Q.digraph().edges(sort=True), frozen=[3])
sage: T.digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

sage: T.exchangeable_part().digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1))]
```

(continues on next page)

(continued from previous page)

```
sage: Q2 = Q.principal_extension()
sage: Q3 = Q2.principal_extension()
sage: Q2.exchangeable_part() == Q3.exchangeable_part()
True
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(4)])
>>> T = ClusterQuiver(Q.digraph().edges(sort=True), frozen=[Integer(3)])
>>> T.digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1)), (2, 3, (1, -1))]

>>> T.exchangeable_part().digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 1, (1, -1))]

>>> Q2 = Q.principal_extension()
>>> Q3 = Q2.principal_extension()
>>> Q2.exchangeable_part() == Q3.exchangeable_part()
True
```

first_sink()

Return the first vertex of `self` that is a sink.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',5])
sage: Q.mutate([1,2,4,3,2])
sage: Q.first_sink()
0
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q.mutate([Integer(1),Integer(2),Integer(4),Integer(3),Integer(2)])
>>> Q.first_sink()
0
```

first_source()

Return the first vertex of `self` that is a source.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',5])
sage: Q.mutate([2,1,3,4,2])
sage: Q.first_source()
1
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q.mutate([Integer(2),Integer(1),Integer(3),Integer(4),Integer(2)])
>>> Q.first_source()
1
```

free_vertices()

Return the list of free vertices of `self`.

EXAMPLES:

```
sage: Q = ClusterQuiver(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
....:                   frozen=['b', 'd'])
sage: Q.free_vertices()
['a', 'c', 'e']
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
...                   frozen=['b', 'd'])
>>> Q.free_vertices()
['a', 'c', 'e']
```

frozen_vertices()

Return the list of frozen vertices of `self`.

EXAMPLES:

```
sage: Q = ClusterQuiver(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
....:                   frozen=['b', 'd'])
sage: sorted(Q.frozen_vertices())
['b', 'd']
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
...                   frozen=['b', 'd'])
>>> sorted(Q.frozen_vertices())
['b', 'd']
```

g_vector_fan()

Return the g-vector fan associated with the quiver.

It is the fan whose maximal cones are generated by the g-matrices of the clusters.

This is a complete simplicial fan. It is only supported for quivers of finite type.

EXAMPLES:

```
sage: Fg = ClusterQuiver([[1,2]]).g_vector_fan(); Fg
Rational polyhedral fan in 2-d lattice N
sage: Fg.ngenerating_cones()
5

sage: Fg = ClusterQuiver([[1,2],[2,3]]).g_vector_fan(); Fg
Rational polyhedral fan in 3-d lattice N
sage: Fg.ngenerating_cones()
14
sage: Fg.is_smooth()
```

(continues on next page)

(continued from previous page)

```
True

sage: Fg = ClusterQuiver([[1,2],[2,3],[3,1]]).g_vector_fan(); Fg
Rational polyhedral fan in 3-d lattice N
sage: Fg.ngenerating_cones()
14
sage: Fg.is_smooth()
True
```

```
>>> from sage.all import *
>>> Fg = ClusterQuiver([[Integer(1),Integer(2)]]).g_vector_fan(); Fg
Rational polyhedral fan in 2-d lattice N
>>> Fg.ngenerating_cones()
5

>>> Fg = ClusterQuiver([[Integer(1),Integer(2)],[Integer(2),Integer(3)]]).g_
↪vector_fan(); Fg
Rational polyhedral fan in 3-d lattice N
>>> Fg.ngenerating_cones()
14
>>> Fg.is_smooth()
True

>>> Fg = ClusterQuiver([[Integer(1),Integer(2)],[Integer(2),Integer(3)],
↪[Integer(3),Integer(1)]]).g_vector_fan(); Fg
Rational polyhedral fan in 3-d lattice N
>>> Fg.ngenerating_cones()
14
>>> Fg.is_smooth()
True
```

interact(*fig_size=1*, *circular=True*)

Start an interactive window for cluster quiver mutations.

Only in *Jupyter notebook mode*.

INPUT:

- `fig_size` – (default: 1) factor by which the size of the plot is multiplied
- `circular` – boolean (default: `True`); if `True`, the circular plot is chosen, otherwise >>spring<< is used

is_acyclic()

Return true if `self` is acyclic.

EXAMPLES:

```
sage: ClusterQuiver(['A',4]).is_acyclic()
True

sage: ClusterQuiver(['A',[2,1],1]).is_acyclic()
True

sage: ClusterQuiver([[0,1],[1,2],[2,0]]).is_acyclic()
False
```

```
>>> from sage.all import *
>>> ClusterQuiver(['A',Integer(4)]).is_acyclic()
True

>>> ClusterQuiver(['A',[Integer(2),Integer(1)],Integer(1)]).is_acyclic()
True

>>> ClusterQuiver([[Integer(0),Integer(1)],[Integer(1),Integer(2)],
↪[Integer(2),Integer(0)]]).is_acyclic()
False
```

is_bipartite(*return_bipartition=False*)

Return `True` if `self` is bipartite.

EXAMPLES:

```
sage: ClusterQuiver(['A',[3,3],1]).is_bipartite()
True

sage: ClusterQuiver(['A',[4,3],1]).is_bipartite()
False
```

```
>>> from sage.all import *
>>> ClusterQuiver(['A',[Integer(3),Integer(3)],Integer(1)]).is_bipartite()
True

>>> ClusterQuiver(['A',[Integer(4),Integer(3)],Integer(1)]).is_bipartite()
False
```

is_finite()

Return `True` if `self` is of finite type.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',3])
sage: Q.is_finite()
True
sage: Q = ClusterQuiver(['A',[2,2],1])
sage: Q.is_finite()
False
sage: Q = ClusterQuiver([['A',3],['B',3]])
sage: Q.is_finite()
True
sage: Q = ClusterQuiver(['T',[4,4,4]])
sage: Q.is_finite()
False
sage: Q = ClusterQuiver([['A',3],['T',[4,4,4]]])
sage: Q.is_finite()
False
sage: Q = ClusterQuiver([['A',3],['T',[2,2,3]]])
sage: Q.is_finite()
True
sage: Q = ClusterQuiver([['A',3],['D',5]])
```

(continues on next page)

(continued from previous page)

```
sage: Q.is_finite()
True
sage: Q = ClusterQuiver([['A',3],['D',5,1]])
sage: Q.is_finite()
False

sage: Q = ClusterQuiver([[0,1,2],[1,2,2],[2,0,2]])
sage: Q.is_finite()
False

sage: Q = ClusterQuiver([[0,1,2],[1,2,2],[2,0,2],[3,4,1],[4,5,1]])
sage: Q.is_finite()
False
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(3)])
>>> Q.is_finite()
True
>>> Q = ClusterQuiver(['A',[Integer(2),Integer(2)],Integer(1)])
>>> Q.is_finite()
False
>>> Q = ClusterQuiver([['A',Integer(3)],['B',Integer(3)]])
>>> Q.is_finite()
True
>>> Q = ClusterQuiver(['T',[Integer(4),Integer(4),Integer(4)]])
>>> Q.is_finite()
False
>>> Q = ClusterQuiver([['A',Integer(3)],['T',[Integer(4),Integer(4),
...Integer(4)]]])
>>> Q.is_finite()
False
>>> Q = ClusterQuiver([['A',Integer(3)],['T',[Integer(2),Integer(2),
...Integer(3)]]])
>>> Q.is_finite()
True
>>> Q = ClusterQuiver([['A',Integer(3)],['D',Integer(5)]])
>>> Q.is_finite()
True
>>> Q = ClusterQuiver([['A',Integer(3)],['D',Integer(5),Integer(1)]])
>>> Q.is_finite()
False

>>> Q = ClusterQuiver([[Integer(0),Integer(1),Integer(2)],[Integer(1),
...Integer(2),Integer(2)],[Integer(2),Integer(0),Integer(2)]])
>>> Q.is_finite()
False

>>> Q = ClusterQuiver([[Integer(0),Integer(1),Integer(2)],[Integer(1),
...Integer(2),Integer(2)],[Integer(2),Integer(0),Integer(2)],[Integer(3),
...Integer(4),Integer(1)],[Integer(4),Integer(5),Integer(1)]])
>>> Q.is_finite()
False
```

is_mutation_finite(*nr_of_checks=None*, *return_path=False*)

Return whether `self` is mutation-finite.

This uses a non-deterministic method by random mutations in various directions. This can result in a wrong answer.

INPUT:

- `nr_of_checks` – (default: `None`) number of mutations applied; Standard is 500*(number of vertices of `self`)
- `return_path` – (default: `False`) if `True`, in case of `self` not being mutation finite, a path from `self` to a quiver with an edge label $(a, -b)$ and $a * b > 4$ is returned

ALGORITHM:

A quiver is mutation infinite if and only if every edge label (a,-b) satisfy a*b > 4. Thus, we apply random mutations in random directions

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',10])
sage: Q._mutation_type = None
sage: Q.is_mutation_finite()
True

sage: Q = ClusterQuiver([(0,1),(1,2),(2,3),(3,4),
....:                    (4,5),(5,6),(6,7),(7,8),(2,9)])
sage: Q.is_mutation_finite()
False
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(10)])
>>> Q._mutation_type = None
>>> Q.is_mutation_finite()
True

>>> Q = ClusterQuiver([(Integer(0),Integer(1)),(Integer(1),Integer(2)),
↪(Integer(2),Integer(3)),(Integer(3),Integer(4)),
...                    (Integer(4),Integer(5)),(Integer(5),Integer(6)),
↪(Integer(6),Integer(7)),(Integer(7),Integer(8)),(Integer(2),Integer(9))])
>>> Q.is_mutation_finite()
False
```

m()

Return the number of frozen vertices of `self`.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',4])
sage: Q.m()
0

sage: T = ClusterQuiver(Q.digraph().edges(sort=True), frozen=[3])
sage: T.n()
3
```

(continues on next page)

(continued from previous page)

```
sage: T.m()
1
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(4)])
>>> Q.m()
0

>>> T = ClusterQuiver(Q.digraph().edges(sort=True), frozen=[Integer(3)])
>>> T.n()
3
>>> T.m()
1
```

mutate(*data*, *inplace=True*)

Mutate `self` at a sequence of vertices.

INPUT:

- `sequence` – a vertex of `self`, an iterator of vertices of `self`, a function which takes in the ClusterQuiver and returns a vertex or an iterator of vertices, or a string of the parameter wanting to be called on `ClusterQuiver` that will return a vertex or an iterator of vertices
- `inplace` – boolean (default: `True`); if `False`, the result is returned, otherwise `self` is modified

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',4]); Q.b_matrix()
[ 0  1  0  0]
[-1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

sage: Q.mutate(0); Q.b_matrix()
[ 0 -1  0  0]
[ 1  0 -1  0]
[ 0  1  0  1]
[ 0  0 -1  0]

sage: T = Q.mutate(0, inplace=False); T
Quiver on 4 vertices of type ['A', 4]

sage: Q.mutate(0)
sage: Q == T
True

sage: Q.mutate([0,1,0])
sage: Q.b_matrix()
[ 0 -1  1  0]
[ 1  0  0  0]
[-1  0  0  1]
[ 0  0 -1  0]

sage: Q = ClusterQuiver(QuiverMutationType([['A',1],['A',3]]))
```

(continues on next page)

(continued from previous page)

```
sage: Q.b_matrix()
[ 0  0  0  0]
[ 0  0  1  0]
[ 0 -1  0 -1]
[ 0  0  1  0]

sage: T = Q.mutate(0,inplace=False)
sage: Q == T
True

sage: Q = ClusterQuiver(['A',3]); Q.b_matrix()
[ 0  1  0]

```

mutation_class(*depth=+Infinity*, *show_depth=False*, *return_paths=False*, *data_type='quiver'*, *up_to_equivalence=True*, *sink_source=False*)

Return the mutation class of `self` together with certain constraints.

INPUT:

- `depth` – (default: `infinity`) integer, only seeds with distance at most depth from `self` are returned
- `show_depth` – boolean (default: `False`); if `True`, the actual depth of the mutation is shown
- `return_paths` – boolean (default: `False`); if `True`, a shortest path of mutation sequences from `self` to the given quiver is returned as well
- `data_type` – (default: `'quiver'`) can be one of the following:
  - `'quiver'` – the quiver is returned
  - `'dig6'` – the dig6-data is returned
  - `'path'` – shortest paths of mutation sequences from `self` are returned
- `sink_source` – boolean (default: `False`); if `True`, only mutations at sinks and sources are applied

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',3])
sage: Ts = Q.mutation_class()
sage: for T in Ts: print(T)
Quiver on 3 vertices of type ['A', 3]
Quiver on 3 vertices of type ['A', 3]
Quiver on 3 vertices of type ['A', 3]
Quiver on 3 vertices of type ['A', 3]

sage: Ts = Q.mutation_class(depth=1)
sage: for T in Ts: print(T)

```

mutation_class_iter(*depth=+Infinity*, *show_depth=False*, *return_paths=False*, *data_type='quiver'*, *up_to_equivalence=True*, *sink_source=False*)

Return an iterator for the mutation class of `self` together with certain constraints.

INPUT:

- `depth` – integer (default: infinity); only quivers with distance at most depth from `self` are returned.
- `show_depth` – boolean (default: `False`); if `True`, the actual depth of the mutation is shown
- `return_paths` – boolean (default: `False`); if `True`, a shortest path of mutation sequences from `self` to the given quiver is returned as well
- `data_type` – (default: `'quiver'`) can be one of the following:

```
* "quiver"
* "matrix"
* "digraph"
* "dig6"
* "path"
```

- `up_to_equivalence` – boolean (default: `True`); if `True`, only one quiver for each graph-isomorphism class is recorded
- `sink_source` – boolean (default: `False`); if `True`, only mutations at sinks and sources are applied

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',3])
sage: it = Q.mutation_class_iter()
sage: for T in it: print(T)
Quiver on 3 vertices of type ['A', 3]
Quiver on 3 vertices of type ['A', 3]
Quiver on 3 vertices of type ['A', 3]
Quiver on 3 vertices of type ['A', 3]

sage: it = Q.mutation_class_iter(depth=1)
sage: for T in it: print(T)
Quiver on 3 vertices of type ['A', 3]
Quiver on 3 vertices of type ['A', 3]
Quiver on 3 vertices of type ['A', 3]

sage: it = Q.mutation_class_iter(show_depth=True)
sage: for T in it: pass

Quiver on 3 vertices of type ['A', 3]
Quiver on 3 vertices of type ['A', 3]

>>> it = Q.mutation_class_iter(return_paths=True,
...        up_to_equivalence=False)
>>> mutation_class = list(it)
>>> len(mutation_class)
14
>>> mutation_class[Integer(0)]
(Quiver on 3 vertices of type ['A', 3], [])

>>> Q = ClusterQuiver(['A',Integer(3)])
>>> it = Q.mutation_class_iter(data_type='path')
```

(continues on next page)

(continued from previous page)

```
>>> for T in it: print(T)
[]
[1]
[0]
[0, 1]

>>> Q = ClusterQuiver(['A',Integer(3)])
>>> it = Q.mutation_class_iter(return_paths=True,
...        data_type='matrix')
>>> next(it)
(
[ 0  0  1]
[ 0  0  1]
[-1 -1  0], []
)

>>> dg = DiGraph([['a', 'b'], ['b', 'c']],
...        format='list_of_edges')
>>> S = ClusterQuiver(dg, frozen=['b'])
>>> S.mutation_class()
[Quiver on 3 vertices with 1 frozen vertex,
 Quiver on 3 vertices with 1 frozen vertex,
 Quiver on 3 vertices with 1 frozen vertex]
```

mutation_sequence(*sequence*, *show_sequence=False*, *fig_size=1.2*)

Return a list containing the sequence of quivers obtained from `self` by a sequence of mutations on vertices.

INPUT:

- `sequence` – list or tuple of vertices of `self`
- `show_sequence` – boolean (default: `False`); if `True`, a png containing the mutation sequence is shown
- `fig_size` – (default: 1.2) factor by which the size of the sequence is expanded

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',4])
sage: seq = Q.mutation_sequence([0,1]); seq
[Quiver on 4 vertices of type ['A', 4],
 Quiver on 4 vertices of type ['A', 4],
 Quiver on 4 vertices of type ['A', 4]]
sage: [T.b_matrix() for T in seq]
[
[ 0  1  0  0]  [ 0 -1  0  0]  [ 0  1 -1  0]
[-1  0 -1  0]  [ 1  0 -1  0]  [-1  0  1  0]
[ 0  1  0  1]  [ 0  1  0  1]  [ 1 -1  0  1]
[ 0  0 -1  0], [ 0  0 -1  0], [ 0  0 -1  0]
]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(4)])
>>> seq = Q.mutation_sequence([Integer(0),Integer(1)]); seq
[Quiver on 4 vertices of type ['A', 4],
```

(continues on next page)

(continued from previous page)

```
 Quiver on 4 vertices of type ['A', 4],
 Quiver on 4 vertices of type ['A', 4]]
>>> [T.b_matrix() for T in seq]
[
[ 0  1  0  0]  [ 0 -1  0  0]  [ 0  1 -1  0]
[-1  0 -1  0]  [ 1  0 -1  0]  [-1  0  1  0]
[ 0  1  0  1]  [ 0  1  0  1]  [ 1 -1  0  1]
[ 0  0 -1  0], [ 0  0 -1  0], [ 0  0 -1  0]
]
```

mutation_type()

Return the mutation type of `self`.

Return the mutation_type of each connected component of `self` if it can be determined, otherwise, the mutation type of this component is set to be unknown.

The mutation types of the components are ordered by vertex labels.

If you do many type recognitions, you should consider to save exceptional mutation types using *save_quiver_data()*

WARNING:

- All finite types can be detected,
- All affine types can be detected, EXCEPT affine type D (the algorithm is not yet implemented)
- All exceptional types can be detected.

EXAMPLES:

```
sage: ClusterQuiver(['A',4]).mutation_type()
['A', 4]
sage: ClusterQuiver(['A',(3,1),1]).mutation_type()
['A', [1, 3], 1]
sage: ClusterQuiver(['C',2]).mutation_type()
['B', 2]
sage: ClusterQuiver(['B',4,1]).mutation_type()
['BD', 4, 1]
```

```
>>> from sage.all import *
>>> ClusterQuiver(['A',Integer(4)]).mutation_type()
['A', 4]
>>> ClusterQuiver(['A',(Integer(3),Integer(1)),Integer(1)]).mutation_type()
['A', [1, 3], 1]
>>> ClusterQuiver(['C',Integer(2)]).mutation_type()
['B', 2]
>>> ClusterQuiver(['B',Integer(4),Integer(1)]).mutation_type()
['BD', 4, 1]
```

finite types:

```
sage: Q = ClusterQuiver(['A',5])
sage: Q._mutation_type = None
sage: Q.mutation_type()
['A', 5]
```

(continues on next page)

(continued from previous page)

```
sage: Q = ClusterQuiver([(0,1),(1,2),(2,3),(3,4)])
sage: Q.mutation_type()
['A', 5]

sage: Q = ClusterQuiver(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
....:                   frozen=['c'])
sage: Q.mutation_type()
[ ['A', 2], ['A', 2] ]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q._mutation_type = None
>>> Q.mutation_type()
['A', 5]

>>> Q = ClusterQuiver([(Integer(0),Integer(1)),(Integer(1),Integer(2)),
↪(Integer(2),Integer(3)),(Integer(3),Integer(4))])
>>> Q.mutation_type()
['A', 5]

>>> Q = ClusterQuiver(DiGraph([['a', 'b'], ['c', 'b'], ['c', 'd'], ['e', 'd
↪']]),
...                   frozen=['c'])
>>> Q.mutation_type()
[ ['A', 2], ['A', 2] ]
```

affine types:

```
sage: Q = ClusterQuiver(['E',8,[1,1]]); Q
Quiver on 10 vertices of type ['E', 8, [1, 1]]
sage: Q._mutation_type = None; Q
Quiver on 10 vertices
sage: Q.mutation_type() # long time
['E', 8, [1, 1]]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['E',Integer(8),[Integer(1),Integer(1)]]); Q
Quiver on 10 vertices of type ['E', 8, [1, 1]]
>>> Q._mutation_type = None; Q
Quiver on 10 vertices
>>> Q.mutation_type() # long time
['E', 8, [1, 1]]
```

the not yet working affine type D (unless user has saved small classical quiver data):

```
sage: Q = ClusterQuiver(['D',4,1])
sage: Q._mutation_type = None
sage: Q.mutation_type() # todo: not implemented
['D', 4, 1]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['D',Integer(4),Integer(1)])
>>> Q._mutation_type = None
>>> Q.mutation_type() # todo: not implemented
['D', 4, 1]
```

the exceptional types:

```
sage: Q = ClusterQuiver(['X',6])
sage: Q._mutation_type = None
sage: Q.mutation_type() # long time
['X', 6]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['X',Integer(6)])
>>> Q._mutation_type = None
>>> Q.mutation_type() # long time
['X', 6]
```

examples from page 8 of [Ke2008]:

```
sage: dg = DiGraph(); dg.add_edges([(9,0),(9,4),(4,6),(6,7),(7,8),(8,3),(3,5),
↪(5,6),(8,1),(2,3)])
sage: ClusterQuiver(dg).mutation_type() # long time
['E', 8, [1, 1]]

sage: dg = DiGraph({ 0:[3], 1:[0,4], 2:[0,6], 3:[1,2,7], 4:[3,8], 5:[2], 6:[3,
↪5], 7:[4,6], 8:[7] })
sage: ClusterQuiver(dg).mutation_type() # long time
['E', 8, 1]

sage: dg = DiGraph({ 0:[3,9], 1:[0,4], 2:[0,6], 3:[1,2,7], 4:[3,8], 5:[2],␣
↪6:[3,5], 7:[4,6], 8:[7], 9:[1] })
sage: ClusterQuiver(dg).mutation_type() # long time
['E', 8, [1, 1]]
```

```
>>> from sage.all import *
>>> dg = DiGraph(); dg.add_edges([(Integer(9),Integer(0)),(Integer(9),
↪Integer(4)),(Integer(4),Integer(6)),(Integer(6),Integer(7)),(Integer(7),
↪Integer(8)),(Integer(8),Integer(3)),(Integer(3),Integer(5)),(Integer(5),
↪Integer(6)),(Integer(8),Integer(1)),(Integer(2),Integer(3))])
>>> ClusterQuiver(dg).mutation_type() # long time
['E', 8, [1, 1]]

>>> dg = DiGraph({ Integer(0):[Integer(3)], Integer(1):[Integer(0),
↪Integer(4)], Integer(2):[Integer(0),Integer(6)], Integer(3):[Integer(1),
↪Integer(2),Integer(7)], Integer(4):[Integer(3),Integer(8)],␣
↪Integer(5):[Integer(2)], Integer(6):[Integer(3),Integer(5)],␣
↪Integer(7):[Integer(4),Integer(6)], Integer(8):[Integer(7)] })
>>> ClusterQuiver(dg).mutation_type() # long time
['E', 8, 1]

>>> dg = DiGraph({ Integer(0):[Integer(3),Integer(9)], Integer(1):[Integer(0),
```

(continues on next page)

(continued from previous page)

```
↪Integer(4)], Integer(2):[Integer(0),Integer(6)], Integer(3):[Integer(1),
↪Integer(2),Integer(7)], Integer(4):[Integer(3),Integer(8)],␣
↪Integer(5):[Integer(2)], Integer(6):[Integer(3),Integer(5)],␣
↪Integer(7):[Integer(4),Integer(6)], Integer(8):[Integer(7)],␣
↪Integer(9):[Integer(1)] })
>>> ClusterQuiver(dg).mutation_type() # long time
['E', 8, [1, 1]]
```

infinite types:

```
sage: Q = ClusterQuiver(['GR',[4,9]])
sage: Q._mutation_type = None
sage: Q.mutation_type()
'undetermined infinite mutation type'
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['GR',[Integer(4),Integer(9)]])
>>> Q._mutation_type = None
>>> Q.mutation_type()
'undetermined infinite mutation type'
```

reducible types:

```
sage: Q = ClusterQuiver([['A', 3], ['B', 3]])
sage: Q._mutation_type = None
sage: Q.mutation_type()
[ ['A', 3], ['B', 3] ]

sage: Q = ClusterQuiver([['A', 3], ['T', [4,4,4]]])
sage: Q._mutation_type = None
sage: Q.mutation_type()
[['A', 3], 'undetermined infinite mutation type']

sage: Q = ClusterQuiver([['A', 3], ['B', 3], ['T', [4,4,4]]])
sage: Q._mutation_type = None
sage: Q.mutation_type()
[['A', 3], ['B', 3], 'undetermined infinite mutation type']

sage: Q = ClusterQuiver([[0,1,2],[1,2,2],[2,0,2],[3,4,1],[4,5,1]])
sage: Q.mutation_type()
['undetermined finite mutation type', ['A', 3]]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver([['A', Integer(3)], ['B', Integer(3)]])
>>> Q._mutation_type = None
>>> Q.mutation_type()
[ ['A', 3], ['B', 3] ]

>>> Q = ClusterQuiver([['A', Integer(3)], ['T', [Integer(4),Integer(4),
↪Integer(4)]]])
>>> Q._mutation_type = None
>>> Q.mutation_type()
```

(continues on next page)

(continued from previous page)

```
[['A', 3], 'undetermined infinite mutation type']

>>> Q = ClusterQuiver([['A', Integer(3)], ['B', Integer(3)], ['T',␣
↪[Integer(4),Integer(4),Integer(4)]]])
>>> Q._mutation_type = None
>>> Q.mutation_type()
[['A', 3], ['B', 3], 'undetermined infinite mutation type']

>>> Q = ClusterQuiver([[Integer(0),Integer(1),Integer(2)],[Integer(1),
↪Integer(2),Integer(2)],[Integer(2),Integer(0),Integer(2)],[Integer(3),
↪Integer(4),Integer(1)],[Integer(4),Integer(5),Integer(1)]])
>>> Q.mutation_type()
['undetermined finite mutation type', ['A', 3]]
```

n()

Return the number of free vertices of `self`.

EXAMPLES:

```
sage: ClusterQuiver(['A',4]).n()
4
sage: ClusterQuiver(['A',(3,1),1]).n()
4
sage: ClusterQuiver(['B',4]).n()
4
sage: ClusterQuiver(['B',4,1]).n()
5
```

```
>>> from sage.all import *
>>> ClusterQuiver(['A',Integer(4)]).n()
4
>>> ClusterQuiver(['A',(Integer(3),Integer(1)),Integer(1)]).n()
4
>>> ClusterQuiver(['B',Integer(4)]).n()
4
>>> ClusterQuiver(['B',Integer(4),Integer(1)]).n()
5
```

number_of_edges()

Return the total number of edges on the quiver.

Note

This only works with non-valued quivers. If used on a non-valued quiver then the positive value is taken to be the number of edges added.

OUTPUT: integer of the number of edges

EXAMPLES:

```
sage: S = ClusterQuiver(['A',4]); S.number_of_edges()
3
```

(continues on next page)

(continued from previous page)

```
sage: S = ClusterQuiver(['B',4]); S.number_of_edges()
3
```

```
>>> from sage.all import *
>>> S = ClusterQuiver(['A',Integer(4)]); S.number_of_edges()
3

>>> S = ClusterQuiver(['B',Integer(4)]); S.number_of_edges()
3
```

plot(*circular=True*, *center=(0, 0)*, *directed=True*, *mark=None*, *save_pos=False*, *greens=[]*)

Return the plot of the underlying digraph of `self`.

INPUT:

- `circular` – boolean (default: `True`); if `True`, the circular plot is chosen, otherwise >>spring<< is used
- `center` – (default: (0,0)) sets the center of the circular plot, otherwise it is ignored
- `directed` – boolean (default: `True`); if `True`, the directed version is shown, otherwise the undirected
- `mark` – (default: `None`) if set to i, the vertex i is highlighted
- `save_pos` – boolean (default: `False`); if `True`, the positions of the vertices are saved
- `greens` – (default: `[]`) if set to a list, will display the green vertices as green

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',5])
sage: Q.plot()
Graphics object consisting of 15 graphics primitives
sage: Q.plot(circular=True)
Graphics object consisting of 15 graphics primitives
sage: Q.plot(circular=True, mark=1)
Graphics object consisting of 15 graphics primitives
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q.plot()
Graphics object consisting of 15 graphics primitives
>>> Q.plot(circular=True)
Graphics object consisting of 15 graphics primitives
>>> Q.plot(circular=True, mark=Integer(1))
Graphics object consisting of 15 graphics primitives
```

poincare_semistable(*theta*, *d*)

Return the Poincaré polynomial of the moduli space of semi-stable representations of dimension vector d.

INPUT:

- `theta` – stability weight, as list or vector of rationals
- `d` – dimension vector, as list or vector of coprime integers

The semi-stability is taken with respect to the slope function

$$\mu(d) = \theta(d)/\dim(d)$$

where d is a dimension vector.

This uses the matrix-inversion algorithm from [Rei2002].

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',2])
sage: Q.poincare_semistable([1,0],[1,0])
1
sage: Q.poincare_semistable([1,0],[1,1])
1

sage: K2 = ClusterQuiver(matrix([[0,2],[-2,0]]))
sage: theta = (1, 0)
sage: K2.poincare_semistable(theta, [1,0])
1
sage: K2.poincare_semistable(theta, [1,1])
v^2 + 1
sage: K2.poincare_semistable(theta, [1,2])
1
sage: K2.poincare_semistable(theta, [1,3])
0

sage: K3 = ClusterQuiver(matrix([[0,3],[-3,0]]))
sage: theta = (1, 0)
sage: K3.poincare_semistable(theta, (2,3))
v^12 + v^10 + 3*v^8 + 3*v^6 + 3*v^4 + v^2 + 1
sage: K3.poincare_semistable(theta, (3,4))(1)
68
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(2)])
>>> Q.poincare_semistable([Integer(1),Integer(0)],[Integer(1),Integer(0)])
1
>>> Q.poincare_semistable([Integer(1),Integer(0)],[Integer(1),Integer(1)])
1

>>> K2 = ClusterQuiver(matrix([[Integer(0),Integer(2)],[-Integer(2),
↪Integer(0)]]))
>>> theta = (Integer(1), Integer(0))
>>> K2.poincare_semistable(theta, [Integer(1),Integer(0)])
1
>>> K2.poincare_semistable(theta, [Integer(1),Integer(1)])
v^2 + 1
>>> K2.poincare_semistable(theta, [Integer(1),Integer(2)])
1
>>> K2.poincare_semistable(theta, [Integer(1),Integer(3)])
0

>>> K3 = ClusterQuiver(matrix([[Integer(0),Integer(3)],[-Integer(3),
↪Integer(0)]]))
```

(continues on next page)

(continued from previous page)

```
>>> theta = (Integer(1), Integer(0))
>>> K3.poincare_semistable(theta, (Integer(2),Integer(3)))
v^12 + v^10 + 3*v^8 + 3*v^6 + 3*v^4 + v^2 + 1
>>> K3.poincare_semistable(theta, (Integer(3),Integer(4)))(Integer(1))
68
```

REFERENCES:

principal_extension(*inplace=False*)

Return the principal extension of `self`, adding n frozen vertices to any previously frozen vertices.

This is the quiver obtained by adding an outgoing edge to every mutable vertex of `self`.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',2]); Q
Quiver on 2 vertices of type ['A', 2]
sage: T = Q.principal_extension(); T
Quiver on 4 vertices of type ['A', 2] with 2 frozen vertices
sage: T2 = T.principal_extension(); T2
Quiver on 6 vertices of type ['A', 2] with 4 frozen vertices
sage: Q.digraph().edges(sort=True)
[(0, 1, (1, -1))]
sage: T.digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 0, (1, -1)), (3, 1, (1, -1))]
sage: T2.digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 0, (1, -1)), (3, 1, (1, -1)),
 (4, 0, (1, -1)), (5, 1, (1, -1))]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(2)]); Q
Quiver on 2 vertices of type ['A', 2]
>>> T = Q.principal_extension(); T
Quiver on 4 vertices of type ['A', 2] with 2 frozen vertices
>>> T2 = T.principal_extension(); T2
Quiver on 6 vertices of type ['A', 2] with 4 frozen vertices
>>> Q.digraph().edges(sort=True)
[(0, 1, (1, -1))]
>>> T.digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 0, (1, -1)), (3, 1, (1, -1))]
>>> T2.digraph().edges(sort=True)
[(0, 1, (1, -1)), (2, 0, (1, -1)), (3, 1, (1, -1)),
 (4, 0, (1, -1)), (5, 1, (1, -1))]
```

qmu_save(*filename=None*)

Save `self` in a `.qmu` file.

This file can then be opened in Bernhard Keller's Quiver Applet.

See https://webusers.imj-prg.fr/~bernhard.keller/quivermutation/

INPUT:

- `filename` – the filename the image is saved to

If a filename is not specified, the default name is `from_sage.qmu` in the current sage directory.

EXAMPLES:

```
sage: Q = ClusterQuiver(['F',4,[1,2]])
sage: import tempfile
sage: with tempfile.NamedTemporaryFile(suffix='.qmu') as f:
....:     Q.qmu_save(f.name)
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['F',Integer(4),[Integer(1),Integer(2)]])
>>> import tempfile
>>> with tempfile.NamedTemporaryFile(suffix='.qmu') as f:
...     Q.qmu_save(f.name)
```

Make sure we can save quivers with $m! = n$ frozen variables, see Issue #14851:

```
sage: S = ClusterSeed(['A',3])
sage: T1 = S.principal_extension()
sage: Q = T1.quiver()
sage: import tempfile
sage: with tempfile.NamedTemporaryFile(suffix='.qmu') as f:
....:     Q.qmu_save(f.name)
```

```
>>> from sage.all import *
>>> S = ClusterSeed(['A',Integer(3)])
>>> T1 = S.principal_extension()
>>> Q = T1.quiver()
>>> import tempfile
>>> with tempfile.NamedTemporaryFile(suffix='.qmu') as f:
...     Q.qmu_save(f.name)
```

relabel(*relabelling*, *inplace=True*)

Return the quiver after doing a relabelling.

Will relabel the vertices of the quiver.

INPUT:

- `relabelling` – dictionary of labels to move around
- `inplace` – boolean (default: `True`); if `True`, will return a duplicate of the quiver

EXAMPLES:

```
sage: S = ClusterQuiver(['A',4]).relabel({1:'5',2:'go'})
```

```
>>> from sage.all import *
>>> S = ClusterQuiver(['A',Integer(4)]).relabel({Integer(1):'5',Integer(2):'go
↪'})
```

reorient(*data*)

Reorient `self` with respect to the given total order, or with respect to an iterator of edges in `self` to be reverted.

Warning

This operation might change the mutation type of `self`.

INPUT:

- `data` – an iterator defining a total order on `self.vertices()`, or an iterator of edges in `self` to be reoriented.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',(2,3),1])
sage: Q.mutation_type()
['A', [2, 3], 1]

sage: Q.reorient([(0,1),(1,2),(2,3),(3,4)])
sage: Q.mutation_type()
['D', 5]

sage: Q.reorient([0,1,2,3,4])
sage: Q.mutation_type()
['A', [1, 4], 1]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',(Integer(2),Integer(3)),Integer(1)])
>>> Q.mutation_type()
['A', [2, 3], 1]

>>> Q.reorient([(Integer(0),Integer(1)),(Integer(1),Integer(2)),(Integer(2),
↪Integer(3)),(Integer(3),Integer(4))])
>>> Q.mutation_type()
['D', 5]

>>> Q.reorient([Integer(0),Integer(1),Integer(2),Integer(3),Integer(4)])
>>> Q.mutation_type()
['A', [1, 4], 1]
```

save(*filename*, ***kwds*)

Save the quiver according to the filename suffix.

The suffix can be an image suffix or `.qmu` or `.sobj`.

If no suffix is given, the default format is `.sobj`.

EXAMPLES:

```
sage: S = ClusterQuiver(['A',4])
sage: import tempfile
sage: with tempfile.NamedTemporaryFile(suffix='.qmu') as f:
....:     S.save(f.name)
sage: with tempfile.NamedTemporaryFile(suffix='.png') as f:
....:     S.save(f.name)
sage: with tempfile.NamedTemporaryFile(suffix='.sobj') as f:
....:     S.save(f.name)
```

```
>>> from sage.all import *
>>> S = ClusterQuiver(['A',Integer(4)])
>>> import tempfile
>>> with tempfile.NamedTemporaryFile(suffix='.qmu') as f:
...     S.save(f.name)
>>> with tempfile.NamedTemporaryFile(suffix='.png') as f:
...     S.save(f.name)
>>> with tempfile.NamedTemporaryFile(suffix='.sobj') as f:
...     S.save(f.name)
```

save_image(*filename*, *circular=False*)

Save the plot of the underlying digraph of `self`.

INPUT:

- `filename` – the filename the image is saved to
- `circular` – boolean (default: `False`); if `True`, the circular plot is chosen, otherwise >>spring<< is used

EXAMPLES:

```
sage: Q = ClusterQuiver(['F',4,[1,2]])
sage: import tempfile
sage: with tempfile.NamedTemporaryFile(suffix='.png') as f:
....:     Q.save_image(f.name)
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['F',Integer(4),[Integer(1),Integer(2)]])
>>> import tempfile
>>> with tempfile.NamedTemporaryFile(suffix='.png') as f:
...     Q.save_image(f.name)
```

show(*fig_size=1*, *circular=False*, *directed=True*, *mark=None*, *save_pos=False*, *greens=[]*)

Show the plot of the underlying digraph of `self`.

INPUT:

- `fig_size` – (default: 1) factor by which the size of the plot is multiplied
- `circular` – boolean (default: `False`); if `True`, the circular plot is chosen, otherwise >>spring<< is used
- `directed` – boolean (default: `True`); if `True`, the directed version is shown, otherwise the undirected
- `mark` – boolean (default: `None`); if set to i, the vertex i is highlighted
- `save_pos` – boolean (default: `False`); if `True`, the positions of the vertices are saved
- `greens` – (default: `[]`) if set to a list, will display the green vertices as green

sinks()

Return all vertices of `self` that are sinks.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',5])
sage: Q.mutate([1,2,4,3,2])
```

(continues on next page)

(continued from previous page)

```
sage: Q.sinks()
[0, 2]

sage: Q = ClusterQuiver(['A',5])
sage: Q.mutate([2,1,3,4,2])
sage: Q.sinks()
[3]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q.mutate([Integer(1),Integer(2),Integer(4),Integer(3),Integer(2)])
>>> Q.sinks()
[0, 2]

>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q.mutate([Integer(2),Integer(1),Integer(3),Integer(4),Integer(2)])
>>> Q.sinks()
[3]
```

sources()

Return all vertices of `self` that are sources.

EXAMPLES:

```
sage: Q = ClusterQuiver(['A',5])
sage: Q.mutate([1,2,4,3,2])
sage: Q.sources()
[]

sage: Q = ClusterQuiver(['A',5])
sage: Q.mutate([2,1,3,4,2])
sage: Q.sources()
[1]
```

```
>>> from sage.all import *
>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q.mutate([Integer(1),Integer(2),Integer(4),Integer(3),Integer(2)])
>>> Q.sources()
[]

>>> Q = ClusterQuiver(['A',Integer(5)])
>>> Q.mutate([Integer(2),Integer(1),Integer(3),Integer(4),Integer(2)])
>>> Q.sources()
[1]
```

Quiver mutation types

sage.combinat.cluster_algebra_quiver.quiver_mutation_type.**QuiverMutationType**(**args*)

***Quiver mutation types* can be seen as a slight generalization of** *generalized Cartan types*.

Background on generalized Cartan types can be found at

Wikipedia article Generalized_Cartan_matrix

For the compendium on the cluster algebra and quiver package in Sage see [MS2011]

A B-matrix is a skew-symmetrizable $(n \times n)$-matrix M. I.e., there exists an invertible diagonal matrix D such that DM is skew-symmetric. M can be encoded as a *quiver* by having a directed edge from vertex i to vertex j with label (a, b) if $a = M_{i,j} > 0$ and $b = M_{j,i} < 0$. We consider quivers up to *mutation equivalence*.

To a quiver mutation type we can associate a *generalized Cartan type* by sending M to the generalized Cartan matrix $C(M)$ obtained by replacing all positive entries by their negatives and adding 2's on the main diagonal.

`QuiverMutationType` constructs a quiver mutation type object. For more detail on the possible different types, please see the compendium.

INPUT:

The input consists either of a quiver mutation type, or of a `letter` (a string), a `rank` (one integer or a list/tuple of integers), and an optional `twist` (an integer or a list of integers). There are several different naming conventions for quiver mutation types.

- Finite type – `letter` is a Dynkin type (A-G), and `rank` is the rank.
- Affine type – there is more than one convention for naming affine types.
  - Kac's notation: `letter` is a Dynkin type, `rank` is the rank of the associated finite Dynkin diagram, and `twist` is the twist, which could be 1, 2, or 3. In the special case of affine type A, there is more than one quiver mutation type associated to the Cartan type. In this case only, `rank` is a pair of integers (i,j), giving the number of edges pointing clockwise and the number of edges pointing counter-clockwise. The total number of vertices is given by i+j in this case.
  - Naive notation: `letter` is one of 'BB', 'BC', 'BD', 'CC', 'CD'. The name specifies the two ends of the diagram, which are joined by a path. The total number of vertices is given by `rank +1` (to match the indexing people expect because these are affine types). In general, `rank` must be large enough for the picture to make sense, but we accept `letter` is `BC` and `rank=1`.
  - Macdonald notation: for the dual of an untwisted affine type (such as ['C', 6, 1]), we accept a twist of -1 (i.e., ['C',6,-1]).
- Elliptic type – `letter` is a Dynkin type, `rank` is the rank of the finite Dynkin diagram, and `twist` is a tuple of two integers. We follow Saito's notation.
- Other shapes:
  - Rank 2: `letter` is 'R2', and `rank` is a pair of integers specifying the label on the unique edge.
  - Triangle: `letter` is `TR`, and `rank` is the number of vertices along a side.
  - T: This defines a quiver shaped like a T. `letter` is 'T', and the `rank` is a triple, whose entries specify the number of vertices along each path from the branch point (counting the branch point).
  - Grassmannian: This defines the cluster algebra (without coefficients) corresponding to the cluster algebra with coefficients which is the coordinate ring of a Grassmannian. `letter` is 'GR'. `rank` is a pair of integers (k, n) with 'k' < 'n' specifying the Grassmannian of k-planes in n-space. This defines a quiver given by a (k-1) x (n-k-1) grid where each square is cyclically oriented.
  - Exceptional mutation finite quivers: The two exceptional mutation finite quivers, found by Derksen-Owen, have `letter` as 'X' and `rank` 6 or 7, equal to the number of vertices.

- AE, BE, CE, DE: Quivers are built of one end which looks like type (affine A), B, C, or D, and the other end which looks like type E (i.e., it consists of two antennae, one of length one, and one of length two). `letter` is 'AE', 'BE', 'CE', or 'DE', and `rank` is the total number of vertices. Note that 'AE' is of a slightly different form and requires `rank` to be a pair of integers (i,j) just as in the case of affine type A. See Exercise 4.3 in Kac's book Infinite Dimensional Lie Algebras for more details.
- Infinite type E: It is also possible to obtain infinite-type E quivers by specifying `letter` as 'E' and `rank` as the number of vertices.

REFERENCES:

- A good reference for finite and affine Dynkin diagrams, including Kac's notation, is the Wikipedia article Dynkin_diagram.
- A good reference for the skew-symmetrizable elliptic diagrams is "Cluster algebras of finite mutation type via unfolding" by A. Felikson, M. Shapiro, and P. Tumarkin, [FST2012].

EXAMPLES:

Finite types:

```
sage: QuiverMutationType('A', 1)
['A', 1]
sage: QuiverMutationType('A',5)
['A', 5]

sage: QuiverMutationType('B', 2)
['B', 2]
sage: QuiverMutationType('B',5)
['B', 5]

sage: QuiverMutationType('C', 2)
['B', 2]
sage: QuiverMutationType('C',5)
['C', 5]

sage: QuiverMutationType('D', 2)
[ ['A', 1], ['A', 1] ]
sage: QuiverMutationType('D',3)
['A', 3]
sage: QuiverMutationType('D',4)
['D', 4]

sage: QuiverMutationType('E',6)
['E', 6]

sage: QuiverMutationType('G', 2)
['G', 2]

sage: QuiverMutationType('A',(1,0), 1)
['A', 1]

sage: QuiverMutationType('A',(2,0), 1)
[ ['A', 1], ['A', 1] ]

sage: QuiverMutationType('A',(7,0), 1)
['D', 7]
```

```
>>> from sage.all import *
>>> QuiverMutationType('A', Integer(1))
['A', 1]
>>> QuiverMutationType('A',Integer(5))

↪Integer(3), Integer(2))
True
```

Affine types using Kac's Notation:

```
sage: QuiverMutationType('A', 1, 1)
['A', [1, 1], 1]
sage: QuiverMutationType('B',5, 1)
['BD', 5, 1]
sage: QuiverMutationType('C',5, 1)
```

(continues on next page)

(continued from previous page)

```
['CC', 5, 1]
sage: QuiverMutationType('A', 2, 2)
['BC', 1, 1]
sage: QuiverMutationType('A',7, 2)
['CD', 4, 1]
sage: QuiverMutationType('A',8, 2)
['BC', 4, 1]
sage: QuiverMutationType('D',6, 2)
['BB', 5, 1]
sage: QuiverMutationType('E',6, 2)
['F', 4, -1]
sage: QuiverMutationType('D',4,3)
['G', 2, -1]
```

```
>>> from sage.all import *
>>> QuiverMutationType('A', Integer(1), Integer(1))
['A', [1, 1], 1]
>>> QuiverMutationType('B',Integer(5), Integer(1))
['BD', 5, 1]
>>> QuiverMutationType('C',Integer(5), Integer(1))
['CC', 5, 1]
>>> QuiverMutationType('A', Integer(2), Integer(2))
['BC', 1, 1]
>>> QuiverMutationType('A',Integer(7), Integer(2))
['CD', 4, 1]
>>> QuiverMutationType('A',Integer(8), Integer(2))
['BC', 4, 1]
>>> QuiverMutationType('D',Integer(6), Integer(2))
['BB', 5, 1]
>>> QuiverMutationType('E',Integer(6), Integer(2))
['F', 4, -1]
>>> QuiverMutationType('D',Integer(4),Integer(3))
['G', 2, -1]
```

Elliptic types:

```
sage: QuiverMutationType('E',6,[1, 1])
['E', 6, [1, 1]]
sage: QuiverMutationType('F',4,[2, 1])
['F', 4, [1, 2]]
sage: QuiverMutationType('G', 2,[3,3])
['G', 2, [3, 3]]
```

```
>>> from sage.all import *
>>> QuiverMutationType('E',Integer(6),[Integer(1), Integer(1)])
['E', 6, [1, 1]]
>>> QuiverMutationType('F',Integer(4),[Integer(2), Integer(1)])
['F', 4, [1, 2]]
>>> QuiverMutationType('G', Integer(2),[Integer(3),Integer(3)])
['G', 2, [3, 3]]
```

Mutation finite types:

Rank 2 cases:

```
sage: QuiverMutationType('R2',(1, 1))
['A', 2]
sage: QuiverMutationType('R2',(1, 2))
['B', 2]
sage: QuiverMutationType('R2',(1,3))
['G', 2]
sage: QuiverMutationType('R2',(1,4))
['BC', 1, 1]
sage: QuiverMutationType('R2',(1,5))
['R2', [1, 5]]
sage: QuiverMutationType('R2',(2, 2))
['A', [1, 1], 1]
sage: QuiverMutationType('R2',(3,5))
['R2', [3, 5]]
```

```
>>> from sage.all import *
>>> QuiverMutationType('R2',(Integer(1), Integer(1)))
['A', 2]
>>> QuiverMutationType('R2',(Integer(1), Integer(2)))
['B', 2]
>>> QuiverMutationType('R2',(Integer(1),Integer(3)))
['G', 2]
>>> QuiverMutationType('R2',(Integer(1),Integer(4)))
['BC', 1, 1]
>>> QuiverMutationType('R2',(Integer(1),Integer(5)))
['R2', [1, 5]]
>>> QuiverMutationType('R2',(Integer(2), Integer(2)))
['A', [1, 1], 1]
>>> QuiverMutationType('R2',(Integer(3),Integer(5)))
['R2', [3, 5]]
```

Exceptional Derksen-Owen quivers:

```
sage: QuiverMutationType('X',6)
['X', 6]
```

```
>>> from sage.all import *
>>> QuiverMutationType('X',Integer(6))
['X', 6]
```

(Mainly) mutation infinite types:

Infinite type E:

```
sage: QuiverMutationType('E',9)
['E', 8, 1]
sage: QuiverMutationType('E', 10)
['E', 10]
sage: QuiverMutationType('E', 12)
['E', 12]

sage: QuiverMutationType('AE',(2,3))
```

(continues on next page)

(continued from previous page)

```
['AE', [2, 3]]
sage: QuiverMutationType('BE',5)
['BE', 5]
sage: QuiverMutationType('CE',5)
['CE', 5]
sage: QuiverMutationType('DE',6)
['DE', 6]
```

```
>>> from sage.all import *
>>> QuiverMutationType('E',Integer(9))
['E', 8, 1]
>>> QuiverMutationType('E', Integer(10))
['E', 10]
>>> QuiverMutationType('E', Integer(12))
['E', 12]

>>> QuiverMutationType('AE',(Integer(2),Integer(3)))
['AE', [2, 3]]
>>> QuiverMutationType('BE',Integer(5))
['BE', 5]
>>> QuiverMutationType('CE',Integer(5))
['CE', 5]
>>> QuiverMutationType('DE',Integer(6))
['DE', 6]
```

Grassmannian types:

```
sage: QuiverMutationType('GR',(2,4))
['A', 1]
sage: QuiverMutationType('GR',(2,6))
['A', 3]
sage: QuiverMutationType('GR',(3,6))
['D', 4]
sage: QuiverMutationType('GR',(3,7))
['E', 6]
sage: QuiverMutationType('GR',(3,8))
['E', 8]
sage: QuiverMutationType('GR',(3, 10))
['GR', [3, 10]]
```

```
>>> from sage.all import *
>>> QuiverMutationType('GR',(Integer(2),Integer(4)))
['A', 1]
>>> QuiverMutationType('GR',(Integer(2),Integer(6)))
['A', 3]
>>> QuiverMutationType('GR',(Integer(3),Integer(6)))
['D', 4]
>>> QuiverMutationType('GR',(Integer(3),Integer(7)))
['E', 6]
>>> QuiverMutationType('GR',(Integer(3),Integer(8)))
['E', 8]
>>> QuiverMutationType('GR',(Integer(3), Integer(10)))
```

(continues on next page)

(continued from previous page)

```
['GR', [3, 10]]
```

Triangular types:

```
sage: QuiverMutationType('TR', 2)
['A', 3]
sage: QuiverMutationType('TR',3)
['D', 6]
sage: QuiverMutationType('TR',4)
['E', 8, [1, 1]]
sage: QuiverMutationType('TR',5)
['TR', 5]
```

```
>>> from sage.all import *
>>> QuiverMutationType('TR', Integer(2))
['A', 3]
>>> QuiverMutationType('TR',Integer(3))
['D', 6]
>>> QuiverMutationType('TR',Integer(4))
['E', 8, [1, 1]]
>>> QuiverMutationType('TR',Integer(5))
['TR', 5]
```

T types:

```
sage: QuiverMutationType('T',(1, 1, 1))
['A', 1]
sage: QuiverMutationType('T',(1, 1,4))
['A', 4]
sage: QuiverMutationType('T',(1,4,4))
['A', 7]
sage: QuiverMutationType('T',(2, 2, 2))
['D', 4]
sage: QuiverMutationType('T',(2, 2,4))
['D', 6]
sage: QuiverMutationType('T',(2,3,3))
['E', 6]
sage: QuiverMutationType('T',(2,3,4))
['E', 7]
sage: QuiverMutationType('T',(2,3,5))
['E', 8]
sage: QuiverMutationType('T',(2,3,6))
['E', 8, 1]
sage: QuiverMutationType('T',(2,3,7))
['E', 10]
sage: QuiverMutationType('T',(3,3,3))
['E', 6, 1]
sage: QuiverMutationType('T',(3,3,4))
['T', [3, 3, 4]]
```

```
>>> from sage.all import *
>>> QuiverMutationType('T',(Integer(1), Integer(1), Integer(1)))
```

(continues on next page)

(continued from previous page)

```
['A', 1]
>>> QuiverMutationType('T',(Integer(1), Integer(1),Integer(4)))
['A', 4]
>>> QuiverMutationType('T',(Integer(1),Integer(4),Integer(4)))
['A', 7]
>>> QuiverMutationType('T',(Integer(2), Integer(2), Integer(2)))
['D', 4]
>>> QuiverMutationType('T',(Integer(2), Integer(2),Integer(4)))
['D', 6]
>>> QuiverMutationType('T',(Integer(2),Integer(3),Integer(3)))
['E', 6]
>>> QuiverMutationType('T',(Integer(2),Integer(3),Integer(4)))
['E', 7]
>>> QuiverMutationType('T',(Integer(2),Integer(3),Integer(5)))
['E', 8]
>>> QuiverMutationType('T',(Integer(2),Integer(3),Integer(6)))
['E', 8, 1]
>>> QuiverMutationType('T',(Integer(2),Integer(3),Integer(7)))
['E', 10]
>>> QuiverMutationType('T',(Integer(3),Integer(3),Integer(3)))
['E', 6, 1]
>>> QuiverMutationType('T',(Integer(3),Integer(3),Integer(4)))
['T', [3, 3, 4]]
```

Reducible types:

```
sage: QuiverMutationType(['A',3],['B',4])
[ ['A', 3], ['B', 4] ]
```

```
>>> from sage.all import *
>>> QuiverMutationType(['A',Integer(3)],['B',Integer(4)])
[ ['A', 3], ['B', 4] ]
```

class sage.combinat.cluster_algebra_quiver.quiver_mutation_type.**QuiverMutationTypeFactory**

Bases: SageObject

samples(*finite=None*, *affine=None*, *elliptic=None*, *mutation_finite=None*)

Return a sample of the available quiver mutations types.

INPUT:

- finite
- affine
- elliptic
- mutation_finite

All four input keywords default values are None. If set to True or False, only these samples are returned.

EXAMPLES:

```
sage: QuiverMutationType.samples()
[['A', 1], ['A', 5], ['B', 2], ['B', 5], ['C', 3],
```

(continues on next page)

(continued from previous page)

```
 ['C', 5], [ ['A', 1], ['A', 1] ], ['D', 5], ['E', 6],
 ['E', 7], ['E', 8], ['F', 4], ['G', 2],
 ['A', [1, 1], 1], ['A', [4, 5], 1], ['D', 4, 1],
 ['BB', 5, 1], ['E', 6, [1, 1]], ['E', 7, [1, 1]],
 ['R2', [1, 5]], ['R2', [3, 5]], ['E', 10], ['BE', 5],
 ['GR', [3, 10]], ['T', [3, 3, 4]]]

sage: QuiverMutationType.samples(finite=True)
[['A', 1], ['A', 5], ['B', 2], ['B', 5], ['C', 3],
 ['C', 5], [ ['A', 1], ['A', 1] ], ['D', 5], ['E', 6],
 ['E', 7], ['E', 8], ['F', 4], ['G', 2]]

sage: QuiverMutationType.samples(affine=True)
[['A', [1, 1], 1], ['A', [4, 5], 1], ['D', 4, 1], ['BB', 5, 1]]

sage: QuiverMutationType.samples(elliptic=True)
[['E', 6, [1, 1]], ['E', 7, [1, 1]]]

sage: QuiverMutationType.samples(mutation_finite=False)
[['R2', [1, 5]], ['R2', [3, 5]], ['E', 10], ['BE', 5],
 ['GR', [3, 10]], ['T', [3, 3, 4]]]
```

```
>>> from sage.all import *
>>> QuiverMutationType.samples()
[['A', 1], ['A', 5], ['B', 2], ['B', 5], ['C', 3],
 ['C', 5], [ ['A', 1], ['A', 1] ], ['D', 5], ['E', 6],
 ['E', 7], ['E', 8], ['F', 4], ['G', 2],
 ['A', [1, 1], 1], ['A', [4, 5], 1], ['D', 4, 1],
 ['BB', 5, 1], ['E', 6, [1, 1]], ['E', 7, [1, 1]],
 ['R2', [1, 5]], ['R2', [3, 5]], ['E', 10], ['BE', 5],

[['A', 1], ['A', 5], ['B', 2], ['B', 5], ['C', 3],
 ['C', 5], [ ['A', 1], ['A', 1] ], ['D', 5], ['E', 6],
 ['E', 7], ['E', 8], ['F', 4], ['G', 2]]

>>> QuiverMutationType.samples(affine=True)
[['A', [1, 1], 1], ['A', [4, 5], 1], ['D', 4, 1], ['BB', 5, 1]]

>>> QuiverMutationType.samples(elliptic=True)
[['E', 6, [1, 1]], ['E', 7, [1, 1]]]

>>> QuiverMutationType.samples(mutation_finite=False)
[['R2', [1, 5]], ['R2', [3, 5]], ['E', 10], ['BE', 5],
 ['GR', [3, 10]], ['T', [3, 3, 4]]]
```

class sage.combinat.cluster_algebra_quiver.quiver_mutation_type.**QuiverMutationType_Irreducible**(*letter*, *rank*, *twist=N*

Bases: *QuiverMutationType_abstract*

The mutation type for a cluster algebra or a quiver. Should not be called directly, but through *QuiverMutationType*.

class_size()

If it is known, the size of the mutation class of all quivers which are mutation equivalent to the standard quiver of `self` (up to isomorphism) is returned.

Otherwise, `NotImplemented` is returned.

Formula for finite type A is taken from Torkildsen - Counting cluster-tilted algebras of type A_n. Formulas for affine type A and finite type D are taken from Bastian, Prellberg, Rubey, Stump - Counting the number of elements in the mutation classes of $\widetilde{A}_n$ quivers. Formulas for finite and affine types B and C are proven but not yet published. Conjectural formulas for several other non-simply-laced affine types are implemented. Exceptional Types (finite, affine, and elliptic) E, F, G, and X are hardcoded.

EXAMPLES:

```
sage: mut_type = QuiverMutationType( ['A',5] ); mut_type
['A', 5]
sage: mut_type.class_size()
19

sage: mut_type = QuiverMutationType( ['A',[10,3], 1] ); mut_type
['A', [3, 10], 1]
sage: mut_type.class_size()
142120

sage: mut_type = QuiverMutationType( ['B',6] ); mut_type
['B', 6]
sage: mut_type.class_size()
132

sage: mut_type = QuiverMutationType( ['BD',6, 1] ); mut_type
['BD', 6, 1]
sage: mut_type.class_size()
Warning: This method uses a formula which has not been proved correct.
504
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType( ['A',Integer(5)] ); mut_type
['A', 5]
>>> mut_type.class_size()
19

>>> mut_type = QuiverMutationType( ['A',[Integer(10),Integer(3)], Integer(1)]␣
↪); mut_type
['A', [3, 10], 1]
>>> mut_type.class_size()
142120

>>> mut_type = QuiverMutationType( ['B',Integer(6)] ); mut_type
['B', 6]
>>> mut_type.class_size()
132
```

(continues on next page)

(continued from previous page)

```
>>> mut_type = QuiverMutationType( ['BD',Integer(6), Integer(1)] ); mut_type
['BD', 6, 1]
>>> mut_type.class_size()
Warning: This method uses a formula which has not been proved correct.
504
```

Check that Issue #14048 is fixed:

```
sage: mut_type = QuiverMutationType( ['F',4,(2, 1)] )
sage: mut_type.class_size()
90
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType( ['F',Integer(4),(Integer(2), Integer(1))] )
>>> mut_type.class_size()
90
```

dual()

Return the *QuiverMutationType* which is dual to `self`.

EXAMPLES:

```
sage: mut_type = QuiverMutationType('A',5); mut_type
['A', 5]
sage: mut_type.dual()
['A', 5]

sage: mut_type = QuiverMutationType('B',5); mut_type
['B', 5]
sage: mut_type.dual()
['C', 5]
sage: mut_type.dual().dual()
['B', 5]
sage: mut_type.dual().dual() == mut_type
True
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType('A',Integer(5)); mut_type
['A', 5]
>>> mut_type.dual()
['A', 5]

>>> mut_type = QuiverMutationType('B',Integer(5)); mut_type
['B', 5]
>>> mut_type.dual()
['C', 5]
>>> mut_type.dual().dual()
['B', 5]
>>> mut_type.dual().dual() == mut_type
True
```

irreducible_components()

Return a list of all irreducible components of `self`.

EXAMPLES:

```
sage: mut_type = QuiverMutationType('A',3); mut_type
['A', 3]
sage: mut_type.irreducible_components()
(['A', 3],)
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType('A',Integer(3)); mut_type
['A', 3]
>>> mut_type.irreducible_components()
(['A', 3],)
```

class sage.combinat.cluster_algebra_quiver.quiver_mutation_type.**QuiverMutationType_Reducible**(**args*)

Bases: *QuiverMutationType_abstract*

The mutation type for a cluster algebra or a quiver. Should not be called directly, but through *QuiverMutationType*. Inherits from *QuiverMutationType_abstract*.

class_size()

If it is known, the size of the mutation class of all quivers which are mutation equivalent to the standard quiver of `self` (up to isomorphism) is returned.

Otherwise, `NotImplemented` is returned.

EXAMPLES:

```
sage: mut_type = QuiverMutationType(['A',3],['B',3]); mut_type
[ ['A', 3], ['B', 3] ]
sage: mut_type.class_size()
20

sage: mut_type = QuiverMutationType(['A',3],['B',3],['X',6])
sage: mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
sage: mut_type.class_size()
100
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)]); mut_type
[ ['A', 3], ['B', 3] ]
>>> mut_type.class_size()
20

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)],['X',
↪Integer(6)])
>>> mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
>>> mut_type.class_size()
100
```

dual()

Return the *QuiverMutationType* which is dual to `self`.

EXAMPLES:

```
sage: mut_type = QuiverMutationType(['A',5],['B',6],['C',5],['D',4]); mut_type
[ ['A', 5], ['B', 6], ['C', 5], ['D', 4] ]
sage: mut_type.dual()
[ ['A', 5], ['C', 6], ['B', 5], ['D', 4] ]
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType(['A',Integer(5)],['B',Integer(6)],['C',
↪Integer(5)],['D',Integer(4)]); mut_type
[ ['A', 5], ['B', 6], ['C', 5], ['D', 4] ]
>>> mut_type.dual()
[ ['A', 5], ['C', 6], ['B', 5], ['D', 4] ]
```

irreducible_components()

Return a list of all irreducible components of `self`.

EXAMPLES:

```
sage: mut_type = QuiverMutationType('A',3); mut_type
['A', 3]
sage: mut_type.irreducible_components()
(['A', 3],)

sage: mut_type = QuiverMutationType(['A',3],['B',3]); mut_type
[ ['A', 3], ['B', 3] ]
sage: mut_type.irreducible_components()
(['A', 3], ['B', 3])

sage: mut_type = QuiverMutationType(['A',3],['B',3],['X',6])
sage: mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
sage: mut_type.irreducible_components()
(['A', 3], ['B', 3], ['X', 6])
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType('A',Integer(3)); mut_type
['A', 3]
>>> mut_type.irreducible_components()
(['A', 3],)

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)]); mut_type
[ ['A', 3], ['B', 3] ]
>>> mut_type.irreducible_components()
(['A', 3], ['B', 3])

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)],['X',
↪Integer(6)])
>>> mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
>>> mut_type.irreducible_components()
(['A', 3], ['B', 3], ['X', 6])
```

class
sage.combinat.cluster_algebra_quiver.quiver_mutation_type.**QuiverMutationType_abstract**

Bases: UniqueRepresentation, SageObject

EXAMPLES:

```
sage: mut_type1 = QuiverMutationType('A',5)
sage: mut_type2 = QuiverMutationType('A',5)
sage: mut_type3 = QuiverMutationType('A',6)
sage: mut_type1 == mut_type2
True
sage: mut_type1 == mut_type3
False
```

```
>>> from sage.all import *
>>> mut_type1 = QuiverMutationType('A',Integer(5))
>>> mut_type2 = QuiverMutationType('A',Integer(5))
>>> mut_type3 = QuiverMutationType('A',Integer(6))
>>> mut_type1 == mut_type2
True
>>> mut_type1 == mut_type3
False
```

b_matrix()

Return the B-matrix of the standard quiver of self.

The conventions for B-matrices agree with Fomin-Zelevinsky (up to a reordering of the simple roots).

EXAMPLES:

```
sage: mut_type = QuiverMutationType(['A',5]); mut_type
['A', 5]
sage: mut_type.b_matrix()                                                   #␣
↪needs sage.modules
[ 0  1  0  0  0]
[-1  0 -1  0  0]
[ 0  1  0  1  0]
[ 0  0 -1  0 -1]
[ 0  0  0  1  0]

sage: mut_type = QuiverMutationType(['A',3],['B',3]); mut_type
[ ['A', 3], ['B', 3] ]
sage: mut_type.b_matrix()                                                   #␣
↪needs sage.modules
[ 0  1  0  0  0  0]
[-1  0 -1  0  0  0]
[ 0  1  0  0  0  0]
[ 0  0  0  0  1  0]
[ 0  0  0 -1  0 -1]
[ 0  0  0  0  2  0]
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType(['A',Integer(5)]); mut_type
['A', 5]
>>> mut_type.b_matrix()                                                     #␣
↪needs sage.modules
```

(continues on next page)

(continued from previous page)

```
[ 0  1  0  0  0]
[-1  0 -1  0  0]
[ 0  1  0  1  0]
[ 0  0 -1  0 -1]
[ 0  0  0  1  0]

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)]); mut_type
[ ['A', 3], ['B', 3] ]
>>> mut_type.b_matrix()                                                    #␣
↪needs sage.modules
[ 0  1  0  0  0  0]
[-1  0 -1  0  0  0]
[ 0  1  0  0  0  0]
[ 0  0  0  0  1  0]
[ 0  0  0 -1  0 -1]
[ 0  0  0  0  2  0]
```

cartan_matrix()

Return the Cartan matrix of `self`.

Note that (up to a reordering of the simple roots) the convention for the definition of Cartan matrix, used here and elsewhere in Sage, agrees with the conventions of Kac, Fulton-Harris, and Fomin-Zelevinsky, but disagrees with the convention of Bourbaki. The (i, j) entry is $2(\alpha_i, \alpha_j)/(\alpha_i, \alpha_i)$.

EXAMPLES:

```
sage: mut_type = QuiverMutationType(['A',5]); mut_type
['A', 5]
sage: mut_type.cartan_matrix()                                             #␣
↪needs sage.modules
[ 2 -1  0  0  0]
[-1  2 -1  0  0]
[ 0 -1  2 -1  0]
[ 0  0 -1  2 -1]
[ 0  0  0 -1  2]

sage: mut_type = QuiverMutationType(['A',3],['B',3]); mut_type
[ ['A', 3], ['B', 3] ]
sage: mut_type.cartan_matrix()                                             #␣
↪needs sage.modules
[ 2 -1  0  0  0  0]
[-1  2 -1  0  0  0]
[ 0 -1  2  0  0  0]
[ 0  0  0  2 -1  0]
[ 0  0  0 -1  2 -1]
[ 0  0  0  0 -2  2]
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType(['A',Integer(5)]); mut_type
['A', 5]
>>> mut_type.cartan_matrix()                                               #␣
↪needs sage.modules
[ 2 -1  0  0  0]
```

(continues on next page)

(continued from previous page)

```
[-1  2 -1  0  0]
[ 0 -1  2 -1  0]
[ 0  0 -1  2 -1]
[ 0  0  0 -1  2]

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)]); mut_type
[ ['A', 3], ['B', 3] ]
>>> mut_type.cartan_matrix()                                                #␣
↪needs sage.modules
[ 2 -1  0  0  0  0]
[-1  2 -1  0  0  0]
[ 0 -1  2  0  0  0]
[ 0  0  0  2 -1  0]
[ 0  0  0 -1  2 -1]
[ 0  0  0  0 -2  2]
```

is_affine()

Return `True` if `self` is of affine type.

EXAMPLES:

```
sage: mt = QuiverMutationType(['A', 2])
sage: mt.is_affine()
False

sage: mt = QuiverMutationType(['A',[4, 2], 1])
sage: mt.is_affine()
True
```

```
>>> from sage.all import *
>>> mt = QuiverMutationType(['A', Integer(2)])
>>> mt.is_affine()
False

>>> mt = QuiverMutationType(['A',[Integer(4), Integer(2)], Integer(1)])
>>> mt.is_affine()
True
```

is_elliptic()

Return `True` if `self` is of elliptic type.

EXAMPLES:

```
sage: mt = QuiverMutationType(['A', 2])
sage: mt.is_elliptic()
False

sage: mt = QuiverMutationType(['E',6,[1, 1]])
sage: mt.is_elliptic()
True
```

```
>>> from sage.all import *
>>> mt = QuiverMutationType(['A', Integer(2)])
```

(continues on next page)

(continued from previous page)

```
>>> mt.is_elliptic()
False

>>> mt = QuiverMutationType(['E',Integer(6),[Integer(1), Integer(1)]])
>>> mt.is_elliptic()
True
```

is_finite()

Return `True` if `self` is of finite type.

This means that the cluster algebra associated to `self` has only a finite number of cluster variables.

EXAMPLES:

```
sage: mt = QuiverMutationType(['A', 2])
sage: mt.is_finite()
True

sage: mt = QuiverMutationType(['A',[4, 2], 1])
sage: mt.is_finite()
False
```

```
>>> from sage.all import *
>>> mt = QuiverMutationType(['A', Integer(2)])
>>> mt.is_finite()
True

>>> mt = QuiverMutationType(['A',[Integer(4), Integer(2)], Integer(1)])
>>> mt.is_finite()
False
```

is_irreducible()

Return `True` if `self` is irreducible.

EXAMPLES:

```
sage: mt = QuiverMutationType(['A', 2])
sage: mt.is_irreducible()
True
```

```
>>> from sage.all import *
>>> mt = QuiverMutationType(['A', Integer(2)])
>>> mt.is_irreducible()
True
```

is_mutation_finite()

Return `True` if `self` is of finite mutation type.

This means that its mutation class has only finitely many different B-matrices.

EXAMPLES:

```
sage: mt = QuiverMutationType(['D',5, 1])
sage: mt.is_mutation_finite()
True
```

```
>>> from sage.all import *
>>> mt = QuiverMutationType(['D',Integer(5), Integer(1)])
>>> mt.is_mutation_finite()
True
```

is_simply_laced()

Return `True` if `self` is simply laced.

This means that the only arrows that appear in the quiver of `self` are single unlabelled arrows.

EXAMPLES:

```
sage: mt = QuiverMutationType(['A', 2])
sage: mt.is_simply_laced()
True

sage: mt = QuiverMutationType(['B', 2])
sage: mt.is_simply_laced()
False

sage: mt = QuiverMutationType(['A',(1, 1), 1])
sage: mt.is_simply_laced()
False
```

```
>>> from sage.all import *
>>> mt = QuiverMutationType(['A', Integer(2)])
>>> mt.is_simply_laced()
True

>>> mt = QuiverMutationType(['B', Integer(2)])
>>> mt.is_simply_laced()
False

>>> mt = QuiverMutationType(['A',(Integer(1), Integer(1)), Integer(1)])
>>> mt.is_simply_laced()
False
```

is_skew_symmetric()

Return `True` if the B-matrix of `self` is skew-symmetric.

EXAMPLES:

```
sage: mt = QuiverMutationType(['A', 2])
sage: mt.is_skew_symmetric()
True

sage: mt = QuiverMutationType(['B', 2])
sage: mt.is_skew_symmetric()
False
```

(continues on next page)

(continued from previous page)

```
sage: mt = QuiverMutationType(['A',(1, 1), 1])
sage: mt.is_skew_symmetric()
True
```

```
>>> from sage.all import *
>>> mt = QuiverMutationType(['A', Integer(2)])
>>> mt.is_skew_symmetric()
True

>>> mt = QuiverMutationType(['B', Integer(2)])
>>> mt.is_skew_symmetric()
False

>>> mt = QuiverMutationType(['A',(Integer(1), Integer(1)), Integer(1)])
>>> mt.is_skew_symmetric()
True
```

letter()

Return the classification letter of `self`.

EXAMPLES:

```
sage: mut_type = QuiverMutationType( ['A',5] ); mut_type
['A', 5]
sage: mut_type.letter()
'A'

sage: mut_type = QuiverMutationType( ['BC',5, 1] ); mut_type
['BC', 5, 1]
sage: mut_type.letter()
'BC'

sage: mut_type = QuiverMutationType(['A',3],['B',3]); mut_type
[ ['A', 3], ['B', 3] ]
sage: mut_type.letter()
'A x B'

sage: mut_type = QuiverMutationType(['A',3],['B',3],['X',6]); mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
sage: mut_type.letter()
'A x B x X'
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType( ['A',Integer(5)] ); mut_type
['A', 5]
>>> mut_type.letter()
'A'

>>> mut_type = QuiverMutationType( ['BC',Integer(5), Integer(1)] ); mut_type
['BC', 5, 1]
>>> mut_type.letter()
'BC'
```

(continues on next page)

(continued from previous page)

```
>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)]); mut_type
[ ['A', 3], ['B', 3] ]
>>> mut_type.letter()
'A x B'

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)],['X',
↪Integer(6)]); mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
>>> mut_type.letter()
'A x B x X'
```

plot(*circular=False*, *directed=True*)

Return the plot of the underlying graph or digraph of `self`.

INPUT:

- `circular` – boolean (default: `False`); if `True`, the circular plot is chosen, otherwise >>spring<< is used
- `directed` – boolean (default: `True`); if `True`, the directed version is shown, otherwise the undirected

EXAMPLES:

```
sage: QMT = QuiverMutationType(['A',5])
sage: pl = QMT.plot()                                                    #␣
↪needs sage.plot sage.symbolic
sage: pl = QMT.plot(circular=True)                                       #␣
↪needs sage.plot sage.symbolic
```

```
>>> from sage.all import *
>>> QMT = QuiverMutationType(['A',Integer(5)])
>>> pl = QMT.plot()                                                      #␣
↪needs sage.plot sage.symbolic
>>> pl = QMT.plot(circular=True)                                         #␣
↪needs sage.plot sage.symbolic
```

properties()

Print a scheme of all properties of `self`.

Most properties have natural definitions for either irreducible or reducible types. `affine` and `elliptic` are only defined for irreducible types.

EXAMPLES:

```
sage: mut_type = QuiverMutationType(['A',3]); mut_type
['A', 3]
sage: mut_type.properties()
['A', 3] has rank 3 and the following properties:
    - irreducible:       True
    - mutation finite:   True
    - simply-laced:      True
    - skew-symmetric:    True
    - finite:            True
    - affine:            False
```

(continues on next page)

(continued from previous page)

```
    - elliptic:          False

sage: mut_type = QuiverMutationType(['B',3]); mut_type
['B', 3]
sage: mut_type.properties()
['B', 3] has rank 3 and the following properties:
    - irreducible:       True
    - mutation finite:   True
    - simply-laced:      False
    - skew-symmetric:    False
    - finite:            True
    - affine:            False
    - elliptic:          False

sage: mut_type = QuiverMutationType(['B',3, 1]); mut_type
['BD', 3, 1]
sage: mut_type.properties()
['BD', 3, 1] has rank 4 and the following properties:
    - irreducible:       True
    - mutation finite:   True
    - simply-laced:      False
    - skew-symmetric:    False
    - finite:            False
    - affine:            True
    - elliptic:          False

sage: mut_type = QuiverMutationType(['E',6,[1, 1]]); mut_type
['E', 6, [1, 1]]
sage: mut_type.properties()
['E', 6, [1, 1]] has rank 8 and the following properties:
    - irreducible:       True
    - mutation finite:   True
    - simply-laced:      False
    - skew-symmetric:    True
    - finite:            False
    - affine:            False
    - elliptic:          True

sage: mut_type = QuiverMutationType(['A',3],['B',3]); mut_type
[ ['A', 3], ['B', 3] ]
sage: mut_type.properties()
[ ['A', 3], ['B', 3] ] has rank 6 and the following properties:
    - irreducible:       False
    - mutation finite:   True
    - simply-laced:      False
    - skew-symmetric:    False
    - finite:            True

sage: mut_type = QuiverMutationType('GR',[4,9]); mut_type
['GR', [4, 9]]
sage: mut_type.properties()

    - affine:            False
    - elliptic:          False
```

rank()

Return the rank in the standard quiver of `self`.

The rank is the number of vertices.

EXAMPLES:

```
sage: mut_type = QuiverMutationType( ['A',5] ); mut_type
['A', 5]
sage: mut_type.rank()
5

sage: mut_type = QuiverMutationType( ['A',[4,5], 1] ); mut_type
['A', [4, 5], 1]
sage: mut_type.rank()
9

sage: mut_type = QuiverMutationType( ['BC',5, 1] ); mut_type
['BC', 5, 1]
sage: mut_type.rank()
6

sage: mut_type = QuiverMutationType(['A',3],['B',3]); mut_type
[ ['A', 3], ['B', 3] ]
sage: mut_type.rank()
```

(continues on next page)

(continued from previous page)

```
6

sage: mut_type = QuiverMutationType(['A',3],['B',3],['X',6]); mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
sage: mut_type.rank()
12
```

```
>>> from sage.all import *
>>> mut_type = QuiverMutationType( ['A',Integer(5)] ); mut_type
['A', 5]
>>> mut_type.rank()
5

>>> mut_type = QuiverMutationType( ['A',[Integer(4),Integer(5)], Integer(1)]␣
↪); mut_type
['A', [4, 5], 1]
>>> mut_type.rank()
9

>>> mut_type = QuiverMutationType( ['BC',Integer(5), Integer(1)] ); mut_type
['BC', 5, 1]
>>> mut_type.rank()
6

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)]); mut_type
[ ['A', 3], ['B', 3] ]
>>> mut_type.rank()
6

>>> mut_type = QuiverMutationType(['A',Integer(3)],['B',Integer(3)],['X',
↪Integer(6)]); mut_type
[ ['A', 3], ['B', 3], ['X', 6] ]
>>> mut_type.rank()
12
```

show(*circular=False*, *directed=True*)

Show the plot of the underlying digraph of `self`.

INPUT:

- `circular` – boolean (default: `False`); if `True`, the circular plot is chosen, otherwise >>spring<< is used
- `directed` – boolean (default: `True`); if `True`, the directed version is shown, otherwise the undirected

standard_quiver()

Return the standard quiver of `self`.

EXAMPLES:

```
sage: mut_type = QuiverMutationType( ['A',5] ); mut_type
['A', 5]
sage: mut_type.standard_quiver()                                              #␣
↪needs sage.modules
```

(continues on next page)

```

sage.combinat.cluster_algebra_quiver.quiver_mutation_type.**save_quiver_data**(*n*, *up_to=True*, *types='ClassicalExceptional'*, *verbose=True*)

Save mutation classes of certain quivers of ranks up to and equal to n or equal to n to `DOT_SAGE/`

cluster_algebra_quiver/mutation_classes_n.dig6.

This data will then be used to determine quiver mutation types.

INPUT:

- n – the rank (or the upper limit on the rank) of the mutation classes that are being saved
- up_to – (default: True) if True, saves data for ranks smaller than or equal to n; if False, saves data for rank exactly n
- types – (default: 'ClassicalExceptional') if all, saves data for both exceptional mutation-finite quivers and for classical quiver; the input 'Exceptional' or 'Classical' is also allowed to save only part of this data

mutation_class

This file contains helper functions for compute the mutation class of a cluster algebra or quiver.

For the compendium on the cluster algebra and quiver package see [MS2011]

4.1.4 sage.combinat.crystals

Affine crystals

class sage.combinat.crystals.affine.**AffineCrystalFromClassical**(*cartan_type*, *classical_crystal*, *category=None*)

Bases: UniqueRepresentation, Parent

This abstract class can be used for affine crystals that are constructed from a classical crystal. The zero arrows can be implemented using different methods (for example using a Dynkin diagram automorphisms or virtual crystals).

This is a helper class, mostly used to implement Kirillov-Reshetikhin crystals (see: *KirillovReshetikhinCrystal()*).

For general information about crystals see *sage.combinat.crystals.crystals*.

INPUT:

- cartan_type – the Cartan type of the resulting affine crystal
- classical_crystal – instance of a classical crystal

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,1)
sage: A.list()
[[[1]], [[2]], [[3]]]
sage: A.cartan_type()
['A', 2, 1]
sage: A.index_set()
(0, 1, 2)
sage: b = A(rows=[[1]])
```

(continues on next page)

(continued from previous page)

```
sage: b.weight()
-Lambda[0] + Lambda[1]
sage: b.classical_weight()
(1, 0, 0)
sage: [x.s(0) for x in A.list()]
[[[3]], [[2]], [[1]]]
sage: [x.s(1) for x in A.list()]
[[[2]], [[1]], [[3]]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> A.list()
[[[1]], [[2]], [[3]]]
>>> A.cartan_type()
['A', 2, 1]
>>> A.index_set()
(0, 1, 2)
>>> b = A(rows=[[Integer(1)]])
>>> b.weight()
-Lambda[0] + Lambda[1]
>>> b.classical_weight()
(1, 0, 0)
>>> [x.s(Integer(0)) for x in A.list()]
[[[3]], [[2]], [[1]]]
>>> [x.s(Integer(1)) for x in A.list()]
[[[2]], [[1]], [[3]]]
```

Element

alias of *AffineCrystalFromClassicalElement*

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: C = crystals.Tableaux(['A',3],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',3,1],C,pr,pr_inverse,
↪1)
sage: A.cardinality() == C.cardinality()
True
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['A',Integer(3)],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
```

(continues on next page)

(continued from previous page)

```
>>> A = crystals.AffineFromClassicalAndPromotion(['A',Integer(3),Integer(1)],
↪C,pr,pr_inverse,Integer(1))
>>> A.cardinality() == C.cardinality()
True
```

lift(*affine_elt*)

Lift an affine crystal element to the corresponding classical crystal element.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A.list()[0]
sage: A.lift(b)
[[1]]
sage: A.lift(b).parent()
The crystal of tableaux of type ['A', 2] and shape(s) [[1]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A.list()[Integer(0)]
>>> A.lift(b)
[[1]]
>>> A.lift(b).parent()
The crystal of tableaux of type ['A', 2] and shape(s) [[1]]
```

retract(*classical_elt*)

Transform a classical crystal element to the corresponding affine crystal element.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: t = C(rows=[[1]])
sage: t.parent()
The crystal of tableaux of type ['A', 2] and shape(s) [[1]]
sage: A.retract(t)
[[1]]
sage: A.retract(t).parent() is A
True
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> t = C(rows=[[Integer(1)]])
>>> t.parent()
The crystal of tableaux of type ['A', 2] and shape(s) [[1]]
>>> A.retract(t)
[[1]]
>>> A.retract(t).parent() is A
True
```

class sage.combinat.crystals.affine.**AffineCrystalFromClassicalAndPromotion**(*cartan_type*, *classical_crystal*, *p_automorphism*, *p_inverse_automorphism*, *dynkin_node*, *category=None*)

Bases: *AffineCrystalFromClassical*

Crystals that are constructed from a classical crystal and a Dynkin diagram automorphism σ. In type A_n, the Dynkin diagram automorphism is $i \to i+1 \pmod{n}+1$ and the corresponding map on the crystal is the promotion operation pr on tableaux. The affine crystal operators are given by $f_0 = \mathrm{pr}^{-1} f_{\sigma(0)} \mathrm{pr}$.

INPUT:

- `cartan_type` – the Cartan type of the resulting affine crystal
- `classical_crystal` – instance of a classical crystal
- `automorphism, inverse_automorphism` – a function on the elements of the `classical_crystal`
- `dynkin_node` – integer specifying the classical node in the image of the zero node under the automorphism sigma

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,1)
sage: A.list()
[[[1]], [[2]], [[3]]]
sage: A.cartan_type()
['A', 2, 1]
sage: A.index_set()
(0, 1, 2)
sage: b = A(rows=[[1]])
```

(continues on next page)

(continued from previous page)

```
sage: b.weight()
-Lambda[0] + Lambda[1]
sage: b.classical_weight()
(1, 0, 0)
sage: [x.s(0) for x in A.list()]
[[[3]], [[2]], [[1]]]
sage: [x.s(1) for x in A.list()]
[[[2]], [[1]], [[3]]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> A.list()
[[[1]], [[2]], [[3]]]
>>> A.cartan_type()
['A', 2, 1]
>>> A.index_set()
(0, 1, 2)
>>> b = A(rows=[[Integer(1)]])
>>> b.weight()
-Lambda[0] + Lambda[1]
>>> b.classical_weight()
(1, 0, 0)
>>> [x.s(Integer(0)) for x in A.list()]
[[[3]], [[2]], [[1]]]
>>> [x.s(Integer(1)) for x in A.list()]
[[[2]], [[1]], [[3]]]
```

Element

alias of *AffineCrystalFromClassicalAndPromotionElement*

automorphism(*x*)

Give the analogue of the affine Dynkin diagram automorphism on the level of crystals.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A.list()[0]
sage: A.automorphism(b)
[[2]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
```

(continues on next page)

(continued from previous page)

```
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A.list()[Integer(0)]
>>> A.automorphism(b)
[[2]]
```

inverse_automorphism(*x*)

Give the analogue of the inverse of the affine Dynkin diagram automorphism on the level of crystals.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A.list()[0]
sage: A.inverse_automorphism(b)
[[3]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A.list()[Integer(0)]
>>> A.inverse_automorphism(b)
[[3]]
```

class sage.combinat.crystals.affine.**AffineCrystalFromClassicalAndPromotionElement**

Bases: *AffineCrystalFromClassicalElement*

Elements of crystals that are constructed from a classical crystal and a Dynkin diagram automorphism. In type A, the automorphism is the promotion operation on tableaux.

This class is not instantiated directly but rather `__call__`-ed from *AffineCrystalFromClassicalAndPromotion*. The syntax of this is governed by the (classical) crystal.

Since this class inherits from *AffineCrystalFromClassicalElement*, the methods that need to be implemented are *e0()*, *f0()* and possibly *epsilon0()* and *phi0()* if more efficient algorithms exist.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,1)
```

(continues on next page)

(continued from previous page)

```
sage: b = A(rows=[[1]])
sage: b._repr_()
'[[1]]'
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A(rows=[[Integer(1)]])
>>> b._repr_()
'[[1]]'
```

e0()

Implement e_0 using the automorphism as $e_0 = \mathrm{pr}^{-1}\, e_{dynkin_node}\, \mathrm{pr}$

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A(rows=[[1]])
sage: b.e0()
[[3]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A(rows=[[Integer(1)]])
>>> b.e0()
[[3]]
```

epsilon0()

Implement $epsilon_0$ using the automorphism.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
```

(continues on next page)

(continued from previous page)

```
sage: [x.epsilon0() for x in A.list()]
[1, 0, 0]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> [x.epsilon0() for x in A.list()]
[1, 0, 0]
```

f0()

Implement f_0 using the automorphism as $f_0 = \mathrm{pr}^{-1}\, f_{dynkin_node}\, \mathrm{pr}$

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A(rows=[[3]])
sage: b.f0()
[[1]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A(rows=[[Integer(3)]])
>>> b.f0()
[[1]]
```

phi0()

Implement phi_0 using the automorphism.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: [x.phi0() for x in A.list()]
[0, 0, 1]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> [x.phi0() for x in A.list()]
[0, 0, 1]
```

class sage.combinat.crystals.affine.**AffineCrystalFromClassicalElement**

Bases: ElementWrapper

Elements of crystals that are constructed from a classical crystal.

The elements inherit many of their methods from the classical crystal using lift and retract.

This class is not instantiated directly but rather __call__-ed from *AffineCrystalFromClassical*. The syntax of this is governed by the (classical) crystal.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,1)
sage: b = A(rows=[[1]])
sage: b._repr_()
'[[1]]'
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A(rows=[[Integer(1)]])
>>> b._repr_()
'[[1]]'
```

classical_weight()

Return the classical weight corresponding to self.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A(rows=[[1]])
```

(continues on next page)

(continued from previous page)

```
sage: b.classical_weight()
(1, 0, 0)
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A(rows=[[Integer(1)]])
>>> b.classical_weight()
(1, 0, 0)
```

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A(rows=[[1]])
sage: b.e(0)
[[3]]
sage: b.e(1)
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A(rows=[[Integer(1)]])
>>> b.e(Integer(0))
[[3]]
>>> b.e(Integer(1))
```

e0()

Assumes that e_0 is implemented separately.

epsilon(*i*)

Return the maximal time the crystal operator e_i can be applied to `self`.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
```

(continues on next page)

(continued from previous page)

```
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: [x.epsilon(0) for x in A.list()]
[1, 0, 0]
sage: [x.epsilon(1) for x in A.list()]
[0, 1, 0]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> [x.epsilon(Integer(0)) for x in A.list()]
[1, 0, 0]
>>> [x.epsilon(Integer(1)) for x in A.list()]
[0, 1, 0]
```

epsilon0()

Uses ε_0 from the super class, but should be implemented if a faster implementation exists.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: [x.epsilon0() for x in A.list()]
[1, 0, 0]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> [x.epsilon0() for x in A.list()]
[1, 0, 0]
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
```

(continues on next page)

(continued from previous page)

```
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A(rows=[[3]])
sage: b.f(0)
[[1]]
sage: b.f(2)
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A(rows=[[Integer(3)]])
>>> b.f(Integer(0))
[[1]]
>>> b.f(Integer(2))
```

f0()

Assumes that f_0 is implemented separately.

lift()

Lift an affine crystal element to the corresponding classical crystal element.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: b = A.list()[0]
sage: b.lift()
[[1]]
sage: b.lift().parent()
The crystal of tableaux of type ['A', 2] and shape(s) [[1]]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> b = A.list()[Integer(0)]
>>> b.lift()
[[1]]
>>> b.lift().parent()
The crystal of tableaux of type ['A', 2] and shape(s) [[1]]
```

phi(*i*)

Return the maximal time the crystal operator f_i can be applied to `self`.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: [x.phi(0) for x in A.list()]
[0, 0, 1]
sage: [x.phi(1) for x in A.list()]
[1, 0, 0]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> [x.phi(Integer(0)) for x in A.list()]
[0, 0, 1]
>>> [x.phi(Integer(1)) for x in A.list()]
[1, 0, 0]
```

phi0()

Uses φ_0 from the super class, but should be implemented if a faster implementation exists.

EXAMPLES:

```
sage: n = 2
sage: C = crystals.Tableaux(['A',n],shape=[1])
sage: pr = attrcall("promotion")
sage: pr_inverse = attrcall("promotion_inverse")
sage: A = crystals.AffineFromClassicalAndPromotion(['A',n,1],C,pr,pr_inverse,
↪1)
sage: [x.phi0() for x in A.list()]
[0, 0, 1]
```

```
>>> from sage.all import *
>>> n = Integer(2)
>>> C = crystals.Tableaux(['A',n],shape=[Integer(1)])
>>> pr = attrcall("promotion")
>>> pr_inverse = attrcall("promotion_inverse")
>>> A = crystals.AffineFromClassicalAndPromotion(['A',n,Integer(1)],C,pr,pr_
↪inverse,Integer(1))
>>> [x.phi0() for x in A.list()]
[0, 0, 1]
```

pp()

Method for pretty printing.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',3,2],1,1)
sage: t=K(rows=[[1]])
sage: t.pp()
1
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(3),Integer(2)],Integer(1),
↪Integer(1))
>>> t=K(rows=[[Integer(1)]])
>>> t.pp()
1
```

Affine factorization crystal of type A

class sage.combinat.crystals.affine_factorization.**AffineFactorizationCrystal**(*w*, *n*, *x=None*)

Bases: UniqueRepresentation, Parent

The crystal on affine factorizations with a cut-point, as introduced by [MS2015].

INPUT:

- `w` – an element in an (affine) Weyl group or a skew shape of k-bounded partitions (if k was specified)
- `n` – the number of factors in the factorization
- `x` – (default: `None`) the cut point; if not specified it is determined as the minimal missing residue in `w`
- `k` – (default: `None`) positive integer, specifies that `w` is k-bounded or a $k+1$-core when specified

EXAMPLES:

```
sage: W = WeylGroup(['A',3,1], prefix='s')
sage: w = W.from_reduced_word([2,3,2,1])
sage: B = crystals.AffineFactorization(w,3); B
Crystal on affine factorizations of type A2 associated to s2*s3*s2*s1
sage: B.list()
[(1, s2, s3*s2*s1),
 (1, s3*s2, s3*s1),
 (1, s3*s2*s1, s3),
 (s3, s2, s3*s1),
 (s3, s2*s1, s3),
 (s3*s2, s1, s3),
 (s3*s2*s1, 1, s3),
 (s3*s2*s1, s3, 1),
 (s3*s2, 1, s3*s1),
 (s3*s2, s3, s1),
 (s3*s2, s3*s1, 1),
 (s2, 1, s3*s2*s1),
 (s2, s3, s2*s1),
 (s2, s3*s2, s1),
 (s2, s3*s2*s1, 1)]
```

```
>>> from sage.all import *
>>> W = WeylGroup(['A',Integer(3),Integer(1)], prefix='s')
>>> w = W.from_reduced_word([Integer(2),Integer(3),Integer(2),Integer(1)])
>>> B = crystals.AffineFactorization(w,Integer(3)); B
Crystal on affine factorizations of type A2 associated to s2*s3*s2*s1
>>> B.list()
[(1, s2, s3*s2*s1),
 (1, s3*s2, s3*s1),
 (1, s3*s2*s1, s3),
 (s3, s2, s3*s1),
 (s3, s2*s1, s3),
 (s3*s2, s1, s3),
 (s3*s2*s1, 1, s3),
 (s3*s2*s1, s3, 1),
 (s3*s2, 1, s3*s1),
 (s3*s2, s3, s1),
 (s3*s2, s3*s1, 1),
 (s2, 1, s3*s2*s1),
 (s2, s3, s2*s1),
 (s2, s3*s2, s1),
 (s2, s3*s2*s1, 1)]
```

We can also access the crystal by specifying a skew shape in terms of k-bounded partitions:

```
sage: crystals.AffineFactorization([[3,1,1],[1]], 3, k=3)
Crystal on affine factorizations of type A2 associated to s2*s3*s2*s1
```

```
>>> from sage.all import *
>>> crystals.AffineFactorization([[Integer(3),Integer(1),Integer(1)],
↪[Integer(1)]], Integer(3), k=Integer(3))
Crystal on affine factorizations of type A2 associated to s2*s3*s2*s1
```

We can compute the highest weight elements:

```
sage: hw = [w for w in B if w.is_highest_weight()]
sage: hw
[(1, s2, s3*s2*s1)]
sage: hw[0].weight()
(3, 1, 0)
```

```
>>> from sage.all import *
>>> hw = [w for w in B if w.is_highest_weight()]
>>> hw
[(1, s2, s3*s2*s1)]
>>> hw[Integer(0)].weight()
(3, 1, 0)
```

And show that this crystal is isomorphic to the tableau model of the same weight:

```
sage: C = crystals.Tableaux(['A',2],shape=[3,1])
sage: GC = C.digraph()
sage: GB = B.digraph()
```

(continues on next page)

(continued from previous page)

```
sage: GC.is_isomorphic(GB, edge_labels=True)
True
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['A',Integer(2)],shape=[Integer(3),Integer(1)])
>>> GC = C.digraph()
>>> GB = B.digraph()
>>> GC.is_isomorphic(GB, edge_labels=True)
True
```

The crystal operators themselves move elements between adjacent factors:

```
sage: b = hw[0];b
(1, s2, s3*s2*s1)
sage: b.f(1)
(1, s3*s2, s3*s1)
```

```
>>> from sage.all import *
>>> b = hw[Integer(0)];b
(1, s2, s3*s2*s1)
>>> b.f(Integer(1))
(1, s3*s2, s3*s1)
```

The cut point x is not supposed to occur in the reduced words for w:

```
sage: B = crystals.AffineFactorization([[3,2],[2]],4,x=0,k=3)
Traceback (most recent call last):
...
ValueError: x cannot be in reduced word of s0*s3*s2
```

```
>>> from sage.all import *
>>> B = crystals.AffineFactorization([[Integer(3),Integer(2)],[Integer(2)]],
↪Integer(4),x=Integer(0),k=Integer(3))
Traceback (most recent call last):
...
ValueError: x cannot be in reduced word of s0*s3*s2
```

class Element

Bases: ElementWrapper

bracketing(i)

Removes all bracketed letters between i-th and $i+1$-th entry.

EXAMPLES:

```
sage: B = crystals.AffineFactorization([[3,1],[1]], 3, k=3, x=4)
sage: W = B.w.parent()
sage: t = B((W.one(),W.from_reduced_word([3]),W.from_reduced_word([2,
↪1])));  t
(1, s3, s2*s1)
sage: t.bracketing(1)
[[3], [2, 1]]
```

```
>>> from sage.all import *
>>> B = crystals.AffineFactorization([[Integer(3),Integer(1)],
↪[Integer(1)]], Integer(3), k=Integer(3), x=Integer(4))
>>> W = B.w.parent()
>>> t = B((W.one(),W.from_reduced_word([Integer(3)]),W.from_reduced_
↪word([Integer(2),Integer(1)]))); t
(1, s3, s2*s1)
>>> t.bracketing(Integer(1))
[[3], [2, 1]]
```

e (i)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: B = crystals.AffineFactorization([[3,1],[1]], 4, k=3)
sage: W = B.w.parent()
sage: t = B((W.one(),W.one(),W.from_reduced_word([3]),W.from_reduced_
↪word([2,1]))); t
(1, 1, s3, s2*s1)
sage: t.e(1)
(1, 1, 1, s3*s2*s1)
```

```
>>> from sage.all import *
>>> B = crystals.AffineFactorization([[Integer(3),Integer(1)],
↪[Integer(1)]], Integer(4), k=Integer(3))
>>> W = B.w.parent()
>>> t = B((W.one(),W.one(),W.from_reduced_word([Integer(3)]),W.from_
↪reduced_word([Integer(2),Integer(1)]))); t
(1, 1, s3, s2*s1)
>>> t.e(Integer(1))
(1, 1, 1, s3*s2*s1)
```

f (i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: B = crystals.AffineFactorization([[3,1],[1]], 4, k=3)
sage: W = B.w.parent()
sage: t = B((W.one(),W.one(),W.from_reduced_word([3]),W.from_reduced_
↪word([2,1]))); t
(1, 1, s3, s2*s1)
sage: t.f(2)
(1, s3, 1, s2*s1)
sage: t.f(1)
(1, 1, s3*s2, s1)
```

```
>>> from sage.all import *
>>> B = crystals.AffineFactorization([[Integer(3),Integer(1)],
↪[Integer(1)]], Integer(4), k=Integer(3))
>>> W = B.w.parent()
>>> t = B((W.one(),W.one(),W.from_reduced_word([Integer(3)]),W.from_
```

(continues on next page)

(continued from previous page)

```
↪reduced_word([Integer(2),Integer(1)])]); t
(1, 1, s3, s2*s1)
>>> t.f(Integer(2))
(1, s3, 1, s2*s1)
>>> t.f(Integer(1))
(1, 1, s3*s2, s1)
```

to_tableau()

Return the tableau representation of `self`.

Uses the recording tableau of a minor variation of Edelman-Greene insertion. See Theorem 4.11 in [MS2015].

EXAMPLES:

```
sage: W = WeylGroup(['A',3,1], prefix='s')
sage: w = W.from_reduced_word([2,1,3,2])
sage: B = crystals.AffineFactorization(w,3)
sage: for x in B:
....:     x
....:     x.to_tableau().pp()
(1, s2*s1, s3*s2)
  1  1
  2  2
(s2, s1, s3*s2)
  1  1
  2  3
(s2, s3*s1, s2)
  1  2
  2  3
(s2*s1, 1, s3*s2)
  1  1
  3  3
(s2*s1, s3, s2)
  1  2
  3  3
(s2*s1, s3*s2, 1)
  2  2
  3  3
```

```
>>> from sage.all import *
>>> W = WeylGroup(['A',Integer(3),Integer(1)], prefix='s')
>>> w = W.from_reduced_word([Integer(2),Integer(1),Integer(3),Integer(2)])
>>> B = crystals.AffineFactorization(w,Integer(3))
>>> for x in B:
...     x
...     x.to_tableau().pp()
(1, s2*s1, s3*s2)
  1  1
  2  2
(s2, s1, s3*s2)
  1  1
  2  3
```

(continues on next page)

(continued from previous page)

```
(s2, s3*s1, s2)
  1  2
  2  3
(s2*s1, 1, s3*s2)
  1  1
  3  3
(s2*s1, s3, s2)
  1  2
  3  3
(s2*s1, s3*s2, 1)
  2  2
  3  3
```

class sage.combinat.crystals.affine_factorization.**FactorizationToTableaux**(*parent*, *cartan_type=None*, *virtualization=None*, *scaling_factors=None*)

Bases: CrystalMorphism

is_embedding()

alias of *is_isomorphism()*.

is_isomorphism()

Return True as this is an isomorphism.

EXAMPLES:

```
sage: W = WeylGroup(['A',3,1], prefix='s')
sage: w = W.from_reduced_word([2,1,3,2])
sage: B = crystals.AffineFactorization(w,3)
sage: phi = B._tableaux_isomorphism
sage: phi.is_isomorphism()
True
```

```
>>> from sage.all import *
>>> W = WeylGroup(['A',Integer(3),Integer(1)], prefix='s')
>>> w = W.from_reduced_word([Integer(2),Integer(1),Integer(3),Integer(2)])
>>> B = crystals.AffineFactorization(w,Integer(3))
>>> phi = B._tableaux_isomorphism
>>> phi.is_isomorphism()
True
```

is_surjective()

alias of *is_isomorphism()*.

sage.combinat.crystals.affine_factorization.**affine_factorizations**(*w*, *l*, *weight=None*)

Return all factorizations of w into l factors or of weight weight.

INPUT:

- w – an (affine) permutation or element of the (affine) Weyl group
- l – nonnegative integer

- `weight` – (default: `None`) tuple of nonnegative integers specifying the length of the factors

EXAMPLES:

```
sage: W = WeylGroup(['A',3,1], prefix='s')
sage: w = W.from_reduced_word([3,2,3,1,0,1])
sage: from sage.combinat.crystals.affine_factorization import affine_
↪factorizations
sage: affine_factorizations(w,4)
[[s2, s3, s0, s2*s1*s0],
[s2, s3, s2*s0, s1*s0],
[s2, s3, s2*s1*s0, s1],
[s2, s3*s2, s0, s1*s0],
[s2, s3*s2, s1*s0, s1],
[s2, s3*s2*s1, s0, s1],
[s3*s2, s3, s0, s1*s0],
[s3*s2, s3, s1*s0, s1],
[s3*s2, s3*s1, s0, s1],
[s3*s2*s1, s3, s0, s1]]

sage: W = WeylGroup(['A',2], prefix='s')

Affinization crystals

class sage.combinat.crystals.affinization.**AffinizationOfCrystal**(B)

Bases: UniqueRepresentation, Parent

An affinization of a crystal.

Let $\mathfrak{g}$ be a Kac-Moody algebra of affine type. The affinization of a finite $U'_q(\mathfrak{g})$-crystal B is the (infinite) $U_q(\mathfrak{g})$-crystal with underlying set:

$$B^{\mathrm{aff}} = \{b(m) \mid b \in B, m \in \mathbf{Z}\}$$

and crystal structure determined by:

$$e_i(b(m)) = \begin{cases} (e_0 b)(m+1) & i = 0, \\ (e_i b)(m) & i \neq 0, \end{cases}$$

$$f_i(b(m)) = \begin{cases} (f_0 b)(m-1) & i = 0, \\ (f_i b)(m) & i \neq 0, \end{cases}$$

$$\mathrm{wt}(b(m)) = \mathrm{wt}(b) + m\delta.$$

EXAMPLES:

We first construct a Kirillov-Reshetikhin crystal and then take it's corresponding affinization:

```
sage: K = crystals.KirillovReshetikhin(['A',2,1], 2, 2)
sage: A = K.affinization()
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(2),␣
↪Integer(2))
>>> A = K.affinization()
```

Next we construct an affinization crystal from a tensor product of KR crystals:

```
sage: KT = crystals.TensorProductOfKirillovReshetikhinTableaux(['C',2,1], [[1,2],
↪[2,1]])
sage: A = crystals.AffinizationOf(KT)
```

```
>>> from sage.all import *
>>> KT = crystals.TensorProductOfKirillovReshetikhinTableaux(['C',Integer(2),
↪Integer(1)], [[Integer(1),Integer(2)],[Integer(2),Integer(1)]])
>>> A = crystals.AffinizationOf(KT)
```

REFERENCES:

- [HK2002] Chapter 10

class Element(*parent*, *b*, *m*)

Bases: `Element`

An element in an affinization crystal.

e(*i*)

Return the action of e_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: A = crystals.KirillovReshetikhin(['A',2,1], 2,2).affinization()
sage: mg = A.module_generators[0]
sage: mg.e(0)
[[1, 2], [2, 3]](1)
sage: mg.e(1)
sage: mg.e(0).e(1)
[[1, 1], [2, 3]](1)
```

```
>>> from sage.all import *
>>> A = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(2),Integer(2)).affinization()
>>> mg = A.module_generators[Integer(0)]
>>> mg.e(Integer(0))
[[1, 2], [2, 3]](1)
>>> mg.e(Integer(1))
>>> mg.e(Integer(0)).e(Integer(1))
[[1, 1], [2, 3]](1)
```

epsilon(*i*)

Return ε_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: A = crystals.KirillovReshetikhin(['A',2,1], 2,2).affinization()
sage: mg = A.module_generators[0]
sage: mg.epsilon(0)
2
sage: mg.epsilon(1)
0
```

```
>>> from sage.all import *
>>> A = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(2),Integer(2)).affinization()
>>> mg = A.module_generators[Integer(0)]
>>> mg.epsilon(Integer(0))
2
>>> mg.epsilon(Integer(1))
0
```

f(*i*)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: A = crystals.KirillovReshetikhin(['A',2,1], 2,2).affinization()
sage: mg = A.module_generators[0]
sage: mg.f(2)
[[1, 1], [2, 3]](0)
sage: mg.f(2).f(2).f(0)
sage: mg.f_string([2,1,1])
sage: mg.f_string([2,1])
[[1, 2], [2, 3]](0)
sage: mg.f_string([2,1,0])
[[1, 1], [2, 2]](-1)
```

```
>>> from sage.all import *
>>> A = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(2),Integer(2)).affinization()
>>> mg = A.module_generators[Integer(0)]
>>> mg.f(Integer(2))
[[1, 1], [2, 3]](0)
>>> mg.f(Integer(2)).f(Integer(2)).f(Integer(0))
>>> mg.f_string([Integer(2),Integer(1),Integer(1)])
>>> mg.f_string([Integer(2),Integer(1)])
[[1, 2], [2, 3]](0)
>>> mg.f_string([Integer(2),Integer(1),Integer(0)])
[[1, 1], [2, 2]](-1)
```

phi(*i*)

Return φ_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: A = crystals.KirillovReshetikhin(['A',2,1], 2,2).affinization()
sage: mg = A.module_generators[0]
sage: mg.phi(0)
0
sage: mg.phi(2)
2
```

```
>>> from sage.all import *
>>> A = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(2),Integer(2)).affinization()
>>> mg = A.module_generators[Integer(0)]
>>> mg.phi(Integer(0))
0
>>> mg.phi(Integer(2))
2
```

weight()

Return the weight of `self`.

The weight wt of an element is:

$$\mathrm{wt}\big(b(m)\big) = \mathrm{wt}(b) + m\delta,$$

where δ is the null root.

EXAMPLES:

```
sage: A = crystals.KirillovReshetikhin(['A',2,1], 2,2).affinization()
sage: mg = A.module_generators[0]
sage: mg.weight()
-2*Lambda[0] + 2*Lambda[2]
sage: mg.e(0).weight()
-Lambda[1] + Lambda[2] + delta
sage: mg.e(0).e(0).weight()
2*Lambda[0] - 2*Lambda[1] + 2*delta
```

```
>>> from sage.all import *
>>> A = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(2),Integer(2)).affinization()
>>> mg = A.module_generators[Integer(0)]
>>> mg.weight()
-2*Lambda[0] + 2*Lambda[2]
>>> mg.e(Integer(0)).weight()
-Lambda[1] + Lambda[2] + delta
>>> mg.e(Integer(0)).e(Integer(0)).weight()
2*Lambda[0] - 2*Lambda[1] + 2*delta
```

Alcove paths

AUTHORS:

- Brant Jones (2008): initial version
- Arthur Lubovsky (2013-03-07): rewritten to implement affine type
- Travis Scrimshaw (2016-06-23): implemented $\mathcal{B}(\infty)$

Special thanks to: Nicolas Borie, Anne Schilling, Travis Scrimshaw, and Nicolas Thiéry.

class sage.combinat.crystals.alcove_path.**CrystalOfAlcovePaths**(*starting_weight*, *highest_weight_crystal*)

Bases: `UniqueRepresentation`, `Parent`

Crystal of alcove paths generated from a "straight-line" path to the negative of a given dominant weight.

INPUT:

- `cartan_type` – Cartan type of a finite or affine untwisted root system
- `weight` – dominant weight as a list of (integral) coefficients of the fundamental weights
- `highest_weight_crystal` – (default: `True`) if `True` returns the highest weight crystal. If `False` returns an object which is close to being isomorphic to the tensor product of Kirillov-Reshetikhin crystals of column shape in the following sense: We get all the vertices, but only some of the edges. We'll call the included edges pseudo-Demazure. They are all nonzero edges and the 0-edges not at the end of a 0-string of edges, i.e. not those with $f_0(b) = b'$ with $\varphi_0(b) = 1$. (Whereas Demazure 0-edges are those that are not at the beginning of a zero string.) In this case the weight $[c_1, c_2, \ldots, c_k]$ represents $\sum_{i=1}^{k} c_i \omega_i$.

Note

If `highest_weight_crystal` = `False`, since we do not get the full crystal, `TestSuite` will fail on the Stembridge axioms.

EXAMPLES:

The following example appears in Figure 2 of [LP2008]:

```
sage: C = crystals.AlcovePaths(['G',2],[0,1])
sage: G = C.digraph()
sage: GG = DiGraph({
....:     ()         : {(0)          : 2 },
....:     (0)        : {(0,8)        : 1 },
....:     (0,1)      : {(0,1,7)      : 2 },
....:     (0,1,2)    : {(0,1,2,9)    : 1 },
....:     (0,1,2,3)  : {(0,1,2,3,4)  : 2 },
....:     (0,1,2,6)  : {(0,1,2,3)    : 1 },
....:     (0,1,2,9)  : {(0,1,2,6)    : 1 },
....:     (0,1,7)    : {(0,1,2)      : 2 },
....:     (0,1,7,9)  : {(0,1,2,9)    : 2 },
....:     (0,5)      : {(0,1)        : 1, (0,5,7) : 2 },
....:     (0,5,7)    : {(0,5,7,9)    : 1 },
....:     (0,5,7,9)  : {(0,1,7,9)    : 1 },
....:     (0,8)      : {(0,5)        : 1 },
....:     })
sage: G.is_isomorphic(GG)
True
sage: for u, v, i in G.edges(sort=True):
....:     print((u.integer_sequence() , v.integer_sequence(), i))
([], [0], 2)
([0], [0, 8], 1)

([0, 5, 7], [0, 5, 7, 9], 1)
([0, 5, 7, 9], [0, 1, 7, 9], 1)
([0, 8], [0, 5], 1)
```

Alcove path crystals are a discrete version of Littelmann paths. We verify that the alcove path crystal is isomorphic to the LS path crystal:

```
sage: C1 = crystals.AlcovePaths(['C',3],[2,1,0])
sage: g1 = C1.digraph() #long time
sage: C2 = crystals.LSPaths(['C',3],[2,1,0])
```

(continues on next page)

(continued from previous page)

```
sage: g2 = C2.digraph() #long time
sage: g1.is_isomorphic(g2, edge_labels=True) #long time
True
```

```
>>> from sage.all import *
>>> C1 = crystals.AlcovePaths(['C',Integer(3)],[Integer(2),Integer(1),Integer(0)])
>>> g1 = C1.digraph() #long time
>>> C2 = crystals.LSPaths(['C',Integer(3)],[Integer(2),Integer(1),Integer(0)])
>>> g2 = C2.digraph() #long time
>>> g1.is_isomorphic(g2, edge_labels=True) #long time
True
```

The preferred initialization method is via explicit weights rather than a Cartan type and the coefficients of the fundamental weights:

```
sage: R = RootSystem(['C',3])
sage: P = R.weight_lattice()
sage: La = P.fundamental_weights()
sage: C = crystals.AlcovePaths(2*La[1]+La[2]); C
Highest weight crystal of alcove paths of type ['C', 3] and weight 2*Lambda[1] +␣
↪Lambda[2]
sage: C1==C
True
```

```
>>> from sage.all import *
>>> R = RootSystem(['C',Integer(3)])
>>> P = R.weight_lattice()
>>> La = P.fundamental_weights()
>>> C = crystals.AlcovePaths(Integer(2)*La[Integer(1)]+La[Integer(2)]); C
Highest weight crystal of alcove paths of type ['C', 3] and weight 2*Lambda[1] +␣
↪Lambda[2]
>>> C1==C
True
```

We now explain the data structure:

```
sage: C = crystals.AlcovePaths(['A',2],[2,0]) ; C
Highest weight crystal of alcove paths of type ['A', 2] and weight 2*Lambda[1]
sage: C._R.lambda_chain()
[(alpha[1], 0), (alpha[1] + alpha[2], 0), (alpha[1], 1), (alpha[1] + alpha[2], 1)]
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(2),Integer(0)]) ; C
Highest weight crystal of alcove paths of type ['A', 2] and weight 2*Lambda[1]
>>> C._R.lambda_chain()
[(alpha[1], 0), (alpha[1] + alpha[2], 0), (alpha[1], 1), (alpha[1] + alpha[2], 1)]
```

The previous list gives the initial "straight line" path from the fundamental alcove A_o to its translation $A_o - \lambda$ where $\lambda = 2\omega_1$ in this example. The initial path for weight λ is called the λ-chain. This path is constructed from the ordered pairs (β, k), by crossing the hyperplane orthogonal to β at height $-k$. We can view a plot of this path as follows:

```
sage: x=C( () )
sage: x.plot() # not tested - outputs a pdf
```

```
>>> from sage.all import *
>>> x=C( () )
>>> x.plot() # not tested - outputs a pdf
```

An element of the crystal is given by a subset of the λ-chain. This subset indicates the hyperplanes where the initial path should be folded. The highest weight element is given by the empty subset.

```
sage: x
()
sage: x.f(1).f(2)
((alpha[1], 1), (alpha[1] + alpha[2], 1))
sage: x.f(1).f(2).integer_sequence()
[2, 3]
sage: C([2,3])
((alpha[1], 1), (alpha[1] + alpha[2], 1))
sage: C([2,3]).is_admissible() #check if a valid vertex
True
sage: C([1,3]).is_admissible() #check if a valid vertex
False
```

```
>>> from sage.all import *
>>> x
()
>>> x.f(Integer(1)).f(Integer(2))
((alpha[1], 1), (alpha[1] + alpha[2], 1))
>>> x.f(Integer(1)).f(Integer(2)).integer_sequence()
[2, 3]
>>> C([Integer(2),Integer(3)])
((alpha[1], 1), (alpha[1] + alpha[2], 1))
>>> C([Integer(2),Integer(3)]).is_admissible() #check if a valid vertex
True
>>> C([Integer(1),Integer(3)]).is_admissible() #check if a valid vertex
False
```

Alcove path crystals now works in affine type (Issue #14143):

```
sage: C = crystals.AlcovePaths(['A',2,1],[1,0,0]) ; C
Highest weight crystal of alcove paths of type ['A', 2, 1] and weight Lambda[0]
sage: x=C(  () )
sage: x.f(0)
((alpha[0], 0),)
sage: C.R
Root system of type ['A', 2, 1]
sage: C.weight
Lambda[0]
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2),Integer(1)],[Integer(1),Integer(0),
↪Integer(0)]) ; C
```

(continues on next page)

(continued from previous page)

```
Highest weight crystal of alcove paths of type ['A', 2, 1] and weight Lambda[0]
>>> x=C(  () )
>>> x.f(Integer(0))
((alpha[0], 0),)
>>> C.R
Root system of type ['A', 2, 1]
>>> C.weight
Lambda[0]
```

Test that the tensor products of Kirillov-Reshetikhin crystals minus non-pseudo-Demazure arrows is in bijection with alcove path construction:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],2,1)
sage: T = crystals.TensorProduct(K,K)
sage: g = T.digraph() #long time
sage: for e in g.edges(sort=False):  #long time
....:     if e[0].phi(0) == 1 and e[2] == 0:
....:         g.delete_edge(e)

sage: C = crystals.AlcovePaths(['B',3,1],[0,2,0], highest_weight_crystal=False)
sage: g2 = C.digraph() #long time
sage: g.is_isomorphic(g2, edge_labels = True) #long time
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(2),
↪Integer(1))
>>> T = crystals.TensorProduct(K,K)
>>> g = T.digraph() #long time
>>> for e in g.edges(sort=False):  #long time
...     if e[Integer(0)].phi(Integer(0)) == Integer(1) and e[Integer(2)] ==␣
↪Integer(0):
...         g.delete_edge(e)

>>> C = crystals.AlcovePaths(['B',Integer(3),Integer(1)],[Integer(0),Integer(2),
↪Integer(0)], highest_weight_crystal=False)
>>> g2 = C.digraph() #long time
>>> g.is_isomorphic(g2, edge_labels = True) #long time
True
```

Note

In type $C_n^{(1)}$, the Kirillov-Reshetikhin crystal is not connected when restricted to pseudo-Demazure arrows, hence the previous example will fail for type $C_n^{(1)}$ crystals.

```
sage: R = RootSystem(['B',3])
sage: P = R.weight_lattice()
sage: La = P.fundamental_weights()
sage: D = crystals.AlcovePaths(2*La[2], highest_weight_crystal=False)
sage: C == D
```

(continues on next page)

(continued from previous page)

```
True
```

```
>>> from sage.all import *
>>> R = RootSystem(['B',Integer(3)])
>>> P = R.weight_lattice()
>>> La = P.fundamental_weights()
>>> D = crystals.AlcovePaths(Integer(2)*La[Integer(2)], highest_weight_
↪crystal=False)
>>> C == D
True
```

Warning

Weights from finite root systems index non-highest weight crystals.

Element

alias of *CrystalOfAlcovePathsElement*

vertices()

Return a list of all the vertices of the crystal.

The vertices are represented as lists of integers recording the folding positions.

One can compute all vertices of the crystal by finding all the admissible subsets of the λ-chain (see method is_admissible, for definition). We use the breadth first search algorithm.

Warning

This method is (currently) only useful for the case when `highest_weight_crystal = False`, where you cannot always reach all vertices of the crystal using crystal operators, starting from the highest weight vertex. This method is typically slower than generating the crystal graph using crystal operators.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['C', 2], [1, 0])
sage: C.vertices()
[[], [0], [0, 1], [0, 1, 2]]
sage: C = crystals.AlcovePaths(['C', 2, 1], [2, 1], False)
sage: len(C.vertices())
80
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['C', Integer(2)], [Integer(1), Integer(0)])
>>> C.vertices()
[[], [0], [0, 1], [0, 1, 2]]
>>> C = crystals.AlcovePaths(['C', Integer(2), Integer(1)], [Integer(2),␣
↪Integer(1)], False)
>>> len(C.vertices())
80
```

The number of elements reachable using the crystal operators from the module generator:

```
sage: len(list(C))
55
```

```
>>> from sage.all import *
>>> len(list(C))
55
```

class sage.combinat.crystals.alcove_path.**CrystalOfAlcovePathsElement**

Bases: ElementWrapper

Crystal of alcove paths element.

INPUT:

- data – list of folding positions in the lambda chain (indexing starts at 0) or a tuple of *RootsWithHeight* giving folding positions in the lambda chain.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[3,2])
sage: x = C ( () )
sage: x.f(1).f(2)
((alpha[1], 2), (alpha[1] + alpha[2], 4))
sage: x.f(1).f(2).integer_sequence()
[8, 9]
sage: C([8,9])
((alpha[1], 2), (alpha[1] + alpha[2], 4))
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(3),Integer(2)])
>>> x = C ( () )
>>> x.f(Integer(1)).f(Integer(2))
((alpha[1], 2), (alpha[1] + alpha[2], 4))
>>> x.f(Integer(1)).f(Integer(2)).integer_sequence()
[8, 9]
>>> C([Integer(8),Integer(9)])
((alpha[1], 2), (alpha[1] + alpha[2], 4))
```

e(i)

Return the i-th crystal raising operator on self.

INPUT:

- i – element of the index set of the underlying root system

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[2,0]); C
Highest weight crystal of alcove paths of type ['A', 2] and weight 2*Lambda[1]
sage: x = C( () )
sage: x.e(1)
sage: x.f(1) == x.f(1).f(2).e(2)
True
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(2),Integer(0)]); C
Highest weight crystal of alcove paths of type ['A', 2] and weight 2*Lambda[1]
>>> x = C( () )
>>> x.e(Integer(1))
>>> x.f(Integer(1)) == x.f(Integer(1)).f(Integer(2)).e(Integer(2))
True
```

epsilon(i)

Return the distance to the start of the i-string.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[1,1])
sage: [c.epsilon(1) for c in C]
[0, 1, 0, 0, 1, 0, 1, 2]
sage: [c.epsilon(2) for c in C]
[0, 0, 1, 2, 1, 1, 0, 0]
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> [c.epsilon(Integer(1)) for c in C]
[0, 1, 0, 0, 1, 0, 1, 2]
>>> [c.epsilon(Integer(2)) for c in C]
[0, 0, 1, 2, 1, 1, 0, 0]
```

f(i)

Return the i-th crystal lowering operator on `self`.

INPUT:

- `i` – element of the index_set of the underlying root_system

EXAMPLES:

```
sage: C=crystals.AlcovePaths(['B',2],[1,1])
sage: x=C(  () )
sage: x.f(1)
((alpha[1], 0),)
sage: x.f(1).f(2)
((alpha[1], 0), (alpha[1] + alpha[2], 2))
```

```
>>> from sage.all import *
>>> C=crystals.AlcovePaths(['B',Integer(2)],[Integer(1),Integer(1)])
>>> x=C(  () )
>>> x.f(Integer(1))
((alpha[1], 0),)
>>> x.f(Integer(1)).f(Integer(2))
((alpha[1], 0), (alpha[1] + alpha[2], 2))
```

integer_sequence()

Return a list of integers corresponding to positions in the λ-chain where it is folded.

Todo

Incorporate this method into the _repr_ for finite Cartan type.

Note

Only works for finite Cartan types and indexing starts at 0.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[3,2])
sage: x = C( () )
sage: x.f(1).f(2).integer_sequence()
[8, 9]
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(3),Integer(2)])
>>> x = C( () )
>>> x.f(Integer(1)).f(Integer(2)).integer_sequence()
[8, 9]
```

is_admissible()

Diagnostic test to check if `self` is a valid element of the crystal.

If `self.value` is given by

$$(\beta_1, i_1), (\beta_2, i_2), \ldots, (\beta_k, i_k),$$

for highest weight crystals this checks if the sequence

$$1 \to s_{\beta_1} \to s_{\beta_1} s_{\beta_2} \to \cdots \to s_{\beta_1} s_{\beta_2} \ldots s_{\beta_k}$$

is a path in the Bruhat graph. If `highest_weight_crystal=False`, then the method checks if the above sequence is a path in the quantum Bruhat graph.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[1,1]); C
Highest weight crystal of alcove paths of type ['A', 2] and weight Lambda[1]␣
↪+ Lambda[2]
sage: roots = sorted(C._R._root_lattice.positive_roots()); roots
[alpha[1], alpha[1] + alpha[2], alpha[2]]
sage: r1 = C._R(roots[0],0); r1
(alpha[1], 0)
sage: r2 = C._R(roots[2],0); r2
(alpha[2], 0)
sage: r3 = C._R(roots[1],1); r3
(alpha[1] + alpha[2], 1)
sage: x = C( ( r1,r2) )
sage: x.is_admissible()
True
sage: x = C( (r3,) ); x
```

(continues on next page)

(continued from previous page)

```
((alpha[1] + alpha[2], 1),)
sage: x.is_admissible()
False
sage: C = crystals.AlcovePaths(['C',2,1],[2,1],False)
sage: C([7,8]).is_admissible()
True
sage: C = crystals.AlcovePaths(['A',2],[3,2])
sage: C([2,3]).is_admissible()
True
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(1),Integer(1)]); C
Highest weight crystal of alcove paths of type ['A', 2] and weight Lambda[1]␣
↪+ Lambda[2]
>>> roots = sorted(C._R._root_lattice.positive_roots()); roots
[alpha[1], alpha[1] + alpha[2], alpha[2]]
>>> r1 = C._R(roots[Integer(0)],Integer(0)); r1
(alpha[1], 0)
>>> r2 = C._R(roots[Integer(2)],Integer(0)); r2
(alpha[2], 0)
>>> r3 = C._R(roots[Integer(1)],Integer(1)); r3
(alpha[1] + alpha[2], 1)
>>> x = C( ( r1,r2) )
>>> x.is_admissible()
True
>>> x = C( (r3,) ); x
((alpha[1] + alpha[2], 1),)
>>> x.is_admissible()
False
>>> C = crystals.AlcovePaths(['C',Integer(2),Integer(1)],[Integer(2),
↪Integer(1)],False)
>>> C([Integer(7),Integer(8)]).is_admissible()
True
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(3),Integer(2)])
>>> C([Integer(2),Integer(3)]).is_admissible()
True
```

Todo

Better doctest

path()

Return the path in the (quantum) Bruhat graph corresponding to `self`.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['B', 3], [3,1,2])
sage: b = C.highest_weight_vector().f_string([1,3,2,1,3,1])
sage: b.path()
[1, s1, s3*s1, s2*s3*s1, s3*s2*s3*s1]
sage: b = C.highest_weight_vector().f_string([2,3,3,2])
```

(continues on next page)

(continued from previous page)

```
sage: b.path()
[1, s2, s3*s2, s2*s3*s2]
sage: b = C.highest_weight_vector().f_string([2,3,3,2,1])
sage: b.path()
[1, s2, s3*s2, s2*s3*s2, s1*s2*s3*s2]
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['B', Integer(3)], [Integer(3),Integer(1),
↪Integer(2)])
>>> b = C.highest_weight_vector().f_string([Integer(1),Integer(3),Integer(2),
↪Integer(1),Integer(3),Integer(1)])
>>> b.path()
[1, s1, s3*s1, s2*s3*s1, s3*s2*s3*s1]
>>> b = C.highest_weight_vector().f_string([Integer(2),Integer(3),Integer(3),
↪Integer(2)])
>>> b.path()
[1, s2, s3*s2, s2*s3*s2]
>>> b = C.highest_weight_vector().f_string([Integer(2),Integer(3),Integer(3),
↪Integer(2),Integer(1)])
>>> b.path()
[1, s2, s3*s2, s2*s3*s2, s1*s2*s3*s2]
```

phi(*i*)

Return the distance to the end of the i-string.

This method overrides the generic implementation in the category of crystals since this computation is more efficient.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[1,1])
sage: [c.phi(1) for c in C]
[1, 0, 0, 1, 0, 2, 1, 0]
sage: [c.phi(2) for c in C]
[1, 2, 1, 0, 0, 0, 0, 1]
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> [c.phi(Integer(1)) for c in C]
[1, 0, 0, 1, 0, 2, 1, 0]
>>> [c.phi(Integer(2)) for c in C]
[1, 2, 1, 0, 0, 0, 0, 1]
```

plot()

Return a plot `self`.

Note

Currently only implemented for types A_2, B_2, and C_2.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[2,0])
sage: x = C( () ).f(1).f(2)
sage: x.plot() # Not tested - creates a pdf
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(2),Integer(0)])
>>> x = C( () ).f(Integer(1)).f(Integer(2))
>>> x.plot() # Not tested - creates a pdf
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: C = crystals.AlcovePaths(['A',2],[2,0])
sage: for i in C: i.weight()
(2, 0, 0)
(1, 1, 0)
(0, 2, 0)
(0, -1, 0)
(-1, 0, 0)
(-2, -2, 0)
sage: B = crystals.AlcovePaths(['A',2,1],[1,0,0])
sage: p = B.module_generators[0].f_string([0,1,2])
sage: p.weight()
Lambda[0] - delta
```

```
>>> from sage.all import *
>>> C = crystals.AlcovePaths(['A',Integer(2)],[Integer(2),Integer(0)])
>>> for i in C: i.weight()
(2, 0, 0)
(1, 1, 0)
(0, 2, 0)
(0, -1, 0)
(-1, 0, 0)
(-2, -2, 0)
>>> B = crystals.AlcovePaths(['A',Integer(2),Integer(1)],[Integer(1),
↪Integer(0),Integer(0)])
>>> p = B.module_generators[Integer(0)].f_string([Integer(0),Integer(1),
↪Integer(2)])
>>> p.weight()
Lambda[0] - delta
```

class sage.combinat.crystals.alcove_path.**InfinityCrystalOfAlcovePaths**(*cartan_type*)

Bases: `UniqueRepresentation`, `Parent`

$\mathcal{B}(\infty)$ crystal of alcove paths.

class Element(*parent*, *elt*, *shift*)

Bases: `ElementWrapper`

Initialize `self`.

EXAMPLES:

```
sage: A = crystals.infinity.AlcovePaths(['F',4])
sage: mg = A.highest_weight_vector()
sage: x = mg.f_string([2,3,1,4,4,2,3,1])
sage: TestSuite(x).run()
```

```
>>> from sage.all import *
>>> A = crystals.infinity.AlcovePaths(['F',Integer(4)])
>>> mg = A.highest_weight_vector()
>>> x = mg.f_string([Integer(2),Integer(3),Integer(1),Integer(4),Integer(4),
↪Integer(2),Integer(3),Integer(1)])
>>> TestSuite(x).run()
```

e(*i*)

Return the action of e_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: A = crystals.infinity.AlcovePaths(['D',5,1])
sage: mg = A.highest_weight_vector()
sage: x = mg.f_string([1,3,4,2,5,4,5,5])
sage: x.f(4).e(5) == x.e(5).f(4)
True
```

```
>>> from sage.all import *
>>> A = crystals.infinity.AlcovePaths(['D',Integer(5),Integer(1)])
>>> mg = A.highest_weight_vector()
>>> x = mg.f_string([Integer(1),Integer(3),Integer(4),Integer(2),
↪Integer(5),Integer(4),Integer(5),Integer(5)])
>>> x.f(Integer(4)).e(Integer(5)) == x.e(Integer(5)).f(Integer(4))
True
```

epsilon(*i*)

Return ε_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: A = crystals.infinity.AlcovePaths(['A',7,2])
sage: mg = A.highest_weight_vector()
sage: x = mg.f_string([1,0,2,3,4,4,4,2,3,3,3])
sage: [x.epsilon(i) for i in A.index_set()]
[0, 0, 0, 3, 0]
sage: x = mg.f_string([2,2,1,1,0,1,0,2,3,3,3,4])
sage: [x.epsilon(i) for i in A.index_set()]
[1, 2, 0, 1, 1]
```

```
>>> from sage.all import *
>>> A = crystals.infinity.AlcovePaths(['A',Integer(7),Integer(2)])
>>> mg = A.highest_weight_vector()
>>> x = mg.f_string([Integer(1),Integer(0),Integer(2),Integer(3),
```

(continues on next page)

(continued from previous page)

```
↪Integer(4),Integer(4),Integer(4),Integer(2),Integer(3),Integer(3),
↪Integer(3)])
>>> [x.epsilon(i) for i in A.index_set()]
[0, 0, 0, 3, 0]
>>> x = mg.f_string([Integer(2),Integer(2),Integer(1),Integer(1),
↪Integer(0),Integer(1),Integer(0),Integer(2),Integer(3),Integer(3),
↪Integer(3),Integer(4)])
>>> [x.epsilon(i) for i in A.index_set()]
[1, 2, 0, 1, 1]
```

f (*i*)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: A = crystals.infinity.AlcovePaths(['E',7,1])
sage: mg = A.highest_weight_vector()
sage: mg.f_string([1,3,5,6,4,2,0,2,1,0,2,4,7,4,2])
((alpha[2], -3), (alpha[5], -1), (alpha[1], -1),
 (alpha[0] + alpha[1], -2),
 (alpha[2] + alpha[4] + alpha[5], -2),
 (alpha[5] + alpha[6], -1), (alpha[1] + alpha[3], -1),
 (alpha[5] + alpha[6] + alpha[7], -1),
 (alpha[0] + alpha[1] + alpha[3], -1),
 (alpha[1] + alpha[3] + alpha[4] + alpha[5], -1))
```

```
>>> from sage.all import *
>>> A = crystals.infinity.AlcovePaths(['E',Integer(7),Integer(1)])
>>> mg = A.highest_weight_vector()
>>> mg.f_string([Integer(1),Integer(3),Integer(5),Integer(6),Integer(4),
↪Integer(2),Integer(0),Integer(2),Integer(1),Integer(0),Integer(2),
↪Integer(4),Integer(7),Integer(4),Integer(2)])
((alpha[2], -3), (alpha[5], -1), (alpha[1], -1),
 (alpha[0] + alpha[1], -2),
 (alpha[2] + alpha[4] + alpha[5], -2),
 (alpha[5] + alpha[6], -1), (alpha[1] + alpha[3], -1),
 (alpha[5] + alpha[6] + alpha[7], -1),
 (alpha[0] + alpha[1] + alpha[3], -1),
 (alpha[1] + alpha[3] + alpha[4] + alpha[5], -1))
```

phi (*i*)

Return φ_i of `self`.

Let $A \in \mathcal{B}(\infty)$ Define $\varphi_i(A) := \varepsilon_i(A) + \langle h_i, \mathrm{wt}(A) \rangle$, where h_i is the i-th simple coroot and $\mathrm{wt}(A)$ is the *weight()* of A.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: A = crystals.infinity.AlcovePaths(['A',8,2])
sage: mg = A.highest_weight_vector()
sage: x = mg.f_string([1,0,2,3,4,4,4,2,3,3,3])
sage: [x.phi(i) for i in A.index_set()]
[1, 1, 1, 3, -2]
sage: x = mg.f_string([2,2,1,1,0,1,0,2,3,3,3,4])
sage: [x.phi(i) for i in A.index_set()]
[4, -1, 0, 0, 2]
```

```
>>> from sage.all import *
>>> A = crystals.infinity.AlcovePaths(['A',Integer(8),Integer(2)])
>>> mg = A.highest_weight_vector()
>>> x = mg.f_string([Integer(1),Integer(0),Integer(2),Integer(3),
...Integer(4),Integer(4),Integer(4),Integer(2),Integer(3),Integer(3),
...Integer(3)])
>>> [x.phi(i) for i in A.index_set()]
[1, 1, 1, 3, -2]
>>> x = mg.f_string([Integer(2),Integer(2),Integer(1),Integer(1),
...Integer(0),Integer(1),Integer(0),Integer(2),Integer(3),Integer(3),
...Integer(3),Integer(4)])
>>> [x.phi(i) for i in A.index_set()]
[4, -1, 0, 0, 2]
```

projection(*k=None*)

Return the projection `self` onto $B(k\rho)$.

INPUT:

- `k` – (optional) if not given, defaults to the smallest value such that `self` is not `None` under the projection

EXAMPLES:

```
sage: A = crystals.infinity.AlcovePaths(['G',2])
sage: mg = A.highest_weight_vector()
sage: x = mg.f_string([2,1,1,2,2,2,1,1]); x
((alpha[2], -3), (alpha[1] + alpha[2], -3),
 (3*alpha[1] + 2*alpha[2], -1), (2*alpha[1] + alpha[2], -1))
sage: x.projection()
((alpha[2], 0), (alpha[1] + alpha[2], 9),
 (3*alpha[1] + 2*alpha[2], 8), (2*alpha[1] + alpha[2], 14))
sage: x.projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 3*Lambda[1] + 3*Lambda[2]

sage: mg.projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 0
sage: mg.f(1).projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight Lambda[1] + Lambda[2]
sage: mg.f(1).f(2).projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight Lambda[1] + Lambda[2]
sage: b = mg.f_string([1,2,2,1,2])
```

(continues on next page)

(continued from previous page)

```
sage: b.projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 2*Lambda[1] + 2*Lambda[2]
sage: b.projection(3).parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 3*Lambda[1] + 3*Lambda[2]
sage: b.projection(1)
```

```
>>> from sage.all import *
>>> A = crystals.infinity.AlcovePaths(['G',Integer(2)])
>>> mg = A.highest_weight_vector()
>>> x = mg.f_string([Integer(2),Integer(1),Integer(1),Integer(2),
↪Integer(2),Integer(2),Integer(1),Integer(1)]); x
((alpha[2], -3), (alpha[1] + alpha[2], -3),
 (3*alpha[1] + 2*alpha[2], -1), (2*alpha[1] + alpha[2], -1))
>>> x.projection()
((alpha[2], 0), (alpha[1] + alpha[2], 9),
 (3*alpha[1] + 2*alpha[2], 8), (2*alpha[1] + alpha[2], 14))
>>> x.projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 3*Lambda[1] + 3*Lambda[2]

>>> mg.projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 0
>>> mg.f(Integer(1)).projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight Lambda[1] + Lambda[2]
>>> mg.f(Integer(1)).f(Integer(2)).projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight Lambda[1] + Lambda[2]
>>> b = mg.f_string([Integer(1),Integer(2),Integer(2),Integer(1),
↪Integer(2)])
>>> b.projection().parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 2*Lambda[1] + 2*Lambda[2]
>>> b.projection(Integer(3)).parent()
Highest weight crystal of alcove paths of type ['G', 2]
 and weight 3*Lambda[1] + 3*Lambda[2]
>>> b.projection(Integer(1))
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: A = crystals.infinity.AlcovePaths(['E',6])
sage: mg = A.highest_weight_vector()
sage: fstr = [1,3,4,2,1,2,3,6,5,3,2,6,2]
sage: x = mg.f_string(fstr)
sage: al = A.weight_lattice_realization().simple_roots()
sage: x.weight() == -sum(al[i]*fstr.count(i) for i in A.index_set())
```

(continues on next page)

(continued from previous page)

```
True
```

```
>>> from sage.all import *
>>> A = crystals.infinity.AlcovePaths(['E',Integer(6)])
>>> mg = A.highest_weight_vector()
>>> fstr = [Integer(1),Integer(3),Integer(4),Integer(2),Integer(1),
↪Integer(2),Integer(3),Integer(6),Integer(5),Integer(3),Integer(2),
↪Integer(6),Integer(2)]
>>> x = mg.f_string(fstr)
>>> al = A.weight_lattice_realization().simple_roots()
>>> x.weight() == -sum(al[i]*fstr.count(i) for i in A.index_set())
True
```

class sage.combinat.crystals.alcove_path.**RootsWithHeight**(*weight*)

Bases: UniqueRepresentation, Parent

Data structure of the ordered pairs (β, k), where β is a positive root and k is a nonnegative integer. A total order is implemented on this set, and depends on the weight.

INPUT:

- cartan_type – Cartan type of a finite or affine untwisted root system
- weight – dominant weight as a list of (integral) coefficients of the fundamental weights

EXAMPLES:

```
sage: from sage.combinat.crystals.alcove_path import RootsWithHeight
sage: R = RootsWithHeight(['A',2],[1,1]); R
Roots with height of Cartan type ['A', 2] and dominant weight Lambda[1] +␣
↪Lambda[2]

sage: r1 = R._root_lattice.from_vector(vector([1,0])); r1
alpha[1]
sage: r2 = R._root_lattice.from_vector(vector([1,1])); r2
alpha[1] + alpha[2]

sage: x = R(r1,0); x
(alpha[1], 0)
sage: y = R(r2,1); y
(alpha[1] + alpha[2], 1)
sage: x < y
True
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.alcove_path import RootsWithHeight
>>> R = RootsWithHeight(['A',Integer(2)],[Integer(1),Integer(1)]); R
Roots with height of Cartan type ['A', 2] and dominant weight Lambda[1] +␣
↪Lambda[2]

>>> r1 = R._root_lattice.from_vector(vector([Integer(1),Integer(0)])); r1
alpha[1]
>>> r2 = R._root_lattice.from_vector(vector([Integer(1),Integer(1)])); r2
alpha[1] + alpha[2]
```

(continues on next page)

(continued from previous page)

```
>>> x = R(r1,Integer(0)); x
(alpha[1], 0)
>>> y = R(r2,Integer(1)); y
(alpha[1] + alpha[2], 1)
>>> x < y
True
```

Element

alias of *RootsWithHeightElement*

lambda_chain()

Return the unfolded λ-chain.

Note

Only works in root systems of finite type.

EXAMPLES:

```
sage: from sage.combinat.crystals.alcove_path import RootsWithHeight
sage: R = RootsWithHeight(['A',2],[1,1]); R
Roots with height of Cartan type ['A', 2] and dominant weight Lambda[1] +␣
↪Lambda[2]
sage: R.lambda_chain()
[(alpha[2], 0), (alpha[1] + alpha[2], 0), (alpha[1], 0), (alpha[1] + alpha[2],
↪ 1)]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.alcove_path import RootsWithHeight
>>> R = RootsWithHeight(['A',Integer(2)],[Integer(1),Integer(1)]); R
Roots with height of Cartan type ['A', 2] and dominant weight Lambda[1] +␣
↪Lambda[2]
>>> R.lambda_chain()
[(alpha[2], 0), (alpha[1] + alpha[2], 0), (alpha[1], 0), (alpha[1] + alpha[2],
↪ 1)]
```

word()

Give the initial alcove path (λ-chain) in terms of simple roots. Used for plotting the path.

Note

Currently only implemented for finite Cartan types.

EXAMPLES:

```
sage: from sage.combinat.crystals.alcove_path import RootsWithHeight
sage: R = RootsWithHeight(['A',2],[3,2])
sage: R.word()
[2, 1, 2, 0, 1, 2, 1, 0, 1, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.alcove_path import RootsWithHeight
>>> R = RootsWithHeight(['A',Integer(2)],[Integer(3),Integer(2)])
>>> R.word()
[2, 1, 2, 0, 1, 2, 1, 0, 1, 2]
```

class sage.combinat.crystals.alcove_path.**RootsWithHeightElement**(*parent*, *root*, *height*)

Bases: Element

Element of *RootsWithHeight*.

INPUT:

- root – a positive root β in our root system
- height – integer such that $0 \leq l \leq \langle \lambda, \beta^\vee \rangle$

EXAMPLES:

```
sage: from sage.combinat.crystals.alcove_path import RootsWithHeight
sage: rl = RootSystem(['A',2]).root_lattice()
sage: x = rl.from_vector(vector([1,1])); x
alpha[1] + alpha[2]
sage: R = RootsWithHeight(['A',2],[1,1]); R
Roots with height of Cartan type ['A', 2] and dominant weight Lambda[1] +␣
↪Lambda[2]
sage: y = R(x, 1); y
(alpha[1] + alpha[2], 1)
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.alcove_path import RootsWithHeight
>>> rl = RootSystem(['A',Integer(2)]).root_lattice()
>>> x = rl.from_vector(vector([Integer(1),Integer(1)])); x
alpha[1] + alpha[2]
>>> R = RootsWithHeight(['A',Integer(2)],[Integer(1),Integer(1)]); R
Roots with height of Cartan type ['A', 2] and dominant weight Lambda[1] +␣
↪Lambda[2]
>>> y = R(x, Integer(1)); y
(alpha[1] + alpha[2], 1)
```

sage.combinat.crystals.alcove_path.**compare_graphs**(*g1*, *g2*, *node1*, *node2*)

Compare two edge-labeled graphs obtained from Crystal.digraph(), starting from the root nodes of each graph.

- g1 – graphs, first digraph
- g2 – graphs, second digraph
- node1 – element of g1
- node2 – element of g2

Traverse g1 starting at node1 and compare this graph with the one obtained by traversing g2 starting with node2. If the graphs match (including labels) then return True. Return False otherwise.

EXAMPLES:

```
sage: from sage.combinat.crystals.alcove_path import compare_graphs
sage: G1 = crystals.Tableaux(['A',3], shape=[1,1]).digraph()
sage: C = crystals.AlcovePaths(['A',3],[0,1,0])
sage: G2 = C.digraph()
sage: compare_graphs(G1, G2, C( () ), G2.vertices(sort=True)[0])
True
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.alcove_path import compare_graphs
>>> G1 = crystals.Tableaux(['A',Integer(3)], shape=[Integer(1),Integer(1)]).
↪digraph()
>>> C = crystals.AlcovePaths(['A',Integer(3)],[Integer(0),Integer(1),Integer(0)])
>>> G2 = C.digraph()
>>> compare_graphs(G1, G2, C( () ), G2.vertices(sort=True)[Integer(0)])
True
```

An introduction to crystals

Informally, a crystal $\mathcal{B}$ is an oriented graph with edges colored in some set I such that, for each $i \in I$, each node x has:

- at most one i-successor, denoted $f_i x$;
- at most one i-predecessor, denoted $e_i x$.

By convention, one writes $f_i x = \emptyset$ and $e_i x = \emptyset$ when x has no successor resp. predecessor.

One may think of $\mathcal{B}$ as essentially a deterministic automaton whose dual is also deterministic; in this context, the f_i's and e_i's are respectively the transition functions of the automaton and of its dual, and $\emptyset$ is the sink.

A crystal comes further endowed with a weight function $\mathrm{wt} : \mathcal{B} \to L$ which satisfies appropriate conditions.

In combinatorial representation theory, crystals are used as combinatorial data to model representations of Lie algebra.

Axiomatic definition

Let C be a Cartan type (*CartanType*) with index set I, and L be a realization of the weight lattice of the type C. Let α_i and $\alpha_i^\vee$ denote the simple roots and coroots respectively.

A type C crystal is a non-empty set $\mathcal{B}$ endowed with maps $\mathrm{wt} : \mathcal{B} \to L$, $e_i, f_i : \mathcal{B} \to \mathcal{B} \cup \{\emptyset\}$, and $\varepsilon_i, \varphi_i : \mathcal{B} \to \mathbf{Z} \cup \{-\infty\}$ for $i \in I$ satisfying the following properties for all $i \in I$:

- for $b, b' \in \mathcal{B}$, we have $f_i b' = b$ if and only if $e_i b = b'$;
- if $e_i b \in \mathcal{B}$, then:
  - $\mathrm{wt}(e_i b) = \mathrm{wt}(b) + \alpha_i$,
  - $\varepsilon_i(e_i b) = \varepsilon_i(b) - 1$,
  - $\varphi_i(e_i b) = \varphi_i(b) + 1$;
- if $f_i b \in \mathcal{B}$, then:
  - $\mathrm{wt}(f_i b) = \mathrm{wt}(b) - \alpha_i$,
  - $\varepsilon_i(f_i b) = \varepsilon_i(b) + 1$,
  - $\varphi_i(f_i b) = \varphi_i(b) - 1$;

- $\varphi_i(b) = \varepsilon_i(b) + \langle \alpha_i^\vee, \mathrm{wt}(b) \rangle$,
- if $\varphi_i(b) = -\infty$ for $b \in \mathcal{B}$, then $e_i b = f_i b = \emptyset$.

Some further conditions are required to guarantee that this data indeed models a representation of a Lie algebra. For finite simply laced types a complete characterization is given by Stembridge's local axioms [Ste2003].

EXAMPLES:

We construct the type A_5 crystal on letters (or in representation theoretic terms, the highest weight crystal of type A_5 corresponding to the highest weight Λ_1):

```
sage: C = crystals.Letters(['A',5]); C
The crystal of letters for type ['A', 5]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)]); C
The crystal of letters for type ['A', 5]
```

It has a single highest weight element:

```
sage: C.highest_weight_vectors()
(1,)
```

```
>>> from sage.all import *
>>> C.highest_weight_vectors()
(1,)
```

A crystal is an enumerated set (see `EnumeratedSets`); and we can count and list its elements in the usual way:

```
sage: C.cardinality()
6
sage: C.list()
[1, 2, 3, 4, 5, 6]
```

```
>>> from sage.all import *
>>> C.cardinality()
6
>>> C.list()
[1, 2, 3, 4, 5, 6]
```

as well as use it in for loops:

```
sage: [x for x in C]
[1, 2, 3, 4, 5, 6]
```

```
>>> from sage.all import *
>>> [x for x in C]
[1, 2, 3, 4, 5, 6]
```

Here are some more elaborate crystals (see their respective documentations):

```
sage: Tens = crystals.TensorProduct(C, C)
sage: Spin = crystals.Spins(['B', 3])
sage: Tab  = crystals.Tableaux(['A', 3], shape = [2,1,1])
```

(continues on next page)

(continued from previous page)

```
sage: Fast = crystals.FastRankTwo(['B', 2], shape = [3/2, 1/2])
sage: KR = crystals.KirillovReshetikhin(['A',2,1],1,1)
```

```
>>> from sage.all import *
>>> Tens = crystals.TensorProduct(C, C)
>>> Spin = crystals.Spins(['B', Integer(3)])
>>> Tab  = crystals.Tableaux(['A', Integer(3)], shape = [Integer(2),Integer(1),
↪Integer(1)])
>>> Fast = crystals.FastRankTwo(['B', Integer(2)], shape = [Integer(3)/Integer(2),␣
↪Integer(1)/Integer(2)])
>>> KR = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],Integer(1),
↪Integer(1))
```

One can get (currently) crude plotting via:

```
sage: Tab.plot()                                                                #␣
↪needs sage.plot
Graphics object consisting of 52 graphics primitives
```

```
>>> from sage.all import *
>>> Tab.plot()                                                                  #␣
↪needs sage.plot
Graphics object consisting of 52 graphics primitives
```

If dot2tex is installed, one can obtain nice latex pictures via:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 1,1)
sage: view(K, pdflatex=True) # optional - dot2tex graphviz, not tested (opens␣
↪external window)
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(1),
↪Integer(1))
>>> view(K, pdflatex=True) # optional - dot2tex graphviz, not tested (opens external␣
↪window)
```

or with colored edges:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 1,1)
sage: G = K.digraph()
sage: G.set_latex_options(color_by_label={0:"black", 1:"red", 2:"blue", 3:"green"})
sage: view(G, pdflatex=True) # optional - dot2tex graphviz, not tested (opens␣
↪external window)
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(1),
↪Integer(1))
>>> G = K.digraph()
>>> G.set_latex_options(color_by_label={Integer(0):"black", Integer(1):"red",␣
↪Integer(2):"blue", Integer(3):"green"})
>>> view(G, pdflatex=True) # optional - dot2tex graphviz, not tested (opens external␣
↪window)
```

For rank two crystals, there is an alternative method of getting metapost pictures. For more information see `C.metapost?`.

The overview of crystal features in Sage

Todo

- Vocabulary and conventions:
  - For a classical crystal: connected / highest weight / irreducible
  - ...
- Layout instructions for plot() for rank 2 types
- RestrictionOfCrystal

The crystals library in Sage grew up from an initial implementation in MuPAD-Combinat (see <MuPAD-Combinat>/lib/COMBINAT/crystals.mu).

class sage.combinat.crystals.crystals.**CrystalBacktracker**(*crystal*, *index_set=None*)

Bases: *GenericBacktracker*

Time complexity: $O(nF)$ amortized for each produced element, where n is the size of the index set, and F is the cost of computing e and f operators.

Memory complexity: $O(D)$ where D is the depth of the crystal.

Principle of the algorithm:

Let C be a classical crystal. It's an acyclic graph where each connected component has a unique element without predecessors (the highest weight element for this component). Let's assume for simplicity that C is irreducible (i.e. connected) with highest weight element u.

One can define a natural spanning tree of C by taking u as the root of the tree, and for any other element y taking as ancestor the element x such that there is an i-arrow from x to y with i minimal. Then, a path from u to y describes the lexicographically smallest sequence $i_1, \ldots, i_k$ such that $(f_{i_k} \circ f_{i_1})(u) = y$.

Morally, the iterator implemented below just does a depth first search walk through this spanning tree. In practice, this can be achieved recursively as follows: take an element x, and consider in turn each successor $y = f_i(x)$, ignoring those such that $y = f_j(x')$ for some x' and $j < i$ (this can be tested by computing $e_j(y)$ for $j < i$).

EXAMPLES:

```
sage: from sage.combinat.crystals.crystals import CrystalBacktracker
sage: C = crystals.Tableaux(['B',3],shape=[3,2,1])
sage: CB = CrystalBacktracker(C)
sage: len(list(CB))
1617
sage: CB = CrystalBacktracker(C, [1,2])
sage: len(list(CB))
8
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.crystals import CrystalBacktracker
>>> C = crystals.Tableaux(['B',Integer(3)],shape=[Integer(3),Integer(2),
↪Integer(1)])
>>> CB = CrystalBacktracker(C)
>>> len(list(CB))
1617
>>> CB = CrystalBacktracker(C, [Integer(1),Integer(2)])
>>> len(list(CB))
8
```

Benkart-Kang-Kashiwara crystals for the general-linear Lie superalgebra

class sage.combinat.crystals.bkk_crystals.**CrystalOfBKKTableaux**(*ct*, *shape*)

Bases: *CrystalOfWords*

Crystal of tableaux for type $A(m|n)$.

This is an implementation of the tableaux model of the Benkart-Kang-Kashiwara crystal [BKK2000] for the Lie superalgebra $\mathfrak{gl}(m+1, n+1)$.

INPUT:

- `ct` – a super Lie Cartan type of type $A(m|n)$
- `shape` – shape specifying the highest weight; this should be a partition contained in a hook of height $n+1$ and width $m+1$

EXAMPLES:

```
sage: T = crystals.Tableaux(['A', [1,1]], shape = [2,1])
sage: T.cardinality()
20
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A', [Integer(1),Integer(1)]], shape = [Integer(2),
↪Integer(1)])
>>> T.cardinality()
20
```

class Element

Bases: *CrystalOfBKKTableauxElement*

genuine_highest_weight_vectors(*index_set=None*)

Return a tuple of genuine highest weight elements.

A *fake highest weight vector* is one which is annihilated by e_i for all i in the index set, but whose weight is not bigger in dominance order than all other elements in the crystal. A *genuine highest weight vector* is a highest weight element that is not fake.

EXAMPLES:

```
sage: B = crystals.Tableaux(['A', [1,1]], shape=[3,2,1])
sage: B.genuine_highest_weight_vectors()
([[-2, -2, -2], [-1, -1], [1]],)
sage: B.highest_weight_vectors()
```

(continues on next page)

(continued from previous page)

```
([[-2, -2, -2], [-1, -1], [1]],
 [[-2, -2, -2], [-1, 2], [1]],
 [[-2, -2, 2], [-1, -1], [1]])
```

```
>>> from sage.all import *
>>> B = crystals.Tableaux(['A', [Integer(1),Integer(1)]], shape=[Integer(3),
↪Integer(2),Integer(1)])
>>> B.genuine_highest_weight_vectors()
([[-2, -2, -2], [-1, -1], [1]],)
>>> B.highest_weight_vectors()
([[-2, -2, -2], [-1, -1], [1]],
 [[-2, -2, -2], [-1, 2], [1]],
 [[-2, -2, 2], [-1, -1], [1]])
```

shape()

Return the shape of `self`.

EXAMPLES:

```
sage: T = crystals.Tableaux(['A', [1, 2]], shape=[2,1])
sage: T.shape()
[2, 1]
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A', [Integer(1), Integer(2)]], shape=[Integer(2),
↪Integer(1)])
>>> T.shape()
[2, 1]
```

Catalog of crystal models For $B(\infty)$

We currently have the following models:

- *AlcovePaths*
- *GeneralizedYoungWalls*
- *LSPaths*
- *Multisegments*
- *MVPolytopes*
- *NakajimaMonomials*
- *PBW*
- *PolyhedralRealization*
- *RiggedConfigurations*

- *Tableaux*

Catalog of crystal models for Kirillov-Reshetikhin crystals

We currently have the following models:

- *KashiwaraNakashimaTableaux*
- *KirillovReshetikhinTableaux*
- *LSPaths*
- *RiggedConfigurations*

Catalog of crystals

Let I be an index set and let $(A, \Pi, \Pi^\vee, P, P^\vee)$ be a Cartan datum associated with generalized Cartan matrix $A = (a_{ij})_{i,j \in I}$. An *abstract crystal* associated to this Cartan datum is a set B together with maps

$$e_i, f_i \colon B \to B \cup \{0\}, \qquad \varepsilon_i, \varphi_i \colon B \to \mathbf{Z} \cup \{-\infty\}, \qquad \mathrm{wt} \colon B \to P,$$

subject to the following conditions:

1. $\varphi_i(b) = \varepsilon_i(b) + \langle h_i, \mathrm{wt}(b) \rangle$ for all $b \in B$ and $i \in I$;
2. $\mathrm{wt}(e_i b) = \mathrm{wt}(b) + \alpha_i$ if $e_i b \in B$;
3. $\mathrm{wt}(f_i b) = \mathrm{wt}(b) - \alpha_i$ if $f_i b \in B$;
4. $\varepsilon_i(e_i b) = \varepsilon_i(b) - 1$, $\varphi_i(e_i b) = \varphi_i(b) + 1$ if $e_i b \in B$;
5. $\varepsilon_i(f_i b) = \varepsilon_i(b) + 1$, $\varphi_i(f_i b) = \varphi_i(b) - 1$ if $f_i b \in B$;
6. $f_i b = b'$ if and only if $b = e_i b'$ for $b, b' \in B$ and $i \in I$;
7. if $\varphi_i(b) = -\infty$ for $b \in B$, then $e_i b = f_i b = 0$.

Crystal of Bernstein-Zelevinsky multisegments

class sage.combinat.crystals.multisegments.**InfinityCrystalOfMultisegments**(*n*)

Bases: Parent, UniqueRepresentation

The type $A_n^{(1)}$ crystal $B(\infty)$ realized using Bernstein-Zelevinsky (BZ) multisegments.

Using (a modified version of the) notation from [JL2009], for $\ell \in \mathbf{Z}_{>0}$ and $i \in \mathbf{Z}/(n+1)\mathbf{Z}$, a segment of length ℓ and head i is the sequence of consecutive residues $[i, i+1, \ldots, i+\ell-1]$. The notation for a segment of length ℓ and head i is simplified to $[i;\ell)$. Similarly, a segment of length ℓ and tail i is the sequence of consecutive residues

$[i-\ell+1,\ldots,i-1,i]$. The latter is denoted simply by $(\ell;i]$. Finally, a multisegment is a formal linear combination of segments, usually written in the form

$$\psi = \sum_{\substack{i\in\mathbf{Z}/(n+1)\mathbf{Z}\\ \ell\in\mathbf{Z}_{>0}}} m_{(\ell;i]}(\ell;i].$$

Such a multisegment is called aperiodic if, for every $\ell>0$, there exists some $i\in\mathbf{Z}/(n+1)\mathbf{Z}$ such that $(\ell;i]$ does not appear in ψ. Denote the set of all periodic multisegments, together with the empty multisegment $\varnothing$, by Ψ. We define a crystal structure on multisegments as follows. Set $S_{\ell,i}=\sum_{k\geq\ell}(m_{(k;i-1]}-m_{(k;i]})$ and let ℓ_f be the minimal ℓ that attains the value $\min_{\ell>0} S_{\ell,i}$. Then we have

$$f_i\psi = \begin{cases} \psi+(1;i] & \text{if } \ell_f=1,\\ \psi+(\ell_f;i]-(\ell_f-1;i-1] & \text{if } \ell_f>1.\end{cases}$$

Similarly, let ℓ_e be the maximal ℓ that attains the value $\min_{\ell>0} S_{\ell,i}$. Then we have

$$e_i\psi = \begin{cases} 0 & \text{if } \min_{\ell>0} S_{\ell,i}=0,\\ \psi+(1;i] & \text{if } \ell_e=1,\\ \psi-(\ell_e;i]+(\ell_e-1;i-1] & \text{if } \ell_e>1.\end{cases}$$

Alternatively, the crystal operators may be defined using a signature rule, as detailed in Section 4 of [JL2009] (following [AJL2011]). For $\psi\in\Psi$ and $i\in\mathbf{Z}/(n+1)\mathbf{Z}$, encode all segments in ψ with tail i by the symbol R and all segments in ψ with tail $i-1$ by A. For $\ell>0$, set $w_{i,\ell}=R^{m_{(\ell;i]}}A^{m_{(\ell;i-1]}}$ and $w_i=\prod_{\ell\geq1} w_{i,\ell}$. By successively canceling out as many RA factors as possible, set $\widetilde{w}_i=A^{a_i(\psi)}R^{r_i(\psi)}$. If $a_i(\psi)>0$, denote by $\ell_f>0$ the length of the rightmost segment A in $\widetilde{w}_i$. If $a_i(\psi)=0$, set $\ell_f=0$. Then

$$f_i\psi = \begin{cases} \psi+(1;i] & \text{if } a_i(\psi)=0,\\ \psi+(\ell_f;i]-(\ell_f-1;i-1] & \text{if } a_i(\psi)>0.\end{cases}$$

The rule for computing $e_i\psi$ is similar.

INPUT:

- `n` – for type $A_n^{(1)}$

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: x = B([(8,1),(6,0),(5,1),(5,0),(4,0),(4,1),(4,1),(3,0),(3,0),(3,1),(3,1),(1,
↪0),(1,2),(1,2)]); x
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (1; 0] + 2 * (1; 2]
sage: x.f(1)
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (2; 1] + 2 * (1; 2]
sage: x.f(1).f(1)
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (2; 1] + (1; 1] + 2 * (1; 2]
sage: x.e(1)
(7; 0] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (1; 0] + 2 * (1; 2]
sage: x.e(1).e(1)
sage: x.f(0)
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (2; 0] + (1; 0] + (1; 2]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> x = B([(Integer(8),Integer(1)),(Integer(6),Integer(0)),(Integer(5),
↪Integer(1)),(Integer(5),Integer(0)),(Integer(4),Integer(0)),(Integer(4),
↪Integer(1)),(Integer(4),Integer(1)),(Integer(3),Integer(0)),(Integer(3),
↪Integer(0)),(Integer(3),Integer(1)),(Integer(3),Integer(1)),(Integer(1),
↪Integer(0)),(Integer(1),Integer(2)),(Integer(1),Integer(2))]); x
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (1; 0] + 2 * (1; 2]
>>> x.f(Integer(1))
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (2; 1] + 2 * (1; 2]
>>> x.f(Integer(1)).f(Integer(1))
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (2; 1] + (1; 1] + 2 * (1; 2]
>>> x.e(Integer(1))
(7; 0] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (1; 0] + 2 * (1; 2]
>>> x.e(Integer(1)).e(Integer(1))
>>> x.f(Integer(0))
(8; 1] + (6; 0] + (5; 0] + (5; 1] + (4; 0] + 2 * (4; 1]
 + 2 * (3; 0] + 2 * (3; 1] + (2; 0] + (1; 0] + (1; 2]
```

We check an $\widehat{\mathfrak{sl}}_2$ example against the generalized Young walls:

```
sage: B = crystals.infinity.Multisegments(1)
sage: G = B.subcrystal(max_depth=4).digraph()
sage: C = crystals.infinity.GeneralizedYoungWalls(1)
sage: GC = C.subcrystal(max_depth=4).digraph()
sage: G.is_isomorphic(GC, edge_labels=True)
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(1))
>>> G = B.subcrystal(max_depth=Integer(4)).digraph()
>>> C = crystals.infinity.GeneralizedYoungWalls(Integer(1))
>>> GC = C.subcrystal(max_depth=Integer(4)).digraph()
>>> G.is_isomorphic(GC, edge_labels=True)
True
```

REFERENCES:

class Element(*parent*, *value*)

Bases: `ElementWrapper`

An element in a BZ multisegments crystal.

e(*i*)

Return the action of e_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: b = B([(4,2), (3,0), (3,1), (1,1), (1,0)])
sage: b.e(0)
(4; 2] + (3; 0] + (3; 1] + (1; 1]
sage: b.e(1)
sage: b.e(2)
(3; 0] + 2 * (3; 1] + (1; 0] + (1; 1]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> b = B([(Integer(4),Integer(2)), (Integer(3),Integer(0)), (Integer(3),
↪Integer(1)), (Integer(1),Integer(1)), (Integer(1),Integer(0))])
>>> b.e(Integer(0))
(4; 2] + (3; 0] + (3; 1] + (1; 1]
>>> b.e(Integer(1))
>>> b.e(Integer(2))
(3; 0] + 2 * (3; 1] + (1; 0] + (1; 1]
```

epsilon(*i*)

Return ε_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: b = B([(4,2), (3,0), (3,1), (1,1), (1,0)])
sage: b.epsilon(0)
1
sage: b.epsilon(1)
0
sage: b.epsilon(2)
1
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> b = B([(Integer(4),Integer(2)), (Integer(3),Integer(0)), (Integer(3),
↪Integer(1)), (Integer(1),Integer(1)), (Integer(1),Integer(0))])
>>> b.epsilon(Integer(0))
1
>>> b.epsilon(Integer(1))
0
>>> b.epsilon(Integer(2))
1
```

f(*i*)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: b = B([(4,2), (3,0), (3,1), (1,1), (1,0)])
sage: b.f(0)
(4; 2] + (3; 0] + (3; 1] + 2 * (1; 0] + (1; 1]
sage: b.f(1)
(4; 2] + (3; 0] + (3; 1] + (1; 0] + 2 * (1; 1]
sage: b.f(2)
2 * (4; 2] + (3; 0] + (1; 0] + (1; 1]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> b = B([(Integer(4),Integer(2)), (Integer(3),Integer(0)), (Integer(3),
↪Integer(1)), (Integer(1),Integer(1)), (Integer(1),Integer(0))])
>>> b.f(Integer(0))
(4; 2] + (3; 0] + (3; 1] + 2 * (1; 0] + (1; 1]
>>> b.f(Integer(1))
(4; 2] + (3; 0] + (3; 1] + (1; 0] + 2 * (1; 1]
>>> b.f(Integer(2))
2 * (4; 2] + (3; 0] + (1; 0] + (1; 1]
```

phi(i)

Return φ_i of `self`.

Let $\psi \in \Psi$. Define $\varphi_i(\psi) := \varepsilon_i(\psi) + \langle h_i, \mathrm{wt}(\psi) \rangle$, where h_i is the i-th simple coroot and $\mathrm{wt}(\psi)$ is the *weight()* of ψ.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: b = B([(4,2), (3,0), (3,1), (1,1), (1,0)])
sage: b.phi(0)
1
sage: b.phi(1)
0
sage: mg = B.highest_weight_vector()
sage: mg.f(1).phi(0)
1
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> b = B([(Integer(4),Integer(2)), (Integer(3),Integer(0)), (Integer(3),
↪Integer(1)), (Integer(1),Integer(1)), (Integer(1),Integer(0))])
>>> b.phi(Integer(0))
1
>>> b.phi(Integer(1))
0
>>> mg = B.highest_weight_vector()
>>> mg.f(Integer(1)).phi(Integer(0))
1
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: b = B([(4,2), (3,0), (3,1), (1,1), (1,0)])
sage: b.weight()
-4*delta
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> b = B([(Integer(4),Integer(2)), (Integer(3),Integer(0)), (Integer(3),
↪Integer(1)), (Integer(1),Integer(1)), (Integer(1),Integer(0))])
>>> b.weight()
-4*delta
```

highest_weight_vector()

Return the highest weight vector of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: B.highest_weight_vector()
0
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> B.highest_weight_vector()
0
```

weight_lattice_realization()

Return a realization of the weight lattice of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.Multisegments(2)
sage: B.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Multisegments(Integer(2))
>>> B.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
```

Crystal of Mirković-Vilonen polytopes

AUTHORS:

- Dinakar Muthiah, Travis Scrimshaw (2015-05-11): initial version

class sage.combinat.crystals.mv_polytopes.**MVPolytope**(*parent*, *lusztig_datum*, *long_word=None*)

Bases: *PBWCrystalElement*

A Mirković-Vilonen (MV) polytope.

EXAMPLES:

We can create an animation showing how the MV polytope changes under a string of crystal operators:

```
sage: MV = crystals.infinity.MVPolytopes(['C', 2])
sage: u = MV.highest_weight_vector()
sage: L = RootSystem(['C',2,1]).ambient_space()
sage: s = [1,2,1,2,2,2,1,1,1,1,2,1,2,2,1,2]
sage: BB = [[-9, 2], [-10, 2]]
sage: p = L.plot(reflection_hyperplanes=False, bounding_box=BB)  # long time
sage: frames = [p + L.plot_mv_polytope(u.f_string(s[:i]),  # long time
....:                                  circle_size=0.1,
....:                                  wireframe='green',
....:                                  fill='purple',
....:                                  bounding_box=BB)
....:           for i in range(len(s))]
sage: for f in frames:  # long time
....:     f.axes(False)
sage: animate(frames).show(delay=60) # optional -- ImageMagick # long time
```

```
>>> from sage.all import *
>>> MV = crystals.infinity.MVPolytopes(['C', Integer(2)])
>>> u = MV.highest_weight_vector()
>>> L = RootSystem(['C',Integer(2),Integer(1)]).ambient_space()
>>> s = [Integer(1),Integer(2),Integer(1),Integer(2),Integer(2),Integer(2),
↪Integer(1),Integer(1),Integer(1),Integer(1),Integer(2),Integer(1),Integer(2),
↪Integer(2),Integer(1),Integer(2)]
>>> BB = [[-Integer(9), Integer(2)], [-Integer(10), Integer(2)]]
>>> p = L.plot(reflection_hyperplanes=False, bounding_box=BB)  # long time
>>> frames = [p + L.plot_mv_polytope(u.f_string(s[:i]),  # long time
...                                  circle_size=RealNumber('0.1'),
...                                  wireframe='green',
...                                  fill='purple',
...                                  bounding_box=BB)
...           for i in range(len(s))]
>>> for f in frames:  # long time
...     f.axes(False)
>>> animate(frames).show(delay=Integer(60)) # optional -- ImageMagick # long time
```

plot(*P=None*, ***options*)

Plot `self`.

INPUT:

- `P` – (optional) a space to realize the polytope; default is the weight lattice realization of the crystal

See also

plot_mv_polytope()

EXAMPLES:

```
sage: MV = crystals.infinity.MVPolytopes(['C', 2])
sage: b = MV.highest_weight_vector().f_string([1,2,1,2,2,2,1,1,1,1,2,1])
```

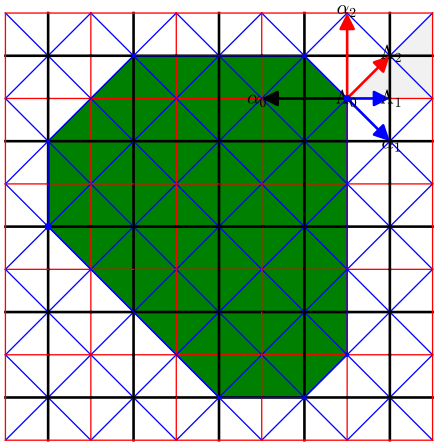
(continues on next page)

(continued from previous page)

```
sage: b.plot()                                                              #␣
↪needs sage.plot
Graphics object consisting of 12 graphics primitives
```

```
>>> from sage.all import *
>>> MV = crystals.infinity.MVPolytopes(['C', Integer(2)])
>>> b = MV.highest_weight_vector().f_string([Integer(1),Integer(2),Integer(1),
↪Integer(2),Integer(2),Integer(2),Integer(1),Integer(1),Integer(1),
↪Integer(1),Integer(2),Integer(1)])
>>> b.plot()                                                                #␣
↪needs sage.plot
Graphics object consisting of 12 graphics primitives
```

Here is the above example placed inside the ambient space of type C_2:



polytope(*P=None*)

Return a polytope of `self`.

INPUT:

- `P` – (optional) a space to realize the polytope; default is the weight lattice realization of the crystal

EXAMPLES:

```
sage: MV = crystals.infinity.MVPolytopes(['C', 3])
sage: b = MV.module_generators[0].f_string([3,2,3,2,1])
sage: P = b.polytope(); P
A 3-dimensional polyhedron in QQ^3 defined as the convex hull of 6 vertices
sage: P.vertices()
(A vertex at (0, 0, 0),
 A vertex at (0, 1, -1),
 A vertex at (0, 1, 1),
 A vertex at (1, -1, 0),
 A vertex at (1, 1, -2),
 A vertex at (1, 1, 2))
```

```
>>> from sage.all import *
>>> MV = crystals.infinity.MVPolytopes(['C', Integer(3)])
```

(continues on next page)

(continued from previous page)

```
>>> b = MV.module_generators[Integer(0)].f_string([Integer(3),Integer(2),
↪Integer(3),Integer(2),Integer(1)])
>>> P = b.polytope(); P
A 3-dimensional polyhedron in QQ^3 defined as the convex hull of 6 vertices
>>> P.vertices()
(A vertex at (0, 0, 0),
 A vertex at (0, 1, -1),
 A vertex at (0, 1, 1),
 A vertex at (1, -1, 0),
 A vertex at (1, 1, -2),
 A vertex at (1, 1, 2))
```

class sage.combinat.crystals.mv_polytopes.**MVPolytopes**(*cartan_type*)

Bases: *PBWCrystal*

The crystal of Mirković-Vilonen (MV) polytopes.

Let W denote the corresponding Weyl group and $P_{\mathbf{R}} = \mathbf{R} \otimes P$. Let $\Gamma = \{w\Lambda_i \mid w \in W, i \in I\}$. Consider $M = (M_\gamma \in \mathbf{Z})_{\gamma\in\Gamma}$ that satisfy the *tropical Plücker relations* (see Proposition 7.1 of [BZ01]). The *MV polytope* is defined as

$$P(M) = \{\alpha \in P_{\mathbf{R}} \mid \langle \alpha, \gamma \rangle \geq M_\gamma \text{ for all } \gamma \in \Gamma\}.$$

The vertices $\{\mu_w\}_{w\in W}$ are given by

$$\langle \mu_w, \gamma \rangle = M_\gamma$$

and are known as the GGMS datum of the MV polytope.

Each path from μ_e to μ_{w_0} corresponds to a reduced expression $\mathbf{i} = (i_1, \ldots, i_m)$ for w_0 and the corresponding edge lengths $(n_k)_{k=1}^m$ from the Lusztig datum with respect to $\mathbf{i}$. Explicitly, we have

$$n_k = -M_{w_{k-1}\Lambda_{i_k}} - M_{w_k\Lambda_{i_k}} - \sum_{j\neq i} a_{ji} M_{w_k\Lambda_j},$$

$$\mu_{w_k} - \mu_{w_{k-1}} = n_k w_{k-1} \alpha_{i_k},$$

where $w_k = s_{i_1} \cdots s_{i_k}$ and (a_{ji}) is the Cartan matrix.

MV polytopes have a crystal structure that corresponds to the crystal structure, which is isomorphic to $\mathcal{B}(\infty)$ with $\mu_{w_0} = 0$, on *PBW data*. Specifically, we have $f_j P(M)$ as being the unique MV polytope given by shifting μ_e by $-\alpha_j$ and fixing the vertices μ_w when $s_j w < w$ (in Bruhat order) and the weight is given by μ_e. Furthermore, the $*$-involution is given by negating $P(M)$.

INPUT:

- `cartan_type` – a Cartan type

EXAMPLES:

```
sage: MV = crystals.infinity.MVPolytopes(['B', 3])
sage: hw = MV.highest_weight_vector()
sage: x = hw.f_string([1,2,2,3,3,1,3,3,2,3,2,1,3,1,2,3,1,2,1,3,2]); x
MV polytope with Lusztig datum (1, 1, 1, 3, 1, 0, 0, 1, 1)
```

```
>>> from sage.all import *
>>> MV = crystals.infinity.MVPolytopes(['B', Integer(3)])
>>> hw = MV.highest_weight_vector()
>>> x = hw.f_string([Integer(1),Integer(2),Integer(2),Integer(3),Integer(3),
↪Integer(1),Integer(3),Integer(3),Integer(2),Integer(3),Integer(2),Integer(1),
↪Integer(3),Integer(1),Integer(2),Integer(3),Integer(1),Integer(2),Integer(1),
↪Integer(3),Integer(2)]); x
MV polytope with Lusztig datum (1, 1, 1, 3, 1, 0, 0, 1, 1)
```

Elements are expressed in terms of Lusztig datum for a fixed reduced expression of w_0:

```
sage: MV.default_long_word()
[1, 3, 2, 3, 1, 2, 3, 1, 2]
sage: MV.set_default_long_word([2,1,3,2,1,3,2,3,1])
sage: x
MV polytope with Lusztig datum (3, 1, 1, 0, 1, 0, 1, 3, 4)
sage: MV.set_default_long_word([1, 3, 2, 3, 1, 2, 3, 1, 2])
```

```
>>> from sage.all import *
>>> MV.default_long_word()
[1, 3, 2, 3, 1, 2, 3, 1, 2]
>>> MV.set_default_long_word([Integer(2),Integer(1),Integer(3),Integer(2),
↪Integer(1),Integer(3),Integer(2),Integer(3),Integer(1)])
>>> x
MV polytope with Lusztig datum (3, 1, 1, 0, 1, 0, 1, 3, 4)
>>> MV.set_default_long_word([Integer(1), Integer(3), Integer(2), Integer(3),␣
↪Integer(1), Integer(2), Integer(3), Integer(1), Integer(2)])
```

We can construct elements by giving it Lusztig data (with respect to the default long word reduced expression):

```
sage: MV([1,1,1,3,1,0,0,1,1])
MV polytope with Lusztig datum (1, 1, 1, 3, 1, 0, 0, 1, 1)
```

```
>>> from sage.all import *
>>> MV([Integer(1),Integer(1),Integer(1),Integer(3),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1)])
MV polytope with Lusztig datum (1, 1, 1, 3, 1, 0, 0, 1, 1)
```

We can also construct elements by passing in a reduced expression for a long word:

```
sage: x = MV([1,1,1,3,1,0,0,1,1], [3,2,1,3,2,3,2,1,2]); x
MV polytope with Lusztig datum (1, 1, 1, 0, 1, 0, 5, 1, 1)
sage: x.to_highest_weight()[1]
[1, 2, 2, 2, 2, 2, 1, 3, 3, 3, 3, 2, 3, 2, 3, 3, 2, 3, 3, 2, 1, 3]
```

```
>>> from sage.all import *
>>> x = MV([Integer(1),Integer(1),Integer(1),Integer(3),Integer(1),Integer(0),
↪Integer(0),Integer(1),Integer(1)], [Integer(3),Integer(2),Integer(1),Integer(3),
↪Integer(2),Integer(3),Integer(2),Integer(1),Integer(2)]); x
MV polytope with Lusztig datum (1, 1, 1, 0, 1, 0, 5, 1, 1)
>>> x.to_highest_weight()[Integer(1)]
[1, 2, 2, 2, 2, 2, 1, 3, 3, 3, 3, 2, 3, 2, 3, 3, 2, 3, 3, 2, 1, 3]
```

The highest weight crystal $B(\lambda) \subseteq B(\infty)$ is characterized by the MV polytopes that sit inside of $W\lambda$ (translating $\mu_{w_0} \mapsto \lambda$):

```
sage: MV = crystals.infinity.MVPolytopes(['A',2])
sage: La = MV.weight_lattice_realization().fundamental_weights()
sage: R = crystals.elementary.R(La[1]+La[2])
sage: T = tensor([R, MV])
sage: x = T(R.module_generators[0], MV.highest_weight_vector())
sage: lw = x.to_lowest_weight()[0]; lw
[(2, 1, 0), MV polytope with Lusztig datum (1, 1, 1)]
sage: lw[1].polytope().vertices()
(A vertex at (0, 0, 0),
 A vertex at (0, 1, -1),
 A vertex at (1, -1, 0),
 A vertex at (1, 1, -2),
 A vertex at (2, -1, -1),
 A vertex at (2, 0, -2))
```

```
>>> from sage.all import *
>>> MV = crystals.infinity.MVPolytopes(['A',Integer(2)])
>>> La = MV.weight_lattice_realization().fundamental_weights()
>>> R = crystals.elementary.R(La[Integer(1)]+La[Integer(2)])
>>> T = tensor([R, MV])
>>> x = T(R.module_generators[Integer(0)], MV.highest_weight_vector())
>>> lw = x.to_lowest_weight()[Integer(0)]; lw
[(2, 1, 0), MV polytope with Lusztig datum (1, 1, 1)]
>>> lw[Integer(1)].polytope().vertices()
(A vertex at (0, 0, 0),
 A vertex at (0, 1, -1),
 A vertex at (1, -1, 0),
 A vertex at (1, 1, -2),
 A vertex at (2, -1, -1),
 A vertex at (2, 0, -2))
```

Element

alias of *MVPolytope*

latex_options()

Return the latex options of `self`.

EXAMPLES:

```
sage: MV = crystals.infinity.MVPolytopes(['F', 4])
sage: MV.latex_options()
{'P': Ambient space of the Root system of type ['F', 4],
 'circle_size': 0.1,
 'mark_endpoints': True,
 'projection': True}
```

```
>>> from sage.all import *
>>> MV = crystals.infinity.MVPolytopes(['F', Integer(4)])
>>> MV.latex_options()
{'P': Ambient space of the Root system of type ['F', 4],
 'circle_size': 0.1,
 'mark_endpoints': True,
 'projection': True}
```

set_latex_options(***kwds*)

Set the latex options for the elements of `self`.

INPUT:

- `projection` – the projection; set to `True` to use the default projection of the specified weight lattice realization (initial: `True`)
- `P` – the weight lattice realization to use (initial: the weight lattice realization of `self`)
- `mark_endpoints` – whether to mark the endpoints (initial: `True`)
- `circle_size` – the size of the endpoint circles (initial: 0.1)

EXAMPLES:

```
sage: MV = crystals.infinity.MVPolytopes(['C', 2])
sage: P = RootSystem(['C', 2]).weight_lattice()
sage: b = MV.highest_weight_vector().f_string([1,2,1,2])
sage: latex(b)
\begin{tikzpicture}
\draw (0, 0) -- (0, -2) -- (-1, -3) -- (-1, -3) -- (-2, -2);
\draw (0, 0) -- (-1, 1) -- (-1, 1) -- (-2, 0) -- (-2, -2);
\draw[fill=black] (0, 0) circle (0.1);
\draw[fill=black] (-2, -2) circle (0.1);
\end{tikzpicture}
sage: MV.set_latex_options(P=P, circle_size=float(0.2))
sage: latex(b)
\begin{tikzpicture}
\draw (0, 0) -- (2, -2) -- (2, -3) -- (2, -3) -- (0, -2);
\draw (0, 0) -- (-2, 1) -- (-2, 1) -- (-2, 0) -- (0, -2);
\draw[fill=black] (0, 0) circle (0.2);
\draw[fill=black] (0, -2) circle (0.2);
\end{tikzpicture}
```

(continues on next page)

(continued from previous page)

```
sage: MV.set_latex_options(mark_endpoints=False)
sage: latex(b)
\begin{tikzpicture}
\draw (0, 0) -- (2, -2) -- (2, -3) -- (2, -3) -- (0, -2);
\draw (0, 0) -- (-2, 1) -- (-2, 1) -- (-2, 0) -- (0, -2);
\end{tikzpicture}
sage: MV.set_latex_options(P=MV.weight_lattice_realization(),
....:                      circle_size=0.2,
....:                      mark_endpoints=True)
```

```
>>> from sage.all import *
>>> MV = crystals.infinity.MVPolytopes(['C', Integer(2)])
>>> P = RootSystem(['C', Integer(2)]).weight_lattice()
>>> b = MV.highest_weight_vector().f_string([Integer(1),Integer(2),Integer(1),
↪Integer(2)])
>>> latex(b)

Crystals of Kac modules of the general-linear Lie superalgebra

class sage.combinat.crystals.kac_modules.**CrystalOfKacModule**(*cartan_type*, *la*, *mu*)

Bases: `UniqueRepresentation`, `Parent`

Crystal of a Kac module.

Let $\mathfrak{g}$ be the general linear Lie superalgebra $\mathfrak{gl}(m|n)$. Let λ and μ be dominant weights for $\mathfrak{gl}_m$ and $\mathfrak{gl}_n$, respectively. Let K be the module $K = \langle f_\alpha \rangle$, where α ranges over all odd positive roots. A *Kac module* is the $U_q(\mathfrak{g})$-module constructed from the highest weight $U_q(\mathfrak{gl}_m \oplus \mathfrak{gl}_n)$-module $V(\lambda, \mu)$ (induced to a $U_q(\mathfrak{g})$-module in the natural way) by

$$K(\lambda, \mu) := K \otimes_L V(\lambda, \mu),$$

where L is the subalgebra generated by e_0 and $U_q(\mathfrak{gl}_m \oplus \mathfrak{gl}_n)$.

The Kac module admits a $U_q(\mathfrak{g})$-crystal structure by taking the crystal structure of K as given by `CrystalOfOddNegativeRoots` and the crystal $B(\lambda, \mu)$ (the natural crystal structure of $V(\lambda, \mu)$).

Note

Our notation differs slightly from [Kwon2012] in that our last tableau is transposed.

EXAMPLES:

```
sage: K = crystals.KacModule(['A', [1,2]], [2], [1,1])
sage: K.cardinality()
576
sage: K.cardinality().factor()
2^6 * 3^2
sage: len(K.cartan_type().root_system().ambient_space().positive_odd_roots())
6
sage: mg = K.module_generator()
sage: mg
({}, [[-2, -2]], [[1], [2]])
sage: mg.weight()
(2, 0, 1, 1, 0)
sage: mg.f(-1)
({}, [[-2, -1]], [[1], [2]])
sage: mg.f(0)
({-e[-1]+e[1]}, [[-2, -2]], [[1], [2]])
sage: mg.f(1)
sage: mg.f(2)

- [Kwon2012]

class Element

Bases: `ElementWrapper`

An element of a Kac module crystal.

e(i)

Return the action of the crystal operator e_i on `self`.

EXAMPLES:

```
sage: K = crystals.KacModule(['A', [2,2]], [2,1], [1])
sage: mg = K.module_generator()
sage: mg.e(0)
sage: mg.e(1)
sage: mg.e(-1)
sage: b = mg.f_string([1,0,1,-1,-2,0,1,2,0,-2,-1,-1,-1]); b
({-e[-3]+e[2], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -1], [-2]], [[3]])
sage: b.e(-2)
sage: b.e(-1)
({-e[-3]+e[2], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -2], [-2]], [[3]])
sage: b.e(0)
sage: b.e(1)
({-e[-3]+e[1], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -1], [-2]], [[3]])
sage: b.e(2)
({-e[-3]+e[2], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -1], [-2]], [[2]])
```

```
>>> from sage.all import *
>>> K = crystals.KacModule(['A', [Integer(2),Integer(2)]], [Integer(2),
↪Integer(1)], [Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> mg = K.module_generator()
>>> mg.e(Integer(0))
>>> mg.e(Integer(1))
>>> mg.e(-Integer(1))
>>> b = mg.f_string([Integer(1),Integer(0),Integer(1),-Integer(1),-
↪Integer(2),Integer(0),Integer(1),Integer(2),Integer(0),-Integer(2),-
↪Integer(1),-Integer(1),-Integer(1)]); b
({-e[-3]+e[2], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -1], [-2]], [[3]])
>>> b.e(-Integer(2))
>>> b.e(-Integer(1))
({-e[-3]+e[2], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -2], [-2]], [[3]])
>>> b.e(Integer(0))
>>> b.e(Integer(1))
({-e[-3]+e[1], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -1], [-2]], [[3]])
>>> b.e(Integer(2))
({-e[-3]+e[2], -e[-2]+e[1], -e[-2]+e[2]}, [[-3, -1], [-2]], [[2]])
```

f (*i*)

Return the action of the crystal operator f_i on `self`.

EXAMPLES:

```
sage: K = crystals.KacModule(['A', [2,2]], [2,1], [1])
sage: mg = K.module_generator()
sage: mg.f(-2)
({}, [[-3, -2], [-2]], [[1]])
sage: mg.f(-1)
({}, [[-3, -3], [-1]], [[1]])
sage: mg.f(0)
({-e[-1]+e[1]}, [[-3, -3], [-2]], [[1]])
sage: mg.f(1)
({}, [[-3, -3], [-2]], [[2]])
sage: mg.f(2)
sage: b = mg.f_string([1,0,1,-1,-2,0,1,2,0,-2,-1,2,0]); b
({-e[-3]+e[3], -e[-2]+e[1], -e[-1]+e[1], -e[-1]+e[2]},
 [[-3, -2], [-2]], [[3]])
```

```
>>> from sage.all import *
>>> K = crystals.KacModule(['A', [Integer(2),Integer(2)]], [Integer(2),
↪Integer(1)], [Integer(1)])
>>> mg = K.module_generator()
>>> mg.f(-Integer(2))
({}, [[-3, -2], [-2]], [[1]])
>>> mg.f(-Integer(1))
({}, [[-3, -3], [-1]], [[1]])
>>> mg.f(Integer(0))
({-e[-1]+e[1]}, [[-3, -3], [-2]], [[1]])
>>> mg.f(Integer(1))
({}, [[-3, -3], [-2]], [[2]])
>>> mg.f(Integer(2))
>>> b = mg.f_string([Integer(1),Integer(0),Integer(1),-Integer(1),-
↪Integer(2),Integer(0),Integer(1),Integer(2),Integer(0),-Integer(2),-
```

(continues on next page)

(continued from previous page)

```
↪Integer(1),Integer(2),Integer(0)]); b
({-e[-3]+e[3], -e[-2]+e[1], -e[-1]+e[1], -e[-1]+e[2]},
 [[-3, -2], [-2]], [[3]])
```

weight()

Return weight of `self`.

EXAMPLES:

```
sage: K = crystals.KacModule(['A', [3,2]], [2,1], [5,1])
sage: mg = K.module_generator()
sage: mg.weight()
(2, 1, 0, 0, 5, 1, 0)
sage: mg.weight().is_dominant()
True
sage: mg.f(0).weight()
(2, 1, 0, -1, 6, 1, 0)
sage: b = mg.f_string([2,1,-3,-2,-1,1,1,0,-2,-1,2,1,1,1,0,2,-3,-2,-1])
sage: b.weight()
(0, 0, 0, 1, 1, 4, 3)
```

```
>>> from sage.all import *
>>> K = crystals.KacModule(['A', [Integer(3),Integer(2)]], [Integer(2),
↪Integer(1)], [Integer(5),Integer(1)])
>>> mg = K.module_generator()
>>> mg.weight()
(2, 1, 0, 0, 5, 1, 0)
>>> mg.weight().is_dominant()
True
>>> mg.f(Integer(0)).weight()
(2, 1, 0, -1, 6, 1, 0)
>>> b = mg.f_string([Integer(2),Integer(1),-Integer(3),-Integer(2),-
↪Integer(1),Integer(1),Integer(1),Integer(0),-Integer(2),-Integer(1),
↪Integer(2),Integer(1),Integer(1),Integer(1),Integer(0),Integer(2),-
↪Integer(3),-Integer(2),-Integer(1)])
>>> b.weight()
(0, 0, 0, 1, 1, 4, 3)
```

module_generator()

Return the module generator of `self`.

EXAMPLES:

```
sage: K = crystals.KacModule(['A', [2,1]], [2,1], [1])
sage: K.module_generator()
({}, [[-3, -3], [-2]], [[1]])
```

```
>>> from sage.all import *
>>> K = crystals.KacModule(['A', [Integer(2),Integer(1)]], [Integer(2),
↪Integer(1)], [Integer(1)])
>>> K.module_generator()
({}, [[-3, -3], [-2]], [[1]])
```

class sage.combinat.crystals.kac_modules.**CrystalOfOddNegativeRoots**(*cartan_type*)

Bases: UniqueRepresentation, Parent

Crystal of the set of odd negative roots.

Let $\mathfrak{g}$ be the general-linear Lie superalgebra $\mathfrak{gl}(m|n)$. This is the crystal structure on the set of negative roots as given by [Kwon2012].

More specifically, this is the crystal basis of the subalgebra of $U_q^-(\mathfrak{g})$ generated by f_α, where α ranges over all odd positive roots. As $\mathbf{Q}(q)$-modules, we have

$$U_q^-(\mathfrak{g}) \cong K \otimes U_q^-(\mathfrak{gl}_m \oplus \mathfrak{gl}_n).$$

EXAMPLES:

```
sage: S = crystals.OddNegativeRoots(['A', [2,1]])
sage: mg = S.module_generator(); mg
{}
sage: mg.f(0)
{-e[-1]+e[1]}
sage: mg.f_string([0,-1,0,1,2,1,0])
{-e[-2]+e[3], -e[-1]+e[1], -e[-1]+e[2]}
```

```
>>> from sage.all import *
>>> S = crystals.OddNegativeRoots(['A', [Integer(2),Integer(1)]])
>>> mg = S.module_generator(); mg
{}
>>> mg.f(Integer(0))
{-e[-1]+e[1]}
>>> mg.f_string([Integer(0),-Integer(1),Integer(0),Integer(1),Integer(2),
↪Integer(1),Integer(0)])
{-e[-2]+e[3], -e[-1]+e[1], -e[-1]+e[2]}
```

class Element

Bases: ElementWrapper

An element of the crystal of odd negative roots.

e(*i*)

Return the action of the crystal operator e_i on `self`.

EXAMPLES:

```
sage: S = crystals.OddNegativeRoots(['A', [2,2]])
sage: mg = S.module_generator()
sage: mg.e(0)
sage: mg.e(1)
sage: b = mg.f_string([0,1,2,-1,0])
sage: b.e(-1)
sage: b.e(0)
{-e[-2]+e[3]}
sage: b.e(1)
sage: b.e(2)
{-e[-2]+e[2], -e[-1]+e[1]}
sage: b.e_string([2,1,0,-1,0])
{}
```

```
>>> from sage.all import *
>>> S = crystals.OddNegativeRoots(['A', [Integer(2),Integer(2)]])
>>> mg = S.module_generator()
>>> mg.e(Integer(0))
>>> mg.e(Integer(1))
>>> b = mg.f_string([Integer(0),Integer(1),Integer(2),-Integer(1),
↪Integer(0)])
>>> b.e(-Integer(1))
>>> b.e(Integer(0))
{-e[-2]+e[3]}
>>> b.e(Integer(1))
>>> b.e(Integer(2))
{-e[-2]+e[2], -e[-1]+e[1]}
>>> b.e_string([Integer(2),Integer(1),Integer(0),-Integer(1),Integer(0)])
{}
```

epsilon(*i*)

Return ε_i of `self`.

EXAMPLES:

```
sage: S = crystals.OddNegativeRoots(['A', [2,2]])
sage: mg = S.module_generator()
sage: [mg.epsilon(i) for i in S.index_set()]
[0, 0, 0, 0, 0]
sage: b = mg.f_string([0,1,0,-1,0,-1,-2,-2]); b
{-e[-3]+e[1], -e[-3]+e[2], -e[-1]+e[1]}
sage: [b.epsilon(i) for i in S.index_set()]
[2, 0, 1, 0, 0]
sage: b = mg.f_string([0,1,0,-1,0,-1,-2,-2,2,-1,0]); b
{-e[-3]+e[1], -e[-3]+e[3], -e[-2]+e[1], -e[-1]+e[1]}
sage: [b.epsilon(i) for i in S.index_set()]
[1, 0, 1, 0, 1]
```

```
>>> from sage.all import *
>>> S = crystals.OddNegativeRoots(['A', [Integer(2),Integer(2)]])
>>> mg = S.module_generator()
>>> [mg.epsilon(i) for i in S.index_set()]
[0, 0, 0, 0, 0]
>>> b = mg.f_string([Integer(0),Integer(1),Integer(0),-Integer(1),
↪Integer(0),-Integer(1),-Integer(2),-Integer(2)]); b
{-e[-3]+e[1], -e[-3]+e[2], -e[-1]+e[1]}
>>> [b.epsilon(i) for i in S.index_set()]
[2, 0, 1, 0, 0]
>>> b = mg.f_string([Integer(0),Integer(1),Integer(0),-Integer(1),
↪Integer(0),-Integer(1),-Integer(2),-Integer(2),Integer(2),-Integer(1),
↪Integer(0)]); b
{-e[-3]+e[1], -e[-3]+e[3], -e[-2]+e[1], -e[-1]+e[1]}
>>> [b.epsilon(i) for i in S.index_set()]
[1, 0, 1, 0, 1]
```

f(*i*)

Return the action of the crystal operator f_i on `self`.

EXAMPLES:

```
sage: S = crystals.OddNegativeRoots(['A', [2,2]])
sage: mg = S.module_generator()
sage: mg.f(0)
{-e[-1]+e[1]}
sage: mg.f(1)
sage: b = mg.f_string([0,1,2,-1,0]); b
{-e[-2]+e[3], -e[-1]+e[1]}
sage: b.f(-2)
{-e[-3]+e[3], -e[-1]+e[1]}
sage: b.f(-1)
sage: b.f(0)
sage: b.f(1)
{-e[-2]+e[3], -e[-1]+e[2]}
```

```
>>> from sage.all import *
>>> S = crystals.OddNegativeRoots(['A', [Integer(2),Integer(2)]])
>>> mg = S.module_generator()
>>> mg.f(Integer(0))
{-e[-1]+e[1]}
>>> mg.f(Integer(1))
>>> b = mg.f_string([Integer(0),Integer(1),Integer(2),-Integer(1),
↪Integer(0)]); b
{-e[-2]+e[3], -e[-1]+e[1]}
>>> b.f(-Integer(2))
{-e[-3]+e[3], -e[-1]+e[1]}
>>> b.f(-Integer(1))
>>> b.f(Integer(0))
>>> b.f(Integer(1))
{-e[-2]+e[3], -e[-1]+e[2]}
```

phi (i)

Return φ_i of `self`.

EXAMPLES:

```
sage: S = crystals.OddNegativeRoots(['A', [2,2]])
sage: mg = S.module_generator()
sage: [mg.phi(i) for i in S.index_set()]
[0, 0, 1, 0, 0]
sage: b = mg.f(0)
sage: [b.phi(i) for i in S.index_set()]
[0, 1, 0, 1, 0]
sage: b = mg.f_string([0,1,0,-1,0,-1]); b
{-e[-2]+e[1], -e[-2]+e[2], -e[-1]+e[1]}
sage: [b.phi(i) for i in S.index_set()]
[2, 0, 0, 1, 1]
```

```
>>> from sage.all import *
>>> S = crystals.OddNegativeRoots(['A', [Integer(2),Integer(2)]])
>>> mg = S.module_generator()
>>> [mg.phi(i) for i in S.index_set()]
```

(continues on next page)

(continued from previous page)

```
[0, 0, 1, 0, 0]
>>> b = mg.f(Integer(0))
>>> [b.phi(i) for i in S.index_set()]
[0, 1, 0, 1, 0]
>>> b = mg.f_string([Integer(0),Integer(1),Integer(0),-Integer(1),
↪Integer(0),-Integer(1)]); b
{-e[-2]+e[1], -e[-2]+e[2], -e[-1]+e[1]}
>>> [b.phi(i) for i in S.index_set()]
[2, 0, 0, 1, 1]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: S = crystals.OddNegativeRoots(['A', [2,2]])
sage: mg = S.module_generator()
sage: mg.weight()
(0, 0, 0, 0, 0, 0)
sage: mg.f_string([0,1,2,-1,-2]).weight()
(-1, 0, 0, 0, 0, 1)
sage: mg.f_string([0,1,2,-1,-2,0,1,0,2]).weight()
(-1, 0, -2, 1, 0, 2)
```

```
>>> from sage.all import *
>>> S = crystals.OddNegativeRoots(['A', [Integer(2),Integer(2)]])
>>> mg = S.module_generator()
>>> mg.weight()
(0, 0, 0, 0, 0, 0)
>>> mg.f_string([Integer(0),Integer(1),Integer(2),-Integer(1),-
↪Integer(2)]).weight()
(-1, 0, 0, 0, 0, 1)
>>> mg.f_string([Integer(0),Integer(1),Integer(2),-Integer(1),-Integer(2),
↪Integer(0),Integer(1),Integer(0),Integer(2)]).weight()
(-1, 0, -2, 1, 0, 2)
```

module_generator()

Return the module generator of `self`.

EXAMPLES:

```
sage: S = crystals.OddNegativeRoots(['A', [2,1]])
sage: S.module_generator()
{}
```

```
>>> from sage.all import *
>>> S = crystals.OddNegativeRoots(['A', [Integer(2),Integer(1)]])
>>> S.module_generator()
{}
```

sage.combinat.crystals.kac_modules.**latex_dual**(*elt*)

Return a latex representation of a type A_n crystal tableau `elt` expressed in terms of dual letters.

The dual letter of k is expressed as $\overline{n+2-k}$.

EXAMPLES:

```
sage: from sage.combinat.crystals.kac_modules import latex_dual
sage: T = crystals.Tableaux(['A',2], shape=[2,1])
sage: print(latex_dual(T[0]))
{\def\lr#1{\multicolumn{1}{|@{\hspace{.6ex}}c@{\hspace{.6ex}}|}{\raisebox{-.3ex}{$
↪#1$}}}
\raisebox{-.6ex}{$\begin{array}[b]{*{2}c}\cline{1-2}
\lr{\overline{3}}&\lr{\overline{3}}\\\cline{1-2}
\lr{\overline{2}}\\\cline{1-1}
\end{array}$}
}
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kac_modules import latex_dual
>>> T = crystals.Tableaux(['A',Integer(2)], shape=[Integer(2),Integer(1)])
>>> print(latex_dual(T[Integer(0)]))
{\def\lr#1{\multicolumn{1}{|@{\hspace{.6ex}}c@{\hspace{.6ex}}|}{\raisebox{-.3ex}{$
↪#1$}}}
\raisebox{-.6ex}{$\begin{array}[b]{*{2}c}\cline{1-2}
\lr{\overline{3}}&\lr{\overline{3}}\\\cline{1-2}
\lr{\overline{2}}\\\cline{1-1}
\end{array}$}
}
```

`sage.combinat.crystals.kac_modules.`**`to_dual_tableau`**(*elt*)

Return a type A_n crystal tableau `elt` as a tableau expressed in terms of dual letters.

The dual letter of k is expressed as $\overline{n+2-k}$ represented as $-(n+2-k)$.

EXAMPLES:

```
sage: from sage.combinat.crystals.kac_modules import to_dual_tableau
sage: T = crystals.Tableaux(['A',2], shape=[2,1])
sage: ascii_art([to_dual_tableau(t) for t in T])
[  -3 -3   -3 -2   -3 -1   -3 -1   -2 -1   -3 -3   -3 -2   -2 -2 ]
[  -2   ,  -2   ,  -2   ,  -1   ,  -1   ,  -1   ,  -1   ,  -1    ]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kac_modules import to_dual_tableau
>>> T = crystals.Tableaux(['A',Integer(2)], shape=[Integer(2),Integer(1)])
>>> ascii_art([to_dual_tableau(t) for t in T])
[  -3 -3   -3 -2   -3 -1   -3 -1   -2 -1   -3 -3   -3 -2   -2 -2 ]
[  -2   ,  -2   ,  -2   ,  -1   ,  -1   ,  -1   ,  -1   ,  -1    ]
```

Crystals of generalized Young walls

Generalized Young walls are certain generalizations of Young tableaux introduced in [KS2010] and designed to be a realization of the crystals $\mathcal{B}(\infty)$ and $\mathcal{B}(\lambda)$ in type $A_n^{(1)}$.

class sage.combinat.crystals.generalized_young_walls.**CrystalOfGeneralizedYoungWalls**(*n*, *La*)

Bases: *InfinityCrystalOfGeneralizedYoungWalls*

The crystal $\mathcal{Y}(\lambda)$ of generalized Young walls of the given type with highest weight λ.

These were characterized in Theorem 4.1 of [KS2010]. See *GeneralizedYoungWall.in_highest_weight_crystal()*.

INPUT:

- `n` – type $A_n^{(1)}$
- `weight` – dominant integral weight

EXAMPLES:

```
sage: La = RootSystem(['A',3,1]).weight_lattice(extended=True).fundamental_
↪weights()[1]
sage: YLa = crystals.GeneralizedYoungWalls(3,La)
sage: y = YLa([[0],[1,0,3,2,1],[2,1,0],[3]])
sage: y.pp()
        3|
    0|1|2|
1|2|3|0|1|
        0|
sage: y.weight()
-Lambda[0] + Lambda[2] + Lambda[3] - 3*delta
sage: y.in_highest_weight_crystal(La)
True
sage: y.f(1)
[[0], [1, 0, 3, 2, 1], [2, 1, 0], [3], [], [1]]
sage: y.f(1).f(1)
sage: yy = crystals.infinity.GeneralizedYoungWalls(3)([[0], [1, 0, 3, 2, 1], [2,␣
↪1, 0], [3], [], [1]])
sage: yy.f(1)
[[0], [1, 0, 3, 2, 1], [2, 1, 0], [3], [], [1], [], [], [], [1]]
sage: yyy = yy.f(1)
sage: yyy.in_highest_weight_crystal(La)
False

sage: LS = crystals.LSPaths(['A',3,1],[1,0,0,0])
sage: C = LS.subcrystal(max_depth=4)
sage: G = LS.digraph(subset=C)
sage: P = RootSystem(['A',3,1]).weight_lattice(extended=True)
sage: La = P.fundamental_weights()
sage: YW = crystals.GeneralizedYoungWalls(3,La[0])
sage: CW = YW.subcrystal(max_depth=4)
sage: GW = YW.digraph(subset=CW)
```

(continues on next page)

(continued from previous page)

```
sage: GW.is_isomorphic(G,edge_labels=True)
True
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(3),Integer(1)]).weight_lattice(extended=True).
↪fundamental_weights()[Integer(1)]
>>> YLa = crystals.GeneralizedYoungWalls(Integer(3),La)
>>> y = YLa([[Integer(0)],[Integer(1),Integer(0),Integer(3),Integer(2),
↪Integer(1)],[Integer(2),Integer(1),Integer(0)],[Integer(3)]])
>>> y.pp()
        3|
    0|1|2|
1|2|3|0|1|
        0|
>>> y.weight()
-Lambda[0] + Lambda[2] + Lambda[3] - 3*delta
>>> y.in_highest_weight_crystal(La)
True
>>> y.f(Integer(1))
[[0], [1, 0, 3, 2, 1], [2, 1, 0], [3], [], [1]]
>>> y.f(Integer(1)).f(Integer(1))
>>> yy = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[Integer(0)],␣
↪[Integer(1), Integer(0), Integer(3), Integer(2), Integer(1)], [Integer(2),␣
↪Integer(1), Integer(0)], [Integer(3)], [], [Integer(1)]])
>>> yy.f(Integer(1))
[[0], [1, 0, 3, 2, 1], [2, 1, 0], [3], [], [1], [], [], [], [1]]
>>> yyy = yy.f(Integer(1))
>>> yyy.in_highest_weight_crystal(La)
False

>>> LS = crystals.LSPaths(['A',Integer(3),Integer(1)],[Integer(1),Integer(0),
↪Integer(0),Integer(0)])
>>> C = LS.subcrystal(max_depth=Integer(4))
>>> G = LS.digraph(subset=C)
>>> P = RootSystem(['A',Integer(3),Integer(1)]).weight_lattice(extended=True)
>>> La = P.fundamental_weights()
>>> YW = crystals.GeneralizedYoungWalls(Integer(3),La[Integer(0)])
>>> CW = YW.subcrystal(max_depth=Integer(4))
>>> GW = YW.digraph(subset=CW)
>>> GW.is_isomorphic(G,edge_labels=True)
True
```

To display the crystal down to a specified depth:

```
sage: S = YLa.subcrystal(max_depth=4)
sage: G = YLa.digraph(subset=S)
sage: view(G) # not tested
```

```
>>> from sage.all import *
>>> S = YLa.subcrystal(max_depth=Integer(4))
>>> G = YLa.digraph(subset=S)
>>> view(G) # not tested
```

Element

alias of *CrystalOfGeneralizedYoungWallsElement*

class sage.combinat.crystals.generalized_young_walls.**CrystalOfGeneralizedYoungWallsElement**(*parent*, *data*)

Bases: *GeneralizedYoungWall*

Element of the highest weight crystal of generalized Young walls.

e(*i*)

Compute the action of e_i restricted to the highest weight crystal.

EXAMPLES:

```
sage: La = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()[1]
sage: hwy = crystals.GeneralizedYoungWalls(2,La)([[],[1,0],[2,1]])
sage: hwy.e(1)
[[], [1, 0], [2]]
sage: hwy.e(2)
sage: hwy.e(3)
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()[Integer(1)]
>>> hwy = crystals.GeneralizedYoungWalls(Integer(2),La)([[],[Integer(1),
↪Integer(0)],[Integer(2),Integer(1)]])
>>> hwy.e(Integer(1))
[[], [1, 0], [2]]
>>> hwy.e(Integer(2))
>>> hwy.e(Integer(3))
```

f(*i*)

Compute the action of f_i restricted to the highest weight crystal.

EXAMPLES:

```
sage: La = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()[1]
sage: GYW = crystals.infinity.GeneralizedYoungWalls(2)
sage: y = GYW([[],[1,0],[2,1]])
sage: y.f(1)
[[], [1, 0], [2, 1], [], [1]]
sage: hwy = crystals.GeneralizedYoungWalls(2,La)([[],[1,0],[2,1]])
sage: hwy.f(1)
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()[Integer(1)]
>>> GYW = crystals.infinity.GeneralizedYoungWalls(Integer(2))
>>> y = GYW([[],[Integer(1),Integer(0)],[Integer(2),Integer(1)]])
>>> y.f(Integer(1))
[[], [1, 0], [2, 1], [], [1]]
```

(continues on next page)

(continued from previous page)

```
>>> hwy = crystals.GeneralizedYoungWalls(Integer(2),La)([[],[Integer(1),
↪Integer(0)],[Integer(2),Integer(1)]])
>>> hwy.f(Integer(1))
```

phi(*i*)

Return the value $\varepsilon_i(Y) + \langle h_i, \mathrm{wt}(Y) \rangle$, where h_i is the i-th simple coroot and Y is `self`.

EXAMPLES:

```
sage: La = RootSystem(['A',3,1]).weight_lattice(extended=True).fundamental_
↪weights()
sage: y = crystals.GeneralizedYoungWalls(3,La[0])([])
sage: y.phi(1)
0
sage: y.phi(2)
0
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(3),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()
>>> y = crystals.GeneralizedYoungWalls(Integer(3),La[Integer(0)])([])
>>> y.phi(Integer(1))
0
>>> y.phi(Integer(2))
0
```

weight()

Return the weight of `self` in the highest weight crystal as an element of the weight lattice $\bigoplus_{i=0}^{n} \mathbf{Z}\Lambda_i$.

EXAMPLES:

```
sage: La = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()[1]
sage: hwy = crystals.GeneralizedYoungWalls(2,La)([[],[1,0],[2,1]])
sage: hwy.weight()
Lambda[0] - Lambda[1] + Lambda[2] - delta
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()[Integer(1)]
>>> hwy = crystals.GeneralizedYoungWalls(Integer(2),La)([[],[Integer(1),
↪Integer(0)],[Integer(2),Integer(1)]])
>>> hwy.weight()
Lambda[0] - Lambda[1] + Lambda[2] - delta
```

class sage.combinat.crystals.generalized_young_walls.**GeneralizedYoungWall**(*parent*, *data*)

Bases: *CombinatorialElement*

A generalized Young wall.

For more information, see *InfinityCrystalOfGeneralizedYoungWalls*.

EXAMPLES:

```
sage: Y = crystals.infinity.GeneralizedYoungWalls(4)
sage: mg = Y.module_generators[0]; mg.pp()
0
sage: mg.f_string([1,2,0,1]).pp()
1|2|
0|1|
  |
```

```
>>> from sage.all import *
>>> Y = crystals.infinity.GeneralizedYoungWalls(Integer(4))
>>> mg = Y.module_generators[Integer(0)]; mg.pp()
0
>>> mg.f_string([Integer(1),Integer(2),Integer(0),Integer(1)]).pp()
1|2|
0|1|
  |
```

Epsilon()

Return $\sum_{i=0}^{n} \varepsilon_i(Y)\Lambda_i$ where Y is `self`.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(3)([[0],[1,0,3,2],[2,1],[3,
↪2,1,0,3,2],[0],[],[2]])
sage: y.Epsilon()
Lambda[0] + 3*Lambda[2]
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[Integer(0)],
↪[Integer(1),Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],
↪[Integer(3),Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],
↪[Integer(0)],[],[Integer(2)]])
>>> y.Epsilon()
Lambda[0] + 3*Lambda[2]
```

Phi()

Return $\sum_{i=0}^{n} \varphi_i(Y)\Lambda_i$ where Y is `self`.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(3)([[0],[1,0,3,2],[2,1],[3,
↪2,1,0,3,2],[0],[],[2]])
sage: y.Phi()
-Lambda[0] + 3*Lambda[1] - Lambda[2] + 3*Lambda[3]

sage: x = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
↪1,0,3,2],[],[],[2]])
sage: x.Phi()
2*Lambda[0] + Lambda[1] - Lambda[2] + Lambda[3]
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[Integer(0)],
↪[Integer(1),Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],
```

(continues on next page)

(continued from previous page)

```
↪[Integer(3),Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],
↪[Integer(0)],[],[Integer(2)]])
>>> y.Phi()
-Lambda[0] + 3*Lambda[1] - Lambda[2] + 3*Lambda[3]

>>> x = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
↪Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> x.Phi()
2*Lambda[0] + Lambda[1] - Lambda[2] + Lambda[3]
```

a(i, k)

Return the number $a_i(k)$ of i-colored boxes in the `k`-th column of `self`.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(3)([[0],[1,0,3,2],[2,1],[3,
↪2,1,0,3,2],[0],[],[2]])
sage: y.a(1,2)
1
sage: y.a(0,2)
1
sage: y.a(3,2)
0
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[Integer(0)],
↪[Integer(1),Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],
↪[Integer(3),Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],
↪[Integer(0)],[],[Integer(2)]])
>>> y.a(Integer(1),Integer(2))
1
>>> y.a(Integer(0),Integer(2))
1
>>> y.a(Integer(3),Integer(2))
0
```

column(k)

Return the list of boxes from the `k`-th column of `self`.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(3)([[0],[1,0,3,2],[2,1],[3,
↪2,1,0,3,2],[0],[],[2]])
sage: y.column(2)
[None, 0, 1, 2, None, None, None]

sage: hw = crystals.infinity.GeneralizedYoungWalls(5)([])
sage: hw.column(1)
[]
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[Integer(0)],
```

(continues on next page)

(continued from previous page)

```
↪[Integer(1),Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],
↪[Integer(3),Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],
↪[Integer(0)],[],[Integer(2)]])
>>> y.column(Integer(2))
[None, 0, 1, 2, None, None, None]

>>> hw = crystals.infinity.GeneralizedYoungWalls(Integer(5))([])
>>> hw.column(Integer(1))
[]
```

content()

Return total number of blocks in `self`.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(2)([[0],[1,0],[2,1,0,2],[],
↪[1]])
sage: y.content()
8

sage: x = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
↪1,0,3,2],[],[],[2]])
sage: x.content()
13
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(2))([[Integer(0)],
↪[Integer(1),Integer(0)],[Integer(2),Integer(1),Integer(0),Integer(2)],[],
↪[Integer(1)]])
>>> y.content()
8

>>> x = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
↪Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> x.content()
13
```

e(i)

Return the application of the Kashiwara raising operator e_i on `self`.

This will remove the i-colored box corresponding to the rightmost $+$ in `self.signature(i)`.

EXAMPLES:

```
sage: x = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
↪1,0,3,2],[],[],[2]])
sage: x.e(2)
[[], [1, 0, 3, 2], [2, 1], [3, 2, 1, 0, 3, 2]]
sage: _.e(2)
[[], [1, 0, 3], [2, 1], [3, 2, 1, 0, 3, 2]]
sage: _.e(2)
[[], [1, 0, 3], [2, 1], [3, 2, 1, 0, 3]]
sage: _.e(2)
```

```
>>> from sage.all import *
>>> x = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
↪Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> x.e(Integer(2))
[[], [1, 0, 3, 2], [2, 1], [3, 2, 1, 0, 3, 2]]
>>> _.e(Integer(2))
[[], [1, 0, 3], [2, 1], [3, 2, 1, 0, 3, 2]]
>>> _.e(Integer(2))
[[], [1, 0, 3], [2, 1], [3, 2, 1, 0, 3]]
>>> _.e(Integer(2))
```

epsilon(i)

Return the number of i-colored arrows in the i-string above `self` in the crystal graph.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
↪1,0,3,2],[],[],[2]])
sage: y.epsilon(1)
0
sage: y.epsilon(2)
3
sage: y.epsilon(0)
0
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
↪Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> y.epsilon(Integer(1))
0
>>> y.epsilon(Integer(2))
3
>>> y.epsilon(Integer(0))
0
```

f(i)

Return the application of the Kashiwara lowering operator f_i on `self`.

This will add an i-colored colored box to the site corresponding to the leftmost plus in `self.signature(i)`.

EXAMPLES:

```
sage: hw = crystals.infinity.GeneralizedYoungWalls(2)([])
sage: hw.f(1)
[[], [1]]
sage: _.f(2)
[[], [1], [2]]
sage: _.f(0)
[[], [1, 0], [2]]
sage: _.f(0)
[[0], [1, 0], [2]]
```

```
>>> from sage.all import *
>>> hw = crystals.infinity.GeneralizedYoungWalls(Integer(2))([])
>>> hw.f(Integer(1))
[[], [1]]
>>> _.f(Integer(2))
[[], [1], [2]]
>>> _.f(Integer(0))
[[], [1, 0], [2]]
>>> _.f(Integer(0))
[[0], [1, 0], [2]]
```

generate_signature(i)

The i-signature of `self` (with whitespace where cancellation occurs) together with the unreduced sequence from $\{+, -\}$. The result also records to the row and column position of the sign.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(2)([[0],[1,0],[2,1,0,2],[],
↪[1]])
sage: y.generate_signature(1)
([['+', 2, 5], ['-', 4, 1]], '  ')
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(2))([[Integer(0)],
↪[Integer(1),Integer(0)],[Integer(2),Integer(1),Integer(0),Integer(2)],[],
↪[Integer(1)]])
>>> y.generate_signature(Integer(1))
([['+', 2, 5], ['-', 4, 1]], '  ')
```

in_highest_weight_crystal(La)

Return a boolean indicating if the generalized Young wall element is in the highest weight crystal cut out by the given highest weight `La`.

By Theorem 4.1 of [KS2010], a generalized Young wall Y represents a vertex in the highest weight crystal $Y(\lambda)$, with $\lambda = \Lambda_{i_1} + \Lambda_{i_2} + \cdots + \Lambda_{i_\ell}$ a dominant integral weight of level $\ell > 0$, if it satisfies the following condition. For each positive integer k, if there exists $j \in I$ such that $a_j(k) - a_{j-1}(k) > 0$, then for some $p = 1, \ldots, \ell$,

$$j + k \equiv i_p + 1 \bmod n + 1 \text{ and } a_j(k) - a_{j-1}(k) \leq \lambda(h_{i_p}),$$

where $\{h_0, h_1, \ldots, h_n\}$ is the set of simple coroots attached to $A_n^{(1)}$.

EXAMPLES:

```
sage: La = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()[1]
sage: GYW = crystals.infinity.GeneralizedYoungWalls(2)
sage: y = GYW([[],[1,0],[2,1]])
sage: y.in_highest_weight_crystal(La)
True
sage: x = GYW([[],[1],[2],[],[],[2],[],[],[2]])
sage: x.in_highest_weight_crystal(La)
False
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()[Integer(1)]
>>> GYW = crystals.infinity.GeneralizedYoungWalls(Integer(2))
>>> y = GYW([[],[Integer(1),Integer(0)],[Integer(2),Integer(1)]])
>>> y.in_highest_weight_crystal(La)
True
>>> x = GYW([[],[Integer(1)],[Integer(2)],[],[],[Integer(2)],[],[],
↪[Integer(2)]])
>>> x.in_highest_weight_crystal(La)
False
```

latex_large()

Generate LaTeX code for `self` but the output is larger.

This requires TikZ.

EXAMPLES:

```
sage: x = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
↪1,0,3,2],[],[],[2]])
sage: x.latex_large()
'\\begin{tikzpicture}[baseline=5,scale=.45] \n \\foreach \\x [count=\\s from␣
↪0] in \n{{},{1,0,3,2},{2,1},{3,2,1,0,3,2},{},{},{2}} \n{\\foreach \\y␣
↪[count=\\t from 0] in \\x {  \\node[font=\\scriptsize] at (-\\t,\\s) {$\\y$}
↪; \n \\draw (-\\t+.5,\\s+.5) to (-\\t-.5,\\s+.5); \n \\draw (-\\t+.5,\\s-.
↪5) to (-\\t-.5,\\s-.5); \n \\draw (-\\t-.5,\\s-.5) to (-\\t-.5,\\s+.5);  } \
↪n \\draw[-,thick] (.5,\\s+1) to (.5,-.5) to (-\\s-1,-.5); } \n \\end
↪{tikzpicture} \n'
```

```
>>> from sage.all import *
>>> x = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
↪Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> x.latex_large()
'\\begin{tikzpicture}[baseline=5,scale=.45] \n \\foreach \\x [count=\\s from␣
↪0] in \n{{},{1,0,3,2},{2,1},{3,2,1,0,3,2},{},{},{2}} \n{\\foreach \\y␣
↪[count=\\t from 0] in \\x {  \\node[font=\\scriptsize] at (-\\t,\\s) {$\\y$}
↪; \n \\draw (-\\t+.5,\\s+.5) to (-\\t-.5,\\s+.5); \n \\draw (-\\t+.5,\\s-.
↪5) to (-\\t-.5,\\s-.5); \n \\draw (-\\t-.5,\\s-.5) to (-\\t-.5,\\s+.5);  } \
↪n \\draw[-,thick] (.5,\\s+1) to (.5,-.5) to (-\\s-1,-.5); } \n \\end
↪{tikzpicture} \n'
```

number_of_parts()

Return the value of $\mathscr{N}$ on `self`.

In [KLRS2016], the statistic $\mathscr{N}$ was defined on elements in $\mathcal{Y}(\infty)$ which counts how many parts are in the corresponding Kostant partition. Specifically, the computation of $\mathscr{N}(Y)$ is done using the following algorithm:

- If Y has no rows whose right-most box is colored n and such that the length of this row is a multiple of $n+1$, then $\mathscr{N}(Y)$ is the total number of distinct rows in Y, not counting multiplicity.
- Otherwise, search Y for the longest row such that the right-most box is colored n and such that the total number of boxes in the row is $k(n+1)$ for some $k \geq 1$. Replace this row by $n+1$ distinct rows of

length k, reordering all rows, if necessary, so that the result is a proper wall. (Note that the resulting wall may no longer be reduced.) Repeat the search and replace process for all other rows of the above form for each $k' < k$. Then $\mathscr{N}(Y)$ is the number of distinct rows, not counting multiplicity, in the wall resulting from this process.

EXAMPLES:

```
sage: Y = crystals.infinity.GeneralizedYoungWalls(3)
sage: y = Y([[0],[],[],[],[0],[],[],[],[0]])
sage: y.number_of_parts()
1

sage: Y = crystals.infinity.GeneralizedYoungWalls(3)
sage: y = Y([[0,3,2],[1,0],[],[],[0,3],[1,0],[],[],[0]])
sage: y.number_of_parts()
4

sage: Y = crystals.infinity.GeneralizedYoungWalls(2)
sage: y = Y([[0,2,1],[1,0],[2,1,0,2,1,0,2,1,0],[],[2,1,0,2,1,0]])
sage: y.number_of_parts()
8
```

```
>>> from sage.all import *
>>> Y = crystals.infinity.GeneralizedYoungWalls(Integer(3))
>>> y = Y([[Integer(0)],[],[],[],[Integer(0)],[],[],[],[Integer(0)]])
>>> y.number_of_parts()
1

>>> Y = crystals.infinity.GeneralizedYoungWalls(Integer(3))
>>> y = Y([[Integer(0),Integer(3),Integer(2)],[Integer(1),Integer(0)],[],[],
...[Integer(0),Integer(3)],[Integer(1),Integer(0)],[],[],[Integer(0)]])
>>> y.number_of_parts()
4

>>> Y = crystals.infinity.GeneralizedYoungWalls(Integer(2))
>>> y = Y([[Integer(0),Integer(2),Integer(1)],[Integer(1),Integer(0)],
...[Integer(2),Integer(1),Integer(0),Integer(2),Integer(1),Integer(0),
...Integer(2),Integer(1),Integer(0)],[],[Integer(2),Integer(1),Integer(0),
...Integer(2),Integer(1),Integer(0)]])
>>> y.number_of_parts()
8
```

phi(i)

Return the value $\varepsilon_i(Y) + \langle h_i, \mathrm{wt}(Y) \rangle$, where h_i is the i-th simple coroot and Y is `self`.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(3)([[0],[1,0,3,2],[2,1],[3,
...2,1,0,3,2],[0],[],[2]])
sage: y.phi(1)
3
sage: y.phi(2)
-1
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[Integer(0)],
↪[Integer(1),Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],
↪[Integer(3),Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],
↪[Integer(0)],[],[Integer(2)]])
>>> y.phi(Integer(1))
3
>>> y.phi(Integer(2))
-1
```

pp()

Pretty print `self`.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(2)([[0,2,1],[1,0,2,1,0],[],
↪[0],[1,0,2],[],[],[1]])
sage: y.pp()
        1|
         |
         |
    2|0|1|
        0|
         |
0|1|2|0|1|
    1|2|0|
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(2))([[Integer(0),
↪Integer(2),Integer(1)],[Integer(1),Integer(0),Integer(2),Integer(1),
↪Integer(0)],[],[Integer(0)],[Integer(1),Integer(0),Integer(2)],[],[],
↪[Integer(1)]])
>>> y.pp()
        1|
         |
         |
    2|0|1|
        0|
         |
0|1|2|0|1|
    1|2|0|
```

raw_signature(i)

Return the sequence from $\{+,-\}$ obtained from all i-admissible slots and removable i-boxes without canceling any $(+,-)$-pairs. The result also notes the row and column of the sign.

EXAMPLES:

```
sage: x = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
↪1,0,3,2],[],[],[2]])
sage: x.raw_signature(2)
[['-', 3, 6], ['-', 1, 4], ['-', 6, 1]]
```

```
>>> from sage.all import *
>>> x = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
↪Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> x.raw_signature(Integer(2))
[['-', 3, 6], ['-', 1, 4], ['-', 6, 1]]
```

signature(i)

Return the i-signature of `self`.

The signature is obtained by reading `self` in columns bottom to top starting from the left. Then add a $-$ at every i-box which may be removed from `self` and still obtain a legal generalized Young wall, and add a $+$ at each site for which an i-box may be added and still obtain a valid generalized Young wall. Then successively cancel any $(+,-)$-pair to obtain a sequence of the form $-\cdots-+\cdots+$. This resulting sequence is the output.

EXAMPLES:

```
sage: y = crystals.infinity.GeneralizedYoungWalls(2)([[0],[1,0],[2,1,0,2],[],
↪[1]])
sage: y.signature(1)
''

sage: x = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
↪1,0,3,2],[],[],[2]])
sage: x.signature(2)
'---'
```

```
>>> from sage.all import *
>>> y = crystals.infinity.GeneralizedYoungWalls(Integer(2))([[Integer(0)],
↪[Integer(1),Integer(0)],[Integer(2),Integer(1),Integer(0),Integer(2)],[],
↪[Integer(1)]])
>>> y.signature(Integer(1))
''

>>> x = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
↪Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
↪Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> x.signature(Integer(2))
'---'
```

sum_of_weighted_row_lengths()

Return the value of $\mathscr{M}$ on `self`.

Let $\mathcal{Y}_0 \subset \mathcal{Y}(\infty)$ be the set of generalized Young walls which have no rows whose right-most box is colored n. For $Y \in \mathcal{Y}_0$,

$$\mathscr{M}(Y) = \sum_{i=1}^{n} (i+1) M_i(Y),$$

where $M_i(Y)$ is the number of nonempty rows in Y whose right-most box is colored $i-1$.

EXAMPLES:

```
sage: Y = crystals.infinity.GeneralizedYoungWalls(2)
sage: y = Y([[0,2,1,0,2],[1,0,2],[],[0,2],[1,0],[],[0],[1,0]])
sage: y.sum_of_weighted_row_lengths()
15
```

```
>>> from sage.all import *
>>> Y = crystals.infinity.GeneralizedYoungWalls(Integer(2))
>>> y = Y([[Integer(0),Integer(2),Integer(1),Integer(0),Integer(2)],
...[Integer(1),Integer(0),Integer(2)],[],[Integer(0),Integer(2)],[Integer(1),
...Integer(0)],[],[Integer(0)],[Integer(1),Integer(0)]])
>>> y.sum_of_weighted_row_lengths()
15
```

weight(*root_lattice=False*)

Return the weight of `self`.

INPUT:

- `root_lattice` – boolean determining whether weight should appear in root lattice or not in extended affine weight lattice

EXAMPLES:

```
sage: x = crystals.infinity.GeneralizedYoungWalls(3)([[],[1,0,3,2],[2,1],[3,2,
...1,0,3,2],[],[],[2]])
sage: x.weight()
2*Lambda[0] + Lambda[1] - 4*Lambda[2] + Lambda[3] - 2*delta
sage: x.weight(root_lattice=True)
-2*alpha[0] - 3*alpha[1] - 5*alpha[2] - 3*alpha[3]
```

```
>>> from sage.all import *
>>> x = crystals.infinity.GeneralizedYoungWalls(Integer(3))([[],[Integer(1),
...Integer(0),Integer(3),Integer(2)],[Integer(2),Integer(1)],[Integer(3),
...Integer(2),Integer(1),Integer(0),Integer(3),Integer(2)],[],[],[Integer(2)]])
>>> x.weight()
2*Lambda[0] + Lambda[1] - 4*Lambda[2] + Lambda[3] - 2*delta
>>> x.weight(root_lattice=True)
-2*alpha[0] - 3*alpha[1] - 5*alpha[2] - 3*alpha[3]
```

class sage.combinat.crystals.generalized_young_walls.**InfinityCrystalOfGeneralizedYoungWalls**(*n*, *category*)

Bases: `UniqueRepresentation`, `Parent`

The crystal $\mathcal{Y}(\infty)$ of generalized Young walls of type $A_n^{(1)}$ as defined in [KS2010].

A generalized Young wall is a collection of boxes stacked on a fixed board, such that color of the box at the site located in the j-th row from the bottom and the i-th column from the right is $j - 1 \bmod n + 1$. There are several growth conditions on elements in $Y \in \mathcal{Y}(\infty)$:

- Walls grow in rows from right to left. That is, for every box $y \in Y$ that is not in the rightmost column, there must be a box immediately to the right of y.
- For all $p > q$ such that $p - q \equiv 0 \bmod n + 1$, the p-th row has most as many boxes as the q-th row.

- There does not exist a column in the wall such that if one i-colored box, for every $i = 0, 1, \ldots, n$, is removed from that column, then the result satisfies the above conditions.

There is a crystal structure on $\mathcal{Y}(\infty)$ defined as follows. Define maps

$$e_i,\ f_i \colon \mathcal{Y}(\infty) \longrightarrow \mathcal{Y}(\infty) \sqcup \{0\}, \qquad \varepsilon_i,\ \varphi_i \colon \mathcal{Y}(\infty) \longrightarrow \mathbf{Z}, \qquad \mathrm{wt} \colon \mathcal{Y}(\infty) \longrightarrow \bigoplus_{i=0}^{n} \mathbf{Z}\Lambda_i \oplus \mathbf{Z}\delta,$$

by

$$\mathrm{wt}(Y) = -\sum_{i=0}^{n} m_i(Y)\alpha_i,$$

where $m_i(Y)$ is the number of i-boxes in Y, $\varepsilon_i(Y)$ is the number of $-$ in the i-signature of Y, and

$$\varphi_i(Y) = \varepsilon_i(Y) + \langle h_i, \mathrm{wt}(Y) \rangle.$$

See *GeneralizedYoungWall.e()*, *GeneralizedYoungWall.f()*, and *GeneralizedYoungWall.signature()* for more about e_i, f_i, and i-signatures.

INPUT:

- `n` – type $A_n^{(1)}$

EXAMPLES:

```
sage: Yinf = crystals.infinity.GeneralizedYoungWalls(3)
sage: y = Yinf([[0],[1,0,3,2],[],[3,2,1],[0],[1,0]])
sage: y.pp()
    0|1|
      0|
  1|2|3|
       |
2|3|0|1|
      0|
sage: y.weight(root_lattice=True)
-4*alpha[0] - 3*alpha[1] - 2*alpha[2] - 2*alpha[3]
sage: y.f(0)
[[0], [1, 0, 3, 2], [], [3, 2, 1], [0], [1, 0], [], [], [0]]
sage: y.e(0).pp()
    0|1|
       |
  1|2|3|
       |
2|3|0|1|
      0|
```

```
>>> from sage.all import *
>>> Yinf = crystals.infinity.GeneralizedYoungWalls(Integer(3))
>>> y = Yinf([[Integer(0)],[Integer(1),Integer(0),Integer(3),Integer(2)],[],
↪[Integer(3),Integer(2),Integer(1)],[Integer(0)],[Integer(1),Integer(0)]])
>>> y.pp()
    0|1|
      0|
  1|2|3|
```

(continues on next page)

(continued from previous page)

```
       |
2|3|0|1|
      0|
>>> y.weight(root_lattice=True)
-4*alpha[0] - 3*alpha[1] - 2*alpha[2] - 2*alpha[3]
>>> y.f(Integer(0))
[[0], [1, 0, 3, 2], [], [3, 2, 1], [0], [1, 0], [], [], [0]]
>>> y.e(Integer(0)).pp()
    0|1|
       |
  1|2|3|
       |
2|3|0|1|
      0|
```

To display the crystal down to depth 3:

```
sage: S = Yinf.subcrystal(max_depth=3)
sage: G = Yinf.digraph(subset=S) # long time
sage: view(G) # not tested
```

```
>>> from sage.all import *
>>> S = Yinf.subcrystal(max_depth=Integer(3))
>>> G = Yinf.digraph(subset=S) # long time
>>> view(G) # not tested
```

Element

alias of *GeneralizedYoungWall*

Crystals of letters

class sage.combinat.crystals.letters.**BKKLetter**

Bases: *Letter*

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A', [2, 1]])
sage: c = C(-2)
sage: c.e(-2)
-3
sage: c = C(1)
sage: c.e(0)
-1
sage: c = C(2)
sage: c.e(1)
1
sage: c.e(-2)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(2), Integer(1)]])
>>> c = C(-Integer(2))
>>> c.e(-Integer(2))
-3
>>> c = C(Integer(1))
>>> c.e(Integer(0))
-1
>>> c = C(Integer(2))
>>> c.e(Integer(1))
1
>>> c.e(-Integer(2))
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A', [2, 1]])
sage: c = C.an_element()
sage: c.f(-2)
-2
sage: c = C(-1)
sage: c.f(0)
1
sage: c = C(1)
sage: c.f(1)
2
sage: c.f(-2)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(2), Integer(1)]])
>>> c = C.an_element()
>>> c.f(-Integer(2))
-2
>>> c = C(-Integer(1))
>>> c.f(Integer(0))
1
>>> c = C(Integer(1))
>>> c.f(Integer(1))
2
>>> c.f(-Integer(2))
```

weight()

Return weight of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A', [2, 1]])
sage: c = C(-1)
sage: c.weight()
(0, 0, 1, 0, 0)
sage: c = C(2)
```

(continues on next page)

(continued from previous page)

```
sage: c.weight()
(0, 0, 0, 0, 1)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(2), Integer(1)]])
>>> c = C(-Integer(1))
>>> c.weight()
(0, 0, 1, 0, 0)
>>> c = C(Integer(2))
>>> c.weight()
(0, 0, 0, 0, 1)
```

class sage.combinat.crystals.letters.**ClassicalCrystalOfLetters**(*cartan_type*, *element_class*, *element_print_style=None*, *dual=None*)

Bases: UniqueRepresentation, Parent

A generic class for classical crystals of letters.

All classical crystals of letters should be instances of this class or of subclasses. To define a new crystal of letters, one only needs to implement a class for the elements (which subclasses *Letter*), with appropriate e_i and f_i operations. If the module generator is not 1, one also needs to define the subclass *ClassicalCrystalOfLetters* for the crystal itself.

The basic assumption is that crystals of letters are small, but used intensively as building blocks. Therefore, we explicitly build in memory the list of all elements, the crystal graph and its transitive closure, so as to make the following operations constant time: `list`, `richcmp`, (todo: `phi`, `epsilon`, `e`, and `f` with caching)

list()

Return a list of the elements of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: C.list()
[1, 2, 3, 4, 5, 6]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> C.list()
[1, 2, 3, 4, 5, 6]
```

lt_elements(*x*, *y*)

Return `True` if and only if there is a path from `x` to `y` in the crystal graph, when `x` is not equal to `y`.

Because the crystal graph is classical, it is a directed acyclic graph which can be interpreted as a poset. This function implements the comparison function of this poset.

EXAMPLES:

```
sage: C = crystals.Letters(['A', 5])
sage: x = C(1)
sage: y = C(2)
sage: C.lt_elements(x,y)
```

(continues on next page)

(continued from previous page)

```
True
sage: C.lt_elements(y,x)
False
sage: C.lt_elements(x,x)
False
sage: C = crystals.Letters(['D', 4])
sage: C.lt_elements(C(4),C(-4))
False
sage: C.lt_elements(C(-4),C(4))
False
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', Integer(5)])
>>> x = C(Integer(1))
>>> y = C(Integer(2))
>>> C.lt_elements(x,y)
True
>>> C.lt_elements(y,x)
False
>>> C.lt_elements(x,x)
False
>>> C = crystals.Letters(['D', Integer(4)])
>>> C.lt_elements(C(Integer(4)),C(-Integer(4)))
False
>>> C.lt_elements(C(-Integer(4)),C(Integer(4)))
False
```

class sage.combinat.crystals.letters.**ClassicalCrystalOfLettersWrapped**(*cartan_type*)

Bases: *ClassicalCrystalOfLetters*

Crystal of letters by wrapping another crystal.

This is used for a crystal of letters of type E_8 and F_4.

This class follows the same output as the other crystal of letters, where b is represented by the "letter" with $\varphi_i(b)$ (resp., ε_i) number of i's (resp., $-i$'s or $\overline{i}$'s). However, this uses an auxiliary crystal to construct these letters to avoid hardcoding the crystal elements and the corresponding edges; in particular, the 248 nodes of E_8.

class sage.combinat.crystals.letters.**CrystalOfBKKLetters**(*ct*, *dual*)

Bases: *ClassicalCrystalOfLetters*

Crystal of letters for Benkart-Kang-Kashiwara supercrystals.

This implements the $\mathfrak{gl}(m|n)$ crystal of Benkart, Kang and Kashiwara [BKK2000].

EXAMPLES:

```
sage: C = crystals.Letters(['A', [1, 1]]); C
The crystal of letters for type ['A', [1, 1]]

sage: C = crystals.Letters(['A', [2,4]], dual=True); C
The crystal of letters for type ['A', [2, 4]] (dual)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(1), Integer(1)]]); C
```

(continues on next page)

(continued from previous page)

```
The crystal of letters for type ['A', [1, 1]]

>>> C = crystals.Letters(['A', [Integer(2),Integer(4)]], dual=True); C
The crystal of letters for type ['A', [2, 4]] (dual)
```

Element

alias of *BKKLetter*

sage.combinat.crystals.letters.**CrystalOfLetters**(*cartan_type*, *element_print_style=None*, *dual=None*)

Return the crystal of letters of the given type.

For classical types, this is a combinatorial model for the crystal with highest weight Λ_1 (the first fundamental weight).

Any irreducible classical crystal appears as the irreducible component of the tensor product of several copies of this crystal (plus possibly one copy of the spin crystal, see *CrystalOfSpins*). See [KN1994]. Elements of this irreducible component have a fixed shape, and can be fit inside a tableau shape. Otherwise said, any irreducible classical crystal is isomorphic to a crystal of tableaux with cells filled by elements of the crystal of letters (possibly tensored with the crystal of spins).

We also have the crystal of fundamental representation of the general linear Lie superalgebra, which are used as letters inside of tableaux following [BKK2000]. Similarly, all of these crystals appear as a subcrystal of a sufficiently large tensor power of this crystal.

INPUT:

- `T` – a Cartan type

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: C.list()
[1, 2, 3, 4, 5, 6]
sage: C.cartan_type()
['A', 5]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> C.list()
[1, 2, 3, 4, 5, 6]
>>> C.cartan_type()
['A', 5]
```

For type E_6, one can also specify how elements are printed. This option is usually set to None and the default representation is used. If one chooses the option 'compact', the elements are printed in the more compact convention with 27 letters `+abcdefghijklmnopqrstuvwxyz` and the 27 letters `-ABCDEFGHIJKLMNOPQRSTUVWXYZ` for the dual crystal.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6], element_print_style = 'compact')
sage: C
The crystal of letters for type ['E', 6]
sage: C.list()
[+, a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p, q, r, s, t, u, v, w, x, y, z]
sage: C = crystals.Letters(['E',6], element_print_style = 'compact', dual = True)
```

(continues on next page)

(continued from previous page)

```
sage: C
The crystal of letters for type ['E', 6] (dual)
sage: C.list()
[-, A, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P, Q, R, S, T, U, V, W, X, Y, Z]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)], element_print_style = 'compact')
>>> C
The crystal of letters for type ['E', 6]
>>> C.list()
[+, a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p, q, r, s, t, u, v, w, x, y, z]
>>> C = crystals.Letters(['E',Integer(6)], element_print_style = 'compact', dual␣
↪= True)
>>> C
The crystal of letters for type ['E', 6] (dual)
>>> C.list()
[-, A, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P, Q, R, S, T, U, V, W, X, Y, Z]
```

class sage.combinat.crystals.letters.**CrystalOfQueerLetters**(*ct*)

Bases: *ClassicalCrystalOfLetters*

Queer crystal of letters elements.

The index set is of the form $\{-n, \ldots, -1, 1, \ldots, n\}$. For $1 < i \leq n$, the operators e_{-i} and f_{-i} are defined as

$$f_{-i} = s_{w_i^{-1}} f_{-1} s_{w_i}, \quad e_{-i} = s_{w_i^{-1}} e_{-1} s_{w_i},$$

where $w_i = s_2 \cdots s_i s_1 \cdots s_{i-1}$ and s_i is the reflection along the i-string in the crystal. See [GJK+2014].

Element

alias of *QueerLetter_element*

index_set()

Return index set of `self`.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q',3])
sage: Q.index_set()
(1, 2, -2, -1)
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q',Integer(3)])
>>> Q.index_set()
(1, 2, -2, -1)
```

class sage.combinat.crystals.letters.**Crystal_of_letters_type_A_element**

Bases: *Letter*

Type A crystal of letters elements.

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',4])
sage: [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1), (3, 2, 2), (4, 3, 3), (5, 4, 4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(4)])
>>> [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1), (3, 2, 2), (4, 3, 3), (5, 4, 4)]
```

epsilon(i)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',4])
sage: [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != 0]
[(2, 1), (3, 2), (4, 3), (5, 4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(4)])
>>> [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != Integer(0)]
[(2, 1), (3, 2), (4, 3), (5, 4)]
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',4])
sage: [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2), (2, 2, 3), (3, 3, 4), (4, 4, 5)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(4)])
>>> [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2), (2, 2, 3), (3, 3, 4), (4, 4, 5)]
```

phi(i)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',4])
sage: [(c,i) for i in C.index_set() for c in C if c.phi(i) != 0]
[(1, 1), (2, 2), (3, 3), (4, 4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(4)])
>>> [(c,i) for i in C.index_set() for c in C if c.phi(i) != Integer(0)]
[(1, 1), (2, 2), (3, 3), (4, 4)]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['A',3])]
[(1, 0, 0, 0), (0, 1, 0, 0), (0, 0, 1, 0), (0, 0, 0, 1)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.Letters(['A',Integer(3)])]
[(1, 0, 0, 0), (0, 1, 0, 0), (0, 0, 1, 0), (0, 0, 0, 1)]
```

class sage.combinat.crystals.letters.**Crystal_of_letters_type_B_element**

Bases: *Letter*

Type B crystal of letters elements.

e(i)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['B',4])
sage: [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3),
 (4, 3, 3),
 (-3, 3, -4),
 (0, 4, 4),
 (-4, 4, 0)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['B',Integer(4)])
>>> [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3),
 (4, 3, 3),
 (-3, 3, -4),
 (0, 4, 4),
 (-4, 4, 0)]
```

epsilon(i)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['B',3])
sage: [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != 0]
[(2, 1), (-1, 1), (3, 2), (-2, 2), (0, 3), (-3, 3)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['B',Integer(3)])
>>> [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != Integer(0)]
[(2, 1), (-1, 1), (3, 2), (-2, 2), (0, 3), (-3, 3)]
```

f(*i*)

Return the actions of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['B',4])
sage: [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2),
 (-2, 1, -1),
 (2, 2, 3),
 (-3, 2, -2),
 (3, 3, 4),
 (-4, 3, -3),
 (4, 4, 0),
 (0, 4, -4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['B',Integer(4)])
>>> [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2),
 (-2, 1, -1),
 (2, 2, 3),
 (-3, 2, -2),
 (3, 3, 4),
 (-4, 3, -3),
 (4, 4, 0),
 (0, 4, -4)]
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['B',3])
sage: [(c,i) for i in C.index_set() for c in C if c.phi(i) != 0]
[(1, 1), (-2, 1), (2, 2), (-3, 2), (3, 3), (0, 3)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['B',Integer(3)])
>>> [(c,i) for i in C.index_set() for c in C if c.phi(i) != Integer(0)]
[(1, 1), (-2, 1), (2, 2), (-3, 2), (3, 3), (0, 3)]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['B',3])]
[(1, 0, 0),
 (0, 1, 0),
 (0, 0, 1),
 (0, 0, 0),
 (0, 0, -1),
 (0, -1, 0),
 (-1, 0, 0)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.Letters(['B',Integer(3)])]
[(1, 0, 0),
 (0, 1, 0),
 (0, 0, 1),
 (0, 0, 0),
 (0, 0, -1),
 (0, -1, 0),
 (-1, 0, 0)]
```

class sage.combinat.crystals.letters.**Crystal_of_letters_type_C_element**

Bases: *Letter*

Type C crystal of letters elements.

e(i)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['C',4])
sage: [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3),
 (4, 3, 3),
 (-3, 3, -4),
 (-4, 4, 4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C',Integer(4)])
>>> [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3),
 (4, 3, 3),
 (-3, 3, -4),
 (-4, 4, 4)]
```

epsilon(i)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['C',3])
sage: [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != 0]
[(2, 1), (-1, 1), (3, 2), (-2, 2), (-3, 3)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C',Integer(3)])
>>> [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != Integer(0)]
[(2, 1), (-1, 1), (3, 2), (-2, 2), (-3, 3)]
```

f(*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['C',4])
sage: [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2), (-2, 1, -1), (2, 2, 3),
 (-3, 2, -2), (3, 3, 4), (-4, 3, -3), (4, 4, -4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C',Integer(4)])
>>> [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2), (-2, 1, -1), (2, 2, 3),
 (-3, 2, -2), (3, 3, 4), (-4, 3, -3), (4, 4, -4)]
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['C',3])
sage: [(c,i) for i in C.index_set() for c in C if c.phi(i) != 0]
[(1, 1), (-2, 1), (2, 2), (-3, 2), (3, 3)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C',Integer(3)])
>>> [(c,i) for i in C.index_set() for c in C if c.phi(i) != Integer(0)]
[(1, 1), (-2, 1), (2, 2), (-3, 2), (3, 3)]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['C',3])]
[(1, 0, 0), (0, 1, 0), (0, 0, 1), (0, 0, -1), (0, -1, 0), (-1, 0, 0)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.Letters(['C',Integer(3)])]
[(1, 0, 0), (0, 1, 0), (0, 0, 1), (0, 0, -1), (0, -1, 0), (-1, 0, 0)]
```

class sage.combinat.crystals.letters.**Crystal_of_letters_type_D_element**

Bases: *Letter*

Type D crystal of letters elements.

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['D',5])
sage: [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
```

(continues on next page)

(continued from previous page)

```
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3),
 (4, 3, 3),
 (-3, 3, -4),
 (5, 4, 4),
 (-4, 4, -5),
 (-5, 5, 4),
 (-4, 5, 5)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['D',Integer(5)])
>>> [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3),
 (4, 3, 3),
 (-3, 3, -4),
 (5, 4, 4),
 (-4, 4, -5),
 (-5, 5, 4),
 (-4, 5, 5)]
```

epsilon(i)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['D',4])
sage: [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != 0]
[(2, 1), (-1, 1), (3, 2), (-2, 2), (4, 3), (-3, 3), (-4, 4), (-3, 4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['D',Integer(4)])
>>> [(c,i) for i in C.index_set() for c in C if c.epsilon(i) != Integer(0)]
[(2, 1), (-1, 1), (3, 2), (-2, 2), (4, 3), (-3, 3), (-4, 4), (-3, 4)]
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['D',5])
sage: [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2),
 (-2, 1, -1),
 (2, 2, 3),
 (-3, 2, -2),
 (3, 3, 4),
 (-4, 3, -3),
 (4, 4, 5),
```

(continues on next page)

(continued from previous page)

```
 (-5, 4, -4),
 (4, 5, -5),
 (5, 5, -4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['D',Integer(5)])
>>> [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2),
 (-2, 1, -1),
 (2, 2, 3),
 (-3, 2, -2),
 (3, 3, 4),
 (-4, 3, -3),
 (4, 4, 5),
 (-5, 4, -4),
 (4, 5, -5),
 (5, 5, -4)]
```

phi(i)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['D',4])
sage: [(c,i) for i in C.index_set() for c in C if c.phi(i) != 0]
[(1, 1), (-2, 1), (2, 2), (-3, 2), (3, 3), (-4, 3), (3, 4), (4, 4)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['D',Integer(4)])
>>> [(c,i) for i in C.index_set() for c in C if c.phi(i) != Integer(0)]
[(1, 1), (-2, 1), (2, 2), (-3, 2), (3, 3), (-4, 3), (3, 4), (4, 4)]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['D',4])]
[(1, 0, 0, 0),
 (0, 1, 0, 0),
 (0, 0, 1, 0),
 (0, 0, 0, 1),
 (0, 0, 0, -1),
 (0, 0, -1, 0),
 (0, -1, 0, 0),
 (-1, 0, 0, 0)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.Letters(['D',Integer(4)])]
[(1, 0, 0, 0),
 (0, 1, 0, 0),
 (0, 0, 1, 0),
```

(continues on next page)

(continued from previous page)

```
 (0, 0, 0, 1),
 (0, 0, 0, -1),
 (0, 0, -1, 0),
 (0, -1, 0, 0),
 (-1, 0, 0, 0)]
```

class sage.combinat.crystals.letters.**Crystal_of_letters_type_E6_element**

Bases: *LetterTuple*

Type E_6 crystal of letters elements. This crystal corresponds to the highest weight crystal $B(\Lambda_1)$.

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6])
sage: C((-1,3)).e(1)
(1,)
sage: C((-2,-3,4)).e(2)
(-3, 2)
sage: C((1,)).e(1)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)])
>>> C((-Integer(1),Integer(3))).e(Integer(1))
(1,)
>>> C((-Integer(2),-Integer(3),Integer(4))).e(Integer(2))
(-3, 2)
>>> C((Integer(1),)).e(Integer(1))
```

f(*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6])
sage: C((1,)).f(1)
(-1, 3)
sage: C((-6,)).f(1)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)])
>>> C((Integer(1),)).f(Integer(1))
(-1, 3)
>>> C((-Integer(6),)).f(Integer(1))
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['E',6])]
[(0, 0, 0, 0, 0, -2/3, -2/3, 2/3),
```

(continues on next page)

(continued from previous page)

```

```

class sage.combinat.crystals.letters.**Crystal_of_letters_type_E6_element_dual**

Bases: *LetterTuple*

Type E_6 crystal of letters elements. This crystal corresponds to the highest weight crystal $B(\Lambda_6)$. This crystal is dual to $B(\Lambda_1)$ of type E_6.

e(i)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6], dual = True)
sage: C((-1,)).e(1)
(1, -3)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)], dual = True)
>>> C((-Integer(1),)).e(Integer(1))
(1, -3)
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6], dual = True)
sage: C((6,)).f(6)
(5, -6)
sage: C((6,)).f(1)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)], dual = True)
>>> C((Integer(6),)).f(Integer(6))
(5, -6)
>>> C((Integer(6),)).f(Integer(1))
```

lift()

Lift an element of `self` to the crystal of letters `crystals.Letters(['E',6])` by taking its inverse weight.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6], dual = True)
sage: b = C.module_generators[0]
sage: b.lift()
(-6,)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)], dual = True)
```

(continues on next page)

(continued from previous page)

```
>>> b = C.module_generators[Integer(0)]
>>> b.lift()
(-6,)
```

retract(*p*)

Retract element `p`, which is an element in `crystals.Letters(['E',6])` to an element in `crystals.Letters(['E',6], dual=True)` by taking its inverse weight.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6])
sage: Cd = crystals.Letters(['E',6], dual = True)
sage: b = Cd.module_generators[0]
sage: p = C((-1,3))
sage: b.retract(p)
(1, -3)
sage: b.retract(None)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)])
>>> Cd = crystals.Letters(['E',Integer(6)], dual = True)
>>> b = Cd.module_generators[Integer(0)]
>>> p = C((-Integer(1),Integer(3)))
>>> b.retract(p)
(1, -3)
>>> b.retract(None)
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6], dual = True)
sage: b=C.module_generators[0]
sage: b.weight()
(0, 0, 0, 0, 1, -1/3, -1/3, 1/3)
sage: [v.weight() for v in C]
[(0, 0, 0, 0, 1, -1/3, -1/3, 1/3),
(0, 0, 0, 1, 0, -1/3, -1/3, 1/3),
(0, 0, 1, 0, 0, -1/3, -1/3, 1/3),
(0, 1, 0, 0, 0, -1/3, -1/3, 1/3),
(-1, 0, 0, 0, 0, -1/3, -1/3, 1/3),
(1, 0, 0, 0, 0, -1/3, -1/3, 1/3),
(1/2, 1/2, 1/2, 1/2, 1/2, 1/6, 1/6, -1/6),
(0, -1, 0, 0, 0, -1/3, -1/3, 1/3),
(-1/2, -1/2, 1/2, 1/2, 1/2, 1/6, 1/6, -1/6),
(0, 0, -1, 0, 0, -1/3, -1/3, 1/3),

class sage.combinat.crystals.letters.**Crystal_of_letters_type_E7_element**

Bases: *LetterTuple*

Type E_7 crystal of letters elements. This crystal corresponds to the highest weight crystal $B(\Lambda_7)$.

e(i)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E',7])
sage: C((7,)).e(7)
sage: C((-7,6)).e(7)
(7,)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(7)])
>>> C((Integer(7),)).e(Integer(7))
>>> C((-Integer(7),Integer(6))).e(Integer(7))
(7,)
```

f(*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E',7])
sage: C((-7,)).f(7)
sage: C((7,)).f(7)
(-7, 6)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(7)])
>>> C((-Integer(7),)).f(Integer(7))
>>> C((Integer(7),)).f(Integer(7))
(-7, 6)
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['E',7])]
[(0, 0, 0, 0, 0, 1, -1/2, 1/2), (0, 0, 0, 0, 1, 0, -1/2, 1/2), (0, 0, 0,
1, 0, 0, -1/2, 1/2), (0, 0, 1, 0, 0, 0, -1/2, 1/2), (0, 1, 0, 0, 0, 0,
-1/2, 1/2), (-1, 0, 0, 0, 0, 0, -1/2, 1/2), (1, 0, 0, 0, 0, 0, -1/2,

```

class sage.combinat.crystals.letters.**Crystal_of_letters_type_G_element**

Bases: *Letter*

Type G_2 crystal of letters elements.

e(i)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['G',2])
sage: [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
 (0, 1, 3),
 (-3, 1, 0),
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['G',Integer(2)])
>>> [(c,i,c.e(i)) for i in C.index_set() for c in C if c.e(i) is not None]
[(2, 1, 1),
 (0, 1, 3),
 (-3, 1, 0),
 (-1, 1, -2),
 (3, 2, 2),
 (-2, 2, -3)]
```

epsilon(i)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['G',2])
sage: [(c,i,c.epsilon(i)) for i in C.index_set() for c in C if c.epsilon(i) !
↪= 0]
[(2, 1, 1), (0, 1, 1), (-3, 1, 2), (-1, 1, 1), (3, 2, 1), (-2, 2, 1)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['G',Integer(2)])
>>> [(c,i,c.epsilon(i)) for i in C.index_set() for c in C if c.epsilon(i) !=␣
↪Integer(0)]
[(2, 1, 1), (0, 1, 1), (-3, 1, 2), (-1, 1, 1), (3, 2, 1), (-2, 2, 1)]
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['G',2])
sage: [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2),
 (3, 1, 0),
 (0, 1, -3),
 (-2, 1, -1),
 (2, 2, 3),
 (-3, 2, -2)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['G',Integer(2)])
>>> [(c,i,c.f(i)) for i in C.index_set() for c in C if c.f(i) is not None]
[(1, 1, 2),
```

(continues on next page)

(continued from previous page)

```
 (3, 1, 0),
 (0, 1, -3),
 (-2, 1, -1),
 (2, 2, 3),
 (-3, 2, -2)]
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['G',2])
sage: [(c,i,c.phi(i)) for i in C.index_set() for c in C if c.phi(i) != 0]
[(1, 1, 1), (3, 1, 2), (0, 1, 1), (-2, 1, 1), (2, 2, 1), (-3, 2, 1)]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['G',Integer(2)])
>>> [(c,i,c.phi(i)) for i in C.index_set() for c in C if c.phi(i) !=␣
↪Integer(0)]
[(1, 1, 1), (3, 1, 2), (0, 1, 1), (-2, 1, 1), (2, 2, 1), (-3, 2, 1)]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['G',2])]
[(1, 0, -1), (1, -1, 0), (0, 1, -1), (0, 0, 0), (0, -1, 1), (-1, 1, 0), (-1,␣
↪0, 1)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.Letters(['G',Integer(2)])]
[(1, 0, -1), (1, -1, 0), (0, 1, -1), (0, 0, 0), (0, -1, 1), (-1, 1, 0), (-1,␣
↪0, 1)]
```

class sage.combinat.crystals.letters.**EmptyLetter**

Bases: `Element`

The affine letter $\emptyset$ thought of as a classical crystal letter in classical type B_n and C_n.

Warning

This is not a classical letter.

Used in the rigged configuration bijections.

e(*i*)

Return e_i of `self` which is `None`.

EXAMPLES:

```
sage: C = crystals.Letters(['C', 3])
sage: C('E').e(1)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C', Integer(3)])
>>> C('E').e(Integer(1))
```

epsilon(i)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['C', 3])
sage: C('E').epsilon(1)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C', Integer(3)])
>>> C('E').epsilon(Integer(1))
0
```

f(i)

Return f_i of `self` which is `None`.

EXAMPLES:

```
sage: C = crystals.Letters(['C', 3])
sage: C('E').f(1)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C', Integer(3)])
>>> C('E').f(Integer(1))
```

phi(i)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['C', 3])
sage: C('E').phi(1)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C', Integer(3)])
>>> C('E').phi(Integer(1))
0
```

value

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['C', 3])
sage: C('E').weight()
(0, 0, 0)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['C', Integer(3)])
>>> C('E').weight()
(0, 0, 0)
```

class sage.combinat.crystals.letters.**Letter**

Bases: Element

A class for letters.

Like ElementWrapper, plus delegates __lt__ (comparison) to the parent.

EXAMPLES:

```
sage: from sage.combinat.crystals.letters import Letter
sage: a = Letter(ZZ, 1)

value

class sage.combinat.crystals.letters.**LetterTuple**

Bases: Element

Abstract class for type E letters.

epsilon(i)

Return ε_i of self.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6])
sage: C((-6,)).epsilon(1)
0
sage: C((-6,)).epsilon(6)
1
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)])
>>> C((-Integer(6),)).epsilon(Integer(1))
0
>>> C((-Integer(6),)).epsilon(Integer(6))
1
```

phi(i)

Return φ_i of self.

EXAMPLES:

```
sage: C = crystals.Letters(['E',6])
sage: C((1,)).phi(1)
1
sage: C((1,)).phi(6)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E',Integer(6)])
```

(continues on next page)

(continued from previous page)

```
>>> C((Integer(1),)).phi(Integer(1))
1
>>> C((Integer(1),)).phi(Integer(6))
0
```

value

class sage.combinat.crystals.letters.**LetterWrapped**

Bases: Element

Element which uses another crystal implementation and converts those elements to a tuple with $\pm i$.

e(i)

Return e_i of self.

EXAMPLES:

```
sage: C = crystals.Letters(['E', 8])
sage: C((-8,)).e(1)
sage: C((-8,)).e(8)
(-7, 8)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E', Integer(8)])
>>> C((-Integer(8),)).e(Integer(1))
>>> C((-Integer(8),)).e(Integer(8))
(-7, 8)
```

epsilon(i)

Return ε_i of self.

EXAMPLES:

```
sage: C = crystals.Letters(['E', 8])
sage: C((-8,)).epsilon(1)
0
sage: C((-8,)).epsilon(8)
1
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E', Integer(8)])
>>> C((-Integer(8),)).epsilon(Integer(1))
0
>>> C((-Integer(8),)).epsilon(Integer(8))
1
```

f(i)

Return f_i of self.

EXAMPLES:

```
sage: C = crystals.Letters(['E', 8])
sage: C((8,)).f(6)
```

(continues on next page)

(continued from previous page)

```
sage: C((8,)).f(8)
(7, -8)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E', Integer(8)])
>>> C((Integer(8),)).f(Integer(6))
>>> C((Integer(8),)).f(Integer(8))
(7, -8)
```

phi(i)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['E', 8])
sage: C((8,)).phi(8)
1
sage: C((8,)).phi(6)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['E', Integer(8)])
>>> C((Integer(8),)).phi(Integer(8))
1
>>> C((Integer(8),)).phi(Integer(6))
0
```

value

class sage.combinat.crystals.letters.**QueerLetter_element**

Bases: *Letter*

Queer supercrystal letters elements.

e(i)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q',3])
sage: [(c,i,c.e(i)) for i in Q.index_set() for c in Q if c.e(i) is not None]
[(2, 1, 1), (3, 2, 2), (3, -2, 2), (2, -1, 1)]
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q',Integer(3)])
>>> [(c,i,c.e(i)) for i in Q.index_set() for c in Q if c.e(i) is not None]
[(2, 1, 1), (3, 2, 2), (3, -2, 2), (2, -1, 1)]
```

epsilon(i)

Return ε_i of `self`.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q',3])
sage: [(c,i) for i in Q.index_set() for c in Q if c.epsilon(i) != 0]
[(2, 1), (3, 2), (3, -2), (2, -1)]
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q',Integer(3)])
>>> [(c,i) for i in Q.index_set() for c in Q if c.epsilon(i) != Integer(0)]
[(2, 1), (3, 2), (3, -2), (2, -1)]
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q',3])
sage: [(c,i,c.f(i)) for i in Q.index_set() for c in Q if c.f(i) is not None]
[(1, 1, 2), (2, 2, 3), (2, -2, 3), (1, -1, 2)]
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q',Integer(3)])
>>> [(c,i,c.f(i)) for i in Q.index_set() for c in Q if c.f(i) is not None]
[(1, 1, 2), (2, 2, 3), (2, -2, 3), (1, -1, 2)]
```

phi(i)

Return φ_i of `self`.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q',3])
sage: [(c,i) for i in Q.index_set() for c in Q if c.phi(i) != 0]
[(1, 1), (2, 2), (2, -2), (1, -1)]
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q',Integer(3)])
>>> [(c,i) for i in Q.index_set() for c in Q if c.phi(i) != Integer(0)]
[(1, 1), (2, 2), (2, -2), (1, -1)]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Letters(['Q',4])]
[(1, 0, 0, 0), (0, 1, 0, 0), (0, 0, 1, 0), (0, 0, 0, 1)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.Letters(['Q',Integer(4)])]
[(1, 0, 0, 0), (0, 1, 0, 0), (0, 0, 1, 0), (0, 0, 0, 1)]
```

Crystals of modified Nakajima monomials

Let $Y_{i,k}$, for $i \in I$ and $k \in \mathbf{Z}$, be a commuting set of variables, and let $\mathbf{1}$ be a new variable which commutes with each $Y_{i,k}$. (Here, I represents the index set of a Cartan datum.) One may endow the structure of a crystal on the set $\widehat{\mathcal{M}}$ of monomials of the form

$$M = \prod_{(i,k) \in I \times \mathbf{Z}_{\geq 0}} Y_{i,k}^{y_i(k)} \mathbf{1}.$$

Elements of $\widehat{\mathcal{M}}$ are called *modified Nakajima monomials*. We will omit the $\mathbf{1}$ from the end of a monomial if there exists at least one $y_i(k) \neq 0$. The crystal structure on this set is defined by

$$\begin{aligned}
\mathrm{wt}(M) &= \sum_{i \in I} \Big(\sum_{k \geq 0} y_i(k) \Big) \Lambda_i, \\
\varphi_i(M) &= \max\Big\{ \sum_{0 \leq j \leq k} y_i(j) : k \geq 0 \Big\}, \\
\varepsilon_i(M) &= \varphi_i(M) - \langle h_i, \mathrm{wt}(M) \rangle, \\
k_f = k_f(M) &= \min\Big\{ k \geq 0 : \varphi_i(M) = \sum_{0 \leq j \leq k} y_i(j) \Big\}, \\
k_e = k_e(M) &= \max\Big\{ k \geq 0 : \varphi_i(M) = \sum_{0 \leq j \leq k} y_i(j) \Big\},
\end{aligned}$$

where $\{h_i : i \in I\}$ and $\{\Lambda_i : i \in I\}$ are the simple coroots and fundamental weights, respectively. With a chosen set of integers $C = (c_{ij})_{i \neq j}$ such that $c_{ij} + c_{ji} = 1$, one defines

$$A_{i,k} = Y_{i,k} Y_{i,k+1} \prod_{j \neq i} Y_{j,k+c_{ji}}^{a_{ji}},$$

where (a_{ij}) is a Cartan matrix. Then

$$\begin{aligned}
e_i M &= \begin{cases} 0 & \text{if } \varepsilon_i(M) = 0, \\ A_{i,k_e} M & \text{if } \varepsilon_i(M) > 0, \end{cases} \\
f_i M &= A_{i,k_f}^{-1} M.
\end{aligned}$$

It is shown in [KKS2007] that the connected component of $\widehat{\mathcal{M}}$ containing the element $\mathbf{1}$, which we denote by $\mathcal{M}(\infty)$, is crystal isomorphic to the crystal $B(\infty)$.

Let $\widetilde{\mathcal{M}}$ be $\widehat{\mathcal{M}}$ as a set, and with crystal structure defined as on $\widehat{\mathcal{M}}$ with the exception that

$$f_i M = \begin{cases} 0 & \text{if } \varphi_i(M) = 0, \\ A_{i,k_f}^{-1} M & \text{if } \varphi_i(M) > 0. \end{cases}$$

Then Kashiwara [Ka2003] showed that the connected component in $\widetilde{\mathcal{M}}$ containing a monomial M such that $e_i M = 0$, for all $i \in I$, is crystal isomorphic to the irreducible highest weight crystal $B(\mathrm{wt}(M))$.

WARNING:

> Monomial crystals depend on the choice of positive integers $C = (c_{ij})_{i \neq j}$ satisfying the condition $c_{ij} + c_{ji} = 1$. We have chosen such integers uniformly such that $c_{ij} = 1$ if $i < j$ and $c_{ij} = 0$ if $i > j$.

AUTHORS:

- Arthur Lubovsky: initial version
- Ben Salisbury: initial version

class sage.combinat.crystals.monomial_crystals.**CrystalOfNakajimaMonomials**(ct, La, c)

Bases: *InfinityCrystalOfNakajimaMonomials*

Let $\widetilde{\mathcal{M}}$ be $\widehat{\mathcal{M}}$ as a set, and with crystal structure defined as on $\widehat{\mathcal{M}}$ with the exception that

$$f_i M = \begin{cases} 0 & \text{if } \varphi_i(M) = 0, \\ A_{i,k_f}^{-1} M & \text{if } \varphi_i(M) > 0. \end{cases}$$

Then Kashiwara [Ka2003] showed that the connected component in $\widetilde{\mathcal{M}}$ containing a monomial M such that $e_i M = 0$, for all $i \in I$, is crystal isomorphic to the irreducible highest weight crystal $B(\mathrm{wt}(M))$.

>>> M.cardinality()
+Infinity
```

class sage.combinat.crystals.monomial_crystals.**CrystalOfNakajimaMonomialsElement**(*parent*, *Y*, *A*)

Bases: *NakajimaMonomial*

Element class for *CrystalOfNakajimaMonomials*.

The f_i operators need to be modified from the version in *NakajimaMonomial* in order to create irreducible highest weight realizations. This modified f_i is defined as

$$f_i M = \begin{cases} 0 & \text{if } \varphi_i(M) = 0, \\ A_{i,k_f}^{-1} M & \text{if } \varphi_i(M) > 0. \end{cases}$$

EXAMPLES:

```
sage: La = RootSystem(['A',5,2]).weight_lattice(extended=True).fundamental_
↪weights()
sage: M = crystals.NakajimaMonomials(['A',5,2],3*La[0])
sage: m = M.module_generators[0].f(0); m
Y(0,0)^2 Y(0,1)^-1 Y(2,0)
sage: TestSuite(m).run()
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(5),Integer(2)]).weight_lattice(extended=True).
↪fundamental_weights()
>>> M = crystals.NakajimaMonomials(['A',Integer(5),Integer(2)],
↪Integer(3)*La[Integer(0)])
>>> m = M.module_generators[Integer(0)].f(Integer(0)); m
Y(0,0)^2 Y(0,1)^-1 Y(2,0)
>>> TestSuite(m).run()
```

f(*i*)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: La = RootSystem(['A',5,2]).weight_lattice(extended=True).fundamental_
↪weights()
sage: M = crystals.NakajimaMonomials(['A',5,2],3*La[0])
sage: m = M.module_generators[0]
sage: [m.f(i) for i in M.index_set()]
[Y(0,0)^2 Y(0,1)^-1 Y(2,0), None, None, None]
```

```
>>> from sage.all import *

 A(2,1)^-1 A(3,1)^-1 A(4,0)^-1 A(7,1)^-1 A(8,0)^-1,
 A(2,1)^-1 A(3,1)^-1 A(4,0)^-1 A(8,0)^-2]
>>> M.set_variables('Y')
```

weight()

Return the weight of `self` as an element of the weight lattice.

EXAMPLES:

```
sage: La = RootSystem("A2").weight_lattice().fundamental_weights()
sage: M = crystals.NakajimaMonomials("A2",La[1]+La[2])
sage: M.module_generators[0].weight()
(2, 1, 0)
```

```
>>> from sage.all import *
>>> La = RootSystem("A2").weight_lattice().fundamental_weights()
>>> M = crystals.NakajimaMonomials("A2",La[Integer(1)]+La[Integer(2)])
>>> M.module_generators[Integer(0)].weight()
(2, 1, 0)
```

class sage.combinat.crystals.monomial_crystals.**InfinityCrystalOfNakajimaMonomials**(*ct*, *c*, *category=None*)

Bases: `UniqueRepresentation`, `Parent`

Crystal $B(\infty)$ in terms of (modified) Nakajima monomials.

Let $Y_{i,k}$, for $i \in I$ and $k \in \mathbf{Z}$, be a commuting set of variables, and let $\mathbf{1}$ be a new variable which commutes with each $Y_{i,k}$. (Here, I represents the index set of a Cartan datum.) One may endow the structure of a crystal on the set $\widehat{\mathcal{M}}$ of monomials of the form

$$M = \prod_{(i,k) \in I \times \mathbf{Z}_{\geq 0}} Y_{i,k}^{y_i(k)} \mathbf{1}.$$

Elements of $\widehat{\mathcal{M}}$ are called *modified Nakajima monomials*. We will omit the $\mathbf{1}$ from the end of a monomial if there exists at least one $y_i(k) \neq 0$. The crystal structure on this set is defined by

$$\begin{aligned}
\mathrm{wt}(M) &= \sum_{i \in I} \Big(\sum_{k \geq 0} y_i(k) \Big) \Lambda_i, \\
\varphi_i(M) &= \max\Big\{ \sum_{0 \leq j \leq k} y_i(j) : k \geq 0 \Big\}, \\
\varepsilon_i(M) &= \varphi_i(M) - \langle h_i, \mathrm{wt}(M) \rangle, \\
k_f = k_f(M) &= \min\Big\{ k \geq 0 : \varphi_i(M) = \sum_{0 \leq j \leq k} y_i(j) \Big\}, \\
k_e = k_e(M) &= \max\Big\{ k \geq 0 : \varphi_i(M) = \sum_{0 \leq j \leq k} y_i(j) \Big\},
\end{aligned}$$

where $\{h_i : i \in I\}$ and $\{\Lambda_i : i \in I\}$ are the simple coroots and fundamental weights, respectively. With a chosen set of nonnegative integers $C = (c_{ij})_{i \neq j}$ such that $c_{ij} + c_{ji} = 1$, one defines

$$A_{i,k} = Y_{i,k} Y_{i,k+1} \prod_{j \neq i} Y_{j,k+c_{ji}}^{a_{ji}},$$

where $(a_{ij})_{i,j \in I}$ is a Cartan matrix. Then

$$\begin{aligned}
e_i M &= \begin{cases} 0 & \text{if } \varepsilon_i(M) = 0, \\ A_{i,k_e} M & \text{if } \varepsilon_i(M) > 0, \end{cases} \\
f_i M &= A_{i,k_f}^{-1} M.
\end{aligned}$$

It is shown in [KKS2007] that the connected component of $\widehat{\mathcal{M}}$ containing the element $\mathbf{1}$, which we denote by $\mathcal{M}(\infty)$, is crystal isomorphic to the crystal $B(\infty)$.

INPUT:

- `cartan_type` – a Cartan type
- `c` – (optional) the matrix $(c_{ij})_{i,j\in I}$ such that $c_{ii} = 0$ for all $i \in I$, $c_{ij} \in \mathbf{Z}_{>0}$ for all $i, j \in I$, and $c_{ij} + c_{ji} = 1$ for all $i \neq j$; the default is $c_{ij} = 0$ if $i < j$ and 0 otherwise

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux("C3")
sage: S = B.subcrystal(max_depth=4)
sage: G = B.digraph(subset=S) # long time
sage: M = crystals.infinity.NakajimaMonomials("C3") # long time
sage: T = M.subcrystal(max_depth=4) # long time
sage: H = M.digraph(subset=T) # long time
sage: G.is_isomorphic(H,edge_labels=True) # long time
True

sage: M = crystals.infinity.NakajimaMonomials(['A',2,1])
sage: T = M.subcrystal(max_depth=3)
sage: H = M.digraph(subset=T) # long time
sage: Y = crystals.infinity.GeneralizedYoungWalls(2)
sage: YS = Y.subcrystal(max_depth=3)
sage: YG = Y.digraph(subset=YS) # long time
sage: YG.is_isomorphic(H,edge_labels=True) # long time
True

sage: M = crystals.infinity.NakajimaMonomials("D4")
sage: B = crystals.infinity.Tableaux("D4")
sage: MS = M.subcrystal(max_depth=3)
sage: BS = B.subcrystal(max_depth=3)
sage: MG = M.digraph(subset=MS) # long time
sage: BG = B.digraph(subset=BS) # long time
sage: BG.is_isomorphic(MG,edge_labels=True) # long time
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("C3")
>>> S = B.subcrystal(max_depth=Integer(4))
>>> G = B.digraph(subset=S) # long time
>>> M = crystals.infinity.NakajimaMonomials("C3") # long time
>>> T = M.subcrystal(max_depth=Integer(4)) # long time
>>> H = M.digraph(subset=T) # long time
>>> G.is_isomorphic(H,edge_labels=True) # long time
True

>>> M = crystals.infinity.NakajimaMonomials(['A',Integer(2),Integer(1)])
>>> T = M.subcrystal(max_depth=Integer(3))
>>> H = M.digraph(subset=T) # long time
>>> Y = crystals.infinity.GeneralizedYoungWalls(Integer(2))
>>> YS = Y.subcrystal(max_depth=Integer(3))
>>> YG = Y.digraph(subset=YS) # long time
```

(continues on next page)

(continued from previous page)

```
>>> YG.is_isomorphic(H,edge_labels=True) # long time
True

>>> M = crystals.infinity.NakajimaMonomials("D4")
>>> B = crystals.infinity.Tableaux("D4")
>>> MS = M.subcrystal(max_depth=Integer(3))
>>> BS = B.subcrystal(max_depth=Integer(3))
>>> MG = M.digraph(subset=MS) # long time
>>> BG = B.digraph(subset=BS) # long time
>>> BG.is_isomorphic(MG,edge_labels=True) # long time
True
```

Element

alias of *NakajimaMonomial*

c()

Return the matrix c_{ij} of `self`.

EXAMPLES:

```
sage: La = RootSystem(['B',3]).weight_lattice().fundamental_weights()
sage: M = crystals.NakajimaMonomials(La[1]+La[2])
sage: M.c()
[0 1 1]
[0 0 1]
[0 0 0]

sage: c = Matrix([[0,0,1],[1,0,0],[0,1,0]])
sage: La = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()
sage: M = crystals.NakajimaMonomials(2*La[1], c=c)
sage: M.c() == c
True
```

```
>>> from sage.all import *
>>> La = RootSystem(['B',Integer(3)]).weight_lattice().fundamental_weights()
>>> M = crystals.NakajimaMonomials(La[Integer(1)]+La[Integer(2)])
>>> M.c()
[0 1 1]
[0 0 1]
[0 0 0]

>>> c = Matrix([[Integer(0),Integer(0),Integer(1)],[Integer(1),Integer(0),
↪Integer(0)],[Integer(0),Integer(1),Integer(0)]])
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()
>>> M = crystals.NakajimaMonomials(Integer(2)*La[Integer(1)], c=c)
>>> M.c() == c
True
```

cardinality()

Return the cardinality of `self`, which is always ∞.

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['A',5,2])
sage: M.cardinality()
+Infinity
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['A',Integer(5),Integer(2)])
>>> M.cardinality()
+Infinity
```

get_variables()

Return the type of monomials to use for the element output.

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['A', 4])
sage: M.get_variables()
'Y'
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['A', Integer(4)])
>>> M.get_variables()
'Y'
```

set_variables(*letter*)

Set the type of monomials to use for the element output.

If the A variables are used, the output is written as $\prod_{i \in I} Y_{i,0}^{\lambda_i} \prod_{i,k} A_{i,k}^{c_{i,k}}$, where $\sum_{i \in I} \lambda_i \Lambda_i$ is the corresponding dominant weight.

INPUT:

- `letter` – can be one of the following:
  - `'Y'` – use $Y_{i,k}$, corresponds to fundamental weights
  - `'A'` – use $A_{i,k}$, corresponds to simple roots

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['A', 4])
sage: elt = M.highest_weight_vector().f_string([2,1,3,2,3,2,4,3])
sage: elt
Y(1,2) Y(2,0)^-1 Y(2,2)^-1 Y(3,0)^-1 Y(3,2)^-1 Y(4,0)
sage: M.set_variables('A')
sage: elt
A(1,1)^-1 A(2,0)^-1 A(2,1)^-2 A(3,0)^-2 A(3,1)^-1 A(4,0)^-1
sage: M.set_variables('Y')
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['A', Integer(4)])
>>> elt = M.highest_weight_vector().f_string([Integer(2),Integer(1),
↪Integer(3),Integer(2),Integer(3),Integer(2),Integer(4),Integer(3)])
>>> elt
Y(1,2) Y(2,0)^-1 Y(2,2)^-1 Y(3,0)^-1 Y(3,2)^-1 Y(4,0)
>>> M.set_variables('A')
```

(continues on next page)

(continued from previous page)

```
>>> elt
A(1,1)^-1 A(2,0)^-1 A(2,1)^-2 A(3,0)^-2 A(3,1)^-1 A(4,0)^-1
>>> M.set_variables('Y')
```

```
sage: La = RootSystem(['A',2]).weight_lattice().fundamental_weights()
sage: M = crystals.NakajimaMonomials(La[1]+La[2])
sage: lw = M.lowest_weight_vectors()[0]
sage: lw
Y(1,2)^-1 Y(2,1)^-1
sage: M.set_variables('A')
sage: lw
Y(1,0) Y(2,0) A(1,0)^-1 A(1,1)^-1 A(2,0)^-2
sage: M.set_variables('Y')
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(2)]).weight_lattice().fundamental_weights()
>>> M = crystals.NakajimaMonomials(La[Integer(1)]+La[Integer(2)])
>>> lw = M.lowest_weight_vectors()[Integer(0)]
>>> lw
Y(1,2)^-1 Y(2,1)^-1
>>> M.set_variables('A')
>>> lw
Y(1,0) Y(2,0) A(1,0)^-1 A(1,1)^-1 A(2,0)^-2
>>> M.set_variables('Y')
```

class sage.combinat.crystals.monomial_crystals.**NakajimaMonomial**(*parent*, Y, A)

Bases: Element

An element of the monomial crystal.

Monomials of the form $Y_{i_1,k_1}^{y_1} \cdots Y_{i_t,k_t}^{y_t}$, where $i_1, \ldots, i_t$ are elements of the index set, $k_1, \ldots, k_t$ are nonnegative integers, and $y_1, \ldots, y_t$ are integers.

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['B',3,1])
sage: mg = M.module_generators[0]
sage: mg
1
sage: mg.f_string([1,3,2,0,1,2,3,0,0,1])
Y(0,0)^-1 Y(0,1)^-1 Y(0,2)^-1 Y(0,3)^-1 Y(1,0)^-3
 Y(1,1)^-2 Y(1,2) Y(2,0)^3 Y(2,2) Y(3,0) Y(3,2)^-1
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['B',Integer(3),Integer(1)])
>>> mg = M.module_generators[Integer(0)]
>>> mg
1
>>> mg.f_string([Integer(1),Integer(3),Integer(2),Integer(0),Integer(1),
↪Integer(2),Integer(3),Integer(0),Integer(0),Integer(1)])
Y(0,0)^-1 Y(0,1)^-1 Y(0,2)^-1 Y(0,3)^-1 Y(1,0)^-3
 Y(1,1)^-2 Y(1,2) Y(2,0)^3 Y(2,2) Y(3,0) Y(3,2)^-1
```

An example using the A variables:

```
sage: M = crystals.infinity.NakajimaMonomials("A3")
sage: M.set_variables('A')
sage: mg = M.module_generators[0]
sage: mg.f_string([1,2,3,2,1])
A(1,0)^-1 A(1,1)^-1 A(2,0)^-2 A(3,0)^-1
sage: mg.f_string([3,2,1])
A(1,2)^-1 A(2,1)^-1 A(3,0)^-1
sage: M.set_variables('Y')
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials("A3")
>>> M.set_variables('A')
>>> mg = M.module_generators[Integer(0)]
>>> mg.f_string([Integer(1),Integer(2),Integer(3),Integer(2),Integer(1)])
A(1,0)^-1 A(1,1)^-1 A(2,0)^-2 A(3,0)^-1
>>> mg.f_string([Integer(3),Integer(2),Integer(1)])
A(1,2)^-1 A(2,1)^-1 A(3,0)^-1
>>> M.set_variables('Y')
```

e (i)

Return the action of e_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['E',7,1])
sage: m = M.module_generators[0].f_string([0,1,4,3])
sage: [m.e(i) for i in M.index_set()]
[None,
 None,
 None,
 Y(0,0)^-1 Y(1,1)^-1 Y(2,1) Y(3,0) Y(3,1) Y(4,0)^-1 Y(4,1)^-1 Y(5,0),
 None,
 None,
 None,
 None]

sage: M = crystals.infinity.NakajimaMonomials("C5")
sage: m = M.module_generators[0].f_string([1,3])
sage: [m.e(i) for i in M.index_set()]
[Y(2,1) Y(3,0)^-1 Y(3,1)^-1 Y(4,0),
 None,
 Y(1,0)^-1 Y(1,1)^-1 Y(2,0),
 None,
 None]

sage: M = crystals.infinity.NakajimaMonomials(['D',4,1])
sage: M.set_variables('A')
sage: m = M.module_generators[0].f_string([4,2,3,0])
sage: [m.e(i) for i in M.index_set()]
[A(2,1)^-1 A(3,1)^-1 A(4,0)^-1,
```

(continues on next page)

(continued from previous page)

```
 None,
 None,
 A(0,2)^-1 A(2,1)^-1 A(4,0)^-1,
 None]
sage: M.set_variables('Y')
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['E',Integer(7),Integer(1)])
>>> m = M.module_generators[Integer(0)].f_string([Integer(0),Integer(1),
↪Integer(4),Integer(3)])
>>> [m.e(i) for i in M.index_set()]
[None,
 None,
 None,
 Y(0,0)^-1 Y(1,1)^-1 Y(2,1) Y(3,0) Y(3,1) Y(4,0)^-1 Y(4,1)^-1 Y(5,0),
 None,
 None,
 None,
 None]

>>> M = crystals.infinity.NakajimaMonomials("C5")
>>> m = M.module_generators[Integer(0)].f_string([Integer(1),Integer(3)])
>>> [m.e(i) for i in M.index_set()]
[Y(2,1) Y(3,0)^-1 Y(3,1)^-1 Y(4,0),
 None,
 Y(1,0)^-1 Y(1,1)^-1 Y(2,0),
 None,
 None]

>>> M = crystals.infinity.NakajimaMonomials(['D',Integer(4),Integer(1)])
>>> M.set_variables('A')
>>> m = M.module_generators[Integer(0)].f_string([Integer(4),Integer(2),
↪Integer(3),Integer(0)])
>>> [m.e(i) for i in M.index_set()]
[A(2,1)^-1 A(3,1)^-1 A(4,0)^-1,
 None,
 None,
 A(0,2)^-1 A(2,1)^-1 A(4,0)^-1,
 None]
>>> M.set_variables('Y')
```

epsilon(i)

Return the value of ε_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['G',2,1])
sage: m = M.module_generators[0].f(2)
sage: [m.epsilon(i) for i in M.index_set()]
```

(continues on next page)

(continued from previous page)

```
[0, 0, 1]

sage: M = crystals.infinity.NakajimaMonomials(['C',4,1])
sage: m = M.module_generators[0].f_string([4,2,3])
sage: [m.epsilon(i) for i in M.index_set()]
[0, 0, 0, 1, 0]
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['G',Integer(2),Integer(1)])
>>> m = M.module_generators[Integer(0)].f(Integer(2))
>>> [m.epsilon(i) for i in M.index_set()]
[0, 0, 1]

>>> M = crystals.infinity.NakajimaMonomials(['C',Integer(4),Integer(1)])
>>> m = M.module_generators[Integer(0)].f_string([Integer(4),Integer(2),
↪Integer(3)])
>>> [m.epsilon(i) for i in M.index_set()]
[0, 0, 0, 1, 0]
```

f(i)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials("B4")
sage: m = M.module_generators[0].f_string([1,3,4])
sage: [m.f(i) for i in M.index_set()]
[Y(1,0)^-2 Y(1,1)^-2 Y(2,0)^2 Y(2,1) Y(3,0)^-1 Y(4,0) Y(4,1)^-1,
 Y(1,0)^-1 Y(1,1)^-1 Y(1,2) Y(2,0) Y(2,2)^-1 Y(3,0)^-1 Y(3,1) Y(4,0) Y(4,1)^-
↪1,
 Y(1,0)^-1 Y(1,1)^-1 Y(2,0) Y(2,1)^2 Y(3,0)^-2 Y(3,1)^-1 Y(4,0)^3 Y(4,1)^-1,
 Y(1,0)^-1 Y(1,1)^-1 Y(2,0) Y(2,1) Y(3,0)^-1 Y(3,1) Y(4,1)^-2]
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials("B4")
>>> m = M.module_generators[Integer(0)].f_string([Integer(1),Integer(3),
↪Integer(4)])
>>> [m.f(i) for i in M.index_set()]
[Y(1,0)^-2 Y(1,1)^-2 Y(2,0)^2 Y(2,1) Y(3,0)^-1 Y(4,0) Y(4,1)^-1,
 Y(1,0)^-1 Y(1,1)^-1 Y(1,2) Y(2,0) Y(2,2)^-1 Y(3,0)^-1 Y(3,1) Y(4,0) Y(4,1)^-
↪1,
 Y(1,0)^-1 Y(1,1)^-1 Y(2,0) Y(2,1)^2 Y(3,0)^-2 Y(3,1)^-1 Y(4,0)^3 Y(4,1)^-1,
 Y(1,0)^-1 Y(1,1)^-1 Y(2,0) Y(2,1) Y(3,0)^-1 Y(3,1) Y(4,1)^-2]
```

phi(i)

Return the value of φ_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['D',4,3])
sage: m = M.module_generators[0].f(1)
sage: [m.phi(i) for i in M.index_set()]
[1, -1, 1]

sage: M = crystals.infinity.NakajimaMonomials(['C',4,1])
sage: m = M.module_generators[0].f_string([4,2,3])
sage: [m.phi(i) for i in M.index_set()]
[0, 1, -1, 2, -1]
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['D',Integer(4),Integer(3)])
>>> m = M.module_generators[Integer(0)].f(Integer(1))
>>> [m.phi(i) for i in M.index_set()]
[1, -1, 1]

>>> M = crystals.infinity.NakajimaMonomials(['C',Integer(4),Integer(1)])
>>> m = M.module_generators[Integer(0)].f_string([Integer(4),Integer(2),
↪Integer(3)])
>>> [m.phi(i) for i in M.index_set()]
[0, 1, -1, 2, -1]
```

weight()

Return the weight of `self` as an element of the weight lattice.

EXAMPLES:

```
sage: C = crystals.infinity.NakajimaMonomials(['A',1,1])
sage: v = C.highest_weight_vector()
sage: v.f(1).weight() + v.f(0).weight()
-delta

sage: M = crystals.infinity.NakajimaMonomials(['A',4,2])
sage: m = M.highest_weight_vector().f_string([1,2,0,1])
sage: m.weight()
2*Lambda[0] - Lambda[1] - delta
```

```
>>> from sage.all import *
>>> C = crystals.infinity.NakajimaMonomials(['A',Integer(1),Integer(1)])
>>> v = C.highest_weight_vector()
>>> v.f(Integer(1)).weight() + v.f(Integer(0)).weight()
-delta

>>> M = crystals.infinity.NakajimaMonomials(['A',Integer(4),Integer(2)])
>>> m = M.highest_weight_vector().f_string([Integer(1),Integer(2),Integer(0),
↪Integer(1)])
>>> m.weight()
2*Lambda[0] - Lambda[1] - delta
```

weight_in_root_lattice()

Return the weight of `self` as an element of the root lattice.

EXAMPLES:

```
sage: M = crystals.infinity.NakajimaMonomials(['F',4])
sage: m = M.module_generators[0].f_string([3,3,1,2,4])
sage: m.weight_in_root_lattice()
-alpha[1] - alpha[2] - 2*alpha[3] - alpha[4]

sage: M = crystals.infinity.NakajimaMonomials(['B',3,1])
sage: mg = M.module_generators[0]
sage: m = mg.f_string([1,3,2,0,1,2,3,0,0,1])
sage: m.weight_in_root_lattice()
-3*alpha[0] - 3*alpha[1] - 2*alpha[2] - 2*alpha[3]

sage: M = crystals.infinity.NakajimaMonomials(['C',3,1])
sage: m = M.module_generators[0].f_string([3,0,1,2,0])
sage: m.weight_in_root_lattice()
-2*alpha[0] - alpha[1] - alpha[2] - alpha[3]
```

```
>>> from sage.all import *
>>> M = crystals.infinity.NakajimaMonomials(['F',Integer(4)])
>>> m = M.module_generators[Integer(0)].f_string([Integer(3),Integer(3),
↪Integer(1),Integer(2),Integer(4)])
>>> m.weight_in_root_lattice()
-alpha[1] - alpha[2] - 2*alpha[3] - alpha[4]

>>> M = crystals.infinity.NakajimaMonomials(['B',Integer(3),Integer(1)])
>>> mg = M.module_generators[Integer(0)]
>>> m = mg.f_string([Integer(1),Integer(3),Integer(2),Integer(0),Integer(1),
↪Integer(2),Integer(3),Integer(0),Integer(0),Integer(1)])
>>> m.weight_in_root_lattice()
-3*alpha[0] - 3*alpha[1] - 2*alpha[2] - 2*alpha[3]

>>> M = crystals.infinity.NakajimaMonomials(['C',Integer(3),Integer(1)])
>>> m = M.module_generators[Integer(0)].f_string([Integer(3),Integer(0),
↪Integer(1),Integer(2),Integer(0)])
>>> m.weight_in_root_lattice()
-2*alpha[0] - alpha[1] - alpha[2] - alpha[3]
```

Direct sum of crystals

class sage.combinat.crystals.direct_sum.**DirectSumOfCrystals**(*crystals*, *facade*, *keepkey*, *category*, ***options*)

Bases: DisjointUnionEnumeratedSets

Direct sum of crystals.

Given a list of crystals $B_0, \ldots, B_k$ of the same Cartan type, one can form the direct sum $B_0 \oplus \cdots \oplus B_k$.

INPUT:

- `crystals` – list of crystals of the same Cartan type
- `keepkey` – boolean

The option `keepkey` is by default set to `False`, assuming that the crystals are all distinct. In this case the elements of the direct sum are just represented by the elements in the crystals B_i. If the crystals are not all distinct, one should set the `keepkey` option to `True`. In this case, the elements of the direct sum are represented as tuples (i, b) where $b \in B_i$.

EXAMPLES:

```
sage: C = crystals.Letters(['A',2])
sage: C1 = crystals.Tableaux(['A',2],shape=[1,1])
sage: B = crystals.DirectSum([C,C1])
sage: B.list()
[1, 2, 3, [[1], [2]], [[1], [3]], [[2], [3]]]
sage: [b.f(1) for b in B]
[2, None, None, None, [[2], [3]], None]
sage: B.module_generators
(1, [[1], [2]])
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> C1 = crystals.Tableaux(['A',Integer(2)],shape=[Integer(1),Integer(1)])
>>> B = crystals.DirectSum([C,C1])
>>> B.list()
[1, 2, 3, [[1], [2]], [[1], [3]], [[2], [3]]]
>>> [b.f(Integer(1)) for b in B]
[2, None, None, None, [[2], [3]], None]
>>> B.module_generators
(1, [[1], [2]])
```

```
sage: B = crystals.DirectSum([C,C], keepkey=True)
sage: B.list()
[(0, 1), (0, 2), (0, 3), (1, 1), (1, 2), (1, 3)]
sage: B.module_generators
((0, 1), (1, 1))
sage: b = B( tuple([0,C(1)]) )
sage: b
(0, 1)
sage: b.weight()
(1, 0, 0)
```

```
>>> from sage.all import *
>>> B = crystals.DirectSum([C,C], keepkey=True)
>>> B.list()
[(0, 1), (0, 2), (0, 3), (1, 1), (1, 2), (1, 3)]
>>> B.module_generators
((0, 1), (1, 1))
>>> b = B( tuple([Integer(0),C(Integer(1))]) )
>>> b
(0, 1)
>>> b.weight()
(1, 0, 0)
```

The following is required, because *DirectSumOfCrystals* takes the same arguments as DisjointUnionEnumeratedSets (which see for details).

class Element

Bases: ElementWrapper

A class for elements of direct sums of crystals.

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',2])
sage: B = crystals.DirectSum([C,C], keepkey=True)
sage: [[b, b.e(2)] for b in B]
[[(0, 1), None], [(0, 2), None], [(0, 3), (0, 2)], [(1, 1), None], [(1,␣
↪2), None], [(1, 3), (1, 2)]]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> B = crystals.DirectSum([C,C], keepkey=True)
>>> [[b, b.e(Integer(2))] for b in B]
[[(0, 1), None], [(0, 2), None], [(0, 3), (0, 2)], [(1, 1), None], [(1,␣
↪2), None], [(1, 3), (1, 2)]]
```

epsilon(*i*)

EXAMPLES:

```
sage: C = crystals.Letters(['A',2])
sage: B = crystals.DirectSum([C,C], keepkey=True)
sage: b = B( tuple([0,C(2)]) )
sage: b.epsilon(2)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> B = crystals.DirectSum([C,C], keepkey=True)
>>> b = B( tuple([Integer(0),C(Integer(2))]) )
>>> b.epsilon(Integer(2))
0
```

f(*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',2])
sage: B = crystals.DirectSum([C,C], keepkey=True)
sage: [[b,b.f(1)] for b in B]
[[(0, 1), (0, 2)], [(0, 2), None], [(0, 3), None], [(1, 1), (1, 2)], [(1,␣
↪2), None], [(1, 3), None]]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> B = crystals.DirectSum([C,C], keepkey=True)
>>> [[b,b.f(Integer(1))] for b in B]
[[(0, 1), (0, 2)], [(0, 2), None], [(0, 3), None], [(1, 1), (1, 2)], [(1,␣
↪2), None], [(1, 3), None]]
```

phi(*i*)

EXAMPLES:

```
sage: C = crystals.Letters(['A',2])
sage: B = crystals.DirectSum([C,C], keepkey=True)
sage: b = B( tuple([0,C(2)]) )
sage: b.phi(2)
1
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> B = crystals.DirectSum([C,C], keepkey=True)
>>> b = B( tuple([Integer(0),C(Integer(2))]) )
>>> b.phi(Integer(2))
1
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',2])
sage: B = crystals.DirectSum([C,C], keepkey=True)
sage: b = B( tuple([0,C(2)]) )
sage: b
(0, 2)
sage: b.weight()
(0, 1, 0)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> B = crystals.DirectSum([C,C], keepkey=True)
>>> b = B( tuple([Integer(0),C(Integer(2))]) )
>>> b
(0, 2)
>>> b.weight()
(0, 1, 0)
```

weight_lattice_realization()

Return the weight lattice realization used to express weights.

The weight lattice realization is the common parent which all weight lattice realizations of the crystals of `self` coerce into.

EXAMPLES:

```
sage: LaZ = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()
sage: LaQ = RootSystem(['A',2,1]).weight_space(extended=True).fundamental_
↪weights()
sage: B = crystals.LSPaths(LaQ[1])
sage: B.weight_lattice_realization()
Extended weight space over the Rational Field of the Root system of type ['A',
↪ 2, 1]
sage: C = crystals.AlcovePaths(LaZ[1])
sage: C.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
```

(continues on next page)

(continued from previous page)

```
sage: D = crystals.DirectSum([B,C])
sage: D.weight_lattice_realization()
Extended weight space over the Rational Field of the Root system of type ['A',
↪ 2, 1]
```

```
>>> from sage.all import *
>>> LaZ = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()
>>> LaQ = RootSystem(['A',Integer(2),Integer(1)]).weight_space(extended=True).
↪fundamental_weights()
>>> B = crystals.LSPaths(LaQ[Integer(1)])
>>> B.weight_lattice_realization()
Extended weight space over the Rational Field of the Root system of type ['A',
↪ 2, 1]
>>> C = crystals.AlcovePaths(LaZ[Integer(1)])
>>> C.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
>>> D = crystals.DirectSum([B,C])
>>> D.weight_lattice_realization()
Extended weight space over the Rational Field of the Root system of type ['A',
↪ 2, 1]
```

Elementary crystals

Let λ be a weight. The crystals T_λ, R_λ, B_i, and C are important objects in the tensor category of crystals. For example, the crystal T_0 is the neutral object in this category; i.e., $T_0 \otimes B \cong B \otimes T_0 \cong B$ for any crystal B. We list some other properties of these crystals:

- The crystal $T_\lambda \otimes B(\infty)$ is the crystal of the Verma module with highest weight λ, where λ is a dominant integral weight.
- Let u_∞ be the highest weight vector of $B(\infty)$ and λ be a dominant integral weight. There is an embedding of crystals $B(\lambda) \longrightarrow T_\lambda \otimes B(\infty)$ sending $u_\lambda \mapsto t_\lambda \otimes u_\infty$ which is not strict, but the embedding $B(\lambda) \longrightarrow C \otimes T_\lambda \otimes B(\infty)$ by $u_\lambda \mapsto c \otimes t_\lambda \otimes u_\infty$ is a strict embedding.
- For any dominant integral weight λ, there is a surjective crystal morphism $\Psi_\lambda \colon R_\lambda \otimes B(\infty) \longrightarrow B(\lambda)$. More precisely, if $B = \{r_\lambda \otimes b \in R_\lambda \otimes B(\infty) : \Psi_\lambda(r_\lambda \otimes b) \neq 0\}$, then $B \cong B(\lambda)$ as crystals.
- For all Cartan types and all weights λ, we have $R_\lambda \cong C \otimes T_\lambda$ as crystals.
- For each i, there is a strict crystal morphism $\Psi_i \colon B(\infty) \longrightarrow B_i \otimes B(\infty)$ defined by $u_\infty \mapsto b_i(0) \otimes u_\infty$, where u_∞ is the highest weight vector of $B(\infty)$.

For more information on $B(\infty)$, see *InfinityCrystalOfTableaux*.

Note

As with *TensorProductOfCrystals*, we are using the opposite of Kashiwara's convention.

class sage.combinat.crystals.elementary_crystals.**AbstractSingleCrystalElement**

Bases: Element

Abstract base class for elements in crystals with a single element.

e(i)

Return e_i of self, which is None for all i.

INPUT:

- i – an element of the index set

EXAMPLES:

```
sage: ct = CartanType(['A',2])
sage: la = RootSystem(ct).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(ct,la[1])
sage: t = T.highest_weight_vector()
sage: t.e(1)
sage: t.e(2)
```

```
>>> from sage.all import *
>>> ct = CartanType(['A',Integer(2)])
>>> la = RootSystem(ct).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(ct,la[Integer(1)])
>>> t = T.highest_weight_vector()
>>> t.e(Integer(1))
>>> t.e(Integer(2))
```

f(i)

Return f_i of self, which is None for all i.

INPUT:

- i – an element of the index set

EXAMPLES:

```
sage: ct = CartanType(['A',2])
sage: la = RootSystem(ct).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(ct,la[1])
sage: t = T.highest_weight_vector()
sage: t.f(1)
sage: t.f(2)
```

```
>>> from sage.all import *
>>> ct = CartanType(['A',Integer(2)])
>>> la = RootSystem(ct).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(ct,la[Integer(1)])
>>> t = T.highest_weight_vector()
>>> t.f(Integer(1))
>>> t.f(Integer(2))
```

class sage.combinat.crystals.elementary_crystals.**ComponentCrystal**(*cartan_type*, P)

Bases: UniqueRepresentation, Parent

The component crystal.

Defined in [Ka1993], the component crystal $C = \{c\}$ is the single element crystal whose crystal structure is defined by

$$\mathrm{wt}(c) = 0, \quad e_i c = f_i c = 0, \quad \varepsilon_i(c) = \varphi_i(c) = 0.$$

Note $C \cong B(0)$, where $B(0)$ is the highest weight crystal of highest weight 0.

INPUT:

- `cartan_type` – a Cartan type

class Element

Bases: *AbstractSingleCrystalElement*

Element of a component crystal.

epsilon(*i*)

Return ε_i of `self`, which is 0 for all i.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: C = crystals.elementary.Component("C5")
sage: c = C.highest_weight_vector()
sage: [c.epsilon(i) for i in C.index_set()]
[0, 0, 0, 0, 0]
```

```
>>> from sage.all import *
>>> C = crystals.elementary.Component("C5")
>>> c = C.highest_weight_vector()
>>> [c.epsilon(i) for i in C.index_set()]
[0, 0, 0, 0, 0]
```

phi(*i*)

Return φ_i of `self`, which is 0 for all i.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: C = crystals.elementary.Component("C5")
sage: c = C.highest_weight_vector()
sage: [c.phi(i) for i in C.index_set()]
[0, 0, 0, 0, 0]
```

```
>>> from sage.all import *
>>> C = crystals.elementary.Component("C5")
>>> c = C.highest_weight_vector()
>>> [c.phi(i) for i in C.index_set()]
[0, 0, 0, 0, 0]
```

weight()

Return the weight of `self`, which is always 0.

EXAMPLES:

```
sage: C = crystals.elementary.Component("F4")
sage: c = C.highest_weight_vector()
sage: c.weight()
(0, 0, 0, 0)
```

```
>>> from sage.all import *
>>> C = crystals.elementary.Component("F4")
>>> c = C.highest_weight_vector()
>>> c.weight()
(0, 0, 0, 0)
```

cardinality()

Return the cardinality of `self`, which is always 1.

EXAMPLES:

```
sage: C = crystals.elementary.Component("E6")
sage: c = C.highest_weight_vector()
sage: C.cardinality()
1
```

```
>>> from sage.all import *
>>> C = crystals.elementary.Component("E6")
>>> c = C.highest_weight_vector()
>>> C.cardinality()
1
```

weight_lattice_realization()

Return the weight lattice realization of `self`.

EXAMPLES:

```
sage: C = crystals.elementary.Component("A2")
sage: C.weight_lattice_realization()
Ambient space of the Root system of type ['A', 2]

sage: P = RootSystem(['A',2]).weight_lattice()
sage: C = crystals.elementary.Component(P)
sage: C.weight_lattice_realization() is P
True
```

```
>>> from sage.all import *
>>> C = crystals.elementary.Component("A2")
>>> C.weight_lattice_realization()
Ambient space of the Root system of type ['A', 2]

>>> P = RootSystem(['A',Integer(2)]).weight_lattice()
>>> C = crystals.elementary.Component(P)
>>> C.weight_lattice_realization() is P
True
```

class sage.combinat.crystals.elementary_crystals.**ElementaryCrystal**(*cartan_type*, *i*)

Bases: `UniqueRepresentation`, `Parent`

The elementary crystal B_i.

For i an element of the index set of type X, the crystal B_i of type X is the set

$$B_i = \{b_i(m) : m \in \mathbf{Z}\},$$

where the crystal structure is given by

$$\begin{aligned}
\mathrm{wt}\big(b_i(m)\big) &= m\alpha_i \\
\varphi_j\big(b_i(m)\big) &= \begin{cases} m & \text{if } j = i, \\ -\infty & \text{if } j \neq i, \end{cases} \\
\varepsilon_j\big(b_i(m)\big) &= \begin{cases} -m & \text{if } j = i, \\ -\infty & \text{if } j \neq i, \end{cases} \\
e_j b_i(m) &= \begin{cases} b_i(m+1) & \text{if } j = i, \\ 0 & \text{if } j \neq i, \end{cases} \\
f_j b_i(m) &= \begin{cases} b_i(m-1) & \text{if } j = i, \\ 0 & \text{if } j \neq i. \end{cases}
\end{aligned}$$

The *Kashiwara embedding theorem* asserts there is a unique strict crystal embedding of crystals

$$B(\infty) \hookrightarrow B_i \otimes B(\infty),$$

satisfying certain properties (see [Ka1993]). The above embedding may be iterated to obtain a new embedding

$$B(\infty) \hookrightarrow B_{i_N} \otimes B_{i_{N-1}} \otimes \cdots \otimes B_{i_2} \otimes B_{i_1} \otimes B(\infty),$$

which is a foundational object in the study of *polyhedral realizations of crystals* (see, for example, [NZ1997]).

class Element(*parent*, *m*)

Bases: `Element`

Element of a B_i crystal.

e(*i*)

Return the action of e_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.elementary.Elementary(['E',7],1)
sage: B(3).e(1)
4
sage: B(172).e_string([1]*171)
343
sage: B(0).e(2)
```

```
>>> from sage.all import *
>>> B = crystals.elementary.Elementary(['E',Integer(7)],Integer(1))
>>> B(Integer(3)).e(Integer(1))
4
>>> B(Integer(172)).e_string([Integer(1)]*Integer(171))
343
>>> B(Integer(0)).e(Integer(2))
```

epsilon(*i*)

Return ε_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.elementary.Elementary(['F',4],3)
sage: [[B(j).epsilon(i) for i in B.index_set()] for j in range(5)]
[[-inf, -inf, 0, -inf],
 [-inf, -inf, -1, -inf],
 [-inf, -inf, -2, -inf],
 [-inf, -inf, -3, -inf],
 [-inf, -inf, -4, -inf]]
```

```
>>> from sage.all import *
>>> B = crystals.elementary.Elementary(['F',Integer(4)],Integer(3))
>>> [[B(j).epsilon(i) for i in B.index_set()] for j in range(Integer(5))]
[[-inf, -inf, 0, -inf],
 [-inf, -inf, -1, -inf],
 [-inf, -inf, -2, -inf],
 [-inf, -inf, -3, -inf],
 [-inf, -inf, -4, -inf]]
```

f(*i*)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.elementary.Elementary(['E',7],1)
sage: B(3).f(1)
2
sage: B(172).f_string([1]*171)
1
sage: B(0).e(2)
```

```
>>> from sage.all import *
>>> B = crystals.elementary.Elementary(['E',Integer(7)],Integer(1))
>>> B(Integer(3)).f(Integer(1))
2
>>> B(Integer(172)).f_string([Integer(1)]*Integer(171))
1
>>> B(Integer(0)).e(Integer(2))
```

phi(*i*)

Return φ_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.elementary.Elementary(['E',8,1],4)
sage: [[B(m).phi(j) for j in B.index_set()] for m in range(44,49)]
[[-inf, -inf, -inf, -inf, 44, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 45, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 46, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 47, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 48, -inf, -inf, -inf, -inf]]
```

```
>>> from sage.all import *
>>> B = crystals.elementary.Elementary(['E',Integer(8),Integer(1)],
↪Integer(4))
>>> [[B(m).phi(j) for j in B.index_set()] for m in range(Integer(44),
↪Integer(49))]
[[-inf, -inf, -inf, -inf, 44, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 45, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 46, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 47, -inf, -inf, -inf, -inf],
 [-inf, -inf, -inf, -inf, 48, -inf, -inf, -inf, -inf]]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: B = crystals.elementary.Elementary(['C',14],12)
sage: B(-385).weight()
-385*alpha[12]
```

```
>>> from sage.all import *
>>> B = crystals.elementary.Elementary(['C',Integer(14)],Integer(12))
>>> B(-Integer(385)).weight()
-385*alpha[12]
```

weight_lattice_realization()

Return a realization of the lattice containing the weights of `self`.

EXAMPLES:

```
sage: B = crystals.elementary.Elementary(['A',4, 1], 2)
sage: B.weight_lattice_realization()
Root lattice of the Root system of type ['A', 4, 1]
```

```
>>> from sage.all import *
>>> B = crystals.elementary.Elementary(['A',Integer(4), Integer(1)],␣
↪Integer(2))
>>> B.weight_lattice_realization()
Root lattice of the Root system of type ['A', 4, 1]
```

class sage.combinat.crystals.elementary_crystals.**RCrystal**(*cartan_type*, *weight*, *dual*)

Bases: UniqueRepresentation, Parent

The crystal R_λ.

For a fixed weight λ, the crystal $R_\lambda = \{r_\lambda\}$ is a single element crystal with the crystal structure defined by

$$\mathrm{wt}(r_\lambda) = \lambda, \quad e_i r_\lambda = f_i r_\lambda = 0, \quad \varepsilon_i(r_\lambda) = -\langle h_i, \lambda \rangle, \quad \varphi_i(r_\lambda) = 0,$$

where $\{h_i\}$ are the simple coroots.

Tensoring R_λ with a crystal B results in shifting the weights of the vertices in B by λ and may also cut a subset out of the original graph of B. That is, $\mathrm{wt}(r_\lambda \otimes b) = \mathrm{wt}(b) + \lambda$, where $b \in B$, provided $r_\lambda \otimes b \neq 0$. For example, the crystal graph of $B(\lambda)$ is the same as the crystal graph of $R_\lambda \otimes B(\infty)$ generated from the component $r_\lambda \otimes u_\infty$.

There is also a dual version of this crystal given by $R_\lambda^\vee = \{r_\lambda^\vee\}$ with the crystal structure defined by

$$\mathrm{wt}(r_\lambda^\vee) = \lambda, \quad e_i r_\lambda^\vee = f_i r_\lambda^\vee = 0, \quad \varepsilon_i(r_\lambda^\vee) = 0, \quad \varphi_i(r_\lambda^\vee) = \langle h_i, \lambda \rangle.$$

INPUT:

- `cartan_type` – a Cartan type
- `weight` – an element of the weight lattice of type `cartan_type`
- `dual` – boolean (default: `False`)

EXAMPLES:

We check by tensoring R_λ with $B(\infty)$ results in a component of $B(\lambda)$:

```
sage: B = crystals.infinity.Tableaux("A2")
sage: R = crystals.elementary.R("A2", B.Lambda()[1]+B.Lambda()[2])
sage: T = crystals.TensorProduct(R, B)
sage: mg = T(R.highest_weight_vector(), B.highest_weight_vector())
sage: S = T.subcrystal(generators=[mg])
sage: sorted([x.weight() for x in S], key=str)
[(0, 1, 2), (0, 2, 1), (1, 0, 2), (1, 1, 1),
 (1, 1, 1), (1, 2, 0), (2, 0, 1), (2, 1, 0)]
sage: C = crystals.Tableaux("A2", shape=[2,1])
sage: sorted([x.weight() for x in C], key=str)
[(0, 1, 2), (0, 2, 1), (1, 0, 2), (1, 1, 1),
 (1, 1, 1), (1, 2, 0), (2, 0, 1), (2, 1, 0)]
sage: GT = T.digraph(subset=S)
sage: GC = C.digraph()
sage: GT.is_isomorphic(GC, edge_labels=True)
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("A2")
>>> R = crystals.elementary.R("A2", B.Lambda()[Integer(1)]+B.Lambda()[Integer(2)])
>>> T = crystals.TensorProduct(R, B)
>>> mg = T(R.highest_weight_vector(), B.highest_weight_vector())
>>> S = T.subcrystal(generators=[mg])
>>> sorted([x.weight() for x in S], key=str)
[(0, 1, 2), (0, 2, 1), (1, 0, 2), (1, 1, 1),
 (1, 1, 1), (1, 2, 0), (2, 0, 1), (2, 1, 0)]
>>> C = crystals.Tableaux("A2", shape=[Integer(2),Integer(1)])
>>> sorted([x.weight() for x in C], key=str)
[(0, 1, 2), (0, 2, 1), (1, 0, 2), (1, 1, 1),
 (1, 1, 1), (1, 2, 0), (2, 0, 1), (2, 1, 0)]
>>> GT = T.digraph(subset=S)
```

(continues on next page)

(continued from previous page)

```
>>> GC = C.digraph()
>>> GT.is_isomorphic(GC, edge_labels=True)
True
```

class Element

Bases: *AbstractSingleCrystalElement*

Element of a R_λ crystal.

epsilon(i)

Return ε_i of `self`.

We have $\varepsilon_i(r_\lambda) = -\langle h_i, \lambda \rangle$ for all i, where h_i is a simple coroot.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: la = RootSystem(['A',2]).weight_lattice().fundamental_weights()
sage: R = crystals.elementary.R("A2", la[1])
sage: r = R.highest_weight_vector()
sage: [r.epsilon(i) for i in R.index_set()]
[-1, 0]

sage: R = crystals.elementary.R("A2", la[1], dual=True)
sage: r = R.highest_weight_vector()
sage: [r.epsilon(i) for i in R.index_set()]
[0, 0]
```

```
>>> from sage.all import *
>>> la = RootSystem(['A',Integer(2)]).weight_lattice().fundamental_
↪weights()
>>> R = crystals.elementary.R("A2", la[Integer(1)])
>>> r = R.highest_weight_vector()
>>> [r.epsilon(i) for i in R.index_set()]
[-1, 0]

>>> R = crystals.elementary.R("A2", la[Integer(1)], dual=True)
>>> r = R.highest_weight_vector()
>>> [r.epsilon(i) for i in R.index_set()]
[0, 0]
```

phi(i)

Return φ_i of `self`, which is 0 for all i.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: la = RootSystem("C5").weight_lattice().fundamental_weights()
sage: R = crystals.elementary.R("C5", la[4]+la[5])
sage: r = R.highest_weight_vector()
sage: [r.phi(i) for i in R.index_set()]
[0, 0, 0, 0, 0]
```

(continues on next page)

(continued from previous page)

```
sage: R = crystals.elementary.R("C5", la[4]+la[5], dual=True)
sage: r = R.highest_weight_vector()
sage: [r.phi(i) for i in R.index_set()]
[0, 0, 0, 1, 1]
```

```
>>> from sage.all import *
>>> la = RootSystem("C5").weight_lattice().fundamental_weights()
>>> R = crystals.elementary.R("C5", la[Integer(4)]+la[Integer(5)])
>>> r = R.highest_weight_vector()
>>> [r.phi(i) for i in R.index_set()]
[0, 0, 0, 0, 0]

>>> R = crystals.elementary.R("C5", la[Integer(4)]+la[Integer(5)],␣
↪dual=True)
>>> r = R.highest_weight_vector()
>>> [r.phi(i) for i in R.index_set()]
[0, 0, 0, 1, 1]
```

weight()

Return the weight of `self`, which is always λ.

EXAMPLES:

```
sage: ct = CartanType(['C',5])
sage: la = RootSystem(ct).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(ct,la[4]+la[5]-la[1]-la[2])
sage: t = T.highest_weight_vector()
sage: t.weight()
-Lambda[1] - Lambda[2] + Lambda[4] + Lambda[5]
```

```
>>> from sage.all import *
>>> ct = CartanType(['C',Integer(5)])
>>> la = RootSystem(ct).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(ct,la[Integer(4)]+la[Integer(5)]-
↪la[Integer(1)]-la[Integer(2)])
>>> t = T.highest_weight_vector()
>>> t.weight()
-Lambda[1] - Lambda[2] + Lambda[4] + Lambda[5]
```

cardinality()

Return the cardinality of `self`, which is always 1.

EXAMPLES:

```
sage: La = RootSystem(['C',12]).weight_lattice().fundamental_weights()
sage: R = crystals.elementary.R(['C',12],La[9])
sage: R.cardinality()
1
```

```
>>> from sage.all import *
>>> La = RootSystem(['C',Integer(12)]).weight_lattice().fundamental_weights()
```

(continues on next page)

(continued from previous page)

```
>>> R = crystals.elementary.R(['C',Integer(12)],La[Integer(9)])
>>> R.cardinality()
1
```

weight_lattice_realization()

Return a realization of the lattice containing the weights of `self`.

EXAMPLES:

```
sage: La = RootSystem(['C',12]).weight_lattice().fundamental_weights()
sage: R = crystals.elementary.R(['C',12], La[9])
sage: R.weight_lattice_realization()
Weight lattice of the Root system of type ['C', 12]

sage: ct = CartanMatrix([[2, -4], [-5, 2]])
sage: La = RootSystem(ct).weight_lattice().fundamental_weights()
sage: R = crystals.elementary.R(ct, La[1])
sage: R.weight_lattice_realization()
Weight lattice of the Root system of type
[ 2 -4]
[-5  2]
```

```
>>> from sage.all import *
>>> La = RootSystem(['C',Integer(12)]).weight_lattice().fundamental_weights()
>>> R = crystals.elementary.R(['C',Integer(12)], La[Integer(9)])
>>> R.weight_lattice_realization()
Weight lattice of the Root system of type ['C', 12]

>>> ct = CartanMatrix([[Integer(2), -Integer(4)], [-Integer(5), Integer(2)]])
>>> La = RootSystem(ct).weight_lattice().fundamental_weights()
>>> R = crystals.elementary.R(ct, La[Integer(1)])
>>> R.weight_lattice_realization()
Weight lattice of the Root system of type
[ 2 -4]
[-5  2]
```

class sage.combinat.crystals.elementary_crystals.**TCrystal**(*cartan_type*, *weight*)

Bases: `UniqueRepresentation`, `Parent`

The crystal T_λ.

Let λ be a weight. As defined in [Ka1993] the crystal $T_\lambda = \{t_\lambda\}$ is a single element crystal with the crystal structure defined by

$$\mathrm{wt}(t_\lambda) = \lambda, \quad e_i t_\lambda = f_i t_\lambda = 0, \quad \varepsilon_i(t_\lambda) = \varphi_i(t_\lambda) = -\infty.$$

The crystal T_λ shifts the weights of the vertices in a crystal B by λ when tensored with B, but leaves the graph structure of B unchanged. That is to say, for all $b \in B$, we have $\mathrm{wt}(b \otimes t_\lambda) = \mathrm{wt}(b) + \lambda$.

INPUT:

- `cartan_type` – a Cartan type
- `weight` – an element of the weight lattice of type `cartan_type`

EXAMPLES:

```
sage: ct = CartanType(['A',2])
sage: C = crystals.Tableaux(ct, shape=[1])
sage: for x in C: x.weight()
(1, 0, 0)
(0, 1, 0)
(0, 0, 1)
sage: La = RootSystem(ct).ambient_space().fundamental_weights()
sage: TLa = crystals.elementary.T(ct, 3*(La[1] + La[2]))
sage: TP = crystals.TensorProduct(TLa, C)
sage: for x in TP: x.weight()
(7, 3, 0)
(6, 4, 0)
(6, 3, 1)
sage: G = C.digraph()
sage: H = TP.digraph()
sage: G.is_isomorphic(H,edge_labels=True)
True
```

```
>>> from sage.all import *
>>> ct = CartanType(['A',Integer(2)])
>>> C = crystals.Tableaux(ct, shape=[Integer(1)])
>>> for x in C: x.weight()
(1, 0, 0)
(0, 1, 0)
(0, 0, 1)
>>> La = RootSystem(ct).ambient_space().fundamental_weights()
>>> TLa = crystals.elementary.T(ct, Integer(3)*(La[Integer(1)] + La[Integer(2)]))
>>> TP = crystals.TensorProduct(TLa, C)
>>> for x in TP: x.weight()
(7, 3, 0)
(6, 4, 0)
(6, 3, 1)
>>> G = C.digraph()
>>> H = TP.digraph()
>>> G.is_isomorphic(H,edge_labels=True)
True
```

class Element

Bases: *AbstractSingleCrystalElement*

Element of a T_λ crystal.

epsilon(i)

Return ε_i of `self`, which is $-\infty$ for all i.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: ct = CartanType(['C',5])
sage: la = RootSystem(ct).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(ct,la[4]+la[5]-la[1]-la[2])
sage: t = T.highest_weight_vector()
```

(continues on next page)

(continued from previous page)

```
sage: [t.epsilon(i) for i in T.index_set()]
[-inf, -inf, -inf, -inf, -inf]
```

```
>>> from sage.all import *
>>> ct = CartanType(['C',Integer(5)])
>>> la = RootSystem(ct).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(ct,la[Integer(4)]+la[Integer(5)]-
↪la[Integer(1)]-la[Integer(2)])
>>> t = T.highest_weight_vector()
>>> [t.epsilon(i) for i in T.index_set()]
[-inf, -inf, -inf, -inf, -inf]
```

phi(i)

Return φ_i of `self`, which is $-\infty$ for all i.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: ct = CartanType(['C',5])
sage: la = RootSystem(ct).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(ct,la[4]+la[5]-la[1]-la[2])
sage: t = T.highest_weight_vector()
sage: [t.phi(i) for i in T.index_set()]
[-inf, -inf, -inf, -inf, -inf]
```

```
>>> from sage.all import *
>>> ct = CartanType(['C',Integer(5)])
>>> la = RootSystem(ct).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(ct,la[Integer(4)]+la[Integer(5)]-
↪la[Integer(1)]-la[Integer(2)])
>>> t = T.highest_weight_vector()
>>> [t.phi(i) for i in T.index_set()]
[-inf, -inf, -inf, -inf, -inf]
```

weight()

Return the weight of `self`, which is always λ.

EXAMPLES:

```
sage: ct = CartanType(['C',5])
sage: la = RootSystem(ct).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(ct,la[4]+la[5]-la[1]-la[2])
sage: t = T.highest_weight_vector()
sage: t.weight()
-Lambda[1] - Lambda[2] + Lambda[4] + Lambda[5]
```

```
>>> from sage.all import *
>>> ct = CartanType(['C',Integer(5)])
>>> la = RootSystem(ct).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(ct,la[Integer(4)]+la[Integer(5)]-
↪la[Integer(1)]-la[Integer(2)])
```

(continues on next page)

(continued from previous page)

```
>>> t = T.highest_weight_vector()
>>> t.weight()
-Lambda[1] - Lambda[2] + Lambda[4] + Lambda[5]
```

cardinality()

Return the cardinality of `self`, which is always 1.

EXAMPLES:

```
sage: La = RootSystem(['C',12]).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(['C',12], La[9])
sage: T.cardinality()
1
```

```
>>> from sage.all import *
>>> La = RootSystem(['C',Integer(12)]).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(['C',Integer(12)], La[Integer(9)])
>>> T.cardinality()
1
```

weight_lattice_realization()

Return a realization of the lattice containing the weights of `self`.

EXAMPLES:

```
sage: La = RootSystem(['C',12]).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(['C',12], La[9])
sage: T.weight_lattice_realization()
Weight lattice of the Root system of type ['C', 12]

sage: ct = CartanMatrix([[2, -4], [-5, 2]])
sage: La = RootSystem(ct).weight_lattice().fundamental_weights()
sage: T = crystals.elementary.T(ct, La[1])
sage: T.weight_lattice_realization()
Weight lattice of the Root system of type
[ 2 -4]
[-5  2]
```

```
>>> from sage.all import *
>>> La = RootSystem(['C',Integer(12)]).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(['C',Integer(12)], La[Integer(9)])
>>> T.weight_lattice_realization()
Weight lattice of the Root system of type ['C', 12]

>>> ct = CartanMatrix([[Integer(2), -Integer(4)], [-Integer(5), Integer(2)]])
>>> La = RootSystem(ct).weight_lattice().fundamental_weights()
>>> T = crystals.elementary.T(ct, La[Integer(1)])
>>> T.weight_lattice_realization()
Weight lattice of the Root system of type
[ 2 -4]
[-5  2]
```

Fast rank two crystals

class sage.combinat.crystals.fast_crystals.**FastCrystal**(*ct*, *shape*, *format*)

Bases: UniqueRepresentation, Parent

An alternative implementation of rank 2 crystals. The root operators are implemented in memory by table lookup. This means that in comparison with the *CrystalOfTableaux*, these crystals are slow to instantiate but faster for computation. Implemented for types A_2, B_2, and C_2.

INPUT:

- `cartan_type` – the Cartan type and must be either type A_2, B_2, or C_2
- `shape` – a shape is of the form `[l1,l2]` where `l1` and `l2` are either integers or (in type B_2) half integers such that `l1 - l2` is integral. It is assumed that `l1 >= l2 >= 0`. If `l1` and `l2` are integers, this will produce a crystal isomorphic to the one obtained by `crystals.Tableaux(type, shape=[l1,l2])`. Furthermore `crystals.FastRankTwo(['B', 2], l1+1/2, l2+1/2)` produces a crystal isomorphic to the following crystal `T`:

```
sage: C = crystals.Tableaux(['B',2], shape=[l1,l2])                # not tested
sage: D = crystals.Spins(['B',2])                                  # not tested
sage: T = crystals.TensorProduct(C, D, C.list()[0], D.list()[0])   # not tested
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['B',Integer(2)], shape=[l1,l2])                #␣
↪not tested
>>> D = crystals.Spins(['B',Integer(2)])                                  #␣
↪not tested
>>> T = crystals.TensorProduct(C, D, C.list()[Integer(0)], D.
↪list()[Integer(0)])  # not tested
```

- `format` – (default: `'string'`) the default representation of elements is in term of theBerenstein-Zelevinsky-Littelmann (BZL) strings `[a1, a2, ...]` described under metapost in `crystals`. Alternative representations may be obtained by the options `'dual_string'` or `'simple'`. In the `'simple'` format, the element is represented by and integer, and in the `'dual_string'` format, it is represented by the BZL string, but the underlying decomposition of the long Weyl group element into simple reflections is changed.

class Element(*parent*, *value*, *format*)

Bases: Element

EXAMPLES:

```
sage: C = crystals.FastRankTwo(['A',2],shape=[2,1])
sage: c = C(0); c
[0, 0, 0]
sage: C[0].parent()
The fast crystal for A2 with shape [2,1]
sage: TestSuite(c).run()
```

```
>>> from sage.all import *
>>> C = crystals.FastRankTwo(['A',Integer(2)],shape=[Integer(2),Integer(1)])
>>> c = C(Integer(0)); c
[0, 0, 0]
>>> C[Integer(0)].parent()
```

(continues on next page)

(continued from previous page)

```
The fast crystal for A2 with shape [2,1]
>>> TestSuite(c).run()
```

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.FastRankTwo(['A',2],shape=[2,1])
sage: C(1).e(1)
[0, 0, 0]
sage: C(0).e(1) is None
True
```

```
>>> from sage.all import *
>>> C = crystals.FastRankTwo(['A',Integer(2)],shape=[Integer(2),
↪Integer(1)])
>>> C(Integer(1)).e(Integer(1))
[0, 0, 0]
>>> C(Integer(0)).e(Integer(1)) is None
True
```

f(*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.FastRankTwo(['A',2],shape=[2,1])
sage: C(6).f(1)
[1, 2, 1]
sage: C(7).f(1) is None
True
```

```
>>> from sage.all import *
>>> C = crystals.FastRankTwo(['A',Integer(2)],shape=[Integer(2),
↪Integer(1)])
>>> C(Integer(6)).f(Integer(1))
[1, 2, 1]
>>> C(Integer(7)).f(Integer(1)) is None
True
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.FastRankTwo(['A',2], shape=[2,1])]
[(2, 1, 0), (1, 2, 0), (1, 1, 1), (1, 0, 2), (0, 1, 2), (2, 0, 1), (1, 1,␣
↪1), (0, 2, 1)]
sage: [v.weight() for v in crystals.FastRankTwo(['B',2], shape=[1,0])]
[(1, 0), (0, 1), (0, 0), (0, -1), (-1, 0)]
sage: [v.weight() for v in crystals.FastRankTwo(['B',2], shape=[1/2,1/2])]
[(1/2, 1/2), (1/2, -1/2), (-1/2, 1/2), (-1/2, -1/2)]
```

(continues on next page)

(continued from previous page)

```
sage: [v.weight() for v in crystals.FastRankTwo(['C',2], shape=[1,0])]
[(1, 0), (0, 1), (0, -1), (-1, 0)]
sage: [v.weight() for v in crystals.FastRankTwo(['C',2], shape=[1,1])]
[(1, 1), (1, -1), (0, 0), (-1, 1), (-1, -1)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.FastRankTwo(['A',Integer(2)],␣
↪shape=[Integer(2),Integer(1)])]
[(2, 1, 0), (1, 2, 0), (1, 1, 1), (1, 0, 2), (0, 1, 2), (2, 0, 1), (1, 1,␣
↪1), (0, 2, 1)]
>>> [v.weight() for v in crystals.FastRankTwo(['B',Integer(2)],␣
↪shape=[Integer(1),Integer(0)])]
[(1, 0), (0, 1), (0, 0), (0, -1), (-1, 0)]
>>> [v.weight() for v in crystals.FastRankTwo(['B',Integer(2)],␣
↪shape=[Integer(1)/Integer(2),Integer(1)/Integer(2)])]
[(1/2, 1/2), (1/2, -1/2), (-1/2, 1/2), (-1/2, -1/2)]
>>> [v.weight() for v in crystals.FastRankTwo(['C',Integer(2)],␣
↪shape=[Integer(1),Integer(0)])]
[(1, 0), (0, 1), (0, -1), (-1, 0)]
>>> [v.weight() for v in crystals.FastRankTwo(['C',Integer(2)],␣
↪shape=[Integer(1),Integer(1)])]
[(1, 1), (1, -1), (0, 0), (-1, 1), (-1, -1)]
```

cmp_elements(x, y)

Return `True` if and only if there is a path from x to y in the crystal graph.

Because the crystal graph is classical, it is a directed acyclic graph which can be interpreted as a poset. This function implements the comparison function of this poset.

EXAMPLES:

```
sage: C = crystals.FastRankTwo(['A',2],shape=[2,1])
sage: x = C(0)
sage: y = C(1)
sage: C.cmp_elements(x,y)
-1
sage: C.cmp_elements(y,x)
1
sage: C.cmp_elements(x,x)
0
```

```
>>> from sage.all import *
>>> C = crystals.FastRankTwo(['A',Integer(2)],shape=[Integer(2),Integer(1)])
>>> x = C(Integer(0))
>>> y = C(Integer(1))
>>> C.cmp_elements(x,y)
-1
>>> C.cmp_elements(y,x)
1
>>> C.cmp_elements(x,x)
0
```

digraph()

Return the digraph associated to `self`.

EXAMPLES:

```
sage: C = crystals.FastRankTwo(['A',2],shape=[2,1])
sage: C.digraph()
Digraph on 8 vertices
```

```
>>> from sage.all import *
>>> C = crystals.FastRankTwo(['A',Integer(2)],shape=[Integer(2),Integer(1)])
>>> C.digraph()
Digraph on 8 vertices
```

Fully commutative stable Grothendieck crystal

AUTHORS:

- Jianping Pan (2020-08-31): initial version
- Wencin Poh (2020-08-31): initial version
- Anne Schilling (2020-08-31): initial version

class sage.combinat.crystals.fully_commutative_stable_grothendieck.**DecreasingHeckeFactorization**(*parent*, *t*)

Bases: `Element`

Class of decreasing factorizations in the 0-Hecke monoid.

INPUT:

- `t` – decreasing factorization inputted as list of lists
- `max_value` – maximal value of entries

EXAMPLES:

```
sage: from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorization
sage: t = [[3, 2], [], [2, 1]]
sage: h = DecreasingHeckeFactorization(t, 3); h
(3, 2)()(2, 1)
sage: h.excess
1
sage: h.factors
3
sage: h.max_value
3
sage: h.value
((3, 2), (), (2, 1))

sage: u = [[3, 2, 1], [3], [2, 1]]
sage: h = DecreasingHeckeFactorization(u); h
(3, 2, 1)(3)(2, 1)
sage: h.weight()
(2, 1, 3)
```

(continues on next page)

(continued from previous page)

```
sage: h.parent()
Decreasing Hecke factorizations with 3 factors associated to [2, 1, 3, 2, 1] with␣
↪excess 1
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorization
>>> t = [[Integer(3), Integer(2)], [], [Integer(2), Integer(1)]]
>>> h = DecreasingHeckeFactorization(t, Integer(3)); h
(3, 2)()(2, 1)
>>> h.excess
1
>>> h.factors
3
>>> h.max_value
3
>>> h.value
((3, 2), (), (2, 1))

>>> u = [[Integer(3), Integer(2), Integer(1)], [Integer(3)], [Integer(2),␣
↪Integer(1)]]
>>> h = DecreasingHeckeFactorization(u); h
(3, 2, 1)(3)(2, 1)
>>> h.weight()
(2, 1, 3)
>>> h.parent()
Decreasing Hecke factorizations with 3 factors associated to [2, 1, 3, 2, 1] with␣
↪excess 1
```

to_increasing_hecke_biword()

Return the associated increasing Hecke biword of `self`.

EXAMPLES:

```
sage: from sage.combinat.crystals.fully_commutative_stable_grothendieck␣
↪import DecreasingHeckeFactorization
sage: t = [[2], [], [2, 1],[4, 3, 1]]
sage: h = DecreasingHeckeFactorization(t, 4)
sage: h.to_increasing_hecke_biword()
[[1, 1, 1, 2, 2, 4], [1, 3, 4, 1, 2, 2]]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorization
>>> t = [[Integer(2)], [], [Integer(2), Integer(1)],[Integer(4), Integer(3),␣
↪Integer(1)]]
>>> h = DecreasingHeckeFactorization(t, Integer(4))
>>> h.to_increasing_hecke_biword()
[[1, 1, 1, 2, 2, 4], [1, 3, 4, 1, 2, 2]]
```

to_word()

Return the word associated to `self` in the 0-Hecke monoid.

EXAMPLES:

```
sage: from sage.combinat.crystals.fully_commutative_stable_grothendieck␣
↪import DecreasingHeckeFactorization
sage: t = [[2], [], [2, 1], [4, 3, 1]]
sage: h = DecreasingHeckeFactorization(t)
sage: h.to_word()
[2, 2, 1, 4, 3, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorization
>>> t = [[Integer(2)], [], [Integer(2), Integer(1)], [Integer(4), Integer(3),␣
↪Integer(1)]]
>>> h = DecreasingHeckeFactorization(t)
>>> h.to_word()
[2, 2, 1, 4, 3, 1]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: from sage.combinat.crystals.fully_commutative_stable_grothendieck␣
↪import DecreasingHeckeFactorization
sage: t = [[2], [2, 1], [], [4, 3, 1]]
sage: h = DecreasingHeckeFactorization(t, 6)
sage: h.weight()
(3, 0, 2, 1)
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorization
>>> t = [[Integer(2)], [Integer(2), Integer(1)], [], [Integer(4), Integer(3),␣
↪Integer(1)]]
>>> h = DecreasingHeckeFactorization(t, Integer(6))
>>> h.weight()
(3, 0, 2, 1)
```

class sage.combinat.crystals.fully_commutative_stable_grothendieck.**DecreasingHeckeFactorizations**(*w*, *factors*, *excess*)

Bases: `UniqueRepresentation`, `Parent`

Set of decreasing factorizations in the 0-Hecke monoid.

INPUT:

- `w` – an element in the symmetric group
- `factors` – the number of factors in the factorization
- `excess` – the total number of letters in the factorization minus the length of a reduced word for `w`

EXAMPLES:

```
sage: from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorizations
sage: S = SymmetricGroup(3+1)
sage: w = S.from_reduced_word([1, 3, 2, 1])
sage: F = DecreasingHeckeFactorizations(w, 3, 3); F
Decreasing Hecke factorizations with 3 factors associated to [1, 3, 2, 1] with␣
↪excess 3
sage: F.list()
[(3, 1)(3, 1)(3, 2, 1), (3, 1)(3, 2, 1)(2, 1), (3, 2, 1)(2, 1)(2, 1)]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorizations
>>> S = SymmetricGroup(Integer(3)+Integer(1))
>>> w = S.from_reduced_word([Integer(1), Integer(3), Integer(2), Integer(1)])
>>> F = DecreasingHeckeFactorizations(w, Integer(3), Integer(3)); F
Decreasing Hecke factorizations with 3 factors associated to [1, 3, 2, 1] with␣
↪excess 3
>>> F.list()
[(3, 1)(3, 1)(3, 2, 1), (3, 1)(3, 2, 1)(2, 1), (3, 2, 1)(2, 1)(2, 1)]
```

Element

alias of *DecreasingHeckeFactorization*

list()

Return list of all elements of `self`.

EXAMPLES:

```
sage: from sage.combinat.crystals.fully_commutative_stable_grothendieck␣
↪import DecreasingHeckeFactorizations
sage: S = SymmetricGroup(3+1)
sage: w = S.from_reduced_word([1, 3, 2, 1])
sage: F = DecreasingHeckeFactorizations(w, 3, 3)
sage: F.list()
[(3, 1)(3, 1)(3, 2, 1), (3, 1)(3, 2, 1)(2, 1), (3, 2, 1)(2, 1)(2, 1)]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorizations
>>> S = SymmetricGroup(Integer(3)+Integer(1))
>>> w = S.from_reduced_word([Integer(1), Integer(3), Integer(2), Integer(1)])
>>> F = DecreasingHeckeFactorizations(w, Integer(3), Integer(3))
>>> F.list()
[(3, 1)(3, 1)(3, 2, 1), (3, 1)(3, 2, 1)(2, 1), (3, 2, 1)(2, 1)(2, 1)]
```

class sage.combinat.crystals.fully_commutative_stable_grothendieck.**FullyCommutativeStableGrothendiecl**

Bases: `UniqueRepresentation`, `Parent`

The crystal on fully commutative decreasing factorizations in the 0-Hecke monoid, as introduced by [MPPS2020].

INPUT:

- `w` – an element in the symmetric group or a (skew) shape
- `factors` – the number of factors in the factorization
- `excess` – the total number of letters in the factorization minus the length of a reduced word for `w`
- `shape` – boolean (default: `False`); indicator for input `w`, `True` if `w` is entered as a (skew) shape and `False` otherwise

EXAMPLES:

```
sage: S = SymmetricGroup(3+1)
sage: w = S.from_reduced_word([1, 3, 2])
sage: B = crystals.FullyCommutativeStableGrothendieck(w, 3, 2); B
Fully commutative stable Grothendieck crystal of type A_2 associated to [1, 3, 2]␣
↪with excess 2
sage: B.list()
[(1)(3, 1)(3, 2),
 (3, 1)(1)(3, 2),
 (3, 1)(3, 1)(2),
 (3)(3, 1)(3, 2),
 (3, 1)(3)(3, 2),
 (3, 1)(3, 2)(2)]
```

```
>>> from sage.all import *
>>> S = SymmetricGroup(Integer(3)+Integer(1))
>>> w = S.from_reduced_word([Integer(1), Integer(3), Integer(2)])
>>> B = crystals.FullyCommutativeStableGrothendieck(w, Integer(3), Integer(2)); B
Fully commutative stable Grothendieck crystal of type A_2 associated to [1, 3, 2]␣
↪with excess 2
>>> B.list()
[(1)(3, 1)(3, 2),
 (3, 1)(1)(3, 2),
 (3, 1)(3, 1)(2),
 (3)(3, 1)(3, 2),
 (3, 1)(3)(3, 2),
 (3, 1)(3, 2)(2)]
```

We can also access the crystal by specifying a skew shape:

```
sage: crystals.FullyCommutativeStableGrothendieck([[2, 2], [1]], 4, 1, shape=True)
Fully commutative stable Grothendieck crystal of type A_3 associated to [2, 1, 3]␣
↪with excess 1
```

```
>>> from sage.all import *
>>> crystals.FullyCommutativeStableGrothendieck([[Integer(2), Integer(2)],␣
↪[Integer(1)]], Integer(4), Integer(1), shape=True)
Fully commutative stable Grothendieck crystal of type A_3 associated to [2, 1, 3]␣
↪with excess 1
```

We can compute the highest weight elements:

```
sage: hw = [w for w in B if w.is_highest_weight()]
sage: hw
```

(continues on next page)

(continued from previous page)

```
[(1)(3, 1)(3, 2), (3)(3, 1)(3, 2)]
sage: hw[0].weight()
(2, 2, 1)
```

```
>>> from sage.all import *
>>> hw = [w for w in B if w.is_highest_weight()]
>>> hw
[(1)(3, 1)(3, 2), (3)(3, 1)(3, 2)]
>>> hw[Integer(0)].weight()
(2, 2, 1)
```

The crystal operators themselves move elements between adjacent factors:

```
sage: b = hw[0]; b
(1)(3, 1)(3, 2)
sage: b.f(2)
(3, 1)(1)(3, 2)
```

```
>>> from sage.all import *
>>> b = hw[Integer(0)]; b
(1)(3, 1)(3, 2)
>>> b.f(Integer(2))
(3, 1)(1)(3, 2)
```

class Element(*parent*, *t*)

Bases: *DecreasingHeckeFactorization*

Create an instance `self` of element `t`.

This method takes into account the constraints on the word, the number of factors, and excess statistic associated to the parent class.

EXAMPLES:

```
sage: S = SymmetricGroup(3+1)
sage: w = S.from_reduced_word([1, 3, 2])
sage: B = crystals.FullyCommutativeStableGrothendieck(w, 3, 2)
sage: from sage.combinat.crystals.fully_commutative_stable_grothendieck␣
↪import DecreasingHeckeFactorization
sage: h = DecreasingHeckeFactorization([[3, 1], [3], [3, 2]], 4)
sage: u = B(h); u.value
((3, 1), (3,), (3, 2))
sage: v = B([[3, 1], [3], [3, 2]]); v.value
((3, 1), (3,), (3, 2))
```

```
>>> from sage.all import *
>>> S = SymmetricGroup(Integer(3)+Integer(1))
>>> w = S.from_reduced_word([Integer(1), Integer(3), Integer(2)])
>>> B = crystals.FullyCommutativeStableGrothendieck(w, Integer(3), Integer(2))
>>> from sage.combinat.crystals.fully_commutative_stable_grothendieck import␣
↪DecreasingHeckeFactorization
>>> h = DecreasingHeckeFactorization([[Integer(3), Integer(1)], [Integer(3)],␣
↪[Integer(3), Integer(2)]], Integer(4))
```

(continues on next page)

(continued from previous page)

```
>>> u = B(h); u.value
((3, 1), (3,), (3, 2))
>>> v = B([[Integer(3), Integer(1)], [Integer(3)], [Integer(3), Integer(2)]]);
↪ v.value
((3, 1), (3,), (3, 2))
```

bracketing(i)

Remove all bracketed letters between i-th and $(i+1)$-th entry.

EXAMPLES:

```
sage: S = SymmetricGroup(4+1)
sage: w = S.from_reduced_word([3, 2, 1, 4, 3])
sage: B = crystals.FullyCommutativeStableGrothendieck(w, 3, 2)
sage: h = B([[3], [4, 2, 1], [4, 3, 1]])
sage: h.bracketing(1)
[[], []]
sage: h.bracketing(2)
[[], [2, 1]]
```

```
>>> from sage.all import *
>>> S = SymmetricGroup(Integer(4)+Integer(1))
>>> w = S.from_reduced_word([Integer(3), Integer(2), Integer(1),␣
↪Integer(4), Integer(3)])
>>> B = crystals.FullyCommutativeStableGrothendieck(w, Integer(3),␣
↪Integer(2))
>>> h = B([[Integer(3)], [Integer(4), Integer(2), Integer(1)],␣
↪[Integer(4), Integer(3), Integer(1)]])
>>> h.bracketing(Integer(1))
[[], []]
>>> h.bracketing(Integer(2))
[[], [2, 1]]
```

e(i)

Return the action of e_i on `self` using the rules described in [MPPS2020].

EXAMPLES:

```
sage: S = SymmetricGroup(4+1)
sage: w = S.from_reduced_word([2, 1, 4, 3, 2])
sage: B = crystals.FullyCommutativeStableGrothendieck(w, 4, 3)
sage: h = B([[4, 2], [4, 2, 1], [3, 2], [2]]); h
(4, 2)(4, 2, 1)(3, 2)(2)
sage: h.e(1)
(4, 2)(4, 2, 1)(3)(3, 2)
sage: h.e(2)
(4, 2)(2, 1)(4, 3, 2)(2)
sage: h.e(3)
```

```
>>> from sage.all import *
>>> S = SymmetricGroup(Integer(4)+Integer(1))
>>> w = S.from_reduced_word([Integer(2), Integer(1), Integer(4),␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(3), Integer(2)])
>>> B = crystals.FullyCommutativeStableGrothendieck(w, Integer(4),␣
↪Integer(3))
>>> h = B([[Integer(4), Integer(2)], [Integer(4), Integer(2), Integer(1)],
↪ [Integer(3), Integer(2)], [Integer(2)]]); h
(4, 2)(4, 2, 1)(3, 2)(2)
>>> h.e(Integer(1))
(4, 2)(4, 2, 1)(3)(3, 2)
>>> h.e(Integer(2))
(4, 2)(2, 1)(4, 3, 2)(2)
>>> h.e(Integer(3))
```

f(*i*)

Return the action of f_i on `self` using the rules described in [MPPS2020].

EXAMPLES:

```
sage: S = SymmetricGroup(4+1)
sage: w = S.from_reduced_word([3, 2, 1, 4, 3])
sage: B = crystals.FullyCommutativeStableGrothendieck(w, 4, 3)
sage: h = B([[3, 2], [2, 1], [4, 3], [3, 1]]); h
(3, 2)(2, 1)(4, 3)(3, 1)
sage: h.f(1)
(3, 2)(2, 1)(4, 3, 1)(3)
sage: h.f(2)
sage: h.f(3)
(3, 2, 1)(1)(4, 3)(3, 1)
```

```
>>> from sage.all import *
>>> S = SymmetricGroup(Integer(4)+Integer(1))
>>> w = S.from_reduced_word([Integer(3), Integer(2), Integer(1),␣
↪Integer(4), Integer(3)])
>>> B = crystals.FullyCommutativeStableGrothendieck(w, Integer(4),␣
↪Integer(3))
>>> h = B([[Integer(3), Integer(2)], [Integer(2), Integer(1)],␣
↪[Integer(4), Integer(3)], [Integer(3), Integer(1)]]); h
(3, 2)(2, 1)(4, 3)(3, 1)
>>> h.f(Integer(1))
(3, 2)(2, 1)(4, 3, 1)(3)
>>> h.f(Integer(2))
>>> h.f(Integer(3))
(3, 2, 1)(1)(4, 3)(3, 1)
```

module_generators()

Return generators for `self` as a crystal.

EXAMPLES:

```
sage: S = SymmetricGroup(3+1)
sage: w = S.from_reduced_word([1, 3, 2])
sage: B = crystals.FullyCommutativeStableGrothendieck(w, 3, 2)
sage: B.module_generators
((1)(3, 1)(3, 2), (3)(3, 1)(3, 2))
```

(continues on next page)

(continued from previous page)

```
sage: C = crystals.FullyCommutativeStableGrothendieck(w, 4, 2)
sage: C.module_generators
((()(1)(3, 1)(3, 2),
 ()(3)(3, 1)(3, 2),
 (1)(1)(1)(3, 2),
 (1)(1)(3)(3, 2),
 (1)(3)(3)(3, 2))
```

```
>>> from sage.all import *
>>> S = SymmetricGroup(Integer(3)+Integer(1))
>>> w = S.from_reduced_word([Integer(1), Integer(3), Integer(2)])
>>> B = crystals.FullyCommutativeStableGrothendieck(w, Integer(3), Integer(2))
>>> B.module_generators
((1)(3, 1)(3, 2), (3)(3, 1)(3, 2))
>>> C = crystals.FullyCommutativeStableGrothendieck(w, Integer(4), Integer(2))
>>> C.module_generators
((()(1)(3, 1)(3, 2),
 ()(3)(3, 1)(3, 2),
 (1)(1)(1)(3, 2),
 (1)(1)(3)(3, 2),
 (1)(3)(3)(3, 2))
```

Highest weight crystals

class sage.combinat.crystals.highest_weight_crystals.**FiniteDimensionalHighestWeightCrystal_TypeE**(*dom-i-nant*

Bases: *TensorProductOfCrystals*

Commonalities for all finite dimensional type E highest weight crystals.

Subclasses should setup an attribute column_crystal in their __init__ method before calling the __init__ method of this class.

Element

alias of *TensorProductOfRegularCrystalsElement*

module_generator()

Yield the module generator (or highest weight element) of the classical crystal of given dominant weight in self.

EXAMPLES:

```
sage: C=CartanType(['E',6])
sage: La=C.root_system().weight_lattice().fundamental_weights()
sage: T = crystals.HighestWeight(La[2])
sage: T.module_generator()
[[(2, -1), (1,)]]
sage: T = crystals.HighestWeight(0*La[2])
sage: T.module_generator()
[]

sage: C=CartanType(['E',7])
```

(continues on next page)

(continued from previous page)

```
sage: La=C.root_system().weight_lattice().fundamental_weights()
sage: T = crystals.HighestWeight(La[1])
sage: T.module_generator()
[[(-7, 1), (7,)]]
```

```
>>> from sage.all import *
>>> C=CartanType(['E',Integer(6)])
>>> La=C.root_system().weight_lattice().fundamental_weights()
>>> T = crystals.HighestWeight(La[Integer(2)])
>>> T.module_generator()
[[(2, -1), (1,)]]
>>> T = crystals.HighestWeight(Integer(0)*La[Integer(2)])
>>> T.module_generator()
[]

>>> C=CartanType(['E',Integer(7)])
>>> La=C.root_system().weight_lattice().fundamental_weights()
>>> T = crystals.HighestWeight(La[Integer(1)])
>>> T.module_generator()
[[(-7, 1), (7,)]]
```

class sage.combinat.crystals.highest_weight_crystals.**FiniteDimensionalHighestWeightCrystal_TypeE6**(*dom*-
nar

Bases: *FiniteDimensionalHighestWeightCrystal_TypeE*

Class of finite dimensional highest weight crystals of type E_6.

EXAMPLES:

```
sage: C=CartanType(['E',6])
sage: La=C.root_system().weight_lattice().fundamental_weights()
sage: T = crystals.HighestWeight(La[2]); T
Finite dimensional highest weight crystal of type ['E', 6] and highest weight␣
↪Lambda[2]
sage: B1 = T.column_crystal[1]; B1
The crystal of letters for type ['E', 6]
sage: B6 = T.column_crystal[6]; B6
The crystal of letters for type ['E', 6] (dual)
sage: t = T(B6([-1]),B1([-1,3])); t
[(-1,), (-1, 3)]
sage: [t.epsilon(i) for i in T.index_set()]
[2, 0, 0, 0, 0, 0]
sage: [t.phi(i) for i in T.index_set()]
[0, 0, 1, 0, 0, 0]
sage: TestSuite(t).run()
```

```
>>> from sage.all import *
>>> C=CartanType(['E',Integer(6)])
>>> La=C.root_system().weight_lattice().fundamental_weights()
>>> T = crystals.HighestWeight(La[Integer(2)]); T
Finite dimensional highest weight crystal of type ['E', 6] and highest weight␣
```

(continues on next page)

(continued from previous page)

```
↪Lambda[2]
>>> B1 = T.column_crystal[Integer(1)]; B1
The crystal of letters for type ['E', 6]
>>> B6 = T.column_crystal[Integer(6)]; B6
The crystal of letters for type ['E', 6] (dual)
>>> t = T(B6([-Integer(1)]),B1([-Integer(1),Integer(3)])); t
[(-1,), (-1, 3)]
>>> [t.epsilon(i) for i in T.index_set()]
[2, 0, 0, 0, 0, 0]
>>> [t.phi(i) for i in T.index_set()]
[0, 0, 1, 0, 0, 0]
>>> TestSuite(t).run()
```

class sage.combinat.crystals.highest_weight_crystals.**FiniteDimensionalHighestWeightCrystal_TypeE7**(*dom*
i-
nar

Bases: *FiniteDimensionalHighestWeightCrystal_TypeE*

Class of finite dimensional highest weight crystals of type E_7.

EXAMPLES:

```
sage: C=CartanType(['E',7])
sage: La=C.root_system().weight_lattice().fundamental_weights()
sage: T = crystals.HighestWeight(La[1])
sage: T.cardinality()
133
sage: B7 = T.column_crystal[7]; B7
The crystal of letters for type ['E', 7]
sage: t = T(B7([-5, 6]), B7([-2, 3])); t
[(-5, 6), (-2, 3)]
sage: [t.epsilon(i) for i in T.index_set()]
[0, 1, 0, 0, 1, 0, 0]
sage: [t.phi(i) for i in T.index_set()]
[0, 0, 1, 0, 0, 1, 0]
sage: TestSuite(t).run()
```

```
>>> from sage.all import *
>>> C=CartanType(['E',Integer(7)])
>>> La=C.root_system().weight_lattice().fundamental_weights()
>>> T = crystals.HighestWeight(La[Integer(1)])
>>> T.cardinality()
133
>>> B7 = T.column_crystal[Integer(7)]; B7
The crystal of letters for type ['E', 7]
>>> t = T(B7([-Integer(5), Integer(6)]), B7([-Integer(2), Integer(3)])); t
[(-5, 6), (-2, 3)]
>>> [t.epsilon(i) for i in T.index_set()]
[0, 1, 0, 0, 1, 0, 0]
>>> [t.phi(i) for i in T.index_set()]
[0, 0, 1, 0, 0, 1, 0]
>>> TestSuite(t).run()
```

sage.combinat.crystals.highest_weight_crystals.**HighestWeightCrystal**(*dominant_weight*, *model=None*)

Return the highest weight crystal of highest weight `dominant_weight` of the given `model`.

INPUT:

- `dominant_weight` – a dominant weight
- `model` – (optional) if not specified, then we have the following default models:
  - types A_n, B_n, C_n, D_n, G_2 - *tableaux*
  - types $E_{6,7}$ - *type E finite dimensional crystal*
  - all other types - *LS paths*

  otherwise can be one of the following:
  - `'Tableaux'` - *KN tableaux*
  - `'TypeE'` - *type E finite dimensional crystal*
  - `'NakajimaMonomials'` - *Nakajima monomials*
  - `'LSPaths'` - *LS paths*
  - `'AlcovePaths'` - *alcove paths*
  - `'GeneralizedYoungWalls'` - *generalized Young walls*
  - `'RiggedConfigurations'` - *rigged configurations*

EXAMPLES:

```
sage: La = RootSystem(['A',2]).weight_lattice().fundamental_weights()
sage: wt = La[1] + La[2]
sage: crystals.HighestWeight(wt)
The crystal of tableaux of type ['A', 2] and shape(s) [[2, 1]]

sage: La = RootSystem(['C',2]).weight_lattice().fundamental_weights()
sage: wt = 5*La[1] + La[2]
sage: crystals.HighestWeight(wt)
The crystal of tableaux of type ['C', 2] and shape(s) [[6, 1]]

sage: La = RootSystem(['B',2]).weight_lattice().fundamental_weights()
sage: wt = La[1] + La[2]
sage: crystals.HighestWeight(wt)
The crystal of tableaux of type ['B', 2] and shape(s) [[3/2, 1/2]]
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(2)]).weight_lattice().fundamental_weights()
>>> wt = La[Integer(1)] + La[Integer(2)]
>>> crystals.HighestWeight(wt)
The crystal of tableaux of type ['A', 2] and shape(s) [[2, 1]]

>>> La = RootSystem(['C',Integer(2)]).weight_lattice().fundamental_weights()
>>> wt = Integer(5)*La[Integer(1)] + La[Integer(2)]
>>> crystals.HighestWeight(wt)
The crystal of tableaux of type ['C', 2] and shape(s) [[6, 1]]
```

(continues on next page)

(continued from previous page)

```
>>> La = RootSystem(['B',Integer(2)]).weight_lattice().fundamental_weights()
>>> wt = La[Integer(1)] + La[Integer(2)]
>>> crystals.HighestWeight(wt)
The crystal of tableaux of type ['B', 2] and shape(s) [[3/2, 1/2]]
```

Some type E examples:

```
sage: C = CartanType(['E',6])
sage: La = C.root_system().weight_lattice().fundamental_weights()
sage: T = crystals.HighestWeight(La[1])
sage: T.cardinality()
27
sage: T = crystals.HighestWeight(La[6])
sage: T.cardinality()
27
sage: T = crystals.HighestWeight(La[2])
sage: T.cardinality()
78
sage: T = crystals.HighestWeight(La[4])
sage: T.cardinality()
2925
sage: T = crystals.HighestWeight(La[3])
sage: T.cardinality()
351
sage: T = crystals.HighestWeight(La[5])
sage: T.cardinality()
351

sage: C = CartanType(['E',7])
sage: La = C.root_system().weight_lattice().fundamental_weights()
sage: T = crystals.HighestWeight(La[1])
sage: T.cardinality()
133
sage: T = crystals.HighestWeight(La[2])
sage: T.cardinality()
912
sage: T = crystals.HighestWeight(La[3])
sage: T.cardinality()
8645
sage: T = crystals.HighestWeight(La[4])
sage: T.cardinality()
365750
sage: T = crystals.HighestWeight(La[5])
sage: T.cardinality()
27664
sage: T = crystals.HighestWeight(La[6])
sage: T.cardinality()
1539
sage: T = crystals.HighestWeight(La[7])
sage: T.cardinality()
56
```

```
>>> from sage.all import *
>>> C = CartanType(['E',Integer(6)])
>>> La = C.root_system().weight_lattice().fundamental_weights()
>>> T = crystals.HighestWeight(La[Integer(1)])
>>> T.cardinality()
27
>>> T = crystals.HighestWeight(La[Integer(6)])
>>> T.cardinality()
27
>>> T = crystals.HighestWeight(La[Integer(2)])
>>> T.cardinality()
78
>>> T = crystals.HighestWeight(La[Integer(4)])
>>> T.cardinality()
2925
>>> T = crystals.HighestWeight(La[Integer(3)])
>>> T.cardinality()
351
>>> T = crystals.HighestWeight(La[Integer(5)])
>>> T.cardinality()
351

>>> C = CartanType(['E',Integer(7)])
>>> La = C.root_system().weight_lattice().fundamental_weights()
>>> T = crystals.HighestWeight(La[Integer(1)])
>>> T.cardinality()
133
>>> T = crystals.HighestWeight(La[Integer(2)])
>>> T.cardinality()
912
>>> T = crystals.HighestWeight(La[Integer(3)])
>>> T.cardinality()
8645
>>> T = crystals.HighestWeight(La[Integer(4)])
>>> T.cardinality()
365750
>>> T = crystals.HighestWeight(La[Integer(5)])
>>> T.cardinality()
27664
>>> T = crystals.HighestWeight(La[Integer(6)])
>>> T.cardinality()
1539
>>> T = crystals.HighestWeight(La[Integer(7)])
>>> T.cardinality()
56
```

An example with an affine type:

```
sage: C = CartanType(['C',2,1])
sage: La = C.root_system().weight_lattice().fundamental_weights()
sage: T = crystals.HighestWeight(La[1])
sage: sorted(T.subcrystal(max_depth=3), key=str)
[(-Lambda[0] + 3*Lambda[1] - Lambda[2] - delta,),
```

(continues on next page)

(continued from previous page)

```
 (-Lambda[0] + Lambda[1] + Lambda[2] - delta,),
 (-Lambda[1] + 2*Lambda[2] - delta,),
 (2*Lambda[0] - Lambda[1],),
 (Lambda[0] + Lambda[1] - Lambda[2],),
 (Lambda[0] - Lambda[1] + Lambda[2],),
 (Lambda[1],)]
```

```
>>> from sage.all import *
>>> C = CartanType(['C',Integer(2),Integer(1)])
>>> La = C.root_system().weight_lattice().fundamental_weights()
>>> T = crystals.HighestWeight(La[Integer(1)])
>>> sorted(T.subcrystal(max_depth=Integer(3)), key=str)
[(-Lambda[0] + 3*Lambda[1] - Lambda[2] - delta,),
 (-Lambda[0] + Lambda[1] + Lambda[2] - delta,),
 (-Lambda[1] + 2*Lambda[2] - delta,),
 (2*Lambda[0] - Lambda[1],),
 (Lambda[0] + Lambda[1] - Lambda[2],),
 (Lambda[0] - Lambda[1] + Lambda[2],),
 (Lambda[1],)]
```

Using the various models:

```
sage: La = RootSystem(['F',4]).weight_lattice().fundamental_weights()
sage: wt = La[1] + La[4]
sage: crystals.HighestWeight(wt)
The crystal of LS paths of type ['F', 4] and weight Lambda[1] + Lambda[4]
sage: crystals.HighestWeight(wt, model='NakajimaMonomials')
Highest weight crystal of modified Nakajima monomials of
 Cartan type ['F', 4] and highest weight Lambda[1] + Lambda[4]
sage: crystals.HighestWeight(wt, model='AlcovePaths')
Highest weight crystal of alcove paths of type ['F', 4] and weight Lambda[1] +␣
↪Lambda[4]
sage: crystals.HighestWeight(wt, model='RiggedConfigurations')
Crystal of rigged configurations of type ['F', 4] and weight Lambda[1] + Lambda[4]
sage: La = RootSystem(['A',3,1]).weight_lattice().fundamental_weights()
sage: wt = La[0] + La[2]
sage: crystals.HighestWeight(wt, model='GeneralizedYoungWalls')
Highest weight crystal of generalized Young walls of
 Cartan type ['A', 3, 1] and highest weight Lambda[0] + Lambda[2]
```

```
>>> from sage.all import *
>>> La = RootSystem(['F',Integer(4)]).weight_lattice().fundamental_weights()
>>> wt = La[Integer(1)] + La[Integer(4)]
>>> crystals.HighestWeight(wt)
The crystal of LS paths of type ['F', 4] and weight Lambda[1] + Lambda[4]
>>> crystals.HighestWeight(wt, model='NakajimaMonomials')
Highest weight crystal of modified Nakajima monomials of
 Cartan type ['F', 4] and highest weight Lambda[1] + Lambda[4]
>>> crystals.HighestWeight(wt, model='AlcovePaths')
Highest weight crystal of alcove paths of type ['F', 4] and weight Lambda[1] +␣
↪Lambda[4]
>>> crystals.HighestWeight(wt, model='RiggedConfigurations')
```

(continues on next page)

(continued from previous page)

```
Crystal of rigged configurations of type ['F', 4] and weight Lambda[1] + Lambda[4]
>>> La = RootSystem(['A',Integer(3),Integer(1)]).weight_lattice().fundamental_
↪weights()
>>> wt = La[Integer(0)] + La[Integer(2)]
>>> crystals.HighestWeight(wt, model='GeneralizedYoungWalls')
Highest weight crystal of generalized Young walls of
 Cartan type ['A', 3, 1] and highest weight Lambda[0] + Lambda[2]
```

Induced crystals

We construct a crystal structure on a set induced by a bijection Φ.

AUTHORS:

- Travis Scrimshaw (2014-05-15): initial implementation

class sage.combinat.crystals.induced_structure.**InducedCrystal**(*X*, *phi*, *inverse*)

Bases: UniqueRepresentation, Parent

A crystal induced from an injection.

Let X be a set and let C be crystal and consider any injection $\Phi : X \to C$. We induce a crystal structure on X by considering Φ to be a crystal morphism.

Alternatively we can induce a crystal structure on some (sub)set of X by considering an injection $\Phi : C \to X$ considered as a crystal morphism. This form is also useful when the set X is not explicitly known.

INPUT:

- `X` – the base set
- `phi` – the map Φ
- `inverse` – (optional) the inverse map Φ^{-1}
- `from_crystal` – boolean (default: `False`); if the induced structure is of the second type $\Phi : C \to X$

EXAMPLES:

We construct a crystal structure of Gelfand-Tsetlin patterns by going through their bijection with semistandard tableaux:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,3))
sage: G = GelfandTsetlinPatterns(4, 3)
sage: phi = lambda x: D(x.to_tableau())
sage: phi_inv = lambda x: G(x.to_tableau())
sage: I = crystals.Induced(G, phi, phi_inv)
sage: I.digraph().is_isomorphic(D.digraph(), edge_labels=True)
True
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)], shapes=PartitionsInBox(Integer(4),
↪Integer(3)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(3))
>>> phi = lambda x: D(x.to_tableau())
>>> phi_inv = lambda x: G(x.to_tableau())
>>> I = crystals.Induced(G, phi, phi_inv)
```

(continues on next page)

(continued from previous page)

```
>>> I.digraph().is_isomorphic(D.digraph(), edge_labels=True)
True
```

Now we construct the above example but inducing the structure going the other way (from tableaux to Gelfand-Tsetlin patterns). This can also give us more information coming from the crystal.

```
sage: D2 = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,1))
sage: G2 = GelfandTsetlinPatterns(4, 1)
sage: phi2 = lambda x: D2(x.to_tableau())
sage: phi2_inv = lambda x: G2(x.to_tableau())
sage: I2 = crystals.Induced(D2, phi2_inv, phi2, from_crystal=True)
sage: I2.module_generators
([[0, 0, 0, 0], [0, 0, 0], [0, 0], [0]],
 [[1, 0, 0, 0], [1, 0, 0], [1, 0], [1]],
 [[1, 1, 0, 0], [1, 1, 0], [1, 1], [1]],
 [[1, 1, 1, 0], [1, 1, 1], [1, 1], [1]],
 [[1, 1, 1, 1], [1, 1, 1], [1, 1], [1]])
```

```
>>> from sage.all import *
>>> D2 = crystals.Tableaux(['A',Integer(3)], shapes=PartitionsInBox(Integer(4),
↪Integer(1)))
>>> G2 = GelfandTsetlinPatterns(Integer(4), Integer(1))
>>> phi2 = lambda x: D2(x.to_tableau())
>>> phi2_inv = lambda x: G2(x.to_tableau())
>>> I2 = crystals.Induced(D2, phi2_inv, phi2, from_crystal=True)
>>> I2.module_generators
([[0, 0, 0, 0], [0, 0, 0], [0, 0], [0]],
 [[1, 0, 0, 0], [1, 0, 0], [1, 0], [1]],
 [[1, 1, 0, 0], [1, 1, 0], [1, 1], [1]],
 [[1, 1, 1, 0], [1, 1, 1], [1, 1], [1]],
 [[1, 1, 1, 1], [1, 1, 1], [1, 1], [1]])
```

We check an example when the codomain is larger than the domain (although here the crystal structure is trivial):

```
sage: P = Permutations(4)
sage: D = crystals.Tableaux(['A',3], shapes=Partitions(4))
sage: T = crystals.TensorProduct(D, D)
sage: phi = lambda p: T(D(RSK(p)[0]), D(RSK(p)[1]))
sage: phi_inv = lambda d: RSK_inverse(d[0].to_tableau(), d[1].to_tableau(),␣
↪output='permutation')
sage: all(phi_inv(phi(p)) == p for p in P) # Check it really is the inverse
True
sage: I = crystals.Induced(P, phi, phi_inv)
sage: I.digraph()
Digraph on 24 vertices
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(4))
>>> D = crystals.Tableaux(['A',Integer(3)], shapes=Partitions(Integer(4)))
>>> T = crystals.TensorProduct(D, D)
>>> phi = lambda p: T(D(RSK(p)[Integer(0)]), D(RSK(p)[Integer(1)]))
>>> phi_inv = lambda d: RSK_inverse(d[Integer(0)].to_tableau(), d[Integer(1)].to_
```

(continues on next page)

(continued from previous page)

```
↪tableau(), output='permutation')
>>> all(phi_inv(phi(p)) == p for p in P) # Check it really is the inverse
True
>>> I = crystals.Induced(P, phi, phi_inv)
>>> I.digraph()
Digraph on 24 vertices
```

We construct an example without a specified inverse map:

```
sage: X = Words(2,4)
sage: L = crystals.Letters(['A',1])
sage: T = crystals.TensorProduct(*[L]*4)
sage: Phi = lambda x : T(*[L(i) for i in x])
sage: I = crystals.Induced(X, Phi)
sage: I.digraph()
Digraph on 16 vertices
```

```
>>> from sage.all import *
>>> X = Words(Integer(2),Integer(4))
>>> L = crystals.Letters(['A',Integer(1)])
>>> T = crystals.TensorProduct(*[L]*Integer(4))
>>> Phi = lambda x : T(*[L(i) for i in x])
>>> I = crystals.Induced(X, Phi)
>>> I.digraph()
Digraph on 16 vertices
```

class Element

Bases: `ElementWrapper`

An element of an induced crystal.

e(*i*)

Return e_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,3))
sage: G = GelfandTsetlinPatterns(4, 3)
sage: phi = lambda x: D(x.to_tableau())
sage: phi_inv = lambda x: G(x.to_tableau())
sage: I = crystals.Induced(G, phi, phi_inv)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: elt.e(1)
sage: elt.e(2)
[[1, 1, 0, 0], [1, 1, 0], [1, 1], [1]]
sage: elt.e(3)
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(3)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(3))
>>> phi = lambda x: D(x.to_tableau())
>>> phi_inv = lambda x: G(x.to_tableau())
```

(continues on next page)

(continued from previous page)

```
>>> I = crystals.Induced(G, phi, phi_inv)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> elt.e(Integer(1))
>>> elt.e(Integer(2))
[[1, 1, 0, 0], [1, 1, 0], [1, 1], [1]]
>>> elt.e(Integer(3))
```

epsilon(*i*)

Return ε_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,3))
sage: G = GelfandTsetlinPatterns(4, 3)
sage: phi = lambda x: D(x.to_tableau())
sage: phi_inv = lambda x: G(x.to_tableau())
sage: I = crystals.Induced(G, phi, phi_inv)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: [elt.epsilon(i) for i in I.index_set()]
[0, 1, 0]
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(3)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(3))
>>> phi = lambda x: D(x.to_tableau())
>>> phi_inv = lambda x: G(x.to_tableau())
>>> I = crystals.Induced(G, phi, phi_inv)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> [elt.epsilon(i) for i in I.index_set()]
[0, 1, 0]
```

f(*i*)

Return f_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,3))
sage: G = GelfandTsetlinPatterns(4, 3)
sage: phi = lambda x: D(x.to_tableau())
sage: phi_inv = lambda x: G(x.to_tableau())
sage: I = crystals.Induced(G, phi, phi_inv)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: elt.f(1)
[[1, 1, 0, 0], [1, 1, 0], [1, 0], [0]]
sage: elt.f(2)
sage: elt.f(3)
[[1, 1, 0, 0], [1, 0, 0], [1, 0], [1]]
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(3)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(3))
>>> phi = lambda x: D(x.to_tableau())
>>> phi_inv = lambda x: G(x.to_tableau())
>>> I = crystals.Induced(G, phi, phi_inv)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> elt.f(Integer(1))
[[1, 1, 0, 0], [1, 1, 0], [1, 0], [0]]
>>> elt.f(Integer(2))
>>> elt.f(Integer(3))
[[1, 1, 0, 0], [1, 0, 0], [1, 0], [1]]
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,3))
sage: G = GelfandTsetlinPatterns(4, 3)
sage: phi = lambda x: D(x.to_tableau())
sage: phi_inv = lambda x: G(x.to_tableau())
sage: I = crystals.Induced(G, phi, phi_inv)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: [elt.phi(i) for i in I.index_set()]
[1, 0, 1]
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(3)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(3))
>>> phi = lambda x: D(x.to_tableau())
>>> phi_inv = lambda x: G(x.to_tableau())
>>> I = crystals.Induced(G, phi, phi_inv)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> [elt.phi(i) for i in I.index_set()]
[1, 0, 1]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,3))
sage: G = GelfandTsetlinPatterns(4, 3)
sage: phi = lambda x: D(x.to_tableau())
sage: phi_inv = lambda x: G(x.to_tableau())
sage: I = crystals.Induced(G, phi, phi_inv)
```

(continues on next page)

(continued from previous page)

```
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: elt.weight()
(1, 0, 1, 0)
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(3)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(3))
>>> phi = lambda x: D(x.to_tableau())
>>> phi_inv = lambda x: G(x.to_tableau())
>>> I = crystals.Induced(G, phi, phi_inv)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> elt.weight()
(1, 0, 1, 0)
```

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: P = Permutations(4)
sage: D = crystals.Tableaux(['A',3], shapes=Partitions(4))
sage: T = crystals.TensorProduct(D, D)
sage: phi = lambda p: T(D(RSK(p)[0]), D(RSK(p)[1]))
sage: phi_inv = lambda d: RSK_inverse(d[0].to_tableau(), d[1].to_tableau(),␣
↪output='permutation')
sage: I = crystals.Induced(P, phi, phi_inv)
sage: I.cardinality() == factorial(4)
True
```

```
>>> from sage.all import *
>>> P = Permutations(Integer(4))
>>> D = crystals.Tableaux(['A',Integer(3)], shapes=Partitions(Integer(4)))
>>> T = crystals.TensorProduct(D, D)
>>> phi = lambda p: T(D(RSK(p)[Integer(0)]), D(RSK(p)[Integer(1)]))
>>> phi_inv = lambda d: RSK_inverse(d[Integer(0)].to_tableau(), d[Integer(1)].
↪to_tableau(), output='permutation')
>>> I = crystals.Induced(P, phi, phi_inv)
>>> I.cardinality() == factorial(Integer(4))
True
```

class sage.combinat.crystals.induced_structure.**InducedFromCrystal**(*X*, *phi*, *inverse*)

Bases: UniqueRepresentation, Parent

A crystal induced from an injection.

Alternatively we can induce a crystal structure on some (sub)set of X by considering an injection $\Phi : C \to X$ considered as a crystal morphism.

See also

InducedCrystal

INPUT:

- `X` – the base set
- `phi` – the map Φ
- `inverse` – (optional) the inverse map Φ^{-1}

EXAMPLES:

We construct a crystal structure on generalized permutations with a fixed first row by using RSK:

```
sage: C = crystals.Tableaux(['A',3], shape=[2,1])
sage: def psi(x):
....:     ret = RSK_inverse(x.to_tableau(), Tableau([[1,1],[2]]))
....:     return (tuple(ret[0]), tuple(ret[1]))
sage: psi_inv = lambda x: C(RSK(*x)[0])
sage: I = crystals.Induced(C, psi, psi_inv, from_crystal=True)
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['A',Integer(3)], shape=[Integer(2),Integer(1)])
>>> def psi(x):
...     ret = RSK_inverse(x.to_tableau(), Tableau([[Integer(1),Integer(1)],
↪[Integer(2)]]))
...     return (tuple(ret[Integer(0)]), tuple(ret[Integer(1)]))
>>> psi_inv = lambda x: C(RSK(*x)[Integer(0)])
>>> I = crystals.Induced(C, psi, psi_inv, from_crystal=True)
```

class Element

Bases: `ElementWrapper`

An element of an induced crystal.

e(i)

Return e_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,1))
sage: G = GelfandTsetlinPatterns(4, 1)
sage: def phi(x): return G(x.to_tableau())
sage: def phi_inv(x): return D(G(x).to_tableau())
sage: I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: elt.e(1)
sage: elt.e(2)
[[1, 1, 0, 0], [1, 1, 0], [1, 1], [1]]
sage: elt.e(3)
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(1)))
```

(continues on next page)

(continued from previous page)

```
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(1))
>>> def phi(x): return G(x.to_tableau())
>>> def phi_inv(x): return D(G(x).to_tableau())
>>> I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> elt.e(Integer(1))
>>> elt.e(Integer(2))
[[1, 1, 0, 0], [1, 1, 0], [1, 1], [1]]
>>> elt.e(Integer(3))
```

epsilon(i)

Return ε_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,1))
sage: G = GelfandTsetlinPatterns(4, 1)
sage: def phi(x): return G(x.to_tableau())
sage: def phi_inv(x): return D(G(x).to_tableau())
sage: I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: [elt.epsilon(i) for i in I.index_set()]
[0, 1, 0]
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(1)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(1))
>>> def phi(x): return G(x.to_tableau())
>>> def phi_inv(x): return D(G(x).to_tableau())
>>> I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> [elt.epsilon(i) for i in I.index_set()]
[0, 1, 0]
```

f(i)

Return f_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,1))
sage: G = GelfandTsetlinPatterns(4, 1)
sage: def phi(x): return G(x.to_tableau())
sage: def phi_inv(x): return D(G(x).to_tableau())
sage: I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: elt.f(1)
[[1, 1, 0, 0], [1, 1, 0], [1, 0], [0]]
sage: elt.f(2)
```

(continues on next page)

(continued from previous page)

```
sage: elt.f(3)
[[1, 1, 0, 0], [1, 0, 0], [1, 0], [1]]
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(1)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(1))
>>> def phi(x): return G(x.to_tableau())
>>> def phi_inv(x): return D(G(x).to_tableau())
>>> I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> elt.f(Integer(1))
[[1, 1, 0, 0], [1, 1, 0], [1, 0], [0]]
>>> elt.f(Integer(2))
>>> elt.f(Integer(3))
[[1, 1, 0, 0], [1, 0, 0], [1, 0], [1]]
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,1))
sage: G = GelfandTsetlinPatterns(4, 1)
sage: def phi(x): return G(x.to_tableau())
sage: def phi_inv(x): return D(G(x).to_tableau())
sage: I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: [elt.epsilon(i) for i in I.index_set()]
[0, 1, 0]
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(1)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(1))
>>> def phi(x): return G(x.to_tableau())
>>> def phi_inv(x): return D(G(x).to_tableau())
>>> I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> [elt.epsilon(i) for i in I.index_set()]
[0, 1, 0]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: D = crystals.Tableaux(['A',3], shapes=PartitionsInBox(4,1))
sage: G = GelfandTsetlinPatterns(4, 1)
```

(continues on next page)

(continued from previous page)

```
sage: def phi(x): return G(x.to_tableau())
sage: def phi_inv(x): return D(G(x).to_tableau())
sage: I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
sage: elt = I([[1, 1, 0, 0], [1, 1, 0], [1, 0], [1]])
sage: elt.weight()
(1, 0, 1, 0)
```

```
>>> from sage.all import *
>>> D = crystals.Tableaux(['A',Integer(3)],␣
↪shapes=PartitionsInBox(Integer(4),Integer(1)))
>>> G = GelfandTsetlinPatterns(Integer(4), Integer(1))
>>> def phi(x): return G(x.to_tableau())
>>> def phi_inv(x): return D(G(x).to_tableau())
>>> I = crystals.Induced(D, phi, phi_inv, from_crystal=True)
>>> elt = I([[Integer(1), Integer(1), Integer(0), Integer(0)],␣
↪[Integer(1), Integer(1), Integer(0)], [Integer(1), Integer(0)],␣
↪[Integer(1)]])
>>> elt.weight()
(1, 0, 1, 0)
```

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: C = crystals.Tableaux(['A',3], shape=[2,1])
sage: def psi(x):
....:     ret = RSK_inverse(x.to_tableau(), Tableau([[1,1],[2]]))
....:     return (tuple(ret[0]), tuple(ret[1]))
sage: psi_inv = lambda x: C(RSK(*x)[0])
sage: I = crystals.Induced(C, psi, psi_inv, from_crystal=True)
sage: I.cardinality() == C.cardinality()
True
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['A',Integer(3)], shape=[Integer(2),Integer(1)])
>>> def psi(x):
...     ret = RSK_inverse(x.to_tableau(), Tableau([[Integer(1),Integer(1)],
↪[Integer(2)]]))
...     return (tuple(ret[Integer(0)]), tuple(ret[Integer(1)]))
>>> psi_inv = lambda x: C(RSK(*x)[Integer(0)])
>>> I = crystals.Induced(C, psi, psi_inv, from_crystal=True)
>>> I.cardinality() == C.cardinality()
True
```

Kirillov-Reshetikhin crystals

class sage.combinat.crystals.kirillov_reshetikhin.**AmbientRetractMap**(*base*, *ambient*, *pdict_inv*, *index_set*, *similarity_factor_domain=None*, *automorphism=None*)

Bases: `Map`

The retraction map from the ambient crystal.

Consider a crystal embedding $\phi : X \to Y$, then the elements X can be considered as a subcrystal of the ambient crystal Y. The ambient retract is the partial map $\tilde{\phi} : Y \to X$ such that $\tilde{\phi} \circ \phi$ is the identity on X.

class sage.combinat.crystals.kirillov_reshetikhin.**CrystalDiagramAutomorphism**(*C*, *on_hw*, *index_set=None*, *automorphism=None*, *cache=True*)

Bases: CrystalMorphism

The crystal automorphism induced from the diagram automorphism.

For example, in type $A_n^{(1)}$ this is the promotion operator and in type $D_n^{(1)}$, this corresponds to the automorphism induced from interchanging the 0 and 1 nodes in the Dynkin diagram.

INPUT:

- `C` – a crystal
- `on_hw` – a function for the images of the `index_set`-highest weight elements
- `index_set` – (default: the empty set) the index set
- `automorphism` – (default: the identity) the twisting automorphism
- `cache` – boolean (default: `True`); cache the result

is_embedding()

alias of *is_isomorphism()*.

is_isomorphism()

Return `True` as `self` is a crystal isomorphism.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: K.promotion().is_isomorphism()
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.promotion().is_isomorphism()
True
```

is_strict()

alias of *is_isomorphism()*.

is_surjective()

alias of *is_isomorphism()*.

class sage.combinat.crystals.kirillov_reshetikhin.**CrystalOfTableaux_E7**(*cartan_type*, *shapes*)

Bases: *CrystalOfTableaux*

The type E_7 crystal $B(s\Lambda_7)$.

This is a helper class for the corresponding:class:$KRcrystal < sage.combinat.crystals.kirillov_reshetikhin.KR_type_E7 > B^{7,s}$.

module_generator(*shape*)

Return the module generator of `self` with shape `shape`.

> **Note**
>
> Only implemented for single rows (i.e., highest weight $s\Lambda_7$).

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import␣
↪CrystalOfTableaux_E7
sage: T = CrystalOfTableaux_E7(CartanType(['E',7]), shapes=(Partition([5]),))
sage: T.module_generator([5])
[[(7,), (7,), (7,), (7,), (7,)]]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import CrystalOfTableaux_
↪E7
>>> T = CrystalOfTableaux_E7(CartanType(['E',Integer(7)]),␣
↪shapes=(Partition([Integer(5)]),))
>>> T.module_generator([Integer(5)])
[[(7,), (7,), (7,), (7,), (7,)]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_A**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinCrystalFromPromotion*

Class of Kirillov-Reshetikhin crystals of type $A_n^{(1)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: b = K(rows=[[1,2],[2,4]])
sage: b.f(0)
[[1, 1], [2, 2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> b = K(rows=[[Integer(1),Integer(2)],[Integer(2),Integer(4)]])
>>> b.f(Integer(0))
[[1, 1], [2, 2]]
```

classical_decomposition()

Specifies the classical crystal underlying the KR crystal of type A.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['A', 3] and shape(s) [[2, 2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['A', 3] and shape(s) [[2, 2]]
```

dynkin_diagram_automorphism(*i*)

Specifies the Dynkin diagram automorphism underlying the promotion action on the crystal elements. The automorphism needs to map node 0 to some other Dynkin node.

For type A we use the Dynkin diagram automorphism which $i \mapsto i+1 \mod n+1$, where n is the rank.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: K.dynkin_diagram_automorphism(0)
1
sage: K.dynkin_diagram_automorphism(3)
0
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.dynkin_diagram_automorphism(Integer(0))
1
>>> K.dynkin_diagram_automorphism(Integer(3))
0
```

promotion()

Specifies the promotion operator used to construct the affine type A crystal.

For type A this corresponds to the Dynkin diagram automorphism which $i \mapsto i+1 \mod n+1$, where n is the rank.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: b = K.classical_decomposition()(rows=[[1,2],[3,4]])
sage: K.promotion()(b)
[[1, 3], [2, 4]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> b = K.classical_decomposition()(rows=[[Integer(1),Integer(2)],[Integer(3),
↪Integer(4)]])
>>> K.promotion()(b)
[[1, 3], [2, 4]]
```

promotion_inverse()

Specifies the inverse promotion operator used to construct the affine type A crystal.

For type A this corresponds to the Dynkin diagram automorphism which $i \mapsto i-1 \mod n+1$, where n is the rank.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: b = K.classical_decomposition()(rows=[[1,3],[2,4]])
sage: K.promotion_inverse()(b)
[[1, 2], [3, 4]]
sage: b = K.classical_decomposition()(rows=[[1,2],[3,3]])
sage: K.promotion_inverse()(K.promotion()(b))
[[1, 2], [3, 3]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> b = K.classical_decomposition()(rows=[[Integer(1),Integer(3)],[Integer(2),
↪Integer(4)]])
>>> K.promotion_inverse()(b)
[[1, 2], [3, 4]]
>>> b = K.classical_decomposition()(rows=[[Integer(1),Integer(2)],[Integer(3),
↪Integer(3)]])
>>> K.promotion_inverse()(K.promotion()(b))
[[1, 2], [3, 3]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_A2**(*cartan_type*, *r*, *s*, *dual=None*)

Bases: *KirillovReshetikhinGenericCrystal*

Class of Kirillov-Reshetikhin crystals $B^{r,s}$ of type $A_{2n}^{(2)}$ for $1 \leq r \leq n$ in the realization with classical subalgebra B_n. The Cartan type in this case is inputted as the dual of $A_{2n}^{(2)}$.

This is an alternative implementation to *KR_type_box* that uses the classical decomposition into type C_n crystals.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 1)
sage: K
Kirillov-Reshetikhin crystal of type ['BC', 2, 2]^* with (r,s)=(1,1)
sage: b = K(rows=[[-1]])
sage: b.f(0)
[[1]]
sage: b.e(0)
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(1))
>>> K
Kirillov-Reshetikhin crystal of type ['BC', 2, 2]^* with (r,s)=(1,1)
>>> b = K(rows=[[-Integer(1)]])
>>> b.f(Integer(0))
[[1]]
>>> b.e(Integer(0))
```

We can now check whether the two KR crystals of type $A_4^{(2)}$ (namely the KR crystal and its dual construction) are isomorphic up to relabelling of the edges:

```
sage: C = CartanType(['A',4,2])
sage: K = crystals.KirillovReshetikhin(C,1,1)
sage: Kdual = crystals.KirillovReshetikhin(C.dual(),1,1)
sage: G = K.digraph()
sage: Gdual = Kdual.digraph()
sage: f = {0:2, 1:1, 2:0}
sage: Gnew = DiGraph(); Gnew.add_vertices(Gdual.vertices(sort=True)); Gnew.add_
↪edges([(u,v,f[i]) for u, v, i in Gdual.edges(sort=True)])
sage: G.is_isomorphic(Gnew, edge_labels=True)
True
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)])
>>> K = crystals.KirillovReshetikhin(C,Integer(1),Integer(1))
>>> Kdual = crystals.KirillovReshetikhin(C.dual(),Integer(1),Integer(1))
>>> G = K.digraph()
>>> Gdual = Kdual.digraph()
>>> f = {Integer(0):Integer(2), Integer(1):Integer(1), Integer(2):Integer(0)}
>>> Gnew = DiGraph(); Gnew.add_vertices(Gdual.vertices(sort=True)); Gnew.add_
↪edges([(u,v,f[i]) for u, v, i in Gdual.edges(sort=True)])
>>> G.is_isomorphic(Gnew, edge_labels=True)
True
```

Element

alias of *KR_type_A2Element*

ambient_crystal()

Return the ambient crystal $B^{r,s}$ of type $B^{(1)}_{n+1}$ associated to the Kirillov-Reshetikhin crystal of type $A^{(2)}_{2n}$ dual.

This ambient crystal is used to construct the zero arrows.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 2, 3)
sage: K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['B', 3, 1] with (r,s)=(2,3)
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(2),␣
↪Integer(3))
>>> K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['B', 3, 1] with (r,s)=(2,3)
```

ambient_dict_pm_diagrams()

Return a dictionary of all self-dual $\pm$ diagrams for the ambient crystal whose keys are their inner shape.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 1)
```

(continues on next page)

(continued from previous page)

```
sage: K.ambient_dict_pm_diagrams()
{[1]: [[0, 0], [1]]}
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 2)
sage: K.ambient_dict_pm_diagrams()
{[]: [[1, 1], [0]], [2]: [[0, 0], [2]]}
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 2, 2)
sage: K.ambient_dict_pm_diagrams()
{[]: [[1, 1], [0, 0], [0]],
 [2]: [[0, 0], [1, 1], [0]],
 [2, 2]: [[0, 0], [0, 0], [2]]}
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(1))
>>> K.ambient_dict_pm_diagrams()
{[1]: [[0, 0], [1]]}
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(2))
>>> K.ambient_dict_pm_diagrams()
{[]: [[1, 1], [0]], [2]: [[0, 0], [2]]}
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(2),␣
↪Integer(2))
>>> K.ambient_dict_pm_diagrams()
{[]: [[1, 1], [0, 0], [0]],
 [2]: [[0, 0], [1, 1], [0]],
 [2, 2]: [[0, 0], [0, 0], [2]]}
```

ambient_highest_weight_dict()

Return a dictionary of all $\{2, \ldots, n+1\}$-highest weight vectors in the ambient crystal.

The key is the inner shape of their corresponding $\pm$ diagram, or equivalently, their $\{2, \ldots, n+1\}$ weight.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 2)
sage: K.ambient_highest_weight_dict()
{[]: [[1, -1]], [2]: [[2, 2]]}
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(2))
>>> K.ambient_highest_weight_dict()
{[]: [[1, -1]], [2]: [[2, 2]]}
```

classical_decomposition()

Return the classical crystal underlying the Kirillov-Reshetikhin crystal of type $A_{2n}^{(2)}$ with B_n as classical subdiagram.

It is given by $B^{r,s} \cong \bigoplus_{\Lambda} B(\Lambda)$, where $B(\Lambda)$ is a highest weight crystal of type B_n of highest weight Λ. The sum is over all weights Λ obtained from a rectangle of width s and height r by removing horizontal dominoes.

Here we identify the fundamental weight Λ_i with a column of height i.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 2, 2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['B', 2] and shape(s) [[], [2], [2, 2]]
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(2),␣
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['B', 2] and shape(s) [[], [2], [2, 2]]
```

from_ambient_crystal()

Return a map from the ambient crystal of type $B^{(1)}_{n+1}$ to the Kirillov-Reshetikhin crystal of type $A^{(2)}_{2n}$.

Note that this map is only well-defined on type $A^{(2)}_{2n}$ elements that are in the image under *to_ambient_crystal()*.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 2)
sage: b = K.ambient_crystal()(rows=[[2,2]])
sage: K.from_ambient_crystal()(b)
[[1, 1]]
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(2))
>>> b = K.ambient_crystal()(rows=[[Integer(2),Integer(2)]])
>>> K.from_ambient_crystal()(b)
[[1, 1]]
```

highest_weight_dict()

Return a dictionary of the classical highest weight vectors of `self` whose keys are their shape.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 2)
sage: K.highest_weight_dict()
{[]: [], [2]: [[1, 1]]}
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(2))
>>> K.highest_weight_dict()
{[]: [], [2]: [[1, 1]]}
```

module_generator()

Return the unique module generator of classical weight $s\Lambda_r$ of a Kirillov-Reshetikhin crystal $B^{r,s}$.

EXAMPLES:

```
sage: ct = CartanType(['A',8,2]).dual()
sage: K = crystals.KirillovReshetikhin(ct, 3, 5)
sage: K.module_generator()
[[1, 1, 1, 1, 1], [2, 2, 2, 2, 2], [3, 3, 3, 3, 3]]
```

```
>>> from sage.all import *
>>> ct = CartanType(['A',Integer(8),Integer(2)]).dual()
>>> K = crystals.KirillovReshetikhin(ct, Integer(3), Integer(5))
>>> K.module_generator()
[[1, 1, 1, 1, 1], [2, 2, 2, 2, 2], [3, 3, 3, 3, 3]]
```

to_ambient_crystal()

Return a map from the Kirillov-Reshetikhin crystal of type $A_{2n}^{(2)}$ to the ambient crystal of type $B_{n+1}^{(1)}$.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 2)
sage: b=K(rows=[[1,1]])
sage: K.to_ambient_crystal()(b)
[[2, 2]]
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 2, 2)
sage: b=K(rows=[[1,1]])
sage: K.to_ambient_crystal()(b)
[[1, 2], [2, -1]]
sage: K.to_ambient_crystal()(b).parent()
Kirillov-Reshetikhin crystal of type ['B', 3, 1] with (r,s)=(2,2)
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(2))
>>> b=K(rows=[[Integer(1),Integer(1)]])
>>> K.to_ambient_crystal()(b)
[[2, 2]]
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(2),␣
↪Integer(2))
>>> b=K(rows=[[Integer(1),Integer(1)]])
>>> K.to_ambient_crystal()(b)
[[1, 2], [2, -1]]
>>> K.to_ambient_crystal()(b).parent()
Kirillov-Reshetikhin crystal of type ['B', 3, 1] with (r,s)=(2,2)
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_A2Element**

Bases: *KirillovReshetikhinGenericCrystalElement*

Class for the elements in the Kirillov-Reshetikhin crystals $B^{r,s}$ of type $A_{2n}^{(2)}$ for $r < n$ with underlying classical algebra B_n.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 2)
sage: type(K.module_generators[0])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2_with_category.
↪element_class'>
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(2))
>>> type(K.module_generators[Integer(0)])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2_with_category.
↪element_class'>
```

e0()

Return e_0 on `self` by mapping `self` to the ambient crystal, calculating $e_1 e_0$ there and pulling the element back.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 1)
sage: b = K(rows=[[1]])
sage: b.e(0) # indirect doctest
[[-1]]
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(1))
>>> b = K(rows=[[Integer(1)]])
>>> b.e(Integer(0)) # indirect doctest
[[-1]]
```

epsilon0()

Calculate ε_0 of `self` by mapping the element to the ambient crystal and calculating `\varepsilon_1` there.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 1)
sage: b=K(rows=[[1]])
sage: b.epsilon(0) # indirect doctest
1
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(1))
>>> b=K(rows=[[Integer(1)]])
>>> b.epsilon(Integer(0)) # indirect doctest
1
```

f0()

Return f_0 on `self` by mapping `self` to the ambient crystal, calculating $f_1 f_0$ there and pulling the element back.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 1)
sage: b = K(rows=[[-1]])
sage: b.f(0) # indirect doctest
[[1]]
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(1))
>>> b = K(rows=[[-Integer(1)]])
>>> b.f(Integer(0)) # indirect doctest
[[1]]
```

phi0()

Calculate φ_0 of `self` by mapping the element to the ambient crystal and calculating φ_1 there.

EXAMPLES:

```
sage: C = CartanType(['A',4,2]).dual()
sage: K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, 1, 1)
sage: b = K(rows=[[-1]])
sage: b.phi(0) # indirect doctest
1
```

```
>>> from sage.all import *
>>> C = CartanType(['A',Integer(4),Integer(2)]).dual()
>>> K = sage.combinat.crystals.kirillov_reshetikhin.KR_type_A2(C, Integer(1),␣
↪Integer(1))
>>> b = K(rows=[[-Integer(1)]])
>>> b.phi(Integer(0)) # indirect doctest
1
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_Bn**(*cartan_type*, *r*, *s*, *dual=None*)

Bases: *KirillovReshetikhinGenericCrystal*

Class of Kirillov-Reshetikhin crystals $B^{n,s}$ of type $B_n^{(1)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,2)
sage: K
Kirillov-Reshetikhin crystal of type ['B', 3, 1] with (r,s)=(3,2)
sage: b = K(rows=[[1],[2],[3]])
sage: b.f(0)
sage: b.e(0)
[[3]]
```

(continues on next page)

(continued from previous page)

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,2)
sage: [b.weight() for b in K if b.is_highest_weight([1,2,3])]
[-Lambda[0] + Lambda[1], -2*Lambda[0] + 2*Lambda[3]]
sage: [b.weight() for b in K if b.is_highest_weight([0,2,3])]
[Lambda[0] - Lambda[1], -2*Lambda[1] + 2*Lambda[3]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> K
Kirillov-Reshetikhin crystal of type ['B', 3, 1] with (r,s)=(3,2)
>>> b = K(rows=[[Integer(1)],[Integer(2)],[Integer(3)]])
>>> b.f(Integer(0))
>>> b.e(Integer(0))
[[3]]

>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> [b.weight() for b in K if b.is_highest_weight([Integer(1),Integer(2),
↪Integer(3)])]
[-Lambda[0] + Lambda[1], -2*Lambda[0] + 2*Lambda[3]]
>>> [b.weight() for b in K if b.is_highest_weight([Integer(0),Integer(2),
↪Integer(3)])]
[Lambda[0] - Lambda[1], -2*Lambda[1] + 2*Lambda[3]]
```

Element

alias of *KR_type_BnElement*

ambient_crystal()

Return the ambient crystal $B^{n,s}$ of type $A^{(2)}_{2n-1}$ associated to the Kirillov-Reshetikhin crystal.

The ambient crystal is used to construct the zero arrows.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,2)
sage: K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['B', 3, 1]^* with (r,s)=(3,2)
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['B', 3, 1]^* with (r,s)=(3,2)
```

ambient_highest_weight_dict()

Return a dictionary of the classical highest weight vectors of the ambient crystal of `self` whose keys are their shape.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,2)
sage: K.ambient_highest_weight_dict()
```

(continues on next page)

(continued from previous page)

```
{(2,): [[1, 1]], (2, 1, 1): [[1, 1], [2], [3]], (2, 2, 2): [[1, 1], [2, 2],␣
↪[3, 3]]}

sage: K = crystals.KirillovReshetikhin(['B',3,1],3,3)
sage: K.ambient_highest_weight_dict()
{(3,): [[1, 1, 1]],
 (3, 1, 1): [[1, 1, 1], [2], [3]],
 (3, 2, 2): [[1, 1, 1], [2, 2], [3, 3]],
 (3, 3, 3): [[1, 1, 1], [2, 2, 2], [3, 3, 3]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> K.ambient_highest_weight_dict()
{(2,): [[1, 1]], (2, 1, 1): [[1, 1], [2], [3]], (2, 2, 2): [[1, 1], [2, 2],␣
↪[3, 3]]}

>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(3))
>>> K.ambient_highest_weight_dict()
{(3,): [[1, 1, 1]],
 (3, 1, 1): [[1, 1, 1], [2], [3]],
 (3, 2, 2): [[1, 1, 1], [2, 2], [3, 3]],
 (3, 3, 3): [[1, 1, 1], [2, 2, 2], [3, 3, 3]]}
```

classical_decomposition()

Return the classical crystal underlying the Kirillov-Reshetikhin crystal $B^{n,s}$ of type $B_n^{(1)}$.

It is the same as for $r < n$, given by $B^{n,s} \cong \bigoplus_\Lambda B(\Lambda)$, where Λ are weights obtained from a rectangle of width $s/2$ and height n by removing horizontal dominoes. Here we identify the fundamental weight Λ_i with a column of height i for $i < n$ and a column of width $1/2$ for $i = n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1], 3, 2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[1], [1, 1, 1]]
sage: K = crystals.KirillovReshetikhin(['B',3,1], 3, 3)
sage: K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[3/2, 1/2, 1/2], [3/2,␣
↪3/2, 3/2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)], Integer(3),␣
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[1], [1, 1, 1]]
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)], Integer(3),␣
↪Integer(3))
>>> K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[3/2, 1/2, 1/2], [3/2,␣
↪3/2, 3/2]]
```

from_ambient_crystal()

Return a map from the ambient crystal of type $A^{(2)}_{2n-1}$ to the Kirillov-Reshetikhin crystal `self`.

Note that this map is only well-defined on elements that are in the image under *to_ambient_crystal()*.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,1)
sage: [b == K.from_ambient_crystal()(K.to_ambient_crystal()(b)) for b in K]
[True, True, True, True, True, True, True, True]
sage: b = K.ambient_crystal()(rows=[[1],[2],[-3]])
sage: K.from_ambient_crystal()(b)
[++-, []]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(1))
>>> [b == K.from_ambient_crystal()(K.to_ambient_crystal()(b)) for b in K]
[True, True, True, True, True, True, True, True]
>>> b = K.ambient_crystal()(rows=[[Integer(1)],[Integer(2)],[-Integer(3)]])
>>> K.from_ambient_crystal()(b)
[++-, []]
```

highest_weight_dict()

Return a dictionary of the classical highest weight vectors of `self` whose keys are 2 times their shape.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,2)
sage: K.highest_weight_dict()
{(2,): [[1]], (2, 2, 2): [[1], [2], [3]]}
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,3)
sage: K.highest_weight_dict()
{(3, 1, 1): [+++, [[1]]], (3, 3, 3): [+++, [[1], [2], [3]]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> K.highest_weight_dict()
{(2,): [[1]], (2, 2, 2): [[1], [2], [3]]}
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(3))
>>> K.highest_weight_dict()
{(3, 1, 1): [+++, [[1]]], (3, 3, 3): [+++, [[1], [2], [3]]]}
```

similarity_factor()

Set the similarity factor used to map to the ambient crystal.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,2)
sage: K.similarity_factor()
{1: 2, 2: 2, 3: 1}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> K.similarity_factor()
{1: 2, 2: 2, 3: 1}
```

to_ambient_crystal()

Return a map from `self` to the ambient crystal of type $A^{(2)}_{2n-1}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,1)
sage: [K.to_ambient_crystal()(b) for b in K]
[[[1], [2], [3]], [[1], [2], [-3]], [[1], [3], [-2]], [[2], [3], [-1]], [[1],␣
↪[-3], [-2]],
[[2], [-3], [-1]], [[3], [-2], [-1]], [[-3], [-2], [-1]]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(1))
>>> [K.to_ambient_crystal()(b) for b in K]
[[[1], [2], [3]], [[1], [2], [-3]], [[1], [3], [-2]], [[2], [3], [-1]], [[1],␣
↪[-3], [-2]],
[[2], [-3], [-1]], [[3], [-2], [-1]], [[-3], [-2], [-1]]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_BnElement**

Bases: *KirillovReshetikhinGenericCrystalElement*

Class for the elements in the Kirillov-Reshetikhin crystals $B^{n,s}$ of type $B^{(1)}_n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B', 3, 1], 3, 2)
sage: type(K.module_generators[0])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_Bn_with_category.
↪element_class'>
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B', Integer(3), Integer(1)], Integer(3),␣
↪Integer(2))
>>> type(K.module_generators[Integer(0)])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_Bn_with_category.
↪element_class'>
```

e0()

Return e_0 on `self` by mapping `self` to the ambient crystal, calculating e_0 there and pulling the element back.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B',3,1],3,1)
sage: b = K.module_generators[0]
sage: b.e(0) # indirect doctest
[--+, []]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)],Integer(3),
↪Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.e(Integer(0)) # indirect doctest
[--+, []]
```

epsilon0()

Calculate ε_0 of `self` by mapping the element to the ambient crystal and calculating ε_0 there.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B', 3, 1], 3, 1)
sage: b = K.module_generators[0]
sage: b.epsilon(0) # indirect doctest
1
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B', Integer(3), Integer(1)],␣
↪Integer(3), Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.epsilon(Integer(0)) # indirect doctest
1
```

f0()

Return f_0 on `self` by mapping `self` to the ambient crystal, calculating f_0 there and pulling the element back.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B', 3, 1], 3, 1)
sage: b = K.module_generators[0]
sage: b.f(0) # indirect doctest
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B', Integer(3), Integer(1)],␣
↪Integer(3), Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.f(Integer(0)) # indirect doctest
```

phi0()

Calculate φ_0 of `self` by mapping the element to the ambient crystal and calculating φ_0 there.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['B', 3, 1], 3, 1)
sage: b = K.module_generators[0]
sage: b.phi(0) # indirect doctest
0
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['B', Integer(3), Integer(1)],␣
↪Integer(3), Integer(1))
```

(continues on next page)

(continued from previous page)

```
>>> b = K.module_generators[Integer(0)]
>>> b.phi(Integer(0)) # indirect doctest
0
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_C**(*cartan_type*, *r*, *s*, *dual=None*)

Bases: *KirillovReshetikhinGenericCrystal*

Class of Kirillov-Reshetikhin crystals $B^{r,s}$ of type $C_n^{(1)}$ for $r < n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',2,1], 1,2)
sage: K
Kirillov-Reshetikhin crystal of type ['C', 2, 1] with (r,s)=(1,2)
sage: b = K(rows=[])
sage: b.f(0)
[[1, 1]]
sage: b.e(0)
[[-1, -1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(2),Integer(1)], Integer(1),
↪Integer(2))
>>> K
Kirillov-Reshetikhin crystal of type ['C', 2, 1] with (r,s)=(1,2)
>>> b = K(rows=[])
>>> b.f(Integer(0))
[[1, 1]]
>>> b.e(Integer(0))
[[-1, -1]]
```

Element

alias of *KR_type_CElement*

ambient_crystal()

Return the ambient crystal $B^{r,s}$ of type $A_{2n+1}^{(2)}$ associated to the Kirillov-Reshetikhin crystal of type $C_n^{(1)}$.

This ambient crystal is used to construct the zero arrows.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,3)
sage: K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['B', 4, 1]^* with (r,s)=(2,3)
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(3))
>>> K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['B', 4, 1]^* with (r,s)=(2,3)
```

ambient_dict_pm_diagrams()

Return a dictionary of all self-dual $\pm$ diagrams for the ambient crystal whose keys are their inner shape.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',2,1], 1,2)
sage: K.ambient_dict_pm_diagrams()
{[]: [[1, 1], [0]], [2]: [[0, 0], [2]]}
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,2)
sage: K.ambient_dict_pm_diagrams()
{[]: [[1, 1], [0, 0], [0]],
 [2]: [[0, 0], [1, 1], [0]],
 [2, 2]: [[0, 0], [0, 0], [2]]}
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,3)
sage: K.ambient_dict_pm_diagrams()
{[1, 1]: [[1, 1], [0, 0], [1]],
 [3, 1]: [[0, 0], [1, 1], [1]],
 [3, 3]: [[0, 0], [0, 0], [3]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(2),Integer(1)], Integer(1),
↪Integer(2))
>>> K.ambient_dict_pm_diagrams()
{[]: [[1, 1], [0]], [2]: [[0, 0], [2]]}
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.ambient_dict_pm_diagrams()
{[]: [[1, 1], [0, 0], [0]],
 [2]: [[0, 0], [1, 1], [0]],
 [2, 2]: [[0, 0], [0, 0], [2]]}
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(3))
>>> K.ambient_dict_pm_diagrams()
{[1, 1]: [[1, 1], [0, 0], [1]],
 [3, 1]: [[0, 0], [1, 1], [1]],
 [3, 3]: [[0, 0], [0, 0], [3]]}
```

ambient_highest_weight_dict()

Return a dictionary of all $\{2, \ldots, n+1\}$-highest weight vectors in the ambient crystal.

The key is the inner shape of their corresponding $\pm$ diagram, or equivalently, their $\{2, \ldots, n+1\}$ weight.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,2)
sage: K.ambient_highest_weight_dict()
{[]: [[2], [-2]], [2]: [[1, 2], [2, -1]], [2, 2]: [[2, 2], [3, 3]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.ambient_highest_weight_dict()
{[]: [[2], [-2]], [2]: [[1, 2], [2, -1]], [2, 2]: [[2, 2], [3, 3]]}
```

classical_decomposition()

Return the classical crystal underlying the Kirillov-Reshetikhin crystal of type $C_n^{(1)}$.

It is given by $B^{r,s} \cong \bigoplus_{\Lambda} B(\Lambda)$, where Λ are weights obtained from a rectangle of width s and height r by removing horizontal dominoes. Here we identify the fundamental weight Λ_i with a column of height i.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['C', 3] and shape(s) [[], [2], [2, 2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['C', 3] and shape(s) [[], [2], [2, 2]]
```

from_ambient_crystal()

Return a map from the ambient crystal of type $A_{2n+1}^{(2)}$ to the Kirillov-Reshetikhin crystal of type $C_n^{(1)}$.

Note that this map is only well-defined on type $C_n^{(1)}$ elements that are in the image under *to_ambient_crystal()*.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,2)
sage: b = K.ambient_crystal()(rows=[[2,2],[3,3]])
sage: K.from_ambient_crystal()(b)
[[1, 1], [2, 2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> b = K.ambient_crystal()(rows=[[Integer(2),Integer(2)],[Integer(3),
↪Integer(3)]])
>>> K.from_ambient_crystal()(b)
[[1, 1], [2, 2]]
```

highest_weight_dict()

Return a dictionary of the classical highest weight vectors of `self` whose keys are their shape.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,2)
sage: K.highest_weight_dict()
{[]: [], [2]: [[1, 1]], [2, 2]: [[1, 1], [2, 2]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> K.highest_weight_dict()
{[]: [], [2]: [[1, 1]], [2, 2]: [[1, 1], [2, 2]]}
```

to_ambient_crystal()

Return a map from the Kirillov-Reshetikhin crystal of type $C_n^{(1)}$ to the ambient crystal of type $A_{2n+1}^{(2)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1], 2,2)
sage: b=K(rows=[[1,1]])
sage: K.to_ambient_crystal()(b)
[[1, 2], [2, -1]]
sage: b=K(rows=[])
sage: K.to_ambient_crystal()(b)
[[2], [-2]]
sage: K.to_ambient_crystal()(b).parent()
Kirillov-Reshetikhin crystal of type ['B', 4, 1]^* with (r,s)=(2,2)
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)], Integer(2),
↪Integer(2))
>>> b=K(rows=[[Integer(1),Integer(1)]])
>>> K.to_ambient_crystal()(b)
[[1, 2], [2, -1]]
>>> b=K(rows=[])
>>> K.to_ambient_crystal()(b)
[[2], [-2]]
>>> K.to_ambient_crystal()(b).parent()
Kirillov-Reshetikhin crystal of type ['B', 4, 1]^* with (r,s)=(2,2)
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_CElement**

Bases: *KirillovReshetikhinGenericCrystalElement*

Class for the elements in the Kirillov-Reshetikhin crystals $B^{r,s}$ of type $C_n^{(1)}$ for $r < n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C', 3, 1], 1, 2)
sage: type(K.module_generators[0])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_C_with_category.
↪element_class'>
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)], Integer(1),␣
↪Integer(2))
>>> type(K.module_generators[Integer(0)])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_C_with_category.
↪element_class'>
```

e0()

Return e_0 on `self` by mapping `self` to the ambient crystal, calculating $e_1 e_0$ there and pulling the element back.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C', 3, 1], 1, 2)
sage: b = K(rows=[])
sage: b.e(0) # indirect doctest
[[-1, -1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)],␣
↪Integer(1), Integer(2))
>>> b = K(rows=[])
>>> b.e(Integer(0)) # indirect doctest
[[-1, -1]]
```

epsilon0()

Calculate ε_0 of `self` by mapping the element to the ambient crystal and calculating ε_1 there.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',2,1], 1,2)
sage: b=K(rows=[[1,1]])
sage: b.epsilon(0) # indirect doctest
2
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(2),Integer(1)], Integer(1),
↪Integer(2))
>>> b=K(rows=[[Integer(1),Integer(1)]])
>>> b.epsilon(Integer(0)) # indirect doctest
2
```

f0()

Return f_0 on `self` by mapping `self` to the ambient crystal, calculating $f_1 f_0$ there and pulling the element back.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C', 3, 1], 1, 2)
sage: b = K(rows=[])
sage: b.f(0) # indirect doctest
[[1, 1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)],␣
↪Integer(1), Integer(2))
>>> b = K(rows=[])
>>> b.f(Integer(0)) # indirect doctest
[[1, 1]]
```

phi0()

Calculate φ_0 of `self` by mapping the element to the ambient crystal and calculating φ_1 there.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',2,1], 1,2)
sage: b=K(rows=[[-1,-1]])
sage: b.phi(0) # indirect doctest
2
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(2),Integer(1)], Integer(1),
↪Integer(2))
>>> b=K(rows=[[-Integer(1),-Integer(1)]])
>>> b.phi(Integer(0)) # indirect doctest
2
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_Cn**(*cartan_type*, *r*, *s*, *dual=None*)

Bases: *KirillovReshetikhinGenericCrystal*

Class of Kirillov-Reshetikhin crystals $B^{n,s}$ of type $C_n^{(1)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1],3,1)
sage: [[b,b.f(0)] for b in K]
[[[[1], [2], [3]], None], [[[1], [2], [-3]], None],
 [[[1], [3], [-3]], None], [[[2], [3], [-3]], None],
 [[[1], [3], [-2]], None], [[[2], [3], [-2]], None],
 [[[2], [3], [-1]], [[1], [2], [3]]], [[[1], [-3], [-2]], None],
 [[[2], [-3], [-2]], None], [[[2], [-3], [-1]], [[1], [2], [-3]]],
 [[[3], [-3], [-2]], None], [[[3], [-3], [-1]], [[1], [3], [-3]]],
 [[[3], [-2], [-1]], [[1], [3], [-2]]],
 [[[-3], [-2], [-1]], [[1], [-3], [-2]]]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)],Integer(3),
↪Integer(1))
>>> [[b,b.f(Integer(0))] for b in K]
[[[[1], [2], [3]], None], [[[1], [2], [-3]], None],
 [[[1], [3], [-3]], None], [[[2], [3], [-3]], None],
 [[[1], [3], [-2]], None], [[[2], [3], [-2]], None],
 [[[2], [3], [-1]], [[1], [2], [3]]], [[[1], [-3], [-2]], None],
 [[[2], [-3], [-2]], None], [[[2], [-3], [-1]], [[1], [2], [-3]]],
 [[[3], [-3], [-2]], None], [[[3], [-3], [-1]], [[1], [3], [-3]]],
 [[[3], [-2], [-1]], [[1], [3], [-2]]],
 [[[-3], [-2], [-1]], [[1], [-3], [-2]]]]
```

Element

alias of *KR_type_CnElement*

classical_decomposition()

Specifies the classical crystal underlying the Kirillov-Reshetikhin crystal $B^{n,s}$ of type $C_n^{(1)}$.

The classical decomposition is given by $B^{n,s} \cong B(s\Lambda_n)$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1],3,2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['C', 3] and shape(s) [[2, 2, 2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)],Integer(3),
```

(continues on next page)

(continued from previous page)

```
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['C', 3] and shape(s) [[2, 2, 2]]
```

from_highest_weight_vector_to_pm_diagram(*b*)

This gives the bijection between an element `b` in the classical decomposition of the KR crystal that is $2, 3, .., n$-highest weight and $\pm$ diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1],3,2)
sage: T = K.classical_decomposition()
sage: b = T(rows=[[2, 2], [3, 3], [-3, -1]])
sage: pm = K.from_highest_weight_vector_to_pm_diagram(b); pm
[[0, 0], [1, 0], [0, 1], [0]]
sage: pm.pp()
.  .
.  +
-  -

sage: hw = [ b for b in T if all(b.epsilon(i)==0 for i in [2,3]) ]
sage: all(K.from_pm_diagram_to_highest_weight_vector(K.from_highest_weight_
↪vector_to_pm_diagram(b)) == b for b in hw)
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> T = K.classical_decomposition()
>>> b = T(rows=[[Integer(2), Integer(2)], [Integer(3), Integer(3)], [-
↪Integer(3), -Integer(1)]])
>>> pm = K.from_highest_weight_vector_to_pm_diagram(b); pm
[[0, 0], [1, 0], [0, 1], [0]]
>>> pm.pp()
.  .
.  +
-  -

>>> hw = [ b for b in T if all(b.epsilon(i)==Integer(0) for i in [Integer(2),
↪Integer(3)]) ]
>>> all(K.from_pm_diagram_to_highest_weight_vector(K.from_highest_weight_
↪vector_to_pm_diagram(b)) == b for b in hw)
True
```

from_pm_diagram_to_highest_weight_vector(*pm*)

This gives the bijection between a $\pm$ diagram and an element `b` in the classical decomposition of the KR crystal that is $\{2, 3, .., n\}$-highest weight.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1],3,2)
sage: pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[0, 0], [1,␣
↪0], [0, 1], [0]])
```

(continues on next page)

(continued from previous page)

```
sage: K.from_pm_diagram_to_highest_weight_vector(pm)
[[2, 2], [3, 3], [-3, -1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)],Integer(3),
↪Integer(2))
>>> pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[Integer(0),␣
↪Integer(0)], [Integer(1), Integer(0)], [Integer(0), Integer(1)],␣
↪[Integer(0)]])
>>> K.from_pm_diagram_to_highest_weight_vector(pm)
[[2, 2], [3, 3], [-3, -1]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_CnElement**

Bases: *KirillovReshetikhinGenericCrystalElement*

Class for the elements in the Kirillov-Reshetikhin crystals $B^{n,s}$ of type $C_n^{(1)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C', 3, 1], 3, 2)
sage: type(K.module_generators[0])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_Cn_with_category.
↪element_class'>
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)], Integer(3),␣
↪Integer(2))
>>> type(K.module_generators[Integer(0)])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_Cn_with_category.
↪element_class'>
```

e0()

Return e_0 on `self` by going to the $\pm$-diagram corresponding to the $\{2, ..., n\}$-highest weight vector in the component of `self`, then applying [Definition 6.1, 4], and pulling back from $\pm$-diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C', 3, 1], 3, 2)
sage: b = K.module_generators[0]
sage: b.e(0) # indirect doctest
[[1, 2], [2, 3], [3, -1]]
sage: b = K(rows=[[1,2],[2,3],[3,-1]])
sage: b.e(0)
[[2, 2], [3, 3], [-1, -1]]
sage: b=K(rows=[[1, -3], [3, -2], [-3, -1]])
sage: b.e(0)
[[3, -3], [-3, -2], [-1, -1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)],␣
↪Integer(3), Integer(2))
>>> b = K.module_generators[Integer(0)]
```

(continues on next page)

(continued from previous page)

```
>>> b.e(Integer(0)) # indirect doctest
[[1, 2], [2, 3], [3, -1]]
>>> b = K(rows=[[Integer(1),Integer(2)],[Integer(2),Integer(3)],[Integer(3),-
↪Integer(1)]])
>>> b.e(Integer(0))
[[2, 2], [3, 3], [-1, -1]]
>>> b=K(rows=[[Integer(1), -Integer(3)], [Integer(3), -Integer(2)], [-
↪Integer(3), -Integer(1)]])
>>> b.e(Integer(0))
[[3, -3], [-3, -2], [-1, -1]]
```

epsilon0()

Calculate ε_0 of `self` using Lemma 6.1 of [4].

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C', 3, 1], 3, 1)
sage: b = K.module_generators[0]
sage: b.epsilon(0) # indirect doctest
1
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)],␣
↪Integer(3), Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.epsilon(Integer(0)) # indirect doctest
1
```

f0()

Return e_0 on `self` by going to the $\pm$-diagram corresponding to the $\{2, ..., n\}$-highest weight vector in the component of `self`, then applying [Definition 6.1, 4], and pulling back from $\pm$-diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',3,1],3,1)
sage: b = K.module_generators[0]
sage: b.f(0) # indirect doctest
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)],Integer(3),
↪Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.f(Integer(0)) # indirect doctest
```

phi0()

Calculate φ_0 of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C', 3, 1], 3, 1)
sage: b = K.module_generators[0]
sage: b.phi(0) # indirect doctest
0
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C', Integer(3), Integer(1)],␣
↪Integer(3), Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.phi(Integer(0)) # indirect doctest
0
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_D_tri1**(ct, s)

Bases: *KirillovReshetikhinGenericCrystal*

Class of Kirillov-Reshetikhin crystals $B^{1,s}$ of type $D_4^{(3)}$.

The crystal structure was defined in Section 4 of [KMOY2007] using the coordinate representation.

class Element

Bases: *KirillovReshetikhinGenericCrystalElement*

coordinates()

Return `self` as coordinates.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,3], 1, 3)
sage: all(K.from_coordinates(x.coordinates()) == x for x in K)
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)],␣
↪Integer(1), Integer(3))
>>> all(K.from_coordinates(x.coordinates()) == x for x in K)
True
```

e0()

Return the action of e_0 on `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,3], 1,1)
sage: [x.e0() for x in K]
[[[-1]], [], [[-3]], [[-2]], None, None, None, None]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)],␣
↪Integer(1),Integer(1))
>>> [x.e0() for x in K]
[[[-1]], [], [[-3]], [[-2]], None, None, None, None]
```

epsilon0()

Return ε_0 of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,3], 1, 5)
sage: [mg.epsilon0() for mg in K.module_generators]
[5, 6, 7, 8, 9, 10]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)],␣
↪Integer(1), Integer(5))
>>> [mg.epsilon0() for mg in K.module_generators]
[5, 6, 7, 8, 9, 10]
```

f0()

Return the action of f_0 on `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,3], 1,1)
sage: [x.f0() for x in K]
[[[1]], None, None, None, None, [[2]], [[3]], []]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)],␣
↪Integer(1),Integer(1))
>>> [x.f0() for x in K]
[[[1]], None, None, None, None, [[2]], [[3]], []]
```

phi0()

Return φ_0 of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,3], 1, 5)
sage: [mg.phi0() for mg in K.module_generators]
[5, 4, 3, 2, 1, 0]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)],␣
↪Integer(1), Integer(5))
>>> [mg.phi0() for mg in K.module_generators]
[5, 4, 3, 2, 1, 0]
```

classical_decomposition()

Return the classical decomposition of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,3], 1, 5)
sage: K.classical_decomposition()
The crystal of tableaux of type ['G', 2]
 and shape(s) [[], [1], [2], [3], [4], [5]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)], Integer(1),␣
↪Integer(5))
>>> K.classical_decomposition()
The crystal of tableaux of type ['G', 2]
 and shape(s) [[], [1], [2], [3], [4], [5]]
```

from_coordinates(*coords*)

Return an element of `self` from the coordinates `coords`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,3], 1, 5)
sage: K.from_coordinates((0, 2, 3, 1, 0, 1))
[[2, 2, 3, 0, -1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(3)], Integer(1),␣
↪Integer(5))
>>> K.from_coordinates((Integer(0), Integer(2), Integer(3), Integer(1),␣
↪Integer(0), Integer(1)))
[[2, 2, 3, 0, -1]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_Dn_twisted**(*cartan_type*, *r*, *s*, *dual=None*)

Bases: *KirillovReshetikhinGenericCrystal*

Class of Kirillov-Reshetikhin crystals $B^{n,s}$ of type $D^{(2)}_{n+1}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2],3,1)
sage: [[b,b.f(0)] for b in K]
[[[+++, []], None], [[++-, []], None], [[+-+, []], None], [[-++, []],
[+++, []]], [[+--, []], None], [[-+-, []], [++-, []]], [[--+, []], [+-+, []]],
[[---, []], [+--, []]]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(1))
>>> [[b,b.f(Integer(0))] for b in K]
[[[+++, []], None], [[++-, []], None], [[+-+, []], None], [[-++, []],
[+++, []]], [[+--, []], None], [[-+-, []], [++-, []]], [[--+, []], [+-+, []]],
[[---, []], [+--, []]]]
```

Element

alias of *KR_type_Dn_twistedElement*

classical_decomposition()

Return the classical crystal underlying the Kirillov-Reshetikhin crystal $B^{n,s}$ of type $D^{(2)}_{n+1}$.

The classical decomposition is given by $B^{n,s} \cong B(s\Lambda_n)$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2],3,1)
sage: K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[1/2, 1/2, 1/2]]
sage: K = crystals.KirillovReshetikhin(['D',4,2],3,2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[1, 1, 1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(1))
>>> K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[1/2, 1/2, 1/2]]
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[1, 1, 1]]
```

from_highest_weight_vector_to_pm_diagram(b)

This gives the bijection between an element `b` in the classical decomposition of the KR crystal that is $\{2, 3, \ldots, n\}$-highest weight and $\pm$ diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2],3,1)
sage: T = K.classical_decomposition()
sage: hw = [ b for b in T if all(b.epsilon(i)==0 for i in [2,3]) ]
sage: [K.from_highest_weight_vector_to_pm_diagram(b) for b in hw]
[[[0, 0], [0, 0], [1, 0], [0]], [[0, 0], [0, 0], [0, 1], [0]]]

sage: K = crystals.KirillovReshetikhin(['D',4,2],3,2)
sage: T = K.classical_decomposition()
sage: hw = [ b for b in T if all(b.epsilon(i)==0 for i in [2,3]) ]
sage: [K.from_highest_weight_vector_to_pm_diagram(b) for b in hw]
[[[0, 0], [0, 0], [2, 0], [0]], [[0, 0], [0, 0], [0, 0], [2]],
 [[0, 0], [2, 0], [0, 0], [0]], [[0, 0], [0, 0], [0, 2], [0]]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(1))
>>> T = K.classical_decomposition()
>>> hw = [ b for b in T if all(b.epsilon(i)==Integer(0) for i in [Integer(2),
↪Integer(3)]) ]
>>> [K.from_highest_weight_vector_to_pm_diagram(b) for b in hw]
[[[0, 0], [0, 0], [1, 0], [0]], [[0, 0], [0, 0], [0, 1], [0]]]

>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(2))
>>> T = K.classical_decomposition()
>>> hw = [ b for b in T if all(b.epsilon(i)==Integer(0) for i in [Integer(2),
↪Integer(3)]) ]
>>> [K.from_highest_weight_vector_to_pm_diagram(b) for b in hw]
[[[0, 0], [0, 0], [2, 0], [0]], [[0, 0], [0, 0], [0, 0], [2]],
 [[0, 0], [2, 0], [0, 0], [0]], [[0, 0], [0, 0], [0, 2], [0]]]
```

Note that, since the classical decomposition of this crystal is of type B_n, there can be (at most one) entry 0 in the $\{2, 3, \ldots, n\}$-highest weight elements at height n. In the following implementation this is realized as an empty column of height n since this uniquely specifies the existence of the 0.

EXAMPLES:

```
sage: b = hw[1]
sage: pm = K.from_highest_weight_vector_to_pm_diagram(b)
sage: pm.pp()
.  .
.  .
.  .
```

```
>>> from sage.all import *
>>> b = hw[Integer(1)]
>>> pm = K.from_highest_weight_vector_to_pm_diagram(b)
>>> pm.pp()
.  .
.  .
.  .
```

from_pm_diagram_to_highest_weight_vector(*pm*)

This gives the bijection between a $\pm$ diagram and an element `b` in the classical decomposition of the KR crystal that is $\{2, 3, \ldots, n\}$-highest weight.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2],3,2)
sage: pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[0, 0], [0,␣
↪0], [0, 0], [2]])
sage: K.from_pm_diagram_to_highest_weight_vector(pm)
[[2], [3], [0]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(2))
>>> pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[Integer(0),␣
↪Integer(0)], [Integer(0), Integer(0)], [Integer(0), Integer(0)],␣
↪[Integer(2)]])
>>> K.from_pm_diagram_to_highest_weight_vector(pm)
[[2], [3], [0]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_Dn_twistedElement**

Bases: *KirillovReshetikhinGenericCrystalElement*

Class for the elements in the Kirillov-Reshetikhin crystals $B^{n,s}$ of type $D_{n+1}^{(2)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D', 4, 2], 3, 2)
sage: type(K.module_generators[0])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_Dn_twisted_with_
↪category.element_class'>
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D', Integer(4), Integer(2)], Integer(3),␣
↪Integer(2))
>>> type(K.module_generators[Integer(0)])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_Dn_twisted_with_
↪category.element_class'>
```

e0()

Return e_0 on `self` by going to the $\pm$-diagram corresponding to the $\{2, \ldots, n\}$-highest weight vector in the component of `self`, then applying [Definition 6.2, 4], and pulling back from $\pm$-diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D', 4, 2], 3, 3)
sage: b = K.module_generators[0]
sage: b.e(0) # indirect doctest
[+++, [[2], [3], [0]]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D', Integer(4), Integer(2)],␣
↪Integer(3), Integer(3))
>>> b = K.module_generators[Integer(0)]
>>> b.e(Integer(0)) # indirect doctest
[+++, [[2], [3], [0]]]
```

epsilon0()

Calculate ε_0 of `self` using Lemma 6.2 of [4].

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D', 4, 2], 3, 1)
sage: b = K.module_generators[0]
sage: b.epsilon(0) # indirect doctest
1
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D', Integer(4), Integer(2)],␣
↪Integer(3), Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.epsilon(Integer(0)) # indirect doctest
1
```

f0()

Return e_0 on `self` by going to the $\pm$-diagram corresponding to the $\{2, \ldots, n\}$-highest weight vector in the component of `self`, then applying [Definition 6.2, 4], and pulling back from $\pm$-diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2],3,2)
sage: b = K.module_generators[0]
sage: b.f(0) # indirect doctest
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(2))
>>> b = K.module_generators[Integer(0)]
>>> b.f(Integer(0)) # indirect doctest
```

phi0()

Calculate φ_0 of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2],3,1)
sage: b = K.module_generators[0]
sage: b.phi(0) # indirect doctest
0
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)],Integer(3),
↪Integer(1))
>>> b = K.module_generators[Integer(0)]
>>> b.phi(Integer(0)) # indirect doctest
0
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_E6**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinCrystalFromPromotion*

Class of Kirillov-Reshetikhin crystals of type $E_6^{(1)}$ for $r = 1, 2, 6$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: K.module_generator().e(0)
[]
sage: K.module_generator().e(0).f(0)
[[(2, -1), (1,)]]
sage: K = crystals.KirillovReshetikhin(['E',6,1], 1,1)
sage: b = K.module_generator()
sage: b
[(1,)]
sage: b.e(0)
[(-2, 1)]
sage: b = next(t for t in K if t.epsilon(1) == 1 and t.phi(3) == 1 and t.phi(2)␣
↪== 0 and t.epsilon(2) == 0)
sage: b
[(-1, 3)]
sage: b.e(0)
[(-1, -2, 3)]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(2),
↪Integer(1))
>>> K.module_generator().e(Integer(0))
[]
>>> K.module_generator().e(Integer(0)).f(Integer(0))
[[(2, -1), (1,)]]
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)], Integer(1),
↪Integer(1))
>>> b = K.module_generator()
>>> b
[(1,)]
>>> b.e(Integer(0))
[(-2, 1)]
>>> b = next(t for t in K if t.epsilon(Integer(1)) == Integer(1) and t.
↪phi(Integer(3)) == Integer(1) and t.phi(Integer(2)) == Integer(0) and t.
```

(continues on next page)

(continued from previous page)

```
↪epsilon(Integer(2)) == Integer(0))
>>> b
[(-1, 3)]
>>> b.e(Integer(0))
[(-1, -2, 3)]
```

The elements of the Kirillov-Reshetikhin crystals can be constructed from a classical crystal element using *retract()*.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: La = K.cartan_type().classical().root_system().weight_lattice().fundamental_
↪weights()
sage: H = crystals.HighestWeight(La[2])
sage: t = H.module_generator()
sage: t
[[(2, -1), (1,)]]
sage: type(K.retract(t))
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_E6_with_category.
↪element_class'>
sage: K.retract(t).e(0)
[]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(2),
↪Integer(1))
>>> La = K.cartan_type().classical().root_system().weight_lattice().fundamental_
↪weights()
>>> H = crystals.HighestWeight(La[Integer(2)])
>>> t = H.module_generator()
>>> t
[[(2, -1), (1,)]]
>>> type(K.retract(t))
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_E6_with_category.
↪element_class'>
>>> K.retract(t).e(Integer(0))
[]
```

affine_weight(*b*)

Return the affine level zero weight corresponding to the element `b` of the classical crystal underlying `self`.

For the coefficients to calculate the level, see Table Aff 1 in [Ka1990].

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: [K.affine_weight(x.lift()) for x in K
....:  if all(x.epsilon(i) == 0 for i in [2,3,4,5])]

```

automorphism_on_affine_weight(*weight*)

Act with the Dynkin diagram automorphism on affine weights as outputted by the `affine_weight` method.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: sorted([x[0], K.automorphism_on_affine_weight(x[0])]
....:  for x in K.highest_weight_dict().values())
[[(-2, 0, 1, 0, 0, 0, 0), (0, -2, 0, 1, 0, 0, 0)],
 [(-1, 0, 0, 1, 0, 0, -1), (-1, -1, 0, 0, 0, 1, 0)],
 [(0, 0, 0, 0, 0, 0, 0), (0, 0, 0, 0, 0, 0, 0)],
 [(0, 0, 0, 0, 0, 0, 0), (0, 0, 0, 0, 0, 0, 0)],
 [(0, 0, 0, 0, 0, 1, -2), (-2, 0, 1, 0, 0, 0, 0)]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(2),
↪Integer(1))
>>> sorted([x[Integer(0)], K.automorphism_on_affine_weight(x[Integer(0)])]
...  for x in K.highest_weight_dict().values())
[[(-2, 0, 1, 0, 0, 0, 0), (0, -2, 0, 1, 0, 0, 0)],
 [(-1, 0, 0, 1, 0, 0, -1), (-1, -1, 0, 0, 0, 1, 0)],
 [(0, 0, 0, 0, 0, 0, 0), (0, 0, 0, 0, 0, 0, 0)],
 [(0, 0, 0, 0, 0, 0, 0), (0, 0, 0, 0, 0, 0, 0)],
 [(0, 0, 0, 0, 0, 1, -2), (-2, 0, 1, 0, 0, 0, 0)]]
```

classical_decomposition()

Specifies the classical crystal underlying the KR crystal of type $E_6^{(1)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1], 2,2)
sage: K.classical_decomposition()
Direct sum of the crystals Family
 (Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight 0,
  Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight Lambda[2],
  Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight 2*Lambda[2])
sage: K = crystals.KirillovReshetikhin(['E',6,1], 1,2)
sage: K.classical_decomposition()
Direct sum of the crystals Family
 (Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight 2*Lambda[1],)
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)], Integer(2),
↪Integer(2))
>>> K.classical_decomposition()
Direct sum of the crystals Family
 (Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight 0,
  Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight Lambda[2],
  Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight 2*Lambda[2])
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)], Integer(1),
↪Integer(2))
>>> K.classical_decomposition()
Direct sum of the crystals Family
 (Finite dimensional highest weight crystal of type ['E', 6] and highest␣
↪weight 2*Lambda[1],)
```

dynkin_diagram_automorphism(i)

Specifies the Dynkin diagram automorphism underlying the promotion action on the crystal elements.

Here we use the Dynkin diagram automorphism of order 3 which maps node 0 to node 1.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: [K.dynkin_diagram_automorphism(i) for i in K.index_set()]
[1, 6, 3, 5, 4, 2, 0]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(2),
↪Integer(1))
>>> [K.dynkin_diagram_automorphism(i) for i in K.index_set()]
[1, 6, 3, 5, 4, 2, 0]
```

highest_weight_dict()

Return a dictionary between $\{1, 2, 3, 4, 5\}$-highest weight elements, and a tuple of affine weights and its classical component.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: sorted(K.highest_weight_dict().items(), key=str)
[([[(2, -1), (1,)]], ((-2, 0, 1, 0, 0, 0, 0), 1)),
 ([[(3, -1, -6), (1,)]], ((-1, 0, 0, 1, 0, 0, -1), 1)),
 ([[(5, -2, -6), (-6, 2)]], ((0, 0, 0, 0, 0, 1, -2), 1)),
 ([[(6, -2), (-6, 2)]], ((0, 0, 0, 0, 0, 0, 0), 1)),
 ([], ((0, 0, 0, 0, 0, 0, 0), 0))]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(2),
↪Integer(1))
>>> sorted(K.highest_weight_dict().items(), key=str)
[([[(2, -1), (1,)]], ((-2, 0, 1, 0, 0, 0, 0), 1)),
 ([[(3, -1, -6), (1,)]], ((-1, 0, 0, 1, 0, 0, -1), 1)),
 ([[(5, -2, -6), (-6, 2)]], ((0, 0, 0, 0, 0, 1, -2), 1)),
 ([[(6, -2), (-6, 2)]], ((0, 0, 0, 0, 0, 0, 0), 1)),
 ([], ((0, 0, 0, 0, 0, 0, 0), 0))]
```

highest_weight_dict_inv()

Return a dictionary between a tuple of affine weights and a classical component, and $\{2, 3, 4, 5, 6\}$-highest weight elements.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: K.highest_weight_dict_inv()
{((-2, 0, 1, 0, 0, 0, 0), 1): [[(2, -1), (1,)]],
 ((-1, -1, 0, 0, 0, 1, 0), 1): [[(5, -3), (-1, 3)]],
 ((0, -2, 0, 1, 0, 0, 0), 1): [[(-1,), (-1, 3)]],
 ((0, 0, 0, 0, 0, 0, 0), 0): [],
 ((0, 0, 0, 0, 0, 0, 0), 1): [[(1, -3), (-1, 3)]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(2),
↪Integer(1))
>>> K.highest_weight_dict_inv()
{((-2, 0, 1, 0, 0, 0, 0), 1): [[(2, -1), (1,)]],
 ((-1, -1, 0, 0, 0, 1, 0), 1): [[(5, -3), (-1, 3)]],
 ((0, -2, 0, 1, 0, 0, 0), 1): [[(-1,), (-1, 3)]],
 ((0, 0, 0, 0, 0, 0, 0), 0): [],
 ((0, 0, 0, 0, 0, 0, 0), 1): [[(1, -3), (-1, 3)]]}
```

hw_auxiliary()

Return the $2, 3, 4, 5$ highest weight elements of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1],2,1)
sage: K.hw_auxiliary()
([], [[(2, -1), (1,)]],
 [[(5, -3), (-1, 3)]],
 [[(6, -2), (-6, 2)]],
```

(continues on next page)

(continued from previous page)

```
 [[(5, -2, -6), (-6, 2)]],
 [[(-1,), (-6, 2)]],
 [[(3, -1, -6), (1,)]],
 [[(4, -3, -6), (-1, 3)]],
 [[(1, -3), (-1, 3)]],
 [[(-1,), (-1, 3)]])
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(2),
↪Integer(1))
>>> K.hw_auxiliary()
([], [[(2, -1), (1,)]],
 [[(5, -3), (-1, 3)]],
 [[(6, -2), (-6, 2)]],
 [[(5, -2, -6), (-6, 2)]],
 [[(-1,), (-6, 2)]],
 [[(3, -1, -6), (1,)]],
 [[(4, -3, -6), (-1, 3)]],
 [[(1, -3), (-1, 3)]],
 [[(-1,), (-1, 3)]])
```

promotion()

Specifies the promotion operator used to construct the affine type $E_6^{(1)}$ crystal.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1], 2,1)
sage: promotion = K.promotion()
sage: all(promotion(promotion(promotion(b))) == b for b in K.classical_
↪decomposition())
True
sage: K = crystals.KirillovReshetikhin(['E',6,1],1,1)
sage: promotion = K.promotion()
sage: all(promotion(promotion(promotion(b))) == b for b in K.classical_
↪decomposition())
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)], Integer(2),
↪Integer(1))
>>> promotion = K.promotion()
>>> all(promotion(promotion(promotion(b))) == b for b in K.classical_
↪decomposition())
True
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(1),
↪Integer(1))
>>> promotion = K.promotion()
>>> all(promotion(promotion(promotion(b))) == b for b in K.classical_
↪decomposition())
True
```

promotion_inverse()

Return the inverse promotion. Since promotion is of order 3, the inverse promotion is the same as promotion applied twice.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1], 2,1)
sage: p = K.promotion()
sage: p_inv = K.promotion_inverse()
sage: all(p_inv(p(b)) == b for b in K.classical_decomposition())
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)], Integer(2),
↪Integer(1))
>>> p = K.promotion()
>>> p_inv = K.promotion_inverse()
>>> all(p_inv(p(b)) == b for b in K.classical_decomposition())
True
```

promotion_on_highest_weight_vectors()

Return a dictionary of the promotion map on $\{1,2,3,4,5\}$-highest weight elements to $\{2,3,4,5,6\}$-highest weight elements in `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1], 2, 1)
sage: dic = K.promotion_on_highest_weight_vectors()
sage: sorted(dic.items(), key=str)
[([[[2, -1), (1,)]], [[(-1,), (-1, 3)]]),
 ([[[3, -1, -6), (1,)]], [[(5, -3), (-1, 3)]]),
 ([[[5, -2, -6), (-6, 2)]], [[(2, -1), (1,)]]),
 ([[[6, -2), (-6, 2)]], []),
 ([], [[(1, -3), (-1, 3)]])]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)], Integer(2),␣
↪Integer(1))
>>> dic = K.promotion_on_highest_weight_vectors()
>>> sorted(dic.items(), key=str)
[([[[2, -1), (1,)]], [[(-1,), (-1, 3)]]),
 ([[[3, -1, -6), (1,)]], [[(5, -3), (-1, 3)]]),
 ([[[5, -2, -6), (-6, 2)]], [[(2, -1), (1,)]]),
 ([[[6, -2), (-6, 2)]], []),
 ([], [[(1, -3), (-1, 3)]])]
```

promotion_on_highest_weight_vectors_function()

Return a lambda function on `x` defined by `self.promotion_on_highest_weight_vectors()[x]`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',6,1], 2, 1)
sage: f = K.promotion_on_highest_weight_vectors_function()
sage: f(K.module_generator().lift())
[(-1,), (-1, 3)]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)], Integer(2),␣
↪Integer(1))
>>> f = K.promotion_on_highest_weight_vectors_function()
>>> f(K.module_generator().lift())
[[(-1,), (-1, 3)]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_E7**(*ct*, *r*, *s*)

Bases: *KirillovReshetikhinGenericCrystal*

The Kirillov-Reshetikhin crystal $B^{7,s}$ of type $E_7^{(1)}$.

A7_decomposition()

Return the decomposition of `self` into A_7 highest weight crystals.

The A_7 decomposition of $B^{7,s}$ is given by the parameters $m_4, m_5, m_6, m_7 \geq 0$ such that $m_4 + m_5 \leq m_7$ and $s = m_4 + m_5 + m_6 + m_7$. The corresponding A_7 highest weight crystal has highest weight $\lambda = (m_7 - m_4 - m_5)\Lambda_6 + m_5\Lambda_4 + m_6\Lambda_2$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',7,1], 7, 3)
sage: K.A7_decomposition()
The crystal of tableaux of type ['A', 7] and shape(s)
 [[3, 3, 3, 3, 3, 3], [3, 3, 2, 2, 2, 2], [3, 3, 1, 1, 1, 1], [3, 3],
  [2, 2, 2, 2, 1, 1], [2, 2, 1, 1], [1, 1, 1, 1, 1, 1], [1, 1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(7),Integer(1)], Integer(7),␣
↪Integer(3))
>>> K.A7_decomposition()
The crystal of tableaux of type ['A', 7] and shape(s)
 [[3, 3, 3, 3, 3, 3], [3, 3, 2, 2, 2, 2], [3, 3, 1, 1, 1, 1], [3, 3],
  [2, 2, 2, 2, 1, 1], [2, 2, 1, 1], [1, 1, 1, 1, 1, 1], [1, 1]]
```

class Element

Bases: *KirillovReshetikhinGenericCrystalElement*

e0()

Return the action of e_0 on `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',7,1], 7, 2)
sage: mg = K.module_generator()
sage: mg.e0()
[[(7,), (-1, 7)]]
sage: mg.e0().e0()
[[(-1, 7), (-1, 7)]]
sage: mg.e_string([0,0,0]) is None
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(7),Integer(1)],␣
```

(continues on next page)

(continued from previous page)

```
↪Integer(7), Integer(2))
>>> mg = K.module_generator()
>>> mg.e0()
[[(7,), (-1, 7)]]
>>> mg.e0().e0()
[[(-1, 7), (-1, 7)]]
>>> mg.e_string([Integer(0),Integer(0),Integer(0)]) is None
True
```

f0()

Return the action of f_0 on `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',7,1], 7, 2)
sage: mg = K.module_generator()
sage: x = mg.f_string([7,6,5,4,3,2,4,5,6,1,3,4,5,2,4,3,1])
sage: x.f0()
[[(7,), (7,)]]
sage: mg.f0() is None
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(7),Integer(1)],␣
↪Integer(7), Integer(2))
>>> mg = K.module_generator()
>>> x = mg.f_string([Integer(7),Integer(6),Integer(5),Integer(4),
↪Integer(3),Integer(2),Integer(4),Integer(5),Integer(6),Integer(1),
↪Integer(3),Integer(4),Integer(5),Integer(2),Integer(4),Integer(3),
↪Integer(1)])
>>> x.f0()
[[(7,), (7,)]]
>>> mg.f0() is None
True
```

classical_decomposition()

Return the classical decomposition of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',7,1], 7, 4)
sage: K.classical_decomposition()
The crystal of tableaux of type ['E', 7] and shape(s) [[4]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(7),Integer(1)], Integer(7),␣
↪Integer(4))
>>> K.classical_decomposition()
The crystal of tableaux of type ['E', 7] and shape(s) [[4]]
```

from_A7_crystal()

Return the inclusion of the KR crystal $B^{7,s}$ of type $E_7^{(1)}$ into type A_7 highest weight crystals.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',7,1], 7, 2)
sage: K.from_A7_crystal()
['A', 6] -> ['E', 7, 1] Virtual Crystal morphism:
  From: The crystal of tableaux of type ['A', 7] and shape(s)
    [[2, 2, 2, 2, 2, 2], [2, 2, 1, 1, 1, 1], [2, 2], [1, 1, 1, 1], []]
  To:   Kirillov-Reshetikhin crystal of type ['E', 7, 1] with (r,s)=(7,2)
  Defn: ...
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(7),Integer(1)], Integer(7),␣
↪Integer(2))
>>> K.from_A7_crystal()
['A', 6] -> ['E', 7, 1] Virtual Crystal morphism:
  From: The crystal of tableaux of type ['A', 7] and shape(s)
    [[2, 2, 2, 2, 2, 2], [2, 2, 1, 1, 1, 1], [2, 2], [1, 1, 1, 1], []]
  To:   Kirillov-Reshetikhin crystal of type ['E', 7, 1] with (r,s)=(7,2)
  Defn: ...
```

to_A7_crystal()

Return the map decomposing the KR crystal $B^{7,s}$ of type $E_7^{(1)}$ into type A_7 highest weight crystals.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['E',7,1], 7, 2)
sage: K.to_A7_crystal()
['A', 6] relabelled by {1: 1, 2: 3, 3: 4, 4: 5, 5: 6, 6: 7} -> ['A', 7]␣
↪Virtual Crystal morphism:
  From: Kirillov-Reshetikhin crystal of type ['E', 7, 1] with (r,s)=(7,2)
  To:   The crystal of tableaux of type ['A', 7] and shape(s)
    [[2, 2, 2, 2, 2, 2], [2, 2, 1, 1, 1, 1], [2, 2], [1, 1, 1, 1], []]
  Defn: ...
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['E',Integer(7),Integer(1)], Integer(7),␣
↪Integer(2))
>>> K.to_A7_crystal()
['A', 6] relabelled by {1: 1, 2: 3, 3: 4, 4: 5, 5: 6, 6: 7} -> ['A', 7]␣
↪Virtual Crystal morphism:
  From: Kirillov-Reshetikhin crystal of type ['E', 7, 1] with (r,s)=(7,2)
  To:   The crystal of tableaux of type ['A', 7] and shape(s)
    [[2, 2, 2, 2, 2, 2], [2, 2, 1, 1, 1, 1], [2, 2], [1, 1, 1, 1], []]
  Defn: ...
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_box**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinGenericCrystal*, *AffineCrystalFromClassical*

Class of Kirillov-Reshetikhin crystals $B^{r,s}$ of type $A_{2n}^{(2)}$ for $r \leq n$ and type $D_{n+1}^{(2)}$ for $r < n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',4,2], 1,1)
sage: K
```

(continues on next page)

(continued from previous page)

```
Kirillov-Reshetikhin crystal of type ['BC', 2, 2] with (r,s)=(1,1)
sage: b = K(rows=[])
sage: b.f(0)
[[1]]
sage: b.e(0)
[[-1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)], Integer(1),
↪Integer(1))
>>> K
Kirillov-Reshetikhin crystal of type ['BC', 2, 2] with (r,s)=(1,1)
>>> b = K(rows=[])
>>> b.f(Integer(0))
[[1]]
>>> b.e(Integer(0))
[[-1]]
```

Element

alias of *KR_type_boxElement*

ambient_crystal()

Return the ambient crystal $B^{r,2s}$ of type $C_n^{(1)}$ associated to the Kirillov-Reshetikhin crystal.

The ambient crystal is used to construct the zero arrows.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',4,2], 2,2)
sage: K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['C', 2, 1] with (r,s)=(2,4)
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)], Integer(2),
↪Integer(2))
>>> K.ambient_crystal()
Kirillov-Reshetikhin crystal of type ['C', 2, 1] with (r,s)=(2,4)
```

ambient_highest_weight_dict()

Return a dictionary of the classical highest weight vectors of the ambient crystal of `self` whose keys are their shape.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',6,2], 2,2)
sage: K.ambient_highest_weight_dict()
{[]: [],
 [2]: [[1, 1]],
 [2, 2]: [[1, 1], [2, 2]],
 [4]: [[1, 1, 1, 1]],
 [4, 2]: [[1, 1, 1, 1], [2, 2]],
 [4, 4]: [[1, 1, 1, 1], [2, 2, 2, 2]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(6),Integer(2)], Integer(2),
↪Integer(2))
>>> K.ambient_highest_weight_dict()
{[]: [],
 [2]: [[1, 1]],
 [2, 2]: [[1, 1], [2, 2]],
 [4]: [[1, 1, 1, 1]],
 [4, 2]: [[1, 1, 1, 1], [2, 2]],
 [4, 4]: [[1, 1, 1, 1], [2, 2, 2, 2]]}
```

classical_decomposition()

Return the classical crystal underlying the Kirillov-Reshetikhin crystal of type $A_{2n}^{(2)}$ and $D_{n+1}^{(2)}$.

It is given by $B^{r,s} \cong \bigoplus_{\Lambda} B(\Lambda)$, where Λ are weights obtained from a rectangle of width s and height r by removing boxes. Here we identify the fundamental weight Λ_i with a column of height i.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',4,2], 2,2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['C', 2] and shape(s) [[], [1], [2], [1, 1],␣
↪[2, 1], [2, 2]]
sage: K = crystals.KirillovReshetikhin(['D',4,2], 2,3)
sage: K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[], [1], [2], [1, 1],␣
↪[3], [2, 1], [3, 1], [2, 2], [3, 2], [3, 3]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)], Integer(2),
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['C', 2] and shape(s) [[], [1], [2], [1, 1],␣
↪[2, 1], [2, 2]]
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)], Integer(2),
↪Integer(3))
>>> K.classical_decomposition()
The crystal of tableaux of type ['B', 3] and shape(s) [[], [1], [2], [1, 1],␣
↪[3], [2, 1], [3, 1], [2, 2], [3, 2], [3, 3]]
```

from_ambient_crystal()

Return a map from the ambient crystal of type $C_n^{(1)}$ to the Kirillov-Reshetikhin crystal `self`.

Note that this map is only well-defined on elements that are in the image under *to_ambient_crystal()*.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2], 1,1)
sage: b = K.ambient_crystal()(rows=[[3,-3]])
sage: K.from_ambient_crystal()(b)
[[0]]
sage: K = crystals.KirillovReshetikhin(['A',4,2], 1,1)
sage: b = K.ambient_crystal()(rows=[])
```

(continues on next page)

(continued from previous page)

```
sage: K.from_ambient_crystal()(b)
[]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)], Integer(1),
↪Integer(1))
>>> b = K.ambient_crystal()(rows=[[Integer(3),-Integer(3)]])
>>> K.from_ambient_crystal()(b)
[[0]]
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)], Integer(1),
↪Integer(1))
>>> b = K.ambient_crystal()(rows=[])
>>> K.from_ambient_crystal()(b)
[]
```

highest_weight_dict()

Return a dictionary of the classical highest weight vectors of `self` whose keys are 2 times their shape.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',6,2], 2,2)
sage: K.highest_weight_dict()
{[]: [],
 [2]: [[1]],
 [2, 2]: [[1], [2]],
 [4]: [[1, 1]],
 [4, 2]: [[1, 1], [2]],
 [4, 4]: [[1, 1], [2, 2]]}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(6),Integer(2)], Integer(2),
↪Integer(2))
>>> K.highest_weight_dict()
{[]: [],
 [2]: [[1]],
 [2, 2]: [[1], [2]],
 [4]: [[1, 1]],
 [4, 2]: [[1, 1], [2]],
 [4, 4]: [[1, 1], [2, 2]]}
```

similarity_factor()

Set the similarity factor used to map to the ambient crystal.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',6,2], 2,2)
sage: K.similarity_factor()
{1: 2, 2: 2, 3: 2}
sage: K = crystals.KirillovReshetikhin(['D',5,2], 1,1)
sage: K.similarity_factor()
{1: 2, 2: 2, 3: 2, 4: 1}
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(6),Integer(2)], Integer(2),
↪Integer(2))
>>> K.similarity_factor()
{1: 2, 2: 2, 3: 2}
>>> K = crystals.KirillovReshetikhin(['D',Integer(5),Integer(2)], Integer(1),
↪Integer(1))
>>> K.similarity_factor()
{1: 2, 2: 2, 3: 2, 4: 1}
```

to_ambient_crystal()

Return a map from `self` to the ambient crystal of type $C_n^{(1)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,2], 1,1)
sage: [K.to_ambient_crystal()(b) for b in K]
[[], [[1, 1]], [[2, 2]], [[3, 3]], [[3, -3]], [[-3, -3]], [[-2, -2]], [[-1, -
↪1]]]
sage: K = crystals.KirillovReshetikhin(['A',4,2], 1,1)
sage: [K.to_ambient_crystal()(b) for b in K]
[[], [[1, 1]], [[2, 2]], [[-2, -2]], [[-1, -1]]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(2)], Integer(1),
↪Integer(1))
>>> [K.to_ambient_crystal()(b) for b in K]
[[], [[1, 1]], [[2, 2]], [[3, 3]], [[3, -3]], [[-3, -3]], [[-2, -2]], [[-1, -
↪1]]]
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)], Integer(1),
↪Integer(1))
>>> [K.to_ambient_crystal()(b) for b in K]
[[], [[1, 1]], [[2, 2]], [[-2, -2]], [[-1, -1]]]
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_boxElement**

Bases: *KirillovReshetikhinGenericCrystalElement*

Class for the elements in the Kirillov-Reshetikhin crystals $B^{r,s}$ of type $A_{2n}^{(2)}$ for $r \leq n$ and type $D_{n+1}^{(2)}$ for $r < n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',4,2],1,2)
sage: type(K.module_generators[0])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_box_with_category.
↪element_class'>
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)],Integer(1),
↪Integer(2))
>>> type(K.module_generators[Integer(0)])
<class 'sage.combinat.crystals.kirillov_reshetikhin.KR_type_box_with_category.
↪element_class'>
```

e0()

Return e_0 on `self` by mapping `self` to the ambient crystal, calculating e_0 there and pulling the element back.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',4,2],1,1)
sage: b = K(rows=[])
sage: b.e(0) # indirect doctest
[[-1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)],Integer(1),
↪Integer(1))
>>> b = K(rows=[])
>>> b.e(Integer(0)) # indirect doctest
[[-1]]
```

epsilon0()

Return ε_0 of `self` by mapping the element to the ambient crystal and calculating ε_0 there.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',4,2], 1,1)
sage: b = K(rows=[[1]])
sage: b.epsilon(0) # indirect doctest
2
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)], Integer(1),
↪Integer(1))
>>> b = K(rows=[[Integer(1)]])
>>> b.epsilon(Integer(0)) # indirect doctest
2
```

f0()

Return f_0 on `self` by mapping `self` to the ambient crystal, calculating f_0 there and pulling the element back.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',4,2],1,1)
sage: b = K(rows=[])
sage: b.f(0) # indirect doctest
[[1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(4),Integer(2)],Integer(1),
↪Integer(1))
>>> b = K(rows=[])
>>> b.f(Integer(0)) # indirect doctest
[[1]]
```

phi0()

Return φ_0 of `self` by mapping the element to the ambient crystal and calculating φ_0 there.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',3,2], 1,1)
sage: b = K(rows=[[-1]])
sage: b.phi(0) # indirect doctest
2
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(3),Integer(2)], Integer(1),
↪Integer(1))
>>> b = K(rows=[[-Integer(1)]])
>>> b.phi(Integer(0)) # indirect doctest
2
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_spin**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinCrystalFromPromotion*

Class of Kirillov-Reshetikhin crystals $B^{n,s}$ of type $D_n^{(1)}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1],4,1); K
Kirillov-Reshetikhin crystal of type ['D', 4, 1] with (r,s)=(4,1)
sage: [[b,b.f(0)] for b in K]
[[[++++, []], None], [[++--, []], None], [[+-+-, []], None],
 [[-++-, []], None], [[+--+, []], None], [[-+-+, []], None],
 [[--++, []], [++++, []]], [[----, []], [++--, []]]]

sage: K = crystals.KirillovReshetikhin(['D',4,1],4,2); K
Kirillov-Reshetikhin crystal of type ['D', 4, 1] with (r,s)=(4,2)
sage: [[b,b.f(0)] for b in K]
[[[1], [2], [3], [4]], None], [[[1], [2], [-4], [4]], None],
 [[1], [3], [-4], [4]], None], [[2], [3], [-4], [4]], None],

```

classical_decomposition()

Return the classical crystal underlying the Kirillov-Reshetikhin crystal $B^{r,s}$ of type $D_n^{(1)}$ for $r = n-1, n$.

The classical decomposition is given by $B^{n,s} \cong B(s\Lambda_r)$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1],4,1)
sage: K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[1/2, 1/2, 1/2, 1/2]]
sage: K = crystals.KirillovReshetikhin(['D',4,1],3,1)
sage: K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[1/2, 1/2, 1/2, -1/2]]
sage: K = crystals.KirillovReshetikhin(['D',4,1],3,2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[1, 1, 1, -1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(4),
↪Integer(1))
>>> K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[1/2, 1/2, 1/2, 1/2]]
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(3),
↪Integer(1))
>>> K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[1/2, 1/2, 1/2, -1/2]]
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(3),
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[1, 1, 1, -1]]
```

dynkin_diagram_automorphism(*i*)

Specifies the Dynkin diagram automorphism underlying the promotion action on the crystal elements.

Here we use the Dynkin diagram automorphism which interchanges nodes 0 and 1 and leaves all other nodes unchanged.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1],4,1)
sage: K.dynkin_diagram_automorphism(0)
1
sage: K.dynkin_diagram_automorphism(1)
0
sage: K.dynkin_diagram_automorphism(4)
4
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(4),
↪Integer(1))
>>> K.dynkin_diagram_automorphism(Integer(0))
1
>>> K.dynkin_diagram_automorphism(Integer(1))
0
>>> K.dynkin_diagram_automorphism(Integer(4))
4
```

promotion()

Return the promotion operator on $B^{r,s}$ of type $D_n^{(1)}$ for $r = n-1, n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1],3,1)
sage: T = K.classical_decomposition()
sage: promotion = K.promotion()
sage: for t in T:
....:     print("{} {}".format(t, promotion(t)))
[+++-, []] [-++-, []]
[++-+, []] [-+-+, []]
[+-++, []] [--++, []]
[-+++, []] [++++, []]
[+---, []] [----, []]
[-+--, []] [++--, []]
[--+-, []] [+-+-, []]
[---+, []] [+--+, []]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(3),
↪Integer(1))
>>> T = K.classical_decomposition()
>>> promotion = K.promotion()
>>> for t in T:
...     print("{} {}".format(t, promotion(t)))
[+++-, []] [-++-, []]
[++-+, []] [-+-+, []]
[+-++, []] [--++, []]
[-+++, []] [++++, []]
[+---, []] [----, []]
[-+--, []] [++--, []]
[--+-, []] [+-+-, []]
[---+, []] [+--+, []]
```

promotion_inverse()

Return the inverse promotion operator on $B^{r,s}$ of type $D_n^{(1)}$ for $r = n-1, n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1],3,1)
sage: T = K.classical_decomposition()
sage: promotion = K.promotion()
sage: promotion_inverse = K.promotion_inverse()
sage: all(promotion_inverse(promotion(t)) == t for t in T)
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(3),
↪Integer(1))
>>> T = K.classical_decomposition()
>>> promotion = K.promotion()
>>> promotion_inverse = K.promotion_inverse()
>>> all(promotion_inverse(promotion(t)) == t for t in T)
True
```

promotion_on_highest_weight_vectors()

Return the promotion operator on $\{2, 3, \ldots, n\}$-highest weight vectors.

A $\{2,3,\ldots,n\}$-highest weight vector in $B(s\Lambda_n)$ of weight $w = (w_1,\ldots,w_n)$ is mapped to a $\{2,3,\ldots,n\}$-highest weight vector in $B(s\Lambda_{n-1})$ of weight $(-w_1,w_2,\ldots,w_n)$ and vice versa.

EXAMPLES:

```
sage: KR = crystals.KirillovReshetikhin(['D',4,1],4,2)
sage: prom = KR.promotion_on_highest_weight_vectors()
sage: T = KR.classical_decomposition()
sage: HW = [t for t in T if t.is_highest_weight([2,3,4])]
sage: for t in HW:
....:     print("{} {}".format(t, prom[t]))
[[1], [2], [3], [4]] [[2], [3], [4], [-1]]
[[2], [3], [-4], [4]] [[2], [3], [4], [-4]]
[[2], [3], [-4], [-1]] [[1], [2], [3], [-4]]

sage: KR = crystals.KirillovReshetikhin(['D',4,1],4,1)
sage: prom = KR.promotion_on_highest_weight_vectors()
sage: T = KR.classical_decomposition()
sage: HW = [t for t in T if t.is_highest_weight([2,3,4])]
sage: for t in HW:
....:     print("{} {}".format(t, prom[t]))
[++++, []] [-+++, []]
[-++-, []] [+++-, []]
```

```
>>> from sage.all import *
>>> KR = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(4),
↪Integer(2))
>>> prom = KR.promotion_on_highest_weight_vectors()
>>> T = KR.classical_decomposition()
>>> HW = [t for t in T if t.is_highest_weight([Integer(2),Integer(3),
↪Integer(4)])]
>>> for t in HW:
...     print("{} {}".format(t, prom[t]))
[[1], [2], [3], [4]] [[2], [3], [4], [-1]]
[[2], [3], [-4], [4]] [[2], [3], [4], [-4]]
[[2], [3], [-4], [-1]] [[1], [2], [3], [-4]]

>>> KR = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(4),
↪Integer(1))
>>> prom = KR.promotion_on_highest_weight_vectors()
>>> T = KR.classical_decomposition()
>>> HW = [t for t in T if t.is_highest_weight([Integer(2),Integer(3),
↪Integer(4)])]
>>> for t in HW:
...     print("{} {}".format(t, prom[t]))
[++++, []] [-+++, []]
[-++-, []] [+++-, []]
```

promotion_on_highest_weight_vectors_inverse()

Return the inverse promotion operator on $\{2, 3, \ldots, n\}$-highest weight vectors.

See also

- *promotion_on_highest_weight_vectors()*
- *promotion_inverse()*

EXAMPLES:

```
sage: KR = crystals.KirillovReshetikhin(['D',4,1],3,2)
sage: prom = KR.promotion_on_highest_weight_vectors()
sage: prom_inv = KR.promotion_on_highest_weight_vectors_inverse()
sage: T = KR.classical_decomposition()
sage: HW = [t for t in T if t.is_highest_weight([2,3,4])]
sage: all(prom_inv[prom[t]] == t for t in HW)
True
```

```
>>> from sage.all import *
>>> KR = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(3),
↪Integer(2))
>>> prom = KR.promotion_on_highest_weight_vectors()
>>> prom_inv = KR.promotion_on_highest_weight_vectors_inverse()
>>> T = KR.classical_decomposition()
>>> HW = [t for t in T if t.is_highest_weight([Integer(2),Integer(3),
↪Integer(4)])]
>>> all(prom_inv[prom[t]] == t for t in HW)
True
```

class sage.combinat.crystals.kirillov_reshetikhin.**KR_type_vertical**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinCrystalFromPromotion*

Class of Kirillov-Reshetikhin crystals $B^{r,s}$ of type $D_n^{(1)}$ for $r \leq n-2$, $B_n^{(1)}$ for $r < n$, and $A_{2n-1}^{(2)}$ for $r \leq n$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: b = K(rows=[])
sage: b.f(0)
[[1], [2]]
sage: b.f(0).f(0)
[[1, 1], [2, 2]]
sage: b.e(0)
[[-2], [-1]]
sage: b.e(0).e(0)
[[-2, -2], [-1, -1]]

sage: K = crystals.KirillovReshetikhin(['D',5,1], 3,1)
sage: b = K(rows=[[1]])
sage: b.e(0)
[[3], [-3], [-2]]
```

```

classical_decomposition()

Specifies the classical crystal underlying the Kirillov-Reshetikhin crystal of type $D_n^{(1)}$, $B_n^{(1)}$, and $A_{2n-1}^{(2)}$.

It is given by $B^{r,s} \cong \bigoplus_{\Lambda} B(\Lambda)$, where Λ are weights obtained from a rectangle of width s and height r by removing vertical dominoes. Here we identify the fundamental weight Λ_i with a column of height i.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[], [1, 1], [2, 2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(2))
>>> K.classical_decomposition()
The crystal of tableaux of type ['D', 4] and shape(s) [[], [1, 1], [2, 2]]
```

dynkin_diagram_automorphism(*i*)

Specifies the Dynkin diagram automorphism underlying the promotion action on the crystal elements. The automorphism needs to map node 0 to some other Dynkin node.

Here we use the Dynkin diagram automorphism which interchanges nodes 0 and 1 and leaves all other nodes unchanged.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1],1,1)
sage: K.dynkin_diagram_automorphism(0)
1
sage: K.dynkin_diagram_automorphism(1)
0
sage: K.dynkin_diagram_automorphism(4)
4
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(1),
↪Integer(1))
>>> K.dynkin_diagram_automorphism(Integer(0))
1
>>> K.dynkin_diagram_automorphism(Integer(1))
0
>>> K.dynkin_diagram_automorphism(Integer(4))
4
```

from_highest_weight_vector_to_pm_diagram(*b*)

This gives the bijection between an element `b` in the classical decomposition of the KR crystal that is $2, 3, \ldots, n$-highest weight and $\pm$ diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: T = K.classical_decomposition()
sage: b = T(rows=[[2],[-2]])
sage: pm = K.from_highest_weight_vector_to_pm_diagram(b); pm
[[1, 1], [0, 0], [0]]
sage: pm.pp()
+
-
sage: b = T(rows=[])
sage: pm=K.from_highest_weight_vector_to_pm_diagram(b); pm
[[0, 2], [0, 0], [0]]
sage: pm.pp()

sage: hw = [ b for b in T if all(b.epsilon(i)==0 for i in [2,3,4]) ]
sage: all(K.from_pm_diagram_to_highest_weight_vector(K.from_highest_weight_
```

(continues on next page)

(continued from previous page)

```
↪vector_to_pm_diagram(b)) == b for b in hw)
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(2))
>>> T = K.classical_decomposition()
>>> b = T(rows=[[Integer(2)],[-Integer(2)]])
>>> pm = K.from_highest_weight_vector_to_pm_diagram(b); pm
[[1, 1], [0, 0], [0]]
>>> pm.pp()
+
-
>>> b = T(rows=[])
>>> pm=K.from_highest_weight_vector_to_pm_diagram(b); pm
[[0, 2], [0, 0], [0]]
>>> pm.pp()

>>> hw = [ b for b in T if all(b.epsilon(i)==Integer(0) for i in [Integer(2),
↪Integer(3),Integer(4)]) ]
>>> all(K.from_pm_diagram_to_highest_weight_vector(K.from_highest_weight_
↪vector_to_pm_diagram(b)) == b for b in hw)
True
```

from_pm_diagram_to_highest_weight_vector(*pm*)

This gives the bijection between a $\pm$ diagram and an element `b` in the classical decomposition of the KR crystal that is $2, 3, \ldots, n$-highest weight.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[1, 1], [0,␣
↪0], [0]])
sage: K.from_pm_diagram_to_highest_weight_vector(pm)
[[2], [-2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(2))
>>> pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[Integer(1),␣
↪Integer(1)], [Integer(0), Integer(0)], [Integer(0)]])
>>> K.from_pm_diagram_to_highest_weight_vector(pm)
[[2], [-2]]
```

promotion()

Specifies the promotion operator used to construct the affine type $D_n^{(1)}$ etc. crystal.

This corresponds to the Dynkin diagram automorphism which interchanges nodes 0 and 1, and leaves all other nodes unchanged. On the level of crystals it is constructed using $\pm$ diagrams.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: promotion = K.promotion()
sage: b = K.classical_decomposition()(rows=[])
sage: promotion(b)
[[1, 2], [-2, -1]]
sage: b = K.classical_decomposition()(rows=[[1,3],[2,-1]])
sage: promotion(b)
[[1, 3], [2, -1]]
sage: b = K.classical_decomposition()(rows=[[1],[-3]])
sage: promotion(b)
[[2, -3], [-2, -1]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(2))
>>> promotion = K.promotion()
>>> b = K.classical_decomposition()(rows=[])
>>> promotion(b)
[[1, 2], [-2, -1]]
>>> b = K.classical_decomposition()(rows=[[Integer(1),Integer(3)],[Integer(2),
↪-Integer(1)]])
>>> promotion(b)
[[1, 3], [2, -1]]
>>> b = K.classical_decomposition()(rows=[[Integer(1)],[-Integer(3)]])
>>> promotion(b)
[[2, -3], [-2, -1]]
```

promotion_inverse()

Return inverse of promotion.

In this case promotion is an involution, so promotion inverse equals promotion.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: promotion = K.promotion()
sage: promotion_inverse = K.promotion_inverse()
sage: all( promotion_inverse(promotion(b.lift())) == b.lift() for b in K )
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(2))
>>> promotion = K.promotion()
>>> promotion_inverse = K.promotion_inverse()
>>> all( promotion_inverse(promotion(b.lift())) == b.lift() for b in K )
True
```

promotion_on_highest_weight_vector(b)

Calculate promotion on a $2, 3, \ldots, n$ highest weight vector b.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: T = K.classical_decomposition()
sage: hw = [ b for b in T if all(b.epsilon(i)==0 for i in [2,3,4]) ]
sage: [K.promotion_on_highest_weight_vector(b) for b in hw]
[[[1, 2], [-2, -1]], [[2, 2], [-2, -1]], [[1, 2], [3, -1]],
 [[2], [-2]], [[1, 2], [2, -2]], [[2, 2], [-1, -1]],
 [[2, 2], [3, -1]], [[2, 2], [3, 3]], [], [[1], [2]],
 [[1, 1], [2, 2]], [[2], [-1]], [[1, 2], [2, -1]],
 [[2], [3]], [[1, 2], [2, 3]]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(2))
>>> T = K.classical_decomposition()
>>> hw = [ b for b in T if all(b.epsilon(i)==Integer(0) for i in [Integer(2),
↪Integer(3),Integer(4)]) ]
>>> [K.promotion_on_highest_weight_vector(b) for b in hw]
[[[1, 2], [-2, -1]], [[2, 2], [-2, -1]], [[1, 2], [3, -1]],
 [[2], [-2]], [[1, 2], [2, -2]], [[2, 2], [-1, -1]],
 [[2, 2], [3, -1]], [[2, 2], [3, 3]], [], [[1], [2]],
 [[1, 1], [2, 2]], [[2], [-1]], [[1, 2], [2, -1]],
 [[2], [3]], [[1, 2], [2, 3]]]
```

sage.combinat.crystals.kirillov_reshetikhin.**KashiwaraNakashimaTableaux**(*cartan_type*, *r*, *s*)

Return the Kashiwara-Nakashima model for the Kirillov-Reshetikhin crystal $B^{r,s}$ in the given type.

The Kashiwara-Nakashima (KN) model constructs the KR crystal from the KN tableaux model for the corresponding classical crystals. This model is named for the underlying KN tableaux.

Many Kirillov-Reshetikhin crystals are constructed from a classical crystal together with an automorphism p on the level of crystals which corresponds to a Dynkin diagram automorphism mapping node 0 to some other node i. The action of f_0 and e_0 is then constructed using $f_0 = p^{-1} \circ f_i \circ p$.

For example, for type $A_n^{(1)}$ the Kirillov-Reshetikhin crystal $B^{r,s}$ is obtained from the classical crystal $B(s\omega_r)$ using the promotion operator. For other types, see [Shi2002], [Sch2008], and [JS2010].

Other Kirillov-Reshetikhin crystals are constructed using similarity methods. See Section 4 of [FOS2009].

For more information on Kirillov-Reshetikhin crystals, see *KirillovReshetikhinCrystal()*.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2, 1)
sage: K2 = crystals.kirillov_reshetikhin.KashiwaraNakashimaTableaux(['A',3,1], 2,␣
↪1)
sage: K is K2
True
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['A',Integer(3),Integer(1)], Integer(2),␣
↪Integer(1))
>>> K2 = crystals.kirillov_reshetikhin.KashiwaraNakashimaTableaux(['A',Integer(3),
↪Integer(1)], Integer(2), Integer(1))
>>> K is K2
True
```

sage.combinat.crystals.kirillov_reshetikhin.**KirillovReshetikhinCrystal**(*cartan_type*, *r*, *s*, *model='KN'*)

Return the Kirillov-Reshetikhin crystal $B^{r,s}$ of the given type in the given model.

For more information about general crystals see *sage.combinat.crystals.crystals*.

There are a variety of models for Kirillov-Reshetikhin crystals. There is one using the classical crystal with *Kashiwara-Nakashima tableaux*. There is one using *rigged configurations*. Another tableaux model comes from the bijection between rigged configurations and tensor products of tableaux called *Kirillov-Reshetikhin tableaux* Lastly there is a model of Kirillov-Reshetikhin crystals for $s = 1$ from crystals of *LS paths*.

INPUT:

- `cartan_type` – an affine Cartan type
- `r` – a label of finite Dynkin diagram
- `s` – positive integer
- `model` – (default: `'KN'`) can be one of the following:
  - `'KN'` or `'KashiwaraNakashimaTableaux'` – use the Kashiwara-Nakashima tableaux model
  - `'KR'` or `'KirillovReshetkihinTableaux'` – use the Kirillov-Reshetkihin tableaux model
  - `'RC'` or `'RiggedConfiguration'` – use the rigged configuration model
  - `'LSPaths'` – use the LS path model

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['A',3,1], 2, 1)
sage: K.index_set()
(0, 1, 2, 3)
sage: K.list()
[[[1], [2]], [[1], [3]], [[2], [3]], [[1], [4]], [[2], [4]], [[3], [4]]]
sage: b=K(rows=[[1],[2]])
sage: b.weight()
-Lambda[0] + Lambda[2]

sage: K = crystals.KirillovReshetikhin(['A',3,1], 2,2)
sage: K.automorphism(K.module_generators[0])
[[2, 2], [3, 3]]
sage: K.module_generators[0].e(0)
[[1, 2], [2, 4]]
sage: K.module_generators[0].f(2)
[[1, 1], [2, 3]]
sage: K.module_generators[0].f(1)
sage: K.module_generators[0].phi(0)
0
sage: K.module_generators[0].phi(1)
0
sage: K.module_generators[0].phi(2)
2
sage: K.module_generators[0].epsilon(0)
2
sage: K.module_generators[0].epsilon(1)
0
sage: K.module_generators[0].epsilon(2)
```

sage.combinat.crystals.kirillov_reshetikhin.**KirillovReshetikhinCrystalFromLSPaths**(*cartan_type*, *r*, *s=1*)

Single column Kirillov-Reshetikhin crystals.

This yields the single column Kirillov-Reshetikhin crystals from the projected level zero LS paths, see *CrystalOfLSPaths*. This works for all types (even exceptional types). The weight of the canonical element in this crystal is Λ_r. For other implementation see *KirillovReshetikhinCrystal()*.

EXAMPLES:

```
sage: K = crystals.kirillov_reshetikhin.LSPaths(['A',2,1],2) # indirect doctest
sage: KR = crystals.KirillovReshetikhin(['A',2,1],2,1)
sage: G = K.digraph()
sage: GR = KR.digraph()
sage: G.is_isomorphic(GR, edge_labels = True)
True

sage: K = crystals.kirillov_reshetikhin.LSPaths(['C',3,1],2)
sage: KR = crystals.KirillovReshetikhin(['C',3,1],2,1)
sage: G = K.digraph()
sage: GR = KR.digraph()
sage: G.is_isomorphic(GR, edge_labels = True)
True

sage: K = crystals.kirillov_reshetikhin.LSPaths(['E',6,1],1)
sage: KR = crystals.KirillovReshetikhin(['E',6,1],1,1)
sage: G = K.digraph()
sage: GR = KR.digraph()
sage: G.is_isomorphic(GR, edge_labels = True)
True
sage: K.cardinality()
27
```

class sage.combinat.crystals.kirillov_reshetikhin.**KirillovReshetikhinCrystalFromPromotion**(*cartan_type*, *r*, *s*)

Bases: *KirillovReshetikhinGenericCrystal*, *AffineCrystalFromClassicalAndPromotion*

This generic class assumes that the Kirillov-Reshetikhin crystal is constructed from a classical crystal using the `classical_decomposition` and an automorphism `promotion` and its inverse, which corresponds to a Dynkin diagram automorphism `dynkin_diagram_automorphism`.

Each instance using this class needs to implement the methods:

- `classical_decomposition`
- `promotion`
- `promotion_inverse`
- `dynkin_diagram_automorphism`

Element

alias of *KirillovReshetikhinCrystalFromPromotionElement*

class sage.combinat.crystals.kirillov_reshetikhin.**KirillovReshetikhinCrystalFromPromotionElement**

Bases: *AffineCrystalFromClassicalAndPromotionElement*, *KirillovReshetikhinGenericCrystalElement*

Element for a Kirillov-Reshetikhin crystal from promotion.

class sage.combinat.crystals.kirillov_reshetikhin.**KirillovReshetikhinGenericCrystal**(*cartan_type*, *r*, *s*, *dual=None*)

Bases: *AffineCrystalFromClassical*

Generic class for Kirillov-Reshetikhin crystal $B^{r,s}$ of the given type.

Input is a Dynkin node `r`, a positive integer `s`, and a Cartan type `cartan_type`.

Element

alias of *KirillovReshetikhinGenericCrystalElement*

classically_highest_weight_vectors()

Return the classically highest weight vectors of `self`.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D', 4, 1], 2, 2)
sage: K.classically_highest_weight_vectors()
([], [[1], [2]], [[1, 1], [2, 2]])
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)],␣
↪Integer(2), Integer(2))
>>> K.classically_highest_weight_vectors()
([], [[1], [2]], [[1, 1], [2, 2]])
```

kirillov_reshetikhin_tableaux()

Return the corresponding set of *KirillovReshetikhinTableaux*.

EXAMPLES:

```
sage: KRC = crystals.KirillovReshetikhin(['D', 4, 1], 2, 2)
sage: KRC.kirillov_reshetikhin_tableaux()
Kirillov-Reshetikhin tableaux of type ['D', 4, 1] and shape (2, 2)
```

```
>>> from sage.all import *
>>> KRC = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)],␣
↪Integer(2), Integer(2))
>>> KRC.kirillov_reshetikhin_tableaux()
Kirillov-Reshetikhin tableaux of type ['D', 4, 1] and shape (2, 2)
```

module_generator()

Return the unique module generator of classical weight $s\Lambda_r$ of a Kirillov-Reshetikhin crystal $B^{r,s}$

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['C',2,1],1,2)
sage: K.module_generator()
[[1, 1]]
sage: K = crystals.KirillovReshetikhin(['E',6,1],1,1)
sage: K.module_generator()
[(1,)]

sage: K = crystals.KirillovReshetikhin(['D',4,1],2,1)
sage: K.module_generator()
[[1], [2]]
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['C',Integer(2),Integer(1)],Integer(1),
↪Integer(2))
>>> K.module_generator()
[[1, 1]]
>>> K = crystals.KirillovReshetikhin(['E',Integer(6),Integer(1)],Integer(1),
↪Integer(1))
>>> K.module_generator()
[(1,)]

>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],Integer(2),
↪Integer(1))
```

(continues on next page)

(continued from previous page)

```
>>> K.module_generator()
[[1], [2]]
```

r()

Return r of the underlying Kirillov-Reshetikhin crystal $B^{r,s}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2, 1)
sage: K.r()
2
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),␣
↪Integer(1))
>>> K.r()
2
```

s()

Return s of the underlying Kirillov-Reshetikhin crystal $B^{r,s}$.

EXAMPLES:

```
sage: K = crystals.KirillovReshetikhin(['D',4,1], 2, 1)
sage: K.s()
1
```

```
>>> from sage.all import *
>>> K = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),␣
↪Integer(1))
>>> K.s()
1
```

class sage.combinat.crystals.kirillov_reshetikhin.**KirillovReshetikhinGenericCrystalElement**

Bases: *AffineCrystalFromClassicalElement*

Abstract class for all Kirillov-Reshetikhin crystal elements.

lusztig_involution()

Return the classical Lusztig involution on `self`.

EXAMPLES:

```
sage: KRC = crystals.KirillovReshetikhin(['D',4,1], 2,2)
sage: elt = KRC(-1,2); elt
[[2], [-1]]
sage: elt.lusztig_involution()
[[1], [-2]]
```

```
>>> from sage.all import *
>>> KRC = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)],␣
↪Integer(2),Integer(2))
```

(continues on next page)

(continued from previous page)

```
>>> elt = KRC(-Integer(1),Integer(2)); elt
[[2], [-1]]
>>> elt.lusztig_involution()
[[1], [-2]]
```

pp()

Pretty print `self`.

EXAMPLES:

```
sage: C = crystals.KirillovReshetikhin(['D',4,1], 2,1)
sage: C(2,1).pp()
  1
  2
sage: C = crystals.KirillovReshetikhin(['B',3,1], 3,3)
sage: C.module_generators[0].pp()
+ (X)   1
+
+
```

```
>>> from sage.all import *
>>> C = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(1))
>>> C(Integer(2),Integer(1)).pp()
  1
  2
>>> C = crystals.KirillovReshetikhin(['B',Integer(3),Integer(1)], Integer(3),
↪Integer(3))
>>> C.module_generators[Integer(0)].pp()
+ (X)   1
+
+
```

to_kirillov_reshetikhin_tableau()

Construct the corresponding *KirillovReshetikhinTableauxElement* from `self`.

We construct the Kirillov-Reshetikhin tableau element as follows:

1. Let λ be the shape of `self`.
2. Determine a path $e_{i_1} e_{i_2} \cdots e_{i_k}$ to the highest weight.
3. Apply $f_{i_k} \cdots f_{i_2} f_{i_1}$ to a highest weight KR tableau from filling the shape λ.

EXAMPLES:

```
sage: KRC = crystals.KirillovReshetikhin(['A', 4, 1], 2, 1)
sage: KRC(columns=[[2,1]]).to_kirillov_reshetikhin_tableau()
[[1], [2]]
sage: KRC = crystals.KirillovReshetikhin(['D', 4, 1], 2, 1)
sage: KRC(rows=[]).to_kirillov_reshetikhin_tableau()
[[1], [-1]]
```

```
>>> from sage.all import *
>>> KRC = crystals.KirillovReshetikhin(['A', Integer(4), Integer(1)],␣
↪Integer(2), Integer(1))
>>> KRC(columns=[[Integer(2),Integer(1)]]).to_kirillov_reshetikhin_tableau()
[[1], [2]]
>>> KRC = crystals.KirillovReshetikhin(['D', Integer(4), Integer(1)],␣
↪Integer(2), Integer(1))
>>> KRC(rows=[]).to_kirillov_reshetikhin_tableau()
[[1], [-1]]
```

to_tableau()

Return the *Tableau* corresponding to `self`.

EXAMPLES:

```
sage: C = crystals.KirillovReshetikhin(['D',4,1], 2,1)
sage: t = C(2,1).to_tableau(); t
[[1], [2]]
sage: type(t)
<class 'sage.combinat.tableau.Tableaux_all_with_category.element_class'>
```

```
>>> from sage.all import *
>>> C = crystals.KirillovReshetikhin(['D',Integer(4),Integer(1)], Integer(2),
↪Integer(1))
>>> t = C(Integer(2),Integer(1)).to_tableau(); t
[[1], [2]]
>>> type(t)
<class 'sage.combinat.tableau.Tableaux_all_with_category.element_class'>
```

class sage.combinat.crystals.kirillov_reshetikhin.**PMDiagram**(*pm_diagram*, *from_shapes=None*)

Bases: *CombinatorialObject*

Class of $\pm$ diagrams. These diagrams are in one-to-one bijection with X_{n-1} highest weight vectors in an X_n highest weight crystal $X = B, C, D$. See Section 4.1 of [Sch2008].

The input is a list $pm = [[a_0, b_0], [a_1, b_1], ..., [a_{n-1}, b_{n-1}], [b_n]]$ of pairs and a last 1-tuple (or list of length 1). The pair $[a_i, b_i]$ specifies the number of a_i $+$ and b_i $-$ in the i-th row of the $\pm$ diagram if $n - i$ is odd and the number of a_i $\pm$ pairs above row i and b_i columns of height i not containing any $+$ or $-$ if $n - i$ is even.

Setting the option `from_shapes = True` one can also input a $\pm$ diagram in terms of its outer, intermediate, and inner shape by specifying a list `[n, s, outer, intermediate, inner]` where `s` is the width of the $\pm$ diagram, and `outer`, `intermediate`, and `inner` are the outer, intermediate, and inner shapes, respectively.

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
sage: pm = PMDiagram([[0,1],[1,2],[1]])
sage: pm.pm_diagram
[[0, 1], [1, 2], [1]]
sage: pm._list
[1, 1, 2, 0, 1]
sage: pm.n
2
sage: pm.width
5
```

(continues on next page)

(continued from previous page)

```
sage: pm.pp()
.  .  .  .
.  +  -  -
sage: PMDiagram([2,5,[4,4],[4,2],[4,1]], from_shapes=True)
[[0, 1], [1, 2], [1]]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
>>> pm = PMDiagram([[Integer(0),Integer(1)],[Integer(1),Integer(2)],[Integer(1)]])
>>> pm.pm_diagram
[[0, 1], [1, 2], [1]]
>>> pm._list
[1, 1, 2, 0, 1]
>>> pm.n
2
>>> pm.width
5
>>> pm.pp()
.  .  .  .
.  +  -  -
>>> PMDiagram([Integer(2),Integer(5),[Integer(4),Integer(4)],[Integer(4),
↪Integer(2)],[Integer(4),Integer(1)]], from_shapes=True)
[[0, 1], [1, 2], [1]]
```

heights_of_addable_plus()

Return a list with the heights of all addable plus in the $\pm$ diagram.

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
sage: pm = PMDiagram([[1,2],[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.heights_of_addable_plus()
[1, 1, 2, 3, 4, 5]
sage: pm = PMDiagram([[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.heights_of_addable_plus()
[1, 2, 3, 4]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(2)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1),Integer(1)],
↪[Integer(1)]])
>>> pm.heights_of_addable_plus()
[1, 1, 2, 3, 4, 5]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(1)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1)]])
>>> pm.heights_of_addable_plus()
[1, 2, 3, 4]
```

heights_of_minus()

Return a list with the heights of all minus in the $\pm$ diagram.

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
sage: pm = PMDiagram([[1,2],[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.heights_of_minus()
[5, 5, 3, 3, 1, 1]
sage: pm = PMDiagram([[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.heights_of_minus()
[4, 4, 2, 2]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(2)],
...[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1),Integer(1)],
...[Integer(1)]])
>>> pm.heights_of_minus()
[5, 5, 3, 3, 1, 1]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(1)],
...[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1)]])
>>> pm.heights_of_minus()
[4, 4, 2, 2]
```

inner_shape()

Return the inner shape of the pm diagram.

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
sage: pm = PMDiagram([[0,1],[1,2],[1]])
sage: pm.inner_shape()
[4, 1]
sage: pm = PMDiagram([[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.inner_shape()
[7, 5, 3, 1]
sage: pm = PMDiagram([[1,2],[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.inner_shape()
[10, 7, 5, 3, 1]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
>>> pm = PMDiagram([[Integer(0),Integer(1)],[Integer(1),Integer(2)],
...[Integer(1)]])
>>> pm.inner_shape()
[4, 1]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(1)],
...[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1)]])
>>> pm.inner_shape()
[7, 5, 3, 1]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(2)],
...[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1),Integer(1)],
...[Integer(1)]])
>>> pm.inner_shape()
[10, 7, 5, 3, 1]
```

intermediate_shape()

Return the intermediate shape of the pm diagram (inner shape plus positions of plusses).

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
sage: pm = PMDiagram([[0,1],[1,2],[1]])
sage: pm.intermediate_shape()
[4, 2]
sage: pm = PMDiagram([[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.intermediate_shape()
[8, 6, 4, 2]
sage: pm = PMDiagram([[1,2],[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.intermediate_shape()
[11, 8, 6, 4, 2]
sage: pm = PMDiagram([[1,0],[0,1],[2,0],[0,0],[0]])
sage: pm.intermediate_shape()
[4, 2, 2]
sage: pm = PMDiagram([[1, 0], [0, 0], [0, 0], [0, 0], [0]])
sage: pm.intermediate_shape()
[1]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
>>> pm = PMDiagram([[Integer(0),Integer(1)],[Integer(1),Integer(2)],
↪[Integer(1)]])
>>> pm.intermediate_shape()
[4, 2]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(1)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1)]])
>>> pm.intermediate_shape()
[8, 6, 4, 2]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(2)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1),Integer(1)],
↪[Integer(1)]])
>>> pm.intermediate_shape()
[11, 8, 6, 4, 2]
>>> pm = PMDiagram([[Integer(1),Integer(0)],[Integer(0),Integer(1)],
↪[Integer(2),Integer(0)],[Integer(0),Integer(0)],[Integer(0)]])
>>> pm.intermediate_shape()
[4, 2, 2]
>>> pm = PMDiagram([[Integer(1), Integer(0)], [Integer(0), Integer(0)],␣
↪[Integer(0), Integer(0)], [Integer(0), Integer(0)], [Integer(0)]])
>>> pm.intermediate_shape()
[1]
```

outer_shape()

Return the outer shape of the $\pm$ diagram.

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
sage: pm = PMDiagram([[0,1],[1,2],[1]])
sage: pm.outer_shape()
[4, 4]
```

(continues on next page)

(continued from previous page)

```
sage: pm = PMDiagram([[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.outer_shape()
[8, 8, 4, 4]
sage: pm = PMDiagram([[1,2],[1,2],[1,1],[1,1],[1,1],[1]])
sage: pm.outer_shape()
[13, 8, 8, 4, 4]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
>>> pm = PMDiagram([[Integer(0),Integer(1)],[Integer(1),Integer(2)],
↪[Integer(1)]])
>>> pm.outer_shape()
[4, 4]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(1)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1)]])
>>> pm.outer_shape()
[8, 8, 4, 4]
>>> pm = PMDiagram([[Integer(1),Integer(2)],[Integer(1),Integer(2)],
↪[Integer(1),Integer(1)],[Integer(1),Integer(1)],[Integer(1),Integer(1)],
↪[Integer(1)]])
>>> pm.outer_shape()
[13, 8, 8, 4, 4]
```

pp()

Pretty print `self`.

EXAMPLES:

```
sage: from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
sage: pm = PMDiagram([[1,0],[0,1],[2,0],[0,0],[0]])
sage: pm.pp()
.  .  .  +
.  .  -  -
+  +
-  -
sage: pm = PMDiagram([[0,2], [0,0], [0]])
sage: pm.pp()
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.kirillov_reshetikhin import PMDiagram
>>> pm = PMDiagram([[Integer(1),Integer(0)],[Integer(0),Integer(1)],
↪[Integer(2),Integer(0)],[Integer(0),Integer(0)],[Integer(0)]])
>>> pm.pp()
.  .  .  +
.  .  -  -
+  +
-  -
>>> pm = PMDiagram([[Integer(0),Integer(2)], [Integer(0),Integer(0)],␣
↪[Integer(0)]])
>>> pm.pp()
```

sigma()

Return sigma on pm diagrams as needed for the analogue of the Dynkin diagram automorphism that interchanges nodes 0 and 1 for type $D_n(1)$, $B_n(1)$, $A_{2n-1}(2)$ for Kirillov-Reshetikhin crystals.

EXAMPLES:

```
sage: pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[0,1],[1,2],
↪[1]])
sage: pm.sigma()
[[1, 0], [2, 1], [1]]
```

```
>>> from sage.all import *
>>> pm = sage.combinat.crystals.kirillov_reshetikhin.PMDiagram([[Integer(0),
↪Integer(1)],[Integer(1),Integer(2)],[Integer(1)]])
>>> pm.sigma()
[[1, 0], [2, 1], [1]]
```

sage.combinat.crystals.kirillov_reshetikhin.**horizontal_dominoes_removed**(*r*, *s*)

Return all partitions obtained from a rectangle of width s and height r by removing horizontal dominoes.

EXAMPLES:

```
sage: sage.combinat.crystals.kirillov_reshetikhin.horizontal_dominoes_removed(2,2)
[[], [2], [2, 2]]
sage: sage.combinat.crystals.kirillov_reshetikhin.horizontal_dominoes_removed(3,2)
[[], [2], [2, 2], [2, 2, 2]]
```

```
>>> from sage.all import *
>>> sage.combinat.crystals.kirillov_reshetikhin.horizontal_dominoes_
↪removed(Integer(2),Integer(2))
[[], [2], [2, 2]]
>>> sage.combinat.crystals.kirillov_reshetikhin.horizontal_dominoes_
↪removed(Integer(3),Integer(2))
[[], [2], [2, 2], [2, 2, 2]]
```

sage.combinat.crystals.kirillov_reshetikhin.**partitions_in_box**(*r*, *s*)

Return all partitions in a box of width s and height r.

EXAMPLES:

```
sage: sage.combinat.crystals.kirillov_reshetikhin.partitions_in_box(3,2)
[[], [1], [2], [1, 1], [2, 1], [1, 1, 1], [2, 2], [2, 1, 1],
[2, 2, 1], [2, 2, 2]]
```

```
>>> from sage.all import *
>>> sage.combinat.crystals.kirillov_reshetikhin.partitions_in_box(Integer(3),
↪Integer(2))
[[], [1], [2], [1, 1], [2, 1], [1, 1, 1], [2, 2], [2, 1, 1],
[2, 2, 1], [2, 2, 2]]
```

sage.combinat.crystals.kirillov_reshetikhin.**vertical_dominoes_removed**(*r*, *s*)

Return all partitions obtained from a rectangle of width s and height r by removing vertical dominoes.

EXAMPLES:

```
sage: sage.combinat.crystals.kirillov_reshetikhin.vertical_dominoes_removed(2,2)
[[], [1, 1], [2, 2]]
sage: sage.combinat.crystals.kirillov_reshetikhin.vertical_dominoes_removed(3,2)
[[2], [2, 1, 1], [2, 2, 2]]
sage: sage.combinat.crystals.kirillov_reshetikhin.vertical_dominoes_removed(4,2)
[[], [1, 1], [1, 1, 1, 1], [2, 2], [2, 2, 1, 1], [2, 2, 2, 2]]
```

```
>>> from sage.all import *
>>> sage.combinat.crystals.kirillov_reshetikhin.vertical_dominoes_
↪removed(Integer(2),Integer(2))
[[], [1, 1], [2, 2]]
>>> sage.combinat.crystals.kirillov_reshetikhin.vertical_dominoes_
↪removed(Integer(3),Integer(2))
[[2], [2, 1, 1], [2, 2, 2]]
>>> sage.combinat.crystals.kirillov_reshetikhin.vertical_dominoes_
↪removed(Integer(4),Integer(2))
[[], [1, 1], [1, 1, 1, 1], [2, 2], [2, 2, 1, 1], [2, 2, 2, 2]]
```

Kyoto path model for affine highest weight crystals

class sage.combinat.crystals.kyoto_path_model.**KyotoPathModel**(*crystals*, *weight*, *P*)

Bases: *TensorProductOfCrystals*

The Kyoto path model for an affine highest weight crystal.

Note

Here we are using anti-Kashiwara notation and might differ from some of the literature.

Consider a Kac–Moody algebra $\mathfrak{g}$ of affine Cartan type X, and we want to model the $U'_q(\mathfrak{g})$-crystal $B(\lambda)$. First we consider the set of fundamental weights $\{\Lambda_i\}_{i \in I}$ of $\mathfrak{g}$ and let $\{\overline{\Lambda}_i\}_{i \in I_0}$ be the corresponding fundamental weights of the corresponding classical Lie algebra $\mathfrak{g}_0$. To model $B(\lambda)$, we start with a sequence of perfect $U'_q(\mathfrak{g})$-crystals $(B^{(i)})_i$ of level l such that

$$\lambda \in \overline{P}_l^+ = \left\{ \mu \in \overline{P}^+ \mid \langle c, \mu \rangle = l \right\}$$

where c is the canonical central element of $U'_q(\mathfrak{g})$ and $\overline{P}^+$ is the nonnegative weight lattice spanned by $\{\overline{\Lambda}_i \mid i \in I\}$.

Next we consider the crystal isomorphism $\Phi_0 : B(\lambda_0) \to B^{(0)} \otimes B(\lambda_1)$ defined by $u_{\lambda_0} \mapsto b^{(0)}_{\lambda_0} \otimes u_{\lambda_1}$ where $b^{(0)}_{\lambda_0}$ is the unique element in $B^{(0)}$ such that $\varphi\left(b^{(0)}_{\lambda_0}\right) = \lambda_0$ and $\lambda_1 = \varepsilon\left(b^{(0)}_{\lambda_0}\right)$ and u_μ is the highest weight element in $B(\mu)$. Iterating this, we obtain the following isomorphism:

$$\Phi_n : B(\lambda) \to B^{(0)} \otimes B^{(1)} \otimes \cdots \otimes B^{(N)} \otimes B(\lambda_{N+1}).$$

We note by Lemma 10.6.2 in [HK2002] that for any $b \in B(\lambda)$ there exists a finite N such that

$$\Phi_N(b) = \left(\bigotimes_{k=0}^{N-1} b^{(k)} \right) \otimes u_{\lambda_N}.$$

Therefore we can model elements $b \in B(\lambda)$ as a $U'_q(\mathfrak{g})$-crystal by considering an infinite list of elements $b^{(k)} \in$

$B^{(k)}$ and defining the crystal structure by:

$$\begin{aligned}
\overline{\mathrm{wt}}(b) &= \lambda_N + \sum_{k=0}^{N-1} \overline{\mathrm{wt}}\left(b^{(k)}\right) \\
e_i(b) &= e_i\left(b' \otimes b^{(N)}\right) \otimes u_{\lambda_N}, \\
f_i(b) &= f_i\left(b' \otimes b^{(N)}\right) \otimes u_{\lambda_N}, \\
\varepsilon_i(b) &= \max\left(\varepsilon_i(b') - \varphi_i\left(b^{(N)}\right), 0\right), \\
\varphi_i(b) &= \varphi_i(b') + \max\left(\varphi_i\left(b^{(N)}\right) - \varepsilon_i(b'), 0\right),
\end{aligned}$$

where $b' = b^{(0)} \otimes \cdots \otimes b^{(N-1)}$. To translate this into a finite list, we consider a finite sequence $b^{(0)} \otimes \cdots \otimes b^{(N-1)} \otimes b^{(N)}_{\lambda_N}$ and if

$$f_i\left(b^{(0)} \otimes \cdots b^{(N-1)} \otimes b^{(N)}_{\lambda_N}\right) = b_0 \otimes \cdots \otimes b^{(N-1)} \otimes f_i\left(b^{(N)}_{\lambda_N}\right),$$

then we take the image as $b^{(0)} \otimes \cdots \otimes f_i\left(b^{(N)}_{\lambda_N}\right) \otimes b^{(N+1)}_{\lambda_{N+1}}$. Similarly we remove $b^{(N)}_{\lambda_N}$ if we have $b_0 \otimes \cdots \otimes b^{(N-1)} \otimes b^{(N-1)}_{\lambda_{N-1}} \otimes b^{(N)}_{\lambda_N}$. Additionally if

$$e_i\left(b^{(0)} \otimes \cdots \otimes b^{(N-1)} \otimes b^{(N)}_{\lambda_N}\right) = b^{(0)} \otimes \cdots \otimes b^{(N-1)} \otimes e_i\left(b^{(N)}_{\lambda_N}\right),$$

then we consider this to be 0.

We can then lift the $U'_q(\mathfrak{g})$-crystal structure to a $U_q(\mathfrak{g})$-crystal structure by using a tensor product of the *affinization* of the of crystals $B^{(i)}$ for all i.

INPUT:

- `B` – a single or list of U'_q perfect crystal(s) of level l
- `weight` – a weight in $\overline{P}^+_l$

EXAMPLES:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]; mg
[[[3]]]
sage: mg.f_string([0,1,2,2])
[[[3]], [[3]], [[1]]]
sage: x = mg.f_string([0,1,2]); x
[[[2]], [[3]], [[1]]]
sage: x.weight()
Lambda[0]
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(1),
↪Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().fundamental_
↪weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
```

(continues on next page)

(continued from previous page)

```
>>> mg = C.module_generators[Integer(0)]; mg
[[[3]]]
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2)])
[[[3]], [[3]], [[1]]]
>>> x = mg.f_string([Integer(0),Integer(1),Integer(2)]); x
[[[2]], [[3]], [[1]]]
>>> x.weight()
Lambda[0]
```

An example of type $A_5^{(2)}$:

```
sage: B = crystals.KirillovReshetikhin(['A',5,2], 1,1)
sage: La = RootSystem(['A',5,2]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]; mg
[[[-1]]]
sage: mg.f_string([0,2,1,3])
[[[-3]], [[2]], [[-1]]]
sage: mg.f_string([0,2,3,1])
[[[-3]], [[2]], [[-1]]]
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(5),Integer(2)], Integer(1),
↪Integer(1))
>>> La = RootSystem(['A',Integer(5),Integer(2)]).weight_lattice().fundamental_
↪weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]; mg
[[[-1]]]
>>> mg.f_string([Integer(0),Integer(2),Integer(1),Integer(3)])
[[[-3]], [[2]], [[-1]]]
>>> mg.f_string([Integer(0),Integer(2),Integer(3),Integer(1)])
[[[-3]], [[2]], [[-1]]]
```

An example of type $D_3^{(2)}$:

```
sage: B = crystals.KirillovReshetikhin(['D',3,2], 1,1)
sage: La = RootSystem(['D',3,2]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]; mg
[[]]
sage: mg.f_string([0,1,2,0])
[[[0]], [[1]], []]
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['D',Integer(3),Integer(2)], Integer(1),
↪Integer(1))
>>> La = RootSystem(['D',Integer(3),Integer(2)]).weight_lattice().fundamental_
↪weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]; mg
[[]]
```

(continues on next page)

(continued from previous page)

```
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(0)])
[[[0]], [[1]], []]
```

An example using multiple crystals of the same level:

```
sage: B1 = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: B2 = crystals.KirillovReshetikhin(['A',2,1], 2,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel([B1, B2, B1], La[0])
sage: mg = C.module_generators[0]; mg
[[[3]]]
sage: mg.f_string([0,1,2,2])
[[[3]], [[1], [3]], [[3]]]
sage: mg.f_string([0,1,2,2,2])
sage: mg.f_string([0,1,2,2,1,0])
[[[3]], [[2], [3]], [[1]], [[2]]]
sage: mg.f_string([0,1,2,2,1,0,0,2])
[[[3]], [[1], [2]], [[1]], [[3]], [[1], [3]]]
```

```
>>> from sage.all import *
>>> B1 = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(1),
↪Integer(1))
>>> B2 = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(2),
↪Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().fundamental_
↪weights()
>>> C = crystals.KyotoPathModel([B1, B2, B1], La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]; mg
[[[3]]]
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2)])
[[[3]], [[1], [3]], [[3]]]
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2),Integer(2)])
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2),Integer(1),
↪Integer(0)])
[[[3]], [[2], [3]], [[1]], [[2]]]
>>> mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2),Integer(1),
↪Integer(0),Integer(0),Integer(2)])
[[[3]], [[1], [2]], [[1]], [[3]], [[1], [3]]]
```

By using the extended weight lattice, the Kyoto path model lifts the perfect crystals to their affinizations:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: P = RootSystem(['A',2,1]).weight_lattice(extended=True)
sage: La = P.fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]; mg
[[[3]](0)]
sage: x = mg.f_string([0,1,2]); x
[[[2]](-1), [[3]](0), [[1]](0)]
sage: x.weight()
Lambda[0] - delta
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(1),
↪Integer(1))
>>> P = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice(extended=True)
>>> La = P.fundamental_weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]; mg
[[[3]](0)]
>>> x = mg.f_string([Integer(0),Integer(1),Integer(2)]); x
[[[2]](-1), [[3]](0), [[1]](0)]
>>> x.weight()
Lambda[0] - delta
```

class Element

Bases: *TensorProductOfRegularCrystalsElement*

An element in the Kyoto path model.

e(i)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]
sage: all(mg.e(i) is None for i in C.index_set())
True
sage: mg.f(0).e(0) == mg
True
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(1),Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().
↪fundamental_weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]
>>> all(mg.e(i) is None for i in C.index_set())
True
>>> mg.f(Integer(0)).e(Integer(0)) == mg
True
```

epsilon(i)

Return ε_i of `self`.

EXAMPLES:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]
sage: [mg.epsilon(i) for i in C.index_set()]
```

(continues on next page)

(continued from previous page)

```
[0, 0, 0]
sage: elt = mg.f(0)
sage: [elt.epsilon(i) for i in C.index_set()]
[1, 0, 0]
sage: elt = mg.f_string([0,1,2])
sage: [elt.epsilon(i) for i in C.index_set()]
[0, 0, 1]
sage: elt = mg.f_string([0,1,2,2])
sage: [elt.epsilon(i) for i in C.index_set()]
[0, 0, 2]
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(1),Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().
↪fundamental_weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]
>>> [mg.epsilon(i) for i in C.index_set()]
[0, 0, 0]
>>> elt = mg.f(Integer(0))
>>> [elt.epsilon(i) for i in C.index_set()]
[1, 0, 0]
>>> elt = mg.f_string([Integer(0),Integer(1),Integer(2)])
>>> [elt.epsilon(i) for i in C.index_set()]
[0, 0, 1]
>>> elt = mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2)])
>>> [elt.epsilon(i) for i in C.index_set()]
[0, 0, 2]
```

f(*i*)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]
sage: mg.f(2)
sage: mg.f(0)
[[[1]], [[2]]]
sage: mg.f_string([0,1,2])
[[[2]], [[3]], [[1]]]
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(1),Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().
↪fundamental_weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]
```

(continues on next page)

(continued from previous page)

```
>>> mg.f(Integer(2))
>>> mg.f(Integer(0))
[[[1]], [[2]]]
>>> mg.f_string([Integer(0),Integer(1),Integer(2)])
[[[2]], [[3]], [[1]]]
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]
sage: [mg.phi(i) for i in C.index_set()]
[1, 0, 0]
sage: elt = mg.f(0)
sage: [elt.phi(i) for i in C.index_set()]
[0, 1, 1]
sage: elt = mg.f_string([0,1])
sage: [elt.phi(i) for i in C.index_set()]
[0, 0, 2]
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(1),Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().
↪fundamental_weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]
>>> [mg.phi(i) for i in C.index_set()]
[1, 0, 0]
>>> elt = mg.f(Integer(0))
>>> [elt.phi(i) for i in C.index_set()]
[0, 1, 1]
>>> elt = mg.f_string([Integer(0),Integer(1)])
>>> [elt.phi(i) for i in C.index_set()]
[0, 0, 2]
```

truncate(*k=None*)

Truncate `self` to have length `k` and return as an element in a (finite) tensor product of crystals.

INPUT:

- `k` – (optional) the length to truncate to; if not specified, then returns one more than the current non-ground-state elements (i.e. the current list in `self`)

EXAMPLES:

```
sage: B1 = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: B2 = crystals.KirillovReshetikhin(['A',2,1], 2,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel([B1,B2,B1], La[0])
sage: mg = C.highest_weight_vector()
```

(continues on next page)

(continued from previous page)

```
sage: elt = mg.f_string([0,1,2,2,1,0]); elt
[[[3]], [[2], [3]], [[1]], [[2]]]
sage: t = elt.truncate(); t
[[[3]], [[2], [3]], [[1]], [[2]]]
sage: t.parent() is C.finite_tensor_product(4)
True
sage: elt.truncate(2)
[[[3]], [[2], [3]]]
sage: elt.truncate(10)
[[[3]], [[2], [3]], [[1]], [[2]], [[1], [3]],
 [[2]], [[1]], [[2], [3]], [[1]], [[3]]]
```

```
>>> from sage.all import *
>>> B1 = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(1),Integer(1))
>>> B2 = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(2),Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().
↪fundamental_weights()
>>> C = crystals.KyotoPathModel([B1,B2,B1], La[Integer(0)])
>>> mg = C.highest_weight_vector()
>>> elt = mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2),
↪Integer(1),Integer(0)]); elt
[[[3]], [[2], [3]], [[1]], [[2]]]
>>> t = elt.truncate(); t
[[[3]], [[2], [3]], [[1]], [[2]]]
>>> t.parent() is C.finite_tensor_product(Integer(4))
True
>>> elt.truncate(Integer(2))
[[[3]], [[2], [3]]]
>>> elt.truncate(Integer(10))
[[[3]], [[2], [3]], [[1]], [[2]], [[1], [3]],
 [[2]], [[1]], [[2], [3]], [[1]], [[3]]]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: P = RootSystem(['A',2,1]).weight_lattice(extended=True)
sage: La = P.fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: mg = C.module_generators[0]
sage: mg.weight()
Lambda[0]
sage: mg.f_string([0,1,2]).weight()
Lambda[0] - delta
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)],␣
↪Integer(1),Integer(1))
```

(continues on next page)

(continued from previous page)

```
>>> P = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True)
>>> La = P.fundamental_weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> mg = C.module_generators[Integer(0)]
>>> mg.weight()
Lambda[0]
>>> mg.f_string([Integer(0),Integer(1),Integer(2)]).weight()
Lambda[0] - delta
```

finite_tensor_product(*k*)

Return the finite tensor product of crystals of length `k` from truncating `self`.

EXAMPLES:

```
sage: B1 = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: B2 = crystals.KirillovReshetikhin(['A',2,1], 2,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel([B1,B2,B1], La[0])
sage: C.finite_tensor_product(5)
Full tensor product of the crystals
 [Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(1,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(2,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(1,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(1,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(2,1)]
```

```
>>> from sage.all import *
>>> B1 = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(1),
↪Integer(1))
>>> B2 = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(2),
↪Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().fundamental_
↪weights()
>>> C = crystals.KyotoPathModel([B1,B2,B1], La[Integer(0)])
>>> C.finite_tensor_product(Integer(5))
Full tensor product of the crystals
 [Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(1,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(2,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(1,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(1,1),
  Kirillov-Reshetikhin crystal of type ['A', 2, 1] with (r,s)=(2,1)]
```

weight_lattice_realization()

Return the weight lattice realization used to express weights.

EXAMPLES:

```
sage: B = crystals.KirillovReshetikhin(['A',2,1], 1,1)
sage: La = RootSystem(['A',2,1]).weight_lattice().fundamental_weights()
sage: C = crystals.KyotoPathModel(B, La[0])
sage: C.weight_lattice_realization()
Weight lattice of the Root system of type ['A', 2, 1]
```

(continues on next page)

(continued from previous page)

```
sage: P = RootSystem(['A',2,1]).weight_lattice(extended=True)
sage: C = crystals.KyotoPathModel(B, P.fundamental_weight(0))
sage: C.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
```

```
>>> from sage.all import *
>>> B = crystals.KirillovReshetikhin(['A',Integer(2),Integer(1)], Integer(1),
↪Integer(1))
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice().fundamental_
↪weights()
>>> C = crystals.KyotoPathModel(B, La[Integer(0)])
>>> C.weight_lattice_realization()
Weight lattice of the Root system of type ['A', 2, 1]

>>> P = RootSystem(['A',Integer(2),Integer(1)]).weight_lattice(extended=True)
>>> C = crystals.KyotoPathModel(B, P.fundamental_weight(Integer(0)))
>>> C.weight_lattice_realization()
Extended weight lattice of the Root system of type ['A', 2, 1]
```

Littelmann paths

AUTHORS:

- Mark Shimozono, Anne Schilling (2012): Initial version
- Anne Schilling (2013): Implemented *CrystalOfProjectedLevelZeroLSPaths*
- Travis Scrimshaw (2016): Implemented *InfinityCrystalOfLSPaths*

class sage.combinat.crystals.littelmann_path.**CrystalOfLSPaths**(*starting_weight*, *starting_weight_parent*)

Bases: UniqueRepresentation, Parent

Crystal graph of LS paths generated from the straight-line path to a given weight.

INPUT:

- `cartan_type` – (optional) the Cartan type
- `starting_weight` – a weight; if `cartan_type` is given, then the weight should be given as a list of coefficients of the fundamental weights, otherwise it should be given in the `weight_space` basis; for affine highest weight crystals, one needs to use the extended weight space

The crystal class of piecewise linear paths in the weight space, generated from a straight-line path from the origin to a given element of the weight lattice.

EXAMPLES:

```
sage: R = RootSystem(['A',2,1])
sage: La = R.weight_space(extended = True).basis()
sage: B = crystals.LSPaths(La[2]-La[0]); B
The crystal of LS paths of type ['A', 2, 1] and weight -Lambda[0] + Lambda[2]

sage: C = crystals.LSPaths(['A',2,1],[-1,0,1]); C
The crystal of LS paths of type ['A', 2, 1] and weight -Lambda[0] + Lambda[2]
```

(continues on next page)

(continued from previous page)

```
sage: B == C
True
sage: c = C.module_generators[0]; c
(-Lambda[0] + Lambda[2],)
sage: [c.f(i) for i in C.index_set()]
[None, None, (Lambda[1] - Lambda[2],)]

sage: R = C.R; R
Root system of type ['A', 2, 1]
sage: Lambda = R.weight_space().basis(); Lambda
Finite family {0: Lambda[0], 1: Lambda[1], 2: Lambda[2]}
sage: b=C(tuple([-Lambda[0]+Lambda[2]]))
sage: b==c
True
sage: b.f(2)
(Lambda[1] - Lambda[2],)
```

```
>>> from sage.all import *
>>> R = RootSystem(['A',Integer(2),Integer(1)])
>>> La = R.weight_space(extended = True).basis()
>>> B = crystals.LSPaths(La[Integer(2)]-La[Integer(0)]); B
The crystal of LS paths of type ['A', 2, 1] and weight -Lambda[0] + Lambda[2]

>>> C = crystals.LSPaths(['A',Integer(2),Integer(1)],[-Integer(1),Integer(0),
↪Integer(1)]); C
The crystal of LS paths of type ['A', 2, 1] and weight -Lambda[0] + Lambda[2]
>>> B == C
True
>>> c = C.module_generators[Integer(0)]; c
(-Lambda[0] + Lambda[2],)
>>> [c.f(i) for i in C.index_set()]
[None, None, (Lambda[1] - Lambda[2],)]

>>> R = C.R; R
Root system of type ['A', 2, 1]
>>> Lambda = R.weight_space().basis(); Lambda
Finite family {0: Lambda[0], 1: Lambda[1], 2: Lambda[2]}
>>> b=C(tuple([-Lambda[Integer(0)]+Lambda[Integer(2)]]))
>>> b==c
True
>>> b.f(Integer(2))
(Lambda[1] - Lambda[2],)
```

For classical highest weight crystals, we can also compare the results with the tableaux implementation:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: sorted(C, key=str)
[(-2*Lambda[1] + Lambda[2],), (-Lambda[1] + 1/2*Lambda[2], Lambda[1] - 1/
↪2*Lambda[2]),
 (-Lambda[1] + 2*Lambda[2],), (-Lambda[1] - Lambda[2],),
 (1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2]), (2*Lambda[1] -␣
↪Lambda[2],),
```

(continues on next page)

(continued from previous page)

```
 (Lambda[1] + Lambda[2],), (Lambda[1] - 2*Lambda[2],)]
sage: C.cardinality()
8
sage: B = crystals.Tableaux(['A',2],shape=[2,1])
sage: B.cardinality()
8
sage: B.digraph().is_isomorphic(C.digraph())
True
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> sorted(C, key=str)
[(-2*Lambda[1] + Lambda[2],), (-Lambda[1] + 1/2*Lambda[2], Lambda[1] - 1/
↪2*Lambda[2]),
 (-Lambda[1] + 2*Lambda[2],), (-Lambda[1] - Lambda[2],),
 (1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2]), (2*Lambda[1] -␣
↪Lambda[2],),
 (Lambda[1] + Lambda[2],), (Lambda[1] - 2*Lambda[2],)]
>>> C.cardinality()
8
>>> B = crystals.Tableaux(['A',Integer(2)],shape=[Integer(2),Integer(1)])
>>> B.cardinality()
8
>>> B.digraph().is_isomorphic(C.digraph())
True
```

Make sure you use the weight space and not the weight lattice for your weights:

```
sage: R = RootSystem(['A',2,1])
sage: La = R.weight_lattice(extended = True).basis()
sage: B = crystals.LSPaths(La[2]); B
Traceback (most recent call last):
...
ValueError: use the weight space, rather than weight lattice for your weights
```

```
>>> from sage.all import *
>>> R = RootSystem(['A',Integer(2),Integer(1)])
>>> La = R.weight_lattice(extended = True).basis()
>>> B = crystals.LSPaths(La[Integer(2)]); B
Traceback (most recent call last):
...
ValueError: use the weight space, rather than weight lattice for your weights
```

REFERENCES:

- [Li1995b]

class Element

Bases: ElementWrapper

A Littelmann path (crystal element).

compress()

Merge consecutive positively parallel steps present in `self`.

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: Lambda = C.R.weight_space().fundamental_weights(); Lambda
Finite family {1: Lambda[1], 2: Lambda[2]}
sage: c = C(tuple([1/2*Lambda[1]+1/2*Lambda[2], 1/2*Lambda[1]+1/
↪2*Lambda[2]]))
sage: c.compress()
(Lambda[1] + Lambda[2],)
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> Lambda = C.R.weight_space().fundamental_weights(); Lambda
Finite family {1: Lambda[1], 2: Lambda[2]}
>>> c = C(tuple([Integer(1)/Integer(2)*Lambda[Integer(1)]+Integer(1)/
↪Integer(2)*Lambda[Integer(2)], Integer(1)/
↪Integer(2)*Lambda[Integer(1)]+Integer(1)/
↪Integer(2)*Lambda[Integer(2)]]))
>>> c.compress()
(Lambda[1] + Lambda[2],)
```

dualize()

Return the dualized path of `self`.

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: for c in C:
....:     print("{} {}".format(c, c.dualize()))
(Lambda[1] + Lambda[2],) (-Lambda[1] - Lambda[2],)
(-Lambda[1] + 2*Lambda[2],) (Lambda[1] - 2*Lambda[2],)
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2]) (1/2*Lambda[1] -␣
↪Lambda[2], -1/2*Lambda[1] + Lambda[2])
(Lambda[1] - 2*Lambda[2],) (-Lambda[1] + 2*Lambda[2],)
(-Lambda[1] - Lambda[2],) (Lambda[1] + Lambda[2],)
(2*Lambda[1] - Lambda[2],) (-2*Lambda[1] + Lambda[2],)
(-Lambda[1] + 1/2*Lambda[2], Lambda[1] - 1/2*Lambda[2]) (-Lambda[1] + 1/
↪2*Lambda[2], Lambda[1] - 1/2*Lambda[2])
(-2*Lambda[1] + Lambda[2],) (2*Lambda[1] - Lambda[2],)
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> for c in C:
...     print("{} {}".format(c, c.dualize()))
(Lambda[1] + Lambda[2],) (-Lambda[1] - Lambda[2],)
(-Lambda[1] + 2*Lambda[2],) (Lambda[1] - 2*Lambda[2],)
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2]) (1/2*Lambda[1] -␣
↪Lambda[2], -1/2*Lambda[1] + Lambda[2])
(Lambda[1] - 2*Lambda[2],) (-Lambda[1] + 2*Lambda[2],)
(-Lambda[1] - Lambda[2],) (Lambda[1] + Lambda[2],)
(2*Lambda[1] - Lambda[2],) (-2*Lambda[1] + Lambda[2],)
(-Lambda[1] + 1/2*Lambda[2], Lambda[1] - 1/2*Lambda[2]) (-Lambda[1] + 1/
↪2*Lambda[2], Lambda[1] - 1/2*Lambda[2])
(-2*Lambda[1] + Lambda[2],) (2*Lambda[1] - Lambda[2],)
```

e(*i*, *power=1*, *to_string_end=False*, *length_only=False*)

Return the i-th crystal raising operator on `self`.

INPUT:

- `i` – element of the index set of the underlying root system
- `power` – positive integer (default: 1); specifies the power of the raising operator to be applied
- `to_string_end` – boolean (default: `False`); if `True`, returns the dominant end of the i-string of `self`
- `length_only` – boolean; if `True`, returns the distance to the dominant end of the i-string of `self`

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: c = C[2]; c
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2])
sage: c.e(1)
sage: c.e(2)
(-Lambda[1] + 2*Lambda[2],)
sage: c.e(2,to_string_end=True)
(-Lambda[1] + 2*Lambda[2],)
sage: c.e(1,to_string_end=True)
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2])
sage: c.e(1,length_only=True)
0
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> c = C[Integer(2)]; c
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2])
>>> c.e(Integer(1))
>>> c.e(Integer(2))
(-Lambda[1] + 2*Lambda[2],)
>>> c.e(Integer(2),to_string_end=True)
(-Lambda[1] + 2*Lambda[2],)
>>> c.e(Integer(1),to_string_end=True)
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2])
>>> c.e(Integer(1),length_only=True)
0
```

endpoint()

Compute the endpoint of `self`.

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: b = C.module_generators[0]
sage: b.endpoint()
Lambda[1] + Lambda[2]
sage: b.f_string([1,2,2,1])
(-Lambda[1] - Lambda[2],)
sage: b.f_string([1,2,2,1]).endpoint()
-Lambda[1] - Lambda[2]
sage: b.f_string([1,2])
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2])
sage: b.f_string([1,2]).endpoint()
```

(continues on next page)

(continued from previous page)

```
0
sage: b = C([])
sage: b.endpoint()
0
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> b = C.module_generators[Integer(0)]
>>> b.endpoint()
Lambda[1] + Lambda[2]
>>> b.f_string([Integer(1),Integer(2),Integer(2),Integer(1)])
(-Lambda[1] - Lambda[2],)
>>> b.f_string([Integer(1),Integer(2),Integer(2),Integer(1)]).endpoint()
-Lambda[1] - Lambda[2]
>>> b.f_string([Integer(1),Integer(2)])
(1/2*Lambda[1] - Lambda[2], -1/2*Lambda[1] + Lambda[2])
>>> b.f_string([Integer(1),Integer(2)]).endpoint()
0
>>> b = C([])
>>> b.endpoint()
0
```

epsilon(*i*)

Return the distance to the beginning of the i-string.

This method overrides the generic implementation in the category of crystals since this computation is more efficient.

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: [c.epsilon(1) for c in C]
[0, 1, 0, 0, 1, 0, 1, 2]
sage: [c.epsilon(2) for c in C]
[0, 0, 1, 2, 1, 1, 0, 0]
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> [c.epsilon(Integer(1)) for c in C]
[0, 1, 0, 0, 1, 0, 1, 2]
>>> [c.epsilon(Integer(2)) for c in C]
[0, 0, 1, 2, 1, 1, 0, 0]
```

f(*i*, *power=1*, *to_string_end=False*, *length_only=False*)

Return the i-th crystal lowering operator on `self`.

INPUT:

- `i` – element of the index set of the underlying root system
- `power` – positive integer (default: 1); specifies the power of the lowering operator to be applied
- `to_string_end` – boolean (default: `False`); if `True`, returns the anti-dominant end of the i-string of `self`
- `length_only` – boolean; if `True`, returns the distance to the anti-dominant end of the i-string of `self`

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: c = C.module_generators[0]
sage: c.f(1)
(-Lambda[1] + 2*Lambda[2],)
sage: c.f(1,power=2)
sage: c.f(2)
(2*Lambda[1] - Lambda[2],)
sage: c.f(2,to_string_end=True)
(2*Lambda[1] - Lambda[2],)
sage: c.f(2,length_only=True)
1

sage: C = crystals.LSPaths(['A',2,1],[-1,-1,2])
sage: c = C.module_generators[0]
sage: c.f(2,power=2)
(Lambda[0] + Lambda[1] - 2*Lambda[2],)
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> c = C.module_generators[Integer(0)]
>>> c.f(Integer(1))
(-Lambda[1] + 2*Lambda[2],)
>>> c.f(Integer(1),power=Integer(2))
>>> c.f(Integer(2))
(2*Lambda[1] - Lambda[2],)
>>> c.f(Integer(2),to_string_end=True)
(2*Lambda[1] - Lambda[2],)
>>> c.f(Integer(2),length_only=True)
1

>>> C = crystals.LSPaths(['A',Integer(2),Integer(1)],[-Integer(1),-
↪Integer(1),Integer(2)])
>>> c = C.module_generators[Integer(0)]
>>> c.f(Integer(2),power=Integer(2))
(Lambda[0] + Lambda[1] - 2*Lambda[2],)
```

phi(*i*)

Return the distance to the end of the i-string.

This method overrides the generic implementation in the category of crystals since this computation is more efficient.

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: [c.phi(1) for c in C]
[1, 0, 0, 1, 0, 2, 1, 0]
sage: [c.phi(2) for c in C]
[1, 2, 1, 0, 0, 0, 0, 1]
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> [c.phi(Integer(1)) for c in C]
[1, 0, 0, 1, 0, 2, 1, 0]
>>> [c.phi(Integer(2)) for c in C]
[1, 2, 1, 0, 0, 0, 0, 1]
```

reflect_step(*which_step*, *i*)

Apply the i-th simple reflection to the indicated step in `self`.

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: b = C.module_generators[0]
sage: b.reflect_step(0,1)
(-Lambda[1] + 2*Lambda[2],)
sage: b.reflect_step(0,2)
(2*Lambda[1] - Lambda[2],)
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> b = C.module_generators[Integer(0)]
>>> b.reflect_step(Integer(0),Integer(1))
(-Lambda[1] + 2*Lambda[2],)
>>> b.reflect_step(Integer(0),Integer(2))
(2*Lambda[1] - Lambda[2],)
```

s(*i*)

Compute the reflection of `self` along the i-string.

This method is more efficient than the generic implementation since it uses powers of e and f in the Littelmann model directly.

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: c = C.module_generators[0]
sage: c.s(1)
(-Lambda[1] + 2*Lambda[2],)
sage: c.s(2)
(2*Lambda[1] - Lambda[2],)

sage: C = crystals.LSPaths(['A',2,1],[-1,0,1])
sage: c = C.module_generators[0]; c
(-Lambda[0] + Lambda[2],)
sage: c.s(2)
(Lambda[1] - Lambda[2],)
sage: c.s(1)
(-Lambda[0] + Lambda[2],)
sage: c.f(2).s(1)
(Lambda[0] - Lambda[1],)
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> c = C.module_generators[Integer(0)]
```

(continues on next page)

(continued from previous page)

```
>>> c.s(Integer(1))
(-Lambda[1] + 2*Lambda[2],)
>>> c.s(Integer(2))
(2*Lambda[1] - Lambda[2],)

>>> C = crystals.LSPaths(['A',Integer(2),Integer(1)],[-Integer(1),
↪Integer(0),Integer(1)])
>>> c = C.module_generators[Integer(0)]; c
(-Lambda[0] + Lambda[2],)
>>> c.s(Integer(2))
(Lambda[1] - Lambda[2],)
>>> c.s(Integer(1))
(-Lambda[0] + Lambda[2],)
>>> c.f(Integer(2)).s(Integer(1))
(Lambda[0] - Lambda[1],)
```

split_step(*which_step*, *r*)

Split the indicated step into two parallel steps of relative lengths r and $1 - r$.

INPUT:

- `which_step` – a position in the tuple `self`
- `r` – a rational number between 0 and 1

EXAMPLES:

```
sage: C = crystals.LSPaths(['A',2],[1,1])
sage: b = C.module_generators[0]
sage: b.split_step(0,1/3)
(1/3*Lambda[1] + 1/3*Lambda[2], 2/3*Lambda[1] + 2/3*Lambda[2])
```

```
>>> from sage.all import *
>>> C = crystals.LSPaths(['A',Integer(2)],[Integer(1),Integer(1)])
>>> b = C.module_generators[Integer(0)]
>>> b.split_step(Integer(0),Integer(1)/Integer(3))
(1/3*Lambda[1] + 1/3*Lambda[2], 2/3*Lambda[1] + 2/3*Lambda[2])
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: B = crystals.LSPaths(['A',1,1],[1,0])
sage: b = B.highest_weight_vector()
sage: b.f(0).weight()
-Lambda[0] + 2*Lambda[1] - delta
```

```
>>> from sage.all import *
>>> B = crystals.LSPaths(['A',Integer(1),Integer(1)],[Integer(1),
↪Integer(0)])
>>> b = B.highest_weight_vector()
>>> b.f(Integer(0)).weight()
-Lambda[0] + 2*Lambda[1] - delta
```

weight_lattice_realization()

Return weight lattice realization of `self`.

EXAMPLES:

```
sage: B = crystals.LSPaths(['B',3],[1,1,0])
sage: B.weight_lattice_realization()
Weight space over the Rational Field of the Root system of type ['B', 3]
sage: B = crystals.LSPaths(['B',3,1],[1,1,1,0])
sage: B.weight_lattice_realization()
Extended weight space over the Rational Field of the Root system of type ['B',
↪ 3, 1]
```

```
>>> from sage.all import *
>>> B = crystals.LSPaths(['B',Integer(3)],[Integer(1),Integer(1),Integer(0)])
>>> B.weight_lattice_realization()
Weight space over the Rational Field of the Root system of type ['B', 3]
>>> B = crystals.LSPaths(['B',Integer(3),Integer(1)],[Integer(1),Integer(1),
↪Integer(1),Integer(0)])
>>> B.weight_lattice_realization()
Extended weight space over the Rational Field of the Root system of type ['B',
↪ 3, 1]
```

class sage.combinat.crystals.littelmann_path.**CrystalOfProjectedLevelZeroLSPaths**(*starting_weight*, *starting_weight_parent*)

Bases: *CrystalOfLSPaths*

Crystal of projected level zero LS paths.

INPUT:

- `weight` – a dominant weight of the weight space of an affine Kac-Moody root system

When `weight` is just a single fundamental weight Λ_r, this crystal is isomorphic to a Kirillov-Reshetikhin (KR) crystal, see also *sage.combinat.crystals.kirillov_reshetikhin.KirillovReshetikhinCrystalFromLSPaths()*. For general weights, it is isomorphic to a tensor product of single-column KR crystals.

EXAMPLES:

```
sage: R = RootSystem(['C',3,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(La[1]+La[3])
sage: LS.cardinality()
84
sage: GLS = LS.digraph()

sage: K1 = crystals.KirillovReshetikhin(['C',3,1],1,1)
sage: K3 = crystals.KirillovReshetikhin(['C',3,1],3,1)
sage: T = crystals.TensorProduct(K3,K1)
sage: T.cardinality()
84
sage: GT = T.digraph() # long time
```

(continues on next page)

(continued from previous page)

```
sage: GLS.is_isomorphic(GT, edge_labels = True) # long time
True
```

```
>>> from sage.all import *
>>> R = RootSystem(['C',Integer(3),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(La[Integer(1)]+La[Integer(3)])
>>> LS.cardinality()
84
>>> GLS = LS.digraph()

>>> K1 = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)],Integer(1),
↪Integer(1))
>>> K3 = crystals.KirillovReshetikhin(['C',Integer(3),Integer(1)],Integer(3),
↪Integer(1))
>>> T = crystals.TensorProduct(K3,K1)
>>> T.cardinality()
84
>>> GT = T.digraph() # long time
>>> GLS.is_isomorphic(GT, edge_labels = True) # long time
True
```

class Element

Bases: *Element*

Element of a crystal of projected level zero LS paths.

energy_function()

Return the energy function of `self`.

The energy function $D(\pi)$ of the level zero LS path $\pi \in \mathbb{B}_{\mathrm{cl}}(\lambda)$ requires a series of definitions; for simplicity the root system is assumed to be untwisted affine.

The LS path π is a piecewise linear map from the unit interval $[0, 1]$ to the weight lattice. It is specified by "times" $0 = \sigma_0 < \sigma_1 < \cdots < \sigma_s = 1$ and "direction vectors" $x_u\lambda$ where $x_u \in W/W_J$ for $1 \leq u \leq s$, and W_J is the stabilizer of λ in the finite Weyl group W. Precisely,

$$\pi(t) = \sum_{u'=1}^{u-1} (\sigma_{u'} - \sigma_{u'-1}) x_{u'}\lambda + (t - \sigma_{u-1}) x_u\lambda$$

for $1 \leq u \leq s$ and $\sigma_{u-1} \leq t \leq \sigma_u$.

For any $x, y \in W/W_J$, let

$$d : x = w_0 \overset{\beta_1}{\leftarrow} w_1 \overset{\beta_2}{\leftarrow} \cdots \overset{\beta_n}{\leftarrow} w_n = y$$

be a shortest directed path in the parabolic quantum Bruhat graph. Define

$$\mathrm{wt}(d) := \sum_{\substack{1 \leq k \leq n \\ \ell(w_{k-1}) < \ell(w_k)}} \beta_k^\vee.$$

It can be shown that $\mathrm{wt}(d)$ depends only on x, y; call its value $\mathrm{wt}(x, y)$. The energy function $D(\pi)$ is defined by

$$D(\pi) = -\sum_{u=1}^{s-1} (1 - \sigma_u) \langle \lambda, \mathrm{wt}(x_u, x_{u+1}) \rangle.$$

For more information, see [LNSSS2013].

Note

In the dual-of-untwisted case the parabolic quantum Bruhat graph that is used is obtained by exchanging the roles of roots and coroots. Moreover, in the computation of the pairing the short roots must be doubled (or tripled for type G). This factor is determined by the translation factor of the corresponding root. Type BC is viewed as untwisted type, whereas the dual of BC is viewed as twisted. Except for the untwisted cases, these formulas are currently still conjectural.

EXAMPLES:

```
sage: R = RootSystem(['C',3,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(La[1]+La[3])
sage: b = LS.module_generators[0]
sage: c = b.f(1).f(3).f(2)
sage: c.energy_function()
0
sage: c=b.e(0)
sage: c.energy_function()
1

sage: R = RootSystem(['A',2,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(2*La[1])
sage: b = LS.module_generators[0]
sage: c = b.e(0)
sage: c.energy_function()
1
sage: for c in sorted(LS, key=str):
....:     print("{} {}".format(c,c.energy_function()))
(-2*Lambda[0] + 2*Lambda[1],)                    0
(-2*Lambda[1] + 2*Lambda[2],)                    0
(-Lambda[0] + Lambda[1], -Lambda[1] + Lambda[2]) 1
(-Lambda[0] + Lambda[1], Lambda[0] - Lambda[2])  1
(-Lambda[1] + Lambda[2], -Lambda[0] + Lambda[1]) 0
(-Lambda[1] + Lambda[2], Lambda[0] - Lambda[2])  1
(2*Lambda[0] - 2*Lambda[2],)                     0
(Lambda[0] - Lambda[2], -Lambda[0] + Lambda[1])  0
(Lambda[0] - Lambda[2], -Lambda[1] + Lambda[2])  0
```

```
>>> from sage.all import *
>>> R = RootSystem(['C',Integer(3),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(La[Integer(1)]+La[Integer(3)])
>>> b = LS.module_generators[Integer(0)]
>>> c = b.f(Integer(1)).f(Integer(3)).f(Integer(2))
>>> c.energy_function()
0
>>> c=b.e(Integer(0))
>>> c.energy_function()
```

(continues on next page)

(continued from previous page)

```
1

>>> R = RootSystem(['A',Integer(2),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(Integer(2)*La[Integer(1)])
>>> b = LS.module_generators[Integer(0)]
>>> c = b.e(Integer(0))
>>> c.energy_function()
1
>>> for c in sorted(LS, key=str):
...     print("{} {}".format(c,c.energy_function()))
(-2*Lambda[0] + 2*Lambda[1],)                    0
(-2*Lambda[1] + 2*Lambda[2],)                    0
(-Lambda[0] + Lambda[1], -Lambda[1] + Lambda[2]) 1
(-Lambda[0] + Lambda[1], Lambda[0] - Lambda[2])  1
(-Lambda[1] + Lambda[2], -Lambda[0] + Lambda[1]) 0
(-Lambda[1] + Lambda[2], Lambda[0] - Lambda[2])  1
(2*Lambda[0] - 2*Lambda[2],)                     0
(Lambda[0] - Lambda[2], -Lambda[0] + Lambda[1])  0
(Lambda[0] - Lambda[2], -Lambda[1] + Lambda[2])  0
```

The next test checks that the energy function is constant on classically connected components:

```
sage: R = RootSystem(['A',2,1])
sage: La = R.weight_space().basis()

>>> C = G.connected_components(sort=False)
>>> [all(c[Integer(0)].energy_function()==a.energy_function() for a in c)␣
↪for c in C] # long time
[True, True, True, True, True, True, True, True, True, True, True]

>>> R = RootSystem(['BC',Integer(2),Integer(2)])
>>> La = R.weight_space().basis()
>>> LS = crystals.
↪ProjectedLevelZeroLSPaths(Integer(2)*La[Integer(1)]+La[Integer(2)])
>>> G = LS.digraph(index_set=R.cartan_type().classical().index_set())
>>> C = G.connected_components(sort=False)
>>> [all(c[Integer(0)].energy_function()==a.energy_function() for a in c)␣
↪for c in C] # long time
[True, True, True, True, True, True, True, True, True, True, True, True,␣
↪True, True, True,
True, True, True, True, True, True, True, True, True, True, True, True,␣
↪True, True, True, True]
```

scalar_factors()

Return the scalar factors for `self`.

Each LS path (or `self`) can be written as a piecewise linear map

$$\pi(t) = \sum_{u'=1}^{u-1} (\sigma_{u'} - \sigma_{u'-1})\nu_{u'} + (t - \sigma_{u-1})\nu_u$$

for $0 < \sigma_1 < \sigma_2 < \cdots < \sigma_s = 1$ and $\sigma_{u-1} \leq t \leq \sigma_u$ and $1 \leq u \leq s$. This method returns the tuple of $(\sigma_1, \ldots, \sigma_s)$.

EXAMPLES:

```
sage: R = RootSystem(['C',3,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(La[1]+La[3])
sage: b = LS.module_generators[0]
sage: b.scalar_factors()
[1]
sage: c = b.f(1).f(3).f(2)
sage: c.scalar_factors()
[1/3, 1]
```

```
>>> from sage.all import *
>>> R = RootSystem(['C',Integer(3),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(La[Integer(1)]+La[Integer(3)])
>>> b = LS.module_generators[Integer(0)]
>>> b.scalar_factors()
[1]
>>> c = b.f(Integer(1)).f(Integer(3)).f(Integer(2))
>>> c.scalar_factors()
[1/3, 1]
```

weyl_group_representation()

Transform the weights in the LS path `self` to elements in the Weyl group.

Each LS path can be written as the piecewise linear map:

$$\pi(t) = \sum_{u'=1}^{u-1} (\sigma_{u'} - \sigma_{u'-1})\nu_{u'} + (t - \sigma_{u-1})\nu_u$$

for $0 < \sigma_1 < \sigma_2 < \cdots < \sigma_s = 1$ and $\sigma_{u-1} \leq t \leq \sigma_u$ and $1 \leq u \leq s$. Each weight ν_u is also associated to a Weyl group element. This method returns the list of Weyl group elements associated to the ν_u for $1 \leq u \leq s$.

EXAMPLES:

```
sage: R = RootSystem(['C',3,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(La[1]+La[3])
sage: b = LS.module_generators[0]
sage: c = b.f(1).f(3).f(2)
sage: c.weyl_group_representation()
[s2*s1*s3, s1*s3]
```

```
>>> from sage.all import *
>>> R = RootSystem(['C',Integer(3),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(La[Integer(1)]+La[Integer(3)])
>>> b = LS.module_generators[Integer(0)]
>>> c = b.f(Integer(1)).f(Integer(3)).f(Integer(2))
>>> c.weyl_group_representation()
[s2*s1*s3, s1*s3]
```

classically_highest_weight_vectors()

Return the classically highest weight vectors of `self`.

EXAMPLES:

```
sage: R = RootSystem(['A',2,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(2*La[1])
sage: LS.classically_highest_weight_vectors()
((-2*Lambda[0] + 2*Lambda[1],),
 (-Lambda[0] + Lambda[1], -Lambda[1] + Lambda[2]))
```

```
>>> from sage.all import *
>>> R = RootSystem(['A',Integer(2),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(Integer(2)*La[Integer(1)])
>>> LS.classically_highest_weight_vectors()
((-2*Lambda[0] + 2*Lambda[1],),
 (-Lambda[0] + Lambda[1], -Lambda[1] + Lambda[2]))
```

is_perfect(*level=1*)

Check whether the crystal `self` is perfect (of level `level`).

INPUT:

- `level` – (default: 1) positive integer

A crystal $\mathcal{B}$ is perfect of level ℓ if:

1. $\mathcal{B}$ is isomorphic to the crystal graph of a finite-dimensional $U_q'(\mathfrak{g})$-module.
2. $\mathcal{B} \otimes \mathcal{B}$ is connected.
3. There exists a $\lambda \in X$, such that $\mathrm{wt}(\mathcal{B}) \subset \lambda + \sum_{i \in I} \mathbf{Z}_{\leq 0} \alpha_i$ and there is a unique element in $\mathcal{B}$ of classical weight λ.
4. For all $b \in \mathcal{B}$, $\mathrm{level}(\varepsilon(b)) \geq \ell$.
5. For all Λ dominant weights of level ℓ, there exist unique elements $b_\Lambda, b^\Lambda \in \mathcal{B}$, such that $\varepsilon(b_\Lambda) = \Lambda = \varphi(b^\Lambda)$.

Points (1)-(3) are known to hold. This method checks points (4) and (5).

EXAMPLES:

```
sage: C = CartanType(['C',2,1])
sage: R = RootSystem(C)
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(La[1])
sage: LS.is_perfect()
False
sage: LS = crystals.ProjectedLevelZeroLSPaths(La[2])
sage: LS.is_perfect()
True

sage: C = CartanType(['E',6,1])
sage: R = RootSystem(C)
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(La[1])
sage: LS.is_perfect()
True
sage: LS.is_perfect(2)
False

sage: C = CartanType(['D',4,1])
sage: R = RootSystem(C)
sage: La = R.weight_space().basis()
sage: all(crystals.ProjectedLevelZeroLSPaths(La[i]).is_perfect() for i in [1,
↪2,3,4])
True
```

(continues on next page)

(continued from previous page)

```
sage: C = CartanType(['A',6,2])
sage: R = RootSystem(C)
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(La[1]+La[2])
sage: LS.is_perfect()
True
sage: LS.is_perfect(2)
False
```

```
>>> from sage.all import *
>>> C = CartanType(['C',Integer(2),Integer(1)])
>>> R = RootSystem(C)
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(La[Integer(1)])
>>> LS.is_perfect()
False
>>> LS = crystals.ProjectedLevelZeroLSPaths(La[Integer(2)])
>>> LS.is_perfect()
True

>>> C = CartanType(['E',Integer(6),Integer(1)])
>>> R = RootSystem(C)
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(La[Integer(1)])
>>> LS.is_perfect()
True
>>> LS.is_perfect(Integer(2))
False

>>> C = CartanType(['D',Integer(4),Integer(1)])
>>> R = RootSystem(C)
>>> La = R.weight_space().basis()
>>> all(crystals.ProjectedLevelZeroLSPaths(La[i]).is_perfect() for i in␣
↪[Integer(1),Integer(2),Integer(3),Integer(4)])
True

>>> C = CartanType(['A',Integer(6),Integer(2)])
>>> R = RootSystem(C)
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(La[Integer(1)]+La[Integer(2)])
>>> LS.is_perfect()
True
>>> LS.is_perfect(Integer(2))
False
```

maximal_vector()

Return the maximal vector of `self`.

EXAMPLES:

```
sage: R = RootSystem(['A',2,1])
```

(continues on next page)

(continued from previous page)

```
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(2*La[1]+La[2])
sage: LS.maximal_vector()
(-3*Lambda[0] + 2*Lambda[1] + Lambda[2],)
```

```
>>> from sage.all import *
>>> R = RootSystem(['A',Integer(2),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.
↪ProjectedLevelZeroLSPaths(Integer(2)*La[Integer(1)]+La[Integer(2)])
>>> LS.maximal_vector()
(-3*Lambda[0] + 2*Lambda[1] + Lambda[2],)
```

one_dimensional_configuration_sum(*q=None*, *group_components=True*)

Compute the one-dimensional configuration sum.

INPUT:

- `q` – (default: `None`) a variable or `None`; if `None`, a variable `q` is set in the code
- `group_components` – boolean (default: `True`); if `True`, then the terms are grouped by classical component

The one-dimensional configuration sum is the sum of the weights of all elements in the crystal weighted by the energy function. For untwisted types it uses the parabolic quantum Bruhat graph, see [LNSSS2013]. In the dual-of-untwisted case, the parabolic quantum Bruhat graph is defined by exchanging the roles of roots and coroots (which is still conjectural at this point).

EXAMPLES:

```
sage: R = RootSystem(['A',2,1])
sage: La = R.weight_space().basis()
sage: LS = crystals.ProjectedLevelZeroLSPaths(2*La[1])
sage: LS.one_dimensional_configuration_sum() # long time
B[-2*Lambda[1] + 2*Lambda[2]] + (q+1)*B[-Lambda[1]]
 + (q+1)*B[Lambda[1] - Lambda[2]] + B[2*Lambda[1]]
 + B[-2*Lambda[2]] + (q+1)*B[Lambda[2]]
sage: R.<t> = ZZ[]
sage: LS.one_dimensional_configuration_sum(t, False) # long time
B[-2*Lambda[1] + 2*Lambda[2]] + (t+1)*B[-Lambda[1]]
 + (t+1)*B[Lambda[1] - Lambda[2]] + B[2*Lambda[1]]
 + B[-2*Lambda[2]] + (t+1)*B[Lambda[2]]
```

```
>>> from sage.all import *
>>> R = RootSystem(['A',Integer(2),Integer(1)])
>>> La = R.weight_space().basis()
>>> LS = crystals.ProjectedLevelZeroLSPaths(Integer(2)*La[Integer(1)])
>>> LS.one_dimensional_configuration_sum() # long time
B[-2*Lambda[1] + 2*Lambda[2]] + (q+1)*B[-Lambda[1]]
 + (q+1)*B[Lambda[1] - Lambda[2]] + B[2*Lambda[1]]
 + B[-2*Lambda[2]] + (q+1)*B[Lambda[2]]
>>> R = ZZ['t']; (t,) = R._first_ngens(1)
>>> LS.one_dimensional_configuration_sum(t, False) # long time
B[-2*Lambda[1] + 2*Lambda[2]] + (t+1)*B[-Lambda[1]]
```

(continues on next page)

(continued from previous page)

```
+ (t+1)*B[Lambda[1] - Lambda[2]] + B[2*Lambda[1]]
+ B[-2*Lambda[2]] + (t+1)*B[Lambda[2]]
```

class sage.combinat.crystals.littelmann_path.**InfinityCrystalOfLSPaths**(*cartan_type*)

Bases: UniqueRepresentation, Parent

LS path model for $\mathcal{B}(\infty)$.

Elements of $\mathcal{B}(\infty)$ are equivalence classes of paths $[\pi]$ in $\mathcal{B}(k\rho)$ for $k \gg 0$, where ρ is the Weyl vector. A canonical representative for an element of $\mathcal{B}(\infty)$ is chosen by taking k to be minimal such that the endpoint of π is strictly dominant but its representative in $\mathcal{B}((k-1)\rho)$ is on the wall of the dominant chamber.

REFERENCES:

- [LZ2011]

class Element

Bases: *Element*

e(*i*, *power=1*, *length_only=False*)

Return the i-th crystal raising operator on `self`.

INPUT:

- `i` – element of the index set
- `power` – (default: 1) positive integer; specifies the power of the lowering operator to be applied
- `length_only` – boolean (default: `False`); if `True`, then return the distance to the anti-dominant end of the i-string of `self`

EXAMPLES:

```
sage: B = crystals.infinity.LSPaths(['B',3,1])
sage: mg = B.module_generator()
sage: mg.e(0)
sage: mg.e(1)
sage: mg.e(2)
sage: x = mg.f_string([1,0,2,1,0,2,1,1,0])
sage: all(x.f(i).e(i) == x for i in B.index_set())
True
sage: all(x.e(i).f(i) == x for i in B.index_set() if x.epsilon(i) > 0)
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.LSPaths(['B',Integer(3),Integer(1)])
>>> mg = B.module_generator()
>>> mg.e(Integer(0))
>>> mg.e(Integer(1))
>>> mg.e(Integer(2))
>>> x = mg.f_string([Integer(1),Integer(0),Integer(2),Integer(1),
↪Integer(0),Integer(2),Integer(1),Integer(1),Integer(0)])
>>> all(x.f(i).e(i) == x for i in B.index_set())
True
>>> all(x.e(i).f(i) == x for i in B.index_set() if x.epsilon(i) >␣
↪Integer(0))
True
```

f(*i*, *power=1*, *length_only=False*)

Return the i-th crystal lowering operator on `self`.

INPUT:

- `i` – element of the index set
- `power` – (default: 1) positive integer; specifies the power of the lowering operator to be applied
- `length_only` – boolean (default: `False`); if `True`, then return the distance to the anti-dominant end of the i-string of `self`

EXAMPLES:

```
sage: B = crystals.infinity.LSPaths(['D',3,2])
sage: mg = B.highest_weight_vector()
sage: mg.f(1)
(3*Lambda[0] - Lambda[1] + 3*Lambda[2],
 2*Lambda[0] + 2*Lambda[1] + 2*Lambda[2])
sage: mg.f(2)
(Lambda[0] + 2*Lambda[1] - Lambda[2],
 2*Lambda[0] + 2*Lambda[1] + 2*Lambda[2])
sage: mg.f(0)
(-Lambda[0] + 2*Lambda[1] + Lambda[2] - delta,
 2*Lambda[0] + 2*Lambda[1] + 2*Lambda[2])
```

```
>>> from sage.all import *
>>> B = crystals.infinity.LSPaths(['D',Integer(3),Integer(2)])
>>> mg = B.highest_weight_vector()
>>> mg.f(Integer(1))
(3*Lambda[0] - Lambda[1] + 3*Lambda[2],
 2*Lambda[0] + 2*Lambda[1] + 2*Lambda[2])
>>> mg.f(Integer(2))
(Lambda[0] + 2*Lambda[1] - Lambda[2],
 2*Lambda[0] + 2*Lambda[1] + 2*Lambda[2])
>>> mg.f(Integer(0))
(-Lambda[0] + 2*Lambda[1] + Lambda[2] - delta,
 2*Lambda[0] + 2*Lambda[1] + 2*Lambda[2])
```

phi(*i*)

Return φ_i of `self`.

Let $\pi \in \mathcal{B}(\infty)$. Define

$$\varphi_i(\pi) := \varepsilon_i(\pi) + \langle h_i, \mathrm{wt}(\pi) \rangle,$$

where h_i is the i-th simple coroot and $\mathrm{wt}(\pi)$ is the *weight()* of π.

INPUT:

- `i` – element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.LSPaths(['D',4])
sage: mg = B.highest_weight_vector()
sage: x = mg.f_string([1,3,4,2,4,3,2,1,4])
sage: [x.phi(i) for i in B.index_set()]
[-1, 4, -2, -3]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.LSPaths(['D',Integer(4)])
>>> mg = B.highest_weight_vector()
>>> x = mg.f_string([Integer(1),Integer(3),Integer(4),Integer(2),
↪Integer(4),Integer(3),Integer(2),Integer(1),Integer(4)])
>>> [x.phi(i) for i in B.index_set()]
[-1, 4, -2, -3]
```

weight()

Return the weight of `self`.

Todo

This is a generic algorithm. We should find a better description and implement it.

EXAMPLES:

```
sage: B = crystals.infinity.LSPaths(['E',6])
sage: mg = B.highest_weight_vector()
sage: f_seq = [1,4,2,6,4,2,3,1,5,5]
sage: x = mg.f_string(f_seq)
sage: x.weight()
-3*Lambda[1] - 2*Lambda[2] + 2*Lambda[3] + Lambda[4] - Lambda[5]

sage: al = B.cartan_type().root_system().weight_space().simple_roots()
sage: x.weight() == -sum(al[i] for i in f_seq)
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.LSPaths(['E',Integer(6)])
>>> mg = B.highest_weight_vector()
>>> f_seq = [Integer(1),Integer(4),Integer(2),Integer(6),Integer(4),
↪Integer(2),Integer(3),Integer(1),Integer(5),Integer(5)]
>>> x = mg.f_string(f_seq)
>>> x.weight()
-3*Lambda[1] - 2*Lambda[2] + 2*Lambda[3] + Lambda[4] - Lambda[5]

>>> al = B.cartan_type().root_system().weight_space().simple_roots()
>>> x.weight() == -sum(al[i] for i in f_seq)
True
```

module_generator()

Return the module generator (or highest weight element) of `self`.

The module generator is the unique path $\pi_\infty : t \mapsto t\rho$, for $t \in [0, \infty)$.

EXAMPLES:

```
sage: B = crystals.infinity.LSPaths(['A',6,2])
sage: mg = B.module_generator(); mg
(Lambda[0] + Lambda[1] + Lambda[2] + Lambda[3],)
sage: mg.weight()
0
```

```
>>> from sage.all import *
>>> B = crystals.infinity.LSPaths(['A',Integer(6),Integer(2)])
>>> mg = B.module_generator(); mg
(Lambda[0] + Lambda[1] + Lambda[2] + Lambda[3],)
>>> mg.weight()
0
```

weight_lattice_realization()

Return the weight lattice realization of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.LSPaths(['C',4])
sage: B.weight_lattice_realization()
Weight space over the Rational Field of the Root system of type ['C', 4]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.LSPaths(['C',Integer(4)])
>>> B.weight_lattice_realization()
Weight space over the Rational Field of the Root system of type ['C', 4]
```

sage.combinat.crystals.littelmann_path.**positively_parallel_weights**(*v*, *w*)

Check whether the vectors `v` and `w` are positive scalar multiples of each other.

EXAMPLES:

```
sage: from sage.combinat.crystals.littelmann_path import positively_parallel_
↪weights
sage: La = RootSystem(['A',5,2]).weight_space(extended=True).fundamental_weights()
sage: rho = sum(La)
sage: positively_parallel_weights(rho, 4*rho)
True
sage: positively_parallel_weights(4*rho, rho)
True
sage: positively_parallel_weights(rho, -rho)
False
sage: positively_parallel_weights(rho, La[1] + La[2])
False
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.littelmann_path import positively_parallel_weights
>>> La = RootSystem(['A',Integer(5),Integer(2)]).weight_space(extended=True).
↪fundamental_weights()
>>> rho = sum(La)
>>> positively_parallel_weights(rho, Integer(4)*rho)
True
>>> positively_parallel_weights(Integer(4)*rho, rho)
True
>>> positively_parallel_weights(rho, -rho)
False
>>> positively_parallel_weights(rho, La[Integer(1)] + La[Integer(2)])
False
```

PBW data

This contains helper classes and functions which encode PBW data in finite type.

AUTHORS:

- Dinakar Muthiah (2015-05): initial version
- Travis Scrimshaw (2016-06): simplified code and converted to Cython

class sage.combinat.crystals.pbw_datum.**PBWData**(*cartan_type*)

Bases: object

Helper class for the set of PBW data.

convert_to_new_long_word(*pbw_datum*, *new_long_word*)

Convert the PBW datum `pbw_datum` from its long word to `new_long_word`.

EXAMPLES:

```
sage: from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
sage: P = PBWData("A2")
sage: datum = PBWDatum(P, (1,2,1), (1,0,1))
sage: new_datum = P.convert_to_new_long_word(datum,(2,1,2))
sage: new_datum
PBW Datum element of type ['A', 2] with long word (2, 1, 2)
 and Lusztig datum (0, 1, 0)
sage: new_datum.long_word
(2, 1, 2)
sage: new_datum.lusztig_datum
(0, 1, 0)
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
>>> P = PBWData("A2")
>>> datum = PBWDatum(P, (Integer(1),Integer(2),Integer(1)), (Integer(1),
↪Integer(0),Integer(1)))
>>> new_datum = P.convert_to_new_long_word(datum,(Integer(2),Integer(1),
↪Integer(2)))
>>> new_datum
PBW Datum element of type ['A', 2] with long word (2, 1, 2)
 and Lusztig datum (0, 1, 0)
>>> new_datum.long_word
(2, 1, 2)
>>> new_datum.lusztig_datum
(0, 1, 0)
```

class sage.combinat.crystals.pbw_datum.**PBWDatum**(*parent*, *long_word*, *lusztig_datum*)

Bases: object

Helper class which represents a PBW datum.

convert_to_long_word_with_first_letter(*i*)

Return a new PBWDatum equivalent to `self` whose long word begins with `i`.

EXAMPLES:

```
sage: from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
sage: P = PBWData("A3")
sage: datum = PBWDatum(P, (1,2,1,3,2,1), (1,0,1,4,2,3))
sage: datum.convert_to_long_word_with_first_letter(1)
PBW Datum element of type ['A', 3] with long word (1, 2, 3, 1, 2, 1)
 and Lusztig datum (1, 0, 4, 1, 2, 3)
sage: datum.convert_to_long_word_with_first_letter(2)
PBW Datum element of type ['A', 3] with long word (2, 1, 2, 3, 2, 1)
 and Lusztig datum (0, 1, 0, 4, 2, 3)
sage: datum.convert_to_long_word_with_first_letter(3)
PBW Datum element of type ['A', 3] with long word (3, 1, 2, 3, 1, 2)
 and Lusztig datum (8, 1, 0, 4, 1, 2)
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
>>> P = PBWData("A3")
>>> datum = PBWDatum(P, (Integer(1),Integer(2),Integer(1),Integer(3),
↪Integer(2),Integer(1)), (Integer(1),Integer(0),Integer(1),Integer(4),
↪Integer(2),Integer(3)))
>>> datum.convert_to_long_word_with_first_letter(Integer(1))
PBW Datum element of type ['A', 3] with long word (1, 2, 3, 1, 2, 1)
 and Lusztig datum (1, 0, 4, 1, 2, 3)
>>> datum.convert_to_long_word_with_first_letter(Integer(2))
PBW Datum element of type ['A', 3] with long word (2, 1, 2, 3, 2, 1)
 and Lusztig datum (0, 1, 0, 4, 2, 3)
>>> datum.convert_to_long_word_with_first_letter(Integer(3))
PBW Datum element of type ['A', 3] with long word (3, 1, 2, 3, 1, 2)
 and Lusztig datum (8, 1, 0, 4, 1, 2)
```

convert_to_new_long_word(*new_long_word*)

Return a new PBWDatum equivalent to `self` whose long word is `new_long_word`.

EXAMPLES:

```
sage: from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
sage: P = PBWData("A2")
sage: datum = PBWDatum(P, (1,2,1), (1,0,1))
sage: new_datum = datum.convert_to_new_long_word((2,1,2))
sage: new_datum.long_word
(2, 1, 2)
sage: new_datum.lusztig_datum
(0, 1, 0)
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
>>> P = PBWData("A2")
>>> datum = PBWDatum(P, (Integer(1),Integer(2),Integer(1)), (Integer(1),
↪Integer(0),Integer(1)))
>>> new_datum = datum.convert_to_new_long_word((Integer(2),Integer(1),
↪Integer(2)))
>>> new_datum.long_word
(2, 1, 2)
>>> new_datum.lusztig_datum
```

(continues on next page)

(continued from previous page)

```
(0, 1, 0)
```

is_equivalent_to(*other_pbw_datum*)

Return whether `self` is equivalent to `other_pbw_datum`.

Here equivalent means modulo the tropical Plücker relations.

EXAMPLES:

```
sage: from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
sage: P = PBWData("A2")
sage: L1 = PBWDatum(P, (1,2,1), (1,0,1))
sage: L2 = PBWDatum(P, (2,1,2), (0,1,0))
sage: L1.is_equivalent_to(L2)
True
sage: L1 == L2
False
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
>>> P = PBWData("A2")
>>> L1 = PBWDatum(P, (Integer(1),Integer(2),Integer(1)), (Integer(1),
↪Integer(0),Integer(1)))
>>> L2 = PBWDatum(P, (Integer(2),Integer(1),Integer(2)), (Integer(0),
↪Integer(1),Integer(0)))
>>> L1.is_equivalent_to(L2)
True
>>> L1 == L2
False
```

star()

Return the starred version of `self`, i.e., with reversed `long_word` and `lusztig_datum`

EXAMPLES:

```
sage: from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
sage: P = PBWData("A2")
sage: L1 = PBWDatum(P, (1,2,1), (1,2,3))
sage: L1.star() == PBWDatum(P, (2,1,2), (3,2,1))
True
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
>>> P = PBWData("A2")
>>> L1 = PBWDatum(P, (Integer(1),Integer(2),Integer(1)), (Integer(1),
↪Integer(2),Integer(3)))
>>> L1.star() == PBWDatum(P, (Integer(2),Integer(1),Integer(2)), (Integer(3),
↪Integer(2),Integer(1)))
True
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
sage: P = PBWData("A2")
sage: L = PBWDatum(P, (1,2,1), (1,1,1))
sage: L.weight()
-2*alpha[1] - 2*alpha[2]
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.pbw_datum import PBWData, PBWDatum
>>> P = PBWData("A2")
>>> L = PBWDatum(P, (Integer(1),Integer(2),Integer(1)), (Integer(1),
↪Integer(1),Integer(1)))
>>> L.weight()
-2*alpha[1] - 2*alpha[2]
```

sage.combinat.crystals.pbw_datum.**compute_new_lusztig_datum**(*enhanced_braid_chain*, *initial_lusztig_datum*)

Return the Lusztig datum obtained by applying tropical Plücker relations along `enhanced_braid_chain` starting with `initial_lusztig_datum`.

EXAMPLES:

```
sage: from sage.combinat.root_system.braid_move_calculator import␣
↪BraidMoveCalculator
sage: from sage.combinat.crystals.pbw_datum import enhance_braid_move_chain
sage: from sage.combinat.crystals.pbw_datum import compute_new_lusztig_datum
sage: ct = CartanType(['A', 2])
sage: W = CoxeterGroup(ct)
sage: B = BraidMoveCalculator(W)
sage: chain = B.chain_of_reduced_words((1,2,1),(2,1,2))
sage: enhanced_braid_chain = enhance_braid_move_chain(chain, ct)
sage: compute_new_lusztig_datum(enhanced_braid_chain,(1,0,1))
(0, 1, 0)
```

```
>>> from sage.all import *
>>> from sage.combinat.root_system.braid_move_calculator import␣
↪BraidMoveCalculator
>>> from sage.combinat.crystals.pbw_datum import enhance_braid_move_chain
>>> from sage.combinat.crystals.pbw_datum import compute_new_lusztig_datum
>>> ct = CartanType(['A', Integer(2)])
>>> W = CoxeterGroup(ct)
>>> B = BraidMoveCalculator(W)
>>> chain = B.chain_of_reduced_words((Integer(1),Integer(2),Integer(1)),
↪(Integer(2),Integer(1),Integer(2)))
>>> enhanced_braid_chain = enhance_braid_move_chain(chain, ct)
>>> compute_new_lusztig_datum(enhanced_braid_chain,(Integer(1),Integer(0),
↪Integer(1)))
(0, 1, 0)
```

sage.combinat.crystals.pbw_datum.**enhance_braid_move_chain**(*braid_move_chain*, *cartan_type*)

Return a list of tuples that records the data of the long words in `braid_move_chain` plus the data of the intervals where the braid moves occur and the data of the off-diagonal entries of the 2×2 Cartan submatrices of each braid move.

INPUT:

- `braid_move_chain` – a chain of reduced words in the Weyl group of `cartan_type`
- `cartan_type` – a finite Cartan type

OUTPUT:

A list of 2-tuples `(interval_of_change, cartan_sub_matrix)` where

- `interval_of_change` is the (half-open) interval of indices where the braid move occurs; this is `None` for the first tuple
- `cartan_sub_matrix` is the off-diagonal entries of the 2×2 submatrix of the Cartan matrix corresponding to the braid move; this is `None` for the first tuple

For a matrix:

```
[2 a]
[b 2]
```

the `cartan_sub_matrix` is the pair `(a, b)`.

`sage.combinat.crystals.pbw_datum.`**`tropical_plucker_relation`**`(a, lusztig_datum)`

Apply the tropical Plücker relation of type `a` to `lusztig_datum`.

The relations are obtained by tropicalizing the relations in Proposition 7.1 of [BZ01].

INPUT:

- `a` – a pair `(x, y)` of the off-diagonal entries of a 2×2 Cartan matrix

EXAMPLES:

```
sage: from sage.combinat.crystals.pbw_datum import tropical_plucker_relation
sage: tropical_plucker_relation((0,0), (2,3))
(3, 2)
sage: tropical_plucker_relation((-1,-1), (1,2,3))
(4, 1, 2)
sage: tropical_plucker_relation((-1,-2), (1,2,3,4))
(8, 1, 2, 3)
sage: tropical_plucker_relation((-2,-1), (1,2,3,4))
(6, 1, 2, 3)
```

```
>>> from sage.all import *
>>> from sage.combinat.crystals.pbw_datum import tropical_plucker_relation
>>> tropical_plucker_relation((Integer(0),Integer(0)), (Integer(2),Integer(3)))
(3, 2)
>>> tropical_plucker_relation((-Integer(1),-Integer(1)), (Integer(1),Integer(2),
↪Integer(3)))
(4, 1, 2)
>>> tropical_plucker_relation((-Integer(1),-Integer(2)), (Integer(1),Integer(2),
↪Integer(3),Integer(4)))
(8, 1, 2, 3)
>>> tropical_plucker_relation((-Integer(2),-Integer(1)), (Integer(1),Integer(2),
↪Integer(3),Integer(4)))
(6, 1, 2, 3)
```

Polyhedral realization of $B(\infty)$

class sage.combinat.crystals.polyhedral_realization.**InfinityCrystalAsPolyhedralRealization**(*cartan_type*, *seq*)

Bases: *TensorProductOfCrystals*

The polyhedral realization of $B(\infty)$.

Note

Here we are using anti-Kashiwara notation and might differ from some of the literature.

Consider a Kac-Moody algebra $\mathfrak{g}$ of Cartan type X with index set I, and consider a finite sequence $J = (j_1, j_2, \ldots, j_m)$ whose support equals I. We extend this to an infinite sequence by taking $\bar{J} = J \cdot J \cdot J \cdots$, where $\cdot$ denotes concatenation of sequences. Let

$$B_J = B_{j_m} \otimes \cdots \otimes B_{j_2} \otimes B_{j_1},$$

where B_i is an *ElementaryCrystal*.

As given in Theorem 2.1.1 of [Ka1993], there exists a strict crystal embedding $\Psi_i \colon B(\infty) \to B_i \otimes B(\infty)$ defined by $u_\infty \mapsto b_i(0) \otimes u_\infty$, where $b_i(0) \in B_i$ and u_∞ is the (unique) highest weight element in $B(\infty)$. This is sometimes known as the *Kashiwara embedding* [NZ1997] (though, in [NZ1997], the target of this map is denoted by $\mathbf{Z}_J^\infty$). By iterating this embedding by taking $\Psi_J = \Psi_{j_n} \circ \Psi_{j_{n-1}} \circ \cdots \circ \Psi_{j_1}$, we obtain the following strict crystal embedding:

$$\Psi_J^n \colon B(\infty) \to B_J^{\otimes n} \otimes B(\infty).$$

We note there is a natural analog of Lemma 10.6.2 in [HK2002] that for any $b \in B(\infty)$, there exists a positive integer N such that

$$\Psi_J^N(b) = \left(\bigotimes_{k=1}^{N} b^{(k)} \right) \otimes u_\infty.$$

Therefore we can model elements $b \in B(\infty)$ by considering an infinite list of elements $b^{(k)} \in B_J$ and defining the crystal structure by:

$$\begin{aligned}
\mathrm{wt}(b) &= \sum_{k=1}^{N} \mathrm{wt}(b^{(k)}) \\
e_i(b) &= e_i\left(\left(\bigotimes_{k=1}^{N} b^{(k)} \right) \right) \otimes u_\infty, \\
f_i(b) &= f_i\left(\left(\bigotimes_{k=1}^{N} b^{(k)} \right) \right) \otimes u_\infty, \\
\varepsilon_i(b) &= \max_{e_i^k(b) \neq 0} k, \\
\varphi_i(b) &= \varepsilon_i(b) - \langle \mathrm{wt}(b), h_i^\vee \rangle.
\end{aligned}$$

To translate this into a finite list, we consider a finite sequence $b_1 \otimes \cdots \otimes b_N$ and if

$$f_i\left(b^{(1)} \otimes \cdots b^{(N-1)} \otimes b^{(N)} \right) = b^{(1)} \otimes \cdots \otimes b^{(N-1)} \otimes f_i\left(b^{(N)} \right),$$

then we take the image as $b^{(1)} \otimes \cdots \otimes f_i\left(b^{(N)}\right) \otimes b^{(N+1)}$. Similarly we remove $b^{(N)}$ if we have $b^{(N)} = \bigotimes_{k=1}^{m} b_{j_k}(0)$. Additionally if

$$e_i\left(b^{(1)} \otimes \cdots \otimes b^{(N-1)} \otimes b^{(N)}\right) = b^{(1)} \otimes \cdots \otimes b^{(N-1)} \otimes e_i\left(b^{(N)}\right),$$

then we consider this to be 0.

INPUT:

- `cartan_type` – a Cartan type
- `seq` – (default: `None`) a finite sequence whose support equals the index set of the Cartan type; if `None`, then this is the index set

EXAMPLES:

```
sage: B = crystals.infinity.PolyhedralRealization(['A',2])
sage: mg = B.module_generators[0]; mg
[0, 0]
sage: mg.f_string([2,1,2,2])
[0, -3, -1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['A',Integer(2)])
>>> mg = B.module_generators[Integer(0)]; mg
[0, 0]
>>> mg.f_string([Integer(2),Integer(1),Integer(2),Integer(2)])
[0, -3, -1, 0, 0, 0]
```

An example of type B_2:

```
sage: B = crystals.infinity.PolyhedralRealization(['B',2])
sage: mg = B.module_generators[0]; mg
[0, 0]
sage: mg.f_string([2,1,2,2])
[0, -2, -1, -1, 0, 0]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['B',Integer(2)])
>>> mg = B.module_generators[Integer(0)]; mg
[0, 0]
>>> mg.f_string([Integer(2),Integer(1),Integer(2),Integer(2)])
[0, -2, -1, -1, 0, 0]
```

An example of type G_2:

```
sage: B = crystals.infinity.PolyhedralRealization(['G',2])
sage: mg = B.module_generators[0]; mg
[0, 0]
sage: mg.f_string([2,1,2,2])
[0, -3, -1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['G',Integer(2)])
>>> mg = B.module_generators[Integer(0)]; mg
```

(continues on next page)

(continued from previous page)

```
[0, 0]
>>> mg.f_string([Integer(2),Integer(1),Integer(2),Integer(2)])
[0, -3, -1, 0, 0, 0]
```

class Element

Bases: *TensorProductOfCrystalsElement*

An element in the polyhedral realization of $B(\infty)$.

e(i)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PolyhedralRealization(['A',2])
sage: mg = B.module_generators[0]
sage: all(mg.e(i) is None for i in B.index_set())
True
sage: mg.f(1).e(1) == mg
True
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['A',Integer(2)])
>>> mg = B.module_generators[Integer(0)]
>>> all(mg.e(i) is None for i in B.index_set())
True
>>> mg.f(Integer(1)).e(Integer(1)) == mg
True
```

epsilon(i)

Return ε_i of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PolyhedralRealization(['A',2,1])
sage: mg = B.module_generators[0]
sage: [mg.epsilon(i) for i in B.index_set()]
[0, 0, 0]
sage: elt = mg.f(0)
sage: [elt.epsilon(i) for i in B.index_set()]
[1, 0, 0]
sage: elt = mg.f_string([0,1,2])
sage: [elt.epsilon(i) for i in B.index_set()]
[0, 0, 1]
sage: elt = mg.f_string([0,1,2,2])
sage: [elt.epsilon(i) for i in B.index_set()]
[0, 0, 2]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['A',Integer(2),
↪Integer(1)])
>>> mg = B.module_generators[Integer(0)]
>>> [mg.epsilon(i) for i in B.index_set()]
```

(continues on next page)

(continued from previous page)

```
[0, 0, 0]
>>> elt = mg.f(Integer(0))
>>> [elt.epsilon(i) for i in B.index_set()]
[1, 0, 0]
>>> elt = mg.f_string([Integer(0),Integer(1),Integer(2)])
>>> [elt.epsilon(i) for i in B.index_set()]
[0, 0, 1]
>>> elt = mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2)])
>>> [elt.epsilon(i) for i in B.index_set()]
[0, 0, 2]
```

f (i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PolyhedralRealization(['A',2])
sage: mg = B.module_generators[0]
sage: mg.f(1)
[-1, 0, 0, 0]
sage: mg.f_string([1,2,2,1])
[-1, -2, -1, 0, 0, 0]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['A',Integer(2)])
>>> mg = B.module_generators[Integer(0)]
>>> mg.f(Integer(1))
[-1, 0, 0, 0]
>>> mg.f_string([Integer(1),Integer(2),Integer(2),Integer(1)])
[-1, -2, -1, 0, 0, 0]
```

phi (i)

Return φ_i of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PolyhedralRealization(['A',2,1])
sage: mg = B.module_generators[0]
sage: [mg.phi(i) for i in B.index_set()]
[0, 0, 0]
sage: elt = mg.f(0)
sage: [elt.phi(i) for i in B.index_set()]
[-1, 1, 1]
sage: elt = mg.f_string([0,1])
sage: [elt.phi(i) for i in B.index_set()]
[-1, 0, 2]
sage: elt = mg.f_string([0,1,2,2])
sage: [elt.phi(i) for i in B.index_set()]
[1, 1, 0]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['A',Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(1)])
>>> mg = B.module_generators[Integer(0)]
>>> [mg.phi(i) for i in B.index_set()]
[0, 0, 0]
>>> elt = mg.f(Integer(0))
>>> [elt.phi(i) for i in B.index_set()]
[-1, 1, 1]
>>> elt = mg.f_string([Integer(0),Integer(1)])
>>> [elt.phi(i) for i in B.index_set()]
[-1, 0, 2]
>>> elt = mg.f_string([Integer(0),Integer(1),Integer(2),Integer(2)])
>>> [elt.phi(i) for i in B.index_set()]
[1, 1, 0]
```

truncate(*k=None*)

Truncate `self` to have length `k` and return as an element in a (finite) tensor product of crystals.

INPUT:

- `k` – (optional) the length of the truncation; if not specified, then returns one more than the current non-ground-state elements (i.e. the current list in `self`)

EXAMPLES:

```
sage: B = crystals.infinity.PolyhedralRealization(['A',2])
sage: mg = B.module_generators[0]
sage: elt = mg.f_string([1,2,2,1]); elt
[-1, -2, -1, 0, 0, 0]
sage: t = elt.truncate(); t
[-1, -2, -1, 0, 0, 0]
sage: t.parent() is B.finite_tensor_product(6)
True
sage: elt.truncate(2)
[-1, -2]
sage: elt.truncate(10)
[-1, -2, -1, 0, 0, 0, 0, 0, 0, 0]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['A',Integer(2)])
>>> mg = B.module_generators[Integer(0)]
>>> elt = mg.f_string([Integer(1),Integer(2),Integer(2),Integer(1)]); elt
[-1, -2, -1, 0, 0, 0]
>>> t = elt.truncate(); t
[-1, -2, -1, 0, 0, 0]
>>> t.parent() is B.finite_tensor_product(Integer(6))
True
>>> elt.truncate(Integer(2))
[-1, -2]
>>> elt.truncate(Integer(10))
[-1, -2, -1, 0, 0, 0, 0, 0, 0, 0]
```

finite_tensor_product(*k*)

Return the finite tensor product of crystals of length `k` by truncating `self`.

EXAMPLES:

```
sage: B = crystals.infinity.PolyhedralRealization(['A',2])
sage: B.finite_tensor_product(5)
Full tensor product of the crystals
 [The 1-elementary crystal of type ['A', 2],
  The 2-elementary crystal of type ['A', 2],
  The 1-elementary crystal of type ['A', 2],
  The 2-elementary crystal of type ['A', 2],
  The 1-elementary crystal of type ['A', 2]]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.PolyhedralRealization(['A',Integer(2)])
>>> B.finite_tensor_product(Integer(5))
Full tensor product of the crystals
 [The 1-elementary crystal of type ['A', 2],
  The 2-elementary crystal of type ['A', 2],
  The 1-elementary crystal of type ['A', 2],
  The 2-elementary crystal of type ['A', 2],
  The 1-elementary crystal of type ['A', 2]]
```

Spin crystals

These are the crystals associated with the three spin representations: the spin representations of odd orthogonal groups (or rather their double covers); and the $+$ and $-$ spin representations of the even orthogonal groups.

We follow Kashiwara and Nakashima (Journal of Algebra 165, 1994) in representing the elements of the spin crystal by sequences of signs $\pm$.

sage.combinat.crystals.spins.**CrystalOfSpins**(*ct*)

Return the spin crystal of the given type B.

This is a combinatorial model for the crystal with highest weight Λ_n (the n-th fundamental weight). It has 2^n elements, here called Spins. See also *CrystalOfLetters()*, *CrystalOfSpinsPlus()*, and *CrystalOfSpinsMinus()*.

INPUT:

- `['B', n]` – a Cartan type B_n

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: C.list()
[+++, ++-, +-+, -++, +--, -+-, --+, ---]
sage: C.cartan_type()
['B', 3]
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> C.list()
[+++, ++-, +-+, -++, +--, -+-, --+, ---]
>>> C.cartan_type()
['B', 3]
```

```
sage: [x.signature() for x in C]
['+++', '++-', '+-+', '-++', '+--', '-+-', '--+', '---']
```

```
>>> from sage.all import *
>>> [x.signature() for x in C]
['+++', '++-', '+-+', '-++', '+--', '-+-', '--+', '---']
```

sage.combinat.crystals.spins.**CrystalOfSpinsMinus**(*ct*)

Return the minus spin crystal of the given type D.

This is the crystal with highest weight Λ_{n-1} (the $(n-1)$-st fundamental weight).

INPUT:

- `['D', n]` – a Cartan type D_n

EXAMPLES:

```
sage: E = crystals.SpinsMinus(['D',4])
sage: E.list()
[+++-, ++-+, +-++, -+++, +---, -+--, --+-, ---+]
sage: [x.signature() for x in E]
['+++-', '++-+', '+-++', '-+++', '+---', '-+--', '--+-', '---+']
```

```
>>> from sage.all import *
>>> E = crystals.SpinsMinus(['D',Integer(4)])
>>> E.list()
[+++-, ++-+, +-++, -+++, +---, -+--, --+-, ---+]
>>> [x.signature() for x in E]
['+++-', '++-+', '+-++', '-+++', '+---', '-+--', '--+-', '---+']
```

sage.combinat.crystals.spins.**CrystalOfSpinsPlus**(*ct*)

Return the plus spin crystal of the given type D.

This is the crystal with highest weight Λ_n (the n-th fundamental weight).

INPUT:

- `['D', n]` – a Cartan type D_n

EXAMPLES:

```
sage: D = crystals.SpinsPlus(['D',4])
sage: D.list()
[++++, ++--, +-+-, -++-, +--+, -+-+, --++, ----]
```

```
>>> from sage.all import *
>>> D = crystals.SpinsPlus(['D',Integer(4)])
>>> D.list()
[++++, ++--, +-+-, -++-, +--+, -+-+, --++, ----]
```

```
sage: [x.signature() for x in D]
['++++', '++--', '+-+-', '-++-', '+--+', '-+-+', '--++', '----']
```

```
>>> from sage.all import *
>>> [x.signature() for x in D]
['++++', '++--', '+-+-', '-++-', '+--+', '-+-+', '--++', '----']
```

class sage.combinat.crystals.spins.**GenericCrystalOfSpins**(*ct*, *element_class*, *case*)

Bases: UniqueRepresentation, Parent

A generic crystal of spins.

lt_elements(*x*, *y*)

Return True if and only if there is a path from x to y in the crystal graph.

Because the crystal graph is classical, it is a directed acyclic graph which can be interpreted as a poset. This function implements the comparison function of this poset.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: x = C([1,1,1])
sage: y = C([-1,-1,-1])
sage: C.lt_elements(x, y)
True
sage: C.lt_elements(y, x)
False
sage: C.lt_elements(x, x)
False
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> x = C([Integer(1),Integer(1),Integer(1)])
>>> y = C([-Integer(1),-Integer(1),-Integer(1)])
>>> C.lt_elements(x, y)
True
>>> C.lt_elements(y, x)
False
>>> C.lt_elements(x, x)
False
```

class sage.combinat.crystals.spins.**Spin**

Bases: Element

A spin letter in the crystal of spins.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: c = C([1,1,1])
sage: c
+++
sage: c.parent()
The crystal of spins for type ['B', 3]

sage: D = crystals.Spins(['B',4])
sage: a = C([1,1,1])
sage: b = C([-1,-1,-1])
sage: c = D([1,1,1,1])
sage: a == a
True
sage: a == b
False
```

(continues on next page)

(continued from previous page)

```
sage: b == c
False
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> c = C([Integer(1),Integer(1),Integer(1)])
>>> c
+++
>>> c.parent()
The crystal of spins for type ['B', 3]

>>> D = crystals.Spins(['B',Integer(4)])
>>> a = C([Integer(1),Integer(1),Integer(1)])
>>> b = C([-Integer(1),-Integer(1),-Integer(1)])
>>> c = D([Integer(1),Integer(1),Integer(1),Integer(1)])
>>> a == a
True
>>> a == b
False
>>> b == c
False
```

pp()

Pretty print `self` as a column.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: b = C([1,1,-1])
sage: b.pp()
+
+
-
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> b = C([Integer(1),Integer(1),-Integer(1)])
>>> b.pp()
+
+
-
```

signature()

Return the signature of `self`.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: C([1,1,1]).signature()
'+++'
sage: C([1,1,-1]).signature()
'++-'
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> C([Integer(1),Integer(1),Integer(1)]).signature()
'+++'
>>> C([Integer(1),Integer(1),-Integer(1)]).signature()
'++-'
```

value

Return `self` as a tuple with $+1$ and -1.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: C([1,1,1]).value
(1, 1, 1)
sage: C([1,1,-1]).value
(1, 1, -1)
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> C([Integer(1),Integer(1),Integer(1)]).value
(1, 1, 1)
>>> C([Integer(1),Integer(1),-Integer(1)]).value
(1, 1, -1)
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: [v.weight() for v in crystals.Spins(['B',3])]
[(1/2, 1/2, 1/2), (1/2, 1/2, -1/2),
 (1/2, -1/2, 1/2), (-1/2, 1/2, 1/2),
 (1/2, -1/2, -1/2), (-1/2, 1/2, -1/2),
 (-1/2, -1/2, 1/2), (-1/2, -1/2, -1/2)]
```

```
>>> from sage.all import *
>>> [v.weight() for v in crystals.Spins(['B',Integer(3)])]
[(1/2, 1/2, 1/2), (1/2, 1/2, -1/2),
 (1/2, -1/2, 1/2), (-1/2, 1/2, 1/2),
 (1/2, -1/2, -1/2), (-1/2, 1/2, -1/2),
 (-1/2, -1/2, 1/2), (-1/2, -1/2, -1/2)]
```

class sage.combinat.crystals.spins.**Spin_crystal_type_B_element**

Bases: *Spin*

Type B spin representation crystal element

e(i)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: [[C[m].e(i) for i in range(1,4)] for m in range(8)]
[[None, None, None], [None, None, +++], [None, ++-, None], [+-+, None, None],
 [None, None, +-+], [+--, None, -++], [None, -+-, None], [None, None, --+]]
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> [[C[m].e(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[None, None, None], [None, None, +++], [None, ++-, None], [+-+, None, None],
 [None, None, +-+], [+--, None, -++], [None, -+-, None], [None, None, --+]]
```

epsilon(i)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: [[C[m].epsilon(i) for i in range(1,4)] for m in range(8)]
[[0, 0, 0], [0, 0, 1], [0, 1, 0], [1, 0, 0],
 [0, 0, 1], [1, 0, 1], [0, 1, 0], [0, 0, 1]]
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> [[C[m].epsilon(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[0, 0, 0], [0, 0, 1], [0, 1, 0], [1, 0, 0],
 [0, 0, 1], [1, 0, 1], [0, 1, 0], [0, 0, 1]]
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: [[C[m].f(i) for i in range(1,4)] for m in range(8)]
[[None, None, ++-], [None, +-+, None], [-++, None, +--], [None, None, -+-],
 [-+-, None, None], [None, --+, None], [None, None, ---], [None, None, None]]
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> [[C[m].f(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[None, None, ++-], [None, +-+, None], [-++, None, +--], [None, None, -+-],
 [-+-, None, None], [None, --+, None], [None, None, ---], [None, None, None]]
```

phi(i)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Spins(['B',3])
sage: [[C[m].phi(i) for i in range(1,4)] for m in range(8)]
```

(continues on next page)

(continued from previous page)

```
[[0, 0, 1], [0, 1, 0], [1, 0, 1], [0, 0, 1],
 [1, 0, 0], [0, 1, 0], [0, 0, 1], [0, 0, 0]]
```

```
>>> from sage.all import *
>>> C = crystals.Spins(['B',Integer(3)])
>>> [[C[m].phi(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[0, 0, 1], [0, 1, 0], [1, 0, 1], [0, 0, 1],
 [1, 0, 0], [0, 1, 0], [0, 0, 1], [0, 0, 0]]
```

class sage.combinat.crystals.spins.**Spin_crystal_type_D_element**

Bases: *Spin*

Type D spin representation crystal element

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: D = crystals.SpinsPlus(['D',4])
sage: [[D.list()[m].e(i) for i in range(1,4)] for m in range(8)]
[[None, None, None], [None, None, None], [None, ++--, None], [+-+-, None,␣
↪None],
 [None, None, +-+-], [+--+, None, -++-], [None, -+-+, None], [None, None,␣
↪None]]
```

```
>>> from sage.all import *
>>> D = crystals.SpinsPlus(['D',Integer(4)])
>>> [[D.list()[m].e(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[None, None, None], [None, None, None], [None, ++--, None], [+-+-, None,␣
↪None],
 [None, None, +-+-], [+--+, None, -++-], [None, -+-+, None], [None, None,␣
↪None]]
```

```
sage: E = crystals.SpinsMinus(['D',4])
sage: [[E[m].e(i) for i in range(1,4)] for m in range(8)]
[[None, None, None], [None, None, +++-], [None, ++-+, None], [+-++, None,␣
↪None],
 [None, None, None], [+---, None, None], [None, -+--, None], [None, None, --+-
↪]]
```

```
>>> from sage.all import *
>>> E = crystals.SpinsMinus(['D',Integer(4)])
>>> [[E[m].e(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[None, None, None], [None, None, +++-], [None, ++-+, None], [+-++, None,␣
↪None],
 [None, None, None], [+---, None, None], [None, -+--, None], [None, None, --+-
↪]]
```

epsilon(i)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.SpinsMinus(['D',4])
sage: [[C[m].epsilon(i) for i in C.index_set()] for m in range(8)]
[[0, 0, 0, 0], [0, 0, 1, 0], [0, 1, 0, 0], [1, 0, 0, 0],
 [0, 0, 0, 1], [1, 0, 0, 1], [0, 1, 0, 0], [0, 0, 1, 0]]
```

```
>>> from sage.all import *
>>> C = crystals.SpinsMinus(['D',Integer(4)])
>>> [[C[m].epsilon(i) for i in C.index_set()] for m in range(Integer(8))]
[[0, 0, 0, 0], [0, 0, 1, 0], [0, 1, 0, 0], [1, 0, 0, 0],
 [0, 0, 0, 1], [1, 0, 0, 1], [0, 1, 0, 0], [0, 0, 1, 0]]
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: D = crystals.SpinsPlus(['D',4])
sage: [[D.list()[m].f(i) for i in range(1,4)] for m in range(8)]
[[None, None, None], [None, +-+-, None], [-++-, None, +--+], [None, None, -+-
↪+],
 [-+-+, None, None], [None, --++, None], [None, None, None], [None, None,␣
↪None]]
```

```
>>> from sage.all import *
>>> D = crystals.SpinsPlus(['D',Integer(4)])
>>> [[D.list()[m].f(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[None, None, None], [None, +-+-, None], [-++-, None, +--+], [None, None, -+-
↪+],
 [-+-+, None, None], [None, --++, None], [None, None, None], [None, None,␣
↪None]]
```

```
sage: E = crystals.SpinsMinus(['D',4])
sage: [[E[m].f(i) for i in range(1,4)] for m in range(8)]
[[None, None, ++-+], [None, +-++, None], [-+++, None, None], [None, None,␣
↪None],
 [-+--, None, None], [None, --+-, None], [None, None, ---+], [None, None,␣
↪None]]
```

```
>>> from sage.all import *
>>> E = crystals.SpinsMinus(['D',Integer(4)])
>>> [[E[m].f(i) for i in range(Integer(1),Integer(4))] for m in␣
↪range(Integer(8))]
[[None, None, ++-+], [None, +-++, None], [-+++, None, None], [None, None,␣
↪None],
 [-+--, None, None], [None, --+-, None], [None, None, ---+], [None, None,␣
↪None]]
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.SpinsPlus(['D',4])
sage: [[C[m].phi(i) for i in C.index_set()] for m in range(8)]
[[0, 0, 0, 1], [0, 1, 0, 0], [1, 0, 1, 0], [0, 0, 1, 0],
 [1, 0, 0, 0], [0, 1, 0, 0], [0, 0, 0, 1], [0, 0, 0, 0]]
```

```
>>> from sage.all import *
>>> C = crystals.SpinsPlus(['D',Integer(4)])
>>> [[C[m].phi(i) for i in C.index_set()] for m in range(Integer(8))]
[[0, 0, 0, 1], [0, 1, 0, 0], [1, 0, 1, 0], [0, 0, 1, 0],
 [1, 0, 0, 0], [0, 1, 0, 0], [0, 0, 0, 1], [0, 0, 0, 0]]
```

Star-crystal structure on $B(\infty)$

AUTHORS:

- Ben Salisbury: initial version
- Travis Scrimshaw: initial version

class sage.combinat.crystals.star_crystal.**StarCrystal**(*Binf*)

Bases: `UniqueRepresentation`, `Parent`

The star-crystal or $*$-crystal version of a highest weight crystal.

The $*$-crystal structure on $B(\infty)$ is the structure induced by the algebra antiautomorphism $*\colon U_q(\mathfrak{g}) \longrightarrow U_q(\mathfrak{g})$ that stabilizes the negative half $U_q^-(\mathfrak{g})$. It is defined by

$$E_i^* = E_i, \quad F_i^* = F_i, \quad q^* = q, \quad (q^h)^* = q^{-h},$$

where E_i and F_i are the Chevalley generators of $U_q(\mathfrak{g})$ and h is an element of the Cartan subalgebra.

The induced operation on the crystal $B(\infty)$ is called the *Kashiwara involution*. Its implementation here is based on the recursive algorithm from Theorem 2.2.1 of [Ka1993], which states that for any $i \in I$ there is a unique strict crystal embedding

$$\Psi_i\colon B(\infty) \longrightarrow B_i \otimes B(\infty)$$

such that

- $u_\infty \mapsto b_i(0) \otimes u_\infty$, where u_∞ is the highest weight vector in $B(\infty)$;
- if $\Psi_i(b) = f_i^m b_i(0) \otimes b_0$, then $\Psi_i(f_i^* b) = f_i^{m+1} b_i(0) \otimes b_0$ and $\varepsilon_i(b^*) = m$;
- the image of Ψ_i is $\{f_i^m b_i(0) \otimes b : \varepsilon_i(b^*) = 0,\ m \geq 0\}$.

Here, B_i is the i-th elementary crystal. See *ElementaryCrystal* for more information.

INPUT:

- `Binf` – a crystal from *catalog_infinity_crystals*

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['A',2])
sage: Bstar = crystals.infinity.Star(B)
sage: mg = Bstar.highest_weight_vector()
sage: mg
[[1, 1], [2]]
sage: mg.f_string([1,2,1,2,2])
[[1, 1, 1, 1, 1, 2, 2], [2, 3, 3, 3]]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['A',Integer(2)])
>>> Bstar = crystals.infinity.Star(B)
>>> mg = Bstar.highest_weight_vector()
>>> mg
[[1, 1], [2]]
>>> mg.f_string([Integer(1),Integer(2),Integer(1),Integer(2),Integer(2)])
[[1, 1, 1, 1, 1, 2, 2], [2, 3, 3, 3]]
```

class Element

Bases: ElementWrapper

e(i)

Return the action of e_i^* on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: RC = crystals.infinity.RiggedConfigurations(['E',6,1])
sage: RCstar = crystals.infinity.Star(RC)
sage: nuJ = RCstar.module_generators[0].f_string([0,4,6,1,2])
sage: ascii_art(nuJ.e(1))
-1[ ]-1   (/)   0[ ]1   (/)   -1[ ]-1   (/)   -2[ ]-1

sage: M = crystals.infinity.NakajimaMonomials(['B',2,1])
sage: Mstar = crystals.infinity.Star(M)
sage: m = Mstar.module_generators[0].f_string([0,1,2,2,1,0])
sage: m.e(1)
Y(0,0)^-1 Y(0,2)^-1 Y(1,1) Y(1,2)^-1 Y(2,1)^2
```

```
>>> from sage.all import *
>>> RC = crystals.infinity.RiggedConfigurations(['E',Integer(6),
↪Integer(1)])
>>> RCstar = crystals.infinity.Star(RC)
>>> nuJ = RCstar.module_generators[Integer(0)].f_string([Integer(0),
↪Integer(4),Integer(6),Integer(1),Integer(2)])
>>> ascii_art(nuJ.e(Integer(1)))
-1[ ]-1   (/)   0[ ]1   (/)   -1[ ]-1   (/)   -2[ ]-1

>>> M = crystals.infinity.NakajimaMonomials(['B',Integer(2),Integer(1)])
>>> Mstar = crystals.infinity.Star(M)
>>> m = Mstar.module_generators[Integer(0)].f_string([Integer(0),
↪Integer(1),Integer(2),Integer(2),Integer(1),Integer(0)])
>>> m.e(Integer(1))
```

(continues on next page)

(continued from previous page)

```
Y(0,0)^-1 Y(0,2)^-1 Y(1,1) Y(1,2)^-1 Y(2,1)^2
```

epsilon(*i*)

Return ε_i^* of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: Y = crystals.infinity.GeneralizedYoungWalls(3)
sage: Ystar = crystals.infinity.Star(Y)
sage: y = Ystar.module_generators[0].f_string([0,1,3,2,1,0])
sage: [y.epsilon(i) for i in y.index_set()]
[1, 0, 1, 0]

sage: RC = crystals.infinity.RiggedConfigurations(['E',6,1])
sage: RCstar = crystals.infinity.Star(RC)
sage: nuJ = RCstar.module_generators[0].f_string([0,4,6,1,2])
sage: [nuJ.epsilon(i) for i in nuJ.index_set()]
[0, 1, 1, 0, 0, 0, 1]
```

```
>>> from sage.all import *
>>> Y = crystals.infinity.GeneralizedYoungWalls(Integer(3))
>>> Ystar = crystals.infinity.Star(Y)
>>> y = Ystar.module_generators[Integer(0)].f_string([Integer(0),
↪Integer(1),Integer(3),Integer(2),Integer(1),Integer(0)])
>>> [y.epsilon(i) for i in y.index_set()]
[1, 0, 1, 0]

>>> RC = crystals.infinity.RiggedConfigurations(['E',Integer(6),
↪Integer(1)])
>>> RCstar = crystals.infinity.Star(RC)
>>> nuJ = RCstar.module_generators[Integer(0)].f_string([Integer(0),
↪Integer(4),Integer(6),Integer(1),Integer(2)])
>>> [nuJ.epsilon(i) for i in nuJ.index_set()]
[0, 1, 1, 0, 0, 0, 1]
```

f(*i*)

Return the action of f_i^* on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: T = crystals.infinity.Tableaux("G2")
sage: Tstar = crystals.infinity.Star(T)
sage: t = Tstar.module_generators[0].f_string([1,2,1,1,2])
sage: t
[[1, 1, 1, 2, 0], [2, 3]]

sage: M = crystals.infinity.NakajimaMonomials(['B',2,1])
sage: Mstar = crystals.infinity.Star(M)
sage: m = Mstar.module_generators[0].f_string([0,1,2,2,1,0])
```

(continues on next page)

(continued from previous page)

```
sage: m
Y(0,0)^-1 Y(0,2)^-1 Y(1,0)^-1 Y(1,2)^-1 Y(2,0)^2 Y(2,1)^2
```

```
>>> from sage.all import *
>>> T = crystals.infinity.Tableaux("G2")
>>> Tstar = crystals.infinity.Star(T)
>>> t = Tstar.module_generators[Integer(0)].f_string([Integer(1),
↪Integer(2),Integer(1),Integer(1),Integer(2)])
>>> t
[[1, 1, 1, 2, 0], [2, 3]]

>>> M = crystals.infinity.NakajimaMonomials(['B',Integer(2),Integer(1)])
>>> Mstar = crystals.infinity.Star(M)
>>> m = Mstar.module_generators[Integer(0)].f_string([Integer(0),
↪Integer(1),Integer(2),Integer(2),Integer(1),Integer(0)])
>>> m
Y(0,0)^-1 Y(0,2)^-1 Y(1,0)^-1 Y(1,2)^-1 Y(2,0)^2 Y(2,1)^2
```

jump(i)

Return the i-jump of `self`.

For $b \in B(\infty)$,

$$\mathrm{jump}_i(b) = \varepsilon_i(b) + \varepsilon_i^*(b) + \langle h_i, \mathrm{wt}(b) \rangle,$$

where h_i is a simple coroot.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: RC = crystals.infinity.RiggedConfigurations("D4")
sage: RCstar = crystals.infinity.Star(RC)
sage: nu0star = RCstar.module_generators[0]
sage: nustar = nu0star.f_string([2,1,3,4,2])
sage: [nustar.jump(i) for i in RC.index_set()]
[0, 1, 0, 0]
sage: nustar = nu0star.f_string([2,1,3,4,2,2,1,3,2]) # long time
sage: [nustar.jump(i) for i in RC.index_set()] # long time
[1, 0, 1, 2]
```

```
>>> from sage.all import *
>>> RC = crystals.infinity.RiggedConfigurations("D4")
>>> RCstar = crystals.infinity.Star(RC)
>>> nu0star = RCstar.module_generators[Integer(0)]
>>> nustar = nu0star.f_string([Integer(2),Integer(1),Integer(3),
↪Integer(4),Integer(2)])
>>> [nustar.jump(i) for i in RC.index_set()]
[0, 1, 0, 0]
>>> nustar = nu0star.f_string([Integer(2),Integer(1),Integer(3),
↪Integer(4),Integer(2),Integer(2),Integer(1),Integer(3),Integer(2)]) #␣
↪long time
```

(continues on next page)

(continued from previous page)

```
>>> [nustar.jump(i) for i in RC.index_set()] # long time
[1, 0, 1, 2]
```

phi(*i*)

Return φ_i^* of `self`.

For $b \in B(\infty)$,

$$\varphi_i^*(b) = \varepsilon_i^*(b) + \langle h_i, \mathrm{wt}(b) \rangle,$$

where h_i is a simple coroot.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: T = crystals.infinity.Tableaux("A2")
sage: Tstar = crystals.infinity.Star(T)
sage: t = Tstar.module_generators[0].f_string([1,2,1,1,2])
sage: [t.phi(i) for i in t.index_set()]
[-3, 1]

sage: M = crystals.infinity.NakajimaMonomials(['B',2,1])
sage: Mstar = crystals.infinity.Star(M)
sage: m = Mstar.module_generators[0].f_string([0,1,2,2,1,0])
sage: [m.phi(i) for i in m.index_set()]
[-1, -1, 4]
```

```
>>> from sage.all import *
>>> T = crystals.infinity.Tableaux("A2")
>>> Tstar = crystals.infinity.Star(T)
>>> t = Tstar.module_generators[Integer(0)].f_string([Integer(1),
↪Integer(2),Integer(1),Integer(1),Integer(2)])
>>> [t.phi(i) for i in t.index_set()]
[-3, 1]

>>> M = crystals.infinity.NakajimaMonomials(['B',Integer(2),Integer(1)])
>>> Mstar = crystals.infinity.Star(M)
>>> m = Mstar.module_generators[Integer(0)].f_string([Integer(0),
↪Integer(1),Integer(2),Integer(2),Integer(1),Integer(0)])
>>> [m.phi(i) for i in m.index_set()]
[-1, -1, 4]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: RC = crystals.infinity.RiggedConfigurations(['E',6,1])
sage: RCstar = crystals.infinity.Star(RC)
sage: nuJ = RCstar.module_generators[0].f_string([0,4,6,1,2])
sage: nuJ.weight()
-Lambda[0] - 2*Lambda[1] + 2*Lambda[3] - Lambda[4]
 + 2*Lambda[5] - 2*Lambda[6] - delta
```

```
>>> from sage.all import *
>>> RC = crystals.infinity.RiggedConfigurations(['E',Integer(6),
↪Integer(1)])
>>> RCstar = crystals.infinity.Star(RC)
>>> nuJ = RCstar.module_generators[Integer(0)].f_string([Integer(0),
↪Integer(4),Integer(6),Integer(1),Integer(2)])
>>> nuJ.weight()
-Lambda[0] - 2*Lambda[1] + 2*Lambda[3] - Lambda[4]
 + 2*Lambda[5] - 2*Lambda[6] - delta
```

Subcrystals

These are the crystals that are subsets of a larger ambient crystal.

AUTHORS:

- Travis Scrimshaw (2013-10-16): Initial implementation

class sage.combinat.crystals.subcrystal.**Subcrystal**(*ambient*, *contained*, *generators*, *cartan_type*, *index_set*, *category*)

Bases: `UniqueRepresentation`, `Parent`

A subcrystal X of an ambient crystal Y is a crystal formed by taking a subset of Y and whose crystal structure is induced by Y.

INPUT:

- `ambient` – the ambient crystal
- `contained` – (optional) a set (or function) which specifies when an element is contained in the subcrystal; the default is everything possible is included
- `generators` – (optional) the generators for the subcrystal; the default is the generators for the ambient crystal
- `virtualization`, `scaling_factors` – (optional) dictionaries whose key i corresponds to the sets σ_i and γ_i respectively used to define virtual crystals; see *VirtualCrystal*
- `cartan_type` – (optional) the Cartan type for the subcrystal; the default is the Cartan type for the ambient crystal
- `index_set` – (optional) the index set for the subcrystal; the default is the index set for the Cartan type
- `category` – (optional) the category for the subcrystal; the default is the `Crystals` category

See also

`subcrystal()`

EXAMPLES:

We build out a subcrystal starting from an element and only going to the lowest weight:

```
sage: B = crystals.Tableaux(['A',3], shape=[2,1])
sage: S = B.subcrystal(generators=[B(3,1,2)], direction='lower')
sage: S.cardinality()
11
```

```
>>> from sage.all import *
>>> B = crystals.Tableaux(['A',Integer(3)], shape=[Integer(2),Integer(1)])
>>> S = B.subcrystal(generators=[B(Integer(3),Integer(1),Integer(2))], direction=
↪'lower')
>>> S.cardinality()
11
```

Here we build out in both directions starting from an element, but we also have restricted ourselves to type A_2:

```
sage: T = B.subcrystal(index_set=[1,2], generators=[B(3,1,1)])
sage: T.cardinality()
8
sage: list(T)
[[[1, 1], [3]],
 [[1, 2], [3]],
 [[1, 1], [2]],
 [[2, 2], [3]],
 [[1, 2], [2]],
 [[2, 3], [3]],
 [[1, 3], [2]],
 [[1, 3], [3]]]
```

```
>>> from sage.all import *
>>> T = B.subcrystal(index_set=[Integer(1),Integer(2)], generators=[B(Integer(3),
↪Integer(1),Integer(1))])
>>> T.cardinality()
8
>>> list(T)
[[[1, 1], [3]],
 [[1, 2], [3]],
 [[1, 1], [2]],
 [[2, 2], [3]],
 [[1, 2], [2]],
 [[2, 3], [3]],
 [[1, 3], [2]],
 [[1, 3], [3]]]
```

Now we take the crystal corresponding to the intersection of the previous two subcrystals:

```
sage: U = B.subcrystal(contained=lambda x: x in S and x in T, generators=B)
sage: list(U)
[[[2, 3], [3]], [[1, 2], [3]], [[2, 2], [3]]]
```

```
>>> from sage.all import *
>>> U = B.subcrystal(contained=lambda x: x in S and x in T, generators=B)
>>> list(U)
[[[2, 3], [3]], [[1, 2], [3]], [[2, 2], [3]]]
```

Todo

Include support for subcrystals which only contains certain arrows.

class Element

Bases: ElementWrapper

An element of a subcrystal. Wraps an element in the ambient crystal.

e(i)

Return e_i of self.

EXAMPLES:

```
sage: B = crystals.Tableaux(['A',4], shape=[2,1])
sage: S = B.subcrystal(generators=(B(2,1,1), B(5,2,4)), index_set=[1,2])
sage: mg = S.module_generators[1]
sage: mg.e(2)
sage: mg.e(1)
[[1, 4], [5]]
```

```
>>> from sage.all import *
>>> B = crystals.Tableaux(['A',Integer(4)], shape=[Integer(2),Integer(1)])
>>> S = B.subcrystal(generators=(B(Integer(2),Integer(1),Integer(1)),␣
↪B(Integer(5),Integer(2),Integer(4))), index_set=[Integer(1),Integer(2)])
>>> mg = S.module_generators[Integer(1)]
>>> mg.e(Integer(2))
>>> mg.e(Integer(1))
[[1, 4], [5]]
```

epsilon(i)

Return ε_i of self.

EXAMPLES:

```
sage: B = crystals.Tableaux(['A',4], shape=[2,1])
sage: S = B.subcrystal(generators=(B(2,1,1), B(5,2,4)), index_set=[1,2])
sage: mg = S.module_generators[1]
sage: mg.epsilon(1)
1
sage: mg.epsilon(2)
0
```

```
>>> from sage.all import *
>>> B = crystals.Tableaux(['A',Integer(4)], shape=[Integer(2),Integer(1)])
>>> S = B.subcrystal(generators=(B(Integer(2),Integer(1),Integer(1)),␣
↪B(Integer(5),Integer(2),Integer(4))), index_set=[Integer(1),Integer(2)])
>>> mg = S.module_generators[Integer(1)]
>>> mg.epsilon(Integer(1))
1
>>> mg.epsilon(Integer(2))
0
```

f(i)

Return f_i of self.

EXAMPLES:

```
sage: B = crystals.Tableaux(['A',4], shape=[2,1])
sage: S = B.subcrystal(generators=(B(2,1,1), B(5,2,4)), index_set=[1,2])
sage: mg = S.module_generators[1]
sage: mg.f(1)
sage: mg.f(2)
[[3, 4], [5]]
```

```
>>> from sage.all import *
>>> B = crystals.Tableaux(['A',Integer(4)], shape=[Integer(2),Integer(1)])
>>> S = B.subcrystal(generators=(B(Integer(2),Integer(1),Integer(1)),␣
↪B(Integer(5),Integer(2),Integer(4))), index_set=[Integer(1),Integer(2)])
>>> mg = S.module_generators[Integer(1)]
>>> mg.f(Integer(1))
>>> mg.f(Integer(2))
[[3, 4], [5]]
```

phi(*i*)

Return φ_i of `self`.

EXAMPLES:

```
sage: B = crystals.Tableaux(['A',4], shape=[2,1])
sage: S = B.subcrystal(generators=(B(2,1,1), B(5,2,4)), index_set=[1,2])
sage: mg = S.module_generators[1]
sage: mg.phi(1)
0
sage: mg.phi(2)
1
```

```
>>> from sage.all import *
>>> B = crystals.Tableaux(['A',Integer(4)], shape=[Integer(2),Integer(1)])
>>> S = B.subcrystal(generators=(B(Integer(2),Integer(1),Integer(1)),␣
↪B(Integer(5),Integer(2),Integer(4))), index_set=[Integer(1),Integer(2)])
>>> mg = S.module_generators[Integer(1)]
>>> mg.phi(Integer(1))
0
>>> mg.phi(Integer(2))
1
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: B = crystals.Tableaux(['A',4], shape=[2,1])
sage: S = B.subcrystal(generators=(B(2,1,1), B(5,2,4)), index_set=[1,2])
sage: mg = S.module_generators[1]
sage: mg.weight()
(0, 1, 0, 1, 1)
```

```
>>> from sage.all import *
>>> B = crystals.Tableaux(['A',Integer(4)], shape=[Integer(2),Integer(1)])
>>> S = B.subcrystal(generators=(B(Integer(2),Integer(1),Integer(1)),␣
```

(continues on next page)

(continued from previous page)

```
↪B(Integer(5),Integer(2),Integer(4))), index_set=[Integer(1),Integer(2)])
>>> mg = S.module_generators[Integer(1)]
>>> mg.weight()
(0, 1, 0, 1, 1)
```

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: B = crystals.Tableaux(['A',4], shape=[2,1])
sage: S = B.subcrystal(generators=[B(2,1,1)], index_set=[1,2])
sage: S.cardinality()
8
sage: B = crystals.infinity.Tableaux(['A',2])
sage: S = B.subcrystal(max_depth=4)
sage: S.cardinality()
22
```

```
>>> from sage.all import *
>>> B = crystals.Tableaux(['A',Integer(4)], shape=[Integer(2),Integer(1)])
>>> S = B.subcrystal(generators=[B(Integer(2),Integer(1),Integer(1))], index_
↪set=[Integer(1),Integer(2)])
>>> S.cardinality()
8
>>> B = crystals.infinity.Tableaux(['A',Integer(2)])
>>> S = B.subcrystal(max_depth=Integer(4))
>>> S.cardinality()
22
```

index_set()

Return the index set of `self`.

EXAMPLES:

```
sage: B = crystals.Tableaux(['A',4], shape=[2,1])
sage: S = B.subcrystal(generators=(B(2,1,1), B(5,2,4)), index_set=[1,2])
sage: S.index_set()
(1, 2)
```

```
>>> from sage.all import *
>>> B = crystals.Tableaux(['A',Integer(4)], shape=[Integer(2),Integer(1)])
>>> S = B.subcrystal(generators=(B(Integer(2),Integer(1),Integer(1)),␣
↪B(Integer(5),Integer(2),Integer(4))), index_set=[Integer(1),Integer(2)])
>>> S.index_set()
(1, 2)
```

Tensor products of crystal elements

AUTHORS:

- Anne Schilling, Nicolas Thiery (2007): initial version

- Ben Salisbury, Travis Scrimshaw (2013): refactored tensor products to handle non-regular crystals and created new subclass to take advantage of the regularity
- Travis Scrimshaw (2017): cythonized element classes
- Franco Saliola (2017): tensor products for crystal of super algebras
- Anne Schilling (2018): tensor products for crystals of queer super algebras

class sage.combinat.crystals.tensor_product_element.**CrystalOfBKKTableauxElement**

Bases: *TensorProductOfSuperCrystalsElement*

Element class for the crystal of tableaux for Lie superalgebras of [BKK2000].

pp()

Pretty print `self`.

EXAMPLES:

```
sage: C = crystals.Tableaux(['A',[1,2]], shape=[1,1])
sage: c = C.an_element()
sage: c.pp()
-2
-1
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['A',[Integer(1),Integer(2)]], shape=[Integer(1),
↪Integer(1)])
>>> c = C.an_element()
>>> c.pp()
-2
-1
```

to_tableau()

Return the *Tableau* object corresponding to `self`.

EXAMPLES:

```
sage: C = crystals.Tableaux(['A',[1,2]], shape=[1,1])
sage: c = C.an_element()
sage: c.to_tableau()
[[-2], [-1]]
sage: type(c.to_tableau())
<class 'sage.combinat.tableau.Tableaux_all_with_category.element_class'>
sage: type(c)
<class 'sage.combinat.crystals.bkk_crystals.CrystalOfBKKTableaux_with_
↪category.element_class'>
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['A',[Integer(1),Integer(2)]], shape=[Integer(1),
↪Integer(1)])
>>> c = C.an_element()
>>> c.to_tableau()
[[-2], [-1]]
>>> type(c.to_tableau())
<class 'sage.combinat.tableau.Tableaux_all_with_category.element_class'>
```

(continues on next page)

(continued from previous page)

```
>>> type(c)
<class 'sage.combinat.crystals.bkk_crystals.CrystalOfBKKTableaux_with_
↪category.element_class'>
```

class sage.combinat.crystals.tensor_product_element.**CrystalOfTableauxElement**

Bases: *TensorProductOfRegularCrystalsElement*

Element in a crystal of tableaux.

pp()

EXAMPLES:

```
sage: T = crystals.Tableaux(['A',3], shape = [2,2])
sage: t = T(rows=[[1,2],[3,4]])
sage: t.pp()
1  2
3  4
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A',Integer(3)], shape = [Integer(2),Integer(2)])
>>> t = T(rows=[[Integer(1),Integer(2)],[Integer(3),Integer(4)]])
>>> t.pp()
1  2
3  4
```

promotion()

Return the result of applying promotion on `self`.

Promotion for type A crystals of tableaux of rectangular shape. This method only makes sense in type A with rectangular shapes.

EXAMPLES:

```
sage: C = crystals.Tableaux(["A",3], shape = [3,3,3])
sage: t = C(Tableau([[1,1,1],[2,2,3],[3,4,4]]))
sage: t
[[1, 1, 1], [2, 2, 3], [3, 4, 4]]
sage: t.promotion()
[[1, 1, 2], [2, 2, 3], [3, 4, 4]]
sage: t.promotion().parent()
The crystal of tableaux of type ['A', 3] and shape(s) [[3, 3, 3]]
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(["A",Integer(3)], shape = [Integer(3),Integer(3),
↪Integer(3)])
>>> t = C(Tableau([[Integer(1),Integer(1),Integer(1)],[Integer(2),Integer(2),
↪Integer(3)],[Integer(3),Integer(4),Integer(4)]]))
>>> t
[[1, 1, 1], [2, 2, 3], [3, 4, 4]]
>>> t.promotion()
[[1, 1, 2], [2, 2, 3], [3, 4, 4]]
>>> t.promotion().parent()
The crystal of tableaux of type ['A', 3] and shape(s) [[3, 3, 3]]
```

promotion_inverse()

Return the result of applying inverse promotion on `self`.

Inverse promotion for type A crystals of tableaux of rectangular shape. This method only makes sense in type A with rectangular shapes.

EXAMPLES:

```
sage: C = crystals.Tableaux(["A",3], shape = [3,3,3])
sage: t = C(Tableau([[1,1,1],[2,2,3],[3,4,4]]))
sage: t
[[1, 1, 1], [2, 2, 3], [3, 4, 4]]
sage: t.promotion_inverse()
[[1, 1, 2], [2, 3, 3], [4, 4, 4]]
sage: t.promotion_inverse().parent()
The crystal of tableaux of type ['A', 3] and shape(s) [[3, 3, 3]]
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(["A",Integer(3)], shape = [Integer(3),Integer(3),
↪Integer(3)])
>>> t = C(Tableau([[Integer(1),Integer(1),Integer(1)],[Integer(2),Integer(2),
↪Integer(3)],[Integer(3),Integer(4),Integer(4)]]))
>>> t
[[1, 1, 1], [2, 2, 3], [3, 4, 4]]
>>> t.promotion_inverse()
[[1, 1, 2], [2, 3, 3], [4, 4, 4]]
>>> t.promotion_inverse().parent()
The crystal of tableaux of type ['A', 3] and shape(s) [[3, 3, 3]]
```

shape()

Return the shape of the tableau corresponding to `self`.

OUTPUT: an instance of *Partition*

See also

to_tableau()

EXAMPLES:

```
sage: C = crystals.Tableaux(["A", 2], shape=[2,1])
sage: x = C.an_element()
sage: x.to_tableau().shape()
[2, 1]
sage: x.shape()
[2, 1]
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(["A", Integer(2)], shape=[Integer(2),Integer(1)])
>>> x = C.an_element()
>>> x.to_tableau().shape()
[2, 1]
>>> x.shape()
[2, 1]
```

to_tableau()

Return the *Tableau* object corresponding to `self`.

EXAMPLES:

```
sage: T = crystals.Tableaux(['A',3], shape = [2,2])
sage: t = T(rows=[[1,2],[3,4]]).to_tableau(); t
[[1, 2], [3, 4]]
sage: type(t)
<class 'sage.combinat.tableau.Tableaux_all_with_category.element_class'>
sage: type(t[0][0])
<class 'int'>
sage: T = crystals.Tableaux(['D',3], shape = [1,1])
sage: t=T(rows=[[-3],[3]]).to_tableau(); t
[[-3], [3]]
sage: t=T(rows=[[3],[-3]]).to_tableau(); t
[[3], [-3]]
sage: T = crystals.Tableaux(['B',2], shape = [1,1])
sage: t = T(rows=[[0],[0]]).to_tableau(); t
[[0], [0]]
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A',Integer(3)], shape = [Integer(2),Integer(2)])
>>> t = T(rows=[[Integer(1),Integer(2)],[Integer(3),Integer(4)]]).to_
↪tableau(); t
[[1, 2], [3, 4]]
>>> type(t)
<class 'sage.combinat.tableau.Tableaux_all_with_category.element_class'>
>>> type(t[Integer(0)][Integer(0)])
<class 'int'>
>>> T = crystals.Tableaux(['D',Integer(3)], shape = [Integer(1),Integer(1)])
>>> t=T(rows=[[-Integer(3)],[Integer(3)]]).to_tableau(); t
[[-3], [3]]
>>> t=T(rows=[[Integer(3)],[-Integer(3)]]).to_tableau(); t
[[3], [-3]]
>>> T = crystals.Tableaux(['B',Integer(2)], shape = [Integer(1),Integer(1)])
>>> t = T(rows=[[Integer(0)],[Integer(0)]]).to_tableau(); t
[[0], [0]]
```

class sage.combinat.crystals.tensor_product_element.**ImmutableListWithParent**

Bases: `ClonableArray`

A class for lists having a parent.

Specification: any subclass `C` should implement `__init__` which accepts the following form `C(parent, list=list)`

class sage.combinat.crystals.tensor_product_element.**InfinityCrystalOfTableauxElement**

Bases: *CrystalOfTableauxElement*

e(i)

Return the action of $\widetilde{e}_i$ on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['B',3])
sage: b = B(rows=[[1,1,1,1,1,1,1,2,0,-3,-1,-1,-1,-1],[2,2,2,2,-2,-2],[3,-3,-
↪3]])
sage: b.e(3).pp()
1  1  1  1  1  1  1  2  0 -3 -1 -1 -1 -1
2  2  2  2 -2 -2
3  0 -3
sage: b.e(1).pp()
1  1  1  1  1  1  1  0 -3 -1 -1 -1 -1
2  2  2  2 -2 -2
3 -3 -3
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['B',Integer(3)])
>>> b = B(rows=[[Integer(1),Integer(1),Integer(1),Integer(1),Integer(1),
↪Integer(1),Integer(1),Integer(2),Integer(0),-Integer(3),-Integer(1),-
↪Integer(1),-Integer(1),-Integer(1)],[Integer(2),Integer(2),Integer(2),
↪Integer(2),-Integer(2),-Integer(2)],[Integer(3),-Integer(3),-Integer(3)]])
>>> b.e(Integer(3)).pp()
1  1  1  1  1  1  1  2  0 -3 -1 -1 -1 -1
2  2  2  2 -2 -2
3  0 -3
>>> b.e(Integer(1)).pp()
1  1  1  1  1  1  1  0 -3 -1 -1 -1 -1
2  2  2  2 -2 -2
3 -3 -3
```

f (i)

Return the action of $\widetilde{f}_i$ on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['C',4])
sage: b = B.highest_weight_vector()
sage: b.f(1).pp()
1  1  1  1  2
2  2  2
3  3
4
sage: b.f(3).pp()
1  1  1  1  1
2  2  2  2
3  3  4
4
sage: b.f(3).f(4).pp()
1  1  1  1  1
2  2  2  2
3  3 -4
4
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['C',Integer(4)])
>>> b = B.highest_weight_vector()
>>> b.f(Integer(1)).pp()
1  1  1  1  2
2  2  2
3  3
4
>>> b.f(Integer(3)).pp()
1  1  1  1  1
2  2  2  2
3  3  4
4
>>> b.f(Integer(3)).f(Integer(4)).pp()
1  1  1  1  1
2  2  2  2
3  3 -4
4
```

class sage.combinat.crystals.tensor_product_element.**InfinityCrystalOfTableauxElementTypeD**

Bases: *InfinityCrystalOfTableauxElement*

e(i)

Return the action of $\widetilde{e}_i$ on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['D',4])
sage: b = B.highest_weight_vector().f_string([1,4,3,1,2]); b.pp()
1  1  1  1  2  3
2  2  2
3 -3
sage: b.e(2).pp()
1  1  1  1  2  2
2  2  2
3 -3
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['D',Integer(4)])
>>> b = B.highest_weight_vector().f_string([Integer(1),Integer(4),Integer(3),
↪Integer(1),Integer(2)]); b.pp()
1  1  1  1  2  3
2  2  2
3 -3
>>> b.e(Integer(2)).pp()
1  1  1  1  2  2
2  2  2
3 -3
```

f(*i*)

Return the action of $\widetilde{f}_i$ on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['D',5])
sage: b = B.highest_weight_vector().f_string([1,4,3,1,5]); b.pp()
1  1  1  1  1  1  2  2
2  2  2  2  2
3  3  3 -5
4  5
sage: b.f(1).pp()
1  1  1  1  1  1  2  2  2
2  2  2  2  2
3  3  3 -5
4  5
sage: b.f(5).pp()
1  1  1  1  1  1  2  2
2  2  2  2  2
3  3  3 -5
4 -4
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['D',Integer(5)])
>>> b = B.highest_weight_vector().f_string([Integer(1),Integer(4),Integer(3),
↪Integer(1),Integer(5)]); b.pp()
1  1  1  1  1  1  2  2
2  2  2  2  2
3  3  3 -5
4  5
>>> b.f(Integer(1)).pp()
1  1  1  1  1  1  2  2  2
2  2  2  2  2
3  3  3 -5
4  5
>>> b.f(Integer(5)).pp()
1  1  1  1  1  1  2  2
2  2  2  2  2
3  3  3 -5
4 -4
```

class sage.combinat.crystals.tensor_product_element.**InfinityQueerCrystalOfTableauxElement**

Bases: *TensorProductOfQueerSuperCrystalsElement*

Initialize `self`.

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['Q',4])
sage: t = B([[4,4,4,4,2,1],[3,3,3],[2,2],[1]])
```

(continues on next page)

(continued from previous page)

```
sage: t
[[4, 4, 4, 4, 2, 1], [3, 3, 3], [2, 2], [1]]
sage: TestSuite(t).run()
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['Q',Integer(4)])
>>> t = B([[Integer(4),Integer(4),Integer(4),Integer(4),Integer(2),Integer(1)],
↪[Integer(3),Integer(3),Integer(3)],[Integer(2),Integer(2)],[Integer(1)]])
>>> t
[[4, 4, 4, 4, 2, 1], [3, 3, 3], [2, 2], [1]]
>>> TestSuite(t).run()
```

e(i)

Return the action of e_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['Q',4])
sage: t = B([[4,4,4,4,4,2,1],[3,3,3,3],[2,2,1],[1]])
sage: t.e(1)
[[4, 4, 4, 4, 4, 4, 2, 1], [3, 3, 3, 3, 3], [2, 2, 1, 1], [1]]
sage: t.e(3)
[[4, 4, 4, 4, 4, 3, 2, 1], [3, 3, 3, 3], [2, 2, 1], [1]]
sage: t.e(-1)
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['Q',Integer(4)])
>>> t = B([[Integer(4),Integer(4),Integer(4),Integer(4),Integer(4),Integer(2),
↪Integer(1)],[Integer(3),Integer(3),Integer(3),Integer(3)],[Integer(2),
↪Integer(2),Integer(1)],[Integer(1)]])
>>> t.e(Integer(1))
[[4, 4, 4, 4, 4, 4, 2, 1], [3, 3, 3, 3, 3], [2, 2, 1, 1], [1]]
>>> t.e(Integer(3))
[[4, 4, 4, 4, 4, 3, 2, 1], [3, 3, 3, 3], [2, 2, 1], [1]]
>>> t.e(-Integer(1))
```

epsilon(i)

Return ε_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['Q',4])
sage: t = B([[4,4,4,4,4,2,1],[3,3,3,3],[2,2,1],[1]])
sage: [t.epsilon(i) for i in B.index_set()]
[-1, 1, -2, 0]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['Q',Integer(4)])
>>> t = B([[Integer(4),Integer(4),Integer(4),Integer(4),Integer(4),Integer(2),
↪Integer(1)],[Integer(3),Integer(3),Integer(3),Integer(3)],[Integer(2),
↪Integer(2),Integer(1)],[Integer(1)]])
>>> [t.epsilon(i) for i in B.index_set()]
[-1, 1, -2, 0]
```

f(*i*)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['Q',4])
sage: t = B([[4,4,4,4,4,2,1],[3,3,3,3],[2,2,1],[1]])
sage: t.f(1)
[[4, 4, 4, 4, 4, 2, 2], [3, 3, 3, 3], [2, 2, 1], [1]]
sage: t.f(3)
sage: t.f(-1)
[[4, 4, 4, 4, 4, 2, 2], [3, 3, 3, 3], [2, 2, 1], [1]]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['Q',Integer(4)])
>>> t = B([[Integer(4),Integer(4),Integer(4),Integer(4),Integer(4),Integer(2),
↪Integer(1)],[Integer(3),Integer(3),Integer(3),Integer(3)],[Integer(2),
↪Integer(2),Integer(1)],[Integer(1)]])
>>> t.f(Integer(1))
[[4, 4, 4, 4, 4, 2, 2], [3, 3, 3, 3], [2, 2, 1], [1]]
>>> t.f(Integer(3))
>>> t.f(-Integer(1))
[[4, 4, 4, 4, 4, 2, 2], [3, 3, 3, 3], [2, 2, 1], [1]]
```

rows()

Return the list of rows of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['Q',4])
sage: t = B([[4,4,4,4,4,2,1],[3,3,3,3],[2,2,1],[1]])
sage: t.rows()
[[1, 2, 4, 4, 4, 4, 4], [3, 3, 3, 3], [1, 2, 2], [1]]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['Q',Integer(4)])
>>> t = B([[Integer(4),Integer(4),Integer(4),Integer(4),Integer(4),Integer(2),
↪Integer(1)],[Integer(3),Integer(3),Integer(3),Integer(3)],[Integer(2),
↪Integer(2),Integer(1)],[Integer(1)]])
>>> t.rows()
[[1, 2, 4, 4, 4, 4, 4], [3, 3, 3, 3], [1, 2, 2], [1]]
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux(['Q',4])
sage: t = B([[4,4,4,4,4,2,1],[3,3,3,3],[2,2,1],[1]])
sage: t.weight()
(4, 2, 2, 0)
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux(['Q',Integer(4)])
>>> t = B([[Integer(4),Integer(4),Integer(4),Integer(4),Integer(4),Integer(2),
...Integer(1)],[Integer(3),Integer(3),Integer(3),Integer(3)],[Integer(2),
...Integer(2),Integer(1)],[Integer(1)]])
>>> t.weight()
(4, 2, 2, 0)
```

class sage.combinat.crystals.tensor_product_element.**TensorProductOfCrystalsElement**

Bases: *ImmutableListWithParent*

A class for elements of tensor products of crystals.

e(i)

Return the action of e_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux("D4")
sage: T = crystals.TensorProduct(B,B)
sage: b1 = B.highest_weight_vector().f_string([1,4,3])
sage: b2 = B.highest_weight_vector().f_string([2,2,3,1,4])
sage: t = T(b2, b1)
sage: t.e(1)
[[[1, 1, 1, 1, 1], [2, 2, 3, -3], [3]], [[1, 1, 1, 1, 2], [2, 2, 2], [3, -3]]]
sage: t.e(2)
sage: t.e(3)
[[[1, 1, 1, 1, 1, 2], [2, 2, 3, -4], [3]], [[1, 1, 1, 1, 2], [2, 2, 2], [3, -
↪3]]]
sage: t.e(4)
[[[1, 1, 1, 1, 1, 2], [2, 2, 3, 4], [3]], [[1, 1, 1, 1, 2], [2, 2, 2], [3, -
↪3]]]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("D4")
>>> T = crystals.TensorProduct(B,B)
>>> b1 = B.highest_weight_vector().f_string([Integer(1),Integer(4),
...Integer(3)])
>>> b2 = B.highest_weight_vector().f_string([Integer(2),Integer(2),Integer(3),
...Integer(1),Integer(4)])
>>> t = T(b2, b1)
```

(continues on next page)

(continued from previous page)

```
>>> t.e(Integer(1))
[[[1, 1, 1, 1, 1], [2, 2, 3, -3], [3]], [[1, 1, 1, 1, 2], [2, 2, 2], [3, -3]]]
>>> t.e(Integer(2))
>>> t.e(Integer(3))
[[[1, 1, 1, 1, 1, 2], [2, 2, 3, -4], [3]], [[1, 1, 1, 1, 2], [2, 2, 2], [3, -
↪3]]]
>>> t.e(Integer(4))
[[[1, 1, 1, 1, 1, 2], [2, 2, 3, 4], [3]], [[1, 1, 1, 1, 2], [2, 2, 2], [3, -
↪3]]]
```

epsilon(i)

Return ε_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux("G2")
sage: T = crystals.TensorProduct(B,B)
sage: b1 = B.highest_weight_vector().f(2)
sage: b2 = B.highest_weight_vector().f_string([2,2,1])
sage: t = T(b2, b1)
sage: [t.epsilon(i) for i in B.index_set()]
[0, 3]
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("G2")
>>> T = crystals.TensorProduct(B,B)
>>> b1 = B.highest_weight_vector().f(Integer(2))
>>> b2 = B.highest_weight_vector().f_string([Integer(2),Integer(2),
↪Integer(1)])
>>> t = T(b2, b1)
>>> [t.epsilon(i) for i in B.index_set()]
[0, 3]
```

f(i)

Return the action of f_i on `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: La = RootSystem(['A',3,1]).weight_lattice(extended=True).fundamental_
↪weights()
sage: B = crystals.GeneralizedYoungWalls(3,La[0])
sage: T = crystals.TensorProduct(B,B,B)
sage: b1 = B.highest_weight_vector().f_string([0,3])
sage: b2 = B.highest_weight_vector().f_string([0])
sage: b3 = B.highest_weight_vector()
sage: t = T(b3, b2, b1)
sage: t.f(0)
```

(continues on next page)

(continued from previous page)

```
[[[0]], [[0]], [[0, 3]]]
sage: t.f(1)
[[], [[0]], [[0, 3], [1]]]
sage: t.f(2)
[[], [[0]], [[0, 3, 2]]]
sage: t.f(3)
[[], [[0, 3]], [[0, 3]]]
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(3),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()
>>> B = crystals.GeneralizedYoungWalls(Integer(3),La[Integer(0)])
>>> T = crystals.TensorProduct(B,B,B)
>>> b1 = B.highest_weight_vector().f_string([Integer(0),Integer(3)])
>>> b2 = B.highest_weight_vector().f_string([Integer(0)])
>>> b3 = B.highest_weight_vector()
>>> t = T(b3, b2, b1)
>>> t.f(Integer(0))
[[[0]], [[0]], [[0, 3]]]
>>> t.f(Integer(1))
[[], [[0]], [[0, 3], [1]]]
>>> t.f(Integer(2))
[[], [[0]], [[0, 3, 2]]]
>>> t.f(Integer(3))
[[], [[0, 3]], [[0, 3]]]
```

phi(*i*)

Return φ_i of `self`.

INPUT:

- `i` – an element of the index set

EXAMPLES:

```
sage: La = RootSystem(['A',2,1]).weight_lattice(extended=True).fundamental_
↪weights()
sage: B = crystals.GeneralizedYoungWalls(2,La[0]+La[1])
sage: T = crystals.TensorProduct(B,B)
sage: b1 = B.highest_weight_vector().f_string([1,0])
sage: b2 = B.highest_weight_vector().f_string([0,1])
sage: t = T(b2, b1)
sage: [t.phi(i) for i in B.index_set()]
[1, 1, 4]
```

```
>>> from sage.all import *
>>> La = RootSystem(['A',Integer(2),Integer(1)]).weight_
↪lattice(extended=True).fundamental_weights()
>>> B = crystals.GeneralizedYoungWalls(Integer(2),
↪La[Integer(0)]+La[Integer(1)])
>>> T = crystals.TensorProduct(B,B)
>>> b1 = B.highest_weight_vector().f_string([Integer(1),Integer(0)])
>>> b2 = B.highest_weight_vector().f_string([Integer(0),Integer(1)])
```

(continues on next page)

(continued from previous page)

```
>>> t = T(b2, b1)
>>> [t.phi(i) for i in B.index_set()]
[1, 1, 4]
```

pp()

Pretty print `self`.

EXAMPLES:

```
sage: C = crystals.Tableaux(['A',3], shape=[3,1])
sage: D = crystals.Tableaux(['A',3], shape=[1])
sage: E = crystals.Tableaux(['A',3], shape=[2,2,2])
sage: T = crystals.TensorProduct(C,D,E)
sage: T.module_generators[0].pp()
  1  1  1 (X)    1 (X)    1  1
  2                      2  2
                         3  3
```

```
>>> from sage.all import *
>>> C = crystals.Tableaux(['A',Integer(3)], shape=[Integer(3),Integer(1)])
>>> D = crystals.Tableaux(['A',Integer(3)], shape=[Integer(1)])
>>> E = crystals.Tableaux(['A',Integer(3)], shape=[Integer(2),Integer(2),
↪Integer(2)])
>>> T = crystals.TensorProduct(C,D,E)
>>> T.module_generators[Integer(0)].pp()
  1  1  1 (X)    1 (X)    1  1
  2                      2  2
                         3  3
```

weight()

Return the weight of `self`.

EXAMPLES:

```
sage: B = crystals.infinity.Tableaux("A3")
sage: T = crystals.TensorProduct(B,B)
sage: b1 = B.highest_weight_vector().f_string([2,1,3])
sage: b2 = B.highest_weight_vector().f(1)
sage: t = T(b2, b1)
sage: t
[[[1, 1, 1, 2], [2, 2], [3]], [[1, 1, 1, 1, 2], [2, 2, 4], [3]]]
sage: t.weight()
(-2, 1, 0, 1)
```

```
>>> from sage.all import *
>>> B = crystals.infinity.Tableaux("A3")
>>> T = crystals.TensorProduct(B,B)
>>> b1 = B.highest_weight_vector().f_string([Integer(2),Integer(1),
↪Integer(3)])
>>> b2 = B.highest_weight_vector().f(Integer(1))
>>> t = T(b2, b1)
>>> t
```

(continues on next page)

(continued from previous page)

```
[[[1, 1, 1, 2], [2, 2], [3]], [[1, 1, 1, 1, 2], [2, 2, 4], [3]]]
>>> t.weight()
(-2, 1, 0, 1)
```

```
sage: C = crystals.Letters(['A',3])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(1),C(2)).weight()
(1, 1, 0, 0)
sage: T = crystals.Tableaux(['D',4],shape=[])
sage: T.list()[0].weight()
(0, 0, 0, 0)
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(3)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(1)),C(Integer(2))).weight()
(1, 1, 0, 0)
>>> T = crystals.Tableaux(['D',Integer(4)],shape=[])
>>> T.list()[Integer(0)].weight()
(0, 0, 0, 0)
```

class sage.combinat.crystals.tensor_product_element.**TensorProductOfQueerSuperCrystalsElement**

Bases: *TensorProductOfRegularCrystalsElement*

Element class for a tensor product of crystals for queer Lie superalgebras.

This implements the tensor product rule for crystals of Grantcharov et al. [GJK+2014]. Given crystals B_1 and B_2 of type $\mathfrak{q}_{n+1}$, we define the tensor product $b_1 \otimes b_2 \in B_1 \otimes B_2$, where $b_1 \in B_1$ and $b_2 \in B_2$, as the following:

In addition to the tensor product rule for type A_n, the tensor product rule for e_{-1} and f_{-1} on $b_1 \otimes b_2$ are given by

$$e_{-1}(b_1 \otimes b_2) = \begin{cases} b_1 \otimes e_{-1}b_2 & \text{if } \mathrm{wt}(b_1)_1 = \mathrm{wt}(b_1)_2 = 0, \\ e_{-1}b_1 \otimes b_2 & \text{otherwise,} \end{cases}$$

$$f_{-1}(b_1 \otimes b_2) = \begin{cases} b_1 \otimes f_{-1}b_2 & \text{if } \mathrm{wt}(b_1)_1 = \mathrm{wt}(b_1)_2 = 0, \\ f_{-1}b_1 \otimes b_2 & \text{otherwise.} \end{cases}$$

For $1 < i \leq n$, the operators e_{-i} and f_{-i} are defined as

$$e_{-i} = s_{w_i^{-1}} e_{-1} s_{w_i}, \quad f_{-i} = s_{w_i^{-1}} f_{-1} s_{w_i}.$$

Here, $w_i = s_2 \cdots s_i s_1 \cdots s_{i-1}$ and s_i is the reflection along the i-string in the crystal. Moreover, for $1 < i \leq n$, we define the operators $e_{-i'}$ and $f_{-i'}$ as

$$e_{-i'} = s_{w_0} f_{-(n+1-i)} s_{w_0}, \quad f_{-i'} = s_{w_0} e_{-(n+1-i)} s_{w_0},$$

where w_0 is the longest element in the symmetric group S_{n+1} generated by $s_1, \ldots, s_n$. In this implementation, we use the integers $-2n, \ldots, -(n+1)$ to respectively denote the indices $-n', \ldots, -1'$.

e(*i*)

Return e_i on `self`.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q', 3])
sage: T = tensor([Q,Q])
sage: t = T(Q(1),Q(1))
sage: t.e(-1)
sage: t = T(Q(2),Q(1))
sage: t.e(-1)
[1, 1]

sage: T = tensor([Q,Q,Q,Q])
sage: t = T(Q(1),Q(3),Q(2),Q(1))
sage: t.e(-2)
[2, 2, 1, 1]
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q', Integer(3)])
>>> T = tensor([Q,Q])
>>> t = T(Q(Integer(1)),Q(Integer(1)))
>>> t.e(-Integer(1))
>>> t = T(Q(Integer(2)),Q(Integer(1)))
>>> t.e(-Integer(1))
[1, 1]

>>> T = tensor([Q,Q,Q,Q])
>>> t = T(Q(Integer(1)),Q(Integer(3)),Q(Integer(2)),Q(Integer(1)))
>>> t.e(-Integer(2))
[2, 2, 1, 1]
```

epsilon(*i*)

Return ε_i on `self`.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q', 3])
sage: T = tensor([Q, Q, Q, Q])
sage: t = T(Q(1), Q(3), Q(2), Q(1))
sage: t.epsilon(-2)
1
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q', Integer(3)])
>>> T = tensor([Q, Q, Q, Q])
>>> t = T(Q(Integer(1)), Q(Integer(3)), Q(Integer(2)), Q(Integer(1)))
>>> t.epsilon(-Integer(2))
1
```

f(*i*)

Return f_i on `self`.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q', 3])
sage: T = tensor([Q, Q])
sage: t = T(Q(1), Q(1))
```

(continues on next page)

(continued from previous page)

```
sage: t.f(-1)
[2, 1]
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q', Integer(3)])
>>> T = tensor([Q, Q])
>>> t = T(Q(Integer(1)), Q(Integer(1)))
>>> t.f(-Integer(1))
[2, 1]
```

phi(*i*)

Return φ_i on `self`.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q', 3])
sage: T = tensor([Q, Q, Q, Q])
sage: t = T(Q(1), Q(3), Q(2), Q(1))
sage: t.phi(-2)
0
sage: t.phi(-1)
1
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q', Integer(3)])
>>> T = tensor([Q, Q, Q, Q])
>>> t = T(Q(Integer(1)), Q(Integer(3)), Q(Integer(2)), Q(Integer(1)))
>>> t.phi(-Integer(2))
0
>>> t.phi(-Integer(1))
1
```

class sage.combinat.crystals.tensor_product_element.**TensorProductOfRegularCrystalsElement**

Bases: *TensorProductOfCrystalsElement*

Element class for a tensor product of regular crystals.

e(*i*)

Return the action of e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(1),C(2)).e(1) == T(C(1),C(1))
True
sage: T(C(2),C(1)).e(1) is None
True
sage: T(C(2),C(2)).e(1) == T(C(1),C(2))
True
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(1)),C(Integer(2))).e(Integer(1)) == T(C(Integer(1)),
↪C(Integer(1)))
True
>>> T(C(Integer(2)),C(Integer(1))).e(Integer(1)) is None
True
>>> T(C(Integer(2)),C(Integer(2))).e(Integer(1)) == T(C(Integer(1)),
↪C(Integer(2)))
True
```

epsilon(i)

Return ε_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(1),C(1)).epsilon(1)
0
sage: T(C(1),C(2)).epsilon(1)
1
sage: T(C(2),C(1)).epsilon(1)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(1)),C(Integer(1))).epsilon(Integer(1))
0
>>> T(C(Integer(1)),C(Integer(2))).epsilon(Integer(1))
1
>>> T(C(Integer(2)),C(Integer(1))).epsilon(Integer(1))
0
```

f(i)

Return the action of f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(1),C(1)).f(1)
[1, 2]
sage: T(C(1),C(2)).f(1)
[2, 2]
sage: T(C(2),C(1)).f(1) is None
True
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
```

(continues on next page)

(continued from previous page)

```
>>> T(C(Integer(1)),C(Integer(1))).f(Integer(1))
[1, 2]
>>> T(C(Integer(1)),C(Integer(2))).f(Integer(1))
[2, 2]
>>> T(C(Integer(2)),C(Integer(1))).f(Integer(1)) is None
True
```

phi(i)

Return φ_i of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(1),C(1)).phi(1)
2
sage: T(C(1),C(2)).phi(1)
1
sage: T(C(2),C(1)).phi(1)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(1)),C(Integer(1))).phi(Integer(1))
2
>>> T(C(Integer(1)),C(Integer(2))).phi(Integer(1))
1
>>> T(C(Integer(2)),C(Integer(1))).phi(Integer(1))
0
```

position_of_first_unmatched_plus(i)

Return the position of the first unmatched $+$ or `None` if there is no unmatched $+$.

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(2),C(1)).position_of_first_unmatched_plus(1)
sage: T(C(1),C(2)).position_of_first_unmatched_plus(1)
1
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(2)),C(Integer(1))).position_of_first_unmatched_
↪plus(Integer(1))
>>> T(C(Integer(1)),C(Integer(2))).position_of_first_unmatched_
↪plus(Integer(1))
1
```

position_of_last_unmatched_minus(i)

Return the position of the last unmatched $-$ or `None` if there is no unmatched $-$.

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(2),C(1)).position_of_last_unmatched_minus(1)
sage: T(C(1),C(2)).position_of_last_unmatched_minus(1)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(2)),C(Integer(1))).position_of_last_unmatched_
↪minus(Integer(1))
>>> T(C(Integer(1)),C(Integer(2))).position_of_last_unmatched_
↪minus(Integer(1))
0
```

positions_of_unmatched_minus(*i*, *dual=False*, *reverse=False*)

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(2),C(1)).positions_of_unmatched_minus(1)
[]
sage: T(C(1),C(2)).positions_of_unmatched_minus(1)
[0]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(2)),C(Integer(1))).positions_of_unmatched_minus(Integer(1))
[]
>>> T(C(Integer(1)),C(Integer(2))).positions_of_unmatched_minus(Integer(1))
[0]
```

positions_of_unmatched_plus(*i*)

EXAMPLES:

```
sage: C = crystals.Letters(['A',5])
sage: T = crystals.TensorProduct(C,C)
sage: T(C(2),C(1)).positions_of_unmatched_plus(1)
[]
sage: T(C(1),C(2)).positions_of_unmatched_plus(1)
[1]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(5)])
>>> T = crystals.TensorProduct(C,C)
>>> T(C(Integer(2)),C(Integer(1))).positions_of_unmatched_plus(Integer(1))
[]
>>> T(C(Integer(1)),C(Integer(2))).positions_of_unmatched_plus(Integer(1))
[1]
```

class sage.combinat.crystals.tensor_product_element.**TensorProductOfSuperCrystalsElement**

Bases: *TensorProductOfRegularCrystalsElement*

Element class for a tensor product of crystals for Lie superalgebras.

This implements the tensor product rule for crystals of Lie superalgebras of [BKK2000].

e(i)

Return e_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A', [2, 1]])
sage: T = tensor([C,C])
sage: t = T(C(1),C(1))
sage: t.e(0)
[-1, 1]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(2), Integer(1)]])
>>> T = tensor([C,C])
>>> t = T(C(Integer(1)),C(Integer(1)))
>>> t.e(Integer(0))
[-1, 1]
```

epsilon(i)

Return ε_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A', [2, 1]])
sage: T = tensor([C,C])
sage: t = T(C(1),C(1))
sage: t.epsilon(0)
1
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(2), Integer(1)]])
>>> T = tensor([C,C])
>>> t = T(C(Integer(1)),C(Integer(1)))
>>> t.epsilon(Integer(0))
1
```

f(i)

Return f_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A', [2, 1]])
sage: T = tensor([C,C])
sage: t = T(C(1),C(1))
sage: t.f(0)
sage: t.f(1)
[1, 2]
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(2), Integer(1)]])
>>> T = tensor([C,C])
>>> t = T(C(Integer(1)),C(Integer(1)))
>>> t.f(Integer(0))
>>> t.f(Integer(1))
[1, 2]
```

phi(*i*)

Return φ_i on `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A', [2, 1]])
sage: T = tensor([C,C])
sage: t = T(C(1),C(1))
sage: t.phi(0)
0
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A', [Integer(2), Integer(1)]])
>>> T = tensor([C,C])
>>> t = T(C(Integer(1)),C(Integer(1)))
>>> t.phi(Integer(0))
0
```

Tensor products of crystals

Main entry points:

- *TensorProductOfCrystals*
- *CrystalOfTableaux*

AUTHORS:

- Anne Schilling, Nicolas Thiery (2007): initial version
- Ben Salisbury, Travis Scrimshaw (2013): refactored tensor products to handle non-regular crystals and created new subclass to take advantage of the regularity
- Travis Scrimshaw (2020): added queer crystal

class sage.combinat.crystals.tensor_product.**CrystalOfQueerTableaux**(*cartan_type*, *shape*)

Bases: *CrystalOfWords*, *QueerSuperCrystalsMixin*

A queer crystal of the semistandard decomposition tableaux of a given shape.

INPUT:

- `cartan_type` – a Cartan type
- `shape` – a shape

class Element

Bases: *TensorProductOfQueerSuperCrystalsElement*

rows()

Return the list of rows of `self`.

EXAMPLES:

```
sage: B = crystals.Tableaux(['Q',3], shape=[3,2,1])
sage: t = B.an_element()
sage: t.rows()
[[3, 3, 3], [2, 2], [1]]
```

```
>>> from sage.all import *
>>> B = crystals.Tableaux(['Q',Integer(3)], shape=[Integer(3),Integer(2),
↪Integer(1)])
>>> t = B.an_element()
>>> t.rows()
[[3, 3, 3], [2, 2], [1]]
```

class sage.combinat.crystals.tensor_product.**CrystalOfTableaux**(*cartan_type*, *shapes*)

Bases: *CrystalOfWords*

A class for crystals of tableaux with integer valued shapes.

INPUT:

- `cartan_type` – a Cartan type
- `shape` – a partition of length at most `cartan_type.rank()`
- `shapes` – list of such partitions

This constructs a classical crystal with the given Cartan type and highest weight(s) corresponding to the given shape(s).

If the type is D_r, the shape is permitted to have a negative value in the r-th position. Thus if the shape equals $[s_1, \ldots, s_r]$, then s_r may be negative but in any case $s_1 \geq \cdots \geq s_{r-1} \geq |s_r|$. This crystal is related to that of shape $[s_1, \ldots, |s_r|]$ by the outer automorphism of $SO(2r)$.

If the type is D_r or B_r, the shape is permitted to be of length r with all parts of half integer value. This corresponds to having one spin column at the beginning of the tableau. If several shapes are provided, they currently should all or none have this property.

Crystals of tableaux are constructed using an embedding into tensor products following Kashiwara and Nakashima [KN1994]. Sage's tensor product rule for crystals differs from that of Kashiwara and Nakashima by reversing the order of the tensor factors. Sage produces the same crystals of tableaux as Kashiwara and Nakashima. With Sage's convention, the tensor product of crystals is the same as the monoid operation on tableaux and hence the plactic monoid.

See also

sage.combinat.crystals.crystals for general help on crystals, and in particular plotting and LaTeX output.

EXAMPLES:

We create the crystal of tableaux for type A_2, with highest weight given by the partition $[2, 1, 1]$:

```
sage: T = crystals.Tableaux(['A',3], shape = [2,1,1])
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A',Integer(3)], shape = [Integer(2),Integer(1),
↪Integer(1)])
```

Here is the list of its elements:

```
sage: T.list()
[[[1, 1], [2], [3]], [[1, 2], [2], [3]], [[1, 3], [2], [3]],
 [[1, 4], [2], [3]], [[1, 4], [2], [4]], [[1, 4], [3], [4]],
 [[2, 4], [3], [4]], [[1, 1], [2], [4]], [[1, 2], [2], [4]],
 [[1, 3], [2], [4]], [[1, 3], [3], [4]], [[2, 3], [3], [4]],
 [[1, 1], [3], [4]], [[1, 2], [3], [4]], [[2, 2], [3], [4]]]
```

```
>>> from sage.all import *
>>> T.list()
[[[1, 1], [2], [3]], [[1, 2], [2], [3]], [[1, 3], [2], [3]],
 [[1, 4], [2], [3]], [[1, 4], [2], [4]], [[1, 4], [3], [4]],
 [[2, 4], [3], [4]], [[1, 1], [2], [4]], [[1, 2], [2], [4]],
 [[1, 3], [2], [4]], [[1, 3], [3], [4]], [[2, 3], [3], [4]],
 [[1, 1], [3], [4]], [[1, 2], [3], [4]], [[2, 2], [3], [4]]]
```

Internally, a tableau of a given Cartan type is represented as a tensor product of letters of the same type. The order in which the tensor factors appear is by reading the columns of the tableaux left to right, top to bottom (in French notation). As an example:

```
sage: T = crystals.Tableaux(['A',2], shape = [3,2])
sage: T.module_generators[0]
[[1, 1, 1], [2, 2]]
sage: list(T.module_generators[0])
[2, 1, 2, 1, 1]
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A',Integer(2)], shape = [Integer(3),Integer(2)])
>>> T.module_generators[Integer(0)]
[[1, 1, 1], [2, 2]]
>>> list(T.module_generators[Integer(0)])
[2, 1, 2, 1, 1]
```

To create a tableau, one can use:

```
sage: Tab = crystals.Tableaux(['A',3], shape = [2,2])
sage: Tab(rows=[[1,2],[3,4]])
[[1, 2], [3, 4]]
sage: Tab(columns=[[3,1],[4,2]])
[[1, 2], [3, 4]]
```

```
>>> from sage.all import *
>>> Tab = crystals.Tableaux(['A',Integer(3)], shape = [Integer(2),Integer(2)])
>>> Tab(rows=[[Integer(1),Integer(2)],[Integer(3),Integer(4)]])
[[1, 2], [3, 4]]
>>> Tab(columns=[[Integer(3),Integer(1)],[Integer(4),Integer(2)]])
[[1, 2], [3, 4]]
```

Todo

FIXME:

- Do we want to specify the columns increasingly or decreasingly? That is, should this be `Tab(columns = [[1,3],[2,4]])`?
- Make this fully consistent with *`Tableau()`*!

We illustrate the use of a shape with a negative last entry in type D:

```
sage: T = crystals.Tableaux(['D',4],shape=[1,1,1,-1])
sage: T.cardinality()
35
sage: TestSuite(T).run()
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['D',Integer(4)],shape=[Integer(1),Integer(1),
↪Integer(1),-Integer(1)])
>>> T.cardinality()
35
>>> TestSuite(T).run()
```

We illustrate the construction of crystals of spin tableaux when the partitions have half integer values in type B and D:

```
sage: T = crystals.Tableaux(['B',3],shape=[3/2,1/2,1/2]); T
The crystal of tableaux of type ['B', 3] and shape(s) [[3/2, 1/2, 1/2]]
sage: T.cardinality()
48
sage: T.module_generators
([+++, [[1]]],)
sage: TestSuite(T).run()

sage: T = crystals.Tableaux(['D',3],shape=[3/2,1/2,-1/2]); T
The crystal of tableaux of type ['D', 3] and shape(s) [[3/2, 1/2, -1/2]]
sage: T.cardinality()
20
sage: T.module_generators
([++-, [[1]]],)
sage: TestSuite(T).run()
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['B',Integer(3)],shape=[Integer(3)/Integer(2),
↪Integer(1)/Integer(2),Integer(1)/Integer(2)]); T
The crystal of tableaux of type ['B', 3] and shape(s) [[3/2, 1/2, 1/2]]
>>> T.cardinality()
48
>>> T.module_generators
([+++, [[1]]],)
>>> TestSuite(T).run()

>>> T = crystals.Tableaux(['D',Integer(3)],shape=[Integer(3)/Integer(2),
```

(continues on next page)

(continued from previous page)

```
↪Integer(1)/Integer(2),-Integer(1)/Integer(2)]); T
The crystal of tableaux of type ['D', 3] and shape(s) [[3/2, 1/2, -1/2]]
>>> T.cardinality()
20
>>> T.module_generators
([++-, [[1]]],)
>>> TestSuite(T).run()
```

We can also construct the tableaux for $\mathfrak{gl}(m|n)$ as given by [BKK2000]:

```
sage: T = crystals.Tableaux(['A', [1,2]], shape=[4,2,1,1,1])
sage: T.cardinality()
1392
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A', [Integer(1),Integer(2)]], shape=[Integer(4),
↪Integer(2),Integer(1),Integer(1),Integer(1)])
>>> T.cardinality()
1392
```

We can also construct the tableaux for $\mathfrak{q}(n)$ as given by [GJK+2014]:

```
sage: T = crystals.Tableaux(['Q', 3], shape=[3,1])
sage: T.cardinality()
24
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['Q', Integer(3)], shape=[Integer(3),Integer(1)])
>>> T.cardinality()
24
```

class Element

Bases: *CrystalOfTableauxElement*

cartan_type()

Return the Cartan type of the associated crystal.

EXAMPLES:

```
sage: T = crystals.Tableaux(['A',3], shape = [2,2])
sage: T.cartan_type()
['A', 3]
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['A',Integer(3)], shape = [Integer(2),Integer(2)])
>>> T.cartan_type()
['A', 3]
```

module_generator(*shape*)

This yields the module generator (or highest weight element) of a classical crystal of given shape. The module generator is the unique tableau with equal shape and content.

EXAMPLES:

```
sage: T = crystals.Tableaux(['D',3], shape = [1,1])
sage: T.module_generator([1,1])
[[1], [2]]

sage: T = crystals.Tableaux(['D',4],shape=[2,2,2,-2])
sage: T.module_generator(tuple([2,2,2,-2]))
[[1, 1], [2, 2], [3, 3], [-4, -4]]
sage: T.cardinality()
294
sage: T = crystals.Tableaux(['D',4],shape=[2,2,2,2])
sage: T.module_generator(tuple([2,2,2,2]))
[[1, 1], [2, 2], [3, 3], [4, 4]]
sage: T.cardinality()
294
```

```
>>> from sage.all import *
>>> T = crystals.Tableaux(['D',Integer(3)], shape = [Integer(1),Integer(1)])
>>> T.module_generator([Integer(1),Integer(1)])
[[1], [2]]

>>> T = crystals.Tableaux(['D',Integer(4)],shape=[Integer(2),Integer(2),
↪Integer(2),-Integer(2)])
>>> T.module_generator(tuple([Integer(2),Integer(2),Integer(2),-Integer(2)]))
[[1, 1], [2, 2], [3, 3], [-4, -4]]
>>> T.cardinality()
294
>>> T = crystals.Tableaux(['D',Integer(4)],shape=[Integer(2),Integer(2),
↪Integer(2),Integer(2)])
>>> T.module_generator(tuple([Integer(2),Integer(2),Integer(2),Integer(2)]))
[[1, 1], [2, 2], [3, 3], [4, 4]]
>>> T.cardinality()
294
```

class sage.combinat.crystals.tensor_product.**CrystalOfWords**

Bases: UniqueRepresentation, Parent

Auxiliary class to provide a call method to create tensor product elements. This class is shared with several tensor product classes and is also used in *CrystalOfTableaux* to allow tableaux of different tensor product structures in column-reading (and hence different shapes) to be considered elements in the same crystal.

class Element

Bases: *TensorProductOfCrystalsElement*

class sage.combinat.crystals.tensor_product.**FullTensorProductOfCrystals**(*crystals*, ***options*)

Bases: *TensorProductOfCrystals*

Full tensor product of crystals.

Todo

Merge this into *TensorProductOfCrystals*.

cardinality()

Return the cardinality of `self`.

EXAMPLES:

```
sage: C = crystals.Letters(['A',2])
sage: T = crystals.TensorProduct(C,C)
sage: T.cardinality()
9
```

```
>>> from sage.all import *
>>> C = crystals.Letters(['A',Integer(2)])
>>> T = crystals.TensorProduct(C,C)
>>> T.cardinality()
9
```

weight_lattice_realization()

Return the weight lattice realization used to express weights.

The weight lattice realization is the common parent which all weight lattice realizations of the crystals of `self` coerce into.

EXAMPLES:

```
sage: B = crystals.elementary.B(['A',4], 2)
sage: B.weight_lattice_realization()
Root lattice of the Root system of type ['A', 4]
sage: T = crystals.infinity.Tableaux(['A',4])
sage: T.weight_lattice_realization()
Ambient space of the Root system of type ['A', 4]
sage: TP = crystals.TensorProduct(B, T)
sage: TP.weight_lattice_realization()
Ambient space of the Root system of type ['A', 4]
```

```
>>> from sage.all import *
>>> B = crystals.elementary.B(['A',Integer(4)], Integer(2))
>>> B.weight_lattice_realization()
Root lattice of the Root system of type ['A', 4]
>>> T = crystals.infinity.Tableaux(['A',Integer(4)])
>>> T.weight_lattice_realization()
Ambient space of the Root system of type ['A', 4]
>>> TP = crystals.TensorProduct(B, T)
>>> TP.weight_lattice_realization()
Ambient space of the Root system of type ['A', 4]
```

class sage.combinat.crystals.tensor_product.**FullTensorProductOfQueerSuperCrystals**(*crystals*, ***options*)

Bases: *FullTensorProductOfCrystals*, *QueerSuperCrystalsMixin*

Tensor product of queer super crystals.

class Element

Bases: *TensorProductOfQueerSuperCrystalsElement*

class sage.combinat.crystals.tensor_product.**FullTensorProductOfRegularCrystals**(*crystals*, ***options*)

Bases: *FullTensorProductOfCrystals*

Full tensor product of regular crystals.

class Element

Bases: *TensorProductOfRegularCrystalsElement*

class sage.combinat.crystals.tensor_product.**FullTensorProductOfSuperCrystals**(*crystals*, ***options*)

Bases: *FullTensorProductOfCrystals*

Tensor product of super crystals.

EXAMPLES:

```
sage: L = crystals.Letters(['A', [1,1]])
sage: T = tensor([L,L,L])
sage: T.cardinality()
64
```

```
>>> from sage.all import *
>>> L = crystals.Letters(['A', [Integer(1),Integer(1)]])
>>> T = tensor([L,L,L])
>>> T.cardinality()
64
```

class Element

Bases: *TensorProductOfSuperCrystalsElement*

class sage.combinat.crystals.tensor_product.**QueerSuperCrystalsMixin**

Bases: object

Mixin class with methods for a finite queer supercrystal.

index_set()

Return the enlarged index set.

EXAMPLES:

```
sage: Q = crystals.Letters(['Q',3])
sage: T = tensor([Q,Q])
sage: T.index_set()
(-4, -3, -2, -1, 1, 2)
```

```
>>> from sage.all import *
>>> Q = crystals.Letters(['Q',Integer(3)])
>>> T = tensor([Q,Q])
>>> T.index_set()
(-4, -3, -2, -1, 1, 2)
```

class sage.combinat.crystals.tensor_product.**TensorProductOfCrystals**

Bases: *CrystalOfWords*

Tensor product of crystals.

Given two crystals B and B' of the same Cartan type, one can form the tensor product $B \otimes B'$. As a set $B \otimes B'$ is the Cartesian product $B \times B'$. The crystal operators f_i and e_i act on $b \otimes b' \in B \otimes B'$ as follows:

$$f_i(b \otimes b') = \begin{cases} f_i(b) \otimes b' & \text{if } \varepsilon_i(b) \geq \varphi_i(b') \\ b \otimes f_i(b') & \text{otherwise} \end{cases}$$

and

$$e_i(b \otimes b') = \begin{cases} e_i(b) \otimes b' & \text{if } \varepsilon_i(b) > \varphi_i(b') \\ b \otimes e_i(b') & \text{otherwise.} \end{cases}$$

We also define:

$$\begin{aligned} \varphi_i(b \otimes b') &= \max\left(\varphi_i(b), \varphi_i(b') + \langle \alpha_i^\vee, \mathrm{wt}(b) \rangle\right), \\ \varepsilon_i(b \otimes b') &= \max\left(\varepsilon_i(b'), \varepsilon_i(b) - \langle \alpha_i^\vee, \mathrm{wt}(b') \rangle\right). \end{aligned}$$

Note

This is the opposite of Kashiwara's convention for tensor products of crystals.

Since tensor products are associative $(\mathcal{B} \otimes \mathcal{C}) \otimes \mathcal{D} \cong \mathcal{B} \otimes (\mathcal{C} \otimes \mathcal{D})$ via the natural isomorphism $(b \otimes c) \otimes d \mapsto b \otimes (c \otimes d)$, we can generalizing this to arbitrary tensor products. Thus consider $B_N \otimes \cdots \otimes B_1$, where each B_k is an abstract crystal. The underlying set of the tensor product is $B_N \times \cdots \times B_1$, while the crystal structure is given as follows. Let I be the index set, and fix some $i \in I$ and $b_N \otimes \cdots \otimes b_1 \in B_N \otimes \cdots \otimes B_1$. Define

$$a_i(k) := \varepsilon_i(b_k) - \sum_{j=1}^{k-1} \langle \alpha_i^\vee, \mathrm{wt}(b_j) \rangle.$$

Then
